Install certificates into the keychain on Mac OS

New in version 2016.3.0.

salt.modules.mac_keychain.get_default_keychain(user=None, domain='user')

Get the default keychain

- **user** The user to check the default keychain of
- **domain** The domain to use valid values are user|system|common|dynamic, the default is user

CLI Example:

```
salt '*' keychain.get_default_keychain
```

salt.modules.mac_keychain.get_friendly_name(cert, password)

Get the friendly name of the given certificate

- **cert** The certificate to install
- **password** The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

Note: The password given here will show up as plaintext in the returned job info.

CLI Example:

```
salt '*' keychain.get_friendly_name /tmp/test.p12 test123
```

salt.modules.mac_keychain.get_hash(name, password=None)

Returns the hash of a certificate in the keychain.

- **name** The name of the certificate (which you can get from keychain.get_friendly_name) or the location of a p12 file.
- **password** The password that is used in the certificate. Only required if your passing a p12 file. Note: This will be outputted to logs

CLI Example:

```
salt '*' keychain.get_hash /tmp/test.p12 test123
```

salt.modules.mac_keychain.install(cert, password, keychain='/Library/Keychains/System.keychain', allow_any=False, keychain_password=None)

Install a certificate

- **cert** The certificate to install
- **password** The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section.

Note: The password given here will show up as plaintext in the job returned info.
- **keychain** The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain
- **allow_any** Allow any application to access the imported certificate without warning
- **keychain_password** If your keychain is likely to be locked pass the password and it will be unlocked before running the import

Note: The password given here will show up as plaintext in the returned job info.

CLI Example:

```
salt '*' keychain.install test.p12 test123
```

salt.modules.mac_keychain.list_certs(keychain='/Library/Keychains/System.keychain')

List all of the installed certificates

- **keychain** The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain

CLI Example:
salt '*' keychain.list_certs

salt.modules.mac_keychain.set_default_keychain(keychain, domain='user', user=None)
Set the default keychain
keychain The location of the keychain to set as default
domain The domain to use valid values are user|system|common|dynamic, the default is user
user The user to set the default keychain as
CLI Example:
salt '*' keychain.set_keychain /Users/fred/Library/Keychains/login.keychain

salt.modules.mac_keychain.uninstall(cert_name, keychain='/Library/Keychains/System.keychain', keychain_password=None)
Uninstall a certificate from a keychain
cert_name The name of the certificate to remove
keychain The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain
keychain_password If your keychain is likely to be locked pass the password and it will be unlocked before running the import

Note: The password given here will show up as plaintext in the returned job info.
CLI Example:
salt '*' keychain.install test.p12 test123

salt.modules.mac_keychain.unlock_keychain(keychain, password)
Unlock the given keychain with the password
keychain The keychain to unlock
password The password to use to unlock the keychain.

Note: The password given here will show up as plaintext in the returned job info.
CLI Example:
salt '*' keychain.unlock_keychain /tmp/test.p12 test123

23.9.244 salt.modules.mac_pkgutil

Installer support for macOS.
Installer is the native .pkg/.mpkg package manager for macOS.
salt.modules.mac_pkgutil.forget(package_id)
New in version 2016.3.0.
Remove the receipt data about the specified package. Does not remove files.

Warniing: DO NOT use this command to fix broken package design

Parameters package_id (str) -- The name of the package to forget
Returns True if successful, otherwise False
Return type bool

CLI Example:
salt '*' pkgutil.forget com.apple.pkg.gcc4.2Leo
salt.modules.mac_pkgutil.install(source, package_id)

Install a .pkg from an URI or an absolute path.

Parameters

- **source (str)** -- The path to a package.
- **package_id (str)** -- The package ID

Returns

True if successful, otherwise False

Return type

bool

CLI Example:

```
salt '*' pkgutil.install source=/vagrant/build_essentials.pkg package_id=com.apple.pkg.gcc4.2Leo
```

salt.modules.mac_pkgutil.is_installed(package_id)

Returns whether a given package id is installed.

Returns

True if installed, otherwise False

Return type

bool

CLI Example:

```
salt '*' pkgutil.is_installed com.apple.pkg.gcc4.2Leo
```

salt.modules.mac_pkgutil.list()

List the installed packages.

Returns

A list of installed packages

Return type

list

CLI Example:

```
salt '*' pkgutil.list
```

### 23.9.245 salt.modules.mac_portspkg

Support for MacPorts under macOS.

This module has some caveats.

1. Updating the database of available ports is quite resource-intensive. However, `refresh=True` is the default for all operations that need an up-to-date copy of available ports. Consider `refresh=False` when you are sure no db update is needed.

2. In some cases MacPorts doesn't always realize when another copy of itself is running and will gleefully tromp all over the available ports database. This makes MacPorts behave in undefined ways until a fresh complete copy is retrieved.

Because of 1 and 2 it is possible to get the salt-minion into a state where `salt mac-machine pkg./something/` won't want to return. Use

```
salt-run jobs.active
```

on the master to check for potentially long-running calls to `port`.

Finally, ports database updates are always handled with `port selfupdate` as opposed to `port sync`. This makes sense in the MacPorts user community but may confuse experienced Linux admins as Linux package managers don't upgrade the packaging software when doing a package database update. In other words `salt mac-machine pkg.refresh_db` is more like `apt-get update; apt-get upgrade dpkg` than simply `apt-get update`.

salt.modules.mac_portspkg.available_version(**names, **kwargs)

This function is an alias of `latest_version`.

---

23.9.  execution modules
Return the latest version of the named package available for upgrade or installation

Options:
refresh  Update ports with port selfupdate

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

salt.modules.mac_portspkg.install(name=None, refresh=False, pkgs=None, **kwargs)
Install the passed package(s) with port install

name  The name of the formula to be installed. Note that this parameter is ignored if "pkgs" is passed.

CLI Example:

```
salt '*' pkg.install <package name>
```

version  Specify a version to pkg to install. Ignored if pkgs is specified.

CLI Example:

```
salt '*' pkg.install <package name>
salt '*' pkg.install git-core version='1.8.5.5'
```

variant  Specify a variant to pkg to install. Ignored if pkgs is specified.

CLI Example:

```
salt '*' pkg.install <package name>
salt '*' pkg.install git-core version='1.8.5.5' variant='+credential
→osxkeychain+doc+pcre'
```

Multiple Package Installation Options:

pkgs  A list of formulas to install. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs=['"foo","bar"]
salt '*' pkg.install pkgs=['"foo@1.2","bar"]
salt '*' pkg.install pkgs=['"foo@1.2+ssl","bar@2.3"]
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
  'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install 'package package package'
```

salt.modules.mac_portspkg.latest_version(*names, **kwargs)
Return the latest version of the named package available for upgrade or installation

Options:
refresh  Update ports with port selfupdate

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

salt.modules.mac_portspkg.list_pkgs(versions_as_list=False, **kwargs)
List the packages currently installed in a dict:
salt Documentation, Release 3003.3

{'<package_name>': '<version>'}

CLI Example:
salt '*' pkg.list_pkgs

salt.modules.mac_portspkg.list_upgrades(refresh=True, **kwargs)
Check whether or not an upgrade is available for all packages
Options:
refresh Update ports with port selfupdate
CLI Example:
salt '*' pkg.list_upgrades

salt.modules.mac_portspkg.refresh_db(**kwargs)
Update ports with port selfupdate
CLI Example:
salt mac pkg.refresh_db

salt.modules.mac_portspkg.remove(name=None, pkgs=None, **kwargs)
Removes packages with port uninstall.
name The name of the package to be deleted.
Multiple Package Options:
pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.
New in version 0.16.0.
Returns a dict containing the changes.
CLI Example:
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'

salt.modules.mac_portspkg.upgrade(refresh=True, **kwargs)
Run a full upgrade using MacPorts 'port upgrade outdated'
Options:
refresh Update ports with port selfupdate
Returns a dictionary containing the changes:

{"<package>": {"old": '<old-version>',
             "new": '<new-version>'}}

CLI Example:
salt '*' pkg.upgrade

salt.modules.mac_portspkg.upgrade_available(pkg, refresh=True, **kwargs)
Check whether or not an upgrade is available for a given package
CLI Example:
salt '*$' pkg.upgrade_available <package name>

salt.modules.mac_portspkg.version("names", **"kwargs")
    Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

    CLI Example:
    salt '*$' pkg.version <package name>
salt '*$' pkg.version <package1> <package2> <package3>

23.9.246 salt.modules.mac_power

Module for editing power settings on macOS

    New in version 2016.3.0.

salt.modules.mac_power.get_computer_sleep()
    Display the amount of idle time until the computer sleeps.
    Returns A string representing the sleep settings for the computer
    Return type str
    CLI Example:
    salt '*$' power.get_computer_sleep

salt.modules.mac_power.get_display_sleep()
    Display the amount of idle time until the display sleeps.
    Returns A string representing the sleep settings for the display
    Return type str
    CLI Example:
    salt '*$' power.get_display_sleep

salt.modules.mac_power.get_harddisk_sleep()
    Display the amount of idle time until the hard disk sleeps.
    Returns A string representing the sleep settings for the hard disk
    Return type str
    CLI Example:
    salt '*$' power.get_harddisk_sleep

salt.modules.mac_power.get_restart_freeze()
    Displays whether 'restart on freeze' is on or off if supported
    Returns A string value representing the "restart on freeze" settings
    Return type string
    CLI Example:
    salt '*$' power.get_restart_freeze

salt.modules.mac_power.get_restart_power_failure()
    Displays whether 'restart on power failure' is on or off if supported
    Returns A string value representing the "restart on power failure" settings
    Return type string
    CLI Example:
salt '∗' power.get_restart_power_failure

salt.modules.mac_power.get_sleep()
Displays the amount of idle time until the machine sleeps. Settings for Computer, Display, and Hard Disk are displayed.
Returns A dictionary containing the sleep status for Computer, Display, and Hard Disk
Return type dict
CLI Example:

salt '∗' power.get_sleep

salt.modules.mac_power.get_sleep_on_power_button()
Displays whether 'allow power button to sleep computer' is on or off if supported
Returns A string value representing the "allow power button to sleep computer" settings
Return type string
CLI Example:

salt '∗' power.get_sleep_on_power_button

salt.modules.mac_power.get_wake_on_modem()
Displays whether 'wake on modem' is on or off if supported
Returns A string value representing the "wake on modem" settings
Return type str
CLI Example:

salt '∗' power.get_wake_on_modem

salt.modules.mac_power.get_wake_on_network()
Displays whether 'wake on network' is on or off if supported
Returns A string value representing the "wake on network" settings
Return type string
CLI Example:

salt '∗' power.get_wake_on_network

salt.modules.mac_power.set_computer_sleep(minutes)
Set the amount of idle time until the computer sleeps. Pass "Never" of "Off" to never sleep.
Parameters minutes -- Can be an integer between 1 and 180 or "Never" or "Off"
Ptype int, str
Returns True if successful, False if not
Return type bool
CLI Example:

salt '∗' power.set_computer_sleep 120
salt '∗' power.set_computer_sleep off

salt.modules.mac_power.set_display_sleep(minutes)
Set the amount of idle time until the display sleeps. Pass "Never" of "Off" to never sleep.
Parameters minutes -- Can be an integer between 1 and 180 or "Never" or "Off"
Ptype int, str
Returns True if successful, False if not
Return type bool
CLI Example:
salt '.*' power.set_display_sleep 120
salt '.*' power.set_display_sleep off

salt.modules.mac_power.set_harddisk_sleep(minutes)
Set the amount of idle time until the harddisk sleeps. Pass "Never" of "Off" to never sleep.

Parameters minutes -- Can be an integer between 1 and 180 or "Never" or "Off"

Ptype int, str

Returns True if successful, False if not

Return type bool

CLI Example:
salt '.*' power.set_harddisk_sleep 120
salt '.*' power.set_harddisk_sleep off

salt.modules.mac_power.set_restart_freeze(enabled)
Specifies whether the server restarts automatically after a system freeze. This setting doesn't seem to be editable. The command completes successfully but the setting isn't actually updated. This is probably a macOS. The functions remains in case they ever fix the bug.

Parameters enabled (bool) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type bool

CLI Example:
salt '.*' power.set_restart_freeze True

salt.modules.mac_power.set_restart_power_failure(enabled)
Set whether or not the computer will automatically restart after a power failure.

Parameters enabled (bool) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type bool

CLI Example:
salt '.*' power.set_restart_power_failure True

salt.modules.mac_power.set_sleep(minutes)
Sets the amount of idle time until the machine sleeps. Sets the same value for Computer, Display, and Hard Disk. Pass "Never" or "Off" for computers that should never sleep.

Parameters minutes -- Can be an integer between 1 and 180 or "Never" or "Off"

Ptype int, str

Returns True if successful, False if not

Return type bool

CLI Example:
salt '.*' power.set_sleep 120
salt '.*' power.set_sleep never

salt.modules.mac_power.set_sleep_on_power_button(enabled)
Set whether or not the power button can sleep the computer.

Parameters enabled (bool) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type bool

CLI Example:
salt.modules.mac_power.set_wake_on_modem(enabled)
Set whether or not the computer will wake from sleep when modem activity is detected.
Parameters enabled(bool) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively
Returns True if successful, False if not
Return type bool
CLI Example:
```
salt '*' power.set_wake_on_modem True
```
salt.modules.mac_power.set_wake_on_network(enabled)
Set whether or not the computer will wake from sleep when network activity is detected.
Parameters enabled(bool) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively
Returns True if successful, False if not
Return type bool
CLI Example:
```
salt '*' power.set_wake_on_network True
```

23.9.247  salt.modules.mac_service

The service module for macOS

New in version 2016.3.0.

This module has support for services in the following locations.
```
/System/Library/LaunchDaemons/
/System/Library/LaunchAgents/
/Library/LaunchDaemons/
/Library/LaunchAgents/

# As of version "2019.2.0" support for user-specific services were added.
/Users/foo/Library/LaunchAgents/
```

Note: As of the 2019.2.0 release, if a service is located in a LaunchAgent path and a runas user is NOT specified, the current console user will be used to properly interact with the service.

Note: As of the 3002 release, if a service name of salt-minion is passed this module will convert it over to it's macOS equivalent name, in this case to com.saltstack.salt.minion. This is true for salt-master, salt-api, and salt-syndic as well.

salt.modules.mac_service.available(name)
Check that the given service is available.
Parameters name(str) -- The name of the service
Returns True if the service is available, otherwise False
Return type bool
CLI Example:
salt '*' service.available com.openssh.sshd

**salt.modules.mac_service.enable**(name, runas=None)
Enable a launchd service. Raises an error if the service fails to be enabled

Parameters
- **name**(str) -- Service label, file name, or full path
- **runas**(str) -- User to run launchctl commands

Returns True if successful or if the service is already enabled

Return type **bool**

CLI Example:
```
salt '*' service.enable org.cups.cupsd
```

**salt.modules.mac_service.disabled**(name, runas=None, domain='system')
Check if the specified service is not enabled. This is the opposite of **service.enabled**

Parameters
- **name**(str) -- The name to look up
- **runas**(str) -- User to run launchctl commands
- **domain**(str) -- domain to check for disabled services. Default is system.

Returns True if the specified service is NOT enabled, otherwise False

Return type **bool**

CLI Example:
```
salt '*' service.disabled org.cups.cupsd
```

**salt.modules.mac_service.enabled**(name, runas=None)
Check if the specified service is enabled (not disabled, capable of being loaded/bootstrapped).

**Note:** Previously this function would see if the service is loaded via `launchctl list` to determine if the service is enabled. This was not an accurate way to do so. The new behavior checks to make sure its not disabled to determine the status. Please use **service.loaded** for the previous behavior.

Parameters
- **name**(str) -- The name of the service to look up.
- **runas**(str) -- User to run launchctl commands.

Returns True if the specified service enabled, otherwise False

Return type **bool**
CLI Example:

```python
salt '* service.enabled org.cups.cupsd
```

**salt.modules.mac_service.get_all**(runas=None)

Return a list of services that are enabled or available. Can be used to find the name of a service.

**Parameters**

- **runas**(str) -- User to run launchctl commands

**Returns**

A list of all the services available or enabled

**Return type**

list

CLI Example:

```python
salt '* service.get_all
```

**salt.modules.mac_service.get_enabled**(runas=None)

Return a list of all services that are enabled. Can be used to find the name of a service.

**Parameters**

- **runas**(str) -- User to run launchctl commands

**Returns**

A list of all the services enabled on the system

**Return type**

list

CLI Example:

```python
salt '* service.get_enabled
```

**salt.modules.mac_service.launchctl**(sub_cmd,*args,**kwargs)

Run a launchctl command and raise an error if it fails

**Parameters**

- **sub_cmd**(str) -- Sub command supplied to launchctl
- **args**(tuple) -- Tuple containing additional arguments to pass to launchctl
- **kwargs**(dict) -- Dictionary containing arguments to pass to cmd.run_all
- **return_stdout**(bool) -- A keyword argument. If true return the stdout of the launchctl command

**Returns**

True if successful, raise CommandExecutionError if not, or the stdout of the launchctl command if requested

**Return type**

bool, str

CLI Example:

```python
salt '* service.launchctl debug org.cups.cupsd
```

**salt.modules.mac_service.list**(name=None, runas=None)

Run launchctl list and return the output

**Parameters**

- **name**(str) -- The name of the service to list
- **runas**(str) -- User to run launchctl commands

**Returns**

If a name is passed returns information about the named service, otherwise returns a list of all services and pids

**Return type**

str

CLI Example:

```python
salt '* service.list
salt '* service.list org.cups.cupsd
```

**salt.modules.mac_service.loaded**(name, runas=None)

Check if the specified service is loaded.
Parameters

- **name** *(str)* -- The name of the service to look up
- **runas** *(str)* -- User to run launchctl commands

Returns  True if the specified service is loaded, otherwise False

Return type  bool

CLI Example:

```shell
salt '*' service.loaded org.cups.cupsd
```

**salt.modules.mac_service.missing(name)**

The inverse of service.available Check that the given service is not available.

Parameters  name *(str)* -- The name of the service

Returns  True if the service is not available, otherwise False

Return type  bool

CLI Example:

```shell
salt '*' service.missing com.openssh.sshd
```

**salt.modules.mac_service.restart(name, runas=None)**

Unloads and reloads a launchd service. Raises an error if the service fails to reload

Parameters

- **name** *(str)* -- Service label, file name, or full path
- **runas** *(str)* -- User to run launchctl commands

Returns  True if successful

Return type  bool

CLI Example:

```shell
salt '*' service.restart org.cups.cupsd
```

**salt.modules.mac_service.show(name)**

Show properties of a launchctl service

Parameters  name *(str)* -- Service label, file name, or full path

Returns  The service information if the service is found

Return type  dict

CLI Example:

```shell
salt '*' service.show org.cups.cupsd   # service label
salt '*' service.show org.cups.cupsd.plist   # file name
salt '*' service.show /System/Library/LaunchDaemons/org.cups.cupsd.plist   # full path
```

**salt.modules.mac_service.start(name, runas=None)**

Start a launchd service. Raises an error if the service fails to start

**Note:** To start a service in macOS the service must be enabled first. Use `service.enable` to enable the service.

Parameters

- **name** *(str)* -- Service label, file name, or full path
- **runas** *(str)* -- User to run launchctl commands

Returns  True if successful or if the service is already running
Return type  **bool**

CLI Example:
```
salt '*' service.start org.cups.cupsd
```

salt.modules.mac_service.status(name, sig=None, runas=None)

Return the status for a service.

**Note:** Previously this function would return a PID for a running service with a PID or 'loaded' for a loaded service without a PID. This was changed to have better parity with other service modules that return True/False.

**Parameters**
- **name (str)** -- Used to find the service from launchctl. Can be the service Label, file name, or path to the service file. (normally a plist)
- **sig (str)** -- Find the service with status.pid instead. Note that name must still be provided.
- **runas (str)** -- User to run launchctl commands.

**Returns** True if running, otherwise False.

**Return type**  **str**

CLI Example:
```
salt '*' service.status cups
```

salt.modules.mac_service.stop(name, runas=None)

Stop a launchd service. Raises an error if the service fails to stop

**Note:** Though service.stop will unload a service in macOS, the service will start on next boot unless it is disabled. Use service.disable to disable the service

**Parameters**
- **name (str)** -- Service label, file name, or full path
- **runas (str)** -- User to run launchctl commands

**Returns** True if successful or if the service is already stopped

**Return type**  **bool**

CLI Example:
23.9.248 salt.modules.mac_shadow

Manage macOS local directory passwords and policies

New in version 2016.3.0.

Note that it is usually better to apply password policies through the creation of a configuration profile.

**salt.modules.mac_shadow.del_password(name)**

Deletes the account password

- **Parameters**
  - `name` *(str)* -- The user name of the account
- **Returns**
  - True if successful, otherwise False
- **Return type**
  - bool
- **Raises**
  - CommandExecutionError on user not found or any other unknown error

**CLI Example:**

```
salt '*' shadow.del_password username
```

**salt.modules.mac_shadow.get_account_created(name)**

Get the date/time the account was created

- **Parameters**
  - `name` *(str)* -- The username of the account
- **Returns**
  - The date/time the account was created (yyyy-mm-dd hh:mm:ss)
- **Return type**
  - str
- **Raises**
  - CommandExecutionError on user not found or any other unknown error

**CLI Example:**

```
salt '*' shadow.get_account_created admin
```

**salt.modules.mac_shadow.get_change(name)**

Gets the date on which the password expires

- **Parameters**
  - `name` *(str)* -- The name of the user account
- **Returns**
  - The date the password will expire
- **Return type**
  - str
- **Raises**
  - CommandExecutionError on user not found or any other unknown error

**CLI Example:**

```
salt '*' shadow.get_change username
```

**salt.modules.mac_shadow.get_expire(name)**

Gets the date on which the account expires

- **Parameters**
  - `name` *(str)* -- The name of the user account
- **Returns**
  - The date the account expires
- **Return type**
  - str
- ** Raises**
  - CommandExecutionError on user not found or any other unknown error

**CLI Example:**

```
salt '*' shadow.get_expire username
```

**salt.modules.mac_shadow.get_last_change(name)**

Get the date/time the account was changed

- **Parameters**
  - `name` *(str)* -- The username of the account
- **Returns**
  - The date/time the account was modified (yyyy-mm-dd hh:mm:ss)
- **Return type**
  - str
**salt.modules.mac_shadow.get_login_failed_count(name)**
Get the number of failed login attempts

Parameters
- **name (str)** -- The username of the account

Returns
The number of failed login attempts

Return type: int

**CLI Example:**
salt '*' shadow.get_login_failed_count admin

**salt.modules.mac_shadow.get_login_failed_last(name)**
Get the date/time of the last failed login attempt

Parameters
- **name (str)** -- The username of the account

Returns
The date/time of the last failed login attempt on this account (yyyy-mm-dd hh:mm:ss)

Return type: str

**CLI Example:**
salt '*' shadow.get_login_failed_last admin

**salt.modules.mac_shadow.get_maxdays(name)**
Get the maximum age of the password

Parameters
- **name (str)** -- The username of the account

Returns
The maximum age of the password in days

Return type: int

**CLI Example:**
salt '*' shadow.get_maxdays admin 90

**salt.modules.mac_shadow.info(name)**
Return information for the specified user

Parameters
- **name (str)** -- The username

Returns
A dictionary containing the user’s shadow information

Return type: dict

**CLI Example:**
salt '*' shadow.info admin

**salt.modules.mac_shadow.set_change(name, date)**
Sets the date on which the password expires. The user will be required to change their password. Format is mm/dd/yyyy

Parameters
- **name (str)** -- The name of the user account
- **date (date)** -- The date the password will expire. Must be in mm/dd/yyyy format.

Returns
True if successful, otherwise False

Return type: bool

**CLI Example:**

---

23.9. execution modules
salt.modules.mac_shadow.set_change(username, date)

Sets the date on which the account expires. The user will not be able to login after this date. Date format is mm/dd/yyyy

Parameters

- name (str) -- The name of the user account
- date (datetime) -- The date the account will expire. Format must be mm/dd/yyyy.

Returns True if successful, False if not

Return type bool

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:
salt '*' shadow.set_change username 09/21/2016

salt.modules.mac_shadow.set_expire(name, date)

Sets the date on which the account expires. The user will not be able to login after this date. Date format is mm/dd/yyyy

Parameters

- name (str) -- The name of the user account
- date (datetime) -- The date the account will expire. Format must be mm/dd/yyyy.

Returns True if successful, False if not

Return type bool

CLI Example:
salt '*' shadow.set_expire username 07/23/2015

salt.modules.mac_shadow.set_inactdays(name, days)

Set the number of inactive days before the account is locked. Not available in macOS

Parameters

- name (str) -- The user name
- days (int) -- The number of days

Returns Will always return False until macOS supports this feature.

Return type bool

CLI Example:
salt '*' shadow.set_inactdays admin 90

salt.modules.mac_shadow.set_maxdays(name, days)

Set the maximum age of the password in days

Parameters

- name (str) -- The username of the account
- days (int) -- The maximum age of the account in days

Returns True if successful, False if not

Return type bool

CLI Example:
salt '*' shadow.set_maxdays admin 90

salt.modules.mac_shadow.set_mindays(name, days)

Set the minimum password age in days. Not available in macOS.

Parameters

- name (str) -- The user name
- days (int) -- The number of days

Returns Will always return False until macOS supports this feature.

Return type bool

CLI Example:
salt '*' shadow.set_mindays admin 90
salt.modules.mac_shadow.set_password(name, password)

Set the password for a named user (insecure, the password will be in the process list while the command is running)

Parameters

- **name**(str) -- The name of the local user, which is assumed to be in the local directory service
- **password**(str) -- The plaintext password to set

Returns True if successful, otherwise False

Return type bool

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' mac_shadow.set_password macuser macpassword
```

salt.modules.mac_shadow.set_warndays(name, days)

Set the number of days before the password expires that the user will start to see a warning. Not available in macOS

Parameters

- **name**(str) -- The user name
- **days**(int) -- The number of days

Returns Will always return False until macOS supports this feature.

Return type bool

CLI Example:

```
salt '*' shadow.set_warndays admin 90
```

**23.9.249 salt.modules.mac_softwareupdate**

Support for the softwareupdate command on MacOS.

salt.modules.mac_softwareupdate.download(name)

Download a named update so that it can be installed later with the update or update_all functions

Parameters **name**(str) -- The update to download.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' softwareupdate.download <update name>
```

salt.modules.mac_softwareupdate.download_all(recommended=False, restart=True)

Download all available updates so that they can be installed later with the update or update_all functions. It returns a list of updates that are now downloaded.

Parameters

- **recommended**(bool) -- If set to True, only install the recommended updates. If set to False (default) all updates are installed.
- **restart**(bool) -- Set this to False if you do not want to install updates that require a restart. Default is True

Returns A list containing all downloaded updates on the system.

Return type list

CLI Example:
salt '*' softwareupdate.download_all

salt.modules.mac_softwareupdate.get_catalog()
New in version 2016.3.0.
Get the current catalog being used for update lookups. Will return a url if a custom catalog has been specified. Otherwise the word 'Default' will be returned.

Returns The catalog being used for update lookups
Return type str

CLI Example:
salt '*' softwareupdates.get_catalog

salt.modules.mac_softwareupdate.ignore(name)
Ignore a specific program update. When an update is ignored the '-' and version number at the end will be omitted, so "SecUpd2014-001-1.0" becomes "SecUpd2014-001". It will be removed automatically if present. An update is successfully ignored when it no longer shows up after list_updates.

Parameters name -- The name of the update to add to the ignore list.
Ptype str
Returns True if successful, False if not
Return type bool

CLI Example:
salt '*' softwareupdate.ignore <update-name>

salt.modules.mac_softwareupdate.list_available(recommended=False, restart=False, shut_down=False)
List all available updates.

Parameters
  - recommended (bool) -- Show only recommended updates.
  - restart (bool) -- Show only updates that require a restart.

Returns Returns a dictionary containing the updates
Return type dict

CLI Example:
salt '*' softwareupdate.list_available

salt.modules.mac_softwareupdate.list_downloads()
Return a list of all updates that have been downloaded locally.

Returns A list of updates that have been downloaded
Return type list

CLI Example:
salt '*' softwareupdate.list_downloads

salt.modules.mac_softwareupdate.list_ignored()
List all updates that have been ignored. Ignored updates are shown without the '-' and version number at the end, this is how the softwareupdate command works.

Returns The list of ignored updates
Return type list

CLI Example:
salt '*' softwareupdate.list_ignored
salt.modules.mac_softwareupdate.reset_catalog()
   New in version 2016.3.0.
   Reset the Software Update Catalog to the default.
   Returns True if successful, False if not
   Return type bool
   CLI Example:
   ```
salt '*' softwareupdates.reset_catalog
   ```

salt.modules.mac_softwareupdate.reset_ignored()
   Make sure the ignored updates are not ignored anymore, returns a list of the updates that are no longer ignored.
   Returns True if the list was reset, Otherwise False
   Return type bool
   CLI Example:
   ```
salt '*' softwareupdate.reset_ignored
   ```

salt.modules.mac_softwareupdate.schedule_enable(enable)
   Enable/disable automatic update scheduling.
   Parameters enable -- True/On/Yes/1 to turn on automatic updates. False/No/Off/0 to turn off automatic updates. If this value is empty, the current status will be returned.
   Type bool str
   Returns True if scheduling is enabled, False if disabled
   Return type bool
   CLI Example:
   ```
salt '*' softwareupdate.schedule_enable on|off
   ```

salt.modules.mac_softwareupdate.schedule_enabled()
   Check the status of automatic update scheduling.
   Returns True if scheduling is enabled, False if disabled
   Return type bool
   CLI Example:
   ```
salt '*' softwareupdate.schedule_enabled
   ```

salt.modules.mac_softwareupdate.set_catalog(url)
   New in version 2016.3.0.
   Set the Software Update Catalog to the URL specified
   Parameters url(str) -- The url to the update catalog
   Returns True if successful, False if not
   Return type bool
   CLI Example:
   ```
salt '*' softwareupdates.set_catalog http://swupd.local:8888/index.sucatalog
   ```

salt.modules.mac_softwareupdate.update(name)
   Install a named update.
   Parameters name (str) -- The name of the of the update to install.
   Returns True if successfully updated, otherwise False
   Return type bool
   CLI Example:
salt '*' softwareupdate.update <update-name>

salt.modules.mac_softwareupdate.update_all(recommended=False, restart=True)
Install all available updates. Returns a dictionary containing the name of the update and the status of its installation.

Parameters

- **recommended (bool)** -- If set to True, only install the recommended updates. If set to False (default) all updates are installed.
- **restart (bool)** -- Set this to False if you do not want to install updates that require a restart. Default is True

Returns A dictionary containing the updates that were installed and the status of its installation. If no updates were installed an empty dictionary is returned.

Return type dict

CLI Example:
salt '*' softwareupdate.update_all

salt.modules.mac_softwareupdate.update_available(name)
Check whether or not an update is available with a given name.

Parameters

- **name (str)** -- The name of the update to look for

Returns True if available, False if not

Return type bool

CLI Example:
salt '*' softwareupdate.update_available <update-name>
salt '*' softwareupdate.update_available "<update with whitespace>"

23.9.250 salt.modules.mac_sysctl

Module for viewing and modifying sysctl parameters

salt.modules.mac_sysctl.assign(name, value)
Assign a single sysctl parameter for this minion

- **name** The name of the sysctl value to edit.
- **value** The sysctl value to apply.

CLI Example:
salt '*' sysctl.assign net.inet.icmp.icmplim 50

salt.modules.mac_sysctl.get(name)
Return a single sysctl parameter for this minion

- **name** The name of the sysctl value to display.

CLI Example:
salt '*' sysctl.get hw.physmem

salt.modules.mac_sysctl.persist(name, value, config='/etc/sysctl.conf', apply_change=False)
Assign and persist a simple sysctl parameter for this minion

- **name** The name of the sysctl value to edit.
- **value** The sysctl value to apply.
- **config** The location of the sysctl configuration file.
- **apply_change** Default is False; Default behavior only creates or edits the sysctl.conf file. If apply is set to True, the changes are applied to the system.
CLI Example:

```
salt '*' sysctl.persist net.inet.icmp.icmplim 50
salt '*' sysctl.persist coretemp_load NO config=/etc/sysctl.conf
```

salt.modules.mac_sysctl.show(config_file=False)
Return a list of sysctl parameters for this minion

`config`: Pull the data from the system configuration file instead of the live data.

CLI Example:

```
salt '*' sysctl.show
```

### 23.9.251 salt.modules.mac_system

System module for sleeping, restarting, and shutting down the system on Mac OS X

New in version 2016.3.0.

**Warning:** Using this module will enable `atrun` on the system if it is disabled.

salt.modules.mac_system.get_boot_arch()
Get the kernel architecture setting from `com.apple.Boot.plist`

- **Returns**: A string value representing the boot architecture setting
- **Return type**: str

CLI Example:

```
salt '*' system.get_boot_arch
```

salt.modules.mac_system.get_computer_name()
Gets the computer name

- **Returns**: The computer name
- **Return type**: str

CLI Example:

```
salt '*' system.get_computer_name
```

salt.modules.mac_system.get_disable_keyboard_on_lock()
Get whether or not the keyboard should be disabled when the X Serve enclosure lock is engaged.

- **Returns**: True if disable keyboard on lock is on, False if off
- **Return type**: bool

CLI Example:

```
salt '*' system.get_disable_keyboard_on_lock
```

salt.modules.mac_system.get_remote_events()
Displays whether remote apple events are on or off.

- **Returns**: True if remote apple events are on, False if off
- **Return type**: bool

CLI Example:

```
salt '*' system.get_remote_events
```

salt.modules.mac_system.get_remote_login()
Displays whether remote login (SSH) is on or off.
Returns True if remote login is on, False if off
Return type bool
CLI Example:
salt '*' system.get_remote_login

salt.modules.mac_system.get_restart_delay()
Get the number of seconds after which the computer will start up after a power failure.
Returns A string value representing the number of seconds the system will delay restart after power loss
Return type str
CLI Example:
```
salt '*' system.get_restart_delay
```

salt.modules.mac_system.get_startup_disk()
Displays the current startup disk
Returns The current startup disk
Return type str
CLI Example:
```
salt '*' system.get_startup_disk
```

salt.modules.mac_system.get_subnet_name()
Gets the local subnet name
Returns The local subnet name
Return type str
CLI Example:
```
salt '*' system.get_subnet_name
```

salt.modules.mac_system.halt(at_time=None)
Halt a running system
Parameters at_time (str) -- Any valid at expression. For example, some valid at expressions could be:
- noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes

Note: If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: "14:00"

CLI Example:
```
salt '*' system.halt
salt '*' system.halt 'now + 10 minutes'
```

salt.modules.mac_system.list_startup_disks()
List all valid startup disks on the system.
Returns A list of valid startup disks
Return type list

CLI Example:
salt '*' system.list_startup_disks

salt.modules.mac_system.restart(at_time=None)
Restart the system

Parameters at_time (str) -- Any valid at expression. For example, some valid at expressions could be:
- noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes

Note: If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: "14:00"

CLI Example:
salt '*' system.restart
salt '*' system.restart '12:00 PM fri'

salt.modules.mac_system.set_boot_arch(arch='default')
Set the kernel to boot in 32 or 64 bit mode on next boot.

Note: When this function fails with the error changes to kernel architecture failed to save!, then the boot arch is not updated. This is either an Apple bug, not available on the test system, or a result of system files being locked down in macOS (SIP Protection).

Parameters arch (str) -- A string representing the desired architecture. If no value is passed, default is assumed. Valid values include:
- i386
- x86_64
- default

Returns True if successful, False if not
Return type bool

CLI Example:
salt '*' system.set_boot_arch i386

salt.modules.mac_system.set_computer_name(name)
Set the computer name

Parameters name (str) -- The new computer name
Returns True if successful, False if not
Return type bool
CLI Example:

```bash
salt '*' system.set_computer_name "Mike's Mac"
```

```python
salt.modules.mac_system.set_disable_keyboard_on_lock(enable)
```

Get whether or not the keyboard should be disabled when the X Serve enclosure lock is engaged.

**Parameters**

- **enable** *(bool)* -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns**

- True if successful, False if not

**Return type**

- bool

CLI Example:

```bash
salt '*' system.set_disable_keyboard_on_lock False
```

```python
salt.modules.mac_system.set_remote_events(enable)
```

Set whether the server responds to events sent by other computers (such as AppleScripts)

**Parameters**

- **enable** *(bool)* -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns**

- True if successful, False if not

**Return type**

- bool

CLI Example:

```bash
salt '*' system.set_remote_events On
```

```python
salt.modules.mac_system.set_remote_login(enable)
```

Set the remote login (SSH) to either on or off.

**Parameters**

- **enable** *(bool)* -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns**

- True if successful, False if not

**Return type**

- bool

CLI Example:

```bash
salt '*' system.set_remote_login True
```

```python
salt.modules.mac_system.set_restart_delay(seconds)
```

Set the number of seconds after which the computer will start up after a power failure.

**Warning:** This command fails with the following error:

```bash
Error, IOServiceOpen returned 0x10000003
```

The setting is not updated. This is an apple bug. It seems like it may only work on certain versions of Mac Server X. This article explains the issue in more detail, though it is quite old.

**Parameters**

- **seconds** *(int)* -- The number of seconds. Must be a multiple of 30

**Returns**

- True if successful, False if not

**Return type**

- bool

CLI Example:

```bash
salt '*' system.set_restart_delay 180
```

```python
salt.modules.mac_system.set_startup_disk(path)
```

Set the current startup disk to the indicated path. Use `system.list_startup_disks` to find valid startup disks on the system.
Parameters **path** *(str)* -- The valid startup disk path

Returns True if successful, False if not

Return type **bool**

CLI Example:

```bash
salt '*' system.set_startup_disk /System/Library/CoreServices
```

salt.modules.mac_system.set_subnet_name(*name*)

Set the local subnet name

Parameters **name** *(str)* -- The new local subnet name

**Note:** Spaces are changed to dashes. Other special characters are removed.

Returns True if successful, False if not

Return type **bool**

CLI Example:

```bash
The following will be set as 'Mikes-Mac'
salt '*' system.set_subnet_name "Mike's Mac"
```

salt.modules.mac_system.shutdown(*at_time=None*)

Shutdown the system

Parameters **at_time** *(str)* -- Any valid *at* expression. For example, some valid *at* expressions could be:

- noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes

**Note:** If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: “14:00”

CLI Example:

```bash
salt '*' system.shutdown
salt '*' system.shutdown 'now + 1 hour'
```

salt.modules.mac_system.sleep(*at_time=None*)

Sleep the system. If a user is active on the system it will likely fail to sleep.

Parameters **at_time** *(str)* -- Any valid *at* expression. For example, some valid *at* expressions could be:

- noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
• now + 10 minutes

Note: If you pass a time only, with no ‘AM/PM’ designation, you have to double quote the parameter on the command line. For example: “14:00”

CLI Example:

```
salt '*' system.sleep
salt '*' system.sleep '10:00 PM'
```

### 23.9.252 salt.modules.mac_timezone

Module for editing date/time settings on macOS

New in version 2016.3.0.

**salt.modules.mac_timezone.get_date()**
Displays the current date

Returns the system date

Return type: str

CLI Example:

```
salt '*' timezone.get_date
```

**salt.modules.mac_timezone.get_hwclock()**
Get current hardware clock setting (UTC or localtime)

CLI Example:

```
salt '*' timezone.get_hwclock
```

**salt.modules.mac_timezone.get_offset()**
Displays the current time zone offset

Returns The current time zone offset

Return type: str

CLI Example:

```
salt '*' timezone.get_offset
```

**salt.modules.mac_timezone.get_time()**
Get the current system time.

Returns The current time in 24 hour format

Return type: str

CLI Example:

```
salt '*' timezone.get_time
```

**salt.modules.mac_timezone.get_time_server()**
Display the currently set network time server.

Returns the network time server

Return type: str

CLI Example:

```
salt '*' timezone.get_time_server
```
salt.modules.mac_timezone.get_using_network_time()
Display whether network time is on or off
Returns True if network time is on, False if off
Return type bool
CLI Example:
```bash
salt '*' timezone.get_using_network_time
```

salt.modules.mac_timezone.get_zone()
Displays the current time zone
Returns The current time zone
Return type str
CLI Example:
```bash
salt '*' timezone.get_zone
```

salt.modules.mac_timezone.get_zonecode()
Displays the current time zone abbreviated code
Returns The current time zone code
Return type str
CLI Example:
```bash
salt '*' timezone.get_zonecode
```

salt.modules.mac_timezone.list_zones()
Displays a list of available time zones. Use this list when setting a time zone using timezone.set_zone
Returns a list of time zones
Return type list
CLI Example:
```bash
salt '*' timezone.list_zones
```

salt.modules.mac_timezone.set_date(date)
Set the current month, day, and year
Parameters date (str) -- The date to set. Valid date formats are:
  • %m:%d:%y
  • %m:%d:%Y
  • %m/%d/%y
  • %m/%d/%Y
Returns True if successful, False if not
Return type bool
Raises SaltInvocationError on Invalid Date format
Raises CommandExecutionError on failure
CLI Example:
```bash
salt '*' timezone.set_date 1/13/2016
```

salt.modules.mac_timezone.set_hwclock(clock)
Sets the hardware clock to be either UTC or localtime
CLI Example:
```bash
salt '*' timezone.set_hwclock UTC
```
salt.modules.mac_timezone.set_time(time)
    Sets the current time. Must be in 24 hour format.
    Parameters time (str) -- The time to set in 24 hour format. The value must be double quoted.
    Returns True if successful, False if not
    Return type bool
    Raises SaltInvocationError on Invalid Time format
    Raises CommandExecutionError on failure
    CLI Example:

    salt '*' timezone.set_time "17:34"

salt.modules.mac_timezone.set_time_server(time_server='time.apple.com')
    Designates a network time server. Enter the IP address or DNS name for the network time server.
    Parameters time_server -- IP or DNS name of the network time server. If nothing is passed
    the time server will be set to the macOS default of 'time.apple.com'
    Type str
    Returns True if successful, False if not
    Return type bool
    Raises CommandExecutionError on failure
    CLI Example:

    salt '*' timezone.set_time_server time.acme.com

salt.modules.mac_timezone.set_using_network_time(enable)
    Set whether network time is on or off.
    Parameters enable -- True to enable, False to disable. Can also use 'on' or 'off'
    Type str bool
    Returns True if successful, False if not
    Return type bool
    Raises CommandExecutionError on failure
    CLI Example:

    salt '*' timezone.set_using_network_time True

salt.modules.mac_timezone.set_zone(time_zone)
    Set the local time zone. Use timezone.list_zones to list valid time_zone arguments
    Parameters time_zone (str) -- The time zone to apply
    Returns True if successful, False if not
    Return type bool
    Raises SaltInvocationError on Invalid Timezone
    Raises CommandExecutionError on failure
    CLI Example:

    salt '*' timezone.set_zone America/Denver

salt.modules.mac_timezone.zone_compare(time_zone)
    Compares the given timezone name with the system timezone name.
    Returns True if they are the same, False if not
    Return type bool
    CLI Example:

    salt '*' timezone.zone_compare America/Boise
23.9.253 salt.modules.mac_user

Manage users on Mac OS 10.7+

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to 'user.info' is not available), see [here](#).

salt.modules.mac_user.add(name, uid=None, gid=None, groups=None, home=None, shell=None, fullname=None, createhome=True, **kwargs)

Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
``` 

salt.modules.mac_user.chfullname(name, fullname)

Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo 'Foo Bar'
``` 

salt.modules.mac_user.chgid(name, gid)

Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
``` 

salt.modules.mac_user.chgroups(name, groups, append=False)

Change the groups to which the user belongs. Note that the user's primary group does not have to be one of the groups passed, membership in the user's primary group is automatically assumed.

groups Groups to which the user should belong, can be passed either as a python list or a comma-separated string

append Instead of removing user from groups not included in the groups parameter, just add user to any groups for which they are not members

CLI Example:

```
salt '*' user.chgroups foo wheel,root
``` 

salt.modules.mac_user.chhome(name, home, **kwargs)

Change the home directory of the user

CLI Example:

```
salt '*' user.chhome foo /Users/foo
``` 

salt.modules.mac_user.chshell(name, shell)

Change the default shell of the user

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
``` 

salt.modules.mac_user.chuid(name, uid)

Change the uid for a named user

CLI Example:
salt '*' user.chuid foo 4376

salt.modules.mac_user.delete(name, remove=False, force=False)
Remove a user from the minion

CLI Example:
salt '*' user.delete name remove=True force=True

salt.modules.mac_user.disable_auto_login()
New in version 2016.3.0.
Disables auto login on the machine
Returns True if successful, otherwise False
Return type bool

CLI Example:
salt '*' user.disable_auto_login

salt.modules.mac_user.enable_auto_login(name, password)
New in version 2016.3.0.
Configures the machine to auto login with the specified user
Parameters

- name (str) -- The user account use for auto login
- password (str) -- The password to user for auto login

New in version 2017.7.3.
Returns True if successful, otherwise False
Return type bool

CLI Example:
salt '*' user.enable_auto_login stevej

salt.modules.mac_user.get_auto_login()
New in version 2016.3.0.
Gets the current setting for Auto Login
Returns If enabled, returns the user name, otherwise returns False
Return type str, bool

CLI Example:
salt '*' user.get_auto_login

salt.modules.mac_user.getent(refresh=False)
Return the list of all info for all users

CLI Example:
salt '*' user.getent

salt.modules.mac_user.info(name)
Return user information

CLI Example:
salt '*' user.info root

salt.modules.mac_user.list_groups(name)
    Return a list of groups the named user belongs to.
    
    name
    The name of the user for which to list groups. Starting in Salt 2016.11.0, all groups for the user, 
    including groups beginning with an underscore will be listed.
    
    Changed in version 2016.11.0.
    CLI Example:
    
    salt '*' user.list_groups foo

salt.modules.mac_user.list_users()
    Return a list of all users
    
    CLI Example:
    
    salt '*' user.list_users

salt.modules.mac_user.primary_group(name)
    Return the primary group of the named user
    
    New in version 2016.3.0.
    CLI Example:
    
    salt '*' user.primary_group saltadmin

salt.modules.mac_user.rename(name, new_name)
    Change the username for a named user
    
    CLI Example:
    
    salt '*' user.rename name new_name

23.9.254 salt.modules.mac_xattr

This module allows you to manage extended attributes on files or directories

salt '*' xattr.list /path/to/file

salt.modules.mac_xattr.clear(path)
    Causes the all attributes on the file/directory to be removed
    
    Parameters
    path (str) -- The file(s) to get attributes from
    
    Returns True if successful, otherwise False
    
    Raises CommandExecutionError on file not found or any other unknown error
    
    CLI Example:
    
    salt '*' xattr.delete /path/to/file "com.test.attr"

salt.modules.mac_xattr.delete(path, attribute)
    Removes the given attribute from the file
    
    Parameters
    
    • path (str) -- The file(s) to get attributes from
- `attribute (str)` -- The attribute name to be deleted from the file/directory
  
  **Returns**  True if successful, otherwise False
  
  **Return type**  bool
  
  **Raises**  CommandExecutionError on file not found, attribute not found, and any other unknown error

  CLI Example:

```
salt '*' xattr.delete /path/to/file "com.test.attr"
```

`salt.modules.mac_xattr.list_ (path, **kwargs)`

List all of the extended attributes on the given file/directory

**Parameters**

- `path (str)` -- The file(s) to get attributes from
- `hex (bool)` -- Return the values with forced hexadecimal values

**Returns**  A dictionary containing extended attributes and values for the given file

**Return type**  dict

**Raises**  CommandExecutionError on file not found or any other unknown error

CLI Example:

```
salt '*' xattr.list /path/to/file
salt '*' xattr.list /path/to/file hex=True
```

`salt.modules.mac_xattr.read (path, attribute, **kwargs)`

Read the given attributes on the given file/directory

**Parameters**

- `path (str)` -- The file to get attributes from
- `attribute (str)` -- The attribute to read
- `hex (bool)` -- Return the values with forced hexadecimal values

**Returns**  A string containing the value of the named attribute

**Return type**  str

**Raises**  CommandExecutionError on file not found, attribute not found, and any other unknown error

CLI Example:

```
salt '*' xattr.read /path/to/file com.test.attr
salt '*' xattr.read /path/to/file com.test.attr hex=True
```

`salt.modules.mac_xattr.write (path, attribute, value, **kwargs)`

Causes the given attribute name to be assigned the given value

**Parameters**

- `path (str)` -- The file(s) to get attributes from
- `attribute (str)` -- The attribute name to be written to the file/directory
- `value (str)` -- The value to assign to the given attribute
- `hex (bool)` -- Set the values with forced hexadecimal values

**Returns**  True if successful, otherwise False

**Return type**  bool

**Raises**  CommandExecutionError on file not found or any other unknown error

CLI Example:

```
salt '*' xattr.write /path/to/file "com.test.attr" "value"
```
23.9.255  `salt.modules.macdefaults`

Set defaults on Mac OS

```python
salt.modules.macdefaults.delete(domain, key, user=None)
```

Delete a default from the system

CLI Example:

```bash
salt '*' macdefaults.delete com.apple.CrashReporter DialogType
salt '*' macdefaults.delete NSGlobalDomain ApplePersistence
```

- **domain**  The name of the domain to delete from
- **key**  The key of the given domain to delete
- **user**  The user to delete the defaults with

```python
salt.modules.macdefaults.read(domain, key, user=None)
```

Read a default from the system

CLI Example:

```bash
salt '*' macdefaults.read com.apple.CrashReporter DialogType
salt '*' macdefaults.read NSGlobalDomain ApplePersistence
```

- **domain**  The name of the domain to read from
- **key**  The key of the given domain to read from
- **user**  The user to read the defaults as

```python
salt.modules.macdefaults.write(domain, key, value, type='string', user=None)
```

Write a default to the system

CLI Example:

```bash
salt '*' macdefaults.write com.apple.CrashReporter DialogType Server
salt '*' macdefaults.write NSGlobalDomain ApplePersistence True type=bool
```

- **domain**  The name of the domain to write to
- **key**  The key of the given domain to write to
- **value**  The value to write to the given key
- **type**  The type of value to be written, valid types are string, data, int[eger], float, bool[ean], date, array, array-add, dict, dict-add
- **user**  The user to write the defaults to

23.9.256  `salt.modules.macpackage`

Install pkg, dmg and .app applications on macOS minions.

```python
salt.modules.macpackage.get_mpkg_ids(mpkg)
```

Attempt to get the package IDs from a mounted .mpkg file

- **mpkg**  (str) -- The location of the mounted mpkg file

CLI Example:

```
```
salt '*/' macpackage.get_mpkg_ids /dev/disk2

salt.modules.macpackage.get_pkg_id(pkg)
    Attempt to get the package ID from a .pkg file
    Parameters pkg (str) -- The location of the pkg file
    Returns List of all of the package IDs
    Return type list
    CLI Example:
    salt '*/' macpackage.get_pkg_id /tmp/test.pkg

salt.modules.macpackage.install(pkg, target='LocalSystem', store=False, allow_untrusted=False)
    Install a pkg file
    Parameters
    • pkg (str) -- The package to install
    • target (str) -- The target in which to install the package to
    • store (bool) -- Should the package be installed as if it was from the store?
    • allow_untrusted (bool) -- Allow the installation of untrusted packages?
    Returns A dictionary containing the results of the installation
    Return type dict
    CLI Example:
    salt '*/' macpackage.install test.pkg

salt.modules.macpackage.install_app(app, target='/Applications/')
    Install an app file by moving it into the specified Applications directory
    Parameters
    • app (str) -- The location of the .app file
    • target (str) -- The target in which to install the package to Default is ''/Applications/''
    Returns The results of the rsync command
    Return type str
    CLI Example:
    salt '*/' macpackage.install_app /tmp/tmp.app /Applications/

salt.modules.macpackage.installed_pkgs()
    Return the list of installed packages on the machine
    Returns List of installed packages
    Return type list
    CLI Example:
    salt '*/' macpackage.installed_pkgs

salt.modules.macpackage.mount(dmg)
    Attempt to mount a dmg file to a temporary location and return the location of the pkg file inside
    Parameters dmg (str) -- The location of the dmg file to mount
    Returns
    Tuple containing the results of the command along with the mount point
    Return type tuple
    CLI Example:
salt '*' macpackage.mount /tmp/software.dmg

salt.modules.macpackage.uninstall_app(app)
Uninstall an app file by removing it from the Applications directory

Parameters app (str) -- The location of the .app file
Returns True if successful, otherwise False
Return type bool

CLI Example:
```
salt '*' macpackage.uninstall_app /Applications/app.app
```

salt.modules.macpackage.unmount(mountpoint)
Attempt to unmount a dmg file from a temporary location

Parameters mountpoint (str) -- The location of the mount point
Returns The results of the hdutil detach command
Return type str

CLI Example:
```
salt '*' macpackage.unmount /dev/disk2
```

23.9.257 salt.modules.makeconf

Support for modifying make.conf under Gentoo

salt.modules.makeconf.append_cflags(value)
Add to or create a new CFLAGS in the make.conf

Return a dict containing the new value for variable:
```
{
    '<variable>':
        'old': '<old-value>',
        'new': '<new-value>'
}
```

CLI Example:
```
salt '*' makeconf.append_cflags '-pipe'
```

salt.modules.makeconf.append_cxxflags(value)
Add to or create a new CXXFLAGS in the make.conf

Return a dict containing the new value for variable:
```
{
    '<variable>':
        'old': '<old-value>',
        'new': '<new-value>'
}
```

CLI Example:
```
salt '*' makeconf.append_cxxflags '-pipe'
```

salt.modules.makeconf.append_emerge_default_opts(value)
Add to or create a new EMERGE_DEFAULT_OPTS in the make.conf

Return a dict containing the new value for variable:
```
{
    '<variable>':
        'old': '<old-value>',
        'new': '<new-value>'
}
```

23.9. execution modules
CLI Example:
```
salt '*' makeconf.append_emerge_default_opts '--jobs'
```

salt.modules.makeconf.append_features(value)
Add to or create a new FEATURES in the make.conf

Return a dict containing the new value for variable:
```
{'<variable>': {'old': '<old-value>',
              'new': '<new-value>'}}
```

CLI Example:
```
salt '*' makeconf.append_features 'webrsync-gpg'
```

salt.modules.makeconf.append_gentoo_mirrors(value)
Add to or create a new GENTOO_MIRRORS in the make.conf

Return a dict containing the new value for variable:
```
{'<variable>': {'old': '<old-value>',
              'new': '<new-value>'}}
```

CLI Example:
```
salt '*' makeconf.append_gentoo_mirrors 'http://distfiles.gentoo.org'
```

salt.modules.makeconf.append_makeopts(value)
Add to or create a new MAKEOPTS in the make.conf

Return a dict containing the new value for variable:
```
{'<variable>': {'old': '<old-value>',
              'new': '<new-value>'}}
```

CLI Example:
```
salt '*' makeconf.append_makeopts '-j3'
```

salt.modules.makeconf.append_var(var, value)
Add to or create a new variable in the make.conf

Return a dict containing the new value for variable:
```
{'<variable>': {'old': '<old-value>',
              'new': '<new-value>'}}
```

CLI Example:
```
salt '*' makeconf.append_var 'LINGUAS' 'en'
```

salt.modules.makeconf.cflags_contains(value)
Verify if CFLAGS variable contains a value in make.conf

Return True if value is set for var

CLI Example:
salt '*' makeconf.cflags_contains '-pipe'

salt.modules.makeconf.chost_contains(value)
    Verify if CHOST variable contains a value in make.conf
    Return True if value is set for var
    CLI Example:
    salt '*' makeconf.chost_contains 'x86_64-pc-linux-gnu'

salt.modules.makeconf.cxxflags_contains(value)
    Verify if CXXFLAGS variable contains a value in make.conf
    Return True if value is set for var
    CLI Example:
    salt '*' makeconf.cxxflags_contains '-pipe'

salt.modules.makeconf.emerge_default_opts_contains(value)
    Verify if EMERGE_DEFAULT_OPTS variable contains a value in make.conf
    Return True if value is set for var
    CLI Example:
    salt '*' makeconf.emerge_default_opts_contains '--jobs'

salt.modules.makeconf.features_contains(value)
    Verify if FEATURES variable contains a value in make.conf
    Return True if value is set for var
    CLI Example:
    salt '*' makeconf.features_contains 'webrsync-gpg'

salt.modules.makeconf.gentoo_mirrors_contains(value)
    Verify if GENTOO_MIRRORS variable contains a value in make.conf
    Return True if value is set for var
    CLI Example:
    salt '*' makeconf.gentoo_mirrors_contains 'http://distfiles.gentoo.org'

salt.modules.makeconf.get_cflags()
    Get the value of CFLAGS variable in the make.conf
    Return the value of the variable or None if the variable is not in the make.conf
    CLI Example:
    salt '*' makeconf.get_cflags

salt.modules.makeconf.get_chost()
    Get the value of CHOST variable in the make.conf
    Return the value of the variable or None if the variable is not in the make.conf
    CLI Example:
### salt

#### makeconf.get_cxxflags()

Get the value of CXXFLAGS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_cxxflags
```

#### makeconf.get_emerge_default_opts()

Get the value of EMERGE_DEFAULT_OPTS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_emerge_default_opts
```

#### makeconf.get_features()

Get the value of FEATURES variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_features
```

#### makeconf.get_gentoo_mirrors()

Get the value of GENTOO_MIRRORS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_gentoo_mirrors
```

#### makeconf.get_makeopts()

Get the value of MAKEOPTS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_makeopts
```

#### makeconf.get_sync()

Get the value of SYNC variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_sync
```

#### makeconf.get_var(var)

Get the value of a variable in make.conf

Return the value of the variable or None if the variable is not in make.conf

CLI Example:
salt '*' makeconf.get_var 'LINGUAS'

salt.modules.makeconf.makeopts_contains(value)
Verify if MAKEOPTS variable contains a value in make.conf
Return True if value is set for var

CLI Example:
salt '*' makeconf.makeopts_contains '-j3'

salt.modules.makeconf.remove_var(var)
Remove a variable from the make.conf
Return a dict containing the new value for the variable:

```json
{ '<variable>': { 'old': '<old-value>', 'new': '<new-value>' }}
```

CLI Example:
salt '*' makeconf.remove_var 'LINGUAS'

salt.modules.makeconf.set_cflags(value)
Set the CFLAGS variable
Return a dict containing the new value for variable:

```json
{ '<variable>': { 'old': '<old-value>', 'new': '<new-value>' }}
```

CLI Example:
salt '*' makeconf.set_cflags '-march=native -O2 -pipe'

salt.modules.makeconf.set_chost(value)
Set the CHOST variable
Return a dict containing the new value for variable:

```json
{ '<variable>': { 'old': '<old-value>', 'new': '<new-value>' }}
```

CLI Example:
salt '*' makeconf.set_chost 'x86_64-pc-linux-gnu'

salt.modules.makeconf.set_cxxflags(value)
Set the CXXFLAGS variable
Return a dict containing the new value for variable:

```json
{ '<variable>': { 'old': '<old-value>', 'new': '<new-value>' }}
```

CLI Example:
salt '*' makeconf.set_cxxflags '-march=native -O2 -pipe'
salt.modules.makeconf.set_emerge_default_opts(value)
Set the EMERGE_DEFAULT_OPTS variable

Return a dict containing the new value for variable:

{ 'variable': { 'old': 'old-value', 'new': 'new-value' }}

CLI Example:
salt '*' makeconf.set_emerge_default_opts 'jobs'

salt.modules.makeconf.set_gentoo_mirrors(value)
Set the GENTOO_MIRRORS variable

Return a dict containing the new value for variable:

{ 'variable': { 'old': 'old-value', 'new': 'new-value' }}

CLI Example:
salt '*' makeconf.set_gentoo_mirrors 'http://distfiles.gentoo.org'

salt.modules.makeconf.set_makeopts(value)
Set the MAKEOPTS variable

Return a dict containing the new value for variable:

{ 'variable': { 'old': 'old-value', 'new': 'new-value' }}

CLI Example:
salt '*' makeconf.set_makeopts '-j3'

salt.modules.makeconf.set_sync(value)
Set the SYNC variable

Return a dict containing the new value for variable:

{ 'variable': { 'old': 'old-value', 'new': 'new-value' }}

CLI Example:
salt '*' makeconf.set_sync 'rsync://rsync.namerica.gentoo.org/gentoo-portage'

salt.modules.makeconf.set_var(var, value)
Set a variable in the make.conf

Return a dict containing the new value for variable:

{ 'variable': { 'old': 'old-value', 'new': 'new-value' }}

CLI Example:
salt '*' makeconf.set_var 'LINGUAS' 'en'

salt.modules.makeconf.sync_contains(value)
Verify if SYNC variable contains a value in make.conf
Return True if value is set for var
CLI Example:
salt '*' makeconf.sync_contains 'rsync://rsync.namerica.gentoo.org/gentoo-portage'

salt.modules.makeconf.trim_cflags(value)
Remove a value from CFLAGS variable in the make.conf
Return a dict containing the new value for variable:

```python
{'<variable>': {'old': '<old-value>',
               'new': '<new-value>'}}
```

CLI Example:
salt '*' makeconf.trim_cflags '-pipe'

salt.modules.makeconf.trim_cxxflags(value)
Remove a value from CXXFLAGS variable in the make.conf
Return a dict containing the new value for variable:

```python
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:
salt '*' makeconf.trim_cxxflags '-pipe'

salt.modules.makeconf.trim_emerge_default_opts(value)
Remove a value from EMERGE_DEFAULT_OPTS variable in the make.conf
Return a dict containing the new value for variable:

```python
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:
salt '*' makeconf.trim_emerge_default_opts '--jobs'

salt.modules.makeconf.trim_features(value)
Remove a value from FEATURES variable in the make.conf
Return a dict containing the new value for variable:

```python
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:
salt '*' makeconf.trim_features 'webrsync-gpg'
salt.modules.makeconf.trim_gentoo_mirrors(value)
Remove a value from GENTOO_MIRRORS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_gentoo_mirrors 'http://distfiles.gentoo.org'
```

salt.modules.makeconf.trim_makeopts(value)
Remove a value from MAKEOPTS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_makeopts '-j3'
```

salt.modules.makeconf.trim_var(var, value)
Remove a value from a variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_var 'LINGUAS' 'en'
```

salt.modules.makeconf.var_contains(var, value)
Verify if variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.var_contains 'LINGUAS' 'en'
```

23.9.258 salt.modules.mandrill

Mandrill

Send out emails using the Mandrill API.

In the minion configuration file, the following block is required:

```
mandrill:
  key: <API_KEY>
```

New in version 2018.3.0.
salt.modules.mandrill.send(message, asynchronous=False, ip_pool=None, send_at=None, api_url=None, api_version=None, api_key=None)

Send out the email using the details from the message argument.

message  The information on the message to send. This argument must be sent as dictionary with at fields as specified in the Mandrill API documentation.

asynchronous: False  Enable a background sending mode that is optimized for bulk sending. In asynchronous mode, messages/send will immediately return a status of "queued" for every recipient. To handle rejections when sending in asynchronous mode, set up a webhook for the 'reject' event. Defaults to false for messages with no more than 10 recipients; messages with more than 10 recipients are always sent asynchronously, regardless of the value of asynchronous.

ip_pool  The name of the dedicated ip pool that should be used to send the message. If you do not have any dedicated IPs, this parameter has no effect. If you specify a pool that does not exist, your default pool will be used instead.

send_at  When this message should be sent as a UTC timestamp in YYYY-MM-DD HH:MM:SS format. If you specify a time in the past, the message will be sent immediately. An additional fee applies for scheduled email, and this feature is only available to accounts with a positive balance.

Note: For further details please consult the API documentation.

CLI Example:

```bash
salt '*' mandrill.send message="{'subject': 'Hi', 'from_email': 'test@example.com
→', 'to': [{'email': 'recv@example.com', 'type': 'to'}]}
```

message  structure example (as YAML for readability):

```yaml
message:
  text: |
    This is the body of the email.
    This is the second line.
  subject: Email subject
  from_name: Test At Example Dot Com
  from_email: test@example.com
  to:
    - email: recv@example.com
      type: to
      name: Recv At Example Dot Com
    - email: cc@example.com
      type: cc
      name: CC At Example Dot Com
  important: true
  track_clicks: true
  track_opens: true
  attachments:
    - type: text/x-yaml
      name: yaml_file.yml
      content: aV9hbV9zdXBlcl9jdXJpb3VzOiB0cnVl
```

Output example:

```yaml
minion:
---------
comment: |
out: |-
---------
```

(continues on next page)
23.9.259 salt.modules.marathon

Module providing a simple management interface to a marathon cluster.
Currently this only works when run through a proxy minion.
New in version 2015.8.2.
salt.modules.marathon.app(id)
   Return the current server configuration for the specified app.
   CLI Example:
   ```
salt marathon-minion-id marathon.app my-app
   ```
salt.modules.marathon.apps()
   Return a list of the currently installed app ids.
   CLI Example:
   ```
salt marathon-minion-id marathon.apps
   ```
salt.modules.marathon.has_app(id)
   Return whether the given app id is currently configured.
   CLI Example:
   ```
salt marathon-minion-id marathon.has_app my-app
   ```
salt.modules.marathon.info()
   Return configuration and status information about the marathon instance.
   CLI Example:
   ```
salt marathon-minion-id marathon.info
   ```
salt.modules.marathon.restart_app(id, restart=False, force=True)
   Restart the current server configuration for the specified app.
   **Parameters**
   ```
   - restart -- Restart the app
   - force -- Override the current deployment
   ```
   CLI Example:
   ```
salt marathon-minion-id marathon.restart_app my-app
   ```
By default, this will only check if the app exists in marathon. It does not check if there are any tasks associated with it or if the app is suspended.

```
salt marathon-minion-id marathon.restart_app my-app true true
```

The restart option needs to be set to True to actually issue a rolling restart to marathon.

The force option tells marathon to ignore the current app deployment if there is one.

```
salt.modules.marathon.rm_app(id)
Remove the specified app from the server.
```

CLI Example:

```
salt marathon-minion-id marathon.rm_app my-app
```

```
salt.modules.marathon.update_app(id, config)
Update the specified app with the given configuration.
```

CLI Example:

```
salt marathon-minion-id marathon.update_app my-app '<config yaml>'
```

### 23.9.260 `salt.modules.match`

The match module allows for match routines to be run and determine target specs

```
salt.modules.match.compound(tgt, minion_id=None)
Return True if the minion ID matches the given compound target
minion_id Specify the minion ID to match against the target expression
```

New in version 2014.7.0.

CLI Example:

```
salt '*' match.compound 'L@cheese,foo and *'
```

```
salt.modules.match.data(tgt)
Return True if the minion matches the given data target
```

CLI Example:

```
salt '*' match.data 'spam:eggs'
```

```
salt.modules.match.filter_by(lookup, tgt_type='compound', minion_id=None, merge=None, merge_lists=False, default='default')
Return the first match in a dictionary of target patterns
New in version 2014.7.0.
```

CLI Example:

```
salt '*' match.filter_by '{foo*: Foo!, bar*: Bar!}' minion_id=bar03
```

Pillar Example:

```
# Filter the data for the current minion into a variable:
{% set roles = salt['match.filter_by']({
    'web*': [app, 'caching'],
    'db*': [db]
})
```

(continues on next page)
salt.modules.match.glob(tgt, minion_id=None)
    Return True if the minion ID matches the given glob target
    minion_id Specify the minion ID to match against the target expression
    New in version 2014.7.0.
    CLI Example:
    salt '*' match.glob '*'

salt.modules.match.grain(tgt, delimiter=': ')
    Return True if the minion matches the given grain target. The delimiter argument can be used to specify a different delimiter.
    CLI Example:
    salt '*' match.grain 'os:Ubuntu'
salt '*' match.grain 'ipv6|2001:db8::ff00:42:8329' delimiter='|'

delimiter Specify an alternate delimiter to use when traversing a nested dict
    New in version 2014.7.0.
    delim Specify an alternate delimiter to use when traversing a nested dict
    New in version 0.16.4.
    Deprecated since version 2015.8.0.

salt.modules.match.grain_pcre(tgt, delimiter=': ')
    Return True if the minion matches the given grain_pcre target. The delimiter argument can be used to specify a different delimiter.
    CLI Example:
    salt '*' match.grain_pcre 'os:Fedo.*'
salt '*' match.grain_pcre 'ipv6|2001:.*' delimiter='|'

delimiter Specify an alternate delimiter to use when traversing a nested dict
    New in version 2014.7.0.
    delim Specify an alternate delimiter to use when traversing a nested dict
    New in version 0.16.4.
    Deprecated since version 2015.8.0.

salt.modules.match.ipcidr(tgt)
    Return True if the minion matches the given ipcidr target
    CLI Example:
    salt '*' match.ipcidr '192.168.44.0/24'
delimiter Pillar Example:
Salt Documentation, Release 3003.3

{'172.16.0.0/12':
  - match: ipcidr
  - nodeclass: internal

salt.modules.match.list(tgt, minion_id=None)
Return True if the minion ID matches the given list target
minion_id Specify the minion ID to match against the target expression

   New in version 2014.7.0.
   CLI Example:
   ```
salt '*' match.list 'server1,server2'
   ```

salt.modules.match.pcre(tgt, minion_id=None)
Return True if the minion ID matches the given pcre target
minion_id Specify the minion ID to match against the target expression

   New in version 2014.7.0.
   CLI Example:
   ```
salt '*' match.pcre '.*'
   ```

salt.modules.match.pillar(tgt, delimiter=':')
Return True if the minion matches the given pillar target. The delimiter argument can be used to specify a different delimiter.

   CLI Example:
   ```
salt '*' match.pillar 'cheese:foo'
salt '*' match.pillar 'clone_url|https://github.com/saltstack/salt.git' delimiter='|'
   ```

delimiter Specify an alternate delimiter to use when traversing a nested dict

   New in version 2014.7.0.
   delim Specify an alternate delimiter to use when traversing a nested dict

   New in version 0.16.4.
   Deprecated since version 2015.8.0.

salt.modules.match.pillar_pcre(tgt, delimiter=':')
Return True if the minion matches the given pillar_pcre target. The delimiter argument can be used to specify a different delimiter.

   CLI Example:
   ```
salt '*' match.pillar_pcre 'cheese:(swiss|american)'
salt '*' match.pillar_pcre 'clone_url|https://github.com/saltstack/salt.git' delimiter='|'
   ```

delimiter Specify an alternate delimiter to use when traversing a nested dict

   New in version 2014.7.0.
   delim Specify an alternate delimiter to use when traversing a nested dict

   New in version 0.16.4.
   Deprecated since version 2015.8.0.

salt.modules.match.search_by(lookup, tgt_type='compound', minion_id=None)
Search a dictionary of target strings for matching targets

23.9. execution modules
This is the inverse of `match.filter_by` and allows matching values instead of matching keys. A minion can be matched by multiple entries.

New in version 2017.7.0.

CLI Example:

```
salt '.*' match.search_by '{web: [node1, node2], db: [node2, node]}'
```

Pillar Example:

```
{% set roles = salt.match.search_by({
    'web': ['G@os_family:Debian not nodeX'],
    'db': ['L@node2,node3 and G@datacenter:west'],
    'caching': ['node3', 'node4'],
}) %}
```

# Make the filtered data available to Pillar:
```
roles: {{ roles | yaml() }}
```

## 23.9.261 salt.modules.mattermost

Module for sending messages to Mattermost

New in version 2017.7.0.

**configuration**  This module can be used by either passing an `api_url` and `hook` directly or by specifying both in a configuration profile in the salt master/minion config. For example:

```
mattermost:
  hook: peWcBiMOS9HzG15peWcBiMOS9HzG15
  api_url: https://example.com
```

`salt.modules.mattermost.post_message(message, channel=None, username=None, api_url=None, hook=None)`

Send a message to a Mattermost channel.

### Parameters

- **channel** -- The channel name, either will work.
- **username** -- The username of the poster.
- **message** -- The message to send to the Mattermost channel.
- **api_url** -- The Mattermost api url, if not specified in the configuration.
- **hook** -- The Mattermost hook, if not specified in the configuration.

### Returns

Boolean if message was sent successfully.

CLI Example:

```
salt '.*' mattermost.post_message message='Build is done'
```
23.9.262  salt.modules.mdadm_raid

Salt module to manage RAID arrays with mdadm

salt.modules.mdadm_raid.add(name, device)
    Add new device to RAID array.

    CLI Example:
    ```
salt '*' raid.add /dev/md0 /dev/sda1
    ```

salt.modules.mdadm_raid.assemble(name, devices, test_mode=False, **kwargs)
    Assemble a RAID device.

    CLI Examples:
    ```
salt '*' raid.assemble /dev/md0 ['/dev/xvdd', '/dev/xvde']
    ```

    Note: Adding test_mode=True as an argument will print out the mdadm command that would have been run.

    name  The name of the array to assemble.
    devices  The list of devices comprising the array to assemble.
    kwargs  Optional arguments to be passed to mdadm.

    returns  
    test_mode=True: Prints out the full command.
    test_mode=False (Default): Executes command on the host(s) and prints out the mdadm output.

    For more info, read the `mdadm` manpage.

salt.modules.mdadm_raid.create(name, level, devices, metadata='default', test_mode=False, **kwargs)
    Create a RAID device.

    Changed in version 2014.7.0.

    Warning: Use with CAUTION, as this function can be very destructive if not used properly!

    CLI Examples:
    ```
salt '*' raid.create /dev/md0 level=1 chunk=256 devices="['/dev/xvdd', '/dev/xvde']" test_mode=True
    ```

    Note: Adding test_mode=True as an argument will print out the mdadm command that would have been run.

    name  The name of the array to create.
    level  The RAID level to use when creating the raid.
    devices  A list of devices used to build the array.
    metadata  Version of metadata to use when creating the array.
    kwargs  Optional arguments to be passed to mdadm.

    returns  
    test_mode=True: Prints out the full command.
    test_mode=False (Default): Executes command on remote the host(s) and Prints out the mdadm output.
Note: It takes time to create a RAID array. You can check the progress in "resync_status:" field of the results from the following command:

```
salt '*' raid.detail /dev/md0
```

For more info, read the `mdadm(8)` manpage.

**salt.modules.mdadm_raid.destroy(device)**

Destroy a RAID device.

**WARNING** This will zero the superblock of all members of the RAID array.

CLI Example:

```
salt '*' raid.destroy /dev/md0
```

**salt.modules.mdadm_raid.detail(device='~/dev/md0')**

Show detail for a specified RAID device

CLI Example:

```
salt '*' raid.detail '~/dev/md0'
```

**salt.modules.mdadm_raid.examine(device, quiet=False)**

Show detail for a specified RAID component device

**device** Device to examine, that is part of the RAID

**quiet** If the device is not part of the RAID, do not show any error

CLI Example:

```
salt '*' raid.examine '~/dev/sda1'
```

**salt.modules.mdadm_raid.list**

List the RAID devices.

CLI Example:

```
salt '*' raid.list
```

**salt.modules.mdadm_raid.save_config()**

Save RAID configuration to config file.

Same as: `mdadm --detail --scan >> /etc/mdadm/mdadm.conf`

Fixes this issue with Ubuntu

**REF:** http://askubuntu.com/questions/209702/why-is-my-raid-dev-md1-showing-up-as-dev-md126-is-mdadm-conf-being-ignored

CLI Example:

```
salt '*' raid.save_config
```

**salt.modules.mdadm_raid.stop()**

Shut down all arrays that can be shut down (i.e. are not currently in use).

CLI Example:

```
salt '*' raid.stop
```
23.9.263 salt.modules.mdata

Module for managing metadata in SmartOS Zones

New in version 2016.3.0.

maintainer Jorge Schrauwen <sjorge@blackdot.be>
maturity new
platform smartos

salt.modules.mdata.delete_('keyname')
Delete metadata
prop [string] name of property
CLI Example:

```bash
salt '*' mdata.get salt:role
salt '*' mdata.get user-script salt:role
```

salt.modules.mdata.get_('keyname')
Get metadata
keyname [string] name of key

Note: If no keynames are specified, we get all (public) properties

CLI Example:

```bash
salt '*' mdata.get salt:role
salt '*' mdata.get user-script salt:role
```

salt.modules.mdata.list()
List available metadata

CLI Example:

```bash
salt '*' mdata.list
```

salt.modules.mdata.put_('keyname', val)
Put metadata
prop [string] name of property
val [string] value to set

CLI Example:

```bash
salt '*' mdata.list
```

23.9.264 salt.modules.memcached

Module for Management of Memcached Keys

New in version 2014.1.0.

salt.modules.memcached.add(key, value, host='127.0.0.1', port=11211, time=0, min_compress_len=0)
Add a key to the memcached server, but only if it does not exist. Returns False if the key already exists.

CLI Example:
### memcached.add

This function allows you to add a key to the memcached server.

**CLI Example:**

```shell
salt '*' memcached.add <key> <value>
```

### memcached.decr

This function decrements the value of a key.

**CLI Example:**

```shell
salt '*' memcached.decr <key> delta=1 host='127.0.0.1' port=11211
```

### memcached.delete

This function deletes a key from the memcached server.

**CLI Example:**

```shell
salt '*' memcached.delete <key>
```

### memcached.get

This function retrieves the value for a key.

**CLI Example:**

```shell
salt '*' memcached.get <key>
```

### memcached.incr

This function increments the value of a key.

**CLI Example:**

```shell
salt '*' memcached.incr <key> delta=1 host='127.0.0.1' port=11211
```

### memcached.replace

This function replaces a key on the memcached server. It only succeeds if the key already exists. This is the opposite of `memcached.add`.

**CLI Example:**

```shell
salt '*' memcached.replace <key> <value>
```
salt.modules.memcached.set_

Set a key on the memcached server, overwriting the value if it exists.

CLI Example:
```
salt '*' memcached.set <key> <value>
```

salt.modules.memcached.status

Get memcached status

CLI Example:
```
salt '*' memcached.status
```

23.9.265 salt.modules.mine

The function cache system allows for data to be stored on the master so it can be easily read by other minions

salt.modules.mine.delete

Remove specific function contents of minion.

Parameters
- `fun` (str) -- The name of the function.

Return type bool

Returns True on success.

CLI Example:
```
salt '*' mine.delete 'network.interfaces'
```

salt.modules.mine.flush

Remove all mine contents of minion.

Return type bool

Returns True on success

CLI Example:
```
salt '*' mine.flush
```

salt.modules.mine.get

Get data from the mine.

Parameters
- `tgt` (str) -- Target whose mine data to get.
- `fun` (str or list) -- Function to get the mine data of. You can specify multiple functions to retrieve using either a list or a comma-separated string of functions.
- `tgt_type` (str) -- Default glob. Target type to use with `tgt`. See Targeting Minions for more information. Note that all pillar matches, whether using the compound matching system or the pillar matching system, will be exact matches, with globbing disabled.
- `exclude_minion` (bool) -- Excludes the current minion from the result set.

CLI Example:
```
salt '*' mine.get '*' network.interfaces
salt '*' mine.get 'os:Fedora' network.interfaces grain
salt '*' mine.get 'G@os:Fedora and S@192.168.5.0/24' network.ipaddrs compound
```
See also:

Retrieving Mine data from Pillar and Orchestrate

This execution module is intended to be executed on minions. Master-side operations such as Pillar or Orchestrate that require Mine data should use the Mine Runner module instead; it can be invoked from a Pillar SLS file using the saltutil.runner module. For example:

```python
{% set minion_ips = salt.saltutil.runner('mine.get',
    tgt='*',
    fun='network.ip_addrs',
    tgt_type='glob') %}
```

salt.modules.mine.get_docker(interfaces=None, cidrs=None, with_container_id=False)

Changed in version 2017.7.8,2018.3.3: When docker.update_mine is set to False for a given minion, no mine data will be populated for that minion, and thus none will be returned for it.

Changed in version 2019.2.0: docker.update_mine now defaults to False

Get all mine data for docker.ps and run an aggregation routine. The interfaces parameter allows for specifying the network interfaces from which to select IP addresses. The cidrs parameter allows for specifying a list of subnets which the IP address must match.

with_container_id Boolean, to expose container_id in the list of results

New in version 2015.8.2.

CLI Example:

```
salt '*' mine.get_docker
salt '*' mine.get_docker interfaces='eth0'
salt '*' mine.get_docker interfaces='["eth0", "eth1"]'
salt '*' mine.get_docker cidrs='107.170.147.0/24'
salt '*' mine.get_docker cidrs='["107.170.147.0/24", "172.17.42.0/24"]'
salt '*' mine.get_docker interfaces='["eth0", "eth1"]' cidrs='["107.170.147.0/24", "172.17.42.0/24"]'
```

salt.modules.mine.send(name, *args, **kwargs)

Send a specific function and its result to the salt mine. This gets stored in either the local cache, or the salt master's cache.

Parameters name (str) -- Name of the function to add to the mine.

The following pameters are extracted from kwargs if present:

Parameters

- mine_function (str) -- The name of the execution_module.function to run and whose value will be stored in the salt mine. Defaults to name.

- allow_tgt (str) -- Targeting specification for ACL. Specifies which minions are allowed to access this function. Please note both your master and minion need to be on, at least, version 3000 for this to work properly.

- allow_tgt_type (str) -- Type of the targeting specification. This value will be ignored if allow_tgt is not specified. Please note both your master and minion need to be on, at least, version 3000 for this to work properly.

Remaining args and kwargs will be passed on to the function to run.

Return type bool

Returns Whether executing the function and storing the information was successful.

Changed in version 3000: Added allow_tgt- and allow_tgt_type-parameters to specify which minions are allowed to access this function. See Targeting Minions for more information about targeting.

CLI Example:
salt '***' mine.send network.ip_addrs eth0
salt '***' mine.send eth0_ip_addrs mine_function=network.ip_addrs eth0
salt '***' mine.send eth0_ip_addrs mine_function=network.ip_addrs eth0 allow_tgt="G@grain:value" allow_tgt_type=compound

salt.modules.mine.update(clear=False, mine_functions=None)

Call the configured functions and send the data back up to the master. The functions to be called are merged from the master config, pillar and minion config under the option `mine_functions`:

```
mine_functions:
    network.ip_addrs:
        - eth0
    disk.usage: []
```

This function accepts the following arguments:

**Parameters**

- **clear** *(bool)* -- Default: False Specifies whether updating will clear the existing values (True), or whether it will update them (False).

- **mine_functions** *(dict)* -- Update (or clear, see `clear`) the mine data on these functions only. This will need to have the structure as defined on https://docs.saltproject.io/en/latest/topics/mine/index.html#mine-functions

This feature can be used when updating the mine for functions that require a refresh at different intervals than the rest of the functions specified under `mine_functions` in the minion/master config or pillar. A potential use would be together with the scheduler, for example:

```
schedule:
    lldp_mine_update:
        function: mine.update
        kwargs:
            mine_functions: net.lldp [ ]
            hours: 12
```

In the example above, the mine for `net.lldp` would be refreshed every 12 hours, while `network.ip_addrs` would continue to be updated as specified in `mine_interval`.

The function cache will be populated with information from executing these functions

CLI Example:

```
salt '***' mine.update
```

salt.modules.mine.valid()

List valid entries in mine configuration.

CLI Example:

```
salt '***' mine.valid
```
23.9.266 salt.modules.minion

Module to provide information about minions

salt.modules.minion.kill(timeout=15)

Kill the salt minion.

timeout int seconds to wait for the minion to die.

If you have a monitor that restarts salt-minion when it dies then this is a great way to restart after a
minion upgrade.

CLI Example:

```
salt minion[12] minion.kill

minion1:
    ---------
    killed: 7874
    retcode: 0

minion2:
    ---------
    killed: 29071
    retcode: 0
```

The result of the salt command shows the process ID of the minions and the results of a kill signal to the minion
in as the retcode value: 0 is success, anything else is a failure.

salt.modules.minion.list()

Return a list of accepted, denied, unaccepted and rejected keys. This is the same output as salt-key -L

CLI Example:

```
salt 'master' minion.list
```

salt.modules.minion.restart()

Kill and restart the salt minion.

The configuration key minion_restart_command is an argv list for the command to restart the minion.
If minion_restart_command is not specified or empty then the argv of the current process will be used.

if the configuration value minion_restart_command is not set and the -d (daemonize) argument is missing
from argv then the minion will be killed but will not be restarted and will require the parent process to
perform the restart. This behavior is intended for managed salt minion processes.

CLI Example:

```
salt minion[12] minion.restart

minion1:
    ---------
    comment:
      - Restart using process argv:
        /home/omniture/install/bin/salt-minion
        -d
        -c
        /home/omniture/install/etc/salt
```

(continues on next page)
killed:
  10070
restart:
  ---------
stderr:
stdout:
retcode:
  0
minion2:
  ---------
comment:
  - Using configuration minion_restart_command:
  - /home/omniture/install/bin/salt-minion
  - --not-an-option
  - -d
  - -c
  - /home/omniture/install/etc/salt
  - Restart failed
killed:
  10896
restart:
  ---------
stderr:
  Usage: salt-minion
  salt-minion: error: no such option: --not-an-option
stdout:
retcode:
  64

The result of the command shows the process ID of minion1 that is shutdown (killed) and the results of the
restart. If there is a failure in the restart it will be reflected in a non-zero retcode and possibly output in the
stderr and/or stdout values along with addition information in the comment field as is demonstrated
with minion2.

23.9.267 salt.modules.mod_random

Provides access to randomness generators.

New in version 2014.7.0.
salt.modules.mod_random.get_str(length=20)
  New in version 2014.7.0.
  Returns a random string of the specified length.
  length  [20] Any valid number of bytes.
  CLI Example:
  salt '*' random.get_str 128

salt.modules.mod_random.hash(value, algorithm='sha512')
  New in version 2014.7.0.
  Encodes a value with the specified encoder.
  value  The value to be hashed.
  algorithm  [sha512] The algorithm to use. May be any valid algorithm supported by hashlib.
CLI Example:

```
salt '*' random.hash 'I am a string' md5
```

salt.modules.mod_random.rand_int\(start=1, \text{end}=10, \text{seed}=\text{None}\)

Returns a random integer number between the start and end number.

New in version 2015.5.3.

- **start**: Any valid integer number
- **end**: Any valid integer number
- **seed**: Optional hashable object

Changed in version 2019.2.0: Added seed argument. Will return the same result when run with the same seed.

CLI Example:

```
salt '*' random.rand_int 1 10
```

salt.modules.mod_random.seed\(range=10, hash=\text{None}\)

Returns a random number within a range. Optional hash argument can be any hashable object. If hash is omitted or None, the id of the minion is used.

New in version 2015.8.0.

- **hash**: None Any hashable object.
- **range**: 10 Any valid integer number

CLI Example:

```
salt '*' random.seed 10 hash=\text{None}
```

salt.modules.mod_random.shadow_hash\(\text{crypt_salt}=\text{None}, \text{password}=\text{None}, \text{algorithm}=\text{'sha512'}\)

Generates a salted hash suitable for /etc/shadow.

- **crypt_salt**: [None] Salt to be used in the generation of the hash. If one is not provided, a random salt will be generated.
- **password**: [None] Value to be salted and hashed. If one is not provided, a random password will be generated.
- **algorithm**: [sha512] Hash algorithm to use.

CLI Example:

```
salt '*' random.shadow_hash 'My5alT' 'MyP@sswd' md5
```

salt.modules.mod_random.str_encode\(\text{value}, \text{encoder}=\text{'base64'}\)

New in version 2014.7.0.

- **value**: The value to be encoded.
- **encoder**: [base64] The encoder to use on the subsequent string.

CLI Example:

```
salt '*' random.str_encode 'I am a new string' base64
```

### 23.9.268 salt.modules.modjk

Below is an example of the configuration needed for this module. This configuration data can be placed either in grains or pillar.

If using grains, this can be accomplished statically or via a grain module.
If using pillar, the yaml configuration can be placed directly into a pillar SLS file, making this both the easier and more dynamic method of configuring this module.

```yaml
modjk:
  default:
    url: http://localhost/jkstatus
    user: modjk
    pass: secret
    realm: authentication realm for digest passwords
    timeout: 5
  otherVhost:
    url: http://otherVhost/jkstatus
    user: modjk
    pass: secret2
    realm: authentication realm2 for digest passwords
    timeout: 600
```

```python
salt.modules.modjk.bulk_activate(workers, lbn, profile='default')
Activate all the given workers in the specific load balancer

CLI Examples:
salt '*' modjk.bulk_activate node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_activate node1,node2,node3 loadbalancer1 other-profile

salt.modules.modjk.bulk_disable(workers, lbn, profile='default')
Disable all the given workers in the specific load balancer

CLI Examples:
salt '*' modjk.bulk_disable node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_disable node1,node2,node3 loadbalancer1 other-profile

salt.modules.modjk.bulk_recover(workers, lbn, profile='default')
Recover all the given workers in the specific load balancer

CLI Examples:
salt '*' modjk.bulk_recover node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_recover node1,node2,node3 loadbalancer1 other-profile

salt.modules.modjk.bulk_stop(workers, lbn, profile='default')
Stop all the given workers in the specific load balancer

CLI Examples:
salt '*' modjk.bulk_stop node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_stop node1,node2,node3 loadbalancer1 other-profile
```

(continues on next page)
Salt Documentation, Release 3003.3

(continued from previous page)

```
salt '*' modjk.bulk_stop ['node1','node2','node3'] loadbalancer1
salt '*' modjk.bulk_stop ['node1','node2','node3'] loadbalancer1 other-profile
```

salt.modules.modjk.dump_config(profile='default')
Dump the original configuration that was loaded from disk

CLI Examples:

```
salt '*' modjk.dump_config
salt '*' modjk.dump_config other-profile
```

salt.modules.modjk.get_running(profile='default')
Get the current running config (not from disk)

CLI Examples:

```
salt '*' modjk.get_running
salt '*' modjk.get_running other-profile
```

salt.modules.modjk.lb_edit(lbn, settings, profile='default')
Edit the loadbalancer settings

Note: http://tomcat.apache.org/connectors-doc/reference/status.html Data Parameters for the standard Update Action

CLI Examples:

```
salt '*' modjk.lb_edit loadbalancer1 '{vlr: 1, vlt: 60}'
salt '*' modjk.lb_edit loadbalancer1 '{vlr: 1, vlt: 60}' other-profile
```

salt.modules.modjk.list_configured_members(lbn, profile='default')
Return a list of member workers from the configuration files

CLI Examples:

```
salt '*' modjk.list_configured_members loadbalancer1
salt '*' modjk.list_configured_members loadbalancer1 other-profile
```

salt.modules.modjk.recover_all(lbn, profile='default')
Set the all the workers in lbn to recover and activate them if they are not

CLI Examples:

```
salt '*' modjk.recover_all loadbalancer1
salt '*' modjk.recover_all loadbalancer1 other-profile
```

salt.modules.modjk.reset_stats(lbn, profile='default')
Reset all runtime statistics for the load balancer

CLI Examples:

```
salt '*' modjk.reset_stats loadbalancer1
salt '*' modjk.reset_stats loadbalancer1 other-profile
```

salt.modules.modjk.version(profile='default')
Return the modjk version

CLI Examples:
salt.modules.modjk.version
salt.modules.modjk.version other-profile

salt.modules.modjk.worker_activate(worker, lbn, profile='default')
Set the worker to activate state in the lbn load balancer

CLI Examples:
salt '*' modjk.worker_activate node1 loadbalancer1
salt '*' modjk.worker_activate node1 loadbalancer1 other-profile

salt.modules.modjk.worker_disable(worker, lbn, profile='default')
Set the worker to disable state in the lbn load balancer

CLI Examples:
salt '*' modjk.worker_disable node1 loadbalancer1
salt '*' modjk.worker_disable node1 loadbalancer1 other-profile

salt.modules.modjk.worker_edit(worker, lbn, settings, profile='default')
Edit the worker settings

CLI Examples:
salt '*' modjk.worker_edit node1 loadbalancer1 "{"vwf": 500, 'vwd': 60}"
salt '*' modjk.worker_edit node1 loadbalancer1 "{"vwf": 500, 'vwd': 60}" other-profile

salt.modules.modjk.worker_recover(worker, lbn, profile='default')
Set the worker to recover this module will fail if it is in OK state

CLI Examples:
salt '*' modjk.worker_recover node1 loadbalancer1
salt '*' modjk.worker_recover node1 loadbalancer1 other-profile

salt.modules.modjk.worker_status(worker, profile='default')
Return the state of the worker

CLI Examples:
salt '*' modjk.worker_status node1
salt '*' modjk.worker_status node1 other-profile

salt.modules.modjk.worker_stop(worker, lbn, profile='default')
Set the worker to stopped state in the lbn load balancer

CLI Examples:
salt '*' modjk.worker_activate node1 loadbalancer1
salt '*' modjk.worker_activate node1 loadbalancer1 other-profile

salt.modules.modjk.workers(profile='default')
Return a list of member workers and their status

CLI Examples:
salt 'salt' modjk.workers
salt 'salt' modjk.workers other-profile

23.9.269 salt.modules.mongodb

Module to provide MongoDB functionality to Salt

configuration This module uses PyMongo, and accepts configuration details as parameters as well as configuration settings:

```
mongodb.host: 'localhost'
mongodb.port: 27017
mongodb.user: ''
mongodb.password: ''
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

salt.modules.mongodb.db_exists(name, user=None, password=None, host=None, port=None, authdb=None)
Checks if a database exists in MongoDB

CLI Example:
salt '*' mongodb.db_exists <name> <user> <password> <host> <port>

salt.modules.mongodb.db_list(user=None, password=None, host=None, port=None, authdb=None)
List all MongoDB databases

CLI Example:
salt '*' mongodb.db_list <user> <password> <host> <port>

salt.modules.mongodb.db_remove(name, user=None, password=None, host=None, port=None, authdb=None)
Remove a MongoDB database

CLI Example:
salt '*' mongodb.db_remove <name> <user> <password> <host> <port>

salt.modules.mongodb.find(collection, query=None, user=None, password=None, host=None, port=None, database='admin', authdb=None)
Find an object or list of objects in a collection

CLI Example:
salt '*' mongodb.find mycollection '[["foo": "FOO", "bar": "BAR"]]' <user> <password> <host> <port> <database>

salt.modules.mongodb.insert(objects, collection, user=None, password=None, host=None, port=None, database='admin', authdb=None)
Insert an object or list of objects into a collection

CLI Example:
salt '*' mongodb.insert '[["foo": "FOO", "bar": "BAR"], {"foo": "BAZ", "bar": "BAM"}]]' mycollection <user> <password> <host> <port> <database>
Salt Documentation, Release 3003.3

salt.modules.mongodb.remove(collection, query=None, user=None, password=None, host=None,
port=None, database='admin', w=1, authdb=None)
Remove an object or list of objects into a collection
CLI Example:
salt '*' mongodb.remove mycollection '[{"foo": "FOO", "bar": "BAR"}, {"foo": "BAZ
,→", "bar": "BAM"}]' <user> <password> <host> <port> <database>

salt.modules.mongodb.update_one(objects, collection, user=None, password=None, host=None,
port=None, database='admin', authdb=None)
Update an object into a collection http://api.mongodb.com/python/current/api/pymongo/collection.html#
pymongo.collection.Collection.update_one
New in version 2016.11.0.
CLI Example:
salt '*' mongodb.update_one '{"_id": "my_minion"} {"bar": "BAR"}' mycollection
,→<user> <password> <host> <port> <database>

salt.modules.mongodb.user_create(name, passwd, user=None, password=None, host=None,
port=None, database='admin', authdb=None, roles=None)
Create a MongoDB user
CLI Example:
salt '*' mongodb.user_create <user_name> <user_password> <roles> <user> <password>
,→ <host> <port> <database>

salt.modules.mongodb.user_exists(name, user=None, password=None, host=None, port=None,
database='admin', authdb=None)
Checks if a user exists in MongoDB
CLI Example:
salt '*' mongodb.user_exists <name> <user> <password> <host> <port> <database>

salt.modules.mongodb.user_find(name, user=None, password=None, host=None, port=None,
database='admin', authdb=None)
Get single user from MongoDB
CLI Example:
salt '*' mongodb.user_find <name> <user> <password> <host> <port> <database>
,→<authdb>

salt.modules.mongodb.user_grant_roles(name, roles, database, user=None, password=None,
host=None, port=None, authdb=None)
Grant one or many roles to a MongoDB user
CLI Examples:
salt '*' mongodb.user_grant_roles johndoe '["readWrite"]' dbname admin adminpwd
,→localhost 27017
salt '*' mongodb.user_grant_roles janedoe '[{"role": "readWrite", "db": "dbname" }
,→, {"role": "read", "db": "otherdb"}]' dbname admin adminpwd localhost 27017

23.9. execution modules

2265


salt.modules.mongodb.

\texttt{user\_list}(\texttt{user=None, password=None, host=None, port=None, database='admin', authdb=None})

List users of a MongoDB database

CLI Example:

\begin{verbatim}
salt '*' mongodb.user_list <user> <password> <host> <port> <database>
\end{verbatim}

salt.modules.mongodb.

\texttt{user\_remove}(\texttt{name, user=None, password=None, host=None, port=None, database='admin', authdb=None})

Remove a MongoDB user

CLI Example:

\begin{verbatim}
salt '*' mongodb.user_remove <name> <user> <password> <host> <port> <database>
\end{verbatim}

salt.modules.mongodb.

\texttt{user\_revoke\_roles}(\texttt{name, roles, database, user=None, password=None, host=None, port=None, authdb=None})

Revoke one or many roles to a MongoDB user

CLI Examples:

\begin{verbatim}
salt '*' mongodb.user_revoke_roles johndoe ['"readWrite"'] dbname admin adminpwd localhost 27017
salt '*' mongodb.user_revoke_roles janedoe [{'role": "readWrite", "db": "dbname"}, {'role": "read", "db": "otherdb"}] dbname admin adminpwd localhost 27017
\end{verbatim}

salt.modules.mongodb.

\texttt{user\_roles\_exists}(\texttt{name, roles, database, user=None, password=None, host=None, port=None, authdb=None})

Checks if a user of a MongoDB database has specified roles

CLI Examples:

\begin{verbatim}
salt '*' mongodb.user_roles_exists johndoe ['"readWrite"] dbname admin adminpwd localhost 27017
salt '*' mongodb.user_roles_exists johndoe [{'role": "readWrite", "db": "dbname"}, {'role": "read", "db": "otherdb"}] dbname admin adminpwd localhost 27017
\end{verbatim}

salt.modules.mongodb.

\texttt{version}(\texttt{user=None, password=None, host=None, port=None, database='admin', authdb=None})

Get MongoDB instance version

CLI Example:

\begin{verbatim}
salt '*' mongodb.version <user> <password> <host> <port> <database>
\end{verbatim}

\texttt{23.9.270 salt.modules.monit}

Monit service module. This module will create a monit type service watcher.

salt.modules.monit.

\texttt{configtest}()

New in version 2016.3.0.

Test monit configuration syntax

CLI Example:
salt ' '* monit.configtest

```python
salt.modules.monit.id_(reset=False)
```

New in version 2016.3.0.

Return monit unique id.
reset [False] Reset current id and generate a new id when it's True.

CLI Example:
```
salt ' '* monit.id [reset=True]
```

```python
salt.modules.monit.monitor(name)
```

monitor service via monit

CLI Example:
```
salt ' '* monit.monitor <service name>
```

```python
salt.modules.monit.reload_()
```

New in version 2016.3.0.

Reload monit configuration

CLI Example:
```
salt ' '* monit.reload
```

```python
salt.modules.monit.restart(name)
```

Restart service via monit

CLI Example:
```
salt ' '* monit.restart <service name>
```

```python
salt.modules.monit.start(name)
```

CLI Example:
```
salt ' '* monit.start <service name>
```

```python
salt.modules.monit.status(svc_name='')
```

Display a process status from monit

CLI Example:
```
salt ' '* monit.status
salt ' '* monit.status <service name>
```

```python
salt.modules.monit.stop(name)
```

Stops service via monit

CLI Example:
```
salt ' '* monit.stop <service name>
```

```python
salt.modules.monit.summary(svc_name='')
```

Display a summary from monit

CLI Example:
salt '*' monit.summary
salt '*' monit.summary <service name>

salt.modules.monit.unmonitor(name)
Unmonitor service via monit

    CLI Example:

    salt '*' monit.unmonitor <service name>

salt.modules.monit.validate()
New in version 2016.3.0.
Check all services

    CLI Example:

    salt '*' monit.validate

salt.modules.monit.version()
New in version 2016.3.0.
Return version from monit -V

    CLI Example:

    salt '*' monit.version

23.9.271 salt.modules.moosefs

Module for gathering and managing information about MooseFS

salt.modules.moosefs.dirinfo(path, opts=None)
Return information on a directory located on the Moose

    CLI Example:

    salt '*' moosefs.dirinfo /path/to/dir/ [-n][h|H]]

salt.modules.moosefs.fileinfo(path)
Return information on a file located on the Moose

    CLI Example:

    salt '*' moosefs.fileinfo /path/to/dir/

salt.modules.moosefs.getgoal(path, opts=None)
Return goal(s) for a file or directory

    CLI Example:

    salt '*' moosefs.getgoal /path/to/file [-n][h|H]]
salt '*' moosefs.getgoal /path/to/dir/ [-n][h|H][r]]

salt.modules.moosefs.mounts()
Return a list of current MooseFS mounts

    CLI Example:
23.9.272 salt.modules.mount

Salt module to manage Unix mounts and the fstab file

salt.modules.mount.active(extended=False)
List the active mounts.

CLI Example:
salt '*' mount.active

salt.modules.mount.automaster(config='/etc/auto_salt')
List the contents of the auto master

CLI Example:
salt '*' mount.automaster

salt.modules.mount.delete_mount_cache(real_name)
New in version 2018.3.0.
Provide information if the path is mounted

CLI Example:
salt '*' mount.delete_mount_cache /mnt/share

salt.modules.mount.filesystems(config='/etc/filesystems')
New in version 2018.3.3.
List the contents of the filesystems

CLI Example:
salt '*' mount.filesystems

salt.modules.mount.fstab(config='/etc/fstab')
Changed in version 2016.3.2.
List the contents of the fstab

CLI Example:
salt '*' mount.fstab

salt.modules.mount.is_fuse_exec(cmd)
Returns true if the command passed is a fuse mountable application.

CLI Example:
salt '*' mount.is_fuse_exec sshfs

salt.modules.mount.is_mounted(name)
New in version 2014.7.0.
Provide information if the path is mounted

CLI Example:
salt '*' mount.is_mounted /mnt/share

salt.modules.mount.mount(name, device=False, mkmnt=False, fstype='', opts='defaults', user=None, util='mount')

Mount a device

CLI Example:

salt '*' mount.mount /mnt/foo /dev/sdz1 True

salt.modules.mount.read_mount_cache(name)

New in version 2018.3.0.

Provide information if the path is mounted

CLI Example:

salt '*' mount.read_mount_cache /mnt/share

salt.modules.mount.remount(name, device, mkmnt=False, fstype='', opts='defaults', user=None)

Attempt to remount a device, if the device is not already mounted, mount is called

CLI Example:

salt '*' mount.remount /mnt/foo /dev/sdz1 True

salt.modules.mount.rm_automaster(name, device, config='/etc/auto_salt')

Remove the mount point from the auto_master

CLI Example:

salt '*' mount.rm_automaster /mnt/foo /dev/sdg

salt.modules.mount.rm_filesystems(name, device, config='/etc/filesystems')

New in version 2018.3.3.

Remove the mount point from the filesystems

CLI Example:

salt '*' mount.rm_filesystems /mnt/foo /dev/sdg

salt.modules.mount.rm_fstab(name, device, config='/etc/fstab')

Changed in version 2016.3.2.

Remove the mount point from the fstab

CLI Example:

salt '*' mount.rm_fstab /mnt/foo /dev/sdg

salt.modules.mount.rm_vfstab(name, device, config='/etc/vfstab')

New in version 2016.3.2.

Remove the mount point from the vfstab

CLI Example:

salt '*' mount.rm_vfstab /mnt/foo /device/c0t0d0p0
salt.modules.mount.set_automaster(name, device, fstype, opts='', config='/etc/auto_salt', test=False, not_change=False, **kwargs)

Verify that this mount is represented in the auto_salt, change the mount to match the data passed, or add the mount if it is not present.

CLI Example:
```
salt '*' mount.set_automaster /mnt/foo /dev/sdz1 ext4
```

salt.modules.mount.set_filesystems(name, device, vfstype, opts='', mount='true', config='/etc/filesystems', test=False, match_on='auto', not_change=False, **kwargs)

New in version 2018.3.3.

Verify that this mount is represented in the filesystems, change the mount to match the data passed, or add the mount if it is not present on AIX

If the entry is found via match_on and not_change is True, the current line will be preserved.

Provide information if the path is mounted

Parameters
- **name** -- The name of the mount point where the device is mounted.
- **device** -- The device that is being mounted.
- **vfstype** -- The file system that is used (AIX has two fstypes, fstype and vfstype - similar to Linux fstype)
- **opts** -- Additional options used when mounting the device.
- **mount** -- Mount if not mounted, default True.
- **config** -- Configuration file, default /etc/filesystems.
- **match** -- File systems type to match on, default auto

CLI Example:
```
salt '*' mount.set_filesystems /mnt/foo /dev/sdz1 jfs2
```

salt.modules.mount.set_fstab(name, device, fstype, opts='defaults', dump=0, pass_num=0, config='/etc/fstab', test=False, match_on='auto', not_change=False, **kwargs)

Verify that this mount is represented in the fstab, change the mount to match the data passed, or add the mount if it is not present.

If the entry is found via match_on and not_change is True, the current line will be preserved.

CLI Example:
```
salt '*' mount.set_fstab /mnt/foo /dev/sdz1 ext4
```

salt.modules.mount.set_vfstab(name, device, fstype, opts='-', device_fsck='-', pass_fsck='-', mount_at_boot='yes', config='/etc/vfstab', test=False, match_on='auto', not_change=False, **kwargs)

New in version 2016.3.2.

Verify that this mount is represented in the vfstab, change the mount to match the data passed, or add the mount if it is not present.

If the entry is found via match_on and not_change is True, the current line will be preserved.

CLI Example:
Salt Documentation, Release 3003.3

```bash
salt '*' mount.set_vfstab /mnt/foo /device/c0t0d0p0 ufs
```

salt.modules.mount.swapoff(name)
Deactivate a named swap mount

Changed in version 2016.3.2.

CLI Example:

```bash
salt '*' mount.swapoff /root/swapfile
```

salt.modules.mount.swapon(name, priority=None)
Activate a swap disk

Changed in version 2016.3.2.

CLI Example:

```bash
salt '*' mount.swapon /root/swapfile
```

salt.modules.mount.swaps()
Return a dict containing information on active swap

Changed in version 2016.3.2.

CLI Example:

```bash
salt '*' mount.swaps
```

salt.modules.mount.umount(name, device=None, user=None, util='mount')
Attempt to unmount a device by specifying the directory it is mounted on

New in version 2015.5.0.

```bash
salt '*' mount.umount /mnt/foo /dev/xvdc1
```

salt.modules.mount.vfstab(config='/etc/vfstab')
New in version 2016.3.2.

List the contents of the vfstab

CLI Example:

```bash
salt '*' mount.vfstab
```

salt.modules.mount.write_mount_cache(real_name, device, mkmnt, fstype, mount_opts)
New in version 2018.3.0.

Provide information if the path is mounted

Parameters

- **real_name** -- The real name of the mount point where the device is mounted.
- **device** -- The device that is being mounted.
- **mkmnt** -- Whether or not the mount point should be created.
- **fstype** -- The file system that is used.
- **mount_opts** -- Additional options used when mounting the device.
  Returns Boolean if message was sent successfully.

  CLI Example:
  
  ```
salt 'salt' mount.write_mount_cache /mnt/share /dev/sda1 False ext4 defaults,nosuid
  ```

## 23.9.273 salt.modules.mssql

Module to provide MS SQL Server compatibility to salt.

**depends**

- FreeTDS
  - pymssql Python module

**configuration** In order to connect to MS SQL Server, certain configuration is required in minion configs/pillars on the relevant minions. Some sample pillars might look like:

```
msql.server: 'localhost'
msql.port: 1433
msql.user: 'sysdba'
msql.password: 'Some preferable complex password'
msql.database: ''
```

The default for the port is '1433' and for the database is '' (empty string); in most cases they can be left at the default setting. Options that are directly passed into functions will overwrite options from configs or pillars.

**salt.modules.mssql.db_create**(*database*, **containment='NONE'**, **new_database_options=**None, **kwargs**)  
Creates a new database. Does not update options of existing databases. new_database_options can only be a list of strings

  CLI Example:
  
  ```
salt minion mssql.db_create DB_NAME
  ```

**salt.modules.mssql.db_exists**(*database_name*, **kwargs*)  
Find if a specific database exists on the MS SQL server.

  CLI Example:
  
  ```
salt minion mssql.db_exists database_name='DBNAME'
  ```

**salt.modules.mssql.db_list**(**kwargs**)  
Return the database list created on a MS SQL server.

  CLI Example:
  
  ```
salt minion mssql.db_list
  ```

**salt.modules.mssql.db_remove**(*database_name*, **kwargs**)  
Drops a specific database from the MS SQL server. It will not drop any of 'master', 'model', 'msdb' or 'tempdb'.

  CLI Example:
  
  ```
salt minion mssql.db_remove database_name='DBNAME'
  ```
salt.modules.mssql.login_create(login, new_login_password=None, new_login_domain='',
new_login_roles=None, new_login_options=None, **kwargs)

Creates a new login. Does not update password of existing logins. For Windows authentication, provide
new_login_domain. For SQL Server authentication, provide new_login_password. Since hashed pass-
words are varbinary values, if the new_login_password is 'int / long', it will be considered to be HASHED.
new_login_roles  a list of SERVER roles
new_login_options  a list of strings

CLI Example:

```
salt minion mssql.login_create LOGIN_NAME database=DBNAME [new_login_--password=PASSWORD]
```

salt.modules.mssql.login_exists(login, domain='', **kwargs)

Find if a login exists in the MS SQL server. domain, if provided, will be prepended to login

CLI Example:

```
salt minion mssql.login_exists 'LOGIN'
```

salt.modules.mssql.login_remove(login, **kwargs)

Removes an login.

CLI Example:

```
salt minion mssql.login_remove LOGINNAME
```

salt.modules.mssql.role_create(role, owner=None, grants=None, **kwargs)

Creates a new database role. If no owner is specified, the role will be owned by the user that executes CREATE
ROLE, which is the user argument or mssql.user option. grants is list of strings.

CLI Example:

```
salt minion mssql.role_create role=product01 owner=sysdba grants='["SELECT", "INSERT", "UPDATE", "DELETE", "EXECUTE"]'
```

salt.modules.mssql.role_exists(role, **kwargs)

Checks if a role exists.

CLI Example:

```
salt minion mssql.role_exists db_owner
```

salt.modules.mssql.role_list(**kwargs)

Lists database roles.

CLI Example:

```
salt minion mssql.role_list
```

salt.modules.mssql.role_remove(role, **kwargs)

Remove a database role.

CLI Example:

```
salt minion mssql.role_create role=test_role01
```

salt.modules.mssql.tsql_query(query, **kwargs)

Run a SQL query and return query result as list of tuples, or a list of dictionaries if as_dict was passed, or an
empty list if no data is available.

2274 Chapter 23. Salt Module Reference
CLI Example:
```
salt minion mssql.tsql_query 'SELECT @version as version' as_dict=True
```

```
salt.modules.mssql.user_create(username, login=None, domain='', database=None, roles=None, options=None, **kwargs)
```
Creates a new user. If login is not specified, the user will be created without a login. domain, if provided, will be prepended to username. options can only be a list of strings

CLI Example:
```
salt minion mssql.user_create USERNAME database=DBNAME
```

```
salt.modules.mssql.user_exists(username, domain='', database=None, **kwargs)
```
Find if an user exists in a specific database on the MS SQL server. domain, if provided, will be prepended to username

CLI Example:
```
salt minion mssql.user_exists 'USERNAME' [database='DBNAME']
```

```
salt.modules.mssql.user_list(**kwargs)
```
Get the user list for a specific database on the MS SQL server.

CLI Example:
```
salt minion mssql.user_list [database='DBNAME']
```

```
salt.modules.mssql.user_remove(username, **kwargs)
```
Removes an user.

CLI Example:
```
salt minion mssql.user_remove USERNAME database=DBNAME
```

```
salt.modules.mssql.version(**kwargs)
```
Return the version of a MS SQL server.

CLI Example:
```
salt minion mssql.version
```

### 23.9.274 salt.modules.msteams

Module for sending messages to MS Teams

New in version 2017.7.0.

configuration This module can be used by either passing a `hook_url` directly or by specifying it in a configuration profile in the salt master/minion config. For example:

```
msteams:
  hook_url: https://outlook.office.com/webhook/837
```

```
salt.modules.msteams.post_card(message, hook_url=None, title=None, theme_color=None)
```
Send a message to an MS Teams channel. :param message: The message to send to the MS Teams channel. :param hook_url: The Teams webhook URL, if not specified in the configuration. :param title: Optional title
for the posted card :param theme_color: Optional hex color highlight for the posted card :return: Boolean if message was sent successfully.

CLI Example:

```
salt '*' msteams.post_card message="Build is done"
```

### 23.9.275 salt.modules.munin

Run munin plugins/checks from salt and format the output as data.

**salt.modules.munin.list_plugins()**

List all the munin plugins

CLI Example:

```
salt '*' munin.list_plugins
```

**salt.modules.munin.run(plugins)**

Run one or more named munin plugins

CLI Example:

```
salt '*' munin.run uptime
salt '*' munin.run uptime,cpu,load,mem
```

**salt.modules.munin.run_all()**

Run all the munin plugins

CLI Example:

```
salt '*' munin.run_all
```

### 23.9.276 salt.modules.mysql

Module to provide MySQL compatibility to salt.

**depends**

- MySQLdb Python module

**Note:** On CentOS 5 (and possibly RHEL 5) both MySQL-python and python26-mysqldb need to be installed.

**configuration** In order to connect to MySQL, certain configuration is required in /etc/salt/minion on the relevant minions. Some sample configs might look like:

```
mysql.host: 'localhost'
mysql.port: 3306
mysql.user: 'root'
mysql.pass: '
mysql.db: 'mysql'
mysql.unix_socket: '/tmp/mysql.sock'
mysql.charset: 'utf8'
```

You can also use a defaults file:
Changed in version 2014.1.0: 'charset' connection argument added. This is a MySQL charset, not a python one.

Changed in version 0.16.2: Connection arguments from the minion config file can be overridden on the CLI by using the arguments defined here. Additionally, it is now possible to setup a user with no password.

**salt.modules.mysql.alter_db**(name, character_set=None, collate=None, **connection_args)**
Modify database using ALTER DATABASE %(dbname)s CHARACTER SET %(charset)s COLLATE %(collation)s; query.

CLI Example:
```
salt '*' mysql.alter_db testdb charset='latin1'
```

**salt.modules.mysql.db_check**(name, table=None, **connection_args)**
Repairs the full database or just a given table

CLI Example:
```
salt '*' mysql.db_check dbname
salt '*' mysql.db_check dbname dbtable
```

**salt.modules.mysql.db_create**(name, character_set=None, collate=None, **connection_args)**
Adds a databases to the MySQL server.

name The name of the database to manage
character_set The character set, if left empty the MySQL default will be used
collate The collation, if left empty the MySQL default will be used

CLI Example:
```
salt '*' mysql.db_create 'dbname'
salt '*' mysql.db_create 'dbname' 'utf8' 'utf8_general_ci'
```

**salt.modules.mysql.db_exists**(name, **connection_args)**
Checks if a database exists on the MySQL server.

CLI Example:
```
salt '*' mysql.db_exists 'dbname'
```

**salt.modules.mysql.db_get**(name, **connection_args)**
Return a list of databases of a MySQL server using the output from the SELECT DEFAULT_CHARACTER_SET_NAME, DEFAULT_COLLATION_NAME FROM INFORMATION_SCHEMA.SCHEMATA WHERE SCHEMA_NAME='dbname'; query.

CLI Example:
```
salt '*' mysql.db_get test
```

**salt.modules.mysql.db_list**( **connection_args)**
Return a list of databases of a MySQL server using the output from the SHOW DATABASES query.

CLI Example:
```
salt '*' mysql.db_list
```

**salt.modules.mysql.db_optimize**(name, table=None, **connection_args)**
Optimizes the full database or just a given table

CLI Example:
salt '*' mysql.db_optimize dbname

**salt.modules.mysql.db_remove**(name, **connection_args)**
Removes a databases from the MySQL server.

CLI Example:
```
salt '*' mysql.db_remove 'dbname'
```

**salt.modules.mysql.db_repair**(name, table=None, **connection_args)**
Repairs the full database or just a given table

CLI Example:
```
salt '*' mysql.db_repair dbname
```

**salt.modules.mysql.db_tables**(name, **connection_args)**
Shows the tables in the given MySQL database (if exists)

CLI Example:
```
salt '*' mysql.db_tables 'database'
```

**salt.modules.mysql.file_query**(database, file_name, **connection_args)**
Run an arbitrary SQL query from the specified file and return the the number of affected rows.

New in version 2017.7.0.

database
database to run script inside

file_name
File name of the script. This can be on the minion, or a file that is reachable by the fileserver

CLI Example:
```
salt '*' mysql.file_query mydb file_name=/tmp/sqlfile.sql
salt '*' mysql.file_query mydb file_name=salt://sqlfile.sql
```

Return data:
```
{
    'query time': {'human': '39.0ms', 'raw': '0.03899'},
    'rows affected': 1L
}
```

**salt.modules.mysql.free_slave**( **connection_args)**
Frees a slave from its master. This is a WIP, do not use.

CLI Example:
```
salt '*' mysql.free_slave
```

**salt.modules.mysql.get_master_status**( **connection_args)**
Retrieves the master status from the minion.

Returns:
```
{
    'host.domain.com': {
        'Binlog_Do_DB': '',
        'Binlog_Ignore_DB': '',
        'File': 'mysql-bin.000021',
        'Position': 107}
}
```

CLI Example:
**salt.modules.mysql.get_slave_status**(**connection_args**)

Retrieves the slave status from the minion.

Returns:

```python
{'host.domain.com': {'Connect_Retry': 60,
'Exec_Master_Log_Pos': 107,
'Last_errno': 0,
'Last_error': '',
'Last_IO_errno': 0,
'Last_IO_error': '',
'Last_SQL_errno': 0,
'Last_SQL_error': '',
'Master_Host': 'comet.scion-eng.com',
'Master_Log_File': 'mysql-bin.000021',
'Master_Port': 3306,
'Master_SSL_Allowed': 'No',
'Master_SSL_CA_File': '',
'Master_SSL_CA_Path': '',
'Master_SSL_Cert': '',
'Master_SSL_Cipher': '',
'Master_SSL_Key': '',
'Master_SSL_Verify_Server_Cert': 'No',
'Master_Server_Id': 1,
'Master_User': 'replu',
'Read_Master_Log_Pos': 107,
'Relay_Log_File': 'klo-relay-bin.000071',
'Relay_Log_Pos': 253,
'Relay_Log_Space': 553,
'Relay_Master_Log_File': 'mysql-bin.000021',
'Replicate_Do_DB': '',
'Replicate_Do_Table': '',
'Replicate_Ignore_DB': '',
'Replicate_Ignore_Server_Ids': '',
'Replicate_Ignore_Table': '',
'Replicate_Wild_Do_Table': '',
'Replicate_Wild_Ignore_Table': '',
'Seconds_Behind_Master': 0,
'Skip_Counter': 0,
'Slave_IO_Running': 'Yes',
'Slave_IO_State': 'Waiting for master to send event',
'Slave_SQL_Running': 'Yes',
'Until_Condition': 'None',
'Until_Log_File': '',
'Until_Log_Pos': 0}}
```

CLI Example:

```bash
salt '*' mysql.get_slave_status
```

**salt.modules.mysql.grant_add**(**grant**, **database**, **user**, host='localhost', grant_option=False, escape=True, ssl_option=False, **connection_args**)

Adds a grant to the MySQL server.

For database, make sure you specify database.table or database.*

CLI Example:
salt 'db' mysql.grant_add 'SELECT,INSERT,UPDATE,...' 'database.*'
  'db' 'frank' 'localhost'
salt.modules.mysql.grant_exists(grant, database, user, host='localhost',
  grant_option=False, escape=True, **connection_args)
Checks to see if a grant exists in the database
CLI Example:
salt 'db' mysql.grant_exists 'SELECT,INSERT,UPDATE,...' 'database.*'
  'db' 'frank' 'localhost'
salt.modules.mysql.grant_revoke(grant, database, user, host='localhost',
  grant_option=False, escape=True, **connection_args)
Removes a grant from the MySQL server.
CLI Example:
salt 'db' mysql.grant_revoke 'SELECT,INSERT,UPDATE' 'database.*'
  'db' 'frank' 'localhost'
salt.modules.mysql.plugin_add(name, soname=None, **connection_args)
Add a plugin.
CLI Example:
salt '*' mysql.plugin_add auth_socket
salt.modules.mysql.plugin_remove(name, **connection_args)
Remove a plugin.
CLI Example:
salt '*' mysql.plugin_remove auth_socket
salt.modules.mysql.plugin_status(name, **connection_args)
Return the status of a plugin.
CLI Example:
salt '*' mysql.plugin_status auth_socket
salt.modules.mysql.plugins_list(**connection_args)
Return a list of plugins and their status from the SHOW PLUGINS query.
CLI Example:
salt '*' mysql.plugins_list
salt.modules.mysql.processlist(**connection_args)
Retrieves the processlist from the MySQL server via "SHOW FULL PROCESSLIST".
Returns: a list of dicts, with each dict representing a process:

```python
{'Command': 'Query',
 'Host': 'localhost',
 'Id': 39,
 'Info': 'SHOW FULL PROCESSLIST',
 'Rows_examined': 0,}
```
(continues on next page)
'Rows_read': 1,
'Rows_sent': 0,
'State': None,
'Time': 0,
'User': 'root',
'db': 'mysql'}

CLI Example:
salt '*' mysql.processlist

salt.modules.mysql.query(database, query, **connection_args)
Run an arbitrary SQL query and return the results or the number of affected rows.

CLI Example:
salt '*' mysql.query mydb "UPDATE mytable set myfield=1 limit 1"

Return data:
{
'query time': {'human': '39.0ms', 'raw': '0.03899'},
'rows affected': 1
}

CLI Example:
salt '*' mysql.query mydb "SELECT id,name,cash from users limit 3"

Return data:
{
'columns': ('id', 'name', 'cash'),
'query time': {'human': '1.0ms', 'raw': '0.001'},
'results': [(1L, 'User 1', Decimal('110.000000')), (2L, 'User 2', Decimal('215.636756')), (3L, 'User 3', Decimal('0.040000'))],
'rows returned': 3
}

CLI Example:
salt '*' mysql.query mydb 'INSERT into users values (null,"user 4", 5)'

Return data:
{
'query time': {'human': '25.6ms', 'raw': '0.02563'},
'rows affected': 1
}

CLI Example:
salt '*' mysql.query mydb 'DELETE from users where id = 4 limit 1'

Return data:
{
'query time': {'human': '39.0ms', 'raw': '0.03899'},
'rows affected': 1
}

Jinja Example: Run a query on mydb and use row 0, column 0's data.

```python
{{ salt['mysql.query']('mydb', 'SELECT info from mytable limit 1')['results'] | json | 0[0] }}
```
Salt Documentation, Release 3003.3

salt.modules.mysql.quote_identifier(identifier, for_grants=False)
Return an identifier name (column, table, database, etc) escaped for MySQL
This means surrounded by "'" character and escaping this character inside. It also means doubling the '%' character for MySQLdb internal usage.

Parameters

- **identifier** -- the table, column or database identifier
- **for_grants** -- is False by default, when using database names on grant queries you should set it to True to also escape "_" and "%' characters as requested by MySQL. Note that theses characters should only be escaped when requesting grants on the database level (my_%db.*) but not for table level grants (my_%db:foo)

CLI Example:
```
salt '*' mysql.quote_identifier 'foo`bar'
```

salt.modules.mysql.showglobal(**connection_args)
Retrieves the show global variables from the minion.
Returns: show global variables full dict
CLI Example:
```
salt '*' mysql.showglobal
```

salt.modules.mysql.showvariables(**connection_args)
Retrieves the show variables from the minion.
Returns: show variables full dict
CLI Example:
```
salt '*' mysql.showvariables
```

salt.modules.mysql.slave_lag(**connection_args)
Return the number of seconds that a slave SQL server is lagging behind the master, if the host is not a slave it will return -1. If the server is configured to be a slave for replication but slave IO is not running then -2 will be returned. If there was an error connecting to the database or checking the slave status, -3 will be returned.

CLI Example:
```
salt '*' mysql.slave_lag
```

salt.modules.mysql.status(**connection_args)
Return the status of a MySQL server using the output from the SHOW STATUS query.

CLI Example:
```
salt '*' mysql.status
```

salt.modules.mysql.tokenize_grant(grant)
External wrapper function :param grant: :return: dict

CLI Example:
```
salt '*' mysql.tokenize_grant "GRANT SELECT, INSERT ON testdb.* TO \"testuser\"@\"localhost\"
```

salt.modules.mysql.user_chpass(user, host='localhost', password=None, password_hash=None, allow_passwordless=False, unix_socket=None, password_column=None, **connection_args)
Change password for a MySQL user
**host** Host for which this user/password combo applies

**password** The password to set for the new user. Will take precedence over the `password_hash` option if both are specified.

**password_hash** The password in hashed form. Be sure to quote the password because YAML doesn't like the `*`. A password hash can be obtained from the `mysql` command-line client like so:

```sql
mysql> SELECT PASSWORD('mypass');
+-----------------------------------------------+ | PASSWORD('mypass') | +-----------------------------------------------+ | 6C8989366EAF75BB670AD8EA7A7FC1176A95CEF4 | +-----------------------------------------------+ 1 row in set (0.00 sec)
```

**allow_passwordless** If `True`, then `password` and `password_hash` can be omitted (or set to `None`) to permit a passwordless login.

New in version 0.16.2: The `allow_passwordless` option was added.

CLI Examples:

```
salt '*' mysql.user_chpass frank localhost newpassword
salt '*' mysql.user_chpass frank localhost password_hash='hash'
salt '*' mysql.user_chpass frank localhost allow_passwordless=True
```

```python
salt.modules.mysql.user_create(user, host='localhost', password=None, password_hash=None,
allow_passwordless=False, unix_socket=False, password_column=None,
auth_plugin='mysql_native_password',
**connection_args)
```

Creates a MySQL user

**host** Host for which this user/password combo applies

**password** The password to use for the new user. Will take precedence over the `password_hash` option if both are specified.

**password_hash** The password in hashed form. Be sure to quote the password because YAML doesn't like the `*`. A password hash can be obtained from the `mysql` command-line client like so:

```sql
mysql> SELECT PASSWORD('mypass');
+-----------------------------------------------+ | PASSWORD('mypass') | +-----------------------------------------------+ | 6C8989366EAF75BB670AD8EA7A7FC1176A95CEF4 | +-----------------------------------------------+ 1 row in set (0.00 sec)
```

**allow_passwordless** If `True`, then `password` and `password_hash` can be omitted (or set to `None`) to permit a passwordless login.

**unix_socket** If `True` and `allow_passwordless` is `True` then will be used `unix_socket` auth plugin.

**password_column** The password column to use in the user table.

**auth_plugin** The authentication plugin to use, default is to use the mysql_native_password plugin.

New in version 0.16.2: The `allow_passwordless` option was added.

CLI Examples:

```
salt '*' mysql.user_create 'username' 'hostname' 'password'
salt '*' mysql.user_create 'username' 'hostname' password_hash='hash'
salt '*' mysql.user_create 'username' 'hostname' allow_passwordless=True
```

```python
salt.modules.mysql.user_exists(user, host='localhost', password=None, password_hash=None,
passwordless=False, unix_socket=False, password_column=None,
**connection_args)
```
Checks if a user exists on the MySQL server. A login can be checked to see if passwordless login is permitted by omitting `password` and `password_hash`, and using `passwordless=True`.

New in version 0.16.2: The `passwordless` option was added.

CLI Example:

```bash
salt '*' mysql.user_exists 'username' 'hostname' 'password'
salt '*' mysql.user_exists 'username' 'hostname' password_hash='hash'
salt '*' mysql.user_exists 'username' passwordless=True
salt '*' mysql.user_exists 'username' password_column='authentication_string'
```

salt.modules.mysql.user_grants(user, host='localhost', **connection_args)

Shows the grants for the given MySQL user (if it exists)

CLI Example:

```bash
salt '*' mysql.user_grants 'frank' 'localhost'
```

salt.modules.mysql.user_info(user, host='localhost', **connection_args)

Get full info on a MySQL user

CLI Example:

```bash
salt '*' mysql.user_info root localhost
```

salt.modules.mysql.user_list(**connection_args)

Return a list of users on a MySQL server

CLI Example:

```bash
salt '*' mysql.user_list
```

salt.modules.mysql.user_remove(user, host='localhost', **connection_args)

Delete MySQL user

CLI Example:

```bash
salt '*' mysql.user_remove frank localhost
```

salt.modules.mysql.verify_login(user, password=None, **connection_args)

Attempt to login using the provided credentials. If successful, return true. Otherwise, return False.

CLI Example:

```bash
salt '*' mysql.verify_login root password
```

salt.modules.mysql.version(**connection_args)

Return the version of a MySQL server using the output from the `SELECT VERSION()` query.

CLI Example:

```bash
salt '*' mysql.version
```
23.9.277  salt.modules.nacl

This module helps include encrypted passwords in pillars, grains and salt state files.

depends libnacl, https://github.com/saltstack/libnacl

This is often useful if you wish to store your pillars in source control or share your pillar data with others that you trust. I don't advise making your pillars public regardless if they are encrypted or not.

When generating keys and encrypting passwords use --local when using salt-call for extra security. Also consider using just the salt runner nacl when encrypting pillar passwords.

configuration The following configuration defaults can be define (pillar or config files) Avoid storing private keys in pillars! Ensure master does not have pillar_opts=True:

```bash
# cat /etc/salt/master.d/nacl.conf

nacl.config:
    # NOTE: `key` and `key_file` have been renamed to `sk`, `sk_file`
    # also `box_type` default changed from secretbox to sealedbox.
    box_type: sealedbox  # default
    sk_file: /etc/salt/pki/master/nacl  # default
    pk_file: /etc/salt/pki/master/nacl.pub  # default
    sk: None
    pk: None
```

Usage can override the config defaults:

```
salt-call nacl.enc sk_file=/etc/salt/pki/master/nacl pk_file=/etc/salt/···pki/master/nacl.pub
```

The nacl lib uses 32byte keys, these keys are base64 encoded to make your life more simple. To generate your sk_file and pk_file use:

```
salt-call --local nacl.keygen sk_file=/etc/salt/pki/master/nacl
# or if you want to work without files.
salt-call --local nacl.keygen

local:  
    --------
    pk:
        /kfGX7PbWeu099702PbBWlpg/9p06IQRSwkdWHCDk0=
    sk:
        SVWut5SqNpuPnzB9y6b2eXg2PLIog43Gbzp48Sow=
```

Now with your keypair, you can encrypt data:

You have two option, sealedbox or secretbox.

SecretBox is data encrypted using private key pk. Sealedbox is encrypted using public key pk.

Recommend using Sealedbox because the one way encryption permits developers to encrypt data for source control but not decrypt. Sealedbox only has one key that is for both encryption and decryption.

```
salt-call --local nacl.enc asecretpass pk=/kfGX7PbWeu099702PbBWlpg/9p06IQRSwkdWHCDk0=
tqXzeIjntAM9Xf0mdLcpEdk1MbfbGPj2oTKmlgRm3S1DTVHh9h8mU1GKIlGq/+cYsk6m5WhGdk58=
```

To decrypt the data:

```
salt-call --local nacl.dec data=
    tqXzeIjntAM9Xf0mdLcpEdk1MbfbGPj2oTKmlgRm3S1DTVHh9h8mU1GKIlGq/+cYsk6m5WhGdk58=
    sk='SVWut5SqNpuPnzB9y6b2eXg2PLIog43Gbzp48Sow='
```

23.9. execution modules
When the keys are defined in the master config you can use them from the nacl runner without extra parameters:

```python
# cat /etc/salt/master.d/nacl.conf
nacl.config:
  sk_file: /etc/salt/pki/master/nacl
  pk: 'cTiqXwmuD1ulg4KxsbeCE7/NoeKEzd4nLeYcCFpd9k='

salt-run nacl.enc 'asecretpass'
salt-run nacl.dec data='tqXzeIJnTAM9Xf0mdLcpEdklMbfbGPj2oTKmlgrm3S1DTVHNnh9h8mU1GKllGq/+cysk6m5WhGdk58='
```

The developer can then use a less-secure system to encrypt data.

```python
salt-call --local nacl.enc apassword
```

Pillar files can include protected data that the salt master decrypts:

```python
pillarexample:
  user: root
  password1: {{salt.nacl.dec('DRB7Q6/X5gGRCTpZyxS6h1bWj011UA+uaVvyou3vJ4=')|json}}
  cert_key: {{salt.nacl.dec_file('/srv/salt/certs/example.com/key.nacl')|json}}
  cert_key2: {{salt.nacl.dec_file('salt:///certs/example.com/key.nacl')|json}}
```

Larger files like certificates can be encrypted with:

```python
salt-call nacl.enc_file /tmp/cert.crt out=/tmp/cert.nacl
```

```python
# or more advanced
salt-call --out=newline_values_only nacl.enc_pub data="$cert" > /tmp/cert.nacl
```

In pillars rendered with jinja be sure to include `json` so line breaks are encoded:

```python
cert: "{{salt.nacl.dec('S2uogToXkgENz9...085KYt')|json}}"
```

In states rendered with jinja it is also good practice to include `json`:

```python
{{sls}} private key:
  file.managed:
    - name: /etc/ssl/private/cert.key
    - mode: 700
    - contents: "{{pillar['pillarexample']['cert_key']|json}}"
```

Optional small program to encrypt data without needing salt modules.

```python
#!/bin/python3
import sys, base64, libnacl.sealed
pk = base64.b64decode('YOURPUBKEY')
b = libnacl.sealed.SealedBox(pk)
data = sys.stdin.buffer.read()
print(base64.b64encode(b.encrypt(data)).decode())
```

```bsh
echo 'apassword' | nacl_enc.py
```
salt.modules.nacl.dec(data, **kwargs)
   Alias to `{box_type}_decrypt`
   box_type: secretbox, sealedbox(default)

salt.modules.nacl.dec_file(name, out=None, **kwargs)
   This is a helper function to decrypt a file and return its contents.
   You can provide an optional output file using `out`
   `name` can be a local file or when not using `salt-run` can be a url like `salt://`, `https://` etc.
   CLI Examples:
   ```
   salt-run nacl.dec_file name=/tmp/id_rsa.nacl
   salt-call nacl.dec_file name=salt://crt/mycert.nacl out=/tmp/id_rsa
   salt-run nacl.dec_file name=/tmp/id_rsa.nacl box_type=secretbox sk_file=/etc/salt/pki/master/nacl.pub
   ```

salt.modules.nacl.enc(data, **kwargs)
   Alias to `{box_type}_encrypt`
   box_type: secretbox, sealedbox(default)

salt.modules.nacl.enc_file(name, out=None, **kwargs)
   This is a helper function to encrypt a file and return its contents.
   You can provide an optional output file using `out`
   `name` can be a local file or when not using `salt-run` can be a url like `salt://`, `https://` etc.
   CLI Examples:
   ```
   salt-run nacl.enc_file name=/tmp/id_rsa
   salt-call nacl.enc_file name=salt://crt/mycert.nacl out=/tmp/cert
   salt-run nacl.enc_file name=/tmp/id_rsa nacl box_type=secretbox sk_file=/etc/salt/pki/master/nacl.pub
   ```

salt.modules.nacl.keygen(sk_file=None, pk_file=None, **kwargs)
   Use libnacl to generate a keypair.
   If no `sk_file` is defined return a keypair.
   If only the `sk_file` is defined `pk_file` will use the same name with a postfix `.pub`.
   When the `sk_file` is already existing, but `pk_file` is not. The `pk_file` will be generated using the `sk_file`.
   CLI Examples:
   ```
   salt-call nacl.keygen
   salt-call nacl.keygen sk_file=/etc/salt/pki/master/nacl
   salt-call nacl.keygen sk_file=/etc/salt/pki/master/nacl pk_file=/etc/salt/pki/master/nacl.pub
   salt-call --local nacl.keygen
   ```

salt.modules.nacl.sealedbox_decrypt(data, **kwargs)
   Decrypt data using a secret key that was encrypted using a public key with `nacl.sealedbox_encrypt`.
   CLI Examples:
salt-call nacl.sealedbox_decrypt pEXHQM6cuaF7A=
salt-call --local nacl.sealedbox_decrypt data='pEXHQM6cuaF7A=' sk_file=/etc/salt/→pki/master/nacl
salt-call --local nacl.sealedbox_decrypt data='pEXHQM6cuaF7A=' sk='YmFkcGFzcwo=

salt.modules.nacl.sealedbox_encrypt(data, **kwargs)
Encrypt data using a public key generated from nacl.keygen. The encryptd data can be decrypted using
nacl.sealedbox_decrypt only with the secret key.

CLI Examples:
salt-run nacl.sealedbox_encrypt datatoenc
salt-call --local nacl.sealedbox_encrypt datatoenc pk_file=/etc/salt/pki/master/
→nacl.pub
salt-call --local nacl.sealedbox_encrypt datatoenc pk=
→'vrwQF7cNiNAVQA1S3bvcbJUnF0cN6fU9YTZD9mBfzQ='

salt.modules.nacl.secretbox_decrypt(data, **kwargs)
Decrypt data that was encrypted using nacl.secretbox_encrypt using the secret key that was generated from
nacl.keygen.

CLI Examples:
salt-run nacl.secretbox_encrypt datatoenc
salt-call --local nacl.secretbox_encrypt datatoenc pk_file=/etc/salt/pki/master/
→nacl
salt-call --local nacl.secretbox_encrypt datatoenc sk='YmFkcGFzcwo=

salt.modules.nacl.secretbox_encrypt(data, **kwargs)
Encrypt data using a secret key generated from nacl.keygen. The same secret key can be used to decrypt the
data using nacl.secretbox_decrypt.

CLI Examples:
salt-run nacl.secretbox_encrypt datatoenc
salt-call --local nacl.secretbox_encrypt datatoenc sk_file=/etc/salt/pki/master/
→nacl
salt-call --local nacl.secretbox_encrypt datatoenc sk='YmFkcGFzcwo=

23.9.278 salt.modules.nagios

Run nagios plugins/checks from salt and get the return as data.

salt.modules.nagios.list_plugins()
List all the nagios plugins

CLI Example:
salt '*' nagios.list_plugins

salt.modules.nagios.retcode(plugin, args='', key_name=None)
Run one nagios plugin and return retcode of the execution

salt.modules.nagios.retcode_pillar(pillar_name)
Run one or more nagios plugins from pillar data and get the result of cmd.retcode The pillar have to be in this format:
webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You must to group different checks (one or more) and always it will return the highest value of all the checks

CLI Example:

```bash
salt '*' nagios.retcode webserver
```

```python
salt.modules.nagios.run(plugin, args='')
```
Run nagios plugin and return all the data execution with cmd.run

CLI Example:

```bash
salt '*' nagios.run check_apt
salt '*' nagios.run check_icmp '8.8.8.8'
```

```python
salt.modules.nagios.run_all(plugin, args='')
```
Run nagios plugin and return all the data execution with cmd.run_all

```python
salt.modules.nagios.run_all_pillar(pillar_name)
```
Run one or more nagios plugins from pillar data and get the result of cmd.run_all The pillar have to be in this format:

```bash
webserver:
    Ping_google:
        - check_icmp: 8.8.8.8
        - check_icmp: google.com
    Load:
        - check_load: -w 0.8 -c 1
    APT:
        - check_apt
```

```bash
webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You have to group different checks in a group

CLI Example:

```bash
salt '*' nagios.run webserver
```

```python
salt.modules.nagios.run_pillar(pillar_name)
```
Run one or more nagios plugins from pillar data and get the result of cmd.run The pillar have to be in this format:
webserver is the role to check, the next keys are the group and the items the check with the arguments if needed
You have to group different checks in a group
CLI Example:
```
salt '*' nagios.run webserver
```

### 23.9.279 salt.modules.nagios_rpc

Check Host & Service status from Nagios via JSON RPC.

New in version 2015.8.0.

salt.modules.nagios_rpc.host_status(hostname=None, **kwargs)
Check status of a particular host By default statuses are returned in a numeric format.

Parameters:
- **hostname** The hostname to check the status of the service in Nagios.
- **numeric** Turn to false in order to return status in text format ('OK' instead of 0, 'Warning' instead of 1 etc)

Returns status: 'OK', 'Warning', 'Critical' or 'Unknown'

CLI Example:
```
salt '*' nagios_rpc.host_status hostname=webserver.domain.com
salt '*' nagios_rpc.host_status hostname=webserver.domain.com numeric=False
```

salt.modules.nagios_rpc.service_status(hostname=None, service=None, **kwargs)
Check status of a particular service on a host on it in Nagios. By default statuses are returned in a numeric format.

Parameters:
- **hostname** The hostname to check the status of the service in Nagios.
- **service** The service to check the status of in Nagios.
- **numeric** Turn to false in order to return status in text format ('OK' instead of 0, 'Warning' instead of 1 etc)

Returns status: 'OK', 'Warning', 'Critical' or 'Unknown'

CLI Example:
```
salt '*' nagios_rpc.service_status hostname=webserver.domain.com service='HTTP'
salt '*' nagios_rpc.service_status hostname=webserver.domain.com service='HTTP' numeric=False
```
23.9.280  salt.modules.namecheap_domains

Namecheap Domain Management

New in version 2017.7.0.

Prerequisites

This module uses the requests Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

```
salt.modules.namecheap_domains.check("domains_to_check")

Checks the availability of domains
domains_to_check  array of strings List of domains to check

Returns a dictionary mapping the each domain name to a boolean denoting whether or not it is available.

CLI Example:
salt 'my-minion' namecheap_domains.check domain-to-check
```

```
salt.modules.namecheap_domains.create(domain_name, years, **kwargs)

Try to register the specified domain name
domain_name  The domain name to be registered
years  Number of years to register

Returns the following information:
  • Whether or not the domain was renewed successfully
  • Whether or not WhoisGuard is enabled
  • Whether or not registration is instant
  • The amount charged for registration
  • The domain ID
  • The order ID
  • The transaction ID

CLI Example:
salt 'my-minion' namecheap_domains.create my-domain-name 2
```

```
salt.modules.namecheap_domains.get_info(domain_name)

Returns information about the requested domain

returns a dictionary of information about the domain_name
domain_name  string Domain name to get information about

CLI Example:
```

23.9.  execution modules
salt 'my-minion' namecheap_domains.get_info my-domain-name

salt.modules.namecheap_domains.get_list(list_type=None, search_term=None, page=None, page_size=None, sort_by=None)
Returns a list of domains for the particular user as a list of objects offset by page length of page_size
list_type [ALL] One of ALL, EXPIRING, EXPIRED
search_term Keyword to look for on the domain list
page [1] Number of result page to return
page_size [20] Number of domains to be listed per page (minimum: 10, maximum: 100)
sort_by One of NAME, NAME_DESC, EXPIREDATE, EXPIREDATE_DESC, CREATEDATE, or CREATEDATE_DESC
CLI Example:
salt 'my-minion' namecheap_domains.get_list

salt.modules.namecheap_domains.get_tld_list()
Returns a list of TLDs as objects
CLI Example:
salt 'my-minion' namecheap_domains.get_tld_list

salt.modules.namecheap_domains.reactivate(domain_name)
Try to reactivate the expired domain name
Returns the following information:
- Whether or not the domain was reactivated successfully
- The amount charged for reactivation
- The order ID
- The transaction ID
CLI Example:
salt 'my-minion' namecheap_domains.reactivate my-domain-name

salt.modules.namecheap_domains.renew(domain_name, years, promotion_code=None)
Try to renew the specified expiring domain name for a specified number of years
domain_name The domain name to be renewed
years Number of years to renew
Returns the following information:
- Whether or not the domain was renewed successfully
- The domain ID
- The order ID
- The transaction ID
- The amount charged for renewal
CLI Example:
salt 'my-minion' namecheap_domains.renew my-domain-name 5
23.9.281 salt.modules.namecheap_domains_dns

Namecheap DNS Management

New in version 2017.7.0.

Prerequisites

This module uses the requests Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

<table>
<thead>
<tr>
<th>Configuration</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>namecheap.name</td>
<td>companyname</td>
</tr>
<tr>
<td>namecheap.key</td>
<td>a1b2c3d4e5f67a8b9c0d1e2f3</td>
</tr>
<tr>
<td>namecheap.client_ip</td>
<td>162.155.30.172</td>
</tr>
<tr>
<td>namecheap.url</td>
<td><a href="https://api.namecheap.com/xml.response">https://api.namecheap.com/xml.response</a></td>
</tr>
</tbody>
</table>

salt.modules.namecheap_domains_dns.get_hosts(sld, tld)

Retrieves DNS host record settings for the requested domain.

- **sld**: SLD of the domain name
- **tld**: TLD of the domain name

CLI Example:

```
salt 'my-minion' namecheap_domains_dns.get_hosts sld tld
```

salt.modules.namecheap_domains_dns.get_list(sld, tld)

Gets a list of DNS servers associated with the requested domain.

- **sld**: SLD of the domain name
- **tld**: TLD of the domain name

CLI Example:

```
salt 'my-minion' namecheap_domains_dns.get_list sld tld
```

salt.modules.namecheap_domains_dns.set_custom(sld, tld, nameservers)

Sets domain to use custom DNS servers.

- **sld**: SLD of the domain name
- **tld**: TLD of the domain name
- **nameservers**: array of strings List of nameservers to be associated with this domain

CLI Example:

```
salt 'my-minion' namecheap_domains_dns.set_custom sld tld nameserver
```

salt.modules.namecheap_domains_dns.set_default(sld, tld)

Sets domain to use namecheap default DNS servers. Required for free services like Host record management, URL forwarding, email forwarding, dynamic DNS and other value added services.
sld  SLD of the domain name

tld  TLD of the domain name

Returns True if the domain was successfully pointed at the default DNS servers.

CLI Example:

```bash
salt 'my-minion' namecheap_domains_dns.set_default sld tld
```

salt.modules.namecheap_domains_dns.set_hosts(sld, tld, hosts)

Sets DNS host records settings for the requested domain.

returns True if the host records were set successfully

sld  SLD of the domain name

tld  TLD of the domain name

hosts  Must be passed as a list of Python dictionaries, with each dictionary containing the following keys:

• hostname
• recordtype - One of A, AAAA, CNAME, MX, MXE, TXT, URL, URL301, or FRAME
• address - URL or IP address
• ttl - An integer between 60 and 60000 (default: 1800)

Additionally, the mxpref key can be present, but must be accompanied by an emailtype key.

CLI Example:

```bash
salt 'my-minion' namecheap_domains_dns.set_hosts sld tld hosts
```

23.9.282  salt.modules.namecheap_domains_ns

Namecheap Nameserver Management

New in version 2017.7.0.

Prerequisites

This module uses the requests Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

salt.modules.namecheap_domains_ns.create(sld, tld, nameserver, ip)

Creates a new nameserver. Returns True if the nameserver was created successfully.

sld  SLD of the domain name

tld  TLD of the domain name

nameserver  Nameserver to create

ip  Nameserver IP address

CLI Example:

```bash
```
salt.modules.namecheap_domains_ns.delete(sld, tld, nameserver)
    Deletes a nameserver. Returns True if the nameserver was deleted successfully.
    sld  SLD of the domain name
    tld  TLD of the domain name
    nameserver Nameserver to delete
    CLI Example:

    salt '*' namecheap_domains_ns.delete sld tld nameserver

salt.modules.namecheap_domains_ns.get_info(sld, tld, nameserver)
    Retrieves information about a registered nameserver. Returns the following information:
    • IP Address set for the nameserver
    • Domain name which was queried
    • A list of nameservers and their statuses
    sld  SLD of the domain name
    tld  TLD of the domain name
    nameserver Nameserver to retrieve
    CLI Example:

    salt '*' namecheap_domains_ns.get_info sld tld nameserver

salt.modules.namecheap_domains_ns.update(sld, tld, nameserver, old_ip, new_ip)
    Deletes a nameserver. Returns True if the nameserver was updated successfully.
    sld  SLD of the domain name
    tld  TLD of the domain name
    nameserver Nameserver to create
    old_ip  Current ip address
    new_ip  New ip address
    CLI Example:

    salt '*' namecheap_domains_ns.update sld tld nameserver old_ip new_ip

23.9.283  salt.modules.namecheap_ssl

Namecheap SSL Certificate Management
New in version 2017.7.0.

Prerequisites

This module uses the requests Python module to communicate to the namecheap API.
Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```yaml
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
# Real url
namecheap.url: https://api.namecheap.com/xml.response
# Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

```python
salt.modules.namecheap_ssl.activate(csr_file, certificate_id, web_server_type, approver_email=None, http_dc_validation=False, **kwargs)
```

Activates a newly-purchased SSL certificate. Returns a dictionary of result values.

csr_file Path to Certificate Signing Request file
certificate_id Unique ID of the SSL certificate you wish to activate
web_server_type The type of certificate format to return. Possible values include:
  • apache2
  • apachepachessl
  • apachenopenssl
  • apacheraven
  • apachessl
  • apachessleay
  • c2net
  • cobaltseries
  • cpanel
  • domino
  • dominogo4625
  • dominogo4626
  • ensim
  • hsphere
  • ibmhttp
  • iis
  • iis4
  • iis5
  • iplanet
  • ipswitch
  • netscape
  • other
  • plesk
  • tomcat
  • weblogic
  • website
  • webstar
  • zeusv3

approver_email The email ID which is on the approver email list.

**Note:** http_dc_validation must be set to False if this option is used.

http_dc_validation [False] Whether or not to activate using HTTP-based validation.
Note: For other parameters which may be required, see here.

CLI Example:

```bash
salt 'my-minion' namecheap_ssl.activate my-csr-file my-cert-id apachessl
```

```python
salt.modules.namecheap_ssl.create(years, certificate_type, promotion_code=None, sans_to_add=None)
```

Creates a new SSL certificate. Returns the following information:
- Whether or not the SSL order was successful
- The certificate ID
- The order ID
- The transaction ID
- The amount charged for the order
- The date on which the certificate was created
- The date on which the certificate will expire
- The type of SSL certificate
- The number of years for which the certificate was purchased
- The current status of the SSL certificate

- **years** [1] Number of years to register
- **certificate_type** Type of SSL Certificate. Possible values include:
  - EV Multi Domain SSL
  - EV SSL
  - EV SSL SGC
  - EssentialSSL
  - EssentialSSL Wildcard
  - InstantSSL
  - InstantSSL Pro
  - Multi Domain SSL
  - PositiveSSL
  - PositiveSSL Multi Domain
  - PositiveSSL Wildcard
  - PremiumSSL
  - PremiumSSL Wildcard
  - QuickSSL Premium
  - RapidSSL
  - RapidSSL Wildcard
  - SGC Supercert
  - SSL Web Server
  - SSL Webserver EV
  - SSL123
  - Secure Site
  - Secure Site Pro
  - Secure Site Pro with EV
  - Secure Site with EV
  - True BusinessID
  - True BusinessID Multi Domain
  - True BusinessID Wildcard
  - True BusinessID with EV
  - True BusinessID with EV Multi Domain
  - Unified Communications

- **promotional_code** An optional promo code to use when creating the certificate
sans_to_add [0] This parameter defines the number of add-on domains to be purchased in addition to the
default number of domains included with a multi-domain certificate. Each certificate that supports SANs
has the default number of domains included. You may check the default number of domains included
and the maximum number of domains that can be added to it in the table below.

<table>
<thead>
<tr>
<th>Provider</th>
<th>Product name</th>
<th>Default number of domains (domain from CSR is counted here)</th>
<th>Maximum number of total domains</th>
<th>Maximum number of domains that can be passed in sans_to_add parameter</th>

</tbody>
</table>

CLI Example:

```
salt 'my-minion' namecheap_ssl.create 2 RapidSSL
```

salt.modules.namecheap_ssl.get_info(certificate_id, returncertificate=False, returntype=None)
Retrieves information about the requested SSL certificate. Returns a dictionary of information about the SSL
certificate with two keys:
- **ssl**: Contains the metadata information
- **certificate**: Contains the details for the certificate such as the CSR, Approver, and certificate data

**certificate_id** Unique ID of the SSL certificate
**returncertificate** [False] Set to True to ask for the certificate in response
**returntype** Optional type for the returned certificate. Can be either "Individual" (for X.509 format) or "PKCS7"

**Note:** Required if returncertificate is True

CLI Example:
salt 'my-minion' namecheap_ssl.get_info my-cert-id

salt.modules.namecheap_ssl.get_list(**kwargs)
Returns a list of SSL certificates for a particular user
ListType [All] Possible values:
  • All
  • Processing
  • EmailSent
  • TechnicalProblem
  • InProgress
  • Completed
  • Deactivated
  • Active
  • Cancelled
  • NewPurchase
  • NewRenewal

SearchTerm Keyword to look for on the SSL list
Page [1] Page number to return
PageSize [20] Total number of SSL certificates to display per page (minimum: 10, maximum: 100)
OrderBy One of PURCHASEDATE, PURCHASEDATE_DESC, SSLTYPE, SSLTYPE_DESC, EXPIREDATETIME, EXPIREDATETIME_DESC, Host_Name, or Host_Name_DESC

CLI Example:
salt 'my-minion' namecheap_ssl.get_list Processing

salt.modules.namecheap_ssl.parse_csr(csr_file, certificate_type, http_de_validation=False)
Parses the CSR. Returns a dictionary of result values.
csr_file Path to Certificate Signing Request file
certificate_type Type of SSL Certificate. Possible values include:
  • EV Multi Domain SSL
  • EV SSL
  • EV SSL SGC
  • EssentialSSL
  • EssentialSSL Wildcard
  • InstantSSL
  • InstantSSL Pro
  • Multi Domain SSL
  • PositiveSSL
  • PositiveSSL Multi Domain
  • PositiveSSL Wildcard
  • PremiumSSL
  • PremiumSSL Wildcard
  • QuickSSL Premium
  • RapidSSL
  • RapidSSL Wildcard
  • SGC Supercert
  • SSL Web Server
  • SSL Webserver EV
  • SSL123
  • Secure Site
  • Secure Site Pro
  • Secure Site Pro with EV
  • Secure Site with EV

23.9. execution modules
• True BusinessID
• True BusinessID Multi Domain
• True BusinessID Wildcard
• True BusinessID with EV
• True BusinessID with EV Multi Domain
• Unified Communications

**http_dc_validation**  [False] Set to True if a Comodo certificate and validation should be done with files instead of emails and to return the info to do so

CLI Example:

```bash
salt 'my-minion' namecheap_ssl.parse_csr my-csr-file PremiumSSL
```

```python
salt.modules.namecheap_ssl.reissue(csr_file, certificate_id, web_server_type, approver_email=None, http_dc_validation=False, **kwargs)
```

Reissues a purchased SSL certificate. Returns a dictionary of result values.

csr_file  Path to Certificate Signing Request file

certificate_id  Unique ID of the SSL certificate you wish to activate

**web_server_type**  The type of certificate format to return. Possible values include:

• apache2
• apacheapachessl
• apacheopenssl
• apacheraven
• apachessl
• apachessleay
• c2net
• cobaltseries
• cpanel
• domino
• dominogo4625
• dominogo4626
• ensim
• hsphere
• ibmhttp
• iis
• iis4
• iis5
•iplanet
• ipswitch
• netscape
• other
• plesk
• tomcat
• weblogic
• website
• webstar
• zeusv3

**approver_email**  The email ID which is on the approver email list.

---

**Note:** `http_dc_validation` must be set to `False` if this option is used.

**http_dc_validation**  [False] Whether or not to activate using HTTP-based validation.

---

**Note:** For other parameters which may be required, see [here](#).
salt.modules.namecheap_ssl.renew(years, certificate_id, certificate_type, promotion_code=None)

Renews an SSL certificate if it is ACTIVE and Expires <= 30 days. Returns the following information:

- The certificate ID
- The order ID
- The transaction ID
- The amount charged for the order

**years**  [1] Number of years to register

**certificate_id**  Unique ID of the SSL certificate you wish to renew

**certificate_type**  Type of SSL Certificate. Possible values include:

- EV Multi Domain SSL
- EV SSL
- EV SSL SGC
- EssentialSSL
- EssentialSSL Wildcard
- InstantSSL
- InstantSSL Pro
- Multi Domain SSL
- PositiveSSL
- PositiveSSL Multi Domain
- PositiveSSL Wildcard
- PremiumSSL
- PremiumSSL Wildcard
- QuickSSL Premium
- RapidSSL
- RapidSSL Wildcard
- SGC Supercert
- SSL Web Server
- SSL Webserver EV
- SSL123
- Secure Site
- Secure Site Pro
- Secure Site Pro with EV
- Secure Site with EV
- True BusinessID
- True BusinessID Multi Domain
- True BusinessID Wildcard
- True BusinessID with EV
- True BusinessID with EV Multi Domain
- Unified Communications

**promotion_code**  An optional promo code to use when renewing the certificate

CLI Example:

```
salt 'my-minion' namecheap_ssl.renew 1 my-cert-id RapidSSL
```
23.9.284 salt.modules.namecheap_users

Namecheap User Management
New in version 2017.7.0.

Prerequisites

This module uses the `requests` Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

<table>
<thead>
<tr>
<th>Salt Module Variables</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>namecheap.name</td>
<td>Namecheap username</td>
</tr>
<tr>
<td>namecheap.key</td>
<td>Namecheap API key</td>
</tr>
<tr>
<td>namecheap.client_ip</td>
<td>Namecheap client IP address</td>
</tr>
<tr>
<td>namecheap.url</td>
<td>Namecheap API URL</td>
</tr>
</tbody>
</table>

```python
salt.modules.namecheap_users.check_balances(minimum=100)
```
Checks if the provided minimum value is present in the user's account.

- `minimum` [100]: The value to check

**CLI Example:**

```
salt 'my-minion' namecheap_users.check_balances
salt 'my-minion' namecheap_users.check_balances minimum=150
```

```python
salt.modules.namecheap_users.get_balances()
```
Gets information about fund in the user's account. This method returns the following information: Available Balance, Account Balance, Earned Amount, Withdrawable Amount and Funds Required for AutoRenew.

**Note:** If a domain setup with automatic renewal is expiring within the next 90 days, the FundsRequired-ForAutoRenew attribute shows the amount needed in your Namecheap account to complete auto renewal.

**CLI Example:**

```
salt 'my-minion' namecheap_users.get_balances
```
23.9.285 salt.modules.napalm_bgp

NAPALM BGP

Manages BGP configuration on network devices and provides statistics.

codeauthor Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>
maturity new
depends napalm
platform unix

Dependencies

- napalm proxy minion

New in version 2016.11.0.

salt.modules.napalm_bgp.config(group=None, neighbor=None, **kwargs)

Provides the BGP configuration on the device.

Parameters

- group -- Name of the group selected to display the configuration.
- neighbor -- IP Address of the neighbor to display the configuration. If the group parameter is not specified, the neighbor setting will be ignored.

Returns A dictionary containing the BGP configuration from the network device. The keys of the main dictionary are the group names.

Each group has the following properties:

- type (string)
- description (string)
- apply_groups (string list)
- multihop_ttl (int)
- multipath (True/False)
- local_address (string)
- local_as (int)
- remote_as (int)
- import_policy (string)
- export_policy (string)
- remove_private_as (True/False)
- prefix_limit (dictionary)
- neighbors (dictionary)

Each neighbor in the dictionary of neighbors provides:

- description (string)
- import_policy (string)
- export_policy (string)
- local_address (string)
- local_as (int)
- remote_as (int)
- authentication_key (string)
- prefix_limit (dictionary)
- route_reflector_client (True/False)
- nhs (True/False)

CLI Example:
salt '*' bgp.config  # entire BGP config
salt '*' bgp.config PEERS-GROUP-NAME  # provides detail only about BGP group PEERS-GROUP-NAME
salt '*' bgp.config PEERS-GROUP-NAME 172.17.17.1  # provides details only about BGP neighbor 172.17.17.1,
# configured in the group PEERS-GROUP-NAME

Output Example:

```
{
    'PEERS-GROUP-NAME':{
        'type' : 'external',
        'description' : 'Here we should have a nice description',
        'apply_groups' : ['BGP-PREFIX-LIMIT'],
        'import_policy' : 'PUBLIC-PEER-IN',
        'export_policy' : 'PUBLIC-PEER-OUT',
        'remove_private': True,
        'multipath' : True,
        'multihop_ttl' : 30,
        'neighbors' : {
            '192.168.0.1':{
                'description' : 'Facebook [CDN]',
                'prefix_limit' : {
                    'inet': {
                        'unicast': {
                            'limit': 100,
                            'teardown': {
                                'threshold': 95,
                                'timeout': 5
                            }
                        }
                    }
                }
            },
            'peer-as': 32934,
            'route_reflector': False,
            'nhs': True
        },
        '172.17.17.1':{
            'description' : 'Twitter [CDN]',
            'prefix_limit' : {
                'inet': {
                    'unicast': {
                        'limit': 500,
                        'no-validate': 'IMPORT-FLOW-Routes'
                    }
                }
            }
        },
        'peer_as': 13414,
        'route_reflector': False,
        'nhs': False
    }
}
```

salt.modules.napalm_bgp.neighbors(neighbor=None, **kwargs)

Provides details regarding the BGP sessions configured on the network device.

Parameters
neighbor -- IP Address of a specific neighbor.
Returns

A dictionary with the statistics of the all/selected BGP neighbors. Outer dictionary keys represent the VRF name. Keys of inner dictionary represent the AS numbers, while the values are lists of dictionaries, having the following keys:

- up (True/False)
- local_as (int)
- remote_as (int)
- local_address (string)
- routing_table (string)
- local_address_configured (True/False)
- local_port (int)
- remote_address (string)
- remote_port (int)
- multihop (True/False)
- multipath (True/False)
- remove_private_as (True/False)
- import_policy (string)
- export_policy (string)
- input_messages (int)
- output_messages (int)
- input_updates (int)
- output_updates (int)
- messages_queue_out (int)
- connection_state (string)
- previous_connection_state (string)
- last_event (string)
- suppress_4byte_as (True/False)
- local_as_prepend (True/False)
- holdtime (int)
- configured_holdtime (int)
- keepalive (int)
- configured_keepalive (int)
- active_prefix_count (int)
- received_prefix_count (int)
- accepted_prefix_count (int)
- suppressed_prefix_count (int)
- advertised_prefix_count (int)
• flap_count (int)

CLI Example:

```python
salt '* bgp.neighbors  # all neighbors
salt '* bgp.neighbors 172.17.17.1  # only session with BGP neighbor(s) 172.17.17.1
```

Output Example:

```python
{
    'default': {
        8121: [
            {'up': True,
             'local_as': 13335,
             'remote_as': 8121,
             'local_address': '172.101.76.1',
             'local_address_configured': True,
             'local_port': 179,
             'remote_address': '192.247.78.0',
             'router_id': '192.168.0.1',
             'remote_port': 58380,
             'multihop': False,
             'import_policy': '4-NTT-TRANSIT-IN',
             'export_policy': '4-NTT-TRANSIT-OUT',
             'input_messages': 123,
             'output_messages': 13,
             'input_updates': 123,
             'output_updates': 5,
             'messages_queued_out': 23,
             'connection_state': 'Established',
             'previous_connection_state': 'EstabSync',
             'last_event': 'RecvKeepAlive',
             'suppress_4byte_as': False,
             'local_as_prepend': False,
             'holdtime': 90,
             'configured_holdtime': 90,
             'keepalive': 30,
             'configured_keepalive': 30,
             'active_prefix_count': 132808,
             'received_prefix_count': 566739,
             'accepted_prefix_count': 566479,
             'suppressed_prefix_count': 0,
             'advertise_prefix_count': 0,
             'flap_count': 27
            }
        ]
    }
}
```
23.9.286 salt.modules.napalm_formula

NAPALM Formula helpers

New in version 2019.2.0.

This is an Execution Module providing helpers for various NAPALM formulas, e.g., napalm-interfaces-formula, napalm-bgp-formula, napalm-ntp-formula etc., meant to provide various helper functions to make the templates more readable.

salt.modules.napalm_formula.container_path(model, key=None, container=None, delim=': ')

Return the list of all the possible paths in a container, down to the config container. This function can be used to verify that the model is a Python object correctly structured and respecting the OpenConfig hierarchy.

- **model**: The OpenConfig-structured object to inspect.
- **delim**: The key delimiter. In particular cases, it is indicated to use // as : might be already used in various cases, e.g., IPv6 addresses, interface name (e.g., Juniper QFX series), etc.

CLI Example:

```shell
salt '*' napalm_formula.container_path "{"interfaces": {"interface": {"Ethernet1": {"config": {"name": 'Ethernet1'}}}}}""
```

The example above would return a list with the following element:

```
interfaces:interface:Ethernet1:config
```

This is the only possible path in that hierarchy.

Other output examples:

```
- interfaces:interface:Ethernet1:config
- interfaces:interface:Ethernet1:subinterfaces:subinterface:0:config
- interfaces:interface:Ethernet2:config
```

salt.modules.napalm_formula.defaults(model, defaults, delim='//', flipped_merge=False)

Apply the defaults to a Python dictionary having the structure as described in the OpenConfig standards.

- **model**: The OpenConfig model to apply the defaults to.
- **defaults**: The dictionary of defaults. This argument must equally be structured with respect to the OpenConfig standards.
  
  For ease of use, the keys of these support glob matching, therefore we don’t have to provide the defaults for each entity but only for the entity type. See an example below.
  
- **delim**: The key delimiter to use. Generally, // should cover all the possible cases, and you don’t need to override this value.
  
- **flipped_merge**: Whether should merge the model into the defaults, or the defaults into the model. Default: False (merge the model into the defaults, i.e., any defaults would be overridden by the values from the model).

CLI Example:

```shell
salt '*' napalm_formula.defaults "{"interfaces": {"interface": {"Ethernet1": { "config": {"name": 'Ethernet1'}}}}}" "{"interfaces": {"interface": {"*": { "config": {"enabled": True}}}}}""
```

As one can notice in the example above, the * corresponds to the interface name, therefore, the defaults will be applied on all the interfaces.

salt.modules.napalm_formula.dictupdate(dest, upd, recursive_update=True, merge_lists=False)

Recursive version of the default dict.update

Merges upd recursively into dest

If recursive_update=False, will use the classic dict.update, or fall back on a manual merge (helpful for non-dict types like FunctionWrapper).
If `merge_lists=True`, will aggregate list object types instead of replace. The list in `upd` is added to the list in `dest`, so the resulting list is `dest[key] + upd[key]`. This behaviour is only activated when `recursive_update=True`. By default `merge_lists=False`.

```python
salt.modules.napalm_formula.render_field(dictionary, field, prepend=None, append=None, quotes=False, **opts)
```

Render a field found under the `field` level of the hierarchy in the `dictionary` object. This is useful to render a field in a Jinja template without worrying that the hierarchy might not exist. For example if we do the following in Jinja: `{{ interfaces.interface.Ethernet5.config.description }}` for the following object: `{'interfaces': {'interface': {'Ethernet1': {'config': {'enabled': True}}}}}` it would error, as the `Ethernet5` key does not exist. With this helper, we can skip this and avoid existence checks. This must be however used with care.

- **dictionary**: The dictionary to traverse.
- **field**: The key name or part to traverse in the `dictionary`.
- **prepend**: `None` - The text to prepend in front of the text. Usually, we need to have the name of the field too when generating the configuration.
- **append**: `None` - Text to append at the end.
- **quotes**: `False` - Whether should wrap the text around quotes.

CLI Example:

```shell
salt '*' napalm_formula.render_field "{'enabled': True}" enabled
# This would return the value of the '\`enabled\`' leaf key
salt '*' napalm_formula.render_field "{'enabled': True}" description
# This would not error
```

Jinja usage example:

```jinja
{% set config = {'enabled': True, 'description': 'Interface description'} %}
{{ salt.napalm_formula.render_field(config, 'description', quotes=True) }}
```

The example above would be rendered on Arista / Cisco as:

```
description "Interface description"
```

While on Junos (the semicolon is important to be added, otherwise the configuration won’t be accepted by Junos):

```
description "Interface description";
```

```python
salt.modules.napalm_formula.render_fields(dictionary, *fields, **opts)
```

This function works similarly to `render_field` but for a list of fields from the same dictionary, rendering, indenting and distributing them on separate lines.

- **dictionary**: The dictionary to traverse.
- **fields**: A list of field names or paths in the dictionary.
- **indent**: `0` - The indentation to use, prepended to the rendered field.
- **separator**: `\n` - The separator to use between fields.

CLI Example:

```shell
salt '*' napalm_formula.render_fields "{'mtu': 68, 'description': 'Interface description'}" mtu description
```

Jinja usage example:

```jinja
{% set config={'mtu': 68, 'description': 'Interface description'} %}
{{ salt.napalm_formula.render_fields(config, 'mtu', 'description', quotes=True) }}
```

The Jinja example above would generate the following configuration:
### salt.modules.napalm_formula.setval

Set a value under the dictionary hierarchy identified under the key. The target 'foo/bar/baz' returns the dictionary hierarchy `{'foo': {'bar': {'baz': {}}}}`.

**Note:** Currently this doesn't work with integers, i.e. cannot build lists dynamically.

**CLI Example:**
```
salt '*' formula.setval foo:baz:bar True
```

### salt.modules.napalm_formula.traverse

Traverse a dict or list using a colon-delimited (or otherwise delimited, using the delimiter param) target string. The target `foo:bar:0` will return `data['foo']['bar'][0]` if this value exists, and will otherwise return the dict in the default argument. Function will automatically determine the target type. The target `foo:bar:0` will return `data['foo']['bar'][0]` if data like `{ 'foo': { 'bar': [ 'baz' ] } }`, if data like `{ 'foo': { 'bar': { '0': 'baz' } } }` then return `data['foo']['bar']['0']`

**CLI Example:**
```
salt '*' napalm_formula.traverse "{'foo': {'bar': {'baz': True}}}" foo:baz:bar
```

## 23.9.287 salt.modules.napalm_mod

### NAPALM helpers

Helpers for the NAPALM modules.

New in version 2017.7.0.

#### salt.modules.napalm_mod.alive(**kwargs)

Returns the alive status of the connection layer. The output is a dictionary under the usual dictionary output of the NAPALM modules.

**CLI Example:**
```
salt '*' napalm.alive
```

**Output Example:**
```
result: True
out:
  is_alive: False
comment: ''
```

#### salt.modules.napalm_mod.call(method, *args, **kwargs)

Execute arbitrary methods from the NAPALM library. To see the expected output, please consult the NAPALM documentation.

**Note:** This feature is not recommended to be used in production. It should be used for testing only!

**CLI Example:**
```
salt '*' napalm.call get_lldp_neighbors
salt '*' napalm.call get_firewall_policies
salt '*' napalm.call get_bgp_config group='my-group'

```
salt.modules.napalm_mod.compliance_report(filepath=None, string=None, render='jinja|yaml', **kwargs)

Return the compliance report.
filepath  The absolute path to the validation file.

Changed in version 2019.2.0.

Beginning with release codename 2019.2.0, this function has been enhanced, to be able to leverage the multi-engine template rendering of Salt, besides the possibility to retrieve the file source from remote systems, the URL schemes supported being:

- salt://
- ftp://
- s3://
- swift://

Or on the local file system (on the Minion).

Note: The rendering result does not necessarily need to be YAML, instead it can be any format interpreted by Salt's rendering pipeline (including pure Python).

string  New in version 2019.2.0.

The compliance report send as inline string, to be used as the file to send through the renderer system. Note, not all render modules can work with strings; the 'py' renderer requires a file, for example.

renderer: jinja|yaml  New in version 2019.2.0.

The renderer pipe to send the file through; this is overridden by a "she-bang" at the top of the file.

kwargs  Changed in version 2019.2.0.

Keyword args to pass to Salt's compile_template() function.

CLI Example:

```
salt '*' napalm.compliance_report ~/validate.yml
salt '*' napalm.compliance_report salt://path/to/validator.sls
```

Validation File Example (pure YAML):

```
- get_facts:
  os_version: 4.17

- get_interfaces_ip:
  Management1:
    ipv4:
      10.0.2.14:
        prefix_length: 24
        _mode: strict
```

Validation File Example (as Jinja + YAML):

```
- get_facts:
  os_version: {{ grains.version }}
- get_interfaces_ip:
  Loopback0:
```

(continues on next page)
ipv4:
    {{ grains.lo0.ipv4 }}:
        prefix_length: 24
        _mode: strict
- get_bgp_neighbors: {{ pillar.bgp.neighbors }}

Output Example:

```
device1:
    comment: 
    out:
        complies: False
        get_facts: 
            complies: False
            extra: 
                missing: 
                    present: 
                        os_version: 
                            actual_value: 
                                15.1F6-S1.4
                            complies: False
                            nested: False
        get_interfaces_ip: 
            complies: False
            extra: 
                missing: 
                    - Management1
            present: 
        skipped: 
        result: 
            True
```

salt.modules.napalm_mod.config_diff_text(source1='candidate', candidate_path=None, source2='running', running_path=None)

New in version 2019.2.0.

Return the diff, as text, between the two different configuration sources. The sources can be either specified using the source1 and source2 arguments when retrieving from the managed network device.

- **source1**: candidate The source from where to retrieve the configuration to be compared with. Available options: candidate, running, startup. Default: candidate.
- **candidate_path**: Absolute or remote path from where to load the candidate configuration text. This argument allows any URI supported by cp.get_url, e.g., salt://, https://, s3://, ftp://, etc.
- **source2**: running The source from where to retrieve the configuration to compare with. Available options: candidate, running, startup. Default: running.
- **running_path**: Absolute or remote path from where to load the running configuration text. This argument...
allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.
saltenv: **base** Salt fileserver environment from which to retrieve the file. Ignored if `candidate_path` or `running_path` is not a `salt://` URL.

CLI Example:

```bash
salt '*' napalm.config_diff_text
salt '*' napalm.config_diff_text candidate_path=https://bit.ly/2mAdq7z
# Would compare the running config with the configuration available at
# https://bit.ly/2mAdq7z
```

**salt.modules.napalm_mod.config_diff_tree** `source1='candidate', candidate_path=None, source2='running', running_path=None`

New in version 2019.2.0.

Return the diff, as Python dictionary, between two different sources. The sources can be either specified using the `source1` and `source2` arguments when retrieving from the managed network device.

- **source1:** `candidate` The source from where to retrieve the configuration to be compared with. Available options: candidate, running, startup. Default: candidate.
- **candidate_path** Absolute or remote path from where to load the candidate configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.
- **source2:** `running` The source from where to retrieve the configuration to compare with. Available options: candidate, running, startup. Default: running.
- **running_path** Absolute or remote path from where to load the running configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**saltenv:** **base** Salt fileserver environment from which to retrieve the file. Ignored if `candidate_path` or `running_path` is not a `salt://` URL.

CLI Example:

```bash
salt '*' napalm.config_diff_text
salt '*' napalm.config_diff_text candidate_path=https://bit.ly/2mAdq7z
# Would compare the running config with the configuration available at
# https://bit.ly/2mAdq7z
```

CLI Example:

```bash
salt '*' napalm.config_diff_tree
salt '*' napalm.config_diff_tree running startup
```

**salt.modules.napalm_mod.config_filter_lines**(parent_regex, child_regex, source='running')

New in version 2019.2.0.

Return a list of detailed matches, for the configuration blocks (parent-child relationship) whose parent respects the regular expressions configured via the `parent_regex` argument, and the child matches the `child_regex` regular expression. The result is a list of dictionaries with the following keys:

- **match:** a boolean value that tells whether `child_regex` matched any children lines.
- **parent:** the parent line (as text).
- **child:** the child line (as text). If no child line matched, this field will be `None`.

**Note:** This function is only available only when the underlying library `ciscoconfparse` is installed. See `ciscoconfparse module` for more details.

- **parent_regex** The regular expression to match the parent configuration lines against.
- **child_regex** The regular expression to match the child configuration lines against.
- **source:** `running` The configuration type to retrieve from the network device. Default: `running`. Available options: running, startup, candidate.

CLI Example:
salt.modules.napalm_mod.config_find_lines(regex, source='running')
New in version 2019.2.0.
Return the configuration lines that match the regular expressions from the regex argument. The configuration is read from the network device interrogated.
regex The regular expression to match the configuration lines against.
CLI Example:
salt '*' napalm.config_filter_lines '^interface' 'ip address'
salt '*' napalm.config_filter_lines '^interface' 'shutdown' source=candidate

salt.modules.napalm_mod.config_lines_w_child(parent_regex, child_regex, source='running')
New in version 2019.2.0.
Return the configuration lines that match the regular expressions from the parent_regex argument, having child lines matching child_regex. The configuration is read from the network device interrogated.

Note: This function is only available only when the underlying library ciscoconfparse is installed. See ciscoconfparse module for more details.

parent_regex The regular expression to match the parent configuration lines against.
child_regex The regular expression to match the child configuration lines against.
CLI Example:
salt '*' napalm.config_lines_w_child '^interface' 'ip address'
salt '*' napalm.config_lines_w_child '^interface' 'shutdown' source=candidate

salt.modules.napalm_mod.config_lines_wo_child(parent_regex, child_regex, source='running')
New in version 2019.2.0.
Return the configuration lines that match the regular expressions from the parent_regex argument, having the child lines not matching child_regex. The configuration is read from the network device interrogated.

Note: This function is only available only when the underlying library ciscoconfparse is installed. See ciscoconfparse module for more details.

parent_regex The regular expression to match the parent configuration lines against.
child_regex The regular expression to match the child configuration lines against.
CLI Example:
salt '*' napalm.config_lines_wo_child '^interface' 'ip address'
salt '*' napalm.config_lines_wo_child '^interface' 'shutdown' source=candidate
salt.modules.napalm_mod.config_merge_diff(source='running',
    merge_config=None,
    merge_path=None, saltenv='base')

New in version 2019.2.0.

Return the merge diff, as text, after merging the merge config into the configuration source requested (without loading the config on the device).

merge_config: The config to be merged into the initial config, sent as text. This argument is ignored when merge_path is set.

merge_path: Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by cp.get_url), e.g., salt://, https://, s3://, ftp://, etc.

saltenv: base  Salt fileserver environment from which to retrieve the file. Ignored if merge_path is not a salt:// URL.

CLI Example:

```
salt '*' napalm.config_merge_diff merge_path=salt://path/to/merge.cfg
```

salt.modules.napalm_mod.config_merge_text(source='running',
    merge_config=None,
    merge_path=None, saltenv='base')

New in version 2019.2.0.

Return the merge result of the configuration from source with the merge configuration, as plain text (without loading the config on the device).

merge_config: The config to be merged into the initial config, sent as text. This argument is ignored when merge_path is set.

merge_path: Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by cp.get_url), e.g., salt://, https://, s3://, ftp://, etc.

saltenv: base  Salt fileserver environment from which to retrieve the file. Ignored if merge_path is not a salt:// URL.

CLI Example:

```
salt '*' napalm.config_merge_text merge_path=salt://path/to/merge.cfg
```

salt.modules.napalm_mod.config_merge_tree(source='running',
    merge_config=None,
    merge_path=None, saltenv='base')

New in version 2019.2.0.

Return the merge tree of the initial_config with the merge_config, as a Python dictionary.

merge_config: The config to be merged into the initial config, sent as text. This argument is ignored when merge_path is set.

merge_path: Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by cp.get_url), e.g., salt://, https://, s3://, ftp://, etc.

saltenv: base  Salt fileserver environment from which to retrieve the file. Ignored if merge_path is not a salt:// URL.

CLI Example:

```
salt '*' napalm.config_merge_tree merge_path=salt://path/to/merge.cfg
```

salt.modules.napalm_mod.config_tree(source='running', with_tags=False)

New in version 2019.2.0.

Transform Cisco IOS style configuration to structured Python dictionary. Depending on the value of the
with_tags argument, this function may provide different views, valuable in different situations.

with_tags: False Whether this function should return a detailed view, with tags.

CLI Example:

```
salt '*' napalm.config_tree
```

```python
salt.modules.napalm_mod.junos_call(fun, *args, **kwargs)
```

New in version 2019.2.0.

Execute an arbitrary function from the junos execution module. To check what args and kwargs you must send to the function, please consult the appropriate documentation.

fun The name of the function. E.g., set_hostname.

args List of arguments to send to the junos function invoked.

kwargs Dictionary of key-value arguments to send to the juno function invoked.

CLI Example:

```
salt '*' napalm.junos_fun cli 'show system commit'
```

```python
salt.modules.napalm_mod.junos_cli(command, format=None, dev_timeout=None, dest=None, **kwargs)
```

New in version 2019.2.0.

Execute a CLI command and return the output in the specified format.

command The command to execute on the Junos CLI.

format: text Format in which to get the CLI output (either text or xml).

dev_timeout: 30 The NETCONF RPC timeout (in seconds).

dest Destination file where the RPC output is stored. Note that the file will be stored on the Proxy Minion.

To push the files to the Master, use cp.push.

CLI Example:

```
salt '*' napalm.junos_cli 'show lldp neighbors'
```

```python
salt.modules.napalm_mod.junos_commit(**kwargs)
```

New in version 2019.2.0.

Commit the changes loaded in the candidate configuration.

dev_timeout: 30 The NETCONF RPC timeout (in seconds).

comment Provide a comment for the commit.

confirm Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.

sync: False When True, on dual control plane systems, requests that the candidate configuration on one control plane be copied to the other control plane, checked for correct syntax, and committed on both Routing Engines.

force_sync: False When True, on dual control plane systems, force the candidate configuration on one control plane to be copied to the other control plane.

full When True, requires all the daemons to check and evaluate the new configuration.

detail When True, return commit detail.

CLI Examples:

```
salt '*' napalm.junos_commit comment='Commiting via Salt' detail=True
salt '*' napalm.junos_commit dev_timeout=60 confirm=10
salt '*' napalm.junos_commit sync=True dev_timeout=90
```

```python
salt.modules.napalm_mod.junos_copy_file(src, dst, **kwargs)
```

New in version 2019.2.0.
Copies the file on the remote Junos device.

**src** The source file path. This argument accepts the usual Salt URIs (e.g., `salt://`, `http://`, `https://`, `s3://`, `ftp://`, etc.).

**dst** The destination path on the device where to copy the file.

CLI Example:

```
salt '*' napalm.junos_copy_file https://example.com/junos.cfg /var/tmp/myjunos.cfg
```

**salt.modules.napalm_mod.junos_facts(**`**kwargs**`)**

New in version 2019.2.0.

The complete list of Junos facts collected by `junos-eznc`.

CLI Example:

```
salt '*' napalm.junos_facts
```

**salt.modules.napalm_mod.junos_install_os(path=None, **kwargs)**

New in version 2019.2.0.

Installs the given image on the device.

**path** The image file source. This argument supports the following URIs:

- Absolute path on the Minion.
- `salt://` to fetch from the Salt fileserver.
- `ftp://`
- `swift://`
- `s3://`

**dev_timeout**: 30 The NETCONF RPC timeout (in seconds)

**reboot**: _False_ Whether to reboot the device after the installation is complete.

**no_copy**: _False_ If True the software package will not be copied to the remote device.

CLI Example:

```
salt '*' napalm.junos_install_os salt://images/junos_16_1.tgz reboot=True
```

**salt.modules.napalm_mod.junos_rpc(cmd=None, dest=None, format=None, **kwargs)**

New in version 2019.2.0.

Execute an RPC request on the remote Junos device.

**cmd** The RPC request to the executed. To determine the RPC request, you can check the from the command line of the device, by executing the usual command followed by `| display xml rpc`, e.g., `show lldp neighbors | display xml rpc`.

**dest** Destination file where the RPC output is stored. Note that the file will be stored on the Proxy Minion.

To push the files to the Master, use `cp.push` Execution function.

**format**: _xml_ The format in which the RPC reply is received from the device.

**dev_timeout**: 30 The NETCONF RPC timeout.

**filter** Used with the `get-config` RPC request to filter out the config tree.

**terse**: _False_ Whether to return terse output.

---

**Note**: Some RPC requests may not support this argument.

**interface_name** Name of the interface to query.

CLI Example:

```
salt '*' napalm.junos_rpc get-lldp-neighbors-information
salt '*' napalm.junos_rpc get-config <configuration><system><ntp/></system></configuration>
```

(continues on next page)
salt.modules.napalm_mod.netmiko_args(**kwargs)

New in version 2019.2.0.

Return the key-value arguments used for the authentication arguments for the netmiko module.

When running in a non-native NAPALM driver (e.g., panos, f5, mos - either from https://github.com/napalm-automation-community or defined in user’s own environment, one can specify the Netmiko device type (the device_type argument) via the netmiko_device_type_map configuration option / Pillar key, e.g.,

```
netmiko_device_type_map:
    f5: f5_ltm
    dellos10: dell_os10
```

The configuration above defines the mapping between the NAPALM os Grain and the Netmiko device_type, e.g., when the NAPALM Grain is f5, it would use the f5_ltm SSH Netmiko driver to execute commands over SSH on the remote network device.

CLI Example:

```
salt '*' napalm.netmiko_args
```

salt.modules.napalm_mod.netmiko_call(method, *args, **kwargs)

New in version 2019.2.0.

Execute an arbitrary Netmiko method, passing the authentication details from the existing NAPALM connection.

method  The name of the Netmiko method to execute.
args     List of arguments to send to the Netmiko method specified in method.
kwargss   Key-value arguments to send to the execution function specified in method.

CLI Example:

```
salt '*' napalm.netmiko_call send_command 'show version'
```

salt.modules.napalm_mod.netmiko_commands(*commands, **kwargs)

New in version 2019.2.0.

Invoke one or more commands to be executed on the remote device, via Netmiko. Returns a list of strings, with the output from each command.

commands  A list of commands to be executed.
expect_string  Regular expression pattern to use for determining end of output. If left blank will default to being based on router prompt.
delay_factor: 1  Multiplying factor used to adjust delays (default: 1).
max_loops: 500  Controls wait time in conjunction with delay_factor. Will default to be based upon self.timeout.
auto_find_prompt: True  Whether it should try to auto-detect the prompt (default: True).
strip_prompt: True  Remove the trailing router prompt from the output (default: True).
strip_command: True  Remove the echo of the command from the output (default: True).
normalize: True  Ensure the proper enter is sent at end of command (default: True).
use_textfsm: False  Process command output through TextFSM template (default: False).

CLI Example:

```
salt '*' napalm.netmiko_commands 'show version' 'show interfaces'
```
salt.modules.napalm_mod.netmiko_config(*config_commands, **kwargs)

New in version 2019.2.0.

Load a list of configuration commands on the remote device, via Netmiko.

**Warning:** Please remember that netmiko does not have any rollback safeguards and any configuration change will be directly loaded into the running config if the platform doesn't have the concept of candidate config.

On Junos, or other platforms that have this capability, the changes will not be loaded into the running config, and the user must set the commit argument to True to transfer the changes from the candidate into the running config before exiting.

**config_commands** A list of configuration commands to be loaded on the remote device.

**config_file** Read the configuration commands from a file. The file can equally be a template that can be rendered using the engine of choice (see template_engine).

This can be specified using the absolute path to the file, or using one of the following URL schemes:
- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

**exit_config_mode:** Determines whether or not to exit config mode after complete.

**delay_factor:** Factor to adjust delays.

**max_loops:** Controls wait time in conjunction with delay_factor (default: 150).

**strip_prompt:** Determines whether or not to strip the prompt (default: False).

**strip_command:** Determines whether or not to strip the command (default: False).

**config_mode_command** The command to enter into config mode.

**commit:** Commit the configuration changes before exiting the config mode. This option is by default disabled, as many platforms don’t have this capability natively.

CLI Example:

```
salt '*' napalm.netmiko_config 'set system ntp peer 1.2.3.4' commit=True
```

salt.modules.napalm_mod.netmiko_conn(**kwargs)

New in version 2019.2.0.

Return the connection object with the network device, over Netmiko, passing the authentication details from the existing NAPALM connection.

**Warning:** This function is not suitable for CLI usage, more rather to be used in various Salt modules.

USAGE Example:

```
conn = __salt__['napalm.netmiko_conn']()
res = conn.send_command('show interfaces')
conn.disconnect()
```

salt.modules.napalm_mod.netmiko_fun(fun, *args, **kwargs)

New in version 2019.2.0.
Call an arbitrary function from the Netmiko module, passing the authentication details from the existing NAPALM connection.

**fun**  The name of the function from the Netmiko to invoke.

**args**  List of arguments to send to the execution function specified in `fun`.

**kwargs**  Key-value arguments to send to the execution function specified in `fun`.

**CLI Example:**

```bash
salt '*' napalm.netmiko_fun send_command 'show version'
```

napalm.netmiko_multi_call(*`methods`, **`kwargs`)

New in version 2019.2.0.

Execute a list of arbitrary Netmiko methods, passing the authentication details from the existing NAPALM connection.

**methods**  List of dictionaries with the following keys:

- **name**: the name of the Netmiko function to invoke.
- **args**: list of arguments to send to the `name` method.
- **kwargs**: key-value arguments to send to the `name` method.

**CLI Example:**

```bash
salt '*' napalm.netmiko_multi_call "{ 'name': 'send_command', 'args': ['show version'] }" "{ 'name': 'send_command', 'args': ['show interfaces'] }"
```

napalm.nxos_api_config(`commands=None`, `config_file=None`, `template_engine='jinja'`, `context=None`, `defaults=None`, `saltenv='base'`, **`kwargs`)

New in version 2019.2.0.

Configures the Nexus switch with the specified commands, via the NX-API.

**commands**  The list of configuration commands to load on the Nexus switch.

**Note:** This argument is ignored when `config_file` is specified.

The file can also be a template that can be rendered using the template engine of choice. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`
- `https://`
- `ftp://`
- `s3://`
- `swift://`

**template_engine**: `jinja`  The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file without attempting to render, set this argument to `None`.

**context**: `None`  Variables to add to the template context.

**defaults**: `None`  Default values of the `context` dict.

**saltenv**: `base`  Salt fileserver environment from which to retrieve the file. Ignored if `config_file` is not a `salt://` URL.

**CLI Example:**

```bash
salt '*' napalm.nxos_api_config 'spanning-tree mode mstp'
salt '*' napalm.nxos_api_config config_file=https://bit.ly/2LGLcDy context="{ 'servers': ['1.2.3.4'] }"
```

napalm.nxos_api_rpc(`commands`, `method='cli'`, **`kwargs`)

New in version 2019.2.0.
Execute an arbitrary RPC request via the Nexus API.

commands The RPC commands to be executed.

method: cli The type of the response, i.e., raw text (cli_ascii) or structured document (cli). Defaults to cli (structured data).

CLI Example:

```
salt '*' napalm.nxos_api_rpc 'show version'
```

```
salt.modules.napalm_mod.nxos_api_show(commands, raw_text=True, **kwargs)
```

New in version 2019.2.0.

Execute one or more show (non-configuration) commands.

commands The commands to be executed.

raw_text: True Whether to return raw text or structured data.

CLI Example:

```
salt '*' napalm.nxos_api_show 'show version'
salt '*' napalm.nxos_api_show 'show bgp sessions' 'show processes' raw_text=False
```

```
salt.modules.napalm_mod.pyeapi_call(method, *args, **kwargs)
```

New in version 2019.2.0.

Invoke an arbitrary method from the pyeapi library. This function forwards the existing connection details to the pyeapi.run_commands execution function.

method The name of the pyeapi method to invoke.

kwargs Key-value arguments to send to the pyeapi method.

CLI Example:

```
salt '*' napalm.pyeapi_call run_commands 'show version' encoding=text
salt '*' napalm.pyeapi_call get_config as_string=True
```

```
salt.modules.napalm_mod.pyeapi_config(commands=None, config_file=None, template_engine='jinja', context=None, defaults=None, saltenv='base', **kwargs)
```

New in version 2019.2.0.

Configures the Arista switch with the specified commands, via the pyeapi library. This function forwards the existing connection details to the pyeapi.run_commands execution function.

commands The list of configuration commands to load on the Arista switch.

Note: This argument is ignored when config_file is specified.

config_file The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- salt://
- https://
- ftp://
- s3://
- swift://

template_engine: jinja The template engine to use when rendering the source file. Default: jinja. To simply fetch the file without attempting to render, set this argument to None.

context: None Variables to add to the template context.

defaults: None Default values of the context dict.

saltenv: base Salt fileserver environment from which to retrieve the file. Ignored if config_file is not a salt:// URL.
salt modules.napalm_mod.pyeapi_conn(**kwargs)
New in version 2019.2.0.

Return the connection object with the Arista switch, over pyeapi, passing the authentication details from the existing NAPALM connection.

**Warning:** This function is not suitable for CLI usage, more rather to be used in various Salt modules, to reusing the established connection, as in opposite to opening a new connection for each task.

Usage example:

```python
conn = __salt__['napalm.pyeapi_conn']()
res1 = conn.run_commands('show version')
res2 = conn.get_config(as_string=True)
```

salt.modules.napalm_mod.pyeapi_nxos_api_args(**prev_kwargs)
New in version 2019.2.0.

Return the key-value arguments used for the authentication arguments for the pyeapi execution module.

CLI Example:

```python
salt '*' napalm.pyeapi_nxos_api_args
```

salt.modules.napalm_mod.pyeapi_run_commands(*commands, **kwargs)
Execute a list of commands on the Arista switch, via the pyeapi library. This function forwards the existing connection details to the pyeapi.run_commands execution function.

- **commands**: A list of commands to execute.
- **encoding**: `json` The requested encoding of the command output. Valid values for encoding are `json` (default) or `text`.

CLI Example:

```python
salt '*' napalm.pyeapi_run_commands 'show version' encoding=text
salt '*' napalm.pyeapi_run_commands 'show ip bgp neighbors'
```

salt.modules.napalm_mod.reconnect(force=False, **kwargs)
Reconnect the NAPALM proxy when the connection is dropped by the network device. The connection can be forced to be restarted using the `force` argument.

**Note:** This function can be used only when running proxy minions.

CLI Example:

```python
salt '*' napalm.reconnect
salt '*' napalm.reconnect force=True
```

salt.modules.napalm_mod.rpc(command, **kwargs)
New in version 2019.2.0.

This is a wrapper to execute RPC requests on various network operating systems supported by NAPALM, invoking the following functions for the NAPALM native drivers:
• `napalm.junos_rpc` for `junos`
• `napalm.pyeapi_run_commands` for `eos`
• `napalm.nxos_api_rpc` for `nxos`
• `napalm.netmiko_commands` for `ios`, `iosxr`, and `nxos_ssh`

**command**  The RPC command to execute. This depends on the nature of the operating system.

**kwargs**  Key-value arguments to be sent to the underlying Execution function.

The function capabilities are extensible in the user environment via the `napalm_rpc_map` configuration option / Pillar, e.g.,

```yaml
napalm_rpc_map:
  f5: napalm.netmiko_commands
  panos: panos.call
```

The mapping above reads: when the NAPALM os Grain is `f5`, then call `napalm.netmiko_commands` for RPC requests.

By default, if the user does not specify any map, non-native NAPALM drivers will invoke the `napalm.netmiko_commands` Execution function.

**CLI Example:**

```bash
salt '*' napalm.rpc 'show version'
salt '*' napalm.rpc get-interfaces
```

salt.modules.napalm_mod.scp_get(
`remote_path`, `local_path``="`, `recursive=False`, `pre-
serve_times=False`, `**kwargs``)
```

New in version 2019.2.0.

Transfer files and directories from remote network device to the localhost of the Minion.

**Note:** This function is only available only when the underlying library `scp` is installed. See `scp module` for more details.

**remote_path**  Path to retrieve from remote host. Since this is evaluated by `scp` on the remote host, shell wildcards and environment variables may be used.

**recursive:** `False`  Transfer files and directories recursively.

**preserve_times:** `False`  Preserve `mtime` and `atime` of transferred files and directories.

**passphrase**  Used for decrypting private keys.

**pkey**  An optional private key to use for authentication.

**key_filename**  The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.

**timeout**  An optional timeout (in seconds) for the TCP connect.

**socket_timeout:** 10  The channel socket timeout in seconds.

**buff_size:** 16384  The size of the SCP send buffer.

**allow_agent:** `True`  Set to `False` to disable connecting to the SSH agent.

**look_for_keys:** `True`  Set to `False` to disable searching for discoverable private key files in `~/.ssh/`

**banner_timeout**  An optional timeout (in seconds) to wait for the SSH banner to be presented.

**auth_timeout**  An optional timeout (in seconds) to wait for an authentication response.

**auto_add_policy:** `False`  Automatically add the host to the `known_hosts`.

**CLI Example:**

```bash
salt '*' napalm.scp_get /var/tmp/file /tmp/file auto_add_policy=True
```
salt.modules.napalm_mod.scp_put(files, remote_path=None, recursive=False, preserve_times=False, saltenv='base', **kwargs)

New in version 2019.2.0.

Transfer files and directories to remote network device.

**Note:** This function is only available only when the underlying library `scp` is installed. See `scp module` for more details.

- **files** A single path or a list of paths to be transferred.
- **remote_path** The path on the remote device where to store the files.
- **recursive** (Default: True) Transfer files and directories recursively.
- **preserve_times** (Default: False) Preserve mtime and atime of transferred files and directories.
- **saltenv** (Default: `base`) The name of the Salt environment. Ignored when `files` is not a `salt:// URL`.
- **hostname** The hostname of the remote device.
- **port** (Default: 22) The port of the remote device.
- **username** The username required for SSH authentication on the device.
- **password** Used for password authentication. It is also used for private key decryption if `passphrase` is not given.
- **passphrase** Used for decrypting private keys.
- **pkey** An optional private key to use for authentication.
- **key_filename** The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.
- **timeout** An optional timeout (in seconds) for the TCP connect.
- **socket_timeout** (Default: 10) The channel socket timeout in seconds.
- **buff_size** (Default: `16384`) The size of the SCP send buffer.
- **allow_agent** (Default: True) Set to False to disable connecting to the SSH agent.
- **look_for_keys** (Default: True) Set to False to disable searching for discoverable private key files in `~/.ssh/`.
- **banner_timeout** An optional timeout (in seconds) to wait for the SSH banner to be presented.
- **auth_timeout** An optional timeout (in seconds) to wait for an authentication response.
- **auto_add_policy** (Default: False) Automatically add the host to the `known_hosts`.

CLI Example:
```
salt '*' napalm.scp_put /path/to/file /var/tmp/file auto_add_policy=True
```

**23.9.288 salt.modules.napalm_netaccl**

**NAPALM ACL**

Generate and load ACL (firewall) configuration on network devices.

New in version 2017.7.0.

**codeauthor** Mircea Ulinic <ping@mirceaulinic.net>

**maturity** new

**depends** capirca, napalm

**platform** unix
Dependencies

The firewall configuration is generated by Capirca.

To install Capirca, execute: `pip install capirca`.

To be able to load configuration on network devices, it requires NAPALM library to be installed: `pip install napalm`. Please check Installation for complete details.

```python
salt.modules.napalm_netacl.get_filter_pillar(filter_name, pillar_key='acl', pillarenv=None, saltenv=None)
```

Helper that can be used inside a state SLS, in order to get the filter configuration given its name.

- `filter_name`: The name of the filter.
- `pillar_key`: The root key of the whole policy config.
- `pillarenv`: Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
- `saltenv`: Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

```python
salt.modules.napalm_netacl.get_term_pillar(filter_name, term_name, pillar_key='acl', pillarenv=None, saltenv=None)
```

Helper that can be used inside a state SLS, in order to get the term configuration given its name, under a certain filter uniquely identified by its name.

- `filter_name`: The name of the filter.
- `term_name`: The name of the term.
- `pillar_key`: acl The root key of the whole policy config. Default: acl.
- `pillarenv`: Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
- `saltenv`: Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

```python
salt.modules.napalm_netacl.load_filter_config(filter_name, filter_options=None, terms=None, prepend=True, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=True, only_lower_merge=False, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d', test=False, commit=True, debug=False, **kwargs)
```

Generate and load the configuration of a policy filter.

**Note:** The order of the terms is very important. The configuration loaded on the device respects the order defined in the terms and/or inside the pillar.

When merging the terms with the pillar data, consider the prepend argument to make sure the order is correct!

- `filter_name`: The name of the policy filter.
- `filter_options`: Additional filter options. These options are platform-specific. See the complete list of options.
- `terms`: List of terms for this policy filter. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as False.
- `prepend`: True When `merge_pillar` is set as True, the final list of terms generated by merging the terms from terms with those defined in the pillar (if any): new terms are prepended at the beginning, while existing ones will preserve the position. To add the new terms at the end of the list, set this argument to False.
- `pillar_key`: acl The key in the pillar containing the default attributes values. Default: acl.
pillarenv  Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
saltenv  Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.
merge_pillar: True  Merge the CLI variables with the pillar. Default: True.

The merge logic depends on the prepend argument and the CLI has higher priority than the pillar.
only_lower_merge: False  Specify if it should merge only the terms fields. Otherwise it will try to merge also filters fields. Default: False. This option requires merge_pillar, otherwise it is ignored.
revision_id  Add a comment in the filter config having the description for the changes applied.
revision_no  The revision count.
revision_date: True  Boolean flag: display the date when the filter configuration was generated. Default: True.
revision_date_format: %Y/%m/%d  The date format to be used when generating the perforce data. Default: %Y/%m/%d (<year>/<month>/<day>).
test: False  Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.
debug: False  Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw configuration loaded on the device.

The output is a dictionary having the same form as net.load_config.

CLI Example:

```
salt 'edge01.bjm01' netacl.load_filter_config my-filter pillar_key=netacl
   ^debug=True
```

Output Example:

```
edge01.bjm01:
   ---------
   already_configured: False
   comment:
   diff:
      [edit firewall]
      +  family inet {
      +    /*
      +    ** $Date: 2017/03/22 $
      +    **
      +    */
      +    filter my-filter {
      +      interface-specific;
      +      term my-term {
      +        from {
      +          source-port [ 1234 1235 ];
      +        }
      +        then { reject;
      +          }
      +      }
      +      term my-other-term {
      +        from {
      +          protocol tcp;
      +          source-port 5678-5680;
      +        }
      +        then accept;
      +      }
```

(continues on next page)
loaded_config:
  firewall {
    family inet {
      replace: /*
      ** $Date: 2017/03/22 $ **
      */
      filter my-filter {
        interface-specific;
        term my-term {
          from {
            source-port [ 1234 1235 ];
          }
          then {
            reject;
          }
        }
        term my-other-term {
          from {
            protocol tcp;
            source-port 5678-5680;
          }
          then accept;
        }
      }
    }
  }
result: True

The filter configuration has been loaded from the pillar, having the following structure:

```
netacl:
  - my-filter:
    terms:
      - my-term:
        source_port:
          - 1234
          - 1235
        action: reject
      - my-other-term:
        source_port:
          - - 5678
          - 5680
        protocol: tcp
        action: accept
```
salt.modules.napalm_netacl.load_policy_config(filters=None, prepend=True, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=True, only_lower_merge=False, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d', test=False, commit=True, debug=False, **kwargs)

Generate and load the configuration of the whole policy.

Note: The order of the filters and their terms is very important. The configuration loaded on the device respects the order defined in the filters and/or inside the pillar.

When merging the filters with the pillar data, consider the prepend argument to make sure the order is correct!

filters List of filters for this policy. If not specified or empty, will try to load the configuration from the pillar, unless merge_pillar is set as False.
prepend: True When merge_pillar is set as True, the final list of filters generated by merging the filters from filters with those defined in the pillar (if any): new filters are prepended at the beginning, while existing ones will preserve the position. To add the new filters at the end of the list, set this argument to False.
pillar_key: acl The key in the pillar containing the default attributes values. Default: acl.
pillarenv Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
saltenv Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.
merge_pillar: True Merge the CLI variables with the pillar. Default: True.

The merge logic depends on the prepend argument and the CLI has higher priority than the pillar.
only_lower_merge: False Specify if it should merge only the filters and terms fields. Otherwise it will try to merge everything at the policy level. Default: False. This option requires merge_pillar, otherwise it is ignored.
revision_id Add a comment in the policy config having the description for the changes applied.
revision_no The revision count.
revision_date: True Boolean flag: display the date when the policy configuration was generated. Default: True.
revision_date_format: %Y/%m/%d The date format to be used when generating the perforce data. Default: %Y/%m/%d (<year>/<month>/<day>).
test: False Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.
debug: False Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw configuration loaded on the device.

The output is a dictionary having the same form as net.load_config.

CLI Example:

```bash
salt 'edge01.flw01' netacl.load_policy_config debug=True
```

Output Example:

```
edge01.flw01:
    --------
    already_configured:
```

(continues on next page)
False

result:
True

The policy configuration has been loaded from the pillar, having the following structure:

```
ac:
  - my-filter:
    terms:
      - my-term:
        source_port:
          - 1234
          - 1235
        protocol:
          - tcp
          - udp
        source_address: 1.2.3.4
        action: reject
      - my-other-term:
```

(continues on next page)
source_port:  
- [5678, 5680]  
protocol: tcp  
action: accept  
- block-icmp:  
terms:  
- first-term:  
protocol:  
- icmp  
action: reject

salt.modules.napalm_netacl.load_term_config(filter_name, term_name, filter_options=None, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=True, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d', test=False, commit=True, debug=False, source_service=None, destination_service=None, **term_fields)

Generate and load the configuration of a policy term.

filter_name The name of the policy filter.
term_name The name of the term.
filter_options Additional filter options. These options are platform-specific. See the complete list of options.
pillar_key: acl The key in the pillar containing the default attributes values. Default: acl. If the pillar contains the following structure:

```
firewall:  
- my-filter:  
terms:  
  - my-term:  
    source_port: 1234  
    source_address:  
    - 1.2.3.4/32  
    - 5.6.7.8/32
```

The pillar_key field would be specified as firewall.
pillarenv Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
saltenv Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.
merge_pillar: True Merge the CLI variables with the pillar. Default: True.
revision_id Add a comment in the term config having the description for the changes applied.
revision_no The revision count.
revision_date: True Boolean flag: display the date when the term configuration was generated. Default: True.
revision_date_format: %Y/%m/%d The date format to be used when generating the perforce data. Default: %Y/%m/%d (<year>/<month>/<day>).
test: False Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.
debug: False Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw configuration loaded on the device.
source_service A special service to choose from. This is a helper so the user is able to select a source just
using the name, instead of specifying a source_port and protocol.

As this module is available on Unix platforms only, it reads the IANA port assignment from /etc/services.

If the user requires additional shortcuts to be referenced, they can add entries under /etc/services, which can be managed using the `file state`.

**destination_service** A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a destination_port and protocol. Allows the same options as `source_service`.

**term_fields** Term attributes. To see what fields are supported, please consult the list of supported keywords. Some platforms have a few other optional keywords.

---

**Note:** The following fields are accepted (some being platform-specific):

- action
- address
- address_exclude
- comment
- counter
- expiration
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging
- log_name
- loss_priority
- option
- policer
- port
- precedence
- principals
- protocol
- protocol_except
- qos
- pan_application
- routing_instance
- source_address
- source_address_exclude
- source_port
- source_prefix
- verbatim
- packet_length
- fragment_offset
- hop_limit
- icmp_type
- ether_type
- traffic_class_count
- traffic_type
- translated
- dscp_set
- dscp_match
- dscp_except
- next_ip
• flexible_match_range
• source_prefix_except
• destination_prefix_except
• vpn
• source_tag
• destination_tag
• source_interface
• destination_interface
• flattened
• flattened_addr
• flattened_saddr
• flattened_daddr
• priority

Note: The following fields can be also a single value and a list of values:
• action
• address
• address_exclude
• comment
• destination_address
• destination_address_exclude
• destination_port
• destination_prefix
• forwarding_class
• forwarding_class_except
• logging
• option
• port
• precedence
• principals
• protocol
• protocol_except
• pan_application
• source_address
• source_address_exclude
• source_port
• source_prefix
• verbatim
• icmp_type
• ether_type
• traffic_type
• dscp_match
• dscp_except
• flexible_match_range
• source_prefix_except
• destination_prefix_except
• source_tag
• destination_tag
• source_service
• destination_service

Example: destination_address can be either defined as:
**destination_address**: 172.17.17.1/24

or as a list of destination IP addresses:

```
**destination_address**:  
- 172.17.17.1/24  
- 172.17.19.1/24
```

or a list of services to be matched:

```
**source_service**:  
- ntp  
- snmp  
- ldap  
- bgpd
```

**Note**: The port fields `source_port` and `destination_port` can be used as above to select either a single value, either a list of values, but also they can select port ranges. Example:

```
**source_port**:  
- - 1000  
- 2000  
- - 3000  
- 4000
```

With the configuration above, the user is able to select the 1000-2000 and 3000-4000 source port ranges.

The output is a dictionary having the same form as `net.load_config`.

**CLI Example**:

```
salt 'edge01.bjm01' netacl.load_term_config filter-name term-name source_address=1.2.3.4 destination_address=5.6.7.8 action=accept test=True debug=True
```

**Output Example**:

```
edge01.bjm01:      
-----------------  
already_configured: False  
comment:           
  Configuration discarded.  
diff:               
  [edit firewall]  
  + family inet {  
  +    /*  
  +      $Date: 2017/03/22$  
  +    */  
  +      filter filter-name {  
  +        interface-specific;  
  +        term term-name {  
  +          from {  
  +            source-address {
```

(continues on next page)
```
+ 1.2.3.4/32;
+
+ destination-address {
+ 5.6.7.8/32;
+ }
+ then accept;
+
}
}
loaded_config:
firewall {
  family inet {
    replace:
    /*
    ** $Date: 2017/03/22 $
    **
    */
    filter filter-name {
      interface-specific;
      term term-name {
        from {
          source-address {
            1.2.3.4/32;
          }
          destination-address {
            5.6.7.8/32;
          }
        }
        then accept;
      }
    }
  }
}
result:
 True
```

23.9.289 salt.modules.napalm_network

NAPALM Network

Basic methods for interaction with the network device through the virtual proxy 'napalm'.

codeauthor Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>
maturity new
depends napalm
platform unix

23.9. execution modules
Dependencies

- `napalm proxy minion`

New in version 2016.11.0.

Changed in version 2017.7.0.

**salt.modules.napalm_network.arp**

(`interface='', ipaddr='', macaddr='', **kwargs)`

NAPALM returns a list of dictionaries with details of the ARP entries.

- `interface` -- interface name to filter on
- `ipaddr` -- IP address to filter on
- `macaddr` -- MAC address to filter on

**Returns** List of the entries in the ARP table

**CLI Example:**

```
salt '*' net.arp
salt '*' net.arp macaddr='5c:5e:ab:da:3c:f0'
```

**Example output:**

```
[
  {
    'interface': 'MgmtEth0/RSP0/CPU0/0',
    'mac': '5c:5e:ab:da:3c:f0',
    'ip': '172.17.17.1',
    'age': 1454496274.84
  },
  {
    'interface': 'MgmtEth0/RSP0/CPU0/0',
    'mac': '66:0e:94:96:e0:ff',
    'ip': '172.17.17.2',
    'age': 1435641582.49
  }
]
```

**salt.modules.napalm_network.blockreplace**

(`marker_start, marker_end, content='', append_if_not_found=False, prepend_if_not_found=False, show_changes=True, append_newline=False, source='running', path=None, test=False, commit=True, debug=False, replace=True)`

New in version 2019.2.0.

Replace content of the configuration source, delimited by the line markers.

A block of content delimited by comments can help you manage several lines without worrying about old entries removal.

- `marker_start` The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output.
- `marker_end` The line content identifying a line as the end of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output.
- `content` The content to be used between the two lines identified by `marker_start` and `marker_stop`.

---

2334 Chapter 23. Salt Module Reference
append_if_not_found: False  If markers are not found and set to True then, the markers and content will be appended to the file.
prepend_if_not_found: False  If markers are not found and set to True then, the markers and content will be prepended to the file.
append_newline: False  Controls whether or not a newline is appended to the content block. If the value of this argument is True then a newline will be added to the content block. If it is False, then a newline will not be added to the content block. If it is None then a newline will only be added to the content block if it does not already end in a newline.
show_changes: True  Controls how changes are presented. If True, this function will return the of the changes made. If False, then it will return a boolean (True if any changes were made, otherwise False).
path: None  Save the temporary configuration to a specific path, then read from there. This argument is optional, can be used when you prefers a particular location of the temporary file.
test: False  Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.
commit: True  Commit the configuration changes? Default: True.
debug: False  Debug mode. Will insert a new key in the output dictionary, as loaded_config containing the raw configuration loaded on the device.
replace: True  Load and replace the configuration. Default: True.

CLI Example:

```
salt '*' net.blockreplace 'ntp' 'interface' ''
```

salt.modules.napalm_network.cancel_commit(jid)
New in version 2019.2.0.
Cancel a commit scheduled to be executed via the commit_in and commit_at arguments from the net.
load_template or net.load_config execution functions. The commit ID is displayed when the commit is scheduled via the functions named above.

CLI Example:

```
salt '*' net.cancel_commit 20180726083540640360
```

salt.modules.napalm_network.cli(*commands, **kwargs)
Returns a dictionary with the raw output of all commands passed as arguments.

commands List of commands to be executed on the device.
textfsm_parse: False  Try parsing the outputs using the TextFSM templates.

New in version 2018.3.0.

Note:  This option can be also specified in the minion configuration file or pillar as napalm_cli_textfsm_parse.

`textfsm_path` The path where the TextFSM templates can be found. This option implies the usage of the TextFSM index file. `textfsm_path` can be either absolute path on the server, either specified using the following URL mschemes: file://, salt://, http://, https://, ftp://, s3://, swift://.

New in version 2018.3.0.

Note:  This needs to be a directory with a flat structure, having an index file (whose name can be specified using the `index_file` option) and a number of TextFSM templates.
textfsm_template The path to a certain the TextFSM template. This can be specified using the absolute path to the file, or using one of the following URL schemes:
- `salt://`, to fetch the template from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`
New in version 2018.3.0.

**textfsm_template_dict** A dictionary with the mapping between a command and the corresponding TextFSM path to use to extract the data. The TextFSM paths can be specified as in `textfsm_template`.
New in version 2018.3.0.

```
Note: This option can be also specified in the minion configuration file or pillar as napalm_cli_textfsm_template_dict.
```

platform_grain_name: os The name of the grain used to identify the platform name in the TextFSM index file. Default: `os`.
New in version 2018.3.0.

```
Note: This option can be also specified in the minion configuration file or pillar as textfsm_platform_grain.
```

platform_column_name: Platform The column name used to identify the platform, exactly as specified in the TextFSM index file. Default: `Platform`.
New in version 2018.3.0.

```
Note: This is field is case sensitive, make sure to assign the correct value to this option, exactly as defined in the index file.
```

```
Note: This option can be also specified in the minion configuration file or pillar as textfsm_platform_column_name.
```

index_file: index The name of the TextFSM index file, under the `textfsm_path`. Default: `index`.
New in version 2018.3.0.

```
Note: This option can be also specified in the minion configuration file or pillar as textfsm_index_file.
```

saltenv: base Salt fileserver environment from which to retrieve the file. Ignored if `textfsm_path` is not a `salt://` URL.
New in version 2018.3.0.

include_empty: False Include empty files under the `textfsm_path`.
New in version 2018.3.0.
**include_pat**  Glob or regex to narrow down the files cached from the given path. If matching with a regex, the regex must be prefixed with E@, otherwise the expression will be interpreted as a glob.

New in version 2018.3.0.

**exclude_pat**  Glob or regex to exclude certain files from being cached from the given path. If matching with a regex, the regex must be prefixed with E@, otherwise the expression will be interpreted as a glob.

New in version 2018.3.0.

**Note:** If used with include_pat, files matching this pattern will be excluded from the subset of files defined by include_pat.

CLI Example:

```
salt '*' net.cli "show version" "show chassis fan"
```

CLI Example with TextFSM template:

```
salt '*' net.cli textfsm_parse=True textfsm_path=salt://textfsm/
```

Example output:

```json
{
    "show version and haiku": "Hostname: re0.edge01.arn01
        Model: mx480
        Junos: 13.3R6.5
        Help me, Obi-Wan
        I just saw Episode Two
        You're my only hope",
    "show chassis fan": [
        { "Item": "Top Rear Fan", "Status": "OK", "RPM": 3840, "Measurement": "Spinning" }
        { "Item": "Bottom Rear Fan", "Status": "OK", "RPM": 3840, "Measurement": "Spinning" }
        { "Item": "Top Middle Fan", "Status": "OK", "RPM": 3900, "Measurement": "Spinning" }
        { "Item": "Bottom Middle Fan", "Status": "OK", "RPM": 3840, "Measurement": "Spinning" }
        { "Item": "Top Front Fan", "Status": "OK", "RPM": 3810, "Measurement": "Spinning" }
        { "Item": "Bottom Front Fan", "Status": "OK", "RPM": 3840, "Measurement": "Spinning" }
    ]
}
```

Example output with TextFSM parsing:

```json
{
    "comment": "",
    "result": true,
    "out": {
        "sh ver": [
            { "kernel": "9.1S3.5",
              "documentation": "9.1S3.5",
              "boot": "9.1S3.5",
        
(continues on next page)
```
"crypto": "9.1S3.5",
"chassis": "",
"routing": "9.1S3.5",
"base": "9.1S3.5",
"model": "mx960"
}
]
}
]

salt.modules.napalm_network.commit(inherit_napalm_device=None, **kwargs)
Commits the configuration changes made on the network device.

CLI Example:

salt '*' net.commit

salt.modules.napalm_network.compare_config(inherit_napalm_device=None, **kwargs)
Returns the difference between the running config and the candidate config.

CLI Example:

salt '*' net.compare_config

salt.modules.napalm_network.config(source=None, **kwargs)
New in version 2017.7.0.
Return the whole configuration of the network device. By default, it will return all possible configuration sources supported by the network device. At most, there will be:

• running config
• startup config
• candidate config

To return only one of the configurations, you can use the source argument.

source Which configuration type you want to display, default is all of them.

Options:
• running
• candidate
• startup

Returns
The object returned is a dictionary with the following keys:

• running (string): Representation of the native running configuration.

• candidate (string): Representation of the native candidate configuration. If the device doesn't differentiate between running and startup configuration this will an empty string.

• startup (string): Representation of the native startup configuration. If the device doesn't differentiate between running and startup configuration this will an empty string.

CLI Example:

salt '*' net.config
salt '*' net.config source=candidate
salt.modules.napalm_network.config_changed(`inherit_napalm_device=None, `**kwargs)
Will prompt if the configuration has been changed.

**Returns** A tuple with a boolean that specifies if the config was changed on the device. And a string that provides more details of the reason why the configuration was not changed.

CLI Example:
```
salt '*i net.config_changed
```

salt.modules.napalm_network.config_control(`inherit_napalm_device=None, `**kwargs)
Will check if the configuration was changed. If differences found, will try to commit. In case commit unsuccessful, will try to rollback.

**Returns** A tuple with a boolean that specifies if the config was changed/committed/rollbacked on the device. And a string that provides more details of the reason why the configuration was not committed properly.

CLI Example:
```
salt '*i net.config_control
```

salt.modules.napalm_network.confirm_commit(`jid`
New in version 2019.2.0.

Confirm a commit scheduled to be reverted via the revert_in and revert_at arguments from the net.load_template or net.load_config execution functions. The commit ID is displayed when the commit confirmed is scheduled via the functions named above.

CLI Example:
```
salt '*i net.confirm_commit 20180726083540640360
```

salt.modules.napalm_network.connected(`**kwargs`
Specifies if the connection to the device succeeded.

CLI Example:
```
salt '*i net.connected
```

salt.modules.napalm_network.discard_config(`inherit_napalm_device=None, `**kwargs)
Discards the changes applied.

CLI Example:
```
salt '*i net.discard_config
```

salt.modules.napalm_network.environment(`**kwargs`
Returns the environment of the device.

CLI Example:
```
salt '*i net.environment
```

Example output:
```
{
  'fans': {
    'Bottom Rear Fan': {
      'status': True
    },
    'Bottom Middle Fan': {
```

{'status': True},
'Top Middle Fan': {
    'status': True
},
'Bottom Front Fan': {
    'status': True
},
'Top Front Fan': {
    'status': True
},
'Top Rear Fan': {
    'status': True
}
},
'memory': {
    'available_ram': 16349,
    'used_ram': 4934
},
'temperature': {
    'FPC 0 Exhaust A': {
        'is_alert': False,
        'temperature': 35.0,
        'is_critical': False
    }
},
'cpu': {
    '1': {
        '%usage': 19.0
    },
    '0': {
        '%usage': 35.0
    }
}
}
salt.modules.napalm_network.facts(**kwargs)
Returns characteristics of the network device. :return: a dictionary with the following keys:
- uptime - Uptime of the device in seconds.
- vendor - Manufacturer of the device.
- model - Device model.
- hostname - Hostname of the device
- fqdn - Fqdn of the device
- os_version - String with the OS version running on the device.
- serial_number - Serial number of the device
- interface_list - List of the interfaces of the device

CLI Example:
salt '*' net.facts

Example output:
{
    'os_version': '13.3R6.5',
    'uptime': 10117140,
    'interface_list': [

salt.modules.napalm_network.interfaces(**kwargs)

Returns details of the interfaces on the device.

Returns a dictionary of dictionaries. The keys for the first dictionary will be the interfaces in the devices.

CLI Example:

```
salt '*' net.interfaces
```

Example output:

```
{
    'Management1': {
        'is_up': False,
        'is_enabled': False,
        'description': '',
        'last_flapped': -1,
        'speed': 1000,
        'mac_address': 'dead:beef:dead',
    },
    'Ethernet1': {
        'is_up': True,
        'is_enabled': True,
        'description': 'foo',
        'last_flapped': 1429978575.1554043,
        'speed': 1000,
        'mac_address': 'beef:dead:beef',
    }
}
```

salt.modules.napalm_network.ipaddrs(**kwargs)

Returns IP addresses configured on the device.

Returns a dictionary with the IPv4 and IPv6 addresses of the interfaces. Returns all configured IP addresses on all interfaces as a dictionary of dictionaries. Keys of the main dictionary represent the name of the interface. Values of the main dictionary represent are dictionaries that may consist of two keys 'ipv4' and 'ipv6' (one, both or none) which are themselves dictionaries with the IP addresses as keys.

CLI Example:
salt 'salt '*' net.ipaddrs

Example output:

```
{
    'FastEthernet8': {
        'ipv4': {
            '10.66.43.169': {
                'prefix_length': 22
            }
        },
    },
    'Loopback555': {
        'ipv4': {
            '192.168.1.1': {
                'prefix_length': 24
            }
        },
        'ipv6': {
            '1::1': {
                'prefix_length': 64
            },
            '2001:DB8:1::1': {
                'prefix_length': 64
            },
            'FE80::3': {
                'prefix_length': 'N/A'
            }
        }
    }
}
```

```
salt.modules.napalm_network.lldp(interface='', **kwargs)

Returns a detailed view of the LLDP neighbors.

Parameters

- **interface** -- interface name to filter on

Returns

A dictionary with the LLDPL neighbors. The keys are the interfaces with LLDP activated on.

CLI Example:

```
salt '* net.lldp
salt '* net.lldp interface='TenGigE0/0/0/8'
```

Example output:

```
{
    'TenGigE0/0/0/8': [
        {
            'parent_interface': 'Bundle-Ether8',
            'interface_description': 'TenGigE0/0/0/8',
            'remote_chassis_id': '8c60.4f69.e96c',
            'remote_system_name': 'switch',
            'remote_port': 'Eth2/2/1',
            'remote_port_description': 'Ethernet2/2/1',
            'remote_system_description': 'Cisco Nexus Operating System (NX-OS)®

→Software 7.1(0)N1(1a)

→TAC support: http://www.cisco.com/tac

Copyright (c) 2002-2015, Cisco Systems, Inc. All rights reserved.
```

(continues on next page)
Applies configuration changes on the device. It can be loaded from a file or from inline string. If you send both a filename and a string containing the configuration, the file has higher precedence.

By default this function will commit the changes. If there are no changes, it does not commit and the flag `already_configured` will be set as `True` to point this out.

To avoid committing the configuration, set the argument `test` to `True` and will discard (dry run).

To keep the changes but not commit, set `commit` to `False`.

To replace the config, set `replace` to `True`.

**filename** Path to the file containing the desired configuration. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the template from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

Changed in version 2018.3.0.

**text** String containing the desired configuration. This argument is ignored when `filename` is specified.

**test**: `False` Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit**: `True` Commit? Default: `True`.

**debug**: `False` Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

New in version 2016.11.2.

**replace**: `False` Load and replace the configuration. Default: `False`.

New in version 2016.11.2.

**commit_in**: `None` Commit the changes in a specific number of minutes / hours. Example of accepted formats: 5 (commit in 5 minutes), 2m (commit in 2 minutes), 1h (commit the changes in 1 hour), 5h30m (commit the changes in 5 hours and 30 minutes).

**Note**: This feature works on any platforms, as it does not rely on the native features of the network operating system.

**Note**: After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the `net.cancel_commit` execution function, using the commit ID returned by this function.
Warning: Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

**commit_at:** None  Commit the changes at a specific time. Example of accepted formats: 1am (will commit the changes at the next 1AM), 13:20 (will commit at 13:20), 1:20am, etc.

**Note:** This feature works on any platforms, as it does not rely on the native features of the network operating system.

**Note:** After the command is executed and the diff is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the `net.cancel_commit` execution function, using the commit ID returned by this function.

Warning: Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

**revert_in:** None  Commit and revert the changes in a specific number of minutes/hours. Example of accepted formats: 5 (revert in 5 minutes), 2m (revert in 2 minutes), 1h (revert the changes in 1 hour), 5h30m (revert the changes in 5 hours and 30 minutes).

**Note:** To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

Warning: This works on any platform, regardless if they have or don't have native capabilities to confirming a commit. However, please be very cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don't have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

**revert_at:** None  Commit and revert the changes at a specific time. Example of accepted formats: 1am (will commit and revert the changes at the next 1AM), 13:20 (will commit and revert at 13:20), 1:20am, etc.

**Note:** To confirm the commit, and prevent reverting the changes, you will have to execute the `net.
confirm_commit function, using the commit ID returned by this function.

Warning: This works on any platform, regardless if they have or don’t have native capabilities to confirming a commit. However, please be very cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don’t have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

saltenv: base Specifies the Salt environment name.

New in version 2018.3.0.

Returns a dictionary having the following keys:

- result (bool): if the config was applied successfully. It is False only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still True and so will be the already_configured flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- loaded_config (str): the configuration loaded on the device. Requires debug to be set as True
- diff (str): returns the config changes applied

CLI Example:

```
salt 'localhost' net.load_config text='ntp peer 192.168.0.1'
salt 'localhost' net.load_config filename='/absolute/path/to/your/file'
salt 'localhost' net.load_config filename='/absolute/path/to/your/file' test=True
```

Example output:

```
{
    'comment': 'Configuration discarded.',
    'already_configured': False,
    'result': True,
    'diff': '[edit interfaces xe-0/0/5]+ description "Adding a description";
}
```

salt.modules.napalm_network.load_template(template_name=None, template_source=None, context=None, defaults=None, template_engine='jinja', saltenv='base', template_hash=None, template_hash_name=None, skip_verify=False, test=False, commit=True, debug=False, replace=False, commit_in=None, commit_at=None, revert_in=None, revert_at=None, inherit_napalm_device=None, **template_vars)

Renders a configuration template (default: Jinja) and loads the result on the device.
By default this function will commit the changes. If there are no changes, it does not commit, discards he config and the flag `already_configured` will be set as `True` to point this out.

To avoid committing the configuration, set the argument `test` to `True` and will discard (dry run).

To preserve the changes, set `commit` to `False`. However, this is recommended to be used only in exceptional cases when there are applied few consecutive states and/or configuration changes. Otherwise the user might forget that the config DB is locked and the candidate config buffer is not cleared/merged in the running config.

To replace the config, set `replace` to `True`.

**template_name** Identifies path to the template source. The template can be either stored on the local machine, either remotely. The recommended location is under the `file_roots` as specified in the master config file. For example, let’s suppose the `file_roots` is configured as:

```yaml
file_roots:
  base: /etc/salt/states
```

Placing the template under `/etc/salt/states/templates/example.jinja`, it can be used as `salt://templates/example.jinja`. Alternatively, for local files, the user can specify the absolute path. If remotely, the source can be retrieved via `http`, `https` or `ftp`.

Examples:
- `salt://my_template.jinja`
- `/absolute/path/to/my_template.jinja`
- `http://example.com/template.cheetah`
- `https://example.com/template.mako`
- `ftp://example.com/template.py`

Changed in version 2019.2.0: This argument can now support a list of templates to be rendered. The resulting configuration text is loaded at once, as a single configuration chunk.

**template_source**: `None` Inline config template to be rendered and loaded on the device.

**template_hash**: `None` Hash of the template file. Format: `{hash_type: 'md5', 'hsum': <md5sum>}`

New in version 2016.11.2.

**context**: `None` Overrides default context variables passed to the template.

New in version 2019.2.0.

**template_hash_name**: `None` When `template_hash` refers to a remote file, this specifies the filename to look for in that file.

New in version 2016.11.2.

**saltenv**: `base` Specifies the template environment. This will influence the relative imports inside the templates.

New in version 2016.11.2.

**template_engine**: `jinja` The following templates engines are supported:
- `cheetah`
- `genshi`
- `jinja`
- `mako`
- `py`
- `wempy`

New in version 2016.11.2.

**skip_verify**: `True` If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.11.2.
**test:** `False`  Dry run? If set to `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit:** `True`  Commit? (default: `True`)

**debug:** `False`  Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw result after the template was rendered.

New in version 2016.11.2.

**replace:** `False`  Load and replace the configuration.

New in version 2016.11.2.

**commit_in:** `None`  Commit the changes in a specific number of minutes / hours. Example of accepted formats: 5 (commit in 5 minutes), 2m (commit in 2 minutes), 1h (commit the changes in 1 hour), 5h30m (commit the changes in 5 hours and 30 minutes).

**Note:** This feature works on any platforms, as it does not rely on the native features of the network operating system.

**Note:** After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the `net.cancel_commit` execution function, using the commit ID returned by this function.

**Warning:** Using this feature, Salt will load the exact configuration you expect, however the `diff` may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

**commit_at:** `None`  Commit the changes at a specific time. Example of accepted formats: 1am (will commit the changes at the next 1AM), 13:20 (will commit at 13:20), 1:20am, etc.

**Note:** This feature works on any platforms, as it does not rely on the native features of the network operating system.

**Note:** After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the `net.cancel_commit` execution function, using the commit ID returned by this function.

**Warning:** Using this feature, Salt will load the exact configuration you expect, however the `diff` may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

**revert_in:** `None`  Commit and revert the changes in a specific number of minutes / hours. Example of accepted formats: 5 (revert in 5 minutes), 2m (revert in 2 minutes), 1h (revert the changes in 1 hour), 5h30m (revert the changes in 5 hours and 30 minutes).
Note: To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

Warning: This works on any platform, regardless if they have or don’t have native capabilities to confirming a commit. However, please be very cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don’t have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

`revert_at`: `None` Commit and revert the changes at a specific time. Example of accepted formats: `1am` (will commit and revert the changes at the next 1AM), `13:20` (will commit and revert at 13:20), `1:20am`, etc.

Note: To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

Warning: This works on any platform, regardless if they have or don’t have native capabilities to confirming a commit. However, please be very cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don’t have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

`defaults`: `None` Default variables/context passed to the template.

New in version 2016.11.2.

`template_vars` Dictionary with the arguments/context to be used when the template is rendered.

Note: Do not explicitly specify this argument. This represents any other variable that will be sent to the template rendering system. Please see the examples below!

Note: It is more recommended to use the `context` argument to avoid conflicts between CLI arguments and template variables.
Returns a dictionary having the following keys:

- result (bool): if the config was applied successfully. It is False only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still True and so will be the already_configured flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- loaded_config (str): the configuration loaded on the device, after rendering the template. Requires debug to be set as True
- diff (str): returns the config changes applied

The template can use variables from the grains, pillar or opts, for example:

```jinja%
{% set router_model = grains.get('model') %}
{% set router_vendor = grains.get('vendor') %}
{% set os_version = grains.get('version') %}
{% set hostname = pillar.get('proxy', {}).get('host') %}
{% if router_vendor|lower == 'juniper' %}
  system {
    host-name {{hostname}};
  }
{% elif router_vendor|lower == 'cisco' %}
  hostname {{hostname}}
{% endif %}
%
```

CLI Examples:

```bash
salt '*' net.load_template set_ntp_peers peers=[192.168.0.1]  # uses NAPALM

# inline template:
salt -G 'os:junos' net.load_template template_source='system { host-name {{host_ name}}; }'  # inline template using grains info:
salt -G 'os:junos' net.load_template template_source='system { host-name {{grains.model}}.lab; }'  # if the device is a MX480, the command above will set the hostname as: MX480.lab

# inline template using pillar data:
salt -G 'os:junos' net.load_template template_source='system { host-name {{pillar.proxy.host}}; }'

salt '*' net.load_template https://bit.ly/2OhSgqP hostname=example  # will commit
call '* net.load_template https://bit.ly/2OhSgqP hostname=example test=True  #

# render a mako template:
salt '*' net.load_template salt://templates/example.mako template_engine=mako

# render remote template
salt -G 'os:junos' net.load_template http://bit.ly/2fReJg7 test=True debug=True peers=['192.168.0.1']
```

(continues on next page)
# render multiple templates at once

```python
```

Example output:

```python
{
    'comment': '',
    'already_configured': False,
    'result': True,
    'diff': '[[edit system]+  host-name edge01.bjm01,
       [edit loaded_config] 'system { host-name edge01.bjm01; }''
}
```

```python
salt.modules.napalm_network.mac(address='', interface='', vlan=0, **kwargs)
```

Returns the MAC Address Table on the device.

**Parameters**

- `address` -- MAC address to filter on
- `interface` -- Interface name to filter on
- `vlan` -- VLAN identifier

**Returns**

A list of dictionaries representing the entries in the MAC Address Table

CLI Example:

```python
salt '*' net.mac
salt '*' net.mac vlan=10
```

Example output:

```python
[
    {
        'mac' : '00:1c:58:29:4a:71',
        'interface' : 'xe-3/0/2',
        'static' : False,
        'active' : True,
        'moves' : 1,
        'vlan' : 10,
        'last_move' : 1454417742.58
    },
    {
        'mac' : '8c:60:4f:58:e1:c1',
        'interface' : 'xe-1/0/1',
        'static' : False,
        'active' : True,
        'moves' : 2,
        'vlan' : 42,
        'last_move' : 1453191948.11
    }
]
```

```python
salt.modules.napalm_network.optics(**kwargs)
```

New in version 2017.7.0.

Fetches the power usage on the various transceivers installed on the network device (in dBm), and returns a view that conforms with the OpenConfig model openconfig-platform-transceiver.yang.
Returns

Returns a dictionary where the keys are as listed below:

- **intf_name** (unicode)
  - **physical_channels**
    - **channels** (list of dicts)
      - **index** (int)
      - **state**
        - **input_power**
          - **instant** (float)
          - **avg** (float)
          - **min** (float)
          - **max** (float)
        - **output_power**
          - **instant** (float)
          - **avg** (float)
          - **min** (float)
          - **max** (float)
        - **laser_bias_current**
          - **instant** (float)
          - **avg** (float)
          - **min** (float)
          - **max** (float)

CLI Example:

```bash
salt '*' net.options
```

**salt.modules.napalm_network.patch**(*patchfile*, *options='', *saltenv='base', *source_hash=None, show_changes=True, *source='running', *path=None, test=False, commit=True, debug=False, replace=True*)

New in version 2019.2.0.

Apply a patch to the configuration source, and load the result into the running config of the device.

**patchfile** A patch file to apply to the configuration source.

**options** Options to pass to patch.

**source_hash** If the patch file (specified via the **patchfile** argument) is an HTTP(S) or FTP URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the file if the cached copy matches the specified hash.

**show_changes** : **True** Controls how changes are presented. If **True**, this function will return the of the changes made. If **False**, then it will return a boolean (**True** if any changes were made, otherwise **False**).

**source** : **running** The configuration source. Choose from: **running**, **candidate**, or **startup**. Default: **running**.

**path** : **None** Save the temporary configuration to a specific path, then read from there. This argument is optional, can the user prefers a particular location of the temporary file.
**Salt Documentation, Release 3003.3**

**test**: `False` Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit**: `True` Commit the configuration changes? Default: `True`.

**debug**: `False` Debug mode. Will insert a new key in the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

**replace**: `True` Load and replace the configuration. Default: `True`.

CLI Example:

```bash
salt '*' net.patch https://example.com/running_config.patch
```

salt.modules.napalm_network.ping

```python
def ping(destination, source=None, ttl=None, timeout=None, size=None, count=None, vrf=None, **kwargs)
```

Executes a ping on the network device and returns a dictionary as a result.

**destination** Hostname or IP address of remote host

**source** Source address of echo request

**ttl** IP time-to-live value (IPv6 hop-limit value) (1..255 hops)

**timeout** Maximum wait time after sending final packet (seconds)

**size** Size of request packets (0..65468 bytes)

**count** Number of ping requests to send (1..200000000 packets)

**vrf** VRF (routing instance) for ping attempt

New in version 2016.11.4.

CLI Example:

```bash
salt '*' net.ping 8.8.8.8
salt '*' net.ping 8.8.8.8 ttl=3 size=65468
salt '*' net.ping 8.8.8.8 source=127.0.0.1 timeout=1 count=100
```

salt.modules.napalm_network.replace_pattern

```python
def replace_pattern(pattern, repl, count=0, flags=8, bufsize=1, append_if_not_found=False, prepend_if_not_found=False, not_found_content=None, search_only=False, show_changes=True, backslash_literal=False, source=None, path=None, test=False, replace=True, debug=False, commit=True)
```

New in version 2019.2.0.

Replace occurrences of a pattern in the configuration source. If `show_changes` is `True`, then a diff of what changed will be returned, otherwise a `True` will be returned when changes are made, and `False` when no changes are made. This is a pure Python implementation that wraps Python's `sub()`.

**pattern** A regular expression, to be matched using Python's `search()`.

**repl** The replacement text.

**count** Maximum number of pattern occurrences to be replaced. If count is a positive integer n, only n occurrences will be replaced, otherwise all occurrences will be replaced.

**flags** (`list` or `int`): 8 A list of flags defined in the `re` module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., `['IGNORECASE', 'MULTILINE']`. Optionally, flags may be an int, with a value corresponding to the XOR (`|`) of all the desired flags. Defaults to 8 (which supports 'MULTILINE').

**bufsize** (`int` or `str`): 1 How much of the configuration to buffer into memory at once. The default value 1 processes one line at a time. The special value `file` may be specified which will read the entire file into memory before processing.

**append_if_not_found**: `False` If set to `True`, and pattern is not found, then the content will be appended to the file.

**prepend_if_not_found**: `False` If set to `True` and pattern is not found, then the content will be prepended to the file.

**not_found_content** Content to use for append/prepend if not found. If None (default), uses `repl`. Useful
when repl uses references to group in pattern.

search_only: False If set to true, this no changes will be performed on the file, and this function will simply return True if the pattern was matched, and False if not.

show_changes: True If True, return a diff of changes made. Otherwise, return True if changes were made, and False if not.

backslash Literal: False Interpret backslashes as literal backslashes for the repl and not escape characters. This will help when using append/prepend so that the backslashes are not interpreted for the repl on the second run of the state.

path Save the temporary configuration to a specific path, then read from there.

test: False Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.

commit: True Commit the configuration changes? Default: True.

debug: False Debug mode. Will insert a new key in the output dictionary, as loaded_config containing the raw configuration loaded on the device.

replace: True Load and replace the configuration. Default: True. If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format key=val. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```python
salt '*' net.replace_pattern "bind-address\s*=\"bind-address:"
```

CLI Example:

```
salt '*' net.replace_pattern PREFIX-LIST_NAME new-prefix-list-name
salt '*' net.replace_pattern bgp-group-name new-bgp-group-name count=1
```

salt.modules.napalm_network.rollback(inherit_napalm_device=None, **kwargs)
Rollbacks the configuration.

CLI Example:

```
salt '*' net.rollback
```

salt.modules.napalm_network.save_config(source=None, path=None)
New in version 2019.2.0. Save the configuration to a file on the local file system.

path Absolute path to file where to save the configuration. To push the files to the Master, use cp.push

Execution function.

CLI Example:

```
salt '*' net.save_config source=running
```

salt.modules.napalm_network.traceroute(destination, source=None, ttl=None, timeout=None, vrf=None, **kwargs)
Calls the method traceroute from the NAPALM driver object and returns a dictionary with the result of the traceroute command executed on the device.

destination Hostname or address of remote host

source Source address to use in outgoing traceroute packets

ttl IP maximum time-to-live value (or IPv6 maximum hop-limit value)

timeout Number of seconds to wait for response (seconds)

vrf VRF (routing instance) for traceroute attempt
New in version 2016.11.4.

CLI Example:

```
salt '*' net.traceroute 8.8.8.8
salt '*' net.traceroute 8.8.8.8 source=127.0.0.1 ttl=5 timeout=1
```

23.9.290 salt.modules.napalm_ntp

**NAPALM NTP**

Manages NTP on network devices.

- **codeauthor** Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

**Dependencies**

- *NAPALM proxy minion*
- *NET basic features*

See also:

*NTP peers management state*

New in version 2016.11.0.

salt.modules.napalm_ntp.delete_peers('peers', **options)**

Removes NTP peers configured on the device.

**Parameters**

- **peers** -- list of IP Addresses/Domain Names to be removed as NTP peers
- **(bool) (commit)** -- discard loaded config. By default test is False (will not discard the changes)
- **(bool)** -- commit loaded config. By default commit is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the commit option. For a dry run, use the test argument.

CLI Example:

```
salt '*' ntp.delete_peers 8.8.8.8 time.apple.com
salt '*' ntp.delete_peers 172.17.17.1 test=True # only displays the diff
salt '*' ntp.delete_peers 192.168.0.1 commit=False # preserves the changes, but doesn't commit
```

salt.modules.napalm_ntp.delete_servers('servers', **options)**

Removes NTP servers configured on the device.

**Parameters**

- **servers** -- list of IP Addresses/Domain Names to be removed as NTP servers
- **(bool) (commit)** -- discard loaded config. By default test is False (will not discard the changes)
--- commit loaded config. By default commit is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the commit option. For dry run use the test argument.

CLI Example:

```
salt '*' ntp.delete_servers 8.8.8.8 time.apple.com
salt '*' ntp.delete_servers 172.17.17.1 test=True  # only displays the diff
salt '*' ntp.delete_servers 192.168.0.1 commit=False  # preserves the changes, but does not commit
```

salt.modules.napalm_ntp.peers(**kwargs)

Returns a list the NTP peers configured on the network device.

Parameters

- **peers** -- list of IP Addresses/Domain Names
- **(bool)** (test) -- discard loaded config. By default test is False (will not dicard the changes)

Returns configured NTP peers as list.

CLI Example:

```
salt '*' ntp.peers
```

Example output:

```
[
    '192.168.0.1',
    '172.17.17.1',
    '172.17.17.2',
    '2400:cb00:6:1024::c71b:840a'
]
```

salt.modules.napalm_ntp.servers(**kwargs)

Returns a list of the configured NTP servers on the device.

CLI Example:

```
salt '*' ntp.servers
```

Example output:

```
[
    '192.168.0.1',
    '172.17.17.1',
    '172.17.17.2',
    '2400:cb00:6:1024::c71b:840a'
]
```

salt.modules.napalm_ntp.set_peers(*peers, **options)

Configures a list of NTP peers on the device.

Parameters

- **peers** -- list of IP Addresses/Domain Names
- **(bool)** (test) -- discard loaded config. By default test is False (will not dicard the changes)

Commit commit (bool) commit loaded config. By default commit is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the commit option. For dry run use the test argument.

CLI Example:
salt.set_peers 192.168.0.1 172.17.17.1 time.apple.com
salt.set_peers 172.17.17.1 test=True  # only displays the diff
salt.set_peers 192.168.0.1 commit=False  # preserves the changes, but does not commit

salt.modules.napalm_ntp.set_servers(servers, **options)
Configures a list of NTP servers on the device.

Parameters
- `servers` -- list of IP Addresses/Domain Names
- `test` (bool) -- discard loaded config. By default `test` is False (will not discard the changes)

Commit `commit` (bool) commit loaded config. By default commit is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the `commit` option. For dry run use the `test` argument.

CLI Example:

```
salt '*' ntp.set_servers 192.168.0.1 172.17.17.1 time.apple.com
salt '*' ntp.set_servers 172.17.17.1 test=True  # only displays the diff
salt '*' ntp.set_servers 192.168.0.1 commit=False  # preserves the changes, but does not commit
```

salt.modules.napalm_ntp.stats(peer=None, **kwargs)
Returns a dictionary containing synchronization details of the NTP peers.

Parameters `peer` -- Returns only the details of a specific NTP peer.

Returns

a list of dictionaries, with the following keys:
- `remote`
- `referencedid`
- `synchronized`
- `stratum`
- `type`
- `when`
- `hostpoll`
- `reachability`
- `delay`
- `offset`
- `jitter`

CLI Example:

```
salt '*' ntp.stats
```

Example output:

```
[
  {
    'remote' : '188.114.101.4',
    'referencedid' : '188.114.100.1',
    'synchronized' : True,
    'stratum' : 4,
    'type' : '-',
    'when' : '107',
    'hostpoll' : 256,
  }
]
```
23.9.291 salt.modules.napalm_probes

NAPALM Probes

Manages RPM/SLA probes on the network device.

codeauthor Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>
maturity new
depends napalm
platform unix

Dependencies

• napalm proxy minion
• NET basic features

See also:
Probes configuration management state

New in version 2016.11.0.
salt.modules.napalm_probes.config(**kwargs)

Returns the configuration of the RPM probes.

Returns A dictionary containing the configuration of the RPM/SLA probes.

CLI Example:
salt '*' probes.config

Output Example:

```python
{
    'probel':{
        'test1': {
            'probe_type': 'icmp-ping',
            'target': '192.168.0.1',
            'source': '192.168.0.2',
            'probe_count': 13,
            'test_interval': 3
        },
        'test2': {
            'probe_type': 'http-ping',
            'target': '172.17.17.1',
            'source': '172.17.17.2',
            'probe_count': 5,
        }},
```
salt.modules.napalm_probes.delete_probes(probes, test=False, commit=True, **kwargs)

Removes RPM/SLA probes from the network device. Calls the configuration template 'delete_probes' from the NAPALM library, providing as input a rich formatted dictionary with the configuration details of the probes to be removed from the configuration of the device.

Parameters

- **probes** -- Dictionary with a similar format as the output dictionary of the function config(), where the details are not necessary.
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes.
  Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

 Raises **MergeConfigException** -- If there is an error on the configuration sent.

 Returns A dictionary having the following keys:

- **result** (bool): if the config was applied successfully. It is False only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still True and so will be the already_configured flag (example below)
- **comment** (str): a message for the user
- **already_configured** (bool): flag to check if there were no changes applied
- **diff** (str): returns the config changes applied

Input example:

```python
probes = {
    'existing_probe':{
        'existing_test1': {},
        'existing_test2': {}
    }
}
```

salt.modules.napalm_probes.results(**kwargs)

Provides the results of the measurements of the RPM/SLA probes.

:returns a dictionary with the results of the probes.

CLI Example:

```bash
salt '*' probes.results
```

Output example:

```python
{
    'probel': {
        'test1': {
            'last_test_min_delay': 63.120,
            'global_test_min_delay': 62.912,
            'current_test_avg_delay': 63.190,
            'global_test_max_delay': 177.349,
```
salties.modules.napalm_probes.schedule_probes(probes, test=False, commit=True, **kwargs)

Will schedule the probes. On Cisco devices, it is not enough to define the probes, it is also necessary to schedule them.

This function calls the configuration template schedule_probes from the NAPALM library, providing as input a rich formatted dictionary with the names of the probes and the tests to be scheduled.

Parameters

- **probes** -- Dictionary with a similar format as the output dictionary of the function config(), where the details are not necessary.
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises MergeConfigException -- If there is an error on the configuration sent.

Returns a dictionary having the following keys:

- **result** (bool): if the config was applied successfully. It is False only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still True and so will be the already_configured flag (example below)
• comment (str): a message for the user
• already_configured (bool): flag to check if there were no changes applied
• diff (str): returns the config changes applied

Input example:

probes = {
    'new_probe': {
        'new_test1': {},
        'new_test2': {}
    }
}
salt.modules.napalm_probes.set_probes(probes, test=False, commit=True, **kwargs)

Configures RPM/SLA probes on the device. Calls the configuration template 'set_probes' from the NAPALM library, providing as input a rich formatted dictionary with the configuration details of the probes to be configured.

Parameters
• probes -- Dictionary formatted as the output of the function config()
• test -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
• commit -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises MergeConfigException -- If there is an error on the configuration sent.

Return a dictionary having the following keys
• result (bool): if the config was applied successfully. It is False only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still True and so will be the already_configured flag (example below)
• comment (str): a message for the user
• already_configured (bool): flag to check if there were no changes applied
• diff (str): returns the config changes applied

Input example - via state/script:

probes = {
    'new_probe': {
        'new_test1': {
            'probe_type': 'icmp-ping',
            'target': '192.168.0.1',
            'source': '192.168.0.2',
            'probe_count': 13,
            'test_interval': 3
        },
        'new_test2': {
            'probe_type': 'http-ping',
            'target': '172.17.17.1',
            'source': '192.17.17.2',
            'probe_count': 5,
            'test_interval': 60
        }
    }
}
salt.set_probes(probes)

CLI Example - to push changes on the fly (not recommended):
```python
salt 'junos_minion' probes.set_probes "{'new_probe': {'new_test1': {'probe_type': ...
  → 'icmp-ping', 'target': '192.168.0.1', 'source': '192.168.0.2', 'probe_count': 13, 'test_interval': 3}}}" test=True
```

Output example - for the CLI example above:

```yaml
junos_minion:
   ----------
   already_configured: False
   comment: Configuration discarded.
   diff:
      [edit services rpm]
      probe transit { ... }
      + probe new_probe {
      +     test new_test1 {
      +       probe-type icmp-ping;
      +       target address 192.168.0.1;
      +       probe-count 13;
      +       test-interval 3;
      +       source-address 192.168.0.2;
      +     }
      + }
   result: True
```

### 23.9.292 salt.modules.napalm_route

**NAPALM Route**

Retrieves route details from network devices.

- **codeauthor** Mircea Ulinic `<ping@mirceaulinic.net>`
- **maturity** new
- **depends** napalm
- **platform** unix

**Dependencies**

- *NAPALM proxy minion*

New in version 2016.11.0.

```python
salt.modules.napalm_route.show(destination, protocol=None, **kwargs)
```

Displays all details for a certain route learned via a specific protocol. If the protocol is not specified, will return all possible routes.

**Note:** This function return the routes from the RIB. In case the destination prefix is too short, there may be too many routes matched. Therefore in cases of devices having a very high number of routes it may be necessary to adjust the prefix length and request using a longer prefix.
destination  destination prefix.
protocol (optional)  protocol used to learn the routes to the destination.

Changed in version 2017.7.0.

CLI Example:

```yaml
salt 'my_router' route.show 172.16.0.0/25
salt 'my_router' route.show 172.16.0.0/25 bgp
```

Output example:

```yaml
{
  '172.16.0.0/25': [
    {
      'protocol': 'BGP',
      'last_active': True,
      'current_active': True,
      'age': 1178693,
      'routing_table': 'inet.0',
      'next_hop': '192.168.0.11',
      'outgoing_interface': 'xe-1/1/1.100',
      'preference': 170,
      'selected_next_hop': False,
      'protocol_attributes': {
        'remote_as': 65001,
        'metric': 5,
        'local_as': 13335,
        'as_path': '',
        'remote_address': '192.168.0.11',
        'metric2': 0,
        'local_preference': 0,
        'communities': [
          '0:2',
          'no-export'
        ],
        'preference2': -1
      },
      'inactive_reason': ''
    },
    {
      'protocol': 'BGP',
      'last_active': False,
      'current_active': False,
      'age': 2359429,
      'routing_table': 'inet.0',
      'next_hop': '192.168.0.17',
      'outgoing_interface': 'xe-1/1/1.100',
      'preference': 170,
      'selected_next_hop': True,
      'protocol_attributes': {
        'remote_as': 65001,
        'metric': 5,
        'local_as': 13335,
        'as_path': '',
        'remote_address': '192.168.0.17',
        'metric2': 0,
        'local_preference': 0,
        'communities': [
```

(continues on next page)
'0:3',
'no-export'
],
'preference2': -1
},
'inactive_reason': 'Not Best in its group - Router ID'
}
}

23.9.293 salt.modules.napalm_snmp

NAPALM SNMP

Manages SNMP on network devices.

codeauthor Mircea Ulinic <ping@mirceaulinic.net>
maturity new
depends napalm
platform unix

Dependencies

• NAPALM proxy minion
• NET basic features

See also:
SNMP configuration management state

New in version 2016.11.0.

salt.modules.napalm_snmp.config(**kwargs)

Returns the SNMP configuration

CLI Example:
salt '*' snmp.config

salt.modules.napalm_snmp.remove_config(chassis_id=None, community=None, contact=None, location=None, test=False, commit=True, **kwargs)

Removes a configuration element from the SNMP configuration.

Parameters

• chassis_id -- (optional) Chassis ID
• community -- (optional) A dictionary having the following optional keys:
  • acl (if any policy / ACL need to be set)
  • mode: rw or ro. Default: ro

Parameters

• contact -- Contact details
• location -- Location
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

**Raises** `MergeConfigException` -- If there is an error on the configuration sent.

**Returns** A dictionary having the following keys:

- result (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

**CLI Example:**

```
salt '*' snmp.remove_config community='abcd'
```

`salt.modules.napalm_snmp.update_config(chassis_id=None, community=None, contact=None, location=None, test=False, commit=True, **kwargs)`

Updates the SNMP configuration.

**Parameters**

- **chassis_id** -- (optional) Chassis ID
- **community** -- (optional) A dictionary having the following optional keys:
  - acl (if any policy / ACL need to be set)
  - mode: rw or ro. Default: ro

**Parameters**

- **contact** -- Contact details
- **location** -- Location
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

**Raises** `MergeConfigException` -- If there is an error on the configuration sent.

**Return** a dictionary having the following keys

- result (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

**CLI Example:**

```
salt 'edge01.lon01' snmp.update_config location="Greenwich, UK" test=True
```

Output example (for the CLI example above):
edge01.lon01:

---

already_configured: False

comment:
Configuration discarded.

diff:
[edit snmp]

- location "London, UK";
+ location "Greenwich, UK";

result:
True

23.9.294 salt.modules.napalm_users

NAPALM Users

Manages the configuration of the users on network devices.

codeauthor Mircea Ulinic <ping@mirceautilinic.net>
maturity new
depends napalm
platform unix

Dependencies

• NAPALM proxy minion

                      nTs8zh0rGScSrtd mircea@master-roshi'
```
salt.modules.napalm_users.delete_users(users, test=False, commit=True, **kwargs)

Removes users from the configuration of network devices.

Parameters

- **users** -- Dictionary formatted as the output of the function config()
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes.
  Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises **MergeConfigException** -- If there is an error on the configuration sent.

Return a dictionary having the following keys

- **result** (bool): if the config was applied successfully. It is False only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still True and so will be the already_configured flag (example below)
- **comment** (str): a message for the user
- **already_configured** (bool): flag to check if there were no changes applied
- **diff** (str): returns the config changes applied

CLI Example:

```bash
salt '*' users.delete_users "{'mircea': {}}"
```

salt.modules.napalm_users.set_users(users, test=False, commit=True, **kwargs)

Configures users on network devices.

Parameters

- **users** -- Dictionary formatted as the output of the function config()
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes.
  Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises **MergeConfigException** -- If there is an error on the configuration sent.

Return a dictionary having the following keys

- **result** (bool): if the config was applied successfully. It is False only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still True and so will be the already_configured flag (example below)
- **comment** (str): a message for the user
- **already_configured** (bool): flag to check if there were no changes applied
- **diff** (str): returns the config changes applied

CLI Example:

```bash
salt '*' users.set_users "{'mircea': {}}"
```
23.9.295 salt.modules.napalm_yang_mod

NAPALM YANG

NAPALM YANG basic operations.

New in version 2017.7.0.

salt.modules.napalm_yang_mod.compliance_report(data, *models, **kwargs)
Return the compliance report using YANG objects.

- data Dictionary structured with respect to the models referenced.
- models A list of models to be used when generating the config.
- filepath The absolute path to the validation file.

CLI Example:
```
salt '*' napalm_yang.compliance_report {} models.openconfig_interfaces filepath=~/.validate.yml
```

Output Example:
```
{
    "skipped": [],
    "complies": true,
    "get_interfaces_ip": {
        "missing": [],
        "complies": true,
        "present": {
            "ge-0/0/0.0": {
                "complies": true,
                "nested": true
            }
        },
        "extra": []
    }
}
```

salt.modules.napalm_yang_mod.diff(candidate, running, *models)
Returns the difference between two configuration entities structured according to the YANG model.

**Note:** This function is recommended to be used mostly as a state helper.

candidate First model to compare.
running Second model to compare.
models A list of models to be used when comparing.

CLI Example:
```
salt '*' napalm_yang.diff {} {} models.openconfig_interfaces
```

Output Example:
```
{
    "interfaces": {
        "interface": {
            "both": {
                "Port-Channel1": {
(continues on next page)
```
"config": {
  "mtu": {
    "first": "0",
    "second": "9000"
  }
},
"first_only": [
  "Loopback0"
],
"second_only": [
  "Loopback1"
]
}

salt.modules.napalm_yang_mod.get_config(data, *models, **kwargs)

Return the native config.

data Dictionary structured with respect to the models referenced.
models A list of models to be used when generating the config.
profiles: None Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

CLI Example:

```
salt '*' napalm_yang.get_config {} models.openconfig_interfaces
```

Output Example:

```
interface et1
  ip address 192.168.1.1/24
  description Uplink1
  mtu 9000
interface et2
  ip address 192.168.2.1/24
  description Uplink2
  mtu 9000
```

salt.modules.napalm_yang_mod.load_config(data, *models, **kwargs)

Generate and load the config on the device using the OpenConfig or IETF models and device profiles.
data Dictionary structured with respect to the models referenced.
models A list of models to be used when generating the config.
profiles: None Use certain profiles to generate the config. If not specified, will use the platform default profile(s).
test: False Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.
debug: False Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw configuration loaded on the device.
replace: False Should replace the config with the new generate one?

CLI Example:

```
salt '*' napalm_yang.load_config {} models.openconfig_interfaces test=True
depth=3
debug=True
```
Output Example:

```
device1:
       --------
   already_configured:
     False
   comment:
diff:
   [edit interfaces ge-0/0/0]
     - mtu 1400;
   [edit interfaces ge-0/0/0 unit 0 family inet]
     - dhcp;
   [edit interfaces lo0]
     - unit 0 {
       - description lo0.0;

    <description>lo0</description>
</interface>
</interfaces>
</configuration>

result: True

salt.modules.napalm_yang_mod.parse(*models, **kwargs)
Parse configuration from the device.
models A list of models to be used when parsing.
config: False Parse config.
state: False Parse state.
profiles: None Use certain profiles to parse. If not specified, will use the device default profile(s).

CLI Example:
salt '*' napalm_yang.parse models.openconfig_interfaces

Output Example:

```json
{
    "interfaces": {
        "interface": {
            "local": {
                "name": "local",

}
23.9.296 salt.modules.netaddress

Module for getting information about network addresses.

New in version 2016.3.0.

**depends** netaddr

**salt.modules.netaddress.cidr_bROADCAST**(cidr)

Get the broadcast address associated with a CIDR address.

CLI Example:

```
salt myminion netaddress.cidr_netmask 192.168.0.0/20
```

**salt.modules.netaddress.cidr_netmask**(cidr)

Get the netmask address associated with a CIDR address.

CLI Example:

```
salt myminion netaddress.cidr_netmask 192.168.0.0/20
```

**salt.modules.netaddress.list_cidr_ips**(cidr)

Get a list of IP addresses from a CIDR.

CLI Example:

```
salt myminion netaddress.list_cidr_ips 192.168.0.0/20
```

**salt.modules.netaddress.list_cidr_ips_ipv6**(cidr)

Get a list of IPv6 addresses from a CIDR.

CLI Example:

```
salt myminion netaddress.list_cidr_ips_ipv6 192.168.0.0/20
```
23.9.297 salt.modules.netbox

NetBox

Module to query NetBox

codeauthor Zach Moody <zmoody@do.co>
maturity new
depends pynetbox

The following config should be in the minion config file. In order to work with secrets you should provide a token and path to your private key file:

```yaml
netbox:
  url: <NETBOX_URL>
  token: <NETBOX_USERNAME_API_TOKEN (OPTIONAL)>
  keyfile: </PATH/TO/NETBOX/KEY (OPTIONAL)>
```

New in version 2018.3.0.
salt.modules.netbox.create_circuit(name, provider_id, circuit_type, description=None)

New in version 2019.2.0.
Create a new Netbox circuit

```python
circuit
name Name of the circuit
provider_id The netbox id of the circuit provider
circuit_type The name of the circuit type
asn The ASN of the circuit provider
description The description of the circuit
```

CLI Example:

```bash
salt myminion netbox.create_circuit NEW_CIRCUIT_01 Telia Transit 1299 "New Telia circuit"
```

salt.modules.netbox.create_circuit_provider(name, asn=None)

New in version 2019.2.0.
Create a new Netbox circuit provider

```python
circuit_provider
name The name of the circuit provider
asn The ASN of the circuit provider
```

CLI Example:

```bash
salt myminion netbox.create_circuit_provider Telia 1299
```

salt.modules.netbox.create_circuit_termination(circuit, interface, device, speed, xconnect_id=None, term_side='A')

New in version 2019.2.0.
Terminate a circuit on an interface

```python
circuit_termination
name The name of the circuit
interface The name of the interface to terminate on
device The name of the device the interface belongs to
speed The speed of the circuit, in Kbps
xconnect_id The cross-connect identifier
term_side The side of the circuit termination
```

CLI Example:
salt myminion netbox.create_circuit_termination NEW_CIRCUIT_01 xe-0/0/1 myminion0

\rightarrow 10000 xconnect_id=XCON01

salt.modules.netbox.create_circuit_type(name)
    New in version 2019.2.0.
    Create a new Netbox circuit type.
    name The name of the circuit type
    CLI Example:

    salt myminion netbox.create_circuit_type Transit

salt.modules.netbox.create_device(name, role, model, manufacturer, site)
    New in version 2019.2.0.
    Create a new device with a name, role, model, manufacturer and site. All these components need to be already
    in Netbox.
    name The name of the device, e.g., edge_router
    role String of device role, e.g., router
    model String of device model, e.g., MX480
    manufacturer String of device manufacturer, e.g., Juniper
    site String of device site, e.g., BRU
    CLI Example:

    salt myminion netbox.create_device edge_router router MX480 Juniper BRU

salt.modules.netbox.create_device_role(role, color)
    New in version 2019.2.0.
    Create a device role
    role String of device role, e.g., router
    CLI Example:

    salt myminion netbox.create_device_role router

salt.modules.netbox.create_device_type(model, manufacturer)
    New in version 2019.2.0.
    Create a device type. If the manufacturer doesn't exist, create a new manufacturer.
    model String of device model, e.g., MX480
    manufacturer String of device manufacturer, e.g., Juniper
    CLI Example:

    salt myminion netbox.create_device_type MX480 Juniper

salt.modules.netbox.create_interface(device_name, interface_name, mac_address=None, description=None, enabled=None, lag=None, lag_parent=None, form_factor=None)
    New in version 2019.2.0.
    Attach an interface to a device. If not all arguments are provided, they will default to Netbox defaults.
    device_name The name of the device, e.g., edge_router
    interface_name The name of the interface, e.g., TenGigE0/0/0
    mac_address String of mac address, e.g., 50:87:89:73:92:C8
    description String of interface description, e.g., NTT
    enabled String of boolean interface status, e.g., True
    lag Boolean of interface lag status, e.g., True

2376 Chapter 23. Salt Module Reference
lag_parent  String of interface lag parent name, e.g., ae13
form_factor  Integer of form factor id, obtained through _choices API endpoint, e.g., 200

CLI Example:
salt myminion netbox.create_interface edge_router ae13 description="Core uplink"

salt.modules.netbox.create_interface_connection(interface_a, interface_b)
New in version 2019.2.0.
Create an interface connection between 2 interfaces
interface_a  Interface id for Side A
interface_b  Interface id for Side B

CLI Example:
salt myminion netbox.create_interface_connection 123 456

salt.modules.netbox.create_inventory_item(device_name, item_name, manufacturer_name=None, serial='', part_id='', description='')
New in version 2019.2.0.
Add an inventory item to an existing device.
device_name  The name of the device, e.g., edge_router.
item_name  String of inventory item name, e.g., Transceiver.
manufacturer_name  String of inventory item manufacturer, e.g., Fiberstore.
serial  String of inventory item serial, e.g., FS1238931.
part_id  String of inventory item part id, e.g., 740-01234.
description  String of inventory item description, e.g., SFP+10G-LR.

CLI Example:
salt myminion netbox.create_inventory_item edge_router Transceiver part_id=740-01234

salt.modules.netbox.create_ipaddress(ip_address, family, device=None, interface=None)
New in version 2019.2.0.
Add an IP address, and optionally attach it to an interface.
ip_address  The IP address and CIDR, e.g., 192.168.1.1/24
family  Integer of IP family, e.g., 4
device  The name of the device to attach IP to, e.g., edge_router
interface  The name of the interface to attach IP to, e.g., ae13

CLI Example:
salt myminion netbox.create_ipaddress 192.168.1.1/24 4 device=edge_router\ninterface=ae13

salt.modules.netbox.create_manufacturer(name)
New in version 2019.2.0.
Create a device manufacturer.
name  The name of the manufacturer, e.g., Juniper

CLI Example:
salt myminion netbox.create_manufacturer Juniper

salt.modules.netbox.create_platform(platform)
New in version 2019.2.0.
Create a new device platform

```python
platform String of device platform, e.g., junos
```

**CLI Example:**
```bash
salt myminion netbox.create_platform junos
```

salt.modules.netbox.create_site(site)
New in version 2019.2.0.

Create a new device site

```python
site String of device site, e.g., BRU
```

**CLI Example:**
```bash
salt myminion netbox.create_site BRU
```

salt.modules.netbox.delete_interface(device_name, interface_name)
New in version 2019.2.0.

Delete an interface from a device.

```python
device_name The name of the device, e.g., edge_router.
interface_name The name of the interface, e.g., ae13
```

**CLI Example:**
```bash
salt myminion netbox.delete_interface edge_router ae13
```

salt.modules.netbox.delete_inventory_item(item_id)
New in version 2019.2.0.

Remove an item from a devices inventory. Identified by the netbox id

```python
item_id Integer of item to be deleted
```

**CLI Example:**
```bash
salt myminion netbox.delete_inventory_item 1354
```

salt.modules.netbox.delete_ipaddress(ipaddr_id)
New in version 2019.2.0.

Delete an IP address. IP addresses in Netbox are a combination of address and the interface it is assigned to.

```python
id The Netbox id for the IP address.
```

**CLI Example:**
```bash
salt myminion netbox.delete_ipaddress 9002
```

salt.modules.netbox.filter_(app, endpoint, **kwargs)

Get a list of items from NetBox.

```python
app String of netbox app, e.g., dcim, circuits, ipam
endpoint String of app endpoint, e.g., sites, regions, devices
kwargs Optional arguments that can be used to filter. All filter keywords are available in Netbox, which can be found by surfing to the corresponding API endpoint, and clicking Filters. e.g., role=router
```

Returns a list of dictionaries

**CLI Example:**
```bash
salt myminion netbox.filter dcim devices status=1 role=router
```

salt.modules.netbox.get_(app, endpoint, id=None, **kwargs)

Get a single item from NetBox.

```python
app String of netbox app, e.g., dcim, circuits, ipam
endpoint String of app endpoint, e.g., sites, regions, devices
```

**CLI Example:**
```bash
```
Returns a single dictionary
To get an item based on ID.

```
salt myminion netbox.get dcim devices id=123
```

Or using named arguments that correspond with accepted filters on the NetBox endpoint.

```
salt myminion netbox.get dcim devices name=my-router
```

```
salt.modules.netbox.get_circuit_provider(name, asn=None)
```
New in version 2019.2.0.

Get a circuit provider with a given name and optional ASN.
name The name of the circuit provider
asn The ASN of the circuit provider

CLI Example:

```
salt myminion netbox.get_circuit_provider Telia 1299
```

```
salt.modules.netbox.get_interfaces(device_name=None, **kwargs)
```
New in version 2019.2.0.

Returns interfaces for a specific device using arbitrary netbox filters
device_name The name of the device, e.g., edge_router
kwargs Optional arguments to be used for filtering

CLI Example:

```
salt myminion netbox.get_interfaces edge_router name="et-0/0/5"
```

```
salt.modules.netbox.get_ipaddresses(device_name=None, **kwargs)
```
New in version 2019.2.0.

Filters for an IP address using specified filters
device_name The name of the device to check for the IP address
kwargs Optional arguments that can be used to filter, e.g., family=4

CLI Example:

```
salt myminion netbox.get_ipaddresses device_name family=4
```

```
salt.modules.netbox.make_interface_child(device_name, interface_name, parent_name)
```
New in version 2019.2.0.

Set an interface as part of a LAG.
device_name The name of the device, e.g., edge_router.
interface_name The name of the interface to be attached to LAG, e.g., xe-1/0/2.
parent_name The name of the LAG interface, e.g., ae13.

CLI Example:

```
salt myminion netbox.make_interface_child xe-1/0/2 ae13
```

```
salt.modules.netbox.make_interface_lag(device_name, interface_name)
```
New in version 2019.2.0.

Update an interface to be a LAG.
device_name The name of the device, e.g., edge_router.
interface_name The name of the interface, e.g., ae13.

CLI Example:
salt myminion netbox.make_interface_lag edge_router ae13

salt.modules.netbox.openconfig_interfaces(device_name=None)

New in version 2019.2.0.

Return a dictionary structured as standardised in the `openconfig-interfaces` YANG model, containing physical and configuration data available in Netbox, e.g., IP addresses, MTU, enabled / disabled, etc.

device_name: None The name of the device to query the interface data for. If not provided, will use the Minion ID.

CLI Example:

```
salt '*' netbox.openconfig_interfaces
salt '*' netbox.openconfig_interfaces device_name=cr1.thn.lon
```

salt.modules.netbox.openconfig_lacp(device_name=None)

New in version 2019.2.0.

Return a dictionary structured as standardised in the `openconfig-lacp` YANG model, with configuration data for Link Aggregation Control Protocol (LACP) for aggregate interfaces.

Note: The `interval` and `lacp_mode` keys have the values set as SLOW and ACTIVE respectively, as this data is not currently available in Netbox, therefore defaulting to the values defined in the standard. See `interval` and `lacp-mode` for further details.

device_name: None The name of the device to query the LACP information for. If not provided, will use the Minion ID.

CLI Example:

```
salt '*' netbox.openconfig_lacp
salt '*' netbox.openconfig_lacp device_name=cr1.thn.lon
```

salt.modules.netbox.slugify(value)

`Slugify` given value. Credit to Djangoproject, https://docs.djangoproject.com/en/2.0/_modules/django/utils/text/#slugify

salt.modules.netbox.update_device(name, **kwargs)

New in version 2019.2.0.

Add attributes to an existing device, identified by name.

name The name of the device, e.g., `edge_router`

kwargs Arguments to change in device, e.g., `serial=JN2932930`

CLI Example:

```
salt myminion netbox.update_device edge_router serial=JN2932920
```

salt.modules.netbox.update_interface(device_name, interface_name, **kwargs)

New in version 2019.2.0.

Update an existing interface with new attributes.

device_name The name of the device, e.g., `edge_router`

interface_name The name of the interface, e.g., `ae13`

kwargs Arguments to change in interface, e.g., `mac_address=50:87:69:53:32:D0`

CLI Example:

```
salt myminion netbox.update_interface edge_router ae13 mac_address=50:87:69:53:32:D0
```

(continues on next page)
23.9.298 salt.modules.netbsd_sysctl

Module for viewing and modifying sysctl parameters

salt.modules.netbsd_sysctl.assign(name, value)
Assign a single sysctl parameter for this minion

CLI Example:
```
salt '*' sysctl.assign net.inet.icmp.icmplim 50
```

salt.modules.netbsd_sysctl.get(name)
Return a single sysctl parameter for this minion

CLI Example:
```
salt '*' sysctl.get hw.physmem
```

salt.modules.netbsd_sysctl.persist(name, value, config='/etc/sysctl.conf')
Assign and persist a simple sysctl parameter for this minion

CLI Example:
```
salt '*' sysctl.persist net.inet.icmp.icmplim 50
```

salt.modules.netbsd_sysctl.show(config_file=False)
Return a list of sysctl parameters for this minion
config: Pull the data from the system configuration file instead of the live data.

CLI Example:
```
salt '*' sysctl.show
```

23.9.299 salt.modules.netbsdservice

The service module for NetBSD

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see here.

salt.modules.netbsdservice.available(name)
Returns True if the specified service is available, otherwise returns False.

CLI Example:
```
salt '*' service.available sshd
```

salt.modules.netbsdservice.disable(name, **kwargs)
Disable the named service to start at boot

CLI Example:
salt '*' service.disable <service name>

salt.modules.netbsdservice.disabled(name)
    Return True if the named service is enabled, false otherwise
    CLI Example:
    
    salt '*' service.disabled <service name>

salt.modules.netbsdservice.enable(name, **kwargs)
    Enable the named service to start at boot
    CLI Example:
    
    salt '*' service.enable <service name>

salt.modules.netbsdservice.enabled(name, **kwargs)
    Return True if the named service is enabled, false otherwise
    CLI Example:
    
    salt '*' service.enabled <service name>

salt.modules.netbsdservice.force_reload(name)
    Force-reload the named service
    CLI Example:
    
    salt '*' service.force_reload <service name>

salt.modules.netbsdservice.get_all()
    Return all available boot services
    CLI Example:
    
    salt '*' service.get_all

salt.modules.netbsdservice.get_disabled()
    Return a set of services that are installed but disabled
    CLI Example:
    
    salt '*' service.get_disabled

salt.modules.netbsdservice.get_enabled()
    Return a list of service that are enabled on boot
    CLI Example:
    
    salt '*' service.get_enabled

salt.modules.netbsdservice.missing(name)
    The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.
    CLI Example:
    
    salt '*' service.missing sshd
salt.modules.netbsdservice.reload(name)
    Reload the named service
    CLI Example:
    ```
salt '*' service.reload <service name>
    ```

salt.modules.netbsdservice.restart(name)
    Restart the named service
    CLI Example:
    ```
salt '*' service.restart <service name>
    ```

salt.modules.netbsdservice.start(name)
    Start the specified service
    CLI Example:
    ```
salt '*' service.start <service name>
    ```

salt.modules.netbsdservice.status(name, sig=None)
    Return the status for a service. If the name contains globbing, a dict mapping service name to True/False
    values is returned.
    Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)
    Parameters
    • name (str) -- The name of the service to check
    • sig (str) -- Signature to use to find the service via ps
    Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise
    Return type bool
    CLI Example:
    ```
salt '*' service.status <service name> [service signature]
    ```

salt.modules.netbsdservice.stop(name)
    Stop the specified service
    CLI Example:
    ```
salt '*' service.stop <service name>
    ```

---

**23.9.300 salt.modules.netmiko_mod**

Netmiko Execution Module

New in version 2019.2.0.

Execution module to interface the connection with a remote network device. It is flexible enough to execute the commands both when running under a Netmiko Proxy Minion, as well as running under a Regular Minion by specifying the connection arguments, i.e., `device_type`, `ip`, `username`, `password` etc.

**codeauthor** Mircea Ulinic <ping@mirceaulinic.net> & Kirk Byers <ktbyers@twb-tech.com>

**maturity** new

**depends** netmiko
platform | unix

Dependencies

The netmiko proxy modules requires Netmiko to be installed: pip install netmiko.

Usage

This module can equally be used via the netmiko Proxy module (check documentation), or directly from an arbitrary (Proxy) Minion that is running on a server (computer) having access to the network device, and has the netmiko library installed.

When running outside of the netmiko Proxy (i.e., from another Proxy Minion type, or regular Minion), the netmiko connection arguments can be either specified from the CLI when executing the command, or in a configuration block under the netmiko key in the configuration opts (i.e., (Proxy) Minion configuration file), or Pillar. The module supports these simultaneously. These fields are the exact same supported by the netmiko Proxy Module:

- **device_type** - Class selection based on device type. Supported options:
  - a10: A10 Networks
  - accedian: Accedian Networks
  - alcatel_aos: Alcatel AOS
  - alcatel_sros: Alcatel SROS
  - apresia_aeos: Apresia AEOS
  - arista_eos: Arista EOS
  - aruba_os: Aruba
  - avaya_ers: Avaya ERS
  - avaya_vsp: Avaya VSP
  - brocade_fastiron: Brocade Fastiron
  - brocade_netiron: Brocade Netiron
  - brocade_nos: Brocade NOS
  - brocade_vdx: Brocade NOS
  - brocade_vyos: VyOS
  - checkpoint_gaia: Check Point GAiA
  - calix_b6: Calix B6
  - ciena_saos: Ciena SAOS
  - cisco_asa: Cisco SA
  - cisco_ios: Cisco IOS
  - cisco_nxos: Cisco NX-oS
  - cisco_s300: Cisco S300
  - cisco_tp: Cisco TpTcCe
  - cisco_wlc: Cisco WLC
- cisco_xe: Cisco IOS
- cisco_xr: Cisco XR
- coriant: Coriant
- dell_force10: Dell Force10
- dell_os10: Dell OS10
- dell_powerconnect: Dell PowerConnect
- eltex: Eltex
- enterasys: Enterasys
- extreme: Extreme
- extreme_wing: Extreme Wing
- f5_ltm: F5 LTM
- fortinet: Fortinet
- generic_termserver: TerminalServer
- hp_comware: HP Comware
- hp_procurve: HP Procurve
- huawei: Huawei
- huawei_vrpv8: Huawei VRPV8
- juniper: Juniper Junos
- juniper_junos: Juniper Junos
- linux: Linux
- mellanox: Mellanox
- mrv_optiswitch: MrvOptiswitch
- netapp_cdot: NetAppcDot
- netscaler: Netscaler
- ovs_linux: OvsLinux
- paloalto_Panos: PaloAlto Panos
- pluribus: Pluribus
- quanta_mesh: Quanta Mesh
- ruckus_fastiron: Ruckus Fastiron
- ubiquiti_edge: Ubiquiti Edge
- ubiquiti_edgeswitch: Ubiquiti Edge
- vyatta_vyos: VyOS
- vyos: VyOS
- brocade_fastiron_telnet: Brocade Fastiron over Telnet
- brocade_netiron_telnet: Brocade Netiron over Telnet
- cisco_ios_telnet: Cisco IOS over Telnet
- apresia_aeos_telnet: Apresia AEOS over Telnet
- arista_eos_telnet: Arista EOS over Telnet
- hp_procurve_telnet: HP Procurve over Telnet
- hp_comware_telnet: HP Comware over Telnet
- juniper_junos_telnet: Juniper Junos over Telnet
- calix_b6_telnet: Calix B6 over Telnet
- dell_powerconnect_telnet: Dell PowerConnect over Telnet
- generic_termserver_telnet: TerminalServer over Telnet
- extreme_telnet: Extreme Networks over Telnet
- ruckus_fastiron_telnet: Ruckus Fastiron over Telnet
- cisco_ios_serial: Cisco IOS over serial port

- ip - IP address of target device (not required if host is provided)
- host - Hostname of target device (not required if ip is provided)
- username - Username to authenticate against target device, if required
- password - Password to authenticate against target device, if required
- secret - The enable password if target device requires one
- port - The destination port used to connect to the target device
- global_delay_factor - Multiplication factor affecting Netmiko delays (default: 1)
- use_keys - Connect to target device using SSH keys (default: False)
- key_file - Filename path of the SSH key file to use
- allow_agent - Enable use of SSH key-agent
- ssh_strict - Automatically reject unknown SSH host keys (default: False, which means unknown SSH host keys will be accepted)
- system_host_keys - Load host keys from the user's "known_hosts" file (default: False)
- alt_host_keys - If True, host keys will be loaded from the file specified in alt_key_file (default: False)
- alt_key_file - SSH host key file to use (if alt_host_keys=True)
- ssh_config_file - File name of OpenSSH configuration file
- timeout - Connection timeout, in seconds (default: 90)
- session_timeout - Set a timeout for parallel requests, in seconds (default: 60)
- keepalive - Send SSH keepalive packets at a specific interval, in seconds. Currently defaults to 0, for backwards compatibility (it will not attempt to keep the connection alive using the KEEPALIVE packets).
- default_enter - Character(s) to send to correspond to enter key (default: \n)
- response_return - Character(s) to use in normalized return data to represent enter key (default: \n)

Example (when not running in a netmiko Proxy Minion):
**netmiko:**

```python
username: test
class: test
```

In case the `username` and `password` are the same on any device you are targeting, the block above (besides other parameters specific to your environment you might need) should suffice to be able to execute commands from outside a `netmiko` Proxy, e.g.:

```bash
salt '*' netmiko.send_command 'show version' host=router1.example.com device_type=juniper
salt '*' netmiko.send_config https://bit.ly/2sgljCB host=sw2.example.com device_type=cisco_ios
```

**Note:** Remember that the above applies only when not running in a `netmiko` Proxy Minion. If you want to use the `<salt.proxy.netmiko_px>`, please follow the documentation notes for a proper setup.

```python
salt.modules.netmiko_mod.call(method, *args, **kwargs)
Invoke an arbitrary Netmiko method.
method The name of the Netmiko method to invoke.
args A list of arguments to send to the method invoked.
kwargs Key-value dictionary to send to the method invoked.
```

```python
salt.modules.netmiko_mod.commit(**kwargs)
Commit the configuration changes.
```

**Warning:** This function is supported only on the platforms that support the `commit` operation.

CLI Example:

```bash
salt '*' netmiko.commit
```

```python
salt.modules.netmiko_mod.enter_config_mode(**kwargs)
Enter into config mode.
config_command Configuration command to send to the device.
pattern Pattern to terminate reading of channel.
```

CLI Example:

```bash
salt '*' netmiko.enter_config_mode
salt '*' netmiko.enter_config_mode device_type='juniper_junos' ip='192.168.0.1' username='example'
```

```python
salt.modules.netmiko_mod.exit_config_mode(**kwargs)
Exit from configuration mode.
exit_config Command to exit configuration mode.
pattern Pattern to terminate reading of channel.
```

CLI Example:

```bash
salt '*' netmiko.exit_config_mode
salt '*' netmiko.exit_config_mode device_type='juniper' ip='192.168.0.1' username='example'
```

```python
salt.modules.netmiko_mod.get_connection(**kwargs)
Return the Netmiko connection object.
```
Warning: This function returns an unserializable object, hence it is not meant to be used on the CLI. This should mainly be used when invoked from other modules for the low level connection with the network device.

**kwargs** Key-value dictionary with the authentication details.

**Usage Example:**

```python
c = __salt__['netmiko.get_connection'](
    host='router1.example.com',
    username='example',
    password='example')
show_if = c.send_command('show interfaces')
c.disconnect()
```

**salt.modules.netmiko_mod.multi_call**(*methods, **kwargs*)

Invoke multiple Netmiko methods at once, and return their output, as list.

- **methods** A list of dictionaries with the following keys:
  - `name`: the name of the Netmiko method to be executed.
  - `args`: list of arguments to be sent to the Netmiko method.
  - `kwargs`: dictionary of arguments to be sent to the Netmiko method.

- **kwargs** Key-value dictionary with the connection details (when not running under a Proxy Minion).

**salt.modules.netmiko_mod.send_command**(*command_string, **kwargs*)

Execute command_string on the SSH channel using a pattern-based mechanism. Generally used for show commands. By default this method will keep waiting to receive data until the network device prompt is detected. The current network device prompt will be determined automatically.

- **command_string** The command to be executed on the remote device.
- **expect_string** Regular expression pattern to use for determining end of output. If left blank will default to being based on router prompt.
- **delay_factor**: 1 Multiplying factor used to adjust delays (default: 1).
- **max_loops**: 500 Controls wait time in conjunction with delay_factor. Will default to be based upon self.timeout.
- **auto_find_prompt**: True Whether it should try to auto-detect the prompt (default: True).
- **strip_prompt**: True Remove the trailing router prompt from the output (default: True).
- **strip_command**: True Remove the echo of the command from the output (default: True).
- **normalize**: True Ensure the proper enter is sent at end of command (default: True).
- **use_textfsm**: False Process command output through TextFSM template (default: False).

**CLI Example:**

```bash
salt '*' netmiko.send_command 'show version'
salt '*' netmiko.send_command 'show_version' host='router1.example.com' username='example' device_type='cisco_ios'
```

**salt.modules.netmiko_mod.send_command_timing**(*command_string, **kwargs*)

Execute command_string on the SSH channel using a delay-based mechanism. Generally used for show commands.

- **command_string** The command to be executed on the remote device.
- **delay_factor**: 1 Multiplying factor used to adjust delays (default: 1).
- **max_loops**: 500 Controls wait time in conjunction with delay_factor. Will default to be based upon self.timeout.
- **strip_prompt**: True Remove the trailing router prompt from the output (default: True).
- **strip_command**: True Remove the echo of the command from the output (default: True).
- **normalize**: True Ensure the proper enter is sent at end of command (default: True).
- **use_textfsm**: False Process command output through TextFSM template (default: False).

**CLI Example:**

```bash
```
salt '*' netmiko.send_command_timing 'show version'
salt '*' netmiko.send_command_timing 'show version' host='router1.example.com'
username='example' device_type='arista_eos'

```
salt.modules.netmiko_mod.send_config(config_file=None, config_commands=None, template_engine='jinja', commit=False, context=None, defaults=None, saltenv='base', **kwargs)
```

Send configuration commands down the SSH channel. Return the configuration lines sent to the device.

The function is flexible to send the configuration from a local or remote file, or simply the commands as list.

- **config_file** The source file with the configuration commands to be sent to the device. The file can also be a template that can be rendered using the template engine of choice.

This can be specified using the absolute path to the file, or using one of the following URL schemes:
- `salt://` to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

- **config_commands** Multiple configuration commands to be sent to the device.

Note: This argument is ignored when `config_file` is specified.

- **template_engine:** `jinja` The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file without attempting to render, set this argument to `None`.
- **commit:** `False` Commit the configuration changes before exiting the config mode. This option is by default disabled, as many platforms don't have this capability natively.
- **context** Variables to add to the template context.
- **defaults** Default values of the context_dict.
- **exit_config_mode:** `True` Determines whether or not to exit config mode after complete.
- **delay_factor:** `1` Factor to adjust delays.
- **max_loops:** `150` Controls wait time in conjunction with delay_factor (default: 150).
- **strip_prompt:** `False` Determines whether or not to strip the prompt (default: False).
- **strip_command:** `False` Determines whether or not to strip the command (default: False).
- **config_mode_command** The command to enter into config mode.

CLI Example:
```
salt '*' netmiko.send_config config_commands=[['interface GigabitEthernet3', 'no ip address']]'
salt '*' netmiko.send_config config_commands=[['snmp-server location {{ grains.location }}']]'
salt '*' netmiko.send_config config_file=salt://config.txt
salt '*' netmiko.send_config config_file=https://bit.ly/2sgljCB device_type='cisco_ios' ip='1.2.3.4' username='example'```
23.9.301 salt.modules.netscaler

Module to provide Citrix Netscaler compatibility to Salt (compatible with netscaler 9.2+)
New in version 2015.2.0.

depends
- nsnitro Python module

Note: You can install nsnitro using:

```
pip install nsnitro
```

configuration  This module accepts connection configuration details either as parameters, or as configuration settings in /etc/salt/minion on the relevant minions

```
netscaler.host: 1.2.3.4
netscaler.user: user
netscaler.pass: password
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

CLI Examples:

Calls relying on configuration passed using /etc/salt/minion, grains, or pillars:

```
salt-call netscaler.server_exists server_name
```

Calls passing configuration as opts

```
salt-call netscaler.server_exists server_name netscaler_host=1.2.3.4 netscaler_user=username netscaler_pass=password
```

```
salt-call netscaler.server_exists server_name netscaler_host=1.2.3.5 netscaler_user=username2 netscaler_pass=password2
```

```
salt-call netscaler.server_enable server_name2 netscaler_host=1.2.3.5
```

```
salt-call netscaler.server_up server_name3 netscaler_host=1.2.3.6 netscaler_useSSL=False
```

salt.modules.netscaler.server_add(s_name, s_ip, s_state=None, **connection_args)

Add a server
Note: The default server state is ENABLED

CLI Example:

```
salt '*' netscaler.server_add 'serverName' 'serverIpAddress'
salt '*' netscaler.server_add 'serverName' 'serverIpAddress' 'serverState'
```

salt.modules.netscaler.server_delete(s_name, **connection_args)

Delete a server

CLI Example:

```
salt '*' netscaler.server_delete 'serverName'
```

salt.modules.netscaler.server_disable(s_name, **connection_args)

Disable a server globally

CLI Example:
salt '*' netscaler.server_disable 'serverName'

salt.modules.netscaler.server_enable(s_name, **connection_args)
Enables a server globally
CLI Example:
salt '*' netscaler.server_enable 'serverName'

salt.modules.netscaler.server_enabled(s_name, **connection_args)
Check if a server is enabled globally
CLI Example:
salt '*' netscaler.server_enabled 'serverName'

salt.modules.netscaler.server_exists(s_name, ip=None, s_state=None, **connection_args)
Checks if a server exists
CLI Example:
salt '*' netscaler.server_exists 'serverName'

salt.modules.netscaler.server_update(s_name, s_ip, **connection_args)
Update a server's attributes
CLI Example:
salt '*' netscaler.server_update 'serverName' 'serverIP'

salt.modules.netscaler.service_disable(s_name, s_delay=None, **connection_args)
Disable a service
CLI Example:
salt '*' netscaler.service_disable 'serviceName'
salt '*' netscaler.service_disable 'serviceName' 'delayInSeconds'

salt.modules.netscaler.service_enable(s_name, **connection_args)
Enable a service
CLI Example:
salt '*' netscaler.service_enable 'serviceName'

salt.modules.netscaler.service_exists(s_name, **connection_args)
Checks if a service exists
CLI Example:
salt '*' netscaler.service_exists 'serviceName'

salt.modules.netscaler.service_up(s_name, **connection_args)
Checks if a service is UP
CLI Example:
salt '*' netscaler.service_up 'serviceName'
salt.modules.netscaler.servicegroup_add(\texttt{sg\_name, sg\_type='HTTP', **connection\_args})
Add a new service group If no service type is specified, HTTP will be used. Most common service types: HTTP, SSL, and SSL\_BRIDGE

CLI Example:

```python
salt '*' netscaler.servicegroup_add 'serviceGroupName'
salt '*' netscaler.servicegroup_add 'serviceGroupName' 'serviceGroupType'
```

salt.modules.netscaler.servicegroup_delete(\texttt{sg\_name, **connection\_args})
Delete a new service group

CLI Example:

```python
salt '*' netscaler.servicegroup_delete 'serviceGroupName'
```

salt.modules.netscaler.servicegroup_exists(\texttt{sg\_name, sg\_type=None, **connection\_args})
Checks if a service group exists

CLI Example:

```python
salt '*' netscaler.servicegroup_exists 'serviceGroupName'
```

salt.modules.netscaler.servicegroup_server_add(\texttt{sg\_name, s\_name, s\_port, **connection\_args})
Add a server:port member to a servicegroup

CLI Example:

```python
salt '*' netscaler.servicegroup_server_add 'serviceGroupName' 'serverName'
```

salt.modules.netscaler.servicegroup_server_delete(\texttt{sg\_name, s\_name, s\_port, **connection\_args})
Remove a server:port member from a servicegroup

CLI Example:

```python
salt '*' netscaler.servicegroup_server_delete 'serviceGroupName' 'serverName'
```

salt.modules.netscaler.servicegroup_server_disable(\texttt{sg\_name, s\_name, s\_port, **connection\_args})
Disable a server:port member of a servicegroup

CLI Example:

```python
salt '*' netscaler.servicegroup_server_disable 'serviceGroupName' 'serverName'
```

salt.modules.netscaler.servicegroup_server_enable(\texttt{sg\_name, s\_name, s\_port, **connection\_args})
Enable a server:port member of a servicegroup

CLI Example:

```python
salt '*' netscaler.servicegroup_server_enable 'serviceGroupName' 'serverName'
```
salt.modules.netscaler.servicegroup_server_exists(\texttt{sg\_name}, \texttt{s\_name}, \texttt{s\_port=\text{None}}, **\texttt{connection\_args})

Check if a server:port combination is a member of a servicegroup

CLI Example:

```python
salt '*' netscaler.servicegroup_server_exists 'serviceGroupName' 'serverName' → 'serverPort'
```

salt.modules.netscaler.servicegroup_server_up(\texttt{sg\_name}, \texttt{s\_name}, \texttt{s\_port}, **\texttt{connection\_args})

Check if a server:port combination is in state UP in a servicegroup

CLI Example:

```python
salt '*' netscaler.servicegroup_server_up 'serviceGroupName' 'serverName' → 'serverPort'
```

salt.modules.netscaler.vserver_add(\texttt{v\_name}, \texttt{v\_ip}, \texttt{v\_port}, \texttt{v\_type}, **\texttt{connection\_args})

Add a new lb vserver

CLI Example:

```python
salt '*' netscaler.vserver_add 'vserverName' 'vserverIP' 'vserverPort' → 'vserverType'
salt '*' netscaler.vserver_add 'alex.patate.chaude.443' '1.2.3.4' '443' 'SSL'
```

salt.modules.netscaler.vserver_delete(\texttt{v\_name}, **\texttt{connection\_args})

Delete a lb vserver

CLI Example:

```python
salt '*' netscaler.vserver_delete 'vserverName'
```

salt.modules.netscaler.vserver_exists(\texttt{v\_name}, \texttt{v\_ip=\text{None}}, \texttt{v\_port=\text{None}}, \texttt{v\_type=\text{None}}, **\texttt{connection\_args})

Checks if a vserver exists

CLI Example:

```python
salt '*' netscaler.vserver_exists 'vserverName'
```

salt.modules.netscaler.vserver_servicegroup_add(\texttt{v\_name}, \texttt{sg\_name}, **\texttt{connection\_args})

Bind a servicegroup to a vserver

CLI Example:

```python
salt '*' netscaler.vserver_servicegroup_add 'vserverName' 'serviceGroupName'
```

salt.modules.netscaler.vserver_servicegroup_delete(\texttt{v\_name}, \texttt{sg\_name}, **\texttt{connection\_args})

Unbind a servicegroup from a vserver

CLI Example:

```python
salt '*' netscaler.vserver_servicegroup_delete 'vserverName' 'serviceGroupName'
```

salt.modules.netscaler.vserver_servicegroup_exists(\texttt{v\_name}, \texttt{sg\_name}, **\texttt{connection\_args})

Checks if a servicegroup is tied to a vserver
CLI Example:

```
salt '*' netscaler.vserver_servicegroup_exists 'vserverName' 'serviceGroupName'
```

salt.modules.netscaler.vserver_sslcert_add(v_name, sc_name, **connection_args)
Binds a SSL certificate to a vserver

CLI Example:

```
salt '*' netscaler.vserver_sslcert_add 'vserverName' 'sslCertificateName'
```

salt.modules.netscaler.vserver_sslcert_delete(v_name, sc_name, **connection_args)
Unbinds a SSL certificate from a vserver

CLI Example:

```
salt '*' netscaler.vserver_sslcert_delete 'vserverName' 'sslCertificateName'
```

salt.modules.netscaler.vserver_sslcert_exists(v_name, sc_name, **connection_args)
Checks if a SSL certificate is tied to a vserver

CLI Example:

```
salt '*' netscaler.vserver_sslcert_exists 'vserverName' 'sslCertificateName'
```

23.9.302 salt.modules.network

Module for gathering and managing network information

salt.modules.network.active_tcp()
Return a dict containing information on all of the running TCP connections (currently linux and solaris only)

Changed in version 2015.8.4: Added support for SunOS

CLI Example:

```
salt '*' network.active_tcp
```

salt.modules.network.arp()
Return the arp table from the minion

Changed in version 2015.8.0: Added support for SunOS

CLI Example:

```
salt '*' network.arp
```

salt.modules.network.calc_net(ip_addr, netmask=None)
Returns the CIDR of a subnet based on an IP address (CIDR notation supported) and optional netmask.

CLI Example:

```
salt '*' network.calc_net 172.17.0.5 255.255.255.240
salt '*' network.calc_net 2a02:f6e:a000:80:84d8:8332:7866:4e07/64
```

New in version 2015.8.0.

salt.modules.network.connect(host, port=None, **kwargs)
Test connectivity to a host using a particular port from the minion.
New in version 2014.7.0.

CLI Example:

```
salt '*' network.connect archlinux.org 80
salt '*' network.connect archlinux.org 80 timeout=3
salt '*' network.connect archlinux.org 80 timeout=3 family=ipv4
salt '*' network.connect google-public-dns-a.google.com port=53 proto=udp
  → timeout=3
```

**salt.modules.network.convert_cidr(cidr)**
returns the network address, subnet mask and broadcast address of a cidr address

New in version 2016.3.0.

CLI Example:

```
salt '*' network.convert_cidr 172.31.0.0/16
```

**salt.modules.network.default_route(family=None)**
Return default route(s) from routing table

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.default_route
```

**salt.modules.network.dig(host)**
Performs a DNS lookup with dig

CLI Example:

```
salt '*' network.dig archlinux.org
```

**salt.modules.network.fqdns()**
Return all known FQDNs for the system by enumerating all interfaces and then trying to reverse resolve them (excluding 'lo' interface).

**salt.modules.network.get_bufsize(iface)**
Return network buffer sizes as a dict (currently linux only)

CLI Example:

```
salt '*' network.get_bufsize eth0
```

**salt.modules.network.get_fqdn()**
Get fully qualified domain name

CLI Example:

```
salt '*' network.get_fqdn
```

**salt.modules.network.get_hostname()**
Get hostname

CLI Example:
salt '*

salt.modules.network.get_route(ip)
Return routing information for given destination ip
New in version 2015.5.3.
Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS) Added support for OpenBSD
Changed in version 2016.11.4: Added support for AIX
CLI Example:
salt '*' network.get_route 10.10.10.10

salt.modules.network.hw_addr(iface)
Return the hardware address (a.k.a. MAC address) for a given interface
CLI Example:
salt '*' network.hw_addr eth0

salt.modules.network.hwaddr(iface)
This function is an alias of hw_addr.
Return the hardware address (a.k.a. MAC address) for a given interface
CLI Example:
salt '*' network.hw_addr eth0

salt.modules.network.ifacestartswith(cidr)
Retrieve the interface name from a specific CIDR
New in version 2016.11.0.
CLI Example:
salt '*' network.ifacestartswith 10.0

salt.modules.network.in_subnet(cidr)
Returns True if host is within specified subnet, otherwise False.
CLI Example:
salt '*' network.in_subnet 10.0.0.0/16

salt.modules.network.interface(iface)
Return the inet address for a given interface
New in version 2014.7.0.
CLI Example:
salt '*' network.interface eth0

salt.modules.network.interface_ip(iface)
Return the inet address for a given interface
New in version 2014.7.0.
CLI Example:
salt '.*' network.interface_ip eth0

salt.modules.network.interfaces()
Return a dictionary of information about all the interfaces on the minion

CLI Example:
	salt '.*' network.interfaces

salt.modules.network.ip_addrs(interface=None, include_loopback=False, cidr=None, type=None)
Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless 'include_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="10.0.0.0/8"' will return only the addresses which are within that subnet. If 'type' is 'public', then only public addresses will be returned. Ditto for 'type'='private'.

Changed in version 3001: interface can now be a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:
	salt '.*' network.ip_addrs

salt.modules.network.ip_addrs6(interface=None, include_loopback=False, cidr=None)
Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless 'include_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="2000::/3"' will return only the addresses which are within that subnet.

Changed in version 3001: interface can now be a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:
	salt '.*' network.ip_addrs6

salt.modules.network.ip_in_subnet(ip_addr, cidr)
Returns True if given IP is within specified subnet, otherwise False.

CLI Example:
	salt '.*' network.ip_in_subnet 172.17.0.4 172.16.0.0/12

salt.modules.network.ip_networks(interface=None, include_loopback=False, verbose=False)
New in version 3001.

Returns a list of IPv4 networks to which the minion belongs.

interface Restrict results to the specified interface(s). This value can be either a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:
	salt '.*' network.list_networks
	salt '.*' network.list_networks interface=docker0
	salt '.*' network.list_networks interface=docker0, enp*
	salt '.*' network.list_networks interface=eth*

salt.modules.network.ip_networks6(interface=None, include_loopback=False, verbose=False)
New in version 3001.

Returns a list of IPv6 networks to which the minion belongs.
interface  Restrict results to the specified interface(s). This value can be either a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```
salt '*' network.list_networks6
salt '*' network.list_networks6 interface= docker0
salt '*' network.list_networks6 interface= docker0, enp*
salt '*' network.list_networks6 interface= eth*
```

**salt.modules.network.ipaddrs** *(interface=None, include_loopback=False, cidr=None, type=None)*

This function is an alias of `ip_addrs`.

Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless `include_loopback=True` is indicated. If `interface` is provided, then only IP addresses from that interface will be returned. Providing a CIDR via `cidr= "10.0.0.0/8"` will return only the addresses which are within that subnet. If `type` is `public`, then only public addresses will be returned. Ditto for `type= 'private'.`

Changed in version 3001: `interface` can now be a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```
salt '*' network.ip_addrs
```

**salt.modules.network.ipaddrs6** *(interface=None, include_loopback=False, cidr=None)*

This function is an alias of `ip_addrs6`.

Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless `include_loopback=True` is indicated. If `interface` is provided, then only IP addresses from that interface will be returned. Providing a CIDR via `cidr= "2000::/3"` will return only the addresses which are within that subnet.

Changed in version 3001: `interface` can now be a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```
salt '*' network.ip_addrs6
```

**salt.modules.network.iphexval(ip)**

Retrieve the hexadecimal representation of an IP address

New in version 2016.11.0.

CLI Example:

```
salt '*' network.iphexval 10.0.0.1
```

**salt.modules.network.is_loopback(ip_addr)**

Check if the given IP address is a loopback address

New in version 2014.7.0.

Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.is_loopback 127.0.0.1
```

**salt.modules.network.is_private(ip_addr)**

Check if the given IP address is a private address

New in version 2014.7.0.
Changed in version 2015.8.0: IPv6 support

CLI Example:
```
salt '*' network.is_private 10.0.0.3
```

salt.modules.network.mod_bufsize(iface, *args, **kwargs)
Modify network interface buffers (currently linux only)

CLI Example:
```
salt '*' network.mod_bufsize tx=<val> rx=<val> rx-mini=<val> rx-jumbo=<val>
```

salt.modules.network.mod_hostname(hostname)
Modify hostname

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

CLI Example:
```
salt '*' network.mod_hostname master.saltstack.com
```

salt.modules.network.netstat()
Return information on open ports and states

Note: On BSD minions, the output contains PID info (where available) for each netstat entry, fetched from sockstat/fstat output.

Changed in version 2014.1.4: Added support for OpenBSD, FreeBSD, and NetBSD
Changed in version 2015.8.0: Added support for SunOS
Changed in version 2016.11.4: Added support for AIX

CLI Example:
```
salt '*' network.netstat
```

salt.modules.network.ping(host, timeout=False, return_boolean=False)
Performs an ICMP ping to a host

Changed in version 2015.8.0: Added support for SunOS

CLI Example:
```
salt '*' network.ping archlinux.org
```

New in version 2015.5.0.
Return a True or False instead of ping output.
```
salt '*' network.ping archlinux.org return_boolean=True
```

Set the time to wait for a response in seconds.
```
salt '*' network.ping archlinux.org timeout=3
```

salt.modules.network.reverse_ip(ip_addr)
Returns the reversed IP address
Changed in version 2015.8.0: IPv6 support

CLI Example:

```bash
salt '*' network.reverse_ip 172.17.0.4
```

**salt.modules.network.routes** *(family=None)*
Return currently configured routes from routing table

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)
Changed in version 2016.11.4: Added support for AIX

CLI Example:

```bash
salt '*' network.routes
```

**salt.modules.network.subnets** *(interfaces=None)*
Returns a list of IPv4 subnets to which the host belongs

CLI Example:

```bash
salt '*' network.subnets
salt '*' network.subnets interfaces=eth1
```

**salt.modules.network.subnets6**
Returns a list of IPv6 subnets to which the host belongs

CLI Example:

```bash
salt '*' network.subnets
```

**salt.modules.network.traceroute** *(host)*
Performs a traceroute to a 3rd party host

Changed in version 2015.8.0: Added support for SunOS
Changed in version 2016.11.4: Added support for AIX

CLI Example:

```bash
salt '*' network.traceroute archlinux.org
```

**salt.modules.network.wol** *(mac, bcast='255.255.255.255', destport=9)*
Send Wake On Lan packet to a host

CLI Example:

```bash
salt '*' network.wol 08-00-27-13-69-77
salt '*' network.wol 08-00-27-13-69-77 255.255.255.255 7
salt '*' network.wol 08:00:27:13:69:77 255.255.255.255 7
```
23.9.303 salt.modules.neutron

Module for handling OpenStack Neutron calls

depends

- neutronclient Python module

configuration This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion's config file. For example:

```
keystone.user: 'admin'
keystone.password: 'password'
keystone.tenant: 'admin'
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
keystone.region_name: 'RegionOne'
keystone.service_type: 'network'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```
openstack1:
  keystone.user: 'admin'
  keystone.password: 'password'
  keystone.tenant: 'admin'
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
  keystone.region_name: 'RegionOne'
  keystone.service_type: 'network'

openstack2:
  keystone.user: 'admin'
  keystone.password: 'password'
  keystone.tenant: 'admin'
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/
  keystone.region_name: 'RegionOne'
  keystone.service_type: 'network'
```

With this configuration in place, any of the neutron functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' neutron.network_list profile=openstack1
```

To use keystoneauth1 instead of keystoneclient, include the use_keystoneauth option in the pillar or minion config.

Note: this is required to use keystone v3 as for authentication.

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v3/
keystone.region_name: 'RegionOne'
keystone.service_type: 'network'
keystone.use_keystoneauth: true
keystone.verify: '/path/to/custom/certs/ca-bundle.crt'
```
Note: by default the neutron module will attempt to verify its connection utilizing the system certificates. If you need to verify against another bundle of CA certificates or want to skip verification altogether you will need to specify the `verify` option. You can specify True or False to verify (or not) against system certificates, a path to a bundle or CA certs to check against, or None to allow keystoneauth to search for the certificates on its own.(defaults to True)

```
salt.modules.neutron.add_gateway_router(router, ext_network, profile=None)
```

Adds an external network gateway to the specified router

**CLI Example:**
```
salt '*' neutron.add_gateway_router router-name ext-network-name
```

**Parameters**
- `router` -- ID or name of the router
- `ext_network` -- ID or name of the external network the gateway
- `profile` -- Profile to build on (Optional)

**Returns**
Added Gateway router information

```
salt.modules.neutron.add_interface_router(router, subnet, profile=None)
```

Adds an internal network interface to the specified router

**CLI Example:**
```
salt '*' neutron.add_interface_router router-name subnet-name
```

**Parameters**
- `router` -- ID or name of the router
- `subnet` -- ID or name of the subnet
- `profile` -- Profile to build on (Optional)

**Returns**
Added interface information

```
salt.modules.neutron.create_firewall_rule(protocol, action, profile=None, **kwargs)
```

Creates a new firewall rule

**CLI Example:**
```
salt '*' neutron.create_firewall_rule protocol action
          tenant_id=TENANT_ID name=NAME description=DESCRIPTION ip_version=IP_
          VERSION
          source_ip_address=SOURCE_IP_ADDRESS destination_ip_address=DESTINATION_IP_
          ADDRESS source_port=SOURCE_PORT
destination_port=DESTINATION_PORT shared=SHARED enabled=ENABLED
```

**Parameters**
- `protocol` -- Protocol for the firewall rule, choose "tcp","udp","icmp" or "None".
- `action` -- Action for the firewall rule, choose "allow" or "deny".
- `tenant_id` -- The owner tenant ID. (Optional)
- `name` -- Name for the firewall rule. (Optional)
- `description` -- Description for the firewall rule. (Optional)
- `ip_version` -- IP protocol version, default: 4. (Optional)
- `source_ip_address` -- Source IP address or subnet. (Optional)
- `destination_ip_address` -- Destination IP address or subnet. (Optional)
- `source_port` -- Source port (integer in [1, 65535] or range in a:b). (Optional)
- `destination_port` -- Destination port (integer in [1, 65535] or range in a:b). (Optional)
- `shared` -- Set shared to True, default: False. (Optional)
- `enabled` -- To enable this rule, default: True. (Optional)
salt.modules.neutron.create_floatingip(floating_network, port=None, profile=None)

Creates a new floatingIP

CLI Example:

```
salt '*' neutron.create_floatingip network-name port-name
```

Parameters

- `floating_network` -- Network name or ID to allocate floatingIP from
- `port` -- Of the port to be associated with the floatingIP (Optional)
- `profile` -- Profile to build on (Optional)

Returns

Created floatingIP information

salt.modules.neutron.create_ikepolicy(name, profile=None, **kwargs)

Creates a new IKEPolicy

CLI Example:

```
salt '*' neutron.create_ikepolicy ikepolicy-name
    phase1_negotiation_mode=main auth_algorithm=sha1
    encryption_algorithm=aes-128 pfs=group5
```

Parameters

- `name` -- Name of the IKE policy
- `phase1_negotiation_mode` -- IKE Phase1 negotiation mode in lowercase, default: main (Optional)
- `auth_algorithm` -- Authentication algorithm in lowercase, default: sha1 (Optional)
- `encryption_algorithm` -- Encryption algorithm in lowercase, default: aes-128 (Optional)
- `pfs` -- Prefect Forward Security in lowercase, default: group5 (Optional)
- `units` -- IKE lifetime attribute. default: seconds (Optional)
- `value` -- IKE lifetime attribute. default: 3600 (Optional)
- `ike_version` -- IKE version in lowercase, default: v1 (Optional)
- `profile` -- Profile to build on (Optional)
- `kwargs` --

Returns

Created IKE policy information

salt.modules.neutron.create_ipsec_site_connection(name, ipsecpolicy, ikepolicy, vpnservice, peer_cidrs, peer_address, peer_id, psk, admin_state_up=True, profile=None, **kwargs)

Creates a new IPsecSiteConnection

CLI Example:

```
salt '*' neutron.show_ipsec_site_connection connection-name
    ipsec-policy-name ikepolicy-name vpnservice-name
    192.168.XXX.XXX/24 192.168.XXX.XXX 192.168.XXX.XXX secret
```

Parameters

- `name` -- Set friendly name for the connection
- `ipsecpolicy` -- IPsec policy ID or name associated with this connection
- `ikepolicy` -- IKE policy ID or name associated with this connection
- `vpnservice` -- VPN service instance ID or name associated with this connection
- `peer_cidrs` -- Remote subnet(s) in CIDR format
- `peer_address` -- Peer gateway public IPv4/IPv6 address or FQDN
• **peer_id** -- Peer router identity for authentication Can be IPv4/IPv6 address, e-mail address, key id, or FQDN
• **psk** -- Pre-shared key string
• **initiator** -- Initiator state in lowercase, default: bi-directional
• **admin_state_up** -- Set admin state up to true or false, default: True (Optional)
• **mtu** -- size for the connection, default: 1500 (Optional)
• **dpd_action** -- Dead Peer Detection attribute: hold/clear/disabled/restart/restart-by-peer (Optional)
• **dpd_interval** -- Dead Peer Detection attribute (Optional)
• **dpd_timeout** -- Dead Peer Detection attribute (Optional)
• **profile** -- Profile to build on (Optional)

**Returns** Created IPSec site connection information

```python
salt.modules.neutron.create_ipsecpolicy(name, profile=None, **kwargs)
```

Creates a new IPsecPolicy

**CLI Example:**
```
salt '*' neutron.create_ipsecpolicy ipsecpolicy-name
   transform_protocol=esp auth_algorithm=sha1
   encapsulation_mode=tunnel encryption_algorithm=aes-128
```

**Parameters**
• **name** -- Name of the IPSec policy
• **transform_protocol** -- Transform protocol in lowercase, default: esp (Optional)
• **auth_algorithm** -- Authentication algorithm in lowercase, default: sha1 (Optional)
• **encapsulation_mode** -- Encapsulation mode in lowercase, default: tunnel (Optional)
• **encryption_algorithm** -- Encryption algorithm in lowercase, default: aes-128 (Optional)
• **pfs** -- Prefect Forward Security in lowercase, default: group5 (Optional)
• **units** -- IPSec lifetime attribute. default: seconds (Optional)
• **value** -- IPSec lifetime attribute. default: 3600 (Optional)
• **profile** -- Profile to build on (Optional)

**Returns** Created IPsec policy information

```python
click.salt.modules.neutron.create_network(name, router_ext=None, admin_state_up=True, network_type=None, physical_network=None, segmentation_id=None, shared=None, profile=None)
```

Creates a new network

**CLI Example:**
```
salt '*' neutron.create_network network-name
salt '*' neutron.create_network network-name profile=openstack1
```

**Parameters**
• **name** -- Name of network to create
• **admin_state_up** -- should the state of the network be up? default: True (Optional)
• **router_ext** -- True then if create the external network (Optional)
• **network_type** -- the Type of network that the provider is such as GRE, VXLAN, VLAN, FLAT, or LOCAL (Optional)
• **physical_network** -- the name of the physical network as neutron knows it (Optional)
• **segmentation_id** -- the vlan id or GRE id (Optional)
• **shared** -- is the network shared or not (Optional)
Salt Documentation, Release 3003.3

- **profile** -- Profile to build on (Optional)

**Returns** Created network information

```python
salt.modules.neutron.create_port(name, network, device_id=None, admin_state_up=True, profile=None)
```

Creates a new port

CLI Example:

```
salt '*' neutron.create_port network-name port-name
```

**Parameters**

- `name` -- Name of port to create
- `network` -- Network name or ID
- `device_id` -- ID of device (Optional)
- `admin_state_up` -- Set admin state up to true or false, default: true (Optional)
- `profile` -- Profile to build on (Optional)

**Returns** Created port information

```python
salt.modules.neutron.create_router(name, ext_network=None, admin_state_up=True, profile=None)
```

Creates a new router

CLI Example:

```
salt '*' neutron.create_router new-router-name
```

**Parameters**

- `name` -- Name of router to create (must be first)
- `ext_network` -- ID or name of the external for the gateway (Optional)
- `admin_state_up` -- Set admin state up to true or false, default:true (Optional)
- `profile` -- Profile to build on (Optional)

**Returns** Created router information

```python
salt.modules.neutron.create_security_group(name=None, description=None, profile=None)
```

Creates a new security group

CLI Example:

```
salt '*' neutron.create_security_group security-group-name
  → description='Security group for servers'
```

**Parameters**

- `name` -- Name of security group (Optional)
- `description` -- Description of security group (Optional)
- `profile` -- Profile to build on (Optional)

**Returns** Created security group information

```python
salt.modules.neutron.create_security_group_rule(security_group, remote_group_id=None, direction='ingress', protocol=None, port_range_min=None, port_range_max=None, ether-type='IPv4', profile=None)
```

Creates a new security group rule

CLI Example:
salt '*' neutron.show_security_group_rule security-group-rule-id

Parameters
- **security_group** -- Security group name or ID to add rule
- **remote_group_id** -- Remote security group name or ID to apply rule (Optional)
- **direction** -- Direction of traffic: ingress/egress, default: ingress (Optional)
- **protocol** -- Protocol of packet: null/icmp/tcp/udp, default: null (Optional)
- **port_range_min** -- Starting port range (Optional)
- **port_range_max** -- Ending port range (Optional)
- **ethertype** -- IPv4/IPv6, default: IPv4 (Optional)
- **profile** -- Profile to build on (Optional)

Returns Created security group rule information

salt.modules.neutron.create_subnet(network, cidr, name=None, ip_version=4, profile=None)

Creates a new subnet

CLI Example:

salt '*' neutron.create_subnet network-name 192.168.1.0/24

Parameters
- **network** -- Network ID or name this subnet belongs to
- **cidr** -- CIDR of subnet to create (Ex. '192.168.1.0/24')
- **name** -- Name of the subnet to create (Optional)
- **ip_version** -- Version to use, default is 4(IPv4) (Optional)
- **profile** -- Profile to build on (Optional)

Returns Created subnet information

salt.modules.neutron.create_vpnservice(subnet, router, name, admin_state_up=True, profile=None)

Creates a new VPN service

CLI Example:

salt '*' neutron.create_vpnservice router-name name

Parameters
- **subnet** -- Subnet unique identifier for the VPN service deployment
- **router** -- Router unique identifier for the VPN service
- **name** -- Set a name for the VPN service
- **admin_state_up** -- Set admin state up to true or false, default:True (Optional)
- **profile** -- Profile to build on (Optional)

Returns Created VPN service information

salt.modules.neutron.delete_firewall_rule(firewall_rule, profile=None)

Deletes the specified firewall_rule

CLI Example:

salt '*' neutron.delete_firewall_rule firewall-rule

Parameters
- **firewall_rule** -- ID or name of firewall rule to delete
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.delete_floatingip(floatingip_id, profile=None)

Deletes the specified floating IP
CLI Example:
```
salt '*' neutron.delete_floatingip floatingip-id
```

Parameters
- `floatingip_id` -- ID of floatingIP to delete
- `profile` -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.delete_ikepolicy(ikepolicy, profile=None)
Deletes the specified IKEPolicy

CLI Example:
```
salt '*' neutron.delete_ikepolicy ikepolicy-name
```

Parameters
- `ikepolicy` -- ID or name of IKE policy to delete
- `profile` -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.delete_ipsec_site_connection(ipsec_site_connection, profile=None)
Deletes the specified IPsecSiteConnection

CLI Example:
```
salt '*' neutron.delete_ipsec_site_connection connection-name
```

Parameters
- `ipsec_site_connection` -- ID or name of ipsec site connection to delete
- `profile` -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.delete_ipsecpolicy(ipsecpolicy, profile=None)
Deletes the specified IPsecPolicy

CLI Example:
```
salt '*' neutron.delete_ipsecpolicy ipsecpolicy-name
```

Parameters
- `ipsecpolicy` -- ID or name of IPSec policy to delete
- `profile` -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.delete_network(network, profile=None)
Deletes the specified network

CLI Example:
```
salt '*' neutron.delete_network network-name
salt '*' neutron.delete_network network-name profile=openstack1
```

Parameters
- `network` -- ID or name of network to delete
- `profile` -- Profile to build on (Optional)

Returns True(Succeed) or False
salt.modules.neutron.delete_port(port, profile=None)

Deletes the specified port

CLI Example:

```
salt '*' neutron.delete_network port-name
salt '*' neutron.delete_network port-name profile=openstack1
```

**Parameters**

- **port** -- port name or ID
- **profile** -- Profile to build on (Optional)

**Returns**

True(Succeed) or False

salt.modules.neutron.delete_quota(tenant_id, profile=None)

Delete the specified tenant's quota value

CLI Example:

```
salt '*' neutron.update_quota tenant-id
salt '*' neutron.update_quota tenant-id profile=openstack1
```

**Parameters**

- **tenant_id** -- ID of tenant to quota delete
- **profile** -- Profile to build on (Optional)

**Returns**

True(Delete succeed) or False(Delete failed)

salt.modules.neutron.delete_router(router, profile=None)

Delete the specified router

CLI Example:

```
salt '*' neutron.delete_router router-name
```

**Parameters**

- **router** -- ID or name of router to delete
- **profile** -- Profile to build on (Optional)

**Returns**

True(Succeed) or False

salt.modules.neutron.delete_security_group(security_group, profile=None)

Deletes the specified security group

CLI Example:

```
salt '*' neutron.delete_security_group security-group-name
```

**Parameters**

- **security_group** -- ID or name of security group to delete
- **profile** -- Profile to build on (Optional)

**Returns**

True(Succeed) or False

salt.modules.neutron.delete_security_group_rule(security_group_rule_id, profile=None)

Deletes the specified security group rule

CLI Example:

```
salt '*' neutron.delete_security_group_rule security-group-rule-id
```

**Parameters**

- **security_group_rule_id** -- ID of security group rule to delete
- **profile** -- Profile to build on (Optional)
**Returns** True(Succeed) or False

salt.modules.neutron.\texttt{delete\_subnet}(\texttt{subnet}, \texttt{profile=None})

Deletes the specified subnet

CLI Example:

\begin{verbatim}
salt '*' neutron.delete_subnet subnet-name
salt '*' neutron.delete_subnet subnet-name profile=openstack1
\end{verbatim}

**Parameters**
- \texttt{subnet} -- ID or name of subnet to delete
- \texttt{profile} -- Profile to build on (Optional)

**Returns** True(Succeed) or False

salt.modules.neutron.\texttt{delete\_vpnservice}(\texttt{vpnservice}, \texttt{profile=None})

Deletes the specified VPN service

CLI Example:

\begin{verbatim}
salt '*' neutron.delete_vpnservice vpnservice-name
\end{verbatim}

**Parameters**
- \texttt{vpnservice} -- ID or name of vpn service to delete
- \texttt{profile} -- Profile to build on (Optional)

**Returns** True(Succeed) or False

salt.modules.neutron.\texttt{get\_quotas\_tenant}(\texttt{profile=None})

Fetches tenant info in server’s context for following quota operation

CLI Example:

\begin{verbatim}
salt '*' neutron.get_quotas_tenant
salt '*' neutron.get_quotas_tenant profile=openstack1
\end{verbatim}

**Parameters** \texttt{profile} -- Profile to build on (Optional)
**Returns** Quotas information

salt.modules.neutron.\texttt{list\_agents}(\texttt{profile=None})

List agents.

CLI Example:

\begin{verbatim}
salt '*' neutron.list_agents
\end{verbatim}

**Parameters** \texttt{profile} -- Profile to build on (Optional)
**Returns** agents message.

salt.modules.neutron.\texttt{list\_extensions}(\texttt{profile=None})

Fetches a list of all extensions on server side

CLI Example:

\begin{verbatim}
salt '*' neutron.list_extensions
salt '*' neutron.list_extensions profile=openstack1
\end{verbatim}

**Parameters** \texttt{profile} -- Profile to build on (Optional)
**Returns** List of extensions

salt.modules.neutron.\texttt{list\_firewall\_rules}(\texttt{profile=None})

Fetches a list of all firewall rules for a tenant
CLI Example:

```
salt '*' neutron.list_firewall_rules
```

Parameters `profile` -- Profile to build on (Optional)
Returns List of firewall rules

```
salt.modules.neutron.list_firewalls(profile=None)
```

Fetches a list of all firewalls for a tenant

CLI Example:

```
salt '*' neutron.list_firewalls
```

Parameters `profile` -- Profile to build on (Optional)
Returns List of firewalls

```
salt.modules.neutron.listloatingips(profile=None)
```

Fetch a list of all floatingIPs for a tenant

CLI Example:

```
salt '*' neutron.listfloatingips
salt '*' neutron.listfloatingips profile=openstack1
```

Parameters `profile` -- Profile to build on (Optional)
Returns List of floatingIP

```
salt.modules.neutron.list_ikepolicies(profile=None)
```

Fetches a list of all configured IKEPolicies for a tenant

CLI Example:

```
salt '*' neutron.list_ikepolicies
salt '*' neutron.list_ikepolicies profile=openstack1
```

Parameters `profile` -- Profile to build on (Optional)
Returns List of IKE policy

```
salt.modules.neutron.list_ipsec_site_connections(profile=None)
```

Fetches all configured IPsec Site Connections for a tenant

CLI Example:

```
salt '*' neutron.list_ipsec_site_connections
salt '*' neutron.list_ipsec_site_connections profile=openstack1
```

Parameters `profile` -- Profile to build on (Optional)
Returns List of IPSec site connection

```
salt.modules.neutron.list_ipsecpolicies(profile=None)
```

Fetches a list of all configured IPsecPolicies for a tenant

CLI Example:

```
salt '*' neutron.list_ipsecpolicies
salt '*' neutron.list_ipsecpolicies ipsecpolicy-name profile=openstack1
```

Parameters `profile` -- Profile to build on (Optional)
Returns List of IPSec policy
salt.modules.neutron.list_l3_agent_hosting_routers(router, profile=None)
List L3 agents hosting a router.

CLI Example:
salt '*' neutron.list_l3_agent_hosting_routers router

:param router: router name or ID to query.
:param profile: Profile to build on (Optional)
:return: L3 agents message.

salt.modules.neutron.list_networks(profile=None)
Fetches a list of all networks for a tenant

CLI Example:
salt '*' neutron.list_networks
salt '*' neutron.list_networks profile=openstack1

Parameters profile -- Profile to build on (Optional)
Returns List of network

salt.modules.neutron.list_ports(profile=None)
Fetches a list of all networks for a tenant

CLI Example:
salt '*' neutron.list_ports
salt '*' neutron.list_ports profile=openstack1

Parameters profile -- Profile to build on (Optional)
Returns List of port

salt.modules.neutron.list_quotas(profile=None)
Fetches all tenants quotas

CLI Example:

Parameters profile -- Profile to build on (Optional)
Returns List of quotas

salt.modules.neutron.list_routers(profile=None)
Fetches a list of all routers for a tenant

CLI Example:

Parameters profile -- Profile to build on (Optional)
Returns List of router

salt.modules.neutron.list_security_group_rules(profile=None)
Fetches a list of all security group rules for a tenant

CLI Example:

Parameters **profile** -- Profile to build on (Optional)  
Returns List of security group rule

```python
salt.modules.neutron.list_security_groups(profile=None)
```

Fetches a list of all security groups for a tenant

CLI Example:

```
salt '*' neutron.list_security_groups
salt '*' neutron.list_security_groups profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)  
Returns List of security group

```python
salt.modules.neutron.list_subnets(profile=None)
```

Fetches a list of all networks for a tenant

CLI Example:

```
salt '*' neutron.list_subnets
salt '*' neutron.list_subnets profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)  
Returns List of subnet

```python
salt.modules.neutron.list_vpnservices(retrieve_all=True, profile=None, **kwargs)
```

Fetches a list of all configured VPN services for a tenant

CLI Example:

```
salt '*' neutron.list_vpnservices
```

Parameters
- **retrieve_all** -- True or False, default: True (Optional)  
- **profile** -- Profile to build on (Optional)

```python
salt.modules.neutron.remove_gateway_router(router, profile=None)
```

Removes an external network gateway from the specified router

CLI Example:

```
salt '*' neutron.remove_gateway_router router-name
```

Parameters
- **router** -- ID or name of router  
- **profile** -- Profile to build on (Optional)  

Returns True(Succeed) or False

```python
salt.modules.neutron.remove_interface_router(router, subnet, profile=None)
```

Removes an internal network interface from the specified router

CLI Example:

```
salt '*' neutron.remove_interface_router router-name subnet-name
```

Parameters
- **router** -- ID or name of the router  
- **subnet** -- ID or name of the subnet  
- **profile** -- Profile to build on (Optional)  

Returns True(Succeed) or False
salt.modules.neutron.show_firewall(firewall, profile=None)
Fetches information of a specific firewall rule

CLI Example:
salt '*' neutron.show_firewall firewall

Parameters
- firewall -- ID or name of firewall to look up
- profile -- Profile to build on (Optional)

Returns firewall information

salt.modules.neutron.show_firewall_rule(firewall_rule, profile=None)
Fetches information of a specific firewall rule

CLI Example:
salt '*' neutron.show_firewall_rule firewall-rule-name

Parameters
- ipsecpolicy -- ID or name of firewall rule to look up
- profile -- Profile to build on (Optional)

Returns firewall rule information

salt.modules.neutron.show_floatingip(floatingip_id, profile=None)
Fetches information of a certain floatingIP

CLI Example:
salt '*' neutron.show_floatingip floatingip-id

Parameters
- floatingip_id -- ID of floatingIP to look up
- profile -- Profile to build on (Optional)

Returns Floating IP information

salt.modules.neutron.show_ikepolicy(ikepolicy, profile=None)
Fetches information of a specific IKEPolicy

CLI Example:
salt '*' neutron.show_ikepolicy ikepolicy-name

Parameters
- ikepolicy -- ID or name of ikepolicy to look up
- profile -- Profile to build on (Optional)

Returns IKE policy information

salt.modules.neutron.show_ipsec_site_connection(ipsec_site_connection, profile=None)
Fetches information of a specific IPsecSiteConnection

CLI Example:
salt '*' neutron.show_ipsec_site_connection connection-name

Parameters
- ipsec_site_connection -- ID or name of ipsec site connection to look up
- profile -- Profile to build on (Optional)

Returns IPSec site connection information
salt.modules.neutron.show_ipsecpolicy(ipsecpolicy, profile=None)
Fetches information of a specific IPSecPolicy

CLI Example:
```
salt '*' neutron.show_ipsecpolicy ipsecpolicy-name
```

Parameters
- **ipsecpolicy** -- ID or name of IPSec policy to look up
- **profile** -- Profile to build on (Optional)

Returns IPSec policy information

salt.modules.neutron.show_network(network, profile=None)
Fetches information of a certain network

CLI Example:
```
salt '*' neutron.show_network network-name
salt '*' neutron.show_network network-name profile=openstack1
```

Parameters
- **network** -- ID or name of network to look up
- **profile** -- Profile to build on (Optional)

Returns Network information

salt.modules.neutron.show_port(port, profile=None)
Fetches information of a certain port

CLI Example:
```
salt '*' neutron.show_port port-id
salt '*' neutron.show_port port-id profile=openstack1
```

Parameters
- **port** -- ID or name of port to look up
- **profile** -- Profile to build on (Optional)

Returns Port information

salt.modules.neutron.show_quota(tenant_id, profile=None)
Fetches information of a certain tenant's quotas

CLI Example:
```
salt '*' neutron.show_quota tenant-id
salt '*' neutron.show_quota tenant-id profile=openstack1
```

Parameters
- **tenant_id** -- ID of tenant
- **profile** -- Profile to build on (Optional)

Returns Quota information

salt.modules.neutron.show_router(router, profile=None)
Fetches information of a certain router

CLI Example:
```
salt '*' neutron.show_router router-name
```

Parameters
- **router** -- ID or name of router to look up
- **profile** -- Profile to build on (Optional)

Returns Router information

salt.modules.neutron.\texttt{show}\_\texttt{security}\_\texttt{group}(\texttt{security}\_\texttt{group}, \texttt{profile}=\texttt{None})

Fetched information of a certain security group

CLI Example:

\begin{verbatim}
salt '*' neutron.show_security_group security-group-name
\end{verbatim}

Parameters

- **security\_group** -- ID or name of security group to look up
- **profile** -- Profile to build on (Optional)

Returns Security group information

salt.modules.neutron.\texttt{show}\_\texttt{security}\_\texttt{group}\_\texttt{rule}(\texttt{security}\_\texttt{group}\_\texttt{rule}\_\texttt{id}, \texttt{profile}=\texttt{None})

Fetched information of a certain security group rule

CLI Example:

\begin{verbatim}
salt '*' neutron.show_security_group_rule security-group-rule-id
\end{verbatim}

Parameters

- **security\_group\_rule\_id** -- ID of security group rule to look up
- **profile** -- Profile to build on (Optional)

Returns Security group rule information

salt.modules.neutron.\texttt{show}\_\texttt{subnet}(\texttt{subnet}, \texttt{profile}=\texttt{None})

Fetched information of a certain subnet

CLI Example:

\begin{verbatim}
salt '*' neutron.show_subnet subnet-name
\end{verbatim}

Parameters

- **subnet** -- ID or name of subnet to look up
- **profile** -- Profile to build on (Optional)

Returns Subnet information

salt.modules.neutron.\texttt{show}\_\texttt{vpnservice}(\texttt{vpnservice}, \texttt{profile}=\texttt{None}, **\texttt{kwargs})

Fetched information of a specific VPN service

CLI Example:

\begin{verbatim}
salt '*' neutron.show_vpnservice vpnservice-name
\end{verbatim}

Parameters

- **vpnservice** -- ID or name of vpn service to look up
- **profile** -- Profile to build on (Optional)

Returns VPN service information

salt.modules.neutron.\texttt{update}\_\texttt{firewall}\_\texttt{rule}(\texttt{firewall}\_\texttt{rule}, protocol=\texttt{None}, action=\texttt{None}, name=\texttt{None}, description=\texttt{None}, ip\_version=\texttt{None}, source\_ip\_address=\texttt{None}, destination\_ip\_address=\texttt{None}, source\_port=\texttt{None}, destination\_port=\texttt{None}, shared=\texttt{None}, enabled=\texttt{None}, profile=\texttt{None})

Update a firewall rule

CLI Example:
salt 'salt' neutron.update_firewall_rule firewall_rule protocol=PROTOCOL
  →action=ACTION
  →name=NAME description=DESCRIPTION ip_version=IP_VERSION
  →source_ip_address=SOURCE_IP_ADDRESS destination_ip_address=DESTINATION_IP
  →source_port=SOURCE_PORT destination_port=DESTINATION_PORT shared=SHARED
  →enabled=ENABLED

Parameters
- **firewall_rule** -- ID or name of firewall rule to update.
- **protocol** -- Protocol for the firewall rule, choose "tcp","udp","icmp" or "None". (Optional)
- **action** -- Action for the firewall rule, choose "allow" or "deny". (Optional)
- **name** -- Name for the firewall rule. (Optional)
- **description** -- Description for the firewall rule. (Optional)
- **ip_version** -- IP protocol version, default: 4. (Optional)
- **source_ip_address** -- Source IP address or subnet. (Optional)
- **destination_ip_address** -- Destination IP address or subnet. (Optional)
- **source_port** -- Source port (integer in [1, 65535] or range in a:b). (Optional)
- **destination_port** -- Destination port (integer in [1, 65535] or range in a:b). (Optional)
- **shared** -- Set shared to True, default: False. (Optional)
- **enabled** -- To enable this rule, default: True. (Optional)
- **profile** -- Profile to build on (Optional)

salt.modules.neutron.update_floatingip(floatingip_id, port=None, profile=None)
Updates a floatingIP

CLI Example:
salt 'salt' neutron.update_floatingip network-name port-name

Parameters
- **floatingip_id** -- ID of floatingIP
- **port** -- ID or name of port, to associate floatingip to None or do not specify to disassociate the floatingip (Optional)
- **profile** -- Profile to build on (Optional)

Returns Value of updated floating IP information

salt.modules.neutron.update_network(network, name, profile=None)
Updates a network

CLI Example:
salt 'salt' neutron.update_network network-name new-network-name

Parameters
- **network** -- ID or name of network to update
- **name** -- Name of this network
- **profile** -- Profile to build on (Optional)

Returns Value of updated network information

salt.modules.neutron.update_port(port, name, admin_state_up=True, profile=None)
Updates a port

CLI Example:
salt 'salt '*' neutron.update_port port-name network-name new-port-name

Parameters
- **port** -- Port name or ID
- **name** -- Name of this port
- **admin_state_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)

Returns 
Value of updated port information

salt.modules.neutron.update_quota

Update a tenant’s quota

CLI Example:
salt 'salt '*' neutron.update_quota tenant-id subnet=40 router=50 network=10 floatingip=30 port=30

Parameters
- **tenant_id** -- ID of tenant
- **subnet** -- Value of subnet quota (Optional)
- **router** -- Value of router quota (Optional)
- **network** -- Value of network quota (Optional)
- **floatingip** -- Value of floatingip quota (Optional)
- **port** -- Value of port quota (Optional)
- **security_group** -- Value of security group (Optional)
- **security_group_rule** -- Value of security group rule (Optional)
- **profile** -- Profile to build on (Optional)

Returns 
Value of updated quota

salt.modules.neutron.update_router

Updates a router

CLI Example:
salt 'salt '*' neutron.update_router router_id name=new-router-name admin_state_up=True

Parameters
- **router** -- ID or name of router to update
- **name** -- Name of this router
- **ext_network** -- ID or name of the external for the gateway (Optional)
- **admin_state_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)
- ****kwargs

Returns 
Value of updated router information

salt.modules.neutron.update_security_group

Updates a security group

CLI Example:
salt 'salt '*' neutron.update_security_group security-group-name new-security-group-name

Parameters
- **security_group** -- ID or name of security group to update
- **name** -- Name of this security group
- **description** -- Description of the security group (Optional)
- **profile** -- Profile to build on (Optional)

Returns 
Value of updated security group information

23.9. execution modules
Parameters

- **security_group** -- ID or name of security group to update
- **name** -- Name of this security group (Optional)
- **description** -- Description of security group (Optional)
- **profile** -- Profile to build on (Optional)

Returns  Value of updated security group information

salt.modules.neutron.update_subnet(subnet, name, profile=None)

Updates a subnet

    CLI Example:

    ```
    salt '*' neutron.update_subnet subnet-name new-subnet-name
    ```

Parameters

- **subnet** -- ID or name of subnet to update
- **name** -- Name of this subnet
- **profile** -- Profile to build on (Optional)

Returns  Value of updated subnet information

salt.modules.neutron.update_vpnervice(vpnservice, desc, profile=None)

Updates a VPN service

    CLI Example:

    ```
    salt '*' neutron.update_vpnervice vpnservice-name desc='VPN Service1'
    ```

Parameters

- **vpnervice** -- ID or name of vpn service to update
- **desc** -- Set a description for the VPN service
- **profile** -- Profile to build on (Optional)

Returns  Value of updated VPN service information

23.9.304  salt.modules.neutronng

Neutron module for interacting with OpenStack Neutron

New in version 2018.3.0.

:depends: shade

Example configuration

```
neutron:
    cloud: default

neutron:
    auth:
        username: admin
        password: password123
        user_domain_name: mydomain
        project_name: myproject
        project_domain_name: myproject
        auth_url: https://example.org:5000/v3
        identity_api_version: 3
```

salt.modules.neutronng.compare_changes(obj, **kwargs)

    Compare two dicts returning only keys that exist in the first dict and are different in the second one

2418  Chapter 23. Salt Module Reference
salt.modules.neutronng.get_openstack_cloud(auth=None)
Return an openstack_cloud

salt.modules.neutronng.get_operator_cloud(auth=None)
Return an operator_cloud

salt.modules.neutronng.list_networks(auth=None, **kwargs)
List networks
filters A Python dictionary of filter conditions to push down
CLI Example:

```python
salt '*' neutronng.list_networks
salt '*' neutronng.list_networks filters={"tenant_id": "1dcac318a83b4610b7a7f7ba01465548"}
```

salt.modules.neutronng.list_subnets(auth=None, **kwargs)
List subnets
filters A Python dictionary of filter conditions to push down
CLI Example:

```python
salt '*' neutronng.list_subnets
salt '*' neutronng.list_subnets filters={"tenant_id": "1dcac318a83b4610b7a7f7ba01465548"}
```

salt.modules.neutronng.network_create(auth=None, **kwargs)
Create a network
name Name of the network being created
shared [False] If True, set the network as shared
admin_state_up [True] If True, Set the network administrative state to "up"
external [False] Control whether or not this network is externally accessible
provider An optional Python dictionary of network provider options
project_id The project ID on which this network will be created
CLI Example:

```python
salt '*' neutronng.network_create name=network2 shared=True admin_state_up=True external=True
salt '*' neutronng.network_create name=network3 provider={"network_type": "vlan", "segmentation_id": "4010", "physical_network": "provider"}, project_id=1dcac318a83b4610b7a7f7ba01465548
```

salt.modules.neutronng.network_delete(auth=None, **kwargs)
Delete a network
name_or_id Name or ID of the network being deleted
CLI Example:

```python
salt '*' neutronng.network_delete name_or_id(network1
salt '*' neutronng.network_delete name_or_id=1dcac318a83b4610b7a7f7ba01465548
```

salt.modules.neutronng.network_get(auth=None, **kwargs)
Get a single network
filters A Python dictionary of filter conditions to push down
CLI Example:

```python
salt '*' neutronng.network_get name=XLB4
```
salt.modules.neutronng.security_group_create(auth=None, **kwargs)
Create a security group. Use security_group_get to create default.

   project_id  The project ID on which this security group will be created

CLI Example:

```
salt '*' neutronng.security_group_create name=secgroup1 description="Very secure security group"
salt '*' neutronng.security_group_create name=secgroup1 description="Very secure security group"
id=1dcac318a83b4610b7a7f7ba01465548
```

salt.modules.neutronng.security_group_delete(auth=None, **kwargs)
Delete a security group

   name_or_id  The name or unique ID of the security group

CLI Example:

```
salt '*' neutronng.security_group_delete name_or_id=secgroup1
```

salt.modules.neutronng.security_group_get(auth=None, **kwargs)
Get a single security group. This will create a default security group if one does not exist yet for a particular project id.

   filters  A Python dictionary of filter conditions to push down

CLI Example:

```
salt '*' neutronng.security_group_get name=1dcac318a83b4610b7a7f7ba01465548
salt '*' neutronng.security_group_get name=default filters='{
    "tenant_id":"2e778bb64ca64a199eb526b5958d8710"}
```

salt.modules.neutronng.security_group_rule_create(auth=None, **kwargs)
Create a rule in a security group

   secgroup_name_or_id  The security group name or ID to associate with this security group rule. If a non-unique group name is given, an exception is raised.

   port_range_min  The minimum port number in the range that is matched by the security group rule. If the protocol is TCP or UDP, this value must be less than or equal to the port_range_max attribute value. If nova is used by the cloud provider for security groups, then a value of None will be transformed to -1.

   port_range_max  The maximum port number in the range that is matched by the security group rule. The port_range_min attribute constrains the port_range_max attribute. If nova is used by the cloud provider for security groups, then a value of None will be transformed to -1.

   protocol  The protocol that is matched by the security group rule. Valid values are None, tcp, udp, and icmp.

   remote_ip_prefix  The remote IP prefix to be associated with this security group rule. This attribute matches the specified IP prefix as the source IP address of the IP packet.

   remote_group_id  The remote group ID to be associated with this security group rule

   direction  Either ingress or egress; the direction in which the security group rule is applied. For a compute instance, an ingress security group rule is applied to incoming (ingress) traffic for that instance. An egress rule is applied to traffic leaving the instance

   ethertype  Must be IPv4 or IPv6, and addresses represented in CIDR must match the ingress or egress rules

   project_id  Specify the project ID this security group will be created on (admin-only)

CLI Example:

```
salt '*' neutronng.security_group_rule_create secgroup_name_or_id=secgroup1
```

(continues on next page)
salt '>*</salt.modules.neutronng.security_group_rule_create(secgroup_name_or_  id=secgroup2 port_range_min=8080 port_range_max=8080 direction='egress')

salt '>*</salt.modules.neutronng.security_group_rule_create(secgroup_name_or_  id=c0e1d1ce-7296-405e-919d-1c08217be529 port_range_min=8080 port_range_max=8080 direction='egress'

salt '>*</salt.modules.neutronng.security_group_rule_delete(auth=None, **kwargs)
Delete a security group
  name_or_id The unique ID of the security group rule
CLI Example:

salt '>*</salt.modules.neutronng.security_group_rule_delete name_or_  id=1dcac318a83b4610b7a7f7ba01465548

salt '>*</salt.modules.neutronng.security_group_update(secgroup=None, auth=None, **kwargs)
Update a security group
  secgroup Name, ID or Raw Object of the security group to update
  name New name for the security group
  description New description for the security group
CLI Example:

salt '>*</salt.modules.neutronng.security_group_update secgroup=secgroup1 name='Very secure security group' description='Very secure security group'
  id=1dcac318a83b4610b7a7f7ba01465548

salt '>*</salt.modules.neutronng.setup_clouds(auth=None)
Call functions to create Shade cloud objects in __context__ to take advantage of Shade's in-memory caching across several states

salt '>*</salt.modules.neutronng.subnet_create(auth=None, **kwargs)
Create a subnet
  network_name_or_id The unique name or ID of the attached network. If a non-unique name is supplied, an exception is raised.
  cidr The CIDR
  ip_version The IP version, which is 4 or 6.
  enable_dhcp [False] Set to True if DHCP is enabled and False if disabled
  subnet_name The name of the subnet
  tenant_id The ID of the tenant who owns the network. Only administrative users can specify a tenant ID other than their own.
  allocation_pools A list of dictionaries of the start and end addresses for the allocation pools.
  gateway_ip The gateway IP address. When you specify both allocation_pools and gateway_ip, you must ensure that the gateway IP does not overlap with the specified allocation pools.
  disable_gateway_ip [False] Set to True if gateway IP address is disabled and False if enabled. It is not allowed with gateway_ip.
  dns_nameservers A list of DNS name servers for the subnet
  host_routes A list of host route dictionaries for the subnet
  ipv6_ra_mode IPv6 Router Advertisement mode. Valid values are dhcpv6-stateful, dhcpv6-stateless, or slaac.
  ipv6_address_mode IPv6 address mode. Valid values are dhcpv6-stateful, dhcpv6-stateless, or slaac.
  use_default_subnetpool If True, use the default subnetpool for ip_version to obtain a CIDR. It is required to pass None to the cidr argument when enabling this option.
CLI Example:

```python
salt '*' neutronng.subnet_create network_name_or_id=network1
  subnet_name=subnet1

salt '*' neutronng.subnet_create subnet_name=subnet2
  network_name_or_id=network2
  enable_dhcp=True
  allocation_pools=[
    {
      "start": "192.168.199.2",
      "end": "192.168.199.254"
    }
  ]
  gateway_ip='192.168.199.1'
  cidr=192.168.199.0/24

salt '*' neutronng.subnet_create
  network_name_or_id=network1
  subnet_name=subnet1
  dns_nameservers=['8.8.8.8', '8.8.8.7']
```

salt.modules.neutronng.subnet_delete(name=subnet1)

Delete a subnet

CLI Example:

```python
salt '*' neutronng.subnet_delete name=subnet1
salt '*' neutronng.subnet_delete name=1dcac318a83b4610b7a7f7ba01465548
```

salt.modules.neutronng.subnet_get(name=subnet1)

Get a single subnet

filters A Python dictionary of filter conditions to push down

CLI Example:

```python
salt '*' neutronng.subnet_get name=subnet1
```

salt.modules.neutronng.subnet_update(name_or_id=subnet1, subnet_name=subnet2, enable_dhcp=True, gateway_ip='192.168.199.1', cidr=192.168.199.0/24, dns_nameservers=['8.8.8.8', '8.8.8.7'])

Update a subnet

name_or_id Name or ID of the subnet to update

subnet_name The new name of the subnet

enable_dhcp Set to True if DHCP is enabled and False if disabled

gateway_ip The gateway IP address. When you specify both allocation_pools and gateway_ip, you must ensure that the gateway IP does not overlap with the specified allocation pools.

disable_gateway_ip [False] Set to True if gateway IP address is disabled and False if enabled. It is not allowed with gateway_ip.

allocation_pools A list of dictionaries of the start and end addresses for the allocation pools.

dns_nameservers A list of DNS name servers for the subnet

host_routes A list of host route dictionaries for the subnet

23.9.305 salt.modules.nexus

Module for fetching artifacts from Nexus 3.x

New in version 2018.3.0.

salt.modules.nexus.get_latest_release(nexus_url, repository, group_id, artifact_id, packaging, target_dir='/tmp', target_file=None, classifier=None, username=None, password=None)

Gets the latest release of the artifact

nexus_url URL of nexus instance
repository  Release repository in nexus to retrieve artifact from, for example: libs-releases

group_id  Group Id of the artifact

artifact_id  Artifact Id of the artifact

packaging  Packaging type (jar,war,ear,etc)

target_dir  Target directory to download artifact to (default: /tmp)

target_file  Target file to download artifact to (by default it is target_dir/artifact_id-version.packaging)

classifier  Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.

username  nexus username. Optional parameter.

password  nexus password. Optional parameter.

```
salt.modules.nexus.get_latest_snapshot(nexus_url, repository, group_id, artifact_id, packaging, target_dir='/tmp', target_file=None, classifier=None, username=None, password=None)
```

Gets latest snapshot of the given artifact

- **nexus_url**: URL of nexus instance
- **repository**: Snapshot repository in nexus to retrieve artifact from, for example: libs-snapshots
- **group_id**: Group Id of the artifact
- **artifact_id**: Artifact Id of the artifact
- **packaging**: Packaging type (jar,war,ear,etc)
- **target_dir**: Target directory to download artifact to (default: /tmp)
- **target_file**: Target file to download artifact to (by default it is target_dir/artifact_id-version.packaging)
- **classifier**: Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.
- **username**: nexus username. Optional parameter.
- **password**: nexus password. Optional parameter.

```
salt.modules.nexus.get_release(nexus_url, repository, group_id, artifact_id, packaging, version, target_dir='/tmp', target_file=None, classifier=None, username=None, password=None)
```

Gets the specified release of the artifact

- **nexus_url**: URL of nexus instance
- **repository**: Release repository in nexus to retrieve artifact from, for example: libs-releases
- **group_id**: Group Id of the artifact
- **artifact_id**: Artifact Id of the artifact
- **packaging**: Packaging type (jar,war,ear,etc)
- **version**: Version of the artifact
- **target_dir**: Target directory to download artifact to (default: /tmp)
- **target_file**: Target file to download artifact to (by default it is target_dir/artifact_id-version.packaging)
- **classifier**: Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.
- **username**: nexus username. Optional parameter.
- **password**: nexus password. Optional parameter.

```
salt.modules.nexus.get_snapshot(nexus_url, repository, group_id, artifact_id, packaging, version, snapshot_version=None, target_dir='/tmp', target_file=None, classifier=None, username=None, password=None)
```

Gets snapshot of the desired version of the artifact

- **nexus_url**: URL of nexus instance
- **repository**: Snapshot repository in nexus to retrieve artifact from, for example: libs-snapshots
- **group_id**: Group Id of the artifact
- **artifact_id**: Artifact Id of the artifact
- **packaging**: Packaging type (jar,war,ear,etc)
- **version**: Version of the artifact
- **snapshot_version**: Snapshot version to download (default: None)
- **target_dir**: Target directory to download artifact to (default: /tmp)
- **target_file**: Target file to download artifact to (by default it is target_dir/artifact_id-snapshot_version.packaging)
- **classifier**: Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.
- **username**: nexus username. Optional parameter.
- **password**: nexus password. Optional parameter.
username  nexus username. Optional parameter.
password  nexus password. Optional parameter.
salt.modules.nexus.get_snapshot_version_string(nexus_url, repository, group_id, artifact_id, packaging, version, classifier=None, username=None, password=None)

Gets the specific version string of a snapshot of the desired version of the artifact
nexus_url  URL of nexus instance
repository  Snapshot repository in nexus to retrieve artifact from, for example: libs-snapshots
group_id  Group Id of the artifact
artifact_id  Artifact Id of the artifact
packaging  Packaging type (jar,war,ear,etc)
version  Version of the artifact
classifier  Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.
username  nexus username. Optional parameter.
password  nexus password. Optional parameter.

exception  salt.modules.nexus.nexusError(value)

23.9.306  salt.modules.nfs3

Module for managing NFS version 3.
salt.modules.nfs3.add_export(exports='/etc/exports', path=None, hosts=None, options=None)
Add an export
CLI Example:

```
salt '*' nfs3.add_export path='/srv/test' hosts='127.0.0.1' options=['rw']
```
salt.modules.nfs3.del_export(exports='/etc/exports', path=None)
Remove an export
CLI Example:

```
salt '*' nfs.del_export /media/storage
```
salt.modules.nfs3.list_exports(exports='/etc/exports')
List configured exports
CLI Example:

```
salt '*' nfs.list_exports
```
salt.modules.nfs3.reload_exports()
Trigger a reload of the exports file to apply changes
CLI Example:

```
salt '*' nfs3.reload_exports
```
23.9.307 salt.modules.nftables

Support for nftables

salt.modules.nftables.append(table='filter', chain=None, rule=None, family='ipv4')

Append a rule to the specified table & chain.

This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' nftables.append filter input
  rule='tcp dport 22 log accept'
IPv6:
salt '*' nftables.append filter input
  rule='tcp dport 22 log accept'
  family=ipv6
```

salt.modules.nftables.build_rule(table=None, chain=None, command=None, position='', full=None, family='ipv4', **kwargs)

Build a well-formatted nftables rule based on kwargs. A table and chain are not required, unless full is True.

If full is True, then table, chain and command are required. command may be specified as either insert, append, or delete. This will return the nftables command, exactly as it would be used from the command line.

If a position is required (as with insert or delete), it may be specified as position. This will only be useful if full is True.

If connstate is passed in, it will automatically be changed to state.

CLI Examples:

```
salt '*' nftables.build_rule match=state
  connstate=RELATED,ESTABLISHED jump=ACCEPT
salt '*' nftables.build_rule filter input command=insert position=3
  full=True match=state state=related,established jump=accept
IPv6:
salt '*' nftables.build_rule match=state
  connstate=related,established jump=accept
  family=ipv6
salt '*' nftables.build_rule filter input command=insert position=3
  full=True match=state state=related,established jump=accept
  family=ipv6
```

salt.modules.nftables.check(table='filter', chain=None, rule=None, family='ipv4')

Check for the existence of a rule in the table and chain

This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' nftables.check filter input
  rule='tcp dport 22 log accept'
IPv6:
salt '*' nftables.check filter input
```

(continues on next page)
salt.modules.nftables.check_chain(table='filter', chain=None, family='ipv4')

New in version 2014.7.0.

Check for the existence of a chain in the table

CLI Example:

```bash
salt '*' nftables.check_chain filter input
IPv6:
salt '*' nftables.check_chain filter input family=ipv6
```

salt.modules.nftables.check_table(table=None, family='ipv4')

Check for the existence of a table

CLI Example:

```bash
salt '*' nftables.check_table nat
```

salt.modules.nftables.delete(table, chain=None, position=None, rule=None, family='ipv4')

Delete a rule from the specified table & chain, specifying either the rule in its entirety, or the rule’s position in the chain.

This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:

```bash
salt '*' nftables.delete filter input position=3
salt '*' nftables.delete filter input \
    rule='tcp dport 22 log accept'
IPv6:
salt '*' nftables.delete filter input position=3 family=ipv6
salt '*' nftables.delete filter input \
    rule='tcp dport 22 log accept' \
    family=ipv6
```

salt.modules.nftables.delete_chain(table='filter', chain=None, family='ipv4')

New in version 2014.7.0.

Delete the chain from the specified table.

CLI Example:

```bash
salt '*' nftables.delete_chain filter input
salt '*' nftables.delete_chain filter foo
IPv6:
salt '*' nftables.delete_chain filter input family=ipv6
salt '*' nftables.delete_chain filter foo family=ipv6
```
salt.modules.nftables.delete_table(table, family='ipv4')
New in version 2014.7.0.
Create new custom table.
CLI Example:

```
salt '*' nftables.delete_table filter
IPv6:
salt '*' nftables.delete_table filter family=ipv6
```

salt.modules.nftables.flush(table='filter', chain='', family='ipv4')
Flush the chain in the specified table, flush all chains in the specified table if chain is not specified.
CLI Example:

```
salt '*' nftables.flush filter
salt '*' nftables.flush filter input
IPv6:
salt '*' nftables.flush filter input family=ipv6
```

salt.modules.nftables.get_policy(table='filter', chain=None, family='ipv4')
New in version 3002.
Return the current policy for the specified table/chain
```
table Name of the table containing the chain to check
chain Name of the chain to get the policy for
family Networking family, either ipv4 or ipv6
```
CLI Example:

```
salt '*' nftables.get_policy filter input
IPv6:
salt '*' nftables.get_policy filter input family=ipv6
```

salt.modules.nftables.get_rule_handle(table='filter', chain=None, rule=None, family='ipv4')
Get the handle for a particular rule
This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.
CLI Example:

```
salt '*' nftables.get_rule_handle filter input \
    rule='tcp dport 22 log accept'
IPv6:
salt '*' nftables.get_rule_handle filter input \
    rule='tcp dport 22 log accept' \ 
    family=ipv6
```

salt.modules.nftables.get_rules(family='ipv4')
Return a data structure of the current, in-memory rules
CLI Example:
salt '*' nftables.get_rules
salt '*' nftables.get_rules family=ipv6

salt.modules.nftables.get_rules_json(family='ipv4')
   New in version 3002.
   Return a list of dictionaries comprising the current, in-memory rules
   family    Networking family, either ipv4 or ipv6
   CLI Example:
   salt '*' nftables.get_rules_json
   salt '*' nftables.get_rules_json family=ipv6

salt.modules.nftables.get_saved_rules(conf_file=None)
   Return a data structure of the rules in the conf file
   CLI Example:
   salt '*' nftables.get_saved_rules

salt.modules.nftables.insert(table='filter', chain=None, position=None, rule=None, family='ipv4')
   Insert a rule into the specified table & chain, at the specified position.
   If position is not specified, rule will be inserted in first position.
   This function accepts a rule in a standard nftables command format, starting with the chain. Trying to
   force users to adapt to a new method of creating rules would be irritating at best, and we already have
   a parser that can handle it.
   CLI Examples:
   salt '*' nftables.insert filter input
       rule='tcp dport 22 log accept'
   salt '*' nftables.insert filter input position=3
       rule='tcp dport 22 log accept'
   IPv6:
   salt '*' nftables.insert filter input
       rule='tcp dport 22 log accept'
       family=ipv6
   salt '*' nftables.insert filter input position=3
       rule='tcp dport 22 log accept'
       family=ipv6

salt.modules.nftables.list_tables(family='ipv4')
   Return a data structure of the current, in-memory tables
   CLI Example:
   salt '*' nftables.list_tables
   salt '*' nftables.list_tables family=ipv6

salt.modules.nftables.new_chain(table='filter', chain=None, table_type=None, hook=None, priority=None, family='ipv4')
   New in version 2014.7.0.
Create new chain to the specified table.

CLI Example:

```
salt '*' nftables.new_chain filter input
salt '*' nftables.new_chain filter input
    table_type=filter hook=input priority=0
salt '*' nftables.new_chain filter foo

IPv6:
salt '*' nftables.new_chain filter input family=ipv6
salt '*' nftables.new_chain filter input
    table_type=filter hook=input priority=0 family=ipv6
salt '*' nftables.new_chain filter foo family=ipv6
```

```
salt.modules.nftables.new_table(table, family='ipv4')
New in version 2014.7.0.
Create new custom table.

CLI Example:

```
salt '*' nftables.new_table filter
IPv6:
salt '*' nftables.new_table filter family=ipv6
```

```
salt.modules.nftables.save(filename=None, family='ipv4')
Changed in version 3002.
Save the current in-memory rules to disk. On systems where /etc/nftables is a directory, a file named salt-all-in-one.nft will be dropped inside by default. The main nftables configuration will need to include this file.

CLI Example:

```
salt '*' nftables.save /etc/nftables
```

```
salt.modules.nftables.set_policy(table='filter', chain=None, policy=None, family='ipv4')
New in version 3002.
Set the current policy for the specified table/chain. This only works on chains with an existing base chain.
  table     Name of the table containing the chain to modify
  chain     Name of the chain to set the policy for
  policy    accept or drop
  family    Networking family, either ipv4 or ipv6

CLI Example:

```
salt '*' nftables.set_policy filter input accept
IPv6:
salt '*' nftables.set_policy filter input accept family=ipv6
```

```
salt.modules.nftables.version()
Return version from nftables --version

CLI Example:
```
23.9.308 salt.modules.nginx

Support for nginx

salt.modules.nginx.build_info()
Return server and build arguments

CLI Example:
salt '*' nginx.build_info

salt.modules.nginx.configtest()
Test configuration and exit

CLI Example:
salt '*' nginx.configtest

salt.modules.nginx.signal(signal=None)
Signals nginx to start, reload, reopen or stop.

CLI Example:
salt '*' nginx.signal reload

salt.modules.nginx.status(url='http://127.0.0.1/status')
Return the data from an Nginx status page as a dictionary. http://wiki.nginx.org/HttpStubStatusModule
url The URL of the status page. Defaults to 'http://127.0.0.1/status'

CLI Example:
salt '*' nginx.status

salt.modules.nginx.version()
Return server version from nginx -v

CLI Example:
salt '*' nginx.version

23.9.309 salt.modules.nilrt_ip

The networking module for NI Linux Real-Time distro

salt.modules.nilrt_ip.apply_network_settings(**settings)
Apply global network configuration.

CLI Example:
salt '*' ip.apply_network_settings

salt.modules.nilrt_ip.build_interface(iface, iface_type, enabled, **settings)
Build an interface script for a network interface.

CLI Example:
salt '¢' ip.build_interface eth0 eth <settings>

salt.modules.nilrt_ip.build_network_settings(**settings)
Build the global network script.

CLI Example:
salt '¢' ip.build_network_settings <settings>

salt.modules.nilrt_ip.disable(interface)
Disable the specified interface

Change adapter mode to Disabled. If previous adapter mode was EtherCAT, the target will need reboot.

Parameters
interface (str) -- interface label

Returns True if the service was disabled, otherwise an exception will be thrown.

Return type bool

CLI Example:
salt '¢' ip.disable interface-label

salt.modules.nilrt_ip.down(interface, iface_type=None)
Disable the specified interface

Change adapter mode to Disabled. If previous adapter mode was EtherCAT, the target will need reboot.

Parameters
interface (str) -- interface label

Returns True if the service was disabled, otherwise an exception will be thrown.

Return type bool

CLI Example:
salt '¢' ip.down interface-label

salt.modules.nilrt_ip.enable(interface)
Enable the specified interface

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

Parameters
interface (str) -- interface label

Returns True if the service was enabled, otherwise an exception will be thrown.

Return type bool

CLI Example:
salt '¢' ip.enable interface-label

salt.modules.nilrt_ip.get_interface(iface)
Returns details about given interface.

CLI Example:
salt '¢' ip.get_interface eth0

salt.modules.nilrt_ip.get_interfaces_details()
Get details about all the interfaces on the minion

Returns information about all interfaces omitting loopback

Return type dictionary

CLI Example:
salt '¢' ip.get_interfaces_details
salt.modules.nilrt_ip.get_network_settings()

Return the contents of the global network script.

CLI Example:
```
salt '*' ip.get_network_settings
```

salt.modules.nilrt_ip.set_dhcp_linklocal_all(interface)

Configure specified adapter to use DHCP with linklocal fallback

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

Parameters
- `interface` (str) -- interface label

Returns True if the settings were applied, otherwise an exception will be thrown.

Return type bool

CLI Example:
```
salt '*' ip.set_dhcp_linklocal_all interface-label
```

salt.modules.nilrt_ip.set_dhcp_only_all(interface)

Configure specified adapter to use DHCP only

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

Parameters
- `interface` (str) -- interface label

Returns True if the settings were applied, otherwise an exception will be thrown.

Return type bool

CLI Example:
```
salt '*' ip.dhcp_only_all interface-label
```

salt.modules.nilrt_ip.set_ethercat(interface, master_id)

Configure specified adapter to use EtherCAT adapter mode. If successful, the target will need reboot if it
doesn't already use EtherCAT adapter mode, otherwise will return true.

Parameters
- `interface` -- interface label
- `master_id` -- EtherCAT Master ID

Returns True if the settings were applied, otherwise an exception will be thrown.

CLI Example:
```
salt '*' ip.set_ethercat interface-label master-id
```

salt.modules.nilrt_ip.set_linklocal_only_all(interface)

Configure specified adapter to use linklocal only

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

Parameters
- `interface` (str) -- interface label

Returns True if the settings were applied, otherwise an exception will be thrown.

Return type bool

CLI Example:
```
salt '*' ip.linklocal_only_all interface-label
```

salt.modules.nilrt_ip.set_static_all(interface, address, netmask, gateway, nameservers=None)

Configure specified adapter to use ipv4 manual settings

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

Parameters
- `interface` (str) -- interface label
- **address** *(str)* -- ipv4 address
- **netmask** *(str)* -- ipv4 netmask
- **gateway** *(str)* -- ipv4 gateway
- **nameservers** *(str)* -- list of nameservers servers separated by spaces (Optional)

**Returns**  True if the settings were applied, otherwise an exception will be thrown.

**Return type**  bool

**CLI Example:**

```
salt '*' ip.set_static_all interface-label address netmask gateway nameservers
```

### salt.modules.nilrt_ip.**up**(interface, iface_type=None)

Enable the specified interface

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

**Parameters**  
- **interface** *(str)* -- interface label

**Returns**  True if the service was enabled, otherwise an exception will be thrown.

**Return type**  bool

**CLI Example:**

```
salt '*' ip.up interface-label
```

---

**23.9.3.10  salt.modules.nix**

**Work with Nix packages**

New in version 2017.7.0.

Does not require the machine to be Nixos, just have Nix installed and available to use for the user running this command. Their profile must be located in their home, under `$HOME/.nix-profile/`, and the nix store, unless specially set up, should be in `/nix`. To easily use this with multiple users or a root user, set up the *nix-daemon*.

This module exposes most of the common nix operations. Currently not meant to be run as a *pkg* module, but explicitly as *nix.*.

For more information on nix, see the *nix documentation*.

### salt.modules.nix.**collect_garbage**()

Completely removed all currently 'uninstalled' packages in the nix store.

Tells the user how many store paths were removed and how much space was freed.

**Returns**  How much space was freed and how many derivations were removed

**Return type**  str

**Warning:** This is a destructive action on the nix store.

```
salt '*' nix.collect_garbage
```

### salt.modules.nix.**install**('pkgs', **kwargs)

Installs a single or multiple packages via nix

**Parameters**  
- **pkgs** *(list(str))* -- packages to update
- **attributes** *(bool)* -- Pass the list of packages or single package as attributes, not package names. default: False

**Returns**  Installed packages. Example element: gcc-3.3.2

**Return type**  list(str)
### salt.modules.nix.list_pkgs

List installed packages. Due to how nix works, it defaults to just doing `nix-env -q`.

**Parameters**

- `installed (bool)` -- list only installed packages. This can be a very long list (12,000+ elements), so caution is advised. Default: True
- `attributes (bool)` -- show the attributes of the packages when listing all packages. Default: True

**Returns** Packages installed or available, along with their attributes.

**Return type** `list(list(str))`

```python
salt '*' nix.list_pkgs
salt '*' nix.list_pkgs installed=False
```

### salt.modules.nix.uninstall

Erases a package from the current nix profile. Nix uninstalls work differently than other package managers, and the symlinks in the profile are removed, while the actual package remains. There is also a `nix.purge` function, to clear the package cache of unused packages.

**Parameters**

- `pkgs (list(str))` -- List, single package to uninstall

**Returns** Packages that have been uninstalled

**Return type** `list(str)`

```python
salt '*' nix.uninstall pkg1 [pkg2 ...]
```

### salt.modules.nix.upgrade

Runs an update operation on the specified packages, or all packages if none is specified.

**Parameters**

- `pkgs (list(str))` -- List of packages to update

**Returns** The upgraded packages. Example element: `['libxslt-1.1.0', 'libxslt-1.1.10']`

**Return type** `list(tuple(str, str))`

```python
salt '*' nix.update
salt '*' nix.update pkgs=one,two
```

## 23.9.311 salt.modules.nova

Module for handling OpenStack Nova calls

**depends**

- novaclient Python module

**configuration** This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion’s config file. For example:

```yaml
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
# Optional
keystone.region_name: 'RegionOne'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles. For example:
With this configuration in place, any of the nova functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' nova.flavor_list profile=openstack1
```

To use keystoneauth1 instead of keystoneclient, include the `use_keystoneauth` option in the pillar or minion config.

**Note:** This is required to use keystone v3 as for authentication.

```
key = openstack2
key.keystone.user = admin
key.keystone.password = verybadpass
key.keystone.tenant = admin
key.keystone.auth_url = 'http://127.0.0.2:5000/v2.0/
key.keystone.use_keystoneauth = true
key.keystone.verify = '/path/to/custom/certs/ca-bundle.crt'
```

**Note:** By default the nova module will attempt to verify its connection utilizing the system certificates. If you need to verify against another bundle of CA certificates or want to skip verification altogether you will need to specify the `verify` option. You can specify True or False to verify (or not) against system certificates, a path to a bundle or CA certs to check against, or None to allow keystoneauth to search for the certificates on its own. (defaults to True)

```
salt.modules.nova.boot(name, flavor_id=0, image_id=0, profile=None, timeout=300)
```

Boot (create) a new instance

- **name** Name of the new instance (must be first)
- **flavor_id** Unique integer ID for the flavor
- **image_id** Unique integer ID for the image
- **timeout** How long to wait, after creating the instance, for the provider to return information about it (default 300 seconds).

New in version 2014.1.0.

CLI Example:

```
salt '*' nova.boot myinstance flavor_id=4596 image_id=2
```

The `flavor_id` and `image_id` are obtained from nova.flavor_list and nova.image_list

```
salt '*' nova.flavor_list
salt '*' nova.image_list
```
salt.modules.nova.delete(instance_id, profile=None)
Delete an instance
instance_id ID of the instance to be deleted
CLI Example:
salt '*' nova.delete 1138

salt.modules.nova.flavor_create(name, flavor_id=0, ram=0, disk=0, vcpus=1, profile=None)
Add a flavor to nova (nova flavor-create). The following parameters are required:
name Name of the new flavor (must be first)
flavor_id Unique integer ID for the new flavor
ram Memory size in MB
disk Disk size in GB
vcpus Number of vcpus
CLI Example:
salt '*' nova.flavor_create myflavor flavor_id=6 ram=4096 disk=10 vcpus=1

salt.modules.nova.flavor_delete(flavor_id, profile=None)
Delete a flavor from nova by id (nova flavor-delete)
CLI Example:
salt '*' nova.flavor_delete 7

salt.modules.nova.flavor_list(profile=None)
Return a list of available flavors (nova flavor-list)
CLI Example:
salt '*' nova.flavor_list

salt.modules.nova.image_list(name=None, profile=None)
Return a list of available images (nova images-list + nova image-show) If a name is provided, only that image will be displayed.
CLI Examples:
salt '*' nova.image_list
salt '*' nova.image_list myimage

salt.modules.nova.image_meta_delete(image_id=None, name=None, keys=None, profile=None)
Delete a key=value pair from the metadata for an image (nova image-meta set)
CLI Examples:
salt '*' nova.image_meta_delete 6f52b2ff-0b31-4d84-8fd1-af45b84824f6 keys=cheese
salt '*' nova.image_meta_delete name=myimage keys=salad,beans

salt.modules.nova.image_meta_set(image_id=None, name=None, profile=None, **kwargs)
Sets a key=value pair in the metadata for an image (nova image-meta set)
CLI Examples:
salt '*' nova.image_meta_set 6f52b2ff-0b31-4d84-8fd1-af45b84824f6 cheese=gruyere
salt '*' nova.image_meta_set name=myimage salad=pasta beans=baked

salt.modules.nova.keypair_add(name, pubfile=None, pubkey=None, profile=None)
Add a keypair to nova (nova keypair-add)
CLI Examples:

```bash
salt '*' nova.keypair_add mykey pubfile=/home/myuser/.ssh/id_rsa.pub
salt '*' nova.keypair_add mykey pubkey='ssh-rsa <key> myuser@mybox'
```

salt.modules.nova.keypair_delete(name, profile=None)
Add a keypair to nova (nova keypair-delete)

CLI Example:

```bash
salt '*' nova.keypair_delete mykey
```

salt.modules.nova.keypair_list(profile=None)
Return a list of available keypairs (nova keypair-list)

CLI Example:

```bash
salt '*' nova.keypair_list
```

salt.modules.nova.list_(profile=None)
To maintain the feel of the nova command line, this function simply calls the server_list function.

CLI Example:

```bash
salt '*' nova.list
```

salt.modules.nova.lock(instance_id, profile=None)
Lock an instance

* **instance_id** ID of the instance to be locked

CLI Example:

```bash
salt '*' nova.lock 1138
```

salt.modules.nova.resume(instance_id, profile=None)
Resume an instance

* **instance_id** ID of the instance to be resumed

CLI Example:

```bash
salt '*' nova.resume 1138
```

salt.modules.nova.secgroupp_create(name, description, profile=None)
Add a secgroupp to nova (nova secgroupp-create)

CLI Example:

```bash
salt '*' nova.secgroupp_create mygroup 'This is my security group'
```

salt.modules.nova.secgroupp_delete(name, profile=None)
Delete a secgroupp to nova (nova secgroupp-delete)

CLI Example:

```bash
salt '*' nova.secgroupp_delete mygroup
```

salt.modules.nova.secgroupp_list(profile=None)
Return a list of available security groups (nova items-list)

CLI Example:
salt '*' nova.secgroup_list

```
salt.modules.nova.server_by_name(name, profile=None)
    Return information about a server
    name   Server Name
    CLI Example:
    salt '*' nova.server_by_name myserver profile=openstack
```

```
salt.modules.nova.server_list(profile=None)
    Return list of active servers
    CLI Example:
    salt '*' nova.server_list
```

```
salt.modules.nova.server_list_detailed(profile=None)
    Return detailed list of active servers
    CLI Example:
    salt '*' nova.server_list_detailed
```

```
salt.modules.nova.server_show(server_id, profile=None)
    Return detailed information for an active server
    CLI Example:
    salt '*' nova.server_show <server_id>
```

```
salt.modules.nova.show(server_id, profile=None)
    To maintain the feel of the nova command line, this function simply calls the server_show function.
    CLI Example:
    salt '*' nova.show
```

```
salt.modules.nova.suspend(instance_id, profile=None)
    Suspend an instance
    instance_id ID of the instance to be suspended
    CLI Example:
    salt '*' nova.suspend 1138
```

```
salt.modules.nova.volume_attach(name, server_name, device='/dev/xvdb', profile=None, timeout=300)
    Attach a block storage volume
    name   Name of the new volume to attach
    server_name Name of the server to attach to
    device   Name of the device on the server
    profile Profile to build on
    CLI Example:
    salt '*' nova.volume_attach myblock slice.example.com profile=openstack
    salt '*' nova.volume_attach myblock server.example.com device='/dev/xvdb' profile=openstack
```
salt.modules.nova.volume_create(name, size=100, snapshot=None, voltype=None, profile=None)

Create a block storage volume
name  Name of the new volume (must be first)
size  Volume size
snapshot  Block storage snapshot id
voltype  Type of storage
profile  Profile to build on

CLI Example:
```
salt '*' nova.volume_create myblock size=300 profile=openstack
```

salt.modules.nova.volume_delete(name, profile=None)

Destroy the volume
name  Name of the volume
profile  Profile to build on

CLI Example:
```
salt '*' nova.volume_delete myblock profile=openstack
```

salt.modules.nova.volume_detach(name, profile=None, timeout=300)

Attach a block storage volume
name  Name of the new volume to attach
server_name  Name of the server to detach from
profile  Profile to build on

CLI Example:
```
salt '*' nova.volume_detach myblock profile=openstack
```

salt.modules.nova.volume_list(search_opts=None, profile=None)

List storage volumes
search_opts  Dictionary of search options
profile  Profile to use

CLI Example:
```
salt '*' nova.volume_list search_opts='{"display_name": "myblock"}'}
```

salt.modules.nova.volume_show(name, profile=None)

Create a block storage volume
name  Name of the volume
profile  Profile to use

CLI Example:
```
salt '*' nova.volume_show myblock profile=openstack
```
23.9.312 salt.modules.npm

Manage and query NPM packages.

`salt.modules.npm.cache_clean(path=None, runas=None, env=None, force=False)`

Clean cached NPM packages.

- **path**: The cache subpath to delete, or None to clear the entire cache
- **runas**: The user to run NPM with
- **env**: Environment variables to set when invoking npm. Uses the same `env` format as the `cmd.run` execution function.
- **force**: Force cleaning of cache. Required for npm@5 and greater

New in version 2016.11.6.

CLI Example:

```
salt '*' npm.cache_clean force=True
```

`salt.modules.npm.cache_list(path=None, runas=None, env=None)`

List NPM cached packages.

- **path**: The cache subpath to list, or None to list the entire cache
- **runas**: The user to run NPM with
- **env**: Environment variables to set when invoking npm. Uses the same `env` format as the `cmd.run` execution function.

CLI Example:

```
salt '*' npm.cache_clean
```

`salt.modules.npm.cache_path(runas=None, env=None)`

List path of the NPM cache directory.

- **runas**: The user to run NPM with
- **env**: Environment variables to set when invoking npm. Uses the same `env` format as the `cmd.run` execution function.

CLI Example:

```
salt '*' npm.cache_path
```

`salt.modules.npm.install(pkg=None, pkgs=None, dir=None, runas=None, registry=None, env=None, dry_run=False, silent=True)`

Install an NPM package.

- **pkg**: A package name in any format accepted by NPM, including a version identifier
- **pkgs**: A list of package names in the same format as the `name` parameter
- **dir**: The target directory in which to install the package, or None for global installation
- **runas**: The user to run NPM with
- **registry**: The NPM registry to install the package from.

New in version 2014.7.0.

- **env**: Environment variables to set when invoking npm. Uses the same `env` format as the `cmd.run` execution function.

New in version 2014.7.0.
**silent** Whether or not to run NPM install with --silent flag.

New in version 2016.3.0.

**dry_run** Whether or not to run NPM install with --dry-run flag.

New in version 2015.8.4.

**silent** Whether or not to run NPM install with --silent flag.

New in version 2015.8.5.

CLI Example:

```
salt '*' npm.install coffee-script
salt '*' npm.install coffee-script@1.0.1
```

`salt.modules.npm.list_` *(pkg=None, dir=None, runas=None, env=None, depth=None)*

List installed NPM packages.

If no directory is specified, this will return the list of globally-installed packages.

**pkg** Limit package listing by name

**dir** The directory whose packages will be listed, or None for global installation

**runas** The user to run NPM with

New in version 2014.7.0.

**env** Environment variables to set when invoking npm. Uses the same `env` format as the `cmd.run` execution function.

New in version 2014.7.0.

**depth** Limit the depth of the packages listed

New in version 2016.11.6, 2017.7.0.

CLI Example:

```
salt '*' npm.list
```

`salt.modules.npm.uninstall` *(pkg, dir=None, runas=None, env=None)*

Uninstall an NPM package.

If no directory is specified, the package will be uninstalled globally.

**pkg** A package name in any format accepted by NPM

**dir** The target directory from which to uninstall the package, or None for global installation

**runas** The user to run NPM with

**env** Environment variables to set when invoking npm. Uses the same `env` format as the `cmd.run` execution function.

New in version 2015.5.3.

CLI Example:

```
salt '*' npm.uninstall coffee-script
```
23.9.313 salt.modules.nspawn

Manage nspawn containers

New in version 2015.8.0.

systemd-nspawn(1) is a tool used to manage lightweight namespace containers. This execution module provides several functions to help manage these containers.

Minions running systemd >= 219 will place new containers in /var/lib/machines, while those running systemd < 219 will place them in /var/lib/container.

salt.modules.nspawn.bootstrap_container(name, dist=None, version=None)

Bootstrap a container from package servers, if dist is None the os the minion is running as will be created, otherwise the needed bootstrapping tools will need to be available on the host.

CLI Example:

```
salt myminion nspawn.bootstrap_container <name>
```

salt.modules.nspawn.bootstrap_salt(name, config=None, approve_key=True, install=True, pub_key=None, priv_key=None, bootstrap_url=None, force_install=False, unconditional_install=False, bootstrap_delay=None, bootstrap_args=None, bootstrap_shell=None)

Bootstrap a container from package servers, if dist is None the os the minion is running as will be created, otherwise the needed bootstrapping tools will need to be available on the host.

CLI Example:

```
salt '*' nspawn.bootstrap_salt arch1
```

salt.modules.nspawn.copy_to(name, source, dest, overwrite=False, makedirs=False)

Copy a file from the host into a container

name Container name
source File to be copied to the container
dest Destination on the container. Must be an absolute path.
overwrite [False] Unless this option is set to True, then if a file exists at the location specified by the dest argument, an error will be raised.
makedirs : False

Create the parent directory on the container if it does not already exist.

CLI Example:

```
salt 'minion' nspawn.copy_to /tmp/foo /root/foo
```

salt.modules.nspawn.cp(name, source, dest, overwrite=False, makedirs=False)

This function is an alias of copy_to.

name Container name
source File to be copied to the container
dest Destination on the container. Must be an absolute path.
overwrite [False] Unless this option is set to True, then if a file exists at the location specified by the dest argument, an error will be raised.
makedirs : False

Create the parent directory on the container if it does not already exist.

CLI Example:
salt 'minion' nspawn.copy_to /tmp/foo /root/foo

salt.modules.nspawn.destroy(name, stop=False)
This function is an alias of remove.
Remove the named container

**Warning:** This function will remove all data associated with the container. It will not, however, remove the btrfs subvolumes created by pulling container images (`nspawn.pull_raw`, `nspawn.pull_tar`, `nspawn.pull_dkr`).

**stop** [False] If True, the container will be destroyed even if it is running/frozen.

CLI Examples:
```
salt '*' nspawn.remove foo
salt '*' nspawn.remove foo stop=True
```

salt.modules.nspawn.disable(name)
Set the named container to not be launched at boot

CLI Example:
```
salt myminion nspawn.enable <name>
```

salt.modules.nspawn.enable(name)
Set the named container to be launched at boot

CLI Example:
```
salt myminion nspawn.enable <name>
```

salt.modules.nspawn.exists(name)
Returns true if the named container exists

CLI Example:
```
salt myminion nspawn.exists <name>
```

salt.modules.nspawn.info(name, **kwargs)
Return info about a container

**Note:** The container must be running for `machinectl` to gather information about it. If the container is stopped, then this function will start it.

**start** [False] If True, then the container will be started to retrieve the info. A `Started` key will be in the return data if the container was started.

CLI Example:
```
salt myminion nspawn.info arch1
salt myminion nspawn.info arch1 force_start=True
```

salt.modules.nspawn.list_()
This function is an alias of `list_running`. 
Lists running nspawn containers

Note: nspawn.list also works to list running containers

CLI Example:

```
salt myminion nspawn.list_running
salt myminion nspawn.list
```

salt.modules.nspawn.list_all()
Lists all nspawn containers

CLI Example:

```
salt myminion nspawn.list_all
```

salt.modules.nspawn.list_running()
Lists running nspawn containers

Note: nspawn.list also works to list running containers

CLI Example:

```
salt myminion nspawn.list_running
salt myminion nspawn.list
```

salt.modules.nspawn.list_stopped()
Lists stopped nspawn containers

CLI Example:

```
salt myminion nspawn.list_stopped
```

salt.modules.nspawn.pid(name)
Returns the PID of a container

name Container name

CLI Example:

```
salt myminion nspawn.pid arch1
```

salt.modules.nspawn.poweroff(name)
Issue a clean shutdown to the container. Equivalent to running machinectl poweroff on the named container.

For convenience, running nspawn.stop``(as shown in the CLI examples below) is equivalent to running ```nspawn.poweroff.

Note: machinectl poweroff is only supported in systemd >= 219. On earlier systemd versions, running this function will simply issue a clean shutdown via systemctl.

CLI Examples:

```
salt myminion nspawn.poweroff arch1
salt myminion nspawn.stop arch1
```
salt.modules.nspawn.pull_dkr(url, name, index)

Execute a machinectl pull-dkr to download a docker image and add it to /var/lib/machines as a new container.

**Note:** Requires systemd >= 219

- **url** URL from which to download the container
- **name** Name for the new container
- **index** URL of the Docker index server from which to pull (must be an http:// or https:// URL).

**CLI Examples:**

```bash
salt myminion nspawn.pull_dkr centos/centos6 cent6 index=https://get.docker.com
salt myminion nspawn.pull_docker centos/centos6 cent6 index=https://get.docker.com
```

salt.modules.nspawn.pull_docker(url, name, index)

This function is an alias of pull_dkr.

Execute a machinectl pull-dkr to download a docker image and add it to /var/lib/machines as a new container.

**Note:** Requires systemd >= 219

- **url** URL from which to download the container
- **name** Name for the new container
- **index** URL of the Docker index server from which to pull (must be an http:// or https:// URL).

**CLI Examples:**

```bash
salt myminion nspawn.pull_dkr centos/centos6 cent6 index=https://get.docker.com
salt myminion nspawn.pull_docker centos/centos6 cent6 index=https://get.docker.com
```

salt.modules.nspawn.pull_raw(url, name, verify=False)

Execute a machinectl pull-raw to download a.qcow2 or raw disk image, and add it to /var/lib/machines as a new container.

**Note:** Requires systemd >= 219

- **url** URL from which to download the container
- **name** Name for the new container
- **verify** [False] Perform signature or checksum verification on the container. See the machinectl(1) man page (section titled "Image Transfer Commands") for more information on requirements for image verification. To perform signature verification, use `verify=signature`. For checksum verification, use `verify=checksum`. By default, no verification will be performed.

**CLI Examples:**

```bash
```

---

23.9. execution modules
salt.modules.nspawn.pull_tar(url, name, verify=False)

Execute a machinectl pull-raw to download a .tar container image, and add it to /var/lib/machines as a new container.

Note: Requires systemd >= 219

url  URL from which to download the container
name  Name for the new container
verify  [False] Perform signature or checksum verification on the container. See the machinectl(1) man page (section titled "Image Transfer Commands") for more information on requirements for image verification. To perform signature verification, use verify=signature. For checksum verification, use verify=checksum. By default, no verification will be performed.

CLI Examples:

```
salt myminion nspawn.pull_tar http://foo.domain.tld/containers/archlinux-2015.02.01.tar.gz arch2
```

salt.modules.nspawn.reboot(name, kill=False)

Reboot the container by sending a SIGINT to its init process. Equivalent to running machinectl reboot on the named container.

For convenience, running nspawn.restart (as shown in the CLI examples below) is equivalent to running nspawn.reboot.

Note: machinectl reboot is only supported in systemd >= 219. On earlier systemd versions, running this function will instead restart the container via systemctl.

CLI Examples:

```
salt myminion nspawn.reboot arch1
salt myminion nspawn.restart arch1
```

salt.modules.nspawn.remove(name, stop=False)

Remove the named container

Warning: This function will remove all data associated with the container. It will not, however, remove the btrfs subvolumes created by pulling container images (nspawn.pull_raw, nspawn.pull_tar, nspawn.pull_dkr).

stop  [False] If True, the container will be destroyed even if it is running/frozen.

CLI Examples:

```
salt '*' nspawn.remove foo
salt '*' nspawn.remove foo stop=True
```

salt.modules.nspawn.restart(name)

This is a compatibility function which simply calls nspawn.reboot.

salt.modules.nspawn.recode(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)

Run cmd.recode within a container
name  Name of the container in which to run the command

command  Command to run

no_start  [False] If the container is not running, don't start it

preserve_state  [True] After running the command, return the container to its previous state

stdin  [None] Standard input to be used for the command

output_loglevel  [debug] Level at which to log the output from the command. Set to quiet to suppress logging.

use_vt  [False] Use SaltStack's utils.vt to stream output to console. Assumes output=all.

keep_env  [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```shell
salt myminion nspawn.run mycontainer 'ip addr show'
```

```
salt.modules.nspawn.run(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)
```

Run `cmd.run` within a container

name  Name of the container in which to run the command

command  Command to run

no_start  [False] If the container is not running, don't start it

preserve_state  [True] After running the command, return the container to its previous state

stdin  [None] Standard input to be used for the command

output_loglevel  [debug] Level at which to log the output from the command. Set to quiet to suppress logging.

use_vt  [False] Use SaltStack's utils.vt to stream output to console.

keep_env  [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```shell
salt myminion nspawn.run_all mycontainer 'ifconfig -a'
```

```
salt.modules.nspawn.run_all(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)
```

Run `cmd.run_all` within a container

Notes: While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

name  Name of the container in which to run the command

command  Command to run

no_start  [False] If the container is not running, don't start it

preserve_state  [True] After running the command, return the container to its previous state

stdin  [None] Standard input to be used for the command

output_loglevel  [debug] Level at which to log the output from the command. Set to quiet to suppress logging.

use_vt  [False] Use SaltStack's utils.vt to stream output to console. Assumes output=all.

keep_env  [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or
Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_all mycontainer 'ip addr show'
```

```
salt.modules.nspawn.run_stderr(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)
```

Run `cmd.run_stderr` within a container

- **name** Name of the container in which to run the command
- **cmd** Command to run
- **no_start** [False] If the container is not running, don’t start it
- **preserve_state** [True] After running the command, return the container to its previous state
- **stdin** [None] Standard input to be used for the command
- **output_loglevel** [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.
- **use_vt** [False] Use SaltStack’s `utils.vt` to stream output to console. Assumes `output=all`.
- **keep_env** [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_stderr mycontainer 'ip addr show'
```

```
salt.modules.nspawn.run_stdout(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)
```

Run `cmd.run_stdout` within a container

- **name** Name of the container in which to run the command
- **cmd** Command to run
- **no_start** [False] If the container is not running, don’t start it
- **preserve_state** [True] After running the command, return the container to its previous state
- **stdin** [None] Standard input to be used for the command
- **output_loglevel** [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.
- **use_vt** [False] Use SaltStack’s `utils.vt` to stream output to console. Assumes `output=all`.
- **keep_env** [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_stdout mycontainer 'ifconfig -a'
```

```
salt.modules.nspawn.start(name)
```

Start the named container

CLI Example:

```
salt myminion nspawn.start <name>
```

```
salt.modules.nspawn.state(name)
```

Return state of container (running or stopped)
CLI Example:

```
salt myminion nspawn.state <name>
```

`salt.modules.nspawn.stop(name, kill=False)`  
This is a compatibility function which provides the logic for nspawn.poweroff and nspawn.terminate.

`salt.modules.nspawn.terminate(name)`  
Kill all processes in the container without issuing a clean shutdown. Equivalent to running machinectl terminate on the named container.

For convenience, running `nspawn.stop` and passing `kill=True` (as shown in the CLI examples below) is equivalent to running `nspawn.terminate`.

**Note:** `machinectl terminate` is only supported in systemd >= 219. On earlier systemd versions, running this function will simply issue a clean shutdown via `systemctl`.

CLI Examples:

```
salt myminion nspawn.terminate arch1
salt myminion nspawn.stop arch1 kill=True
```

### 23.9.314 `salt.modules.nxos`

Execution module for Cisco NX OS Switches.

New in version 2016.11.0.

**This module supports execution using a Proxy Minion or Native Minion:** 1) Proxy Minion: Connect over SSH or NX-API HTTP(S). See `salt.proxy.nxos` for proxy minion setup details. 2) Native Minion: Connect over NX-API Unix Domain Socket (UDS). Install the minion inside the GuestShell running on the NX-OS device.

- **maturity** new
- **platform** nxos

**Note:** To use this module over remote NX-API the feature must be enabled on the NX-OS device by executing `feature nxapi` in configuration mode.

This is not required for NX-API over UDS.

Configuration example:

```
switch# conf t
switch(config)# feature nxapi
```

To check that NX-API is properly enabled, execute `show nxapi`.

Output example:

```
switch# show nxapi
nxapi enabled
HTTPS Listen on port 443
```

Native minion configuration options:
cookie: Use the option to override the default cookie ‘admin:local’ when connecting over UDS and use ‘username:local’ instead. This is needed when running the salt-minion in the GuestShell using a non-admin user. This option is ignored for SSH and NX-API Proxy minions.

save_config: If True, 'copy running-config starting-config' is issues for every configuration command. If False, Running config is not saved to startup config Default: True

The recommended approach is to use the save_running_config function instead of this option to improve performance. The default behavior controlled by this option is preserved for backwards compatibility.

The APIs defined in this execution module can also be executed using salt-call from the GuestShell environment as follows.

```
salt-call --local nxos.show 'show lldp neighbors' raw_text
```

Note: The functions in this module should be executed like so:
salt '*' nxos.<function> salt '*' nxos.get_user username=admin

For backwards compatibility, the following syntax will be supported until the 3001 release.
salt '*' nxos.cmd <function> salt '*' nxos.cmd get_user username=admin

```
salt.modules.nxos.add_config(lines, **kwargs)
Add one or more config lines to the NX-OS device running config.
lines Configuration lines to add
save_config If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True
```

```
salt '*' nxos.add_config 'snmp-server community TESTSTRINGHERE group network-operator'
```

Note: For more than one config added per command, lines should be a list.

```
salt.modules.nxos.check_password(username, password, encrypted=False, **kwargs)
Verify user password.
username Username on which to perform password check
password Password to check
encrypted Whether or not the password is encrypted Default: False
```

```
salt.modules.nxos.check_role(username, role, **kwargs)
Verify role assignment for user.
salt '*' nxos.check_role username=admin role=network-admin
```

```
salt.modules.nxos.cmd(command, *args, **kwargs)
NOTE: This function is preserved for backwards compatibility. This allows commands to be executed using either of the following syntactic forms.
salt '*' nxos.cmd <function>
or
```

```
```
salt '*' nxos.<function>
command function from salt.modules.nxos to run
args positional args to pass to command function
kwargs key word arguments to pass to command function

```
salt '*' nxos.cmd sendline 'show ver'
salt '*' nxos.cmd show_run
salt '*' nxos.cmd check_password username=admin password='$$lkjsdfoi$blahblahblah' encrypted=True
```

salt.modules.nxos.config(commands=None, config_file=None, template_engine='jinja', context=None, defaults=None, saltenv='base', **kwargs)
Configures the Nexus switch with the specified commands.
This method is used to send configuration commands to the switch. It will take either a string or a list and prepend the necessary commands to put the session into config mode.

**Warning:** All the commands will be applied directly to the running-config.

config_file The source file with the configuration commands to be sent to the device.
The file can also be a template that can be rendered using the template engine of choice.
This can be specified using the absolute path to the file, or using one of the following URL schemes:
- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`
commands The commands to send to the switch in config mode. If the commands argument is a string it will be cast to a list. The list of commands will also be prepended with the necessary commands to put the session in config mode.

**Note:** This argument is ignored when `config_file` is specified.

template_engine: jinja The template engine to use when rendering the source file. Default: jinja. To simply fetch the file without attempting to render, set this argument to `None`.
context Variables to add to the template context.
defaults Default values of the context_dict.
save_config If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

CLI Example:
```
salt '*' nxos.config commands="["spanning-tree mode mstp"]"
salt '*' nxos.config config_file=salt://config.txt
salt '*' nxos.config config_file=https://bit.ly/2LGLcDy context="{"servers": ["1.2.3.4"]}""
```

salt.modules.nxos.delete_config(lines, **kwargs)
Delete one or more config lines to the switch running config.
lines Configuration lines to remove.
save_config If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True
salt 'nxos.delete_config 'snmp-server community TESTSTRINGHERE group network-operator'\n
Note: For more than one config deleted per command, lines should be a list.

salt.modules.nxos.find(pattern, **kwargs)
Find all instances where the pattern is in the running configuration.

salt 'nxos.find '^snmp-server.*$'\n
Note: This uses the re.MULTILINE regex format for python, and runs the regex against the whole show_run output.

salt.modules.nxos.get_roles(username, **kwargs)
Get roles assigned to a username.

salt.modules.nxos.get_user(username, **kwargs)
Get username line from switch.

salt.modules.nxos.grains(**kwargs)
Get grains for minion.

salt.modules.nxos.grains_refresh(**kwargs)
Refresh the grains for the NX-OS device.

salt.modules.nxos.ping(**kwargs)
Ping the device on the other end of the connection.

salt.modules.nxos.remove_user(username, **kwargs)
Remove user from switch.

username Username to remove
save_config If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

salt 'nxos.remove_user username=daniel\n
salt.modules.nxos.replace(old_value, new_value, full_match=False, **kwargs)
Replace string or full line matches in switch's running config.
If full_match is set to True, then the whole line will need to be matched as part of the old value.

salt 'nxos.replace 'TESTSTRINGHERE' 'NEWTESTSTRINGHERE'\n
salt.modules.nxos.save_running_config(**kwargs)
Save the running configuration to startup configuration.

salt 'nxos.save_running_config\n
salt.modules.nxos.sendline(command, method='cli_show_ascii', **kwargs)
Send arbitrary commands to the NX-OS device.
command The command or list of commands to be sent. ['cmd1','cmd2'] is converted to 'cmd1 ; cmd2'.
method: cli_show_ascii: Return raw test or unstructured output. cli_show: Return structured output. cli_conf: Send configuration commands to the device. Defaults to cli_show_ascii. NOTE: method is ignored for SSH proxy minion. All data is returned unstructured.
error_pattern  Use the option to pass in a regular expression to search for in the returned output of the command that indicates an error has occurred. This option is only used when proxy minion connection type is ssh and otherwise ignored.

salt.modules.nxos.set_password(username, password, encrypted=False, role=None, crypt_salt=None, algorithm='sha256', **kwargs)

Set users password on switch.

username  Username to configure
password  Password to configure for username
encrypted  Whether or not to encrypt the password Default: False
role  Configure role for the username Default: None
crypt_salt  Configure crypt_salt setting Default: None
algorithm  Encryption algorithm Default: sha256
save_config  If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

```
salt '*' nxos.set_password admin TestPass
salt '*' nxos.set_password admin \n  password='\$5$2FwW2vK$s7.Hr3YltMNHuhywQQ3nfOQ.gAPHgs3S0BYyGDT3E.A' \n  encrypted=True
```

salt.modules.nxos.set_role(username, role, **kwargs)

Assign role to username.

username  Username for role configuration
role  Configure role for username
save_config  If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

```
salt '*' nxos.set_role username=daniel role=vdc-admin.
```

salt.modules.nxos.show(commands, raw_text=True, **kwargs)

Execute one or more show (non-configuration) commands.

commands  The commands to be executed.

raw_text  True Whether to return raw text or structured data. NOTE: raw_text option is ignored for SSH proxy minion. Data is returned unstructured.

CLI Example:

```
salt-call --local nxos.show 'show version'
salt '*' nxos.show 'show bgp sessions ; show processes' raw_text=False
salt 'regular-minion' nxos.show 'show interfaces' host=sw01.example.com\n    username=test password=test
```

salt.modules.nxos.show_run(**kwargs)

Shortcut to run show running-config on the NX-OS device.

```
salt '*' nxos.show_run
```

salt.modules.nxos.show_ver(**kwargs)

Shortcut to run show version on the NX-OS device.

```
salt '*' nxos.show_ver
```

salt.modules.nxos.system_info(**kwargs)

Return system information for grains of the minion.

```
salt '*' nxos.system_info
```

23.9. execution modules
salt.modules.nxos.unset_role(username, role, **kwargs)

Remove role from username.

username  Username for role removal
role  Role to remove
save_config  If False, don't save configuration commands to startup configuration. If True, save configuration
to startup configuration. Default: True

salt '*' nxos.unset_role username=daniel role=vdc-admin

23.9.315 salt.modules.nxos_api

Execution module to manage Cisco Nexus Switches (NX-OS) over the NX-API

New in version 2019.2.0.

Execution module used to interface the interaction with a remote or local Nexus switch whether we're running in a
Proxy Minion or regular Minion (or regular Minion running directly on the Nexus switch).

codeauthor  Mircea Ulinic <ping@mirceaulinic.net>
maturity  new
platform  any

Note: To be able to use this module you need to enable to NX-API on your switch, by executing feature nxapi
in configuration mode.

Configuration example:

switch# conf t
switch(config)# feature nxapi

To check that NX-API is properly enabled, execute show nxapi.

Output example:

switch# show nxapi
nxapi enabled
HTTPS Listen on port 443

Note: NX-API requires modern NXOS distributions, typically at least 7.0 depending on the hardware. Due to
reliability reasons it is recommended to run the most recent version.

guide/b_Cisco_Nexus_7000_Series_NX-OS_Programmability_Guide/b_Cisco_Nexus_7000_Series_NX-OS_
Programmability_Guide_chapter_0101.html for more details.
Usage

This module can equally be used via the nxos_api Proxy module or directly from an arbitrary (Proxy) Minion that is running on a machine having access to the network device API. Given that there are no external dependencies, this module can very well used when using the regular Salt Minion directly installed on the switch.

When running outside of the nxos_api Proxy (i.e., from another Proxy Minion type, or regular Minion), the NX-API connection arguments can be either specified from the CLI when executing the command, or in a configuration block under the nxos_api key in the configuration opts (i.e., (Proxy) Minion configuration file), or Pillar. The module supports these simultaneously. These fields are the exact same supported by the nxos_api Proxy Module:

transport: **https** Specifies the type of connection transport to use. Valid values for the connection are http, and https.

**host:** localhost The IP address or DNS host name of the connection device.

**username:** admin The username to pass to the device to authenticate the NX-API connection.

**password** The password to pass to the device to authenticate the NX-API connection.

**port** The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).

**timeout:** 60 Time in seconds to wait for the device to respond. Default: 60 seconds.

**verify:** True Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to True.

When there is no certificate configuration on the device and this option is set as True (default), the commands will fail with the following error: SSLError: [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed (_ssl.c:581). In this case, you either need to configure a proper certificate on the device (recommended), or bypass the checks setting this argument as False with all the security risks considered.

Example (when not running in a nxos_api Proxy Minion):

```
nxos_api:
    username: test
    password: test
```

In case the username and password are the same on any device you are targeting, the block above (besides other parameters specific to your environment you might need) should suffice to be able to execute commands from outside a nxos_api Proxy, e.g.:

```
salt-call --local nxos_api.show 'show lldp neighbors' raw_text
```

# The command above is available when running in a regular Minion where Salt is installed

```
salt '*' nxos_api.show 'show version' raw_text=False
```

**Note:** Remember that the above applies only when not running in a nxos_api Proxy Minion. If you want to use the nxos_api Proxy, please follow the documentation notes for a proper setup.
salt.modules.nxos_api.config(commands=None, config_file=None, template_engine='jinja', context=None, defaults=None, saltenv='base', **kwargs)

Configures the Nexus switch with the specified commands.

This method is used to send configuration commands to the switch. It will take either a string or a list and prepend the necessary commands to put the session into config mode.

**Warning:** All the commands will be applied directly into the running-config.

**config_file** The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice.

This can be specified using the absolute path to the file, or using one of the following URL schemes:
- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

**commands** The commands to send to the switch in config mode. If the commands argument is a string it will be cast to a list. The list of commands will also be prepended with the necessary commands to put the session in config mode.

**Note:** This argument is ignored when **config_file** is specified.

**template_engine:** *jinja* The template engine to use when rendering the source file. Default: jinja. To simply fetch the file without attempting to render, set this argument to None.

**context** Variables to add to the template context.

**defaults** Default values of the context_dict.

**transport:** *https* Specifies the type of connection transport to use. Valid values for the connection are http, and https.

**host:** *localhost* The IP address or DNS host name of the connection device.

**username:** *admin* The username to pass to the device to authenticate the NX-API connection.

**password** The password to pass to the device to authenticate the NX-API connection.

**port** The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).

**timeout:** *60* Time in seconds to wait for the device to respond. Default: 60 seconds.

**verify:** *True* Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to True.

**CLI Example:**

```bash
salt '*' nxos_api.config commands="['spanning-tree mode mstp']"
salt '*' nxos_api.config config_file=salt://config.txt
salt '*' nxos_api.config config_file=https://bit.ly/2LGLcDy context="{'servers': ['1.2.3.4']}"
```

salt.modules.nxos_api.rpc(commands, method='cli', **kwargs)

Execute an arbitrary RPC request via the Nexus API.

**commands** The commands to be executed.

**method:** *cli* The type of the response, i.e., raw text (cli_ascii) or structured document (cli). Defaults to cli (structured data).

**transport:** *https* Specifies the type of connection transport to use. Valid values for the connection are http, and https.

**host:** *localhost* The IP address or DNS host name of the connection device.
username: **admin**  The username to pass to the device to authenticate the NX-API connection.
password  The password to pass to the device to authenticate the NX-API connection.
port  The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).

**timeout**: 60  Time in seconds to wait for the device to respond. Default: 60 seconds.

**verify**: **True**  Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to **True**.

CLI Example:

```
salt-call --local nxps_api.rpc 'show version'
```

```python
salt.modules.nxos_api.show(commands, raw_text=True, **kwargs)
```

Execute one or more show (non-configuration) commands.

- **commands**  The commands to be executed.
- **raw_text**: **True**  Whether to return raw text or structured data.
- **transport**: **https**  Specifies the type of connection transport to use. Valid values for the connection are http, and https.
- **host**: **localhost**  The IP address or DNS host name of the connection device.
- **username**: **admin**  The username to pass to the device to authenticate the NX-API connection.
- **password**  The password to pass to the device to authenticate the NX-API connection.
- **port**  The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).
- **timeout**: 60  Time in seconds to wait for the device to respond. Default: 60 seconds.
- **verify**: **True**  Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to **True**.

CLI Example:

```
salt-call --local nxos_api.show 'show version'
salt '*' nxos_api.show 'show bgp sessions' 'show processes' raw_text=False
salt 'regular-minion' nxos_api.show 'show interfaces' host=sw01.example.com
   --username=test password=test
```

### 23.9.316 salt.modules.nxos_upgrade

Execution module to upgrade Cisco NX-OS Switches.

New in version 3001.

**This module supports execution using a Proxy Minion or Native Minion:**

1)  Proxy Minion:  Connect over SSH or NX-API HTTP(S).  See `salt.proxy.nxos` for proxy minion setup details.

2)  Native Minion:  Connect over NX-API Unix Domain Socket (UDS).  Install the minion inside the Guest-Shell running on the NX-OS device.

**maturity**  new

**platform**  nxos

**codeauthor**  Michael G Wiebe

**Note:**  To use this module over remote NX-API the feature must be enabled on the NX-OS device by executing `feature nxapi` in configuration mode.

This is not required for NX-API over UDS.
Configuration example:

```
switch# conf t
switch(config)# feature nxapi
```

To check that NX-API is properly enabled, execute `show nxapi`.

Output example:

```
switch# show nxapi
nxapi enabled
HTTPS Listen on port 443
```

```
salt.modules.nxos_upgrade.check_upgrade_impact(system_image, kickstart_image=None, issu=True, **kwargs)
```

Display upgrade impact information without actually upgrading the device.

- **system_image** (Mandatory Option) Path on bootflash: to system image upgrade file.
- **kickstart_image** Path on bootflash: to kickstart image upgrade file. (Not required if using combined system/kickstart image file) Default: None
- **issu** In Service Software Upgrade (non-disruptive). When True, the upgrade will abort if issu is not possible. When False: Force (disruptive) Upgrade/Downgrade. Default: True
- **timeout** Timeout in seconds for long running 'install all' impact command. Default: 900
- **error_pattern** Use the option to pass in a regular expression to search for in the output of the 'install all impact' command that indicates an error has occurred. This option is only used when proxy minion connection type is ssh and otherwise ignored.

```
salt 'n9k' nxos.check_upgrade_impact system_image=nxos.9.2.1.bin
salt 'n7k' nxos.check_upgrade_impact system_image=n7000-s2-dk9.8.1.1.bin \ kickstart_image=n7000-s2-kickstart.8.1.1.bin issu=False
```

```
salt.modules.nxos_upgrade.upgrade(system_image, kickstart_image=None, issu=True, **kwargs)
```

Upgrade NX-OS switch.

- **system_image** (Mandatory Option) Path on bootflash: to system image upgrade file.
- **kickstart_image** Path on bootflash: to kickstart image upgrade file. (Not required if using combined system/kickstart image file) Default: None
- **issu** Set this option to True when an In Service Software Upgrade or non-disruptive upgrade is required. The upgrade will abort if issu is not possible. Default: True
- **timeout** Timeout in seconds for long running ‘install all’ upgrade command. Default: 900
- **error_pattern** Use the option to pass in a regular expression to search for in the output of the ‘install all upgrade command that indicates an error has occurred. This option is only used when proxy minion connection type is ssh and otherwise ignored.

```
salt 'n9k' nxos.upgrade system_image=nxos.9.2.1.bin
salt 'n7k' nxos.upgrade system_image=n7000-s2-dk9.8.1.1.bin \ kickstart_image=n7000-s2-kickstart.8.1.1.bin issu=False
```
23.9.317  salt.modules.omapi

This module interacts with an ISC DHCP Server via OMAPI. server_ip and server_port params may be set in the
minion config or pillar:

```
<table>
<thead>
<tr>
<th>param</th>
<th>value</th>
</tr>
</thead>
<tbody>
<tr>
<td>omapi.server_ip</td>
<td>127.0.0.1</td>
</tr>
<tr>
<td>omapi.server_port</td>
<td>7991</td>
</tr>
</tbody>
</table>
```

depends  pypureomapi Python module

```
salt.modules.omapi.add_host(mac, name=None, ip=None, ddns=False, group=None, super-sede_host=False)
```

Add a host object for the given mac.

CLI Example:

```
salt dhcp-server omapi.add_host ab:ab:ab:ab:ab:ab name=host1
```

Add ddns-hostname and a fixed-ip statements:

```
salt dhcp-server omapi.add_host ab:ab:ab:ab:ab:ab name=host1 ip=10.1.1.1 ddns=true
```

```
salt.modules.omapi.delete_host(mac=None, name=None)
```

Delete the host with the given mac or name.

CLI Examples:

```
salt dhcp-server omapi.delete_host name=host1
salt dhcp-server omapi.delete_host mac=ab:ab:ab:ab:ab:ab
```

23.9.318  salt.modules.openbsd_sysctl

Module for viewing and modifying OpenBSD sysctl parameters

```
salt.modules.openbsd_sysctl.assign(name, value)
```

Assign a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.assign net.inet.ip.forwarding 1
```

```
salt.modules.openbsd_sysctl.get(name)
```

Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

```
salt.modules.openbsd_sysctl.persist(name, value, config='/etc/sysctl.conf')
```

Assign and persist a simple sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.persist net.inet.ip.forwarding 1
```

```
salt.modules.openbsd_sysctl.show(config_file=False)
```

Return a list of sysctl parameters for this minion

config: Pull the data from the system configuration file instead of the live data.
CLI Example:

```bash
salt '*' sysctl.show
```

## 23.9.319 salt.modules.openbsdpkg

Package support for OpenBSD

**Note:** The package repository is configured on each host using `/etc/installurl` from OpenBSD 6.1 onwards. Earlier releases relied on `/etc/pkg.conf`.

Changed in version 2016.3.5: Package versions on OpenBSD are not normally specified explicitly; instead packages may be available in multiple *flavors*, and *branches* which are specified by the format of the package name. This module allows you to use the same formatting as `pkg_add(1)`, and will select the empty flavor and default branch by default. Examples:

- rsync
- vim--no_x11
- ruby%2.3

### salt.modules.openbsdpkg.install(name=None, pkgs=None, sources=None, **kwargs)

Install the passed package

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

**CLI Example, Install one package:**

```bash
class '*' pkg.install <package name>
```

**CLI Example, Install more than one package:**

```bash
class '*' pkg.install pkgs=['<package name>']
```

**CLI Example, Install more than one package from a alternate source (e.g. salt file-server, HTTP, FTP, local filesystem):**

```bash
class '*' pkg.install sources=['<pkg name>': 'salt://pkgs/<pkg filename>']
```

### salt.modules.openbsdpkg.latest_version(*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

**CLI Example:**

```bash
class '*' pkg.latest_version <package name>
```

### salt.modules.openbsdpkg.list_pkgs(versions_as_list=False, **kwargs)

List the packages currently installed as a dict:
{'<package_name>': '<version>'

CLI Example:

```
salt '*' pkg.list_pkgs
```

salt.modules.openbsdpkg.purge(name=None, pkgs=None, **kwargs)

Remove a package and extra configuration files.

- **name** The name of the package to be deleted.
- Multiple Package Options:
  - **pkgs** A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs=['"foo", "bar"]'
```

salt.modules.openbsdpkg.remove(name=None, pkgs=None, purge=False, **kwargs)

Remove a single package with pkg_delete

- Multiple Package Options:
  - **pkgs** A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['"foo", "bar"]'
```

salt.modules.openbsdpkg.upgrade(name=None, pkgs=None, **kwargs)

Run a full package upgrade (pkg_add -u), or upgrade a specific package if `name` or `pkgs` is provided. `name` is ignored when `pkgs` is specified.

Returns a dictionary containing the changes:

New in version 2019.2.0.

```
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
salt '*' pkg.upgrade python%2.7
```

salt.modules.openbsdpkg.upgrade_available(name, **kwargs)

Check whether or not an upgrade is available for a given package

New in version 2019.2.0.

CLI Example:
```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.openbsdpkg.version(*names, **kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:
```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

23.9.320 salt.modules.openbsdrctl_service.py

The rcctl service module for OpenBSD

```python
salt.modules.openbsdrctl_service.available(name)
```

Return True if the named service is available.

CLI Example:
```
salt '*' service.available sshd
```

```
salt.modules.openbsdrctl_service.disable(name, **kwargs)
```

Disable the named service to not start at boot.

CLI Example:
```
salt '*' service.disable <service name>
```

```
salt.modules.openbsdrctl_service.disabled(name)
```

Return True if the named service is disabled at boot, False otherwise.

CLI Example:
```
salt '*' service.disabled <service name>
```

```
salt.modules.openbsdrctl_service.enable(name, **kwargs)
```

Enable the named service to start at boot.

flags [None] Set optional flags to run the service with.

service.flags can be used to change the default flags.

CLI Example:
```
salt '*' service.enable <service name>
salt '*' service.enable <service name> flags=<flags>
```

```
salt.modules.openbsdrctl_service.enabled(name, **kwargs)
```

Return True if the named service is enabled at boot and the provided flags match the configured ones (if any). Return False otherwise.

name Service name

CLI Example:
```
salt '*' service.enabled <service name>
salt '*' service.enabled <service name> flags=<flags>
```

```
salt.modules.openbsdrctl_service.get_all()
```

Return all installed services.
CLI Example:
```
salt '*' service.get_all
```

`salt.modules.openbsdrcctl_service.get_disabled()`
Return what services are available but not enabled to start at boot.

CLI Example:
```
salt '*' service.get_disabled
```

`salt.modules.openbsdrcctl_service.get_enabled()`
Return what services are set to run on boot.

CLI Example:
```
salt '*' service.get_enabled
```

`salt.modules.openbsdrcctl_service.missing(name)`
The inverse of `service.available`. Return `True` if the named service is not available.

CLI Example:
```
salt '*' service.missing sshd
```

`salt.modules.openbsdrcctl_service.reload_(name)`
Reload the named service.

CLI Example:
```
salt '*' service.reload <service name>
```

`salt.modules.openbsdrcctl_service.restart(name)`
Restart the named service.

CLI Example:
```
salt '*' service.restart <service name>
```

`salt.modules.openbsdrcctl_service.start(name)`
Start the named service.

CLI Example:
```
salt '*' service.start <service name>
```

`salt.modules.openbsdrcctl_service.status(name, sig=None)`
Return the status for a service, returns a bool whether the service is running.

CLI Example:
```
salt '*' service.status <service name>
```

`salt.modules.openbsdrcctl_service.stop(name)`
Stop the named service.

CLI Example:
```
salt '*' service.stop <service name>
```
23.9.321 salt.modules.openbsdservice

The service module for OpenBSD

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see [here](#).

salt.modules.openbsdservice.available(name)
New in version 2014.7.0.
Returns True if the specified service is available, otherwise returns False.

CLI Example:

```bash
salt '*' service.available sshd
```

salt.modules.openbsdservice.disabled(name)
New in version 2014.7.0.
Return True if the named service is disabled, false otherwise

CLI Example:

```bash
salt '*' service.disabled <service name>
```

salt.modules.openbsdservice.enabled(name, **kwargs)
New in version 2014.7.0.
Return True if the named service is enabled, false otherwise

CLI Example:

```bash
salt '*' service.enabled <service name>
```

salt.modules.openbsdservice.get_all()
New in version 2014.7.0.
Return all available boot services

CLI Example:

```bash
salt '*' service.get_all
```

salt.modules.openbsdservice.get_disabled()
New in version 2014.7.0.
Return a set of services that are installed but disabled

CLI Example:

```bash
salt '*' service.get_disabled
```

salt.modules.openbsdservice.get_enabled()
New in version 2014.7.0.
Return a list of service that are enabled on boot

CLI Example:
salt '*' service.get_enabled

salt.modules.openbsdservice.missing(name)
New in version 2014.7.0.
The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.
CLI Example:
salt '*' service.missing sshd

salt.modules.openbsdservice.reload_(name)
New in version 2014.7.0.
Reload the named service
CLI Example:
salt '*' service.reload <service name>

salt.modules.openbsdservice.restart(name)
Restart the named service
CLI Example:
salt '*' service.restart <service name>

salt.modules.openbsdservice.start(name)
Start the specified service
CLI Example:
salt '*' service.start <service name>

salt.modules.openbsdservice.status(name, sig=None)
Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.
Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)
Parameters
- name (str) -- The name of the service to check
- sig (str) -- Signature to use to find the service via ps
Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise
Return type bool
CLI Example:
salt '*' service.status <service name> [service signature]

salt.modules.openbsdservice.stop(name)
Stop the specified service
CLI Example:
salt '*' service.stop <service name>
23.9.322 salt.modules.openscap

Module for OpenSCAP Management

salt.modules.openscap.xccdf(params)
Run oscap xccdf commands on minions. It uses cp.push_dir to upload the generated files to the salt master in the master's minion files cachedir (defaults to /var/cache/salt/master/minions/minion-id/files)

It needs file_recv set to True in the master configuration file.

CLI Example:
```
salt '*' openscap.xccdf "eval --profile Default /usr/share/openscap/scap-yast2sec-xccdf.xml"
```

23.9.323 salt.modules.openstack_config

Modify, retrieve, or delete values from OpenStack configuration files.

maintainer Jeffrey C. Ollie <jeff@ocjtech.us>
maturity new
depends
platform linux

salt.modules.openstack_config.delete(filename, section, parameter)
Delete a value from an OpenStack configuration file.
filename The full path to the configuration file
section The section from which to delete the parameter
parameter The parameter to delete

CLI Example:
```
salt-call openstack_config.delete /etc/keystone/keystone.conf sql connection
```

salt.modules.openstack_config.get(filename, section, parameter)
Get a value from an OpenStack configuration file.
filename The full path to the configuration file
section The section from which to search for the parameter
parameter The parameter to return

CLI Example:
```
salt-call openstack_config.get /etc/keystone/keystone.conf sql connection
```

salt.modules.openstack_config.set_(filename, section, parameter, value)
Set a value in an OpenStack configuration file.
filename The full path to the configuration file
section The section in which the parameter will be set
parameter The parameter to change
value The value to set

CLI Example:
```
salt-call openstack_config.set /etc/keystone/keystone.conf sql connection foo
```
23.9.324  salt.modules.openstack_mng

Module for OpenStack Management

codeauthor  Konrad Mosoń <mosonkonrad@gmail.com>
maturity  new
depends  openstack-utils
platform  linux

salt.modules.openstack_mng.restart_service(service_name, minimum_running_time=None)

Restart OpenStack service immediately, or only if it's running longer than specified value

CLI Example:

```
salt '*' openstack_mng.restart_service neutron
salt '*' openstack_mng.restart_service neutron minimum_running_time=600
```

salt.modules.openstack_mng.start_service(service_name)

Start OpenStack service immediately

CLI Example:

```
salt '*' openstack_mng.start_service neutron
```

salt.modules.openstack_mng.stop_service(service_name)

Stop OpenStack service immediately

CLI Example:

```
salt '*' openstack_mng.stop_service neutron
```

23.9.325  salt.modules.openvswitch

Support for Open vSwitch - module with basic Open vSwitch commands.
Suitable for setting up Openstack Neutron.

codeauthor  Jiri Kotlin <jiri.kotlin@ultimum.io>

salt.modules.openvswitch.bridge_create(br, may_exist=True)

Creates a new bridge.

Parameters
- **br** -- A string - bridge name
- **may_exist** -- Bool, if False - attempting to create a bridge that exists returns False.

Returns  True on success, else False.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.bridge_create br0
```

salt.modules.openvswitch.bridge_delete(br, if_exists=True)

Deletes bridge and all of its ports.

Parameters
- **br** -- A string - bridge name
- `if_exists` -- Bool, if False - attempting to delete a bridge that does not exist returns False.

  **Returns** True on success, else False.

  New in version 2016.3.0.

  CLI Example:

  ```
salt '*' openvswitch.bridge_delete br0
  ```

`salt.modules.openvswitch.bridge_exists(br)`

Tests whether bridge exists as a real or fake bridge.

  **Returns** True if Bridge exists, else False.

  New in version 2016.3.0.

  CLI Example:

  ```
salt '*' openvswitch.bridge_exists br0
  ```

`salt.modules.openvswitch.bridge_list()`

Lists all existing real and fake bridges.

  **Returns** List of bridges (or empty list), False on failure.

  New in version 2016.3.0.

  CLI Example:

  ```
salt '*' openvswitch.bridge_list
  ```

`salt.modules.openvswitch.interface_get_options(port)`

Port's interface's optional parameters.

  **Parameters** `port` -- A string - port name.

  **Returns** String containing optional parameters of port's interface, False on failure.

  New in version 2016.3.0.

  CLI Example:

  ```
salt '*' openvswitch.interface_get_options tap0
  ```

`salt.modules.openvswitch.interface_get_type(port)`

Type of port's interface.

  **Parameters** `port` -- A string - port name.

  **Returns** String - type of interface or empty string, False on failure.

  New in version 2016.3.0.

  CLI Example:

  ```
salt '*' openvswitch.interface_get_type tap0
  ```

`salt.modules.openvswitch.port_add(br, port, may_exist=False, internal=False)`

Creates a new port named port.

  **Returns** True on success, else False.

  **Parameters**

  - `br` -- A string - bridge name
  - `port` -- A string - port name
  - `may_exist` -- Bool, if False - attempting to create a port that exists returns False.
  - `internal` -- A boolean to create an internal interface if one does not exist.

  New in version 2016.3.0.

  CLI Example:
salt.modules.openvswitch.port_add(br0, 8080)

salt.modules.openvswitch.port_create_gre(br, port, id, remote)
Generic Routing Encapsulation - creates GRE tunnel between endpoints.

Parameters
- **br** -- A string - bridge name.
- **port** -- A string - port name.
- **id** -- An integer - unsigned 32-bit number, tunnel’s key.
- **remote** -- A string - remote endpoint’s IP address.

Returns True on success, else False.
New in version 2016.3.0.

CLI Example:
salt '*' openvswitch.port_create_gre br0 gre1 5001 192.168.1.10

salt.modules.openvswitch.port_create_vlan(br, port, id, internal=False)
Isolate VM traffic using VLANs.

Parameters
- **br** -- A string - bridge name.
- **port** -- A string - port name.
- **id** -- An integer in the valid range 0 to 4095 (inclusive), name of VLAN.
- **internal** -- A boolean to create an internal interface if one does not exist.

Returns True on success, else False.
New in version 2016.3.0.

CLI Example:
salt '*' openvswitch.port_create_vlan br0 tap0 100

salt.modules.openvswitch.port_create_vxlan(br, port, id, remote, dst_port=None)
Virtual eXtensible Local Area Network - creates VXLAN tunnel between endpoints.

Parameters
- **br** -- A string - bridge name.
- **port** -- A string - port name.
- **id** -- An integer - unsigned 64-bit number, tunnel’s key.
- **remote** -- A string - remote endpoint’s IP address.
- **dst_port** -- An integer - port to use when creating tunnelport in the switch.

Returns True on success, else False.
New in version 2016.3.0.

CLI Example:
salt '*' openvswitch.port_create_vxlan br0 vx1 5001 192.168.1.10 8472

salt.modules.openvswitch.port_get_tag(port)
Lists tags of the port.

Parameters **port** -- A string - port name.

Returns List of tags (or empty list), False on failure.
New in version 2016.3.0.

CLI Example:
salt '*' openvswitch.port_get_tag tap0

salt.modules.openvswitch.port_list(br)
Lists all of the ports within bridge.
Parameters `br` -- A string - bridge name.

Returns List of bridges (or empty list), False on failure.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.port_list br0
```

**salt.modules.openvswitch.port_remove(b, port, if_exists=True)**

Deletes port.

**Parameters**

- `br` -- A string - bridge name (If bridge is None, port is removed from whatever bridge contains it)
- `port` -- A string - port name.
- `if_exists` -- Bool, if False - attempting to delete a por that does not exist returns False. (Default True)

**Returns** True on success, else False.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.port_remove br0 8080
```

### 23.9.326 salt.modules.opkg

Support for Opkg

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

New in version 2016.3.0.

**Note:** For version comparison support on opkg < 0.3.4, the opkg-utils package must be installed.

**salt.modules.opkg.available_version(**names**, **kwargs**)**

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

**salt.modules.opkg.check_extra_requirements(pkpgname, pkgver)**

Check if the installed package already has the given requirements. There's nothing do to here for nipkg.py, therefore it will always return True.

**salt.modules.opkg.del_repo(repo, **kwargs**)**

Delete a repo from /etc/opkg/*.*.conf

If the file does not contain any other repo configuration, the file itself will be deleted.
CLI Examples:

```
salt '*' pkg.del_repo repo
```

```
salt.modules.opkg.file_dict('packages', **kwargs)
```

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system’s package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

```
salt.modules.opkg.file_list('packages', **kwargs)
```

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system’s package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

```
salt.modules.opkg.get_repo(repo, **kwargs)
```

Display a repo from the /etc/opkg/*.conf

CLI Examples:

```
salt '*' pkg.get_repo repo
```

```
salt.modules.opkg.hold(name=None, pkgs=None, sources=None, **kwargs)
```

Set package in 'hold' state, meaning it will not be upgraded.

- **name** The name of the package, e.g., 'tmux'

  CLI Example:

  ```
salt '*' pkg.hold <package name>
  ```

- **pkgs** A list of packages to hold. Must be passed as a python list.

  CLI Example:

  ```
salt '*' pkg.hold pkgs='["foo", "bar"]'
  ```

```
salt.modules.opkg.info_installed('names', **kwargs)
```

Return the information of the named package(s), installed on the system.

New in version 2017.7.0.

**Parameters**

- **names** -- Names of the packages to get information about. If none are specified, will return information for all installed packages.
- **attr** -- Comma-separated package attributes. If no 'attr' is specified, all available attributes returned.

  **Valid attributes are:** arch, conffiles, conflicts, depends, description, filename, group, install_date_time_t, md5sum, packager, provides, recommends, replaces, size, source, suggests, url, version

  CLI Example:
salt.modules.opkg.install(name=None, refresh=False, pkgs=None, sources=None, reinstall=False, **kwargs)

Install the passed package, add refresh=True to update the opkg database.

**name** The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option.

**CLI Example:**

```bash
salt '*' pkg.install <package name>
```

**refresh** Whether or not to refresh the package database before installing.

**version** Install a specific version of the package, e.g. 1.2.3-0ubuntu0. Ignored if "pkgs" or "sources" is passed.

New in version 2017.7.0.

**reinstall** [False] Specifying reinstall=True will use opkg install --force-reinstall rather than simply opkg install for requested packages that are already installed.

If a version is specified with the requested package, then opkg install --force-reinstall will only be used if the installed version matches the requested version.

New in version 2017.7.0.

**Multiple Package Installation Options:**

**pkgs** A list of packages to install from a software repository. Must be passed as a python list.

**CLI Example:**

```bash
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-0ubuntu0"}]'
```

**sources** A list of IPK packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package. Dependencies are automatically resolved and marked as auto-installed.

**CLI Example:**

```bash
salt '*' pkg.install sources='["foo": "salt://foo.deb"],{"bar": "salt://bar.deb"}]
```

**install_recommends** Whether to install the packages marked as recommended. Default is True.

**only_upgrade** Only upgrade the packages (disallow downgrades), if they are already installed. Default is False.

New in version 2017.7.0.

Returns a dict containing the new package names and versions:

```json
{"<package>": {"old": '<old-version>',
              "new": '<new-version>'}}
```

salt.modules.opkg.latest_version(names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.
If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

```
salt.modules.opkg.list_pkgs(versions_as_list=False, **kwargs)
```

List the packages currently installed in a dict:

```
{
'package_name': '<version>
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

```
salt.modules.opkg.list_repos(**kwargs)
```

Lists all repos on /etc/opkg/*.conf

CLI Example:

```
salt '*' pkg.list_repos
```

```
salt.modules.opkg.list_upgrades(refresh=True, **kwargs)
```

List all available package upgrades.

CLI Example:

```
salt '*' pkg.list_upgrades
```

```
salt.modules.opkg.mod_repo(repo, **kwargs)
```

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as uri is defined.

The following options are available to modify a repo definition:

- **repo** alias by which opkg refers to the repo.
- **uri** the URI to the repo.
- **compressed** defines (True or False) if the index file is compressed
- **enabled** enable or disable (True or False) repository but do not remove if disabled.
- **refresh** enable or disable (True or False) auto-refresh of the repositories

CLI Examples:

```
salt '*' pkg.mod_repo repo uri=http://new/uri
salt '*' pkg.mod_repo repo enabled=False
```

```
salt.modules.opkg.owner(*paths, **kwargs)
```

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version`

```
salt.modules.opkg.version if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.
```

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /usr/bin/basename
```
salt.modules.opkg.purge(name=None, pkgs=None, **kwargs)
Purges a package from the database.

Multiple Package Options:
- name: The name of the package to be deleted.
- pkgs: A list of packages to delete. Must be passed as a Python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

- `salt '*' pkg.purge <package name>`
- `salt '*' pkg.purge <package1>,<package2>,<package3>`
- `salt '*' pkg.purge pkgs='["foo", "bar"]'`

salt.modules.opkg.refresh_db(failhard=False, **kwargs)
Updates the opkg database to the latest packages based upon repositories.

Returns a dict, with the keys being package databases and the values being the result of the update attempt. Values can be one of the following:
- True: Database updated successfully
- False: Problem updating database

- failhard: If False, return results of failed lines as False for the package database that encountered the error. If True, raise an error with a list of the package databases that encountered errors.

New in version 2018.3.0.

CLI Example:

- `salt '*' pkg.refresh_db`

salt.modules.opkg.remove(name=None, pkgs=None, **kwargs)
Removes a package using `opkg remove`.

Multiple Package Options:
- name: The name of the package to be deleted.
- pkgs: A list of packages to delete. Must be passed as a Python list. The name parameter will be ignored if this option is passed.

- remove_dependencies: Remove package and all dependencies
- auto_remove_deps: Remove packages that were automatically installed to satisfy dependencies

New in version 2019.2.0.

CLI Example:

- `salt '*' pkg.remove <package name>`
- `salt '*' pkg.remove <package1>,<package2>,<package3>`
- `salt '*' pkg.remove pkgs='["foo", "bar"]'`
- `salt '*' pkg.remove pkgs='["foo", "bar"]' remove_dependencies=True auto_remove_deps=True`

salt.modules.opkg.unhold(name=None, pkgs=None, sources=None, **kwargs)
Sets the package in a 'hold' state to an install state, meaning it will be upgraded.

- name: The name of the package, e.g., 'tmux'

CLI Example:
salt '*' pkg.unhold <package name>

**pkgs** A list of packages to hold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.unhold pkgs=['"foo", "bar"]'
```

**salt.modules.opkg.upgrade**(refresh=True, **kwargs)

Upgrades all packages via opkg upgrade

Returns a dictionary containing the changes:

```
{"<package>": {"old": '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

**salt.modules.opkg.upgrade_available**(name, **kwargs)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

**salt.modules.opkg.version**(names, **kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

**salt.modules.opkg.version_clean**(version)

Clean the version string removing extra data. There’s nothing do to here for nipkg.py, therefore it will always return the given version.

**salt.modules.opkg.version_cmp**(pkg1, pkg2, ignore_epoch=False, **kwargs)

Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

**ignore_epoch** [False] Set to True to ignore the epoch when comparing versions

New in version 2016.3.4.

CLI Example:

```
salt '*' pkg.version_cmp '0.2.4-0' '0.2.4.1-0'
```
### 23.9.327 salt.modules.opsgenie

Module for sending data to OpsGenie

New in version 2018.3.0.

**configuration** This module can be used in Reactor System for posting data to OpsGenie as a remote-execution function.

For example:

```python
opsgenie_event_poster:
  local.opsgenie.post_data:
    - tgt: 'salt-minion'
    - kwarg:
      name: event.reactor
      api_key: XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX
      reason: {{ data['data']['reason'] }}
      action_type: Create
```

salt.modules.opsgenie.post_data(api_key=None, name='OpsGenie Execution Module', reason=None, action_type=None)

Post data to OpsGenie. It's designed for Salt's Event Reactor.

After configuring the sls reaction file as shown above, you can trigger the module with your designated tag (og-tag in this case).

CLI Example:

```bash
salt-call event.send 'og-tag' '{"reason" : "Overheating CPU!"}'
```

Required parameters:
- **api_key** It's the API Key you've copied while adding integration in OpsGenie.
- **reason** It will be used as alert's default message in OpsGenie.
- **action_type** OpsGenie supports the default values Create/Close for action_type. You can customize this field with OpsGenie's custom actions for other purposes like adding notes or acknowledging alerts.

Optional parameters:
- **name** It will be used as alert's alias. If you want to use the close functionality you must provide name field for both states like in this case.

### 23.9.328 salt.modules.oracle

Oracle DataBase connection module

**maintainer** Vladimir Bormotov <bormotov@gmail.com>

**maturity** new

**depends** cx_Oracle

**platform** all

**configuration** module provide connections for multiple Oracle DB instances.

**OS Environment**

```
ORACLE_HOME: path to oracle product
PATH: path to Oracle Client libs need to be in PATH
```

**pillar**
oracle:
dbs:
  <db>:
    uri: connection credentials in format:
      user/password@host[:port]/sid[ servicename as {sysdba|sysoper}]
      optional keyword servicename will determine whether it is a sid or
      service_name
  <db>:
    uri: ...

salt.modules.oracle.client_version()
  Oracle Client Version
  CLI Example:
  
  salt '*' oracle.client_version

salt.modules.oracle.run_query(db, query)
  Run SQL query and return result
  CLI Example:
  
  salt '*' oracle.run_query my_db "select * from my_table"

salt.modules.oracle.show_dbs(*dbs)
  Show databases configuration from pillar. Filter by *args
  CLI Example:
  
  salt '*' oracle.show_dbs
  salt '*' oracle.show_dbs my_db

salt.modules.oracle.show_env()
  Show Environment used by Oracle Client
  CLI Example:
  
  salt '*' oracle.show_env

Note: at first _connect() NLS_LANG will forced to '.AL32UTF8'

salt.modules.oracle.show_pillar(item=None)
  Show Pillar segment oracle:* and subitem with notation "item:subitem"
  CLI Example:
  
  salt '*' oracle.show_pillar
  salt '*' oracle.show_pillar dbs:my_db

salt.modules.oracle.version(*dbs)
  Server Version (select banner from v$version)
  CLI Example:
  
  salt '*' oracle.version
  salt '*' oracle.version my_db
23.9.329 salt.modules.osquery

New in version 2015.8.0.

salt.modules.osquery.acpi_tables(attributes=None, where=None)
    Return acpi_tables information from osquery
    
    CLI Example:
    ```
salt '*' osquery.acpi_tables
    ```

salt.modules.osquery.alf(attributes=None, where=None)
    Return alf information from osquery
    
    CLI Example:
    ```
salt '*' osquery.alf
    ```

salt.modules.osquery.alf_exceptions(attributes=None, where=None)
    Return alf_exceptions information from osquery
    
    CLI Example:
    ```
salt '*' osquery.alf_exceptions
    ```

salt.modules.osquery.alf_explicit_auths(attributes=None, where=None)
    Return alf_explicit_auths information from osquery
    
    CLI Example:
    ```
salt '*' osquery.alf_explicit_auths
    ```

salt.modules.osquery.alf_services(attributes=None, where=None)
    Return alf_services information from osquery
    
    CLI Example:
    ```
salt '*' osquery.alf_services
    ```

salt.modules.osquery.apps(attributes=None, where=None)
    Return apps information from osquery
    
    CLI Example:
    ```
salt '*' osquery.apps
    ```

salt.modules.osquery.apt_sources(attributes=None, where=None)
    Return apt_sources information from osquery
    
    CLI Example:
    ```
salt '*' osquery.apt_sources
    ```

salt.modules.osquery.arp_cache(attributes=None, where=None)
    Return arp_cache information from osquery
    
    CLI Example:
salt '*' osquery.arp_cache

salt.modules.osquery.block_devices(attrs=None, where=None)

- Return block_devices information from osquery

- CLI Example:

  ```
salt '*' osquery.block_devices
  ```

salt.modules.osquery.certificates(attrs=None, where=None)

- Return certificates information from osquery

- CLI Example:

  ```
salt '*' osquery.certificates
  ```

salt.modules.osquery.chrome_extensions(attrs=None, where=None)

- Return chrome_extensions information from osquery

- CLI Example:

  ```
salt '*' osquery.chrome_extensions
  ```

salt.modules.osquery.cpuid(attrs=None, where=None)

- Return cpuid information from osquery

- CLI Example:

  ```
salt '*' osquery.cpuid
  ```

salt.modules.osquery.crontab(attrs=None, where=None)

- Return crontab information from osquery

- CLI Example:

  ```
salt '*' osquery.crontab
  ```

salt.modules.osquery.deb_packages(attrs=None, where=None)

- Return deb_packages information from osquery

- CLI Example:

  ```
salt '*' osquery.deb_packages
  ```

salt.modules.osquery.etc_hosts(attrs=None, where=None)

- Return etc_hosts information from osquery

- CLI Example:

  ```
salt '*' osquery.etc_hosts
  ```

salt.modules.osquery.etc_services(attrs=None, where=None)

- Return etc_services information from osquery

- CLI Example:

  ```
salt '*' osquery.etc_services
  ```
salt.modules.osquery.file_(attrs=None, where=None)
Return file information from osquery

CLI Example:
salt '*' osquery.file

salt.modules.osquery.file_changes_(attrs=None, where=None)
Return file_changes information from osquery

CLI Example:
salt '*' osquery.file_changes

salt.modules.osquery.firefox_addons_(attrs=None, where=None)
Return firefox_addons information from osquery

CLI Example:
salt '*' osquery.firefox_addons

salt.modules.osquery.groups_(attrs=None, where=None)
Return groups information from osquery

CLI Example:
salt '*' osquery.groups

salt.modules.osquery.hardware_events_(attrs=None, where=None)
Return hardware_events information from osquery

CLI Example:
salt '*' osquery.hardware_events

salt.modules.osquery.hash_(attrs=None, where=None)
Return hash information from osquery

CLI Example:
salt '*' osquery.hash

salt.modules.osquery.homebrew_packages_(attrs=None, where=None)
Return homebrew_packages information from osquery

CLI Example:
salt '*' osquery.homebrew_packages

salt.modules.osquery.interface_addresses_(attrs=None, where=None)
Return interface_addresses information from osquery

CLI Example:
salt '*' osquery.interface_addresses

salt.modules.osquery.interface_details_(attrs=None, where=None)
Return interface_details information from osquery

CLI Example:
**Salt Documentation, Release 3003.3**

```python
salt '*' osquery.interface_details

salt.modules.osquery.iokit_devicetree(attrs=None, where=None)
    Return iokit_devicetree information from osquery
    CLI Example:
    
    ```
    salt '*' osquery.iokit_devicetree

salt.modules.osquery.iokit_registry(attrs=None, where=None)
    Return iokit_registry information from osquery
    CLI Example:
    
    ```
    salt '*' osquery.iokit_registry

salt.modules.osquery.kernel_extensions(attrs=None, where=None)
    Return kernel_extensions information from osquery
    CLI Example:
    
    ```
    salt '*' osquery.kernel_extensions

salt.modules.osquery.kernel_info(attrs=None, where=None)
    Return kernel_info information from osquery
    CLI Example:
    
    ```
    salt '*' osquery.kernel_info

salt.modules.osquery.kernel_integrity(attrs=None, where=None)
    Return kernel_integrity information from osquery
    CLI Example:
    
    ```
    salt '*' osquery.kernel_integrity

salt.modules.osquery.kernel_modules(attrs=None, where=None)
    Return kernel_modules information from osquery
    CLI Example:
    
    ```
    salt '*' osquery.kernel_modules

salt.modules.osquery.keychain_items(attrs=None, where=None)
    Return keychain_items information from osquery
    CLI Example:
    
    ```
    salt '*' osquery.keychain_items

salt.modules.osquery.last(attrs=None, where=None)
    Return last information from osquery
    CLI Example:
    
    ```
    salt '*' osquery.last
```

---

**23.9. execution modules**
salt.modules.osquery.launchd (attrs=None, where=None)
Return launchd information from osquery

CLI Example:
```
salt '*' osquery.launchd
```

salt.modules.osquery.listening_ports (attrs=None, where=None)
Return listening_ports information from osquery

CLI Example:
```
salt '*' osquery.listening_ports
```

salt.modules.osquery.logged_in_users (attrs=None, where=None)
Return logged_in_users information from osquery

CLI Example:
```
salt '*' osquery.logged_in_users
```

salt.modules.osquery.memory_map (attrs=None, where=None)
Return memory_map information from osquery

CLI Example:
```
salt '*' osquery.memory_map
```

salt.modules.osquery.mounts (attrs=None, where=None)
Return mounts information from osquery

CLI Example:
```
salt '*' osquery.mounts
```

salt.modules.osquery.nfs_shares (attrs=None, where=None)
Return nfs_shares information from osquery

CLI Example:
```
salt '*' osquery.nfs_shares
```

salt.modules.osquery.nvram (attrs=None, where=None)
Return nvram information from osquery

CLI Example:
```
salt '*' osquery.nvram
```

salt.modules.osquery.os_version (attrs=None, where=None)
Return os_version information from osquery

CLI Example:
```
salt '*' osquery.os_version
```

salt.modules.osquery.osquery_extensions (attrs=None, where=None)
Return osquery_extensions information from osquery

CLI Example:
salt 'salt '*' osquery.osquery_extensions

salt.modules.osquery.osquery_flags(*args, **kwargs)
    Return osquery_flags information from osquery
    CLI Example:
    salt '*' osquery.osquery_flags

salt.modules.osquery.osquery_info(*args, **kwargs)
    Return osquery_info information from osquery
    CLI Example:
    salt '*' osquery.osquery_info

salt.modules.osquery.osquery_registry(*args, **kwargs)
    Return osquery_registry information from osquery
    CLI Example:
    salt '*' osquery.osquery_registry

salt.modules.osquery.passwd_changes(*args, **kwargs)
    Return passwd_changes information from osquery
    CLI Example:
    salt '*' osquery.passwd_changes

salt.modules.osquery.pci_devices(*args, **kwargs)
    Return pci_devices information from osquery
    CLI Example:
    salt '*' osquery.pci_devices

salt.modules.osquery.preferences(*args, **kwargs)
    Return preferences information from osquery
    CLI Example:
    salt '*' osquery.preferences

salt.modules.osquery.process_envs(*args, **kwargs)
    Return process_envs information from osquery
    CLI Example:
    salt '*' osquery.process_envs

salt.modules.osquery.process_memory_map(*args, **kwargs)
    Return process_memory_map information from osquery
    CLI Example:
    salt '*' osquery.process_memory_map

23.9. execution modules
salt.modules.osquery.process_open_files
Return process_open_files information from osquery

CLI Example:
```
salt '*' osquery.process_open_files
```

salt.modules.osquery.process_open_sockets
Return process_open_sockets information from osquery

CLI Example:
```
salt '*' osquery.process_open_sockets
```

salt.modules.osquery.processes
Return processes information from osquery

CLI Example:
```
salt '*' osquery.processes
```

salt.modules.osquery.quarantine
Return quarantine information from osquery

CLI Example:
```
salt '*' osquery.quarantine
```

salt.modules.osquery.query
Return time information from osquery

CLI Example:
```
salt '*' osquery.query "select * from users;"
```

salt.modules.osquery.routes
Return routes information from osquery

CLI Example:
```
salt '*' osquery.routes
```

salt.modules.osquery.rpm_packages
Return cpuid information from osquery

CLI Example:
```
salt '*' osquery.rpm_packages
```

salt.modules.osquery.safari_extensions
Return safari_extensions information from osquery

CLI Example:
```
salt '*' osquery.safari_extensions
```

salt.modules.osquery.shared_memory
Return shared_memory information from osquery

CLI Example:
salt '*' osquery.shared_memory

salt.modules.osquery.shell_history(attrs=None, where=None)
Return shell_history information from osquery
CLI Example:
salt '*' osquery.shell_history

salt.modules.osquery.smbios_tables(attrs=None, where=None)
Return smbios_tables information from osquery
CLI Example:
salt '*' osquery.smbios_tables

salt.modules.osquery.startup_items(attrs=None, where=None)
Return startup_items information from osquery
CLI Example:
salt '*' osquery.startup_items

salt.modules.osquery.suid_bin(attrs=None, where=None)
Return suid_bin information from osquery
CLI Example:
salt '*' osquery.suid_bin

salt.modules.osquery.system_controls(attrs=None, where=None)
Return system_controls information from osquery
CLI Example:
salt '*' osquery.system_controls

salt.modules.osquery.time_(attrs=None)
Return time information from osquery
CLI Example:
salt '*' osquery.time

salt.modules.osquery.usb_devices(attrs=None, where=None)
Return usb_devices information from osquery
CLI Example:
salt '*' osquery.usb_devices

salt.modules.osquery.users(attrs=None, where=None)
Return users information from osquery
CLI Example:
salt '*' osquery.users
salt.modules.osquery.version()
   Return version of osquery
   CLI Example:
   
   salt '*' osquery.version

salt.modules.osquery.xattr_where_from(attrs=None, where=None)
   Return xattr_where_from information from osquery
   CLI Example:
   
   salt '*' osquery.xattr_where_from

salt.modules.osquery.xprotect_entries(attrs=None, where=None)
   Return xprotect_entries information from osquery
   CLI Example:
   
   salt '*' osquery.xprotect_entries

salt.modules.osquery.xprotect_reports(attrs=None, where=None)
   Return xprotect_reports information from osquery
   CLI Example:
   
   salt '*' osquery.xprotect_reports

23.9.330 **salt.modules.out**

Output Module

New in version 2018.3.0.

Execution module that processes JSON serializable data and returns string having the format as processed by the outputters.

Although this does not bring much value on the CLI, it turns very handy in applications that require human readable data rather than Python objects.

For example, inside a Jinja template:

```
{{ salt.out.string_format(complex_object, out='highstate') }}
```

salt.modules.out.html_format(data, out='nested', opts=None, **kwargs)
   Return the formatted string as HTML.
   data  The JSON serializable object.
   out: nested The name of the output to use to transform the data. Default: nested.
   opts Dictionary of configuration options. Default: __opts__.
   kwargs Arguments to sent to the outputter module.
   CLI Example:
   
   salt '*' out.html_format "{"key": 'value'}" out=yaml

salt.modules.out.out_format(data, out='nested', opts=None, **kwargs)
   Return the formatted outputter string for the Python object.
   data  The JSON serializable object.
   out: nested The name of the output to use to transform the data. Default: nested.
opts  Dictionary of configuration options. Default: __opts__.
kwargs  Arguments to sent to the outpoutter module.

CLI Example:

```python
salt '*' out.out_format "{'key': 'value'}"
```

```
salt.modules.out.string_format(data, out='nested', opts=None, **kwargs)
```

Return the outpoutter formatted string, removing the ANSI escape sequences.

- **data**: The JSON serializable object.
- **out**: nested The name of the output to use to transform the data. Default: nested.
- **opts**: Dictionary of configuration options. Default: __opts__.
- **kwargs**: Arguments to sent to the outputter module.

CLI Example:

```python
salt '*' out.string_format "{'key': 'value'}" out=table
```

### 23.9.331 salt.modules.pacmanpkg

A module to wrap pacman calls, since Arch is the best [((https://wiki.archlinux.org/index.php/Arch_is_the_best)]

**Important**: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

```
salt.modules.pacmanpkg.available_version(*names, **kwargs)
```

This function is an alias of latest_version.

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```python
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

```
salt.modules.pacmanpkg.file_dict(*packages, **kwargs)
```

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```python
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

```
salt.modules.pacmanpkg.file_list(*packages, **kwargs)
```

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```python
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```
salt.modules.pacmanpkg.group_diff(name)
New in version 2016.11.0.
Lists which of a group's packages are installed and which are not installed
Compatible with yumpkg.group_diff for easy support of state.pkg.group_installed
CLI Example:
```
salt '*' pkg.group_diff 'xorg'
```

salt.modules.pacmanpkg.group_info(name)
New in version 2016.11.0.
Lists all packages in the specified group
CLI Example:
```
salt '*' pkg.group_info 'xorg'
```

salt.modules.pacmanpkg.group_list()
New in version 2016.11.0.
Lists all groups known by pacman on this system
CLI Example:
```
salt '*' pkg.group_list
```

salt.modules.pacmanpkg.install(name=None, refresh=False, sysupgrade=None, pkgs=None, sources=None, **kwargs)
Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Install (pacman -S) the specified package(s). Add refresh=True to install with -y, add sysupgrade=True to install with -u.

**name** The name of the package to be installed. Note that this parameter is ignored if either pkgs or sources is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the sources option.

CLI Example:
```
salt '*' pkg.install <package name>
```

**refresh** Whether or not to refresh the package database before installing.

**sysupgrade** Whether or not to upgrade the system packages before installing. If refresh is set to True but sysupgrade is not specified, -u will be applied

**pkgs** A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. As with the version parameter above, comparison operators can be used to target a specific version of a package.

CLI Examples:
sources  A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and
the values being the source URI or local path to the package.

CLI Example:

```bash
salt '*' pkg.install pkgs=['foo', "bar"]
salt '*' pkg.install pkgs=['foo', "1.2.3-4"]
salt '*' pkg.install pkgs=['foo', "<1.2.3-4"]
```

Returns a dict containing the new package names and versions:

```json
':{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

salt.modules.pacmanpkg.latest_version (*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package
name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.pacmanpkg.list_pkgs (versions_as_list=False, **kwargs)

List the packages currently installed as a dict:

```json
{'<package_name>': '<version>'}
```

CLI Example:

```bash
salt '*' pkg.list_pkgs
```

salt.modules.pacmanpkg.list_repo_pkgs (*args, **kwargs)

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will
be filtered to packages matching those names.

This function can be helpful in discovering the version or repo to specify in a pkg.installed state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest
to oldest. If byrepo is set to True, then the return dictionary will contain repository names at the top level,
and each repository will map packages to lists of version numbers. For example:

```bash
# With byrepo=False (default)
{
    'bash': ['4.4.005-2'],
    'nginx': ['1.10.2-2']
}
# With byrepo=True
{
    'core': {
        'bash': ['4.4.005-2']
    },
    'extra': {
        'nginx': ['1.10.2-2']
    }
}
```

(continues on next page)
fromrepo [None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

byrepo [False] When True, the return data for each package will be organized by repository.

refresh [False] When True, the package database will be refreshed (i.e. pacman -Sy) before checking for available versions.

CLI Examples:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'samba4*' fromrepo=base,updates
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True
```

salt.modules.pacmanpkg.list_upgrades(refresh=False, root=None, **kwargs)

List all available package upgrades on this system

CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.pacmanpkg.owner(*paths, **kwargs)

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like pkg.version, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /usr/bin/zsh
```

salt.modules.pacmanpkg.purge(name=None, pkgs=None, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Recursively remove a package and all dependencies which were installed with it, this will call a pacman -Rsc

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:
salt modules.pacmanpkg.refresh_db(root=None, **kwargs)

Just run a pacman -Sy, return a dict:

```python
{'<database name>': Bool}
```

CLI Example:

```
salt '*' pkg.refresh_db
```

salt modules.pacmanpkg.remove(name=None, pkgs=None, **kwargs)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Remove packages with pacman -R.

```python
name The name of the package to be deleted.
```

Multiple Package Options:

```python
pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.
```

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt modules.pacmanpkg.upgrade(refresh=False, root=None, **kwargs)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Run a full system upgrade, a pacman -Syu

```python
refresh Whether or not to refresh the package database before installing.
```

Returns a dictionary containing the changes:

```python
{'<package>': {'old': '<old-version>',
  'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

salt modules.pacmanpkg.upgrade_available(name, **kwargs)

Check whether or not an upgrade is available for a given package

23.9. execution modules 2491
23.9.332 salt.modules.pagerduty

Module for Firing Events via PagerDuty

New in version 2014.1.0.

configuration This module can be used by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```
my-pagerduty-account:
pagerduty.api_key: F3Rbyjbe43rfWf2214
pagerduty.subdomain: mysubdomain
```

salt.modules.pagerduty.create_event(service_key=None, description=None, details=None, incident_key=None, profile=None)

Create an event in PagerDuty. Designed for use in states.

CLI Example:

```
salt myminion pagerduty.create_event <service_key> <description> <details> → profile=my-pagerduty-account
```

The following parameters are required:

service_key This key can be found by using pagerduty.list_services.
description This is a short description of the event.
details This can be a more detailed description of the event.
profile This refers to the configuration profile to use to connect to the PagerDuty service.

salt.modules.pagerduty.list_escalation_policies(profile=None, api_key=None)

This function is an alias of list_policies.

List escalation policies belonging to this account

CLI Example:

```
salt myminion pagerduty.list_policies my-pagerduty-account
salt myminion pagerduty.list_escalation_policies my-pagerduty-account
```

salt.modules.pagerduty.list_incidents(profile=None, api_key=None)

List incidents belonging to this account

CLI Example:

```
salt myminion pagerduty.list_incidents my-pagerduty-account
```
salt.modules.pagerduty.list_maintenance_windows(profile=None, api_key=None)
This function is an alias of list_windows.
List maintenance windows belonging to this account
   CLI Example:
   salt myminion pagerduty.list_windows my-pagerduty-account
   salt myminion pagerduty.list_maintenance_windows my-pagerduty-account

salt.modules.pagerduty.list_policies(profile=None, api_key=None)
List escalation policies belonging to this account
   CLI Example:
   salt myminion pagerduty.list_policies my-pagerduty-account
   salt myminion pagerduty.list_escalation_policies my-pagerduty-account

salt.modules.pagerduty.list_schedules(profile=None, api_key=None)
List schedules belonging to this account
   CLI Example:
   salt myminion pagerduty.list_schedules my-pagerduty-account

salt.modules.pagerduty.list_services(profile=None, api_key=None)
List services belonging to this account
   CLI Example:
   salt myminion pagerduty.list_services my-pagerduty-account

salt.modules.pagerduty.list_users(profile=None, api_key=None)
List users belonging to this account
   CLI Example:
   salt myminion pagerduty.list_users my-pagerduty-account

salt.modules.pagerduty.list_windows(profile=None, api_key=None)
List maintenance windows belonging to this account
   CLI Example:
   salt myminion pagerduty.list_windows my-pagerduty-account
   salt myminion pagerduty.list_maintenance_windows my-pagerduty-account

23.9.333 salt.modules.pagerduty_util

Module for managing PagerDuty resource

configuration This module can be used by specifying the name of a configuration profile in the minion
   config, minion pillar, or master config. The default configuration profile name is 'pagerduty.'
   For example:
   pagerduty:
   pagerduty.api_key: F3Rbyjive43rfFWf2214
   pagerduty.subdomain: mysubdomain
For PagerDuty API details, see https://developer.pagerduty.com/documentation/rest

```python
salt.modules.pagerduty_util.create_or_update_resource(resource_name, identifier_fields, data, diff=None, profile='pagerduty', subdomain=None, api_key=None)
```

create or update any pagerduty resource

Helper method for present().

Determining if two resources are the same is different for different PD resource, so this method accepts a diff function. The diff function will be invoked as diff(state_information, object_returned_from_pagerduty), and should return a dict of data to pass to the PagerDuty update API method, or None if no update is to be performed. If no diff method is provided, the default behavior is to scan the keys in the state_information, comparing the matching values in the object Returned_from_pagerduty, and update any values that differ.

**Examples**

```python
create_or_update_resource("user", ["id","name","email"])
create_or_update_resource("escalation_policies", ["id","name"], diff=my_diff_function)
```

```python
salt.modules.pagerduty_util.delete_resource(resource_name, key, identifier_fields, profile='pagerduty', subdomain=None, api_key=None)
```

delete any pagerduty resource

Helper method for absent()

**Example**

```python
delete_resource("users", key, ["id","name","email"])
```

```python
salt.modules.pagerduty_util.get_escalation_policies(profile='pagerduty', subdomain=None, api_key=None)
```

List escalation_policies belonging to this account

CLI Example:

```
salt myminion pagerduty.get_escalation_policies
```

```python
salt.modules.pagerduty_util.get_resource(resource_name, key, identifier_fields, profile='pagerduty', subdomain=None, api_key=None)
```

Get any single pagerduty resource by key.

We allow flexible lookup by any of a list of identifier_fields. So, for example, you can look up users by email address or name by calling:

```python
get_resource('users', key, ['name', 'email'], ...)
```

This method is mainly used to translate state sls into pagerduty id's for dependent objects. For example, a pagerduty escalation policy contains one or more schedules, which must be passed by their pagerduty id. We look up the schedules by name (using this method), and then translate the names into id's.

This method is implemented by getting all objects of the resource type (cached into __context__), then brute force searching through the list and trying to match any of the identifier_fields. The __context__ cache is purged after any create, update or delete to the resource.

```python
salt.modules.pagerduty_util.get_schedules(profile='pagerduty', subdomain=None, api_key=None)
```

List schedules belonging to this account

CLI Example:
salt myminion pagerduty.get_schedules

salt.modules.pagerduty_util.get_services(profile='pagerduty', subdomain=None, api_key=None)

List services belonging to this account

CLI Example:
salt myminion pagerduty.get_services

salt.modules.pagerduty_util.get_users(profile='pagerduty', subdomain=None, api_key=None)

List users belonging to this account

CLI Example:
salt myminion pagerduty.get_users

salt.modules.pagerduty_util.resource_absent(resource, identifier_fields, profile='pagerduty', subdomain=None, api_key=None, **kwargs)

Generic resource.absent state method. Pagerduty state modules should be a thin wrapper over this method, with a custom diff function.

This method calls delete_resource() and formats the result as a salt state return value.

Example

resource_absent("users", ["id","name","email"])

salt.modules.pagerduty_util.resource_present(resource, identifier_fields, diff=None, profile='pagerduty', subdomain=None, api_key=None, **kwargs)

Generic resource.present state method. Pagerduty state modules should be a thin wrapper over this method, with a custom diff function.

This method calls create_or_update_resource() and formats the result as a salt state return value.

Example

resource_present("users", ["id","name","email"])

23.9.334 salt.modules.pam

Support for pam

salt.modules.pam.read_file(file_name)

This is just a test function, to make sure parsing works

CLI Example:
salt '*' pam.read_file /etc/pam.d/login
23.9.335  salt.modules.panos

Module to provide Palo Alto compatibility to Salt

codeauthor  Spencer Ervin <spencer_ervin@hotmail.com>
maturity  new
depends  none
platform  unix

New in version 2018.3.0.

Configuration

This module accepts connection configuration details either as parameters, or as configuration settings in pillar as a Salt proxy. Options passed into opts will be ignored if options are passed into pillar.

See also:

Palo Alto Proxy Module

About

This execution module was designed to handle connections to a Palo Alto based firewall. This module adds support to send connections directly to the device through the XML API or through a brokered connection to Panorama.

salt.modules.panos.add_config_lock()
Prevent other users from changing configuration until the lock is released.

CLI Example:

salt '*' panos.add_config_lock

salt.modules.panos.check_antivirus()
Get anti-virus information from PaloAlto Networks server

CLI Example:

salt '*' panos.check_antivirus

salt.modules.panos.check_software()
Get software information from PaloAlto Networks server.

CLI Example:

salt '*' panos.check_software

salt.modules.panos.clear_commit_tasks()
Clear all commit tasks.

CLI Example:

salt '*' panos.clear_commit_tasks

salt.modules.panos.commit()
Commits the candidate configuration to the running configuration.

CLI Example:
salt '*' panos.commit

salt.modules.panos.deactivate_license(key_name=None)
    Deactivates an installed license. Required version 7.0.0 or greater.
    key_name(str): The file name of the license key installed.
    CLI Example:

    salt '*' panos.deactivate_license key_name=License_File_Name.key

salt.modules.panos.delete_license(key_name=None)
    Remove license keys on disk.
    key_name(str): The file name of the license key to be deleted.
    CLI Example:

    salt '*' panos.delete_license key_name=License_File_Name.key

salt.modules.panos.download_antivirus()
    Download the most recent anti-virus package.
    CLI Example:

    salt '*' panos.download_antivirus

salt.modules.panos.download_software_file(filename=None, synch=False)
    Download software packages by filename.
    Parameters
        • filename(str) -- The filename of the PANOS file to download.
        • synch(bool) -- If true then the file will synch to the peer unit.
    CLI Example:

    salt '*' panos.download_software_file PanOS_5000-8.0.0
    salt '*' panos.download_software_file PanOS_5000-8.0.0 True

salt.modules.panos.download_software_version(version=None, synch=False)
    Download software packages by version number.
    Parameters
        • version(str) -- The version of the PANOS file to download.
        • synch(bool) -- If true then the file will synch to the peer unit.
    CLI Example:

    salt '*' panos.download_software_version 8.0.0
    salt '*' panos.download_software_version 8.0.0 True

salt.modules.panos.fetch_license(auth_code=None)
    Get new license(s) using from the Palo Alto Network Server.
    auth_code The license authorization code.
    CLI Example:

    salt '*' panos.fetch_license
    salt '*' panos.fetch_license auth_code=foobar

salt.modules.panos.get_address(address=None, vsys='1')
    Get the candidate configuration for the specified get_address object. This will not return address objects that
    are marked as pre-defined objects.
address(str): The name of the address object.

vsys(str): The string representation of the VSYS ID.

CLI Example:

    salt '*' panos.get_address myhost
    salt '*' panos.get_address myhost

salt.modules.panos.get_address_group(addressgroup=None, vsys='1')

Get the candidate configuration for the specified address group. This will not return address groups that are marked as pre-defined objects.

addressgroup(str): The name of the address group.

vsys(str): The string representation of the VSYS ID.

CLI Example:

    salt '*' panos.get_address_group foobar
    salt '*' panos.get_address_group foobar

salt.modules.panos.get_admins_active()

Show active administrators.

CLI Example:

    salt '*' panos.get_admins_active

salt.modules.panos.get_admins_all()

Show all administrators.

CLI Example:

    salt '*' panos.get_admins_all

salt.modules.panos.get_antivirus_info()

Show information about available anti-virus packages.

CLI Example:

    salt '*' panos.get_antivirus_info

salt.modules.panos.get_arp()

Show ARP information.

CLI Example:

    salt '*' panos.get_arp

salt.modules.panos.get_cli_idle_timeout()

Show timeout information for this administrative session.

CLI Example:

    salt '*' panos.get_cli_idle_timeout

salt.modules.panos.get_cli_permissions()

Show cli administrative permissions.

CLI Example:
salt ' '*' panos.get_cli_permissions

salt.modules.panos.get_disk_usage()
Report filesystem disk space usage.

CLI Example:

salt ' '*' panos.get_disk_usage

salt.modules.panos.get_dns_server_config()
Get the DNS server configuration from the candidate configuration.

CLI Example:

salt ' '*' panos.get_dns_server_config

salt.modules.panos.get_domain_config()
Get the domain name configuration from the candidate configuration.

CLI Example:

salt ' '*' panos.get_domain_config

salt.modules.panos.get_dos_blocks()
Show the DoS block-ip table.

CLI Example:

salt ' '*' panos.get_dos_blocks

salt.modules.panos.get_fqdn_cache()
Print FQDNs used in rules and their IPs.

CLI Example:

salt ' '*' panos.get_fqdn_cache

salt.modules.panos.get_ha_config()
Get the high availability configuration.

CLI Example:

salt ' '*' panos.get_ha_config

salt.modules.panos.get_ha_link()
Show high-availability link-monitoring state.

CLI Example:

salt ' '*' panos.get_ha_link

salt.modules.panos.get_ha_path()
Show high-availability path-monitoring state.

CLI Example:

salt ' '*' panos.get_ha_path
salt.modules.panos.get_ha_state()
  Show high-availability state information.
  CLI Example:
  
  ```
  salt '*' panos.get_ha_state
  ```

salt.modules.panos.get_ha_transitions()
  Show high-availability transition statistic information.
  CLI Example:
  
  ```
  salt '*' panos.get_ha_transitions
  ```

salt.modules.panos.get_hostname()
  Get the hostname of the device.
  CLI Example:
  
  ```
  salt '*' panos.get_hostname
  ```

salt.modules.panos.get_interface_counters(name='all')
  Get the counter statistics for interfaces.
  Parameters name (str) -- The name of the interface to view. By default, all interface statistics are viewed.
  CLI Example:
  
  ```
  salt '*' panos.get_interface_counters
  salt '*' panos.get_interface_counters ethernet1/1
  ```

salt.modules.panos.get_interfaces(name='all')
  Show interface information.
  Parameters name (str) -- The name of the interface to view. By default, all interface statistics are viewed.
  CLI Example:
  
  ```
  salt '*' panos.get_interfaces
  salt '*' panos.get_interfaces ethernet1/1
  ```

salt.modules.panos.get_job(jid=None)
  List all a single job by ID.
  jid The ID of the job to retrieve.
  CLI Example:
  
  ```
  salt '*' panos.get_job jid=15
  ```

salt.modules.panos.get_jobs(state='all')
  List all jobs on the device.
  state The state of the jobs to display. Valid options are all, pending, or processed. Pending jobs are jobs that are currently in a running or waiting state. Processed jobs are jobs that have completed execution.
  CLI Example:
  
  ```
  salt '*' panos.get_jobs
  salt '*' panos.get_jobs state=pending
  ```

salt.modules.panos.get_lacp()
  Show LACP state.
CLI Example:
```
salt '*' panos.get_lACP
```

`salt.modules.panos.get_license_info()`  
Show information about owned license(s).  
CLI Example:  
```
salt '*' panos.get_license_info
```

`salt.modules.panos.get_license_tokens()`  
Show license token files for manual license deactivation.  
CLI Example:  
```
salt '*' panos.get_license_tokens
```

`salt.modules.panos.get_lldp_config()`  
Show lldp config for interfaces.  
CLI Example:  
```
salt '*' panos.get_lldp_config
```

`salt.modules.panos.get_lldp_counters()`  
Show lldp counters for interfaces.  
CLI Example:  
```
salt '*' panos.get_lldp_counters
```

`salt.modules.panos.get_lldp_local()`  
Show lldp local info for interfaces.  
CLI Example:  
```
salt '*' panos.get_lldp_local
```

`salt.modules.panos.get_lldp_neighbors()`  
Show lldp neighbors info for interfaces.  
CLI Example:  
```
salt '*' panos.get_lldp_neighbors
```

`salt.modules.panos.get_local_admins()`  
Show all local administrator accounts.  
CLI Example:  
```
salt '*' panos.get_local_admins
```

`salt.modules.panos.get_logdb_quota()`  
Report the logdb quotas.  
CLI Example:  
```
salt '*' panos.get_logdb_quota
```
salt.modules.panos.get_master_key()
Get the master key properties.

CLI Example:
```
salt '*' panos.get_master_key
```

salt.modules.panos.get_ntp_config()
Get the NTP configuration from the candidate configuration.

CLI Example:
```
salt '*' panos.get_ntp_config
```

salt.modules.panos.get_ntp_servers()
Get list of configured NTP servers.

CLI Example:
```
salt '*' panos.get_ntp_servers
```

salt.modules.panos.get_operational_mode()
Show device operational mode setting.

CLI Example:
```
salt '*' panos.get_operational_mode
```

salt.modules.panos.get_panorama_status()
Show panorama connection status.

CLI Example:
```
salt '*' panos.get_panorama_status
```

salt.modules.panos.get_permitted_ips()
Get the IP addresses that are permitted to establish management connections to the device.

CLI Example:
```
salt '*' panos.get_permitted_ips
```

salt.modules.panos.get_platform()
Get the platform model information and limitations.

CLI Example:
```
salt '*' panos.get_platform
```

salt.modules.panos.get_predefined_application(application=None)
Get the configuration for the specified pre-defined application object. This will only return pre-defined application objects.

application(str): The name of the pre-defined application object.

CLI Example:
```
salt '*' panos.get_predefined_application saltstack
```
salt.modules.panos.get_security_rule(rulename=None, vsys='1')
Get the candidate configuration for the specified security rule.

rulename(str): The name of the security rule.
vsys(str): The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_security_rule rule01
salt '*' panos.get_security_rule rule01 3
```

salt.modules.panos.get_service(service=None, vsys='1')
Get the candidate configuration for the specified service object. This will not return services that are marked as pre-defined objects.

service(str): The name of the service object.
vsys(str): The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_service tcp-443
salt '*' panos.get_service tcp-443 3
```

salt.modules.panos.get_service_group(servicegroup=None, vsys='1')
Get the candidate configuration for the specified service group. This will not return service groups that are marked as pre-defined objects.

servicegroup(str): The name of the service group.
vsys(str): The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_service_group foobar
salt '*' panos.get_service_group foobar 3
```

salt.modules.panos.get_session_info()
Show device session statistics.

CLI Example:

```
salt '*' panos.get_session_info
```

salt.modules.panos.get_snmp_config()
Get the SNMP configuration from the device.

CLI Example:

```
salt '*' panos.get_snmp_config
```

salt.modules.panos.get_software_info()
Show information about available software packages.

CLI Example:

```
salt '*' panos.get_software_info
```

salt.modules.panos.get_system_date_time()
Get the system date/time.

CLI Example:
salt '*' panos.get_system_date_time

salt.modules.panos.get_system_files()
    List important files in the system.
    CLI Example:
    ```
    salt '*' panos.get_system_files
    ```

salt.modules.panos.get_system_info()
    Get the system information.
    CLI Example:
    ```
    salt '*' panos.get_system_info
    ```

salt.modules.panos.get_system_services()
    Show system services.
    CLI Example:
    ```
    salt '*' panos.get_system_services
    ```

salt.modules.panos.get_system_state(mask=None)
    Show the system state variables.
    mask  Filters by a subtree or a wildcard.
    CLI Example:
    ```
    salt '*' panos.get_system_state
    salt '*' panos.get_system_state mask=cfg.ha.config.enabled
    salt '*' panos.get_system_state mask=cfg.ha.*
    ```

salt.modules.panos.get_uncommitted_changes()
    Retrieve a list of all uncommitted changes on the device. Requires PANOS version 8.0.0 or greater.
    CLI Example:
    ```
    salt '*' panos.get_uncommitted_changes
    ```

salt.modules.panos.get_users_config()
    Get the local administrative user account configuration.
    CLI Example:
    ```
    salt '*' panos.get_users_config
    ```

salt.modules.panos.get_vlans()
    Show all VLAN information.
    CLI Example:
    ```
    salt '*' panos.get_vlans
    ```

salt.modules.panos.get_xpath(xpath='')
    Retrieve a specified xpath from the candidate configuration.
    xpath(str): The specified xpath in the candidate configuration.
    CLI Example:
**salt modules.panos.get_zone**(zone='', vsys='1')
Get the candidate configuration for the specified zone.

- **zone**(str): The name of the zone.
- **vsys**(str): The string representation of the VSYS ID.

CLI Example:
```
salt '*' panos.get_zone trust
salt '*' panos.get_zone trust 2
```

**salt modules.panos.get_zones**(vsys='1')
Get all the zones in the candidate configuration.

- **vsys**(str): The string representation of the VSYS ID.

CLI Example:
```
salt '*' panos.get_zones
salt '*' panos.get_zones 2
```

**salt modules.panos.install_antivirus**(version=None, latest=False, synch=False, skip_commit=False)
Install anti-virus packages.

- **version**(str) -- The version of the PANOS file to install.
- **latest**(bool) -- If true, the latest anti-virus file will be installed. The specified version option will be ignored.
- **synch**(bool) -- If true, the anti-virus will synch to the peer unit.
- **skip_commit**(bool) -- If true, the install will skip committing to the device.

CLI Example:
```
salt '*' panos.install_antivirus 8.0.0
```

**salt modules.panos.install_license()**
Install the license key(s).

CLI Example:
```
salt '*' panos.install_license
```

**salt modules.panos.install_software**(version=None)
Upgrade to a software package by version.

- **version**(str) -- The version of the PANOS file to install.

CLI Example:
```
salt '*' panos.install_software 8.0.0
```

**salt modules.panos.reboot()**
Reboot a running system.

CLI Example:
```
salt '*' panos.reboot
```
salt.modules.panos.refresh_fqdn_cache(force=False)
Force refreshes all FQDNs used in rules.
force Forces all fqdn refresh
CLI Example:

```
salt '*' panos.refresh_fqdn_cache
salt '*' panos.refresh_fqdn_cache force=True
```

salt.modules.panos.remove_config_lock()
Release config lock previously held.
CLI Example:

```
salt '*' panos.remove_config_lock
```

salt.modules.panos.resolve_address(address=None, vsys=None)
Resolve address to ip address. Required version 7.0.0 or greater.
address Address name you want to resolve.
vsys The vsys name.
CLI Example:

```
salt '*' panos.resolve_address foo.bar.com
salt '*' panos.resolve_address foo.bar.com vsys=2
```

salt.modules.panos.save_device_config(filename=None)
Save device configuration to a named file.
filename The filename to save the configuration to.
CLI Example:

```
salt '*' panos.save_device_config foo.xml
```

salt.modules.panos.save_device_state()
Save files needed to restore device to local disk.
CLI Example:

```
salt '*' panos.save_device_state
```

salt.modules.panos.set_authentication_profile(profile=None, deploy=False)
Set the authentication profile of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

```
Parameters
• profile (str) -- The name of the authentication profile to set.
• deploy (bool) -- If true then commit the full candidate configuration, if false only set pending change.
```

```
salt '*' panos.set_authentication_profile foo
salt '*' panos.set_authentication_profile foo deploy=True
```

salt.modules.panos.set_hostname(hostname=None, deploy=False)
Set the hostname of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

```
Parameters
• hostname (str) -- The hostname to set
• deploy (bool) -- If true then commit the full candidate configuration, if false only set pending change.
```
salt '⋆' panos.set_hostname newhostname
salt '⋆' panos.set_hostname newhostname deploy=True

salt.modules.panos.set_management_http(enabled=True, deploy=False)
Enables or disables the HTTP management service on the device.

CLI Example:
Parameters
- enabled (bool) -- If true the service will be enabled. If false the service will be disabled.
- deploy (bool) -- If true then commit the full candidate configuration, if false only set pending change.

salt '⋆' panos.set_management_http
salt '⋆' panos.set_management_http enabled=False deploy=True

salt.modules.panos.set_management_https(enabled=True, deploy=False)
Enables or disables the HTTPS management service on the device.

CLI Example:
Parameters
- enabled (bool) -- If true the service will be enabled. If false the service will be disabled.
- deploy (bool) -- If true then commit the full candidate configuration, if false only set pending change.

salt '⋆' panos.set_management_https
salt '⋆' panos.set_management_https enabled=False deploy=True

salt.modules.panos.set_management_icmp(enabled=True, deploy=False)
Enables or disables the ICMP management service on the device.

CLI Example:
Parameters
- enabled (bool) -- If true the service will be enabled. If false the service will be disabled.
- deploy (bool) -- If true then commit the full candidate configuration, if false only set pending change.

salt '⋆' panos.set_management_icmp
salt '⋆' panos.set_management_icmp enabled=False deploy=True

salt.modules.panos.set_management_ocsp(enabled=True, deploy=False)
Enables or disables the HTTP OCSP management service on the device.

CLI Example:
Parameters
- enabled (bool) -- If true the service will be enabled. If false the service will be disabled.
- deploy (bool) -- If true then commit the full candidate configuration, if false only set pending change.

salt '⋆' panos.set_management_ocsp
salt '⋆' panos.set_management_ocsp enabled=False deploy=True

salt.modules.panos.set_management_snmp(enabled=True, deploy=False)
Enables or disables the SNMP management service on the device.

23.9. execution modules
CLI Example:
Parameters
- `enabled (bool)` -- If true the service will be enabled. If false the service will be disabled.
- `deploy (bool)` -- If true then commit the full candidate configuration, if false only set pending change.

```python
salt '*' panos.set_management_snmp
salt '*' panos.set_management_snmp enabled=False deploy=True
```

```python
salt.modules.panos.set_management_ssh(enabled=True, deploy=False)
```
Enables or disables the SSH management service on the device.

CLI Example:
Parameters
- `enabled (bool)` -- If true the service will be enabled. If false the service will be disabled.
- `deploy (bool)` -- If true then commit the full candidate configuration, if false only set pending change.

```python
salt '*' panos.set_management_ssh
salt '*' panos.set_management_ssh enabled=False deploy=True
```

```python
salt.modules.panos.set_management_telnet(enabled=True, deploy=False)
```
Enables or disables the Telnet management service on the device.

CLI Example:
Parameters
- `enabled (bool)` -- If true the service will be enabled. If false the service will be disabled.
- `deploy (bool)` -- If true then commit the full candidate configuration, if false only set pending change.

```python
salt '*' panos.set_management_telnet
salt '*' panos.set_management_telnet enabled=False deploy=True
```

```python
salt.modules.panos.set_ntp_authentication(target=None, authentication_type=None, key_id=None, authentication_key=None, algorithm=None, deploy=False)
```
Set the NTP authentication of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:
Parameters
- `target (str)` -- Determines the target of the authentication. Valid options are primary, secondary, or both.
- `authentication_type (str)` -- The authentication type to be used. Valid options are symmetric, autokey, and none.
- `key_id (int)` -- The NTP authentication key ID.
- `authentication_key (str)` -- The authentication key.
- `algorithm (str)` -- The algorithm type to be used for a symmetric key. Valid options are md5 and sha1.
- `deploy (bool)` -- If true then commit the full candidate configuration, if false only set pending change.

```python
salt '*' ntp.set_authentication target=both authentication_type=autokey
salt '*' ntp.set_authentication target=primary authentication_type=none
```

(continues on next page)
salt '⋆' ntp.set_authentication  
  target=both  
  authentication_type=symmetric  
  authentication_key=mykey  
  algorithm=md5  
  id=15
salt '⋆' ntp.set_servers 0.pool.ntp.org 1.pool.ntp.org

salt.modules.panos.set_ntp_servers (primary_server=None, secondary_server=None, deploy=False)
Set the NTP servers of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

Parameters

• primary_server (str) -- The primary NTP server IP address or FQDN.
• secondary_server (str) -- The secondary NTP server IP address or FQDN.
• deploy (bool) -- If true then commit the full candidate configuration, if false only set pending change.

salt '⋆' ntp.set_servers 0.pool.ntp.org 1.pool.ntp.org  
  primary_server=0.pool.ntp.org  secondary_server=1.pool.ntp.org
salt '⋆' ntp.set_servers 0.pool.ntp.org 1.pool.ntp.org  deploy=True

salt.modules.panos.set_permitted_ip (address=None, deploy=False)
Add an IPv4 address or network to the permitted IP list.

CLI Example:

Parameters

• address (str) -- The IPv4 address or network to allow access to add to the Palo Alto device.
• deploy (bool) -- If true then commit the full candidate configuration, if false only set pending change.

salt '⋆' panos.set_permitted_ip 10.0.0.1
salt '⋆' panos.set_permitted_ip 10.0.0.0/24
salt '⋆' panos.set_permitted_ip 10.0.0.1 deploy=True

salt.modules.panos.set_timezone (tz=None, deploy=False)
Set the timezone of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

Parameters

• tz (str) -- The name of the timezone to set.
• deploy (bool) -- If true then commit the full candidate configuration, if false only set pending change.

salt '⋆' panos.set_timezone UTC
salt '⋆' panos.set_timezone UTC deploy=True

salt.modules.panos.shutdown ()
Shutdown a running system.

CLI Example:

salt '⋆' panos.shutdown

salt.modules.panos.test_fib_route (ip=None, vr='vr1')
Perform a route lookup within active route table (fib).
ip (str): The destination IP address to test.

vr (str): The name of the virtual router to test.

CLI Example:

```
salt '*' panos.test_fib_route 4.2.2.2
salt '*' panos.test_fib_route 4.2.2.2 my-vr
```

```
salt.modules.panos.test_security_policy(sourcezone=None, destinationzone=None, source=None, destination=None, protocol=None, port=None, application=None, category=None, vsys='1', allrules=False)
```

Checks which security policy as connection will match on the device.

sourcezone (str): The source zone matched against the connection.

destinationzone (str): The destination zone matched against the connection.

source (str): The source address. This must be a single IP address.

destination (str): The destination address. This must be a single IP address.

protocol (int): The protocol number for the connection. This is the numerical representation of the protocol.

port (int): The port number for the connection.

application (str): The application that should be matched.

category (str): The category that should be matched.

vsys (int): The numerical representation of the VSYS ID.

allrules (bool): Show all potential match rules until first allow rule.

CLI Example:

```
salt '*' panos.test_security_policy sourcezone=trust destinationzone=untrust protocol=6 port=22
salt '*' panos.test_security_policy sourcezone=trust destinationzone=untrust protocol=6 port=22 vsys=2
```

```
salt.modules.panos.unlock_admin(username=None)
```

Unlocks a locked administrator account.

username Username of the administrator.

CLI Example:

```
salt '*' panos.unlock_admin username=bob
```

23.9.336 salt.modules.parallels

Manage Parallels Desktop VMs with prlctl and prlsrvctl. Only some of the prlctl commands implemented so far. Of those that have been implemented, not all of the options may have been provided yet. For a complete reference, see the Parallels Desktop Reference Guide.

This module requires the prlctl binary to be installed to run most functions. To run parallels.prlsrvctl, the prlsrvctl binary is required.

What has not been implemented yet can be accessed through parallels.prlctl and parallels.prlsrvctl (note the preceding double dash -- as necessary):
salt '*' parallels.prlctl installtools macvm runas=macdev
salt -- '*' parallels.prlctl capture 'macvm --file macvm.display.png' runas=macdev
salt -- '*' parallels.prlsrvctl set '--mem-limit auto' runas=macdev

New in version 2016.3.0.
salt.modules.parallels.clone(name, new_name, linked=False, template=False, runas=None)
Clone a VM

Parameters
- **name (str)** -- Name/ID of VM to clone
- **new_name (str)** -- Name of the new VM
- **linked (bool)** -- Create a linked virtual machine.
- **template (bool)** -- Create a virtual machine template instead of a real virtual machine.
- **runas (str)** -- The user that the prlctl command will be run as

Example:
salt '*' parallels.clone macvm macvm_new runas=macdev
salt '*' parallels.clone macvm macvm_templ template=True runas=macdev

salt.modules.parallels.delete(name, runas=None)
Delete a VM

Parameters
- **name (str)** -- Name/ID of VM to clone
- **runas (str)** -- The user that the prlctl command will be run as

Example:
salt '*' parallels.exec macvm 'find /etc/paths.d' runas=macdev

salt.modules.parallels.delete_snapshot(name, snap_name, runas=None, all=False)
Delete a snapshot

Note: Deleting a snapshot from which other snapshots are derived will not delete the derived snapshots

Parameters
- **name (str)** -- Name/ID of VM whose snapshot will be deleted
- **snap_name (str)** -- Name/ID of snapshot to delete
- **runas (str)** -- The user that the prlctl command will be run as
- **all (bool)** -- Delete all snapshots having the name given

Example:
salt '*' parallels.delete_snapshot macvm 'unneeded snapshot' runas=macdev
salt '*' parallels.delete_snapshot macvm 'Snapshot for linked clone' all=True runas=macdev

salt.modules.parallels.exec_(name, command, runas=None)
Run a command on a VM

Parameters
- **name (str)** -- Name/ID of VM whose exec will be returned
- **command** *(str)* -- Command to run on the VM
- **runas** *(str)* -- The user that the prlctl command will be run as

Example:
```
salt '*' parallels.exec macvm 'find /etc/paths.d' runas=macdev
```

**salt.modules.parallels.exists(name, runas=None)**
Query whether a VM exists
New in version 2016.11.0.

Parameters
- **name** *(str)* -- Name/ID of VM
- **runas** *(str)* -- The user that the prlctl command will be run as

Example:
```
salt '*' parallels.exists macvm runas=macdev
```

**salt.modules.parallels.list_snapshots(name, snap_name=None, tree=False, names=False, runas=None)**
List the snapshots

Parameters
- **name** *(str)* -- Name/ID of VM whose snapshots will be listed
- **snap_id** *(str)* -- Name/ID of snapshot to display information about. If tree=True is also specified, display the snapshot subtree having this snapshot as the root snapshot
- **tree** *(bool)* -- List snapshots in tree format rather than tabular format
- **names** *(bool)* -- List snapshots as ID, name pairs
- **runas** *(str)* -- The user that the prlctl command will be run as

Example:
```
salt '*' parallels.list_snapshots macvm runas=macdev
salt '*' parallels.list_snapshots macvm tree=True runas=macdev
salt '*' parallels.list_snapshots macvm snap_name=original runas=macdev
salt '*' parallels.list_snapshots macvm names=True runas=macdev
```

**salt.modules.parallels.list_vms(name=None, info=False, all=False, args=None, runas=None, template=False)**
List information about the VMs

Parameters
- **name** *(str)* -- Name/ID of VM to list

  Changed in version 2016.11.0: No longer implies info=True
- **info** *(str)* -- List extra information
- **all** *(bool)* -- List all non-template VMs
- **args** *(tuple)* -- Additional arguments given to prctl list
- **runas** *(str)* -- The user that the prlctl command will be run as
- **template** *(bool)* -- List the available virtual machine templates. The real virtual machines will not be included in the output

Example:
```
salt '*' parallels.list_vms runas=macdev
salt '*' parallels.list_vms name=macvm info=True runas=macdev
salt '*' parallels.list_vms info=True runas=macdev
salt '*' parallels.list_vms ' -o uuid,status' all=True runas=macdev
```
salt.modules.parallels.prlctl(sub_cmd, args=None, runas=None)
Execute a prlctl command
Parameters
  - **sub_cmd** *(str)* -- prlctl subcommand to execute
  - **args** *(str)* -- The arguments supplied to prlctl <sub_cmd>
  - **runas** *(str)* -- The user that the prlctl command will be run as
Example:
```
salt '*' parallels.prlctl user list runas=macdev
salt '*' parallels.prlctl exec 'macvm uname' runas=macdev
salt -- '*' parallels.prlctl capture 'macvm --file macvm.display.png' runas=macdev
```
salt.modules.parallels.prlsrvctl(sub_cmd, args=None, runas=None)
Execute a prlsrvctl command
New in version 2016.11.0.
Parameters
  - **sub_cmd** *(str)* -- prlsrvctl subcommand to execute
  - **args** *(str)* -- The arguments supplied to prlsrvctl <sub_cmd>
  - **runas** *(str)* -- The user that the prlsrvctl command will be run as
Example:
```
salt '*' parallels.prlsrvctl info runas=macdev
salt '*' parallels.prlsrvctl usb list runas=macdev
salt -- '*' parallels.prlsrvctl set '--mem-limit auto' runas=macdev
```
salt.modules.parallels.reset(name, runas=None)
Reset a VM by performing a hard shutdown and then a restart
Parameters
  - **name** *(str)* -- Name/ID of VM to reset
  - **runas** *(str)* -- The user that the prlctl command will be run as
Example:
```
salt '*' parallels.reset macvm runas=macdev
```
salt.modules.parallels.restart(name, runas=None)
Restart a VM by gracefully shutting it down and then restarting it
Parameters
  - **name** *(str)* -- Name/ID of VM to restart
  - **runas** *(str)* -- The user that the prlctl command will be run as
Example:
```
salt '*' parallels.restart macvm runas=macdev
```
salt.modules.parallels.revert_snapshot(name, snap_name=None, runas=None)
Revert a VM to a snapshot
Parameters
  - **name** *(str)* -- Name/ID of VM to revert
  - **snap_name** *(str)* -- Name/ID of snapshot to revert to
  - **runas** *(str)* -- The user that the prlctl command will be run as
Example:
```
salt '*' parallels.revert_snapshot macvm base-with-updates runas=macdev
```
salt.modules.parallels.snapshot(name, snap_name=None, desc=None, runas=None)
Create a snapshot
Parameters

- **name** *(str)* -- Name/ID of VM to take a snapshot of
- **snap_name** *(str)* -- Name of snapshot
- **desc** *(str)* -- Description of snapshot
- **runas** *(str)* -- The user that the prlctl command will be run as

Example:

```shell
salt '*' parallels.create_snapshot macvm snap_name=macvm-original runas=macdev
salt '*' parallels.create_snapshot macvm snap_name=macvm-updates desc='clean\n→ install with updates' runas=macdev
```

**salt.modules.parallels.snapshot_id_to_name** *(name, snap_id, strict=False, runas=None)*

Attempt to convert a snapshot ID to a snapshot name. If the snapshot has no name or if the ID is not found or invalid, an empty string will be returned.

Parameters

- **name** *(str)* -- Name/ID of VM whose snapshots are inspected
- **snap_id** *(str)* -- ID of the snapshot
- **strict** *(bool)* -- Raise an exception if a name cannot be found for the given snap_id
- **runas** *(str)* -- The user that the prlctl command will be run as

Example data

```
ID: {a5b8999f-5d95-4aff-82de-e515b0101b66}
Name: original
Date: 2016-03-04 10:50:34
Current: yes
State: poweroff
Description: original state
```

CLI Example:

```shell
salt '*' parallels.snapshot_id_to_name macvm a5b8999f-5d95-4aff-82de-e515b0101b66 runas=macdev
```

**salt.modules.parallels.snapshot_name_to_id** *(name, snap_name, strict=False, runas=None)*

Attempt to convert a snapshot name to a snapshot ID. If the name is not found an empty string is returned. If multiple snapshots share the same name, a list will be returned.

Parameters

- **name** *(str)* -- Name/ID of VM whose snapshots are inspected
- **snap_name** *(str)* -- Name of the snapshot
- **strict** *(bool)* -- Raise an exception if multiple snapshot IDs are found
- **runas** *(str)* -- The user that the prlctl command will be run as

CLI Example:

```shell
salt '*' parallels.snapshot_id_to_name macvm original runas=macdev
```

**salt.modules.parallels.start** *(name, runas=None)*

Start a VM

Parameters

- **name** *(str)* -- Name/ID of VM to start
- **runas** *(str)* -- The user that the prlctl command will be run as

Example:

```shell
salt '*' parallels.start macvm runas=macdev
```

**salt.modules.parallels.status** *(name, runas=None)*
Status of a VM

Parameters

- **name** *(str)* -- Name/ID of VM whose status will be returned
- **runas** *(str)* -- The user that the prlctl command will be run as

Example:

```
salt '*'parallels.status macvm runas=macdev
```

salt.modules.parallels.

**stop**(name, **kill=False**, runas=None)

Stop a VM

Parameters

- **name** *(str)* -- Name/ID of VM to stop
- **kill** *(bool)* -- Perform a hard shutdown
- **runas** *(str)* -- The user that the prlctl command will be run as

Example:

```
salt '*'parallels.stop macvm runas=macdev
salt '*'parallels.stop macvm kill=True runas=macdev
```

### 23.9.337  salt.modules.parted_partition

Module for managing partitions on POSIX-like systems.

**depends**

- parted, partprobe, lsblk (usually parted and util-linux packages)

Some functions may not be available, depending on your version of parted.

Check the manpage for **parted(8)** for more information, or the online docs at:

In light of parted not directly supporting partition IDs, some of this module has been written to utilize sfdisk instead. For further information, please reference the man page for **sfdisk(8)**.

salt.modules.parallels.

**align_check**(device, **part_type**, partition)

Check if partition satisfies the alignment constraint of part_type. Type must be "minimal" or "optimal".

CLI Example:

```
salt '*'partition.align_check /dev/sda minimal 1
```

salt.modules.parallels.

**check**(device, **minor**)

Checks if the file system on partition **<minor>** has any errors.

CLI Example:

```
salt '*'partition.check 1
```

salt.modules.parallels.

**cp**(device, **from_minor**, **to_minor**)

Copies the file system on the partition **<from-minor>** to partition **<to-minor>**, deleting the original contents of the destination partition.

CLI Example:

```
salt '*'partition.cp /dev/sda 2 3
```
Salt Documentation, Release 3003.3

salt.modules.parted_partition.disk_set(device, flag, state)
Changes a flag on selected device.

A flag can be either "on" or "off" (make sure to use proper quoting, see YAML Idiosyncrasies). Some or all of these flags will be available, depending on what disk label you are using.

Valid flags are:
- cylinder_alignment
- pmbr_boot
- implicit_partition_table

CLI Example:

```
salt '*' partition.disk_set /dev/sda pmbr_boot "on"
```

salt.modules.parted_partition.disk_toggle(device, flag)
Toggle the state of <flag> on <device>. Valid flags are the same as the disk_set command.

CLI Example:

```
salt '*' partition.disk_toggle /dev/sda pmbr_boot
```

salt.modules.parted_partition.exists(device=)
Check to see if the partition exists

CLI Example:

```
salt '*' partition.exists /dev/sdb1
```

salt.modules.parted_partition.get_block_device()
Retrieve a list of disk devices

New in version 2014.7.0.

CLI Example:

```
salt '*' partition.get_block_device
```

salt.modules.parted_partition.get_id(device, minor)
Prints the system ID for the partition. Some typical values are:

```
b: FAT32 (vfat)
  7: HPFS/NTFS
  82: Linux Swap
  83: Linux
  8e: Linux LVM
  fd: Linux RAID Auto
```

CLI Example:

```
salt '*' partition.get_id /dev/sda 1
```

salt.modules.parted_partition.list_(device, unit=None)
Prints partition information of given <device>

CLI Examples:

```
salt '*' partition.list /dev/sda
salt '*' partition.list /dev/sda unit=s
salt '*' partition.list /dev/sda unit=kB
```
salt.modules.parted_partition.mkfs\((device, fs\_type)\)
Makes a file system \(<fs\_type>\) on partition \(<device>\), destroying all data that resides on that partition. \(<fs\_type>\) must be one of "ext2", "fat32", "fat16", "linux-swap" or "reiserfs" (if libreiserfs is installed)

CLI Example:
```
salt '*' partition.mkfs /dev/sda2 fat32
```

salt.modules.parted_partition.mklabel\((device, label\_type)\)
Create a new disklabel (partition table) of label\_type.
Type should be one of "aix", "amiga", "bsd", "dvh", "gpt", "loop", "mac", "msdos", "pe98", or "sun".

CLI Example:
```
salt '*' partition.mklabel /dev/sda msdos
```

salt.modules.parted_partition.mkpart\((device, part\_type, fs\_type=None, start=None, end=None)\)
Make a part\_type partition for filesystem fs\_type, beginning at start and ending at end (by default in megabytes). part\_type should be one of "primary", "logical", or "extended".

CLI Examples:
```
salt '*' partition.mkpart /dev/sda primary fs\_type=fat32 start=0 end=639
salt '*' partition.mkpart /dev/sda primary start=0 end=639
```

salt.modules.parted_partition.mkpartfs\((device, part\_type, fs\_type=None, start=None, end=None)\)
The mkpartfs actually is an alias to mkpart and is kept for compatibility. To know the valid options and usage syntax read mkpart documentation.

CLI Examples:
```
salt '*' partition.mkpartfs /dev/sda primary fs\_type=fat32 start=0 end=639
salt '*' partition.mkpartfs /dev/sda primary start=0 end=639
```

salt.modules.parted_partition.name\((device, partition, name)\)
Set the name of partition to name. This option works only on Mac, PC98, and GPT disklabels. The name can be placed in quotes, if necessary.

CLI Example:
```
salt '*' partition.name /dev/sda 1 'My Documents'
```

salt.modules.parted_partition.probe\((devices)\)
Ask the kernel to update its local partition data. When no args are specified all block devices are tried.
Caution: Generally only works on devices with no mounted partitions and may take a long time to return if specified devices are in use.

CLI Examples:
```
salt '*' partition.probe
salt '*' partition.probe /dev/sda
salt '*' partition.probe /dev/sda /dev/sdb
```

salt.modules.parted_partition.rescue\((device, start, end)\)
Rescue a lost partition that was located somewhere between start and end. If a partition is found, parted will ask if you want to create an entry for it in the partition table.

CLI Example:
The partition will start <start> from the beginning of the disk, and end <end> from the beginning of the disk. 
resize never changes the minor number. Extended partitions can be resized, so long as the new extended 
presentation contains all logical partitions.

CLI Example:

```bash
salt '*' partition.resize /dev/sda 3 200 850
```

salt.modules.parted_partition.rm(device, minor)
Removes the partition with number <minor>.

CLI Example:

```bash
salt '*' partition.rm /dev/sda 5
```

salt.modules.parted_partition.set_(device, minor, flag, state)
Changes a flag on the partition with number <minor>.

A flag can be either "on" or "off" (make sure to use proper quoting, see YAML Idiosyncrasies). Some or all of 
these flags will be available, depending on what disk label you are using.

Valid flags are:

- boot
- root
- swap
- hidden
- raid
- lvm
- lba
- hp-service
- palo
- prep
- msftres
- bios_grub
- atvrecv
- diag
- legacy_boot
- msftdata
- irst
- esp
- type

CLI Example:

```bash
salt '*' partition.set /dev/sda 1 boot "on"
```

salt.modules.parted_partition.set_id(device, minor, system_id)
Sets the system ID for the partition. Some typical values are:

```
b: FAT32 (vfat)
7: HPFS/NTFS
82: Linux Swap
83: Linux
```
CLI Example:

```bash
salt '*' partition.set_id /dev/sda 1 83
```

```
salt.modules.parted_partition.system_types()
    List the system types that are supported by the installed version of sfdisk
    CLI Example:
    salt '*' partition.system_types
```

```
salt.modules.parted_partition.toggle(device, partition, flag)
    Toggle the state of <flag> on <partition>. Valid flags are the same as the set command.
    CLI Example:
    salt '*' partition.toggle /dev/sda 1 boot
```

23.9.338 salt.modules.pcs

Configure a Pacemaker/Corosync cluster with PCS

Configure Pacemaker/Corosync clusters with the Pacemaker/Corosync configuration system (PCS)

```
depends pcs
```

New in version 2016.3.0.

```
salt.modules.pcs.auth(nodes, pcsuser='hacluster', pcspasswd='hacluster', extra_args=None)
    Authorize nodes to the cluster
    nodes a list of nodes which should be authorized to the cluster
    pcsuser user for communication with PCS (default: hacluster)
    pcspasswd password for pcsuser (default: hacluster)
    extra_args list of extra option for the 'pcs cluster auth' command. The newer cluster host command has no extra args and so will ignore it.
    CLI Example:
    salt '*' pcs.auth nodes='[ node1.example.org node2.example.org ]'
    → pcsuser=hacluster pcspasswd=hoonetorg extra_args=[ '--force' ]
```

```
salt.modules.pcs.cib_create(cibfile, scope='configuration', extra_args=None)
    Create a CIB-file from the current CIB of the cluster
    cibfile name/path of the file containing the CIB
    scope specific section of the CIB (default: configuration)
    extra_args additional options for creating the CIB-file
    CLI Example:
    salt '*' pcs.cib_create cibfile='/tmp/VIP_apache_1.cib' scope=False
```

```
salt.modules.pcs.cib_push(cibfile, scope='configuration', extra_args=None)
    Push a CIB-file as the new CIB to the cluster
    cibfile name/path of the file containing the CIB
    scope specific section of the CIB (default: configuration)
```
extra_args  additional options for creating the CIB-file
CLI Example:

```
salt '*' pcs.cib_push cibfile='!/tmp/VIP_apache_1.cib' scope=False
```

salt.modules.pcs.cluster_destroy(extra_args=None)
Destroy corosync cluster using the pcs command
extra_args  list of extra option for the 'pcs cluster destroy' command (only really --all)
CLI Example:

```
salt '*' pcs.cluster_destroy extra_args=--all
```

salt.modules.pcs.cluster_node_add(node, extra_args=None)
Add a node to the pacemaker cluster via pcs command
node  node that should be added
extra_args  list of extra option for the 'pcs cluster node add' command
CLI Example:

```
salt '*' pcs.cluster_node_add node=node2.example.org
```

salt.modules.pcs.cluster_setup(nodes, pcsclustername='pcscluster', extra_args=None)
Setup pacemaker cluster via pcs command
nodes  a list of nodes which should be set up
pcsclustername  Name of the Pacemaker cluster (default: pcscluster)
extra_args  list of extra option for the 'pcs cluster setup' command
CLI Example:

```
salt '*' pcs.cluster_setup nodes='[ node1.example.org node2.example.org ]' ⤟
→pcsclustername=pcscluster
```

salt.modules.pcs.config_show(cibfile=None)
Show config of cluster
cibfile  name/path of the file containing the CIB
CLI Example:

```
salt '*' pcs.config_show cibfile='!/tmp/cib_for_galera'
```

salt.modules.pcs.is_auth(nodes, pcsuser='hacluster', pcspasswd='hacluster')
Check if nodes are already authorized
nodes  a list of nodes to be checked for authorization to the cluster
pcsuser  user for communication with PCS (default: hacluster)
pcspasswd  password for pcsuser (default: hacluster)
CLI Example:

```
salt '*' pcs.is_auth nodes='[node1.example.org node2.example.org]' ⤟
→pcsuser=hacluster pcspasswd=hoonetorg
```

salt.modules.pcs.item_create(item, item_id, item_type, create='create', extra_args=None, cibfile=None)
Create an item via pcs command (mainly for use with the pcs state module)
item  config, property, resource, constraint etc.
item_id  id of the item
item_type  item type
create  create command (create or set f.e., default: create)
extra_args  additional options for the pcs command
cibfile  use cibfile instead of the live CIB
salt.modules.pcs.item_show(item, item_id=None, item_type=None, show='show', extra_args=None, cibfile=None)
    Show an item via pcs command (mainly for use with the pcs state module)
    item  config, property, resource, constraint etc.
    item_id  id of the item
    item_type  item type
    show  show command (probably None, default: show or status for newer implementation)
    extra_args  additional options for the pcs command
    cibfile  use cibfile instead of the live CIB

salt.modules.pcs.prop_set(prop, value, extra_args=None, cibfile=None)
    Set the value of a cluster property
    prop  name of the property
    value  value of the property prop
    extra_args  additional options for the pcs property command
    cibfile  use cibfile instead of the live CIB

    CLI Example:
    
    salt '*' pcs.prop_set prop='no-quorum-policy' value='ignore' cibfile='/tmp/2_node_cluster.cib'

salt.modules.pcs.prop_show(prop, extra_args=None, cibfile=None)
    Show the value of a cluster property
    prop  name of the property
    extra_args  additional options for the pcs property command
    cibfile  use cibfile instead of the live CIB

    CLI Example:
    
    salt '*' pcs.prop_show cibfile='/tmp/2_node_cluster.cib' prop='no-quorum-policy'

salt.modules.pcs.resource_create(resource_id, resource_type, resource_options=None, cibfile=None)
    Create a resource via pcs command
    resource_id  name for the resource
    resource_type  resource type (f.e. ocf:heartbeat:IPaddr2 or VirtualIP)
    resource_options  additional options for creating the resource
    cibfile  use cibfile instead of the live CIB for manipulation

    CLI Example:
    
    salt '*' pcs.resource_create resource_id='galera' resource_type='ocf:heartbeat:galera' resource_options="["wsrep_cluster_address=gcomm://node1.example.org,node2.example.org,node3.example.org", '--master']" cibfile='/tmp/cib_for_galera.cib'

salt.modules.pcs.resource_show(resource_id, extra_args=None, cibfile=None)
    Show a resource via pcs command
    resource_id  name of the resource
    extra_args  additional options for the pcs command
    cibfile  use cibfile instead of the live CIB

    CLI Example:
    
    salt '*' pcs.resource_show resource_id='galera' cibfile='/tmp/cib_for_galera.cib'

salt.modules.pcs.stonith_create(stonith_id, stonith_device_type, stonith_device_options=None, cibfile=None)
    Create a stonith resource via pcs command
**stonith_id**  name for the stonith resource
**stonith_device_type**  name of the stonith agent fence_eps, fence_xvm f.e.
**stonith_device_options**  additional options for creating the stonith resource
**cibfile**  use cibfile instead of the live CIB for manipulation

CLI Example:

```
salt '*' pcs.stonith_create stonith_id='eps_fence' stonith_device_type='fence_eps'
   stonith_device_options="["pcmk_host_map=node1.example.org:01;node2.example.org:02', 'ipaddr=myepsdevice.example.org', 'action=reboot',
   'power_wait=5', 'verbose=1', 'debug=/var/log/pcsd/eps_fence.log', 'login=hidden'
   ', 'passwd=hoonetorg']" cibfile='/tmp/cib_for_stonith.cib'
```

```
salt '*' pcs.stonith_show stonith_id='eps_fence' cibfile=None
```

### 23.9.339  `salt.modules.pdbedit`

Manage accounts in Samba's passdb using pdbedit

- **maintainer** Jorge Schrauwen  <sjorge@blackdot.be>
- **maturity** new
- **platform** posix

New in version 2017.7.0.

**salt.modules.pdbedit.create**(login, password, password_hashed=False, machine_account=False)

Create user account

- **login**  [string] login name
- **password**  [string] password
- **password_hashed**  [boolean] set if password is a nt hash instead of plain text
- **machine_account**  [boolean] set to create a machine trust account instead

CLI Example:

```
salt '*' pdbedit.create zoe 9764951149F84E778889011E1DC4A927 nthash
salt '*' pdbedit.create river 1sw4ll0w3d4bug
```

**salt.modules.pdbedit.delete**(login)

Delete user account

- **login**  [string] login name

CLI Example:

```
salt '*' pdbedit.delete wash
```

**salt.modules.pdbedit.generate_nt_hash**(password)

Generate a NT HASH

CLI Example:
salt '*' pdbedit.generate_nt_hash my_passwd

salt.modules.pdbedit.get_user(login, hashes=False)
Get user account details
login [string] login name
hashes [boolean] include NTHASH and LMHASH in verbose output
CLI Example:
salt '*' pdbedit.get kaylee

salt.modules.pdbedit.list_users(verbos=True, hashes=False)
List user accounts
verbose [boolean] return all information
hashes [boolean] include NT HASH and LM HASH in verbose output
CLI Example:
salt '*' pdbedit.list

salt.modules.pdbedit.modify(login, password=None, password_hashed=False, domain=None, profile=None, script=None, drive=None, homedir=None, fullname=None, account_desc=None, account_control=None, machine_sid=None, user_sid=None, reset_login_hours=False, reset_bad_password_count=False)
Modify user account
login [string] login name
password [string] password
password_hashed [boolean] set if password is a nt hash instead of plain text
domain [string] users domain
profile [string] profile path
script [string] logon script
drive [string] home drive
homedir [string] home directory
fullname [string] full name
account_desc [string] account description
machine_sid [string] specify the machines new primary group SID or rid
user_sid [string] specify the users new primary group SID or rid
account_control [string] specify user account control properties

Note: Only the following can be set: - N: No password required - D: Account disabled - H: Home directory required - L: Automatic Locking - X: Password does not expire
reset_login_hours [boolean] reset the users allowed logon hours
reset_bad_password_count [boolean] reset the stored bad login counter

Note: if user is absent and password is provided, the user will be created

CLI Example:
salt '*' pdbedit.modify inara fullname='Inara Serra'
salt '*' pdbedit.modify simon password=r1v3r
salt '*' pdbedit.modify jane drive='V:' homedir='\serenity\jane\profile'
salt '*' pdbedit.modify mal account_control=NX
23.9.340 salt.modules.pecl

Manage PHP pecl extensions.

`salt.modules.pecl.install(pecls, defaults=False, force=False, preferred_state='stable')`

New in version 0.17.0.

Installs one or several pecl extensions.
pecls The pecl extensions to install.
defaults Use default answers for extensions such as pecl_http which ask questions before installation. Without this option, the pecl.installed state will hang indefinitely when trying to install these extensions.
force Whether to force the installed version or not

CLI Example:
```
salt '*' pecl.install fuse
```

`salt.modules.pecl.list_(channel=None)`

List installed pecl extensions.

CLI Example:
```
salt '*' pecl.list
```

`salt.modules.pecl.uninstall(pecls)`

Uninstall one or several pecl extensions.
pecls The pecl extensions to uninstall.

CLI Example:
```
salt '*' pecl.uninstall fuse
```

`salt.modules.pecl.update(pecls)`

Update one or several pecl extensions.
pecls The pecl extensions to update.

CLI Example:
```
salt '*' pecl.update fuse
```

23.9.341 salt.modules.peeringdb

PeeringDB Module

New in version 2019.2.0.

Execution module for the basic interaction with the PeeringDB API.

While for GET operations (the functions prefixed by `get_`) the credentials are optional, there are some specific details that are visible only to authenticated users. Moreover, the credentials are required when adding or updating information. That means, the module can equally work out of the box without any further configuration with the limitations imposed by the PeeringDB API.

For complete API documentation, please refer to https://www.peeringdb.com/apidocs/.

Configuration (in the opts or Pillar):

```
peeringdb:
  username: salt
  password: 5@1t
```
salt.modules.peeringdb.get_fac(**kwargs)
Return the details of the facility identified using the search filters specified in the query.

**Note:** If no `id` or filter arguments are specified, it will return all the possible facilities registered in PeeringDB.
The available filters are documented at: https://www.peeringdb.com/apidocs/#!/netfac/netfac_list

**CLI Example:**
```
salt '*' peeringdb.get_fac id=1774
salt '*' peeringdb.get_fac state=UT
```

salt.modules.peeringdb.get_ix(**kwargs)
Return the details of an IX (Internet Exchange) using the search filters specified in the query.

**Note:** If no `id` or filter arguments are specified, it will return all the possible IXs registered in PeeringDB.
The available filters are documented at: https://www.peeringdb.com/apidocs/#!/ix/ix_list

**CLI Example:**
```
salt '*' peeringdb.get_ix id=1
salt '*' peeringdb.get_ix city='Milwaukee'
```

salt.modules.peeringdb.get_ixfac(**kwargs)
Return the details of an IX (Internet Exchange) facility using the search filters specified in the query.

**Note:** If no `id` or filter arguments are specified, it will return all the possible IX facilities registered in PeeringDB.
The available filters are documented at: https://www.peeringdb.com/apidocs/#!/ixfac/ixfac_list

**CLI Example:**
```
salt '*' peeringdb.get_ixfac id=1
salt '*' peeringdb.get_ixfac city='Milwaukee'
```

salt.modules.peeringdb.get_ixlan(**kwargs)
Return the details of an IX (Internet Exchange) together with the networks available in this location (and their details), using the search filters specified in the query.

**Note:** If no `id` or filter arguments are specified, it will return all the possible IX LAN facilities registered in PeeringDB.
The available filters are documented at: https://www.peeringdb.com/apidocs/#!/ixlan/ixlan_list

**CLI Example:**
```
salt '*' peeringdb.get_ixlan id=780
salt '*' peeringdb.get_ixlan city='Milwaukee'
```

salt.modules.peeringdb.get_ixpfx(**kwargs)
Return the details of an IX (Internet Exchange) together with the PeeringDB IDs of the networks available in this location, using the search filters specified in the query.
Note: If no `id` or filter arguments are specified, it will return all the possible IX LAN facilities registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/ixpfx/ixpfx_list

CLI Example:
```
salt '*' peeringdb.get_ixpfx id=780
salt '*' peeringdb.get_ixpfx city='Milwaukee'
```

```
salt.modules.peeringdb.get_net(**kwargs)
```

Return the details of a network identified using the search filters specified in the query.

Note: If no `id` or filter arguments are specified, it will return all the possible networks registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/net/net_list

CLI Example:
```
salt '*' peeringdb.get_net id=4224
salt '*' peeringdb.get_net asn=13335
salt '*' peeringdb.get_net city='Salt Lake City'
salt '*' peeringdb.get_net name__startswith=GTT
```

```
salt.modules.peeringdb.get_netfac(**kwargs)
```

Return the list of facilities used by a particular network, given the `id` or other filters specified in the query.

Note: If no `id` or filter arguments are specified, it will return all the possible network facilities registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/netfac/netfac_list

CLI Example:
```
salt '*' peeringdb.get_netfac id=780
salt '*' peeringdb.get_netfac city='Milwaukee'
```

```
salt.modules.peeringdb.get_netixlan(**kwargs)
```

Return the IP addresses used by a particular network at all the IXs where it is available. The network is selected either via the `id` argument or the other filters specified in the query.

Note: If no `id` or filter arguments are specified, it will return all the possible IP addresses, of all networks, at all IXs, registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/netixlan/netixlan_list

CLI Example:
```
salt '*' peeringdb.get_netixlan asn=13335
salt '*' peeringdb.get_netixlan ipaddr4=185.1.114.25
```
salt.modules.peeringdb.get_org(**kwargs)
Return the details of an organisation together with the networks available in this location, using the search filters specified in the query.

**Note:** If no id or filter arguments are specified, it will return all the possible organisations registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/org/org_list

**CLI Example:**
```bash
salt '*' peeringdb.get_org id=2
salt '*' peeringdb.get_org city=Duesseldorf
```

salt.modules.peeringdb.get_poc(**kwargs)
Return the details of a person of contact together using the search filters specified in the query.

**Note:** If no id or filter arguments are specified, it will return all the possible contacts registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/poc/poc_list

**CLI Example:**
```bash
salt '*' peeringdb.get_poc id=6721
salt '*' peeringdb.get_poc email__contains='@cloudflare.com'
```

**23.9.342 salt.modules.pf**
Control the OpenBSD packet filter (PF).

**Code author** Jasper Lievisse Adriaanse <j@jasper.la>

New in version 2019.2.0.

salt.modules.pf.disable()
Disable the Packet Filter.

**CLI Example:**
```bash
salt '*' pf.disable
```

salt.modules.pf.enable()
Enable the Packet Filter.

**CLI Example:**
```bash
salt '*' pf.enable
```

salt.modules.pf.flush(modifier)
Flush the specified packet filter parameters.
**modifier:** Should be one of the following:
- all
- info
- osfp
- rules
Please refer to the OpenBSD `pfctl(8)` documentation for a detailed explanation of each command.

**CLI Example:**
```
salt '*' pf.flush states
```

### `salt.modules.pf.load` (file=`/etc/pf.conf`, noop=False)
Load a ruleset from the specific file, overwriting the currently loaded ruleset.

- **file**: Full path to the file containing the ruleset.
- **noop**: Don’t actually load the rules, just parse them.

**CLI Example:**
```
salt '*' pf.load /etc/pf.conf.d/lockdown.conf
```

### `salt.modules.pf.loglevel` (level)
Set the debug level which limits the severity of log messages printed by `pf(4)`.

- **level**: Log level. Should be one of the following: emerg, alert, crit, err, warning, notice, info or debug (OpenBSD); or none, urgent, misc, loud (FreeBSD).

**CLI Example:**
```
salt '*' pf.loglevel emerg
```

### `salt.modules.pf.show` (modifier)
Show filter parameters.

- **modifier**: Modifier to apply for filtering. Only a useful subset of what `pfctl` supports can be used with Salt.
  - rules
  - states
  - tables

**CLI Example:**
```
salt '*' pf.show rules
```

### `salt.modules.pf.table` (command, table, **kwargs)
Apply a command on the specified table.

- **table**: Name of the table.
- **command**: Command to apply to the table. Supported commands are:
  - add
  - delete
  - expire
  - flush
  - kill
  - replace
  - show
  - test
  - zero

Please refer to the OpenBSD `pfctl(8)` documentation for a detailed explanation of each command.

**CLI Example:**
```
salt '*' pf.table expire table=spam_hosts number=300
salt '*' pf.table add table=local_hosts addresses='["127.0.0.1", ":1"]'
```
23.9.343 salt.modules.philips_hue

Philips HUE lamps module for proxy.
New in version 2015.8.3.

23.9.344 salt.modules.pillar

Extract the pillar data for this minion

```
salt.modules.pillar.data(*args, **kwargs)
This function is an alias of `items`. Calls the master for a fresh pillar and generates the pillar data on the fly

Contrast with `raw()` which returns the pillar data that is currently loaded into the minion.

`pillar` If specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar rendering. These pillar variables will also override any variables of the same name in pillar or ext_pillar.
New in version 2015.5.0.

`pillar_enc` If specified, the data passed in the `pillar` argument will be passed through this renderer to decrypt it.

Note: This will decrypt on the minion side, so the specified renderer must be set up on the minion for this to work. Alternatively, pillar data can be decrypted master-side. For more information, see the Pillar Encryption documentation. Pillar data that is decrypted master-side is not decrypted until the end of pillar compilation though, so minion-side decryption will be necessary if the encrypted pillar data must be made available in an decrypted state pillar/ext_pillar rendering.

New in version 2017.7.0.

`pillarenv` Pass a specific pillar environment from which to compile pillar data. If not specified, then the minion’s `pillarenv` option is not used, and if that also is not specified then all configured pillar environments will be merged into a single pillar dictionary and returned.
New in version 2016.11.2.

`saltenv` Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

CLI Example:
```
salt '*' pillar.items
```

salt.modules.pillar.ext(external, pillar=None)

Generate the pillar and apply an explicit external pillar

`external` A single ext_pillar to add to the ext_pillar configuration. This must be passed as a single section from the ext_pillar configuration (see CLI examples below). For more complicated ext_pillar configurations, it can be helpful to use the Python shell to load YAML configuration into a dictionary, and figure out

```
>>> import salt.utils.yaml
>>> ext_pillar = salt.utils.yaml.safe_load(""
...   ext_pillar:
```

(continues on next page)
In the above example, the value to pass would be `{git: [{'mybranch https://github.com/myuser/myrepo': {'env': 'base'}}]}`. Note that this would need to be quoted when passing on the CLI (as in the CLI examples below).

pillar  [None] If specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar rendering. These pillar variables will also override any variables of the same name in pillar or ext_pillar.

New in version 2015.5.0.

CLI Examples:

```
salt '*' pillar.ext '{libvirt: _}'
salt '*' pillar.ext '{git: ['master https://github.com/myuser/myrepo']}'
salt '*' pillar.ext '{git: ['mybranch https://github.com/myuser/myrepo': {'env': 'base']]}']
```

salt.modules.pillar.fetch(key, default=<class 'KeyError'>, merge=False, merge_nested_lists=None, delimiter=':', pillarenv=None, saltenv=None)

New in version 0.14.

Attempt to retrieve the named value from in-memory pillar data. If the pillar key is not present in the in-memory pillar, then the value specified in the default option (described below) will be returned.

If the merge parameter is set to True, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in pillar looks like this:

```
{pkg: {
  apache: httpd
}}
```

To retrieve the value associated with the apache key in the pkg dict this key can be passed as:

```
pkg:apache
```

key  The pillar key to get value from

default  The value specified by this option will be returned if the desired pillar key does not exist.

If a default value is not specified, then it will be an empty string, unless pillar_raise_on_missing is set to True, in which case an error will be raised.

merge  [False] If True, the retrieved values will be merged into the passed default. When the default and the retrieved value are both dictionaries, the dictionaries will be recursively merged.

New in version 2014.7.0.

Changed in version 2016.3.7, 2016.11.4, 2017.7.0: If the default and the retrieved value are not of the same type, then merging will be skipped and the retrieved value will be returned. Earlier releases raised an error in these cases.

merge_nested_lists  If set to False, lists nested within the retrieved pillar dictionary will overwrite lists in default. If set to True, nested lists will be merged into lists in default. If unspecified (the default), this option is inherited from the pillar_merge_lists minion config option.
**Note:** This option is ignored when `merge` is set to `False`.

New in version 2016.11.6.

**delimiter** Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

New in version 2014.7.0.

**pillarenv** If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion’s pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.0.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

New in version 2017.7.0.

CLI Example:

```
salt '*' pillar.get pkg:apache
salt '*' pillar.get abc::def|ghi delimiter='|'
```

**salt.modules.pillar.file_exists** *(path, saltenv=None)*

New in version 2016.3.0.

This is a master-only function. Calling from the minion is not supported.

Use the given path and search relative to the pillar environments to see if a file exists at that path.

If the `saltenv` argument is given, restrict search to that environment only.

Will only work with `pillar_roots`, not external pillars.

Returns True if the file is found, and False otherwise.

**Parameters**

- `path` The path to the file in question. Will be treated as a relative path
- `saltenv` Optional argument to restrict the search to a specific saltenv

CLI Example:

```
salt '*' pillar.file_exists foo/bar.sls
```

**salt.modules.pillar.filter_by** *(lookup_dict, pillar, merge=None, default='default', base=None)*

New in version 2017.7.0.

Look up the given pillar in a given dictionary and return the result

**Parameters**

- `lookup_dict` -- A dictionary, keyed by a pillar, containing a value or values relevant to systems matching that pillar. For example, a key could be a pillar for a role and the value could be the name of a package on that particular OS.

  The dictionary key can be a globbing pattern. The function will return the corresponding `lookup_dict` value where the pillar value matches the pattern. For example:
# this will render 'got some salt' if `role` begins with
→`salt'
salt `{salt*: got some salt, default:`
→`salt is not here}' role

- **pillar** -- The name of a pillar to match with the system's pillar. For example, the value of the "role" pillar could be used to pull values from the `lookup_dict` dictionary.

  The pillar value can be a list. The function will return the `lookup_dict` value for a first found item in the list matching one of the `lookup_dict` keys.

- **merge** -- A dictionary to merge with the results of the pillar selection from `lookup_dict`. This allows another dictionary to override the values in the `lookup_dict`.

- **default** -- default `lookup_dict`'s key used if the pillar does not exist or if the pillar value has no match on `lookup_dict`. If unspecified the value is "default".

- **base** -- A `lookup_dict` key to use for a base dictionary. The pillar-selected `lookup_dict` is merged over this and then finally the `merge` dictionary is merged. This allows common values for each case to be collected in the base and overridden by the pillar selection dictionary and the merge dictionary. Default is unset.

CLI Example:

```
salt `{salt*: got some salt, default:`
→`salt is not here}' role
```

salt.modules.pillar.get(key, default=<class 'KeyError'>, merge=False, merge_nested_lists=None, delimiternone=True, pillarenv=None, saltenv=None)

New in version 0.14.

Attempt to retrieve the named value from *in-memory pillar data*. If the pillar key is not present in the in-memory pillar, then the value specified in the **default** option (described below) will be returned.

If the merge parameter is set to `True`, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in pillar looks like this:

```
{`pkg`: {`apache`: `httpd`}}
```

To retrieve the value associated with the `apache` key in the `pkg` dict this key can be passed as:

```
 pkg:apache
```

**key** The pillar key to get value from

**default** The value specified by this option will be returned if the desired pillar key does not exist.

  If a default value is not specified, then it will be an empty string, unless `pillar_raise_on_missing` is set to `True`, in which case an error will be raised.

**merge** [False] If `True`, the retrieved values will be merged into the passed default. When the default and the retrieved value are both dictionaries, the dictionaries will be recursively merged.

  New in version 2014.7.0.

  Changed in version 2016.3.7,2016.11.4,2017.7.0: If the default and the retrieved value are not of the same type, then merging will be skipped and the retrieved value will be returned. Earlier releases raised an error in these cases.

**merge_nested_lists** If set to `False`, lists nested within the retrieved pillar dictionary will *overwrite* lists in `default`. If set to `True`, nested lists will be *merged* into lists in `default`. If unspecified (the default), this option is inherited from the `pillar_merge_lists` minion config option.
**Note:** This option is ignored when `merge` is set to `False`.

New in version 2016.11.6.

**delimiter** Specify an alternate delimiter to use when traversing a nested dict. This is useful when the desired key contains a colon. See CLI example below for usage.

New in version 2014.7.0.

**pillarenv** If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion’s pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.0.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

New in version 2017.7.0.

CLI Example:

```
salt '*' pillar.get pkg:apache
salt '*' pillar.get abc::def|ghi delimiter='|'
```

**salt.modules.pillar.item**(`*args, **kwargs`)

New in version 0.16.2.

Return one or more pillar entries from the in-memory pillar data.

**delimiter** Delimiter used to traverse nested dictionaries.

**Note:** This is different from `pillar.get` in that no default value can be specified. `pillar.get` should probably still be used in most cases to retrieve nested pillar values, as it is a bit more flexible. One reason to use this function instead of `pillar.get` however is when it is desirable to retrieve the values of more than one key, since `pillar.get` can only retrieve one key at a time.

New in version 2015.8.0.

**pillarenv** If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion’s pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.6,2018.3.1.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

New in version 2017.7.6,2018.3.1.

CLI Examples:
salt.modules.pillar.items(*args, **kwargs)
Calls the master for a fresh pillar and generates the pillar data on the fly
Contrast with row() which returns the pillar data that is currently loaded into the minion.

pillar  If specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar rendering.
these pillar variables will also override any variables of the same name in pillar or ext_pillar.
New in version 2015.5.0.
pillar_enc  If specified, the data passed in the pillar argument will be passed through this renderer to decrypt it.

Note:  This will decrypt on the minion side, so the specified renderer must be set up on the minion for this to work. Alternatively, pillar data can be decrypted master-side. For more information, see the Pillar Encryption documentation. Pillar data that is decrypted master-side, is not decrypted until the end of pillar compilation though, so minion-side decryption will be necessary if the encrypted pillar data must be made available in an decrypted state pillar/ext_pillar rendering.

New in version 2017.7.0.
pillarenv  Pass a specific pillar environment from which to compile pillar data. If not specified, then the minion's pillarenv option is not used, and if that also is not specified then all configured pillar environments will be merged into a single pillar dictionary and returned.
New in version 2016.11.2.
saltenv  Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

CLI Example:
salt '*' pillar.items

salt.modules.pillar.keys(key, delimiter=': ')
Attempt to retrieve a list of keys from the named value from the pillar.
The value can also represent a value in a nested dict using a ":" delimiter for the dict, similar to how pillar.get works.
delimiter  Specify an alternate delimiter to use when traversing a nested dict

CLI Example:
salt '*' pillar.keys web:sites

salt.modules.pillar.ls(*args)
Calls the master for a fresh pillar, generates the pillar data on the fly (same as items()), but only shows the available main keys.

CLI Examples:
salt '*' pillar.ls

salt.modules.pillar.obfuscate(*args)
New in version 2015.8.0.
Same as `items()`, but replace pillar values with a simple type indication.

This is useful to avoid displaying sensitive information on console or flooding the console with long output, such as certificates. For many debug or control purposes, the stakes lie more in dispatching than in actual values.

In case the value is itself a collection type, obfuscation occurs within the value. For mapping types, keys are not obfuscated. Here are some examples:

- `'secret password'` becomes `<str>'
- `['secret', 1]` becomes `[<str>', '<int>']`
- `{login': 'somelogin', 'pwd': 'secret'}` becomes `{login': '<str>', 'pwd': '<str>'}

CLI Examples:

```
salt '*' pillar.obfuscate
```

salt.modules.pillar.raw(`key=`None)

Return the raw pillar data that is currently loaded into the minion.

Contrast with `items()` which calls the master to fetch the most up-to-date Pillar.

CLI Example:

```
salt '*' pillar.raw
```

With the optional key argument, you can select a subtree of the pillar raw data:

```
salt '*' pillar.raw key='roles'
```

### 23.9.345 salt.modules.pip

Install Python packages with pip to either the system or a virtualenv

**Windows Support**

New in version 2014.7.4.

Salt now uses a portable python. As a result the entire pip module is now functional on the salt installation itself. You can pip install dependencies for your custom modules. You can even upgrade salt itself using pip. For this to work properly, you must specify the Current Working Directory (`cwd`) and the Pip Binary (`bin_env`) salt should use. The variable `pip_bin` can be either a virtualenv path or the path to the pip binary itself.

For example, the following command will list all software installed using pip to your current salt environment:

```
salt <minion> pip.list cwd='C:\salt\bin\Scripts' bin_env='C:\salt\bin\Scripts\pip.exe'
```

Specifying the `cwd` and `bin_env` options ensures you're modifying the salt environment. If these are omitted, it will default to the local installation of python. If python is not installed locally it will fail saying it couldn't find pip.
State File Support

This functionality works in states as well. If you need to pip install colorama with a state, for example, the following will work:

```python
install_colorama:
  pip.installed:
    - name: colorama
    - cwd: 'C:\salt\bin\scripts'
    - bin_env: 'C:\salt\bin\scripts\pip.exe'
    - upgrade: True
```

Upgrading Salt using Pip

You can now update salt using pip to any version from the 2014.7 branch forward. Previous version require recompiling some of the dependencies which is painful in windows.

To do this you just use pip with git to update to the version you want and then restart the service. Here is a sample state file that upgrades salt to the head of the 2015.5 branch:

```python
install_salt:
  pip.installed:
    - cwd: 'C:\salt\bin\scripts'
    - bin_env: 'C:\salt\bin\scripts\pip.exe'
    - editable: git+https://github.com/saltstack/salt@2015.5#egg=salt
    - upgrade: True

restart_service:
  service.running:
    - name: salt-minion
    - enable: True
    - watch:
      - pip: install_salt
```

Note: If you're having problems, you might try doubling the back slashes. For example, cwd: 'C:salt\bin\scripts'. Sometimes python thinks the single back slash is an escape character.

There is a known incompatibility between Python2 pip>=10.2 and Salt <=2018.3.0. The issue is described here: [https://github.com/saltstack/salt/issues/46163](https://github.com/saltstack/salt/issues/46163)

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

- **bin_env** Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. /usr/bin/pip-2.7 or /usr/bin/pip-2.6. If a directory path is specified, it is assumed to be a virtualenv.
- **user** The user under which to run pip
- **cwd** Directory from which to run pip

Note: If the version of pip available is older than 8.0.3, the list will not include the packages pip, wheel, setuptools, or distribute even if they are installed.
Install packages with pip

Install packages individually or from a pip requirements file. Install packages globally or to a virtualenv.

**pkgs**  Comma separated list of packages to install

**requirements**  Path to requirements

**bin_env**  Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`). If a directory path is specified, it is assumed to be a virtualenv.

**use_wheel**  Prefer wheel archives (requires pip>=1.4)

**no_use_wheel**  Force to not use wheel archives (requires pip>=1.4,<10.0.0)

**no_binary**  Force to not use binary packages (requires pip >= 7.0.0) Accepts either :all: to disable all binary packages, :none: to empty the set, or one or more package names with commas between them

**log**  Log file where a complete (maximum verbosity) record will be kept

**proxy**  Specify a proxy in the form `user:password@proxy.server:port`. Note that the `user:password@` is optional and required only if you are behind an authenticated proxy. If you provide `user@proxy.server:port` then you will be prompted for a password.

**timeout**  Set the socket timeout (default 15 seconds)

**editable**  install something editable (e.g. `git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed`)

**find_links**  URL to search for packages

**index_url**  Base URL of Python Package Index

**extra_index_url**  Extra URLs of package indexes to use in addition to `index_url`

**no_index**  Ignore package index

**mirrors**  Specific mirror URL(s) to query (automatically adds --use-mirrors)

---

**Warning:** This option has been deprecated and removed in pip version 7.0.0. Please use `index_url` and/or `extra_index_url` instead.
build Unpack packages into build dir
target Install packages into target dir
download Download packages into download instead of installing them
download_cache|cache_dir Cache downloaded packages in download_cache or cache_dir dir
source Check out editable packages into source dir
upgrade Upgrade all packages to the newest available version
force_reinstall When upgrading, reinstall all packages even if they are already up-to-date.
ignore_installed Ignore the installed packages (reinstalling instead)
exists_action Default action when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup
no_deps Ignore package dependencies
no_install Download and unpack all packages, but don't actually install them
no_download Don't download any packages, just install the ones already downloaded (completes an install run with --no-install)
install_options Extra arguments to be supplied to the setup.py install command (e.g. like --install-option='--install-scripts=/usr/local/bin'). Use multiple --install-option options to pass multiple options to setup.py install. If you are using an option with a directory path, be sure to use absolute path.

global_options Extra global options to be supplied to the setup.py call before the install command.
user The user under which to run pip
cwd Directory from which to run pip
pre_releases Include pre-releases in the available versions
cert Provide a path to an alternate CA bundle
allow_all_external Allow the installation of all externally hosted files
allow_external Allow the installation of externally hosted files (comma separated list)
allow_unverified Allow the installation of insecure and unverifiable files (comma separated list)
process_dependency_links Enable the processing of dependency links
env_vars Set environment variables that some builds will depend on. For example, a Python C-module may have a Makefile that needs INCLUDE_PATH set to pick up a header file while compiling. This must be in the form of a dictionary or a mapping.

Example:

```
salt '*' pip.install django_app env_vars="{'CUSTOM_PATH': '/opt/django_app'}"
```

trusted_host Mark this host as trusted, even though it does not have valid or any HTTPS.
use_vt Use VT terminal emulation (see output while installing)
no_cache_dir Disable the cache.
extra_args pip keyword and positional arguments not yet implemented in salt

```
salt '*' pip.install pandas extra_args="[{'--latest-pip-kwarg': 'param'}, {'--latest-pip-arg'}]
```

Warning: If unsupported options are passed here that are not supported in a minion's version of pip, a No such option error will be thrown.

Will be translated into the following pip command:

```
pip install pandas --latest-pip-kwarg param --latest-pip-arg
```

disable_version_check Pip may periodically check PyPI to determine whether a new version of pip is available to download. Passing True for this option disables that check.

CLI Example:
Complicated CLI Example:

```bash
salt '*' pip.install markdown,django editable=git+https://github.
   →com/worldcompany/djangoembed.git#egg=djangoembed upgrade=True no_deps=True
```

```bash
salt.modules.pip.is_installed(pkgname=None, bin_env=None, user=None, cwd=None)
```

New in version 2018.3.0.

Filter list of installed apps from `freeze` and return True or False if `pkgname` exists in the list of packages installed.

**Note:** If the version of pip available is older than 8.0.3, the packages wheel, setuptools, and distribute will not be reported by this function even if they are installed. Unlike `pip.freeze`, this function always reports the version of pip which is installed.

CLI Example:

```bash
salt '*' pip.is_installed salt
```

```bash
salt.modules.pip.list_(prefix=None, bin_env=None, user=None, cwd=None, **kwargs)
```

Filter list of installed apps from `freeze` and check to see if `prefix` exists in the list of packages installed.

**Note:** If the version of pip available is older than 8.0.3, the packages wheel, setuptools, and distribute will not be reported by this function even if they are installed. Unlike `pip.freeze`, this function always reports the version of pip which is installed.

CLI Example:

```bash
salt '*' pip.list salt
```

```bash
salt.modules.pip.list_all_versions(pkg, bin_env=None, include_alpha=False, include_beta=False, include_rc=False, user=None, cwd=None, index_url=None, extra_index_url=None)
```

New in version 2017.7.3.

List all available versions of a pip package

**pkg** The package to check

**bin_env** Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`). If a directory path is specified, it is assumed to be a virtualenv.

**include_alpha** Include alpha versions in the list

**include_beta** Include beta versions in the list

**include_rc** Include release candidates versions in the list

**user** The user under which to run pip

**cwd** Directory from which to run pip

**index_url** Base URL of Python Package Index .. versionadded:: 2019.2.0

**extra_index_url** Additional URL of Python Package Index .. versionadded:: 2019.2.0

CLI Example:
salt modules.pip.list_upgrades(bin_env=None, user=None, cwd=None)

Check whether or not an upgrade is available for all packages

CLI Example:

```
salt '*' pip.list_upgrades
```

salt modules.pip.uninstall(pkgs=None, requirements=None, bin_env=None, log=None, proxy=None, timeout=None, user=None, cwd=None, saltenv='base', use_vt=False)

Uninstall packages individually or from a pip requirements file

pkgs comma separated list of packages to install

requirements Path to requirements file

bin_env Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. /usr/bin/pip-2.7 or /usr/bin/pip-2.6. If a directory path is specified, it is assumed to be a virtualenv.

log Log file where a complete (maximum verbosity) record will be kept

proxy Specify a proxy in the format user:passwd@proxy.server:port. Note that the user:password@ is optional and required only if you are behind an authenticated proxy. If you provide user@proxy.server:port then you will be prompted for a password.

Note: If the Minion has a globally configured proxy - it will be used even if no proxy was set here. To explicitly disable proxy for pip you should pass False as a value.

timeout Set the socket timeout (default 15 seconds)

user The user under which to run pip

cwd Directory from which to run pip

use_vt Use VT terminal emulation (see output while installing)

CLI Example:

```
salt '*' pip.uninstall <package name>,<package2 name>
salt '*' pip.uninstall requirements=/path/to/requirements.txt
salt '*' pip.uninstall <package name> bin_env=/path/to/virtualenv
salt '*' pip.uninstall <package name> bin_env=/path/to/pip_bin
```

salt modules.pip.upgrade(bin_env=None, user=None, cwd=None, use_vt=False)

New in version 2015.5.0.

Upgrades outdated pip packages.

Note: On Windows you can’t update salt from pip using salt, so salt will be skipped

Returns a dict containing the changes.

```
{<package>: {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pip.upgrade
```

salt modules.pip.upgrade_available(pkg, bin_env=None, user=None, cwd=None)

New in version 2015.5.0.

Check whether or not an upgrade is available for a given package

CLI Example:
salt 'x' pip.upgrade_available <package name>

salt.modules.pip.version('bin_env=None, cwd=None, user=None')
New in version 0.17.0.
Returns the version of pip. Use bin_env to specify the path to a virtualenv and get the version of pip in that virtualenv.
If unable to detect the pip version, returns None.
Changed in version 3001.1: The user parameter was added, to allow specifying the user who runs the version command.
CLI Example:
salt 'x' pip.version

23.9.346 salt.modules.pkg_resource

Resources needed by pkg providers
salt.modules.pkg_resource.add_pkg(pkgs, name, pkgver)
Add a package to a dict of installed packages.
CLI Example:
salt 'x' pkg_resource.add_pkg '{}' bind 9

salt.modules.pkg_resource.check_extra_requirements(pkgsname, pkgver)
Check if the installed package already has the given requirements. This function will return the result of pkg.check_extra_requirements if this function exists for the minion, otherwise it will return True.
CLI Example:
salt 'x' pkg_resource.check_extra_requirements <pkgsname> <extra_requirements>

salt.modules.pkg_resource.format_pkg_list(packages, versions_as_list, attr)
Forms packages according to parameters for list_pkgs.
salt.modules.pkg_resource.format_version(epoch, version, release)
Forms a version string for list_pkgs.
salt.modules.pkg_resource.pack_sources(sources, normalize=True)
Accepts list of dicts (or a string representing a list of dicts) and packs the key/value pairs into a single dict.
'[["foo": "salt://foo.rpm"], {"bar": "salt://bar.rpm"}]' would become {"foo": "salt://foo.rpm", "bar": "salt://bar.rpm"}
normalize [True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.
New in version 2015.8.0.
CLI Example:
salt 'x' pkg_resource.pack_sources '[["foo": "salt://foo.rpm"], {"bar": "salt:// bar.rpm"}]'
salt.modules.pkg_resource.parse_targets

```python
(name=None, pkgs=None, sources=None, saltenv='base', normalize=True, **kwargs)
```

Parses the input to pkg.install and returns back the package(s) to be installed. Returns a list of packages, as well as a string noting whether the packages are to come from a repository or a binary package.

CLI Example:

```bash
salt '*' pkg_resource.parse_targets
```

salt.modules.pkg_resource.sort_pkglist

```python
pkgs
```

Accepts a dict obtained from pkg.list_pkgs() and sorts in place the list of versions for any packages that have multiple versions installed, so that two package lists can be compared to one another.

CLI Example:

```bash
salt '*' pkg_resource.sort_pkglist [['3.45', '2.13']]
```

salt.modules.pkg_resource.stringify

```python
pkgs
```

Takes a dict of package name/version information and joins each list of installed versions into a string.

CLI Example:

```bash
salt '*' pkg_resource.stringify 'vim: 7.127'
```

salt.modules.pkg_resource.version

```python
*names, **kwargs
```

Common interface for obtaining the version of installed packages.

CLI Example:

```bash
salt '*' pkg_resource.version vim
salt '*' pkg_resource.version foo bar baz
salt '*' pkg_resource.version 'python*'
```

salt.modules.pkg_resource.version_clean

```python
verstr
```

Clean the version string removing extra data. This function will simply try to call pkg.version_clean.

CLI Example:

```bash
salt '*' pkg_resource.version_clean <version_string>
```

salt.modules.pkg_resource.version_compare

```python
ver1, oper, ver2, ignore_epoch=False
```

New in version 3001.

Perform a version comparison, using (where available) platform-specific version comparison tools to make the comparison.

- **ver1** The first version to be compared
- **oper** One of `==`, `!=`, `>=`, `<=`, `>`, `<`
- **ver2** The second version to be compared

**Note:** To avoid shell interpretation, each of the above values should be quoted when this function is used on the CLI.

**ignore_epoch** [False] If True, both package versions will have their epoch prefix stripped before comparison.

This function is useful in Jinja templates, to perform specific actions when a package's version meets certain criteria. For example:
{%- set postfix_version = salt.pkg.version('postfix') %}
{%- if postfix_version and salt.pkg_resource.version_compare(postfix_version, '>= 3.3', ignore_epoch=True) %}
{%- do stuff %}
{%- endif %}

CLI Examples:

salt myminion pkg_resource.version_compare '3.5' '<=' '2.4'
salt myminion pkg_resource.version_compare '3.5' '<=' '2.4' ignore_epoch=True

23.9.347 salt.modules.pkgin

Package support for pkgin based systems, inspired from freebsdpkg module

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to ‘pkg.install’ is not available), see here.

salt.modules.pkgin.available_version(*names, **kwargs)
This function is an alias of latest_version.
Changed in version 2016.3.0.
Return the latest version of the named package available for upgrade or installation.
If the latest version of a given package is already installed, an empty string will be returned for that package.
CLI Example:

salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> ...

salt.modules.pkgin.file_dict(*packages, **kwargs)
Changed in version 2016.3.0.
List the files that belong to a package.
CLI Examples:

salt '*' pkg.file_dict nginx
salt '*' pkg.file_dict nginx varnish

salt.modules.pkgin.file_list(package, **kwargs)
List the files that belong to a package.
CLI Examples:

salt '*' pkg.file_list nginx

salt.modules.pkgin.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)
Install the passed package
name The name of the package to be installed.
refresh Whether or not to refresh the package database before installing.
fromrepo Specify a package repository to install from.
Multiple Package Installation Options:
**pkgs** A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo","bar"]'
```

**sources** A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"},{"bar": "salt://bar.deb"}]'
```

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install <package name>
```

salt.modules.pkgin.latest_version(*names, **kwargs)

Changed in version 2016.3.0.

Return the latest version of the named package available for upgrade or installation.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> ...
```

salt.modules.pkgin.list_pkgs(versions_as_list=False, **kwargs)

Changed in version 2016.3.0.

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

salt.modules.pkgin.list_upgrades(refresh=True, **kwargs)

List all available package upgrades.

New in version 2018.3.0.

refresh Whether or not to refresh the package database before installing.

CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.pkgin.normalize_name(pkgs, **kwargs)

Normalize package names

**Note:** Nothing special to do to normalize, just return the original. (We do need it to be compatible with the pkg_resource provider.)
salt.modules.pkgin.purge(name=None, pkgs=None, **kwargs)
Package purges are not supported, this function is identical to remove().
name The name of the package to be deleted.
Multiple Package Options:
pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.
New in version 0.16.0.
Returns a dict containing the changes.
CLI Example:
```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.pkgin.refresh_db(force=False, **kwargs)
Use pkg update to get latest pkg_summary
force Pass -f so that the cache is always refreshed.
New in version 2018.3.0.
CLI Example:
```
salt '*' pkg.refresh_db
```

salt.modules.pkgin.remove(name=None, pkgs=None, **kwargs)
name The name of the package to be deleted.
Multiple Package Options:
pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.
New in version 0.16.0.
Returns a list containing the removed packages.
CLI Example:
```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.pkgin.search(pkg_name, **kwargs)
Searches for an exact match using pkgin ^package$
CLI Example:
```
salt '*' pkg.search 'mysql-server'
```

salt.modules.pkgin.upgrade(refresh=True, pkgs=None, **kwargs)
Run pkg upgrade, if pkgin used. Otherwise do nothing
refresh Whether or not to refresh the package database before installing.
Multiple Package Upgrade Options:
pkgs A list of packages to upgrade from a software repository. Must be passed as a python list.
CLI Example:
```
salt '*' pkg.upgrade pkgs='["foo","bar"]'
```
Returns a dictionary containing the changes:
{'<package>': {'old': '<old-version>',
             'new': '<new-version>'}}

CLI Example:
salt '*' pkg.upgrade

salt.modules.pkgin.version(*names, **kwargs)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...

23.9.348 salt.modules.pkgng
Support for pkgng, the new package manager for FreeBSD

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

Warning: This module has been completely rewritten. Up to and including version 0.17.x, it was available as the pkgng module, (pkgng.install, pkgng.delete, etc.), but moving forward this module will no longer be available as pkgng, as it will behave like a normal Salt pkg provider. The documentation below should not be considered to apply to this module in versions <= 0.17.x. If your minion is running a 0.17.x release or older, then the documentation for this module can be viewed using the sys.doc function:
salt bsdminion sys.doc pkgng

This module provides an interface to pkg(8). It acts as the default package provider for FreeBSD 10 and newer. For FreeBSD hosts which have been upgraded to use pkgng, you will need to override the pkg provider by setting the providers parameter in your Minion config file, in order to use this module to manage packages, like so:

providers:
  pkg: pkgng

salt.modules.pkgng.audit(jail=None, chroot=None, root=None)
Audits installed packages against known vulnerabilities

CLI Example:
salt '*' pkg.audit

jail Audit packages within the specified jail

CLI Example:
salt '*' pkg.audit jail=<jail name or id>

chroot Audit packages within the specified chroot (ignored if jail is specified)
root  Audit packages within the specified root (ignored if jail is specified)

CLI Example:

```bash
salt '*' pkg.audit chroot=/path/to/chroot
```

salt.modules.pkgng.autoremove(jail=None, chroot=None, root=None, dryrun=False)

Delete packages which were automatically installed as dependencies and are not required anymore.

dryrun  Dry-run mode. The list of changes to packages is always printed, but no changes are actually made.

CLI Example:

```bash
salt '*' pkg.autoremove
salt '*' pkg.autoremove jail=<jail name or id>
salt '*' pkg.autoremove dryrun=True
salt '*' pkg.autoremove jail=<jail name or id> dryrun=True
```

salt.modules.pkgng.available_version(*names, **kwargs)

This function is an alias of latest_version.

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> jail=<jail name or id>
salt '*' pkg.latest_version <package name> chroot=/path/to/chroot
```

salt.modules.pkgng.backup(file_name, jail=None, chroot=None, root=None)

Export installed packages into yaml+mtree file

CLI Example:

```bash
salt '*' pkg.backup /tmp/pkg
```

jail  Backup packages from the specified jail. Note that this will run the command within the jail, and so the path to the backup file will be relative to the root of the jail

CLI Example:

```bash
salt '*' pkg.backup /tmp/pkg jail=<jail name or id>
```

chroot  Backup packages from the specified chroot (ignored if jail is specified). Note that this will run the command within the chroot, and so the path to the backup file will be relative to the root of the chroot.

root  Backup packages from the specified root (ignored if jail is specified). Note that this will run the command within the root, and so the path to the backup file will be relative to the root of the root.

CLI Example:

```bash
salt '*' pkg.backup /tmp/pkg chroot=/path/to/chroot
```

salt.modules.pkgng.check(jail=None, chroot=None, root=None, depends=False, recompute=False, checksum=False, checklibs=False)

Sanity checks installed packages

jail  Perform the sanity check in the specified jail

CLI Example:
salt '⋆' pkg.check jail=<jail name or id>

chroot Perform the sanity check in the specified chroot (ignored if jail is specified)
root Perform the sanity check in the specified root (ignored if jail is specified)

CLI Example:
salt '⋆' pkg.check chroot=/path/to/chroot

Of the below, at least one must be set to True.

depends Check for and install missing dependencies.

CLI Example:
salt '⋆' pkg.check depends=True

recompute Recompute sizes and checksums of installed packages.

CLI Example:
salt '⋆' pkg.check recompute=True

checksum Find invalid checksums for installed packages.

CLI Example:
salt '⋆' pkg.check checksum=True

checklibs Regenerates the library dependency metadata for a package.

CLI Example:
salt '⋆' pkg.check checklibs=True

salt.modules.pkgng.clean(jail=None, chroot=None, root=None, clean_all=False, dryrun=False)
Cleans the local cache of fetched remote packages

CLI Example:
salt '*' pkg.clean

jail Cleans the package cache in the specified jail

CLI Example:
salt '⋆' pkg.clean jail=<jail name or id>

chroot Cleans the package cache in the specified chroot (ignored if jail is specified)
root Cleans the package cache in the specified root (ignored if jail is specified)

CLI Example:
salt '⋆' pkg.clean chroot=/path/to/chroot

clean_all Clean all packages from the local cache (not just those that have been superseded by newer versions).

CLI Example:
salt '' pkg.clean clean_all=True

dryrun Dry-run mode. This list of changes to the local cache is always printed, but no changes are actually made.

CLI Example:
salt '/*' pkg.clean dryrun=True

salt.modules.pkgng.delete(name=None, pkgs=None, jail=None, chroot=None, root=None, all_installed=False, force=False, glob=False, dryrun=False, recurse=False, regex=False, pcre=False, **kwargs)

This function is an alias of remove. Remove a package from the database and system

**Note:** This function can accessed using pkg.delete in addition to pkg.remove, to more closely match the CLI usage of pkg(8).

**name** The package to remove

CLI Example:

```bash
salt '/*' pkg.remove <package name>
```

**jail** Delete the package from the specified jail

**chroot** Delete the package from the specified chroot (ignored if jail is specified)

**root** Delete the package from the specified root (ignored if jail is specified)

**all_installed** Deletes all installed packages from the system and empties the database. USE WITH CAUTION!

CLI Example:

```bash
salt '/*' pkg.remove all all_installed=True force=True
```

**force** Forces packages to be removed despite leaving unresolved dependencies.

CLI Example:

```bash
salt '/*' pkg.remove <package name> force=True
```

**glob** Treat the package names as shell glob patterns.

CLI Example:

```bash
salt '/*' pkg.remove <package name> glob=True
```

**dryrun** Dry run mode. The list of packages to delete is always printed, but no packages are actually deleted.

CLI Example:

```bash
salt '/*' pkg.remove <package name> dryrun=True
```

**recurse** Delete all packages that require the listed package as well.

CLI Example:

```bash
salt '/*' pkg.remove <package name> recurse=True
```

**regex** Treat the package names as regular expressions.

CLI Example:

```bash
salt '/*' pkg.remove <regular expression> regex=True
```

**pcre** Treat the package names as extended regular expressions.

CLI Example:
salt '*' pkg.remove <extended regular expression> pcre=True

salt.modules.pkgng.fetch(name, jail=None, chroot=None, root=None, fetch_all=False, quiet=False, fromrepo=None, glob=True, regex=False, pcre=False, local=False, depends=False)

Fetches remote packages

CLI Example:

```
salt '*' pkg.fetch <package name>
```

jail Fetch package in the specified jail

CLI Example:

```
salt '*' pkg.fetch <package name> jail=<jail name or id>
```

chroot Fetch package in the specified chroot (ignored if jail is specified)

root Fetch package in the specified root (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.fetch <package name> chroot=/path/to/chroot
```

fetch_all Fetch all packages.

CLI Example:

```
salt '*' pkg.fetch <package name> fetch_all=True
```

quiet Quiet mode. Show less output.

CLI Example:

```
salt '*' pkg.fetch <package name> quiet=True
```

fromrepo Fetches packages from the given repo if multiple repo support is enabled. See pkg.conf(5).

CLI Example:

```
salt '*' pkg.fetch <package name> fromrepo=repo
```

glob Treat pkg_name as a shell glob pattern.

CLI Example:

```
salt '*' pkg.fetch <package name> glob=True
```

regex Treat pkg_name as a regular expression.

CLI Example:

```
salt '*' pkg.fetch <regular expression> regex=True
```

pcre Treat pkg_name is an extended regular expression.

CLI Example:

```
salt '*' pkg.fetch <extended regular expression> pcre=True
```

local Skip updating the repository catalogs with pkg-update(8). Use the local cache only.

CLI Example:
salt '...' pkg.fetch <package name> local=True

depends Fetch the package and its dependencies as well.

CLI Example:
```
salt '...' pkg.fetch <package name> depends=True
```

salt.modules.pkgng.hold(name=None, pkgs=None, **kwargs)
Version-lock packages

Note: This function is provided primarily for compatibility with some parts of states.pkg. Consider using pkg.lock instead.

name The name of the package to be held.

Multiple Package Options:
pkgs A list of packages to hold. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:
```
salt '...' pkg.hold <package name>
salt '...' pkg.hold pkgs='["foo", "bar"]'
```

salt.modules.pkgng.info('names, **kwargs)
This function is an alias of version.

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

Note: This function can accessed using pkg.info in addition to pkg.version, to more closely match the CLI usage of pkg(8).

jail Get package version information for the specified jail
chroot Get package version information for the specified chroot (ignored if jail is specified)
root Get package version information for the specified root (ignored if jail is specified)
with_origin [False] Return a nested dictionary containing both the origin name and version for each specified package.

New in version 2014.1.0.

CLI Example:
```
salt '...' pkg.version <package name>
salt '...' pkg.version <package name> jail=<jail name or id>
salt '...' pkg.version <package1> <package2> <package3> ...
```

salt.modules.pkgng.install(name=None, fromrepo=None, pkgs=None, sources=None, jail=None,
chroot=None, root=None, orphan=False, force=False, glob=False, local=False, dryrun=False, quiet=False, reinstall_requires=False,
regex=False, pcre=False, batch=False, **kwargs)
Install package(s) from a repository
name The name of the package to install

CLI Example:
salt '*' pkg.install <package name>

jail Install the package into the specified jail

chroot Install the package into the specified chroot (ignored if jail is specified)

root Install the package into the specified root (ignored if jail is specified)

orphan Mark the installed package as orphan. Will be automatically removed if no other packages depend on them. For more information please refer to pkg-autoremove(8).

CLI Example:

```
salt '*' pkg.install <package name> orphan=True
```

force Force the reinstallation of the package if already installed.

CLI Example:

```
salt '*' pkg.install <package name> force=True
```

glob Treat the package names as shell glob patterns.

CLI Example:

```
salt '*' pkg.install <package name> glob=True
```

local Do not update the repository catalogs with pkg-update(8). A value of True here is equivalent to using the -U flag with pkg install.

CLI Example:

```
salt '*' pkg.install <package name> local=True
```

dryrun Dru-run mode. The list of changes to packages is always printed, but no changes are actually made.

CLI Example:

```
salt '*' pkg.install <package name> dryrun=True
```

quiet Force quiet output, except when dryrun is used, where pkg install will always show packages to be installed, upgraded or deleted.

CLI Example:

```
salt '*' pkg.install <package name> quiet=True
```

reinstall_requires When used with force, reinstall any packages that require the given package.

CLI Example:

```
salt '*' pkg.install <package name> reinstall_requires=True force=True
```

Changed in version 2014.7.0: require kwarg renamed to reinstall_requires

fromrepo In multi-repo mode, override the pkg.conf ordering and only attempt to download packages from the named repository.

CLI Example:

```
salt '*' pkg.install <package name> fromrepo=repo
```

regex Treat the package names as a regular expression

CLI Example:

```
salt '*' pkg.install <regular expression> regex=True
```
pcre  Treat the package names as extended regular expressions.

CLI Example:

```
salt '*' pkg.install <package name> batch=True
```

batch  Use BATCH=true for pkg install, skipping all questions. Be careful when using in production.

CLI Example:

```
salt '*' pkg.install <package name> batch=True
```

class `latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> jail=<jail name or id>
salt '*' pkg.latest_version <package name> chroot=/path/to/chroot
```

class `list_locked(**kwargs)`

Query the package database those packages which are locked against reinstallation, modification or deletion.

Returns returns a list of package names with version strings

CLI Example:

```
salt '*' pkg.list_locked
```

jail  List locked packages within the specified jail

CLI Example:

```
salt '*' pkg.list_locked jail=<jail name or id>
```

chroot  List locked packages within the specified chroot (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.list_locked chroot=/path/to/chroot
```

root  List locked packages within the specified root (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.list_locked root=/path/to/chroot
```

class `list_pkgs(versions_as_list=False, jail=None, chroot=None, root=None, with_origin=False, **kwargs)`

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

jail  List the packages in the specified jail

chroot  List the packages in the specified chroot (ignored if jail is specified)

root  List the packages in the specified root (ignored if jail is specified)

with_origin  [False] Return a nested dictionary containing both the origin name and version for each installed package.
New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs jail=<jail name or id>
salt '*' pkg.list_pkgs chroot=/path/to/chroot
```

salt.modules.pkgng.list_upgrades(refresh=True, **kwargs)
List those packages for which an upgrade is available
The fromrepo argument is also supported, as used in pkg states.

CLI Example:

```
salt '*' pkg.list_upgrades
```

**jail** List upgrades within the specified jail

CLI Example:

```
salt '*' pkg.list_upgrades jail=<jail name or id>
```

**chroot** List upgrades within the specified chroot (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.list_upgrades chroot=/path/to/chroot
```

**root** List upgrades within the specified root (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.list_upgrades root=/path/to/chroot
```

salt.modules.pkgng.lock(name, **kwargs)
Lock the named package against reinstallation, modification or deletion.
Returns True if the named package was successfully locked.

CLI Example:

```
salt '*' pkg.lock <package name>
```

**jail** Lock packages within the specified jail

CLI Example:

```
salt '*' pkg.lock <package name> jail=<jail name or id>
```

**chroot** Lock packages within the specified chroot (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.lock <package name> chroot=/path/to/chroot
```

**root** Lock packages within the specified root (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.lock <package name> root=/path/to/chroot
```
salt.modules.pkgng.locked(name, **kwargs)
Query the package database to determine if the named package is locked against reinstallation, modification or deletion.

Returns True if the named package is locked, False otherwise.

CLI Example:

```
salt '*' pkg.locked <package name>
```

-jail Test if a package is locked within the specified jail

CLI Example:

```
salt '*' pkg.locked <package name> jail=<jail name or id>
```

-chroot Test if a package is locked within the specified chroot (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.locked <package name> chroot=/path/to/chroot
```

-root Test if a package is locked within the specified root (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.locked <package name> root=/path/to/chroot
```

salt.modules.pkgng.parse_config(file_name='/usr/local/etc/pkg.conf')
Return dict of uncommented global variables.

CLI Example:

```
salt '*' pkg.parse_config
```

NOTE: not working properly right now

salt.modules.pkgng.purge(name=None, pkgs=None, jail=None, chroot=None, root=None, all_installed=False, force=False, glob=False, dryrun=False, recurse=False, regex=False, pcre=False, **kwargs)
This function is an alias of remove.
Remove a package from the database and system

Note: This function can accessed using pkg.delete in addition to pkg.remove, to more closely match the CLI usage of pkg(8).

-name The package to remove

CLI Example:

```
salt '*' pkg.remove <package name>
```

-jail Delete the package from the specified jail

-chroot Delete the package from the specified chroot (ignored if jail is specified)

-root Delete the package from the specified root (ignored if jail is specified)

-all_installed Deletes all installed packages from the system and empties the database. USE WITH CAUTION!

CLI Example:
force  Forces packages to be removed despite leaving unresolved dependencies.

CLI Example:

```
salt '*' pkg.remove <package name> force=True
```

glob  Treat the package names as shell glob patterns.

CLI Example:

```
salt '*' pkg.remove <package name> glob=True
```

dryrun  Dry run mode. The list of packages to delete is always printed, but no packages are actually deleted.

CLI Example:

```
salt '*' pkg.remove <package name> dryrun=True
```

recurse  Delete all packages that require the listed package as well.

CLI Example:

```
salt '*' pkg.remove <package name> recurse=True
```

regex  Treat the package names as regular expressions.

CLI Example:

```
salt '*' pkg.remove <regular expression> regex=True
```

pcre  Treat the package names as extended regular expressions.

CLI Example:

```
salt '*' pkg.remove <extended regular expression> pcre=True
```

salt.modules.pkgngr.refresh_db(jail=None, chroot=None, root=None, force=False, **kwargs)

Refresh PACKAGESITE contents

Note: This function can accessed using pkg.update in addition to pkg.refresh_db, to more closely match the CLI usage of pkg(8).

CLI Example:

```
salt '*' pkg.refresh_db
```

jail  Refresh the pkg database within the specified jail

chroot  Refresh the pkg database within the specified chroot (ignored if jail is specified)

root  Refresh the pkg database within the specified root (ignored if jail is specified)

force  Force a full download of the repository catalog without regard to the respective ages of the local and remote copies of the catalog.

CLI Example:

```
salt '*' pkg.refresh_db force=True
```
salt.modules.pkgng.remove(name=None, pkgs=None, jail=None, chroot=None, root=None, all_installed=False, force=False, glob=False, dryrun=False, recurse=False, regex=False, pcre=False, **kwargs)

Remove a package from the database and system

Note: This function can be accessed using pkg.delete in addition to pkg.remove, to more closely match the CLI usage of pkg(8).

name  The package to remove

CLI Example:

| salt '*' pkg.remove <package name> |

jail  Delete the package from the specified jail

chroot  Delete the package from the specified chroot (ignored if jail is specified)

root  Delete the package from the specified root (ignored if jail is specified)

all_installed  Deletes all installed packages from the system and empties the database. USE WITH CAUTION!

CLI Example:

| salt '*' pkg.remove all all_installed=True force=True |

force  Forces packages to be removed despite leaving unresolved dependencies.

CLI Example:

| salt '*' pkg.remove <package name> force=True |

glob  Treat the package names as shell glob patterns.

CLI Example:

| salt '*' pkg.remove <package name> glob=True |

dryrun  Dry run mode. The list of packages to delete is always printed, but no packages are actually deleted.

CLI Example:

| salt '*' pkg.remove <package name> dryrun=True |

recurse  Delete all packages that require the listed package as well.

CLI Example:

| salt '*' pkg.remove <package name> recurse=True |

regex  Treat the package names as regular expressions.

CLI Example:

| salt '*' pkg.remove <regular expression> regex=True |

pcre  Treat the package names as extended regular expressions.

CLI Example:

| salt '*' pkg.remove <extended regular expression> pcre=True |

salt.modules.pkgng.restore(file_name, jail=None, chroot=None, root=None)

Reads archive created by pkg backup -d and recreates the database.

CLI Example:
**salt**

`pkg.restore /tmp/pkg`  

**jail**  
Restore database to the specified jail. Note that this will run the command within the jail, and so the path to the file from which the pkg database will be restored is relative to the root of the jail.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg jail=<jail name or id>
```

**chroot**  
Restore database to the specified chroot (ignored if jail is specified). Note that this will run the command within the chroot, and so the path to the file from which the pkg database will be restored is relative to the root of the chroot.

**root**  
Restore database to the specified root (ignored if jail is specified). Note that this will run the command within the root, and so the path to the file from which the pkg database will be restored is relative to the root of the root.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg chroot=/path/to/chroot
```

**salt.modules.pkgng.search**

```
(name, jail=None, chroot=None, root=None, exact=False, glob=False, regex=False, pcre=False, comment=False, desc=False, full=False, depends=False, size=False, quiet=False, origin=False, prefix=False)
```

Searches in remote package repositories

CLI Example:

```
salt '*' pkg.search pattern
```

**jail**  
Perform the search using the `pkg.conf(5)` from the specified jail

CLI Example:

```
salt '*' pkg.search pattern jail=<jail name or id>
```

**chroot**  
Perform the search using the `pkg.conf(5)` from the specified chroot (ignored if jail is specified)

**root**  
Perform the search using the `pkg.conf(5)` from the specified root (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.search pattern chroot=/path/to/chroot
```

**exact**  
Treat pattern as exact pattern.

CLI Example:

```
salt '*' pkg.search pattern exact=True
```

**glob**  
Treat pattern as a shell glob pattern.

CLI Example:

```
salt '*' pkg.search pattern glob=True
```

**regex**  
Treat pattern as a regular expression.

CLI Example:

```
salt '*' pkg.search pattern regex=True
```

**pcre**  
Treat pattern as an extended regular expression.

CLI Example:
Salt Documentation, Release 3003.3

salt '*'

pkg.search pattern pc=\texttt{True}

\textbf{comment}  Search for pattern in the package comment one-line description.

CLI Example:

\texttt{salt '*' pkg.search pattern comment=\texttt{True}}

\textbf{desc}  Search for pattern in the package description.

CLI Example:

\texttt{salt '*' pkg.search pattern desc=\texttt{True}}

\textbf{full}  Displays full information about the matching packages.

CLI Example:

\texttt{salt '*' pkg.search pattern full=\texttt{True}}

\textbf{depends}  Displays the dependencies of pattern.

CLI Example:

\texttt{salt '*' pkg.search pattern depends=\texttt{True}}

\textbf{size}  Displays the size of the package

CLI Example:

\texttt{salt '*' pkg.search pattern size=\texttt{True}}

\textbf{quiet}  Be quiet. Prints only the requested information without displaying many hints.

CLI Example:

\texttt{salt '*' pkg.search pattern quiet=\texttt{True}}

\textbf{origin}  Displays pattern origin.

CLI Example:

\texttt{salt '*' pkg.search pattern origin=\texttt{True}}

\textbf{prefix}  Displays the installation prefix for each package matching pattern.

CLI Example:

\texttt{salt '*' pkg.search pattern prefix=\texttt{True}}

\texttt{salt.modules.pkgng.stats( local=False, remote=False, jail=None, chroot=None, root=None, bytes=False)}

Return pkgng stats.

CLI Example:

\texttt{salt '*' pkg.stats}

\textbf{local}  Display stats only for the local package database.

CLI Example:

\texttt{salt '*' pkg.stats local=\texttt{True}}

\textbf{remote}  Display stats only for the remote package database(s).

CLI Example:
salt 'host' pkg.stats remote=True

**bytes** Display disk space usage in bytes only.

CLI Example:
salt 'host' pkg.stats bytes=True

**jail** Retrieve stats from the specified jail.

CLI Example:
salt 'host' pkg.stats jail=<jail name or id>
salt 'host' pkg.stats jail=<jail name or id> local=True
salt 'host' pkg.stats jail=<jail name or id> remote=True

**chroot** Retrieve stats from the specified chroot (ignored if `jail` is specified).

**root** Retrieve stats from the specified root (ignored if `jail` is specified).

CLI Example:
salt 'host' pkg.stats chroot=/path/to/chroot
salt 'host' pkg.stats chroot=/path/to/chroot local=True
salt 'host' pkg.stats chroot=/path/to/chroot remote=True

salt.modules.pkgng.unhold(name=None, pkgs=None, **kwargs)
Remove version locks

**Note:** This function is provided primarily for compatibility with some parts of `states.pkg`. Consider using `pkg.unlock` instead.

**name** The name of the package to be unheld

Multiple Package Options:

**pkgs** A list of packages to unhold. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:
salt 'host' pkg.unhold <package name>
salt 'host' pkg.unhold pkgs=['foo', 'bar']

salt.modules.pkgng.unlock(name, **kwargs)
Unlock the named package against reinstallation, modification or deletion.

Returns True if the named package was successfully unlocked.

CLI Example:
salt 'host' pkg.unlock <package name>

**jail** Unlock packages within the specified jail

CLI Example:
salt 'host' pkg.unlock <package name> jail=<jail name or id>

**chroot** Unlock packages within the specified chroot (ignored if `jail` is specified)

CLI Example:
**salt Documentation, Release 3003.3**

```
salt '*' pkg.unlock <package name> chroot=/path/to/chroot
```

**root** Unlock packages within the specified root (ignored if jail is specified)

CLI Example:
```
salt '*' pkg.unlock <package name> root=/path/to/chroot
```

**salt.modules.pkgng.update** *(jail=None, chroot=None, root=None, force=False, **kwargs)*

This function is an alias of refresh_db.

Refresh PACKAGESITE contents

**Note:** This function can accessed using pkg.update in addition to pkg.refresh_db, to more closely match the CLI usage of pkg(8).

CLI Example:
```
salt '*' pkg.refresh_db
```

**jail** Refresh the pkg database within the specified jail

**chroot** Refresh the pkg database within the specified chroot (ignored if jail is specified)

**root** Refresh the pkg database within the specified root (ignored if jail is specified)

**force** Force a full download of the repository catalog without regard to the respective ages of the local and remote copies of the catalog.

CLI Example:
```
salt '*' pkg.refresh_db force=True
```

**salt.modules.pkgng.update_package_site** *(new_url)*

Updates remote package repo URL, PACKAGESITE var to be exact.

Must use http://, ftp://, or https:// protocol

CLI Example:
```
salt '*' pkg.update_package_site http://127.0.0.1/
```

**salt.modules.pkgng.updating** *(name, jail=None, chroot=None, root=None, filedate=None, filename=None)*

‘Displays UPDATING entries of software packages

CLI Example:
```
salt '*' pkg.updating foo
```

**jail** Perform the action in the specified jail

CLI Example:
```
salt '*' pkg.updating foo jail=<jail name or id>
```

**chroot** Perform the action in the specified chroot (ignored if jail is specified)

**root** Perform the action in the specified root (ignored if jail is specified)

CLI Example:
```
salt '*' pkg.updating foo chroot=/path/to/chroot
```
**filedate**  Only entries newer than date are shown. Use a YYYYMMDD date format.

**CLI Example:**
```
salt '*' pkg.updating foo filedate=20130101
```

**filename**  Defines an alternative location of the UPDATING file.

**CLI Example:**
```
salt '*' pkg.updating foo filename=/tmp/UPDATING
```

**salt.modules.pkgng.upgrade**(*names, **kwargs*)

Upgrade named or all packages (run a pkg upgrade). If <package name> is omitted, the operation is executed on all packages.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

**CLI Example:**
```
salt '*' pkg.upgrade <package name>
```

**jail**  Audit packages within the specified jail

**CLI Example:**
```
salt '*' pkg.upgrade <package name> jail=<jail name or id>
```

**chroot**  Audit packages within the specified chroot (ignored if jail is specified)

**root**  Audit packages within the specified root (ignored if jail is specified)

**CLI Example:**
```
salt '*' pkg.upgrade <package name> chroot=/path/to/chroot
```

Any of the below options can also be used with jail or chroot.

**force**  Force reinstalling/upgrading the whole set of packages.

**CLI Example:**
```
salt '*' pkg.upgrade <package name> force=True
```

**local**  Do not update the repository catalogs with pkg-update(8). A value of True here is equivalent to using the -U flag with pkg upgrade.

**CLI Example:**
```
salt '*' pkg.upgrade <package name> local=True
```

**dryrun**  Dry-run mode: show what packages have updates available, but do not perform any upgrades. Repository catalogs will be updated as usual unless the local option is also given.

**CLI Example:**
```
salt '*' pkg.upgrade <package name> dryrun=True
```

**fromrepo**  In multi-repo mode, override the pkg.conf ordering and only attempt to upgrade packages from the named repository.

**CLI Example:**
**salt.modules.pkgng.pkg.upgrade**

Generic package upgrade command.

```
salt '*' pkg.upgrade <package name> fromrepo=repo
```

**fetchonly**

Do not perform installation of packages, merely fetch packages that should be upgraded and detect possible conflicts.

CLI Example:

```
salt '*' pkg.upgrade <package name> fetchonly=True
```

**salt.modules.pkgng.version**

```
salt.modules.pkgng.version(*names, **kwargs)
```

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

**Note:** This function can accessed using `pkg.info` in addition to `pkg.version`, to more closely match the CLI usage of `pkg(8)`.

**jail**

Get package version information for the specified jail

**chroot**

Get package version information for the specified chroot (ignored if `jail` is specified)

**root**

Get package version information for the specified root (ignored if `jail` is specified)

**with_origin**

[False]

Return a nested dictionary containing both the origin name and version for each specified package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package name> jail=<jail name or id>
salt '*' pkg.version <package1> <package2> <package3> ...
```

**salt.modules.pkgng.version_cmp**

```
salt.modules.pkgng.version_cmp(pkg1, pkg2, ignore_epoch=False, **kwargs)
```

Do a cmp-style comparison on two packages. Return -1 if `pkg1 < pkg2`, 0 if `pkg1 == pkg2`, and 1 if `pkg1 > pkg2`. Return None if there was a problem making the comparison.

CLI Example:

```
salt '*' pkg.version_cmp '2.1.11' '2.1.12'
```

**salt.modules.pkgng.which**

```
salt.modules.pkgng.which(path, jail=None, chroot=None, root=None, origin=False, quiet=False)
```

Displays which package installed a specific file

CLI Example:

```
salt '*' pkg.which <file name>
```

**jail**

Perform the check in the specified jail

CLI Example:

```
salt '*' pkg.which <file name> jail=<jail name or id>
```

**chroot**

Perform the check in the specified chroot (ignored if `jail` is specified)

**root**

Perform the check in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.which <file name> chroot=/path/to/chroot
```
origin  Shows the origin of the package instead of name-version.

CLI Example:

```
salt '*' pkg.which <file name> origin=True
```

quiet  Quiet output.

CLI Example:

```
salt '*' pkg.which <file name> quiet=True
```

## 23.9.349 salt.modules.pkgutil

Pkgutil support for Solaris

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

### salt.modules.pkgutil.available_version(*names, **kwargs)

This function is an alias of latest_version.

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkgutil.latest_version CSWpython
salt '*' pkgutil.latest_version <package1> <package2> <package3> ...
```

### salt.modules.pkgutil.install(name=None, refresh=False, version=None, pkgs=None, **kwargs)

Install packages using the pkgutil tool.

CLI Example:

```
salt '*' pkg.install <package_name>
salt '*' pkg.install SMClgcc346
```

Multiple Package Installation Options:

**pkgs**  A list of packages to install from OpenCSW. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs=['"foo", "bar"]'
salt '*' pkg.install pkgs=['"foo", {"bar": "1.2.3"}']
```

Returns a dict containing the new package names and versions:

```
{"<package>": {'old': '<old-version>',
              'new': '<new-version>'}}
```

### salt.modules.pkgutil.latest_version(*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.
Salt Documentation, Release 3003.3

CLI Example:

```
salt '*' pkgutil.latest_version CSWpython
salt '*' pkgutil.latest_version <package1> <package2> <package3> ...
```

`salt.modules.pkgutil.list_pkgs` *(versions_as_list=False, **kwargs)*
List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

`salt.modules.pkgutil.list_upgrades` *(refresh=True, **kwargs)*
List all available package upgrades on this system

CLI Example:

```
salt '*' pkgutil.list_upgrades
```

`salt.modules.pkgutil.purge` *(name=None, pkgs=None, **kwargs)*
Package purges are not supported, this function is identical to `remove()`.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

`salt.modules.pkgutil.refresh_db`()
Updates the pkgutil repo database (pkgutil -U)

CLI Example:

```
salt '*' pkgutil.refresh_db
```

`salt.modules.pkgutil.remove` *(name=None, pkgs=None, **kwargs)*
Remove a package and all its dependencies which are not in use by other packages.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'

salt.modules.pkgutil.upgrade(refresh=True)
Upgrade all of the packages to the latest available version.
Returns a dict containing the changes:

```
{<package>: {'old': '<old-version>',
              'new': '<new-version>'}}
```

CLI Example:
salt '*' pkgutil.upgrade

salt.modules.pkgutil.upgrade_available(name)
Check if there is an upgrade available for a certain package
CLI Example:
salt '*' pkgutil.upgrade_available CSWpython

salt.modules.pkgutil.version(*names, **kwargs)
Returns a version if the package is installed, else returns an empty string
CLI Example:
salt '*' pkgutil.version CSWpython

23.9.350  salt.modules.portage_config
Configure portage(5)
salt.modules.portage_config.append_to_package_conf(conf, atom=None, string='',
                                                  overwrite=False)
Append a string or a list of flags for a given package or DEPEND atom to a given configuration file.
CLI Example:
salt '*' portage_config.append_to_package_conf use string="app-admin/salt ldap -
                                                  → libvirt"
salt '*' portage_config.append_to_package_conf use atom="> = app-admin/salt-0.14.1
                                                  ←" flags="['ldap', '-libvirt']"

salt.modules.portage_config.append_use_flags(atom, uses=None, overwrite=False)
Append a list of use flags for a given package or DEPEND atom
CLI Example:
salt '*' portage_config.append_use_flags "app-admin/salt[ldap, -libvirt]"
salt '*' portage_config.append_use_flags ">=app-admin/salt-0.14.1" "]dap', '-
                                                  ←libvirt']"

salt.modules.portage_config.enforce_nice_config()
Enforce a nice tree structure for /etc/portage/package.* configuration files.
See also:
**salt.modules.ebuild.ex_mod_init()** for information on automatically running this when pkg is used.

CLI Example:
```
salt '*' portage_config.enforce_nice_config
```

**salt.modules.portage_config.filter_flags**

New in version 2015.8.0.

Filter function to remove hidden or otherwise not normally visible USE flags from a list.

@type use: list @param use: the USE flag list to be filtered. @type use_expand_hidden: list @param use_expand_hidden: list of flags hidden. @type usemasked: list @param usemasked: list of masked USE flags. @type useforced: list @param useforced: the forced USE flags. @rtype: list @return the filtered USE flags.

**salt.modules.portage_config.get_all_cpv_use**

New in version 2015.8.0.

Uses portage to determine final USE flags and settings for an emerge.

@type cp: string @param cp: eg cat/pkg @rtype: lists @return use, use_expand_hidden, usemask, useforce

**salt.modules.portage_config.get_cleared_flags**

New in version 2015.8.0.

Uses portage for compare use flags which is used for installing package and use flags which now exist int /etc/portage/package.use/

@type cp: string @param cp: eg cat/pkg @rtype: tuple @rparam: tuple with two lists - list of used flags and list of flags which will be used

**salt.modules.portage_config.get_flags_from_package_conf**

Get flags for a given package or DEPEND atom. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:
```
salt '*' portage_config.get_flags_from_package_conf license salt
```

**salt.modules.portage_config.get_installed_use**

New in version 2015.8.0.

Gets the installed USE flags from the VARDB.

@type: cp: string @param cp: cat/pkg @type use: string @param use: 1 of ["USE", "PKGUSE"] @rtype list @returns [] or the list of IUSE flags

**salt.modules.portage_config.get_iuse**

New in version 2015.8.0.

Gets the current IUSE flags from the tree.

@type: cpv: string @param cpv: cat/pkg @rtype list @returns [] or the list of IUSE flags

**salt.modules.portage_config.get_missing_flags**

Find out which of the given flags are currently not set.

CLI Example:
```
salt '*' portage_config.get_missing_flags use salt "['ldap', '-libvirt', 'openssl']"
```
salt.modules.portage_config.has_flag

Verify if the given package or DEPEND atom has the given flag. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:
```
salt '*' portage_config.has_flag license salt Apache-2.0
```

salt.modules.portage_config.has_use

Verify if the given package or DEPEND atom has the given use flag. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:
```
salt '*' portage_config.has_use salt libvirt
```

salt.modules.portage_config.is_changed_uses

New in version 2015.8.0.
Uses portage for determine if the use flags of installed package is compatible with use flags in portage configs.

@type cp: string @param cp: eg cat/pkg

salt.modules.portage_config.is_present

Tell if a given package or DEPEND atom is present in the configuration files tree. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:
```
salt '*' portage_config.is_present unmask salt
```

23.9.351 salt.modules.postfix

Support for Postfix
This module is currently little more than a config file viewer and editor. It is able to read the master.cf file (which is one style) and files in the style of main.cf (which is a different style, that is used in multiple postfix configuration files).

The design of this module is such that when files are edited, a minimum of changes are made to them. Each file should look as if it has been edited by hand; order, comments and whitespace are all preserved.

salt.modules.postfix.delete
Delete message(s) from the mail queue

CLI Example:
```
salt '*' postfix.delete 5C33CA0DEA
salt '*' postfix.delete ALL
```

salt.modules.postfix.hold
Put message(s) on hold from the mail queue

CLI Example:
```
salt '*' postfix.hold 5C33CA0DEA
salt '*' postfix.hold ALL
```
salt.modules.postfix.requeue(queue_id)
Requeue message(s) in the mail queue

CLI Example:
```
salt '*' postfix.requeue 5C33CA0DEA
salt '*' postfix.requeue ALL
```

salt.modules.postfix.set_main(key, value, path='/etc/postfix/main.cf')
Set a single config value in the main.cf file. If the value does not already exist, it will be appended to the end.

CLI Example:
```
salt <minion> postfix.set_main mailq_path /usr/bin/mailq
```

salt.modules.postfix.set_master(service, conn_type, private='y', unpriv='y', chroot='y',
                                 wakeup='n', maxproc=100, command='', write_conf=True,
                                 path='/etc/postfix/master.cf')
Set a single config value in the master.cf file. If the value does not already exist, it will be appended to the end.

Because of shell parsing issues, '-' cannot be set as a value, as is normal in the master.cf file; either 'y', 'n' or a number should be used when calling this function from the command line. If the value used matches the default, it will internally be converted to a '-'. Calling this function from the Python API is not affected by this limitation.

The settings and their default values, in order, are: service (required), conn_type (required), private (y), unpriv (y), chroot (y), wakeup (n), maxproc (100), command (required).

By default, this function will write out the changes to the master.cf file, and then returns the full contents of the file. By setting the write_conf option to False, it will skip writing the file.

CLI Example:
```
salt <minion> postfix.set_master smtp inet n y n n 100 smtpd
```

salt.modules.postfix.show_main(path='/etc/postfix/main.cf')
Return a dict of active config values. This does not include comments, spacing or order. Bear in mind that order is functionally important in the main.cf file, since keys can be referred to as variables. This means that the data returned from this function should not be used for direct modification of the main.cf file; other functions are available for that.

CLI Examples:
```
salt <minion> postfix.show_main
salt <minion> postfix.show_main path=/path/to/main.cf
```

salt.modules.postfix.show_master(path='/etc/postfix/master.cf')
Return a dict of active config values. This does not include comments, spacing or order.

The data returned from this function should not be used for direct modification of the main.cf file; other functions are available for that.

CLI Examples:
```
salt <minion> postfix.show_master
salt <minion> postfix.show_master path=/path/to/master.cf
```

salt.modules.postfix.show_queue()
Show contents of the mail queue
CLI Example:

```bash
salt '*' postfix.show_queue
```

`salt.modules.postfix.unhold(queue_id)`
Set held message(s) in the mail queue to unheld

CLI Example:

```bash
salt '*' postfix.unhold 5C33CA0DEA
salt '*' postfix.unhold ALL
```

## 23.9.352 salt.modules.postgres

Module to provide Postgres compatibility to salt.

**configuration** In order to connect to Postgres, certain configuration is required in `/etc/salt/minion` on the relevant minions. Some sample configs might look like:

```plaintext
postgres
  host: 'localhost'
postgres.port: '5432'
postgres.user: 'postgres' -> db user
postgres.pass: ''
postgres.maintenance_db: 'postgres'
```

The default for the `maintenance_db` is 'postgres' and in most cases it can be left at the default setting. This data can also be passed into pillar. Options passed into `opts` will overwrite options passed into `pillar`.

**note** This module uses MD5 hashing which may not be compliant with certain security audits.

**note** When installing postgres from the official postgres repos, on certain Linux distributions, either the `psql` or the `initdb` binary is *not* automatically placed on the path. Add a configuration to the location of the postgres bin's path to the relevant minion for this module:

```plaintext
postgres.bins_dir: '/usr/pgsql-9.5/bin/
```

`salt.modules.postgres.available_extensions(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)`

List available postgresql extensions

CLI Example:

```bash
salt '*' postgres.available_extensions
```

`salt.modules.postgres.create_extension(name, if_not_exists=None, schema=None, ext_version=None, from_version=None, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)`

Install a postgresql extension

CLI Example:

```bash
salt '*' postgres.create_extension 'adminpack'
```
salt.modules.postgres.create_metadata(name, ext_version=None, schema=None, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Get lifecycle information about an extension

CLI Example:
```
salt '*' postgres.create_metadata adminpack
```

salt.modules.postgres.datadir_exists(name)

New in version 2016.3.0.

Checks if postgres data directory has been initialized

CLI Example:
```
salt '*' postgres.datadir_exists '/var/lib/pgsql/data'
```

name Name of the directory to check

salt.modules.postgres.datadir_init(name, auth='password', user=None, password=None, encoding='UTF8', locale=None, waldir=None, checksums=False, runas=None)

New in version 2016.3.0.

Initializes a postgres data directory

CLI Example:
```
salt '*' postgres.datadir_init '/var/lib/pgsql/data'
```

name The name of the directory to initialize
auth The default authentication method for local connections
password The password to set for the postgres user
user The database superuser name
encoding The default encoding for new databases
locale The default locale for new databases
waldir The transaction log (WAL) directory (default is to keep WAL inside the data directory)

New in version 2019.2.0.

checksums If True, the cluster will be created with data page checksums.

Note: Data page checksums are supported since PostgreSQL 9.3.

New in version 2019.2.0.

runas The system user the operation should be performed on behalf of

salt.modules.postgres.db_alter(name, user=None, host=None, port=None, maintenance_db=None, password=None, tablespace=None, owner=None, owner_recurse=False, runas=None)

Change tablespace or/and owner of database.

CLI Example:
```
salt '*' postgres.db_alter dbname owner=otheruser
```

23.9. execution modules
salt.modules.postgres.db_create(name, user=None, host=None, port=None, maintenance_db=None, password=None, tablespace=None, encoding=None, lc_collate=None, lc_ctype=None, owner=None, template=None, runas=None)

Adds a databases to the Postgres server.

CLI Example:
```
salt '*' postgres.db_create 'dbname'
salt '*' postgres.db_create 'dbname' template=template_postgis
```

salt.modules.postgres.db_exists(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Checks if a database exists on the Postgres server.

CLI Example:
```
salt '*' postgres.db_exists 'dbname'
```

salt.modules.postgres.db_list(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Return dictionary with information about databases of a Postgres server.

CLI Example:
```
salt '*' postgres.db_list
```

salt.modules.postgres.db_remove(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Removes a databases from the Postgres server.

CLI Example:
```
salt '*' postgres.db_remove 'dbname'
```

salt.modules.postgres.drop_extension(name, if_exists=None, restrict=None, cascade=None, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Drop an installed postgresql extension

CLI Example:
```
salt '*' postgres.drop_extension 'adminpack'
```

salt.modules.postgres.get_available_extension(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Get info about an available postgresql extension

CLI Example:
```
salt '*' postgres.get_available_extension plpgsql
```

salt.modules.postgres.get_installed_extension(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Get info about an installed postgresql extension

CLI Example:
salt '*' postgres.get_installed_extension plppgsql

salt.modules.postgres.group_create(groupname, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, createroles=None, encrypted=None, login=None, inherit=None, superuser=None, replication=None, rolepassword=None, groups=None, runas=None)

Creates a Postgres group. A group is postgres is similar to a user, but cannot login.

CLI Example:

```
salt '*' postgres.group_create 'groupname' user='user' \  
    host='hostname' port='port' password='password' \  
    rolepassword='rolepassword'
```

salt.modules.postgres.group_remove(groupname, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Removes a group from the Postgres server.

CLI Example:

```
salt '*' postgres.group_remove 'groupname'
```

salt.modules.postgres.group_update(groupname, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, createroles=None, encrypted=None, inherit=None, superuser=None, replication=None, rolepassword=None, groups=None, runas=None)

Updates a postgres group

CLI Examples:

```
salt '*' postgres.group_update 'username' user='user' \  
    host='hostname' port='port' password='password' \  
    rolepassword='rolepassword'
```

salt.modules.postgres.has_privileges(name, object_name, object_type, privileges=None, grant_option=None, prepend='public', maintenance_db=None, user=None, host=None, port=None, password=None, runas=None)

New in version 2016.3.0.

Check if a role has the specified privileges on an object

CLI Example:

```
salt '*' postgres.has_privileges user_name table_name table \
    SELECT,INSERT maintenance_db=db_name
```

**name** Name of the role whose privileges should be checked on object_type

**object_name** Name of the object on which the check is to be performed

**object_type** The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
• group
• function

privileges Comma separated list of privileges to check, from the list below:
• INSERT
• CREATE
• TRUNCATE
• CONNECT
• TRIGGER
• SELECT
• USAGE
• TEMPORARY
• UPDATE
• EXECUTE
• REFERENCES
• DELETE
• ALL

grant_option If grant_option is set to True, the grant option check is performed

prepend Table and Sequence object types live under a schema so this should be provided if the object is not
under the default public schema

maintenance_db The database to connect to

user database username if different from config or default

password user password if any password for a specified user

host Database host if different from config or default

port Database port if different from config or default

runas System user all operations should be performed on behalf of

salt.modules.postgres.installed_extensions(user=None, host=None, port=None,
maintenance_db=None, password=None, runas=None)

List installed postgresql extensions

CLI Example:

salt '*' postgres.installed_extensions

salt.modules.postgres.is_available_extension(name, user=None, host=None, port=None,
maintenance_db=None, password=None, runas=None)

Test if a specific extension is available

CLI Example:

salt '*' postgres.is_available_extension

salt.modules.postgres.is_installed_extension(name, user=None, host=None, port=None,
maintenance_db=None, password=None, runas=None)

Test if a specific extension is installed

CLI Example:

salt '*' postgres.is_installed_extension

salt.modules.postgres.language_create(name, maintenance_db, user=None, host=None,
port=None, password=None, runas=None)

New in version 2016.3.0.

Installs a language into a database
CLI Example:

```
salt '*' postgres.language_create plpgsql dbname
```

**name**  
Language to install

**maintenance_db**  
The database to install the language in

**user**  
database username if different from config or default

**password**  
user password if any password for a specified user

**host**  
Database host if different from config or default

**port**  
Database port if different from config or default

**runas**  
System user all operations should be performed on behalf of

salt.modules.postgres.language_exists(name, maintenance_db, user=None, host=None, port=None, password=None, runas=None)

New in version 2016.3.0.

Checks if language exists in a database.

CLI Example:

```
salt '*' postgres.language_exists plpgsql dbname
```

**name**  
Language to check for

**maintenance_db**  
The database to check in

**user**  
database username if different from config or default

**password**  
user password if any password for a specified user

**host**  
Database host if different from config or default

**port**  
Database port if different from config or default

**runas**  
System user all operations should be performed on behalf of

salt.modules.postgres.language_list(maintenance_db, user=None, host=None, port=None, password=None, runas=None)

New in version 2016.3.0.

Return a list of languages in a database.

CLI Example:

```
salt '*' postgres.language_list dbname
```

**maintenance_db**  
The database to check

**user**  
database username if different from config or default

**password**  
user password if any password for a specified user

**host**  
Database host if different from config or default

**port**  
Database port if different from config or default

**runas**  
System user all operations should be performed on behalf of

salt.modules.postgres.language_remove(name, maintenance_db, user=None, host=None, port=None, password=None, runas=None)

New in version 2016.3.0.

Removes a language from a database.

CLI Example:

```
salt '*' postgres.language_remove plpgsql dbname
```

**name**  
Language to remove

**maintenance_db**  
The database to install the language in

**user**  
database username if different from config or default
password  user password if any password for a specified user
host     Database host if different from config or default
port     Database port if different from config or default
runas    System user all operations should be performed on behalf of

salt.modules.postgres.owner_to(dbname, ownername, user=None, host=None, port=None, password=None, runas=None)

Set the owner of all schemas, functions, tables, views and sequences to the given username.

CLI Example:

```
salt '*' postgres.owner_to 'dbname' 'username'
```

salt.modules.postgres.privileges_grant(name, object_name, object_type, privileges=None, grant_option=None, prepend='public', maintenance_db=None, user=None, host=None, port=None, password=None, runas=None)

New in version 2016.3.0.

Grant privileges on a postgres object

CLI Example:

```
salt '*' postgres.privileges_grant user_name table_name table \SELECT,UPDATE maintenance_db=db_name
```

name Name of the role to which privileges should be granted
object_name Name of the object on which the grant is to be performed
object_type The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

privileges Comma separated list of privileges to grant, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

grant_option If grant_option is set to True, the recipient of the privilege can in turn grant it to others
prepend Table and Sequence object types live under a schema so this should be provided if the object is not under the default public schema
maintenance_db The database to connect to
user database username if different from config or default
password user password if any password for a specified user
host  Database host if different from config or default
port  Database port if different from config or default
runas  System user all operations should be performed on behalf of

salt.modules.postgres.privileges_list(name, object_type, prepend='public'; maintenance_db=None, user=None, host=None, port=None, password=None, runas=None)

New in version 2016.3.0.
Return a list of privileges for the specified object.

CLI Example:
```
salt '*' postgres.privileges_list table_name table maintenance_db=db_name
```

name  Name of the object for which the permissions should be returned
object_type  The object type, which can be one of the following:
  • table
  • sequence
  • schema
  • tablespace
  • language
  • database
  • group
  • function
prepend  Table and Sequence object types live under a schema so this should be provided if the object is not under the default public schema
maintenance_db  The database to connect to
user  database username if different from config or default
password  user password if any password for a specified user
host  Database host if different from config or default
port  Database port if different from config or default
runas  System user all operations should be performed on behalf of

salt.modules.postgres.privileges_revoke(name, object_name, object_type, privileges=None, prepend='public'; maintenance_db=None, user=None, host=None, port=None, password=None, runas=None)

New in version 2016.3.0.
Revoke privileges on a postgres object

CLI Example:
```
salt '*' postgres.privileges_revoke user_name table_name table \  SELECT,UPDATE maintenance_db=db_name
```

name  Name of the role whose privileges should be revoked
object_name  Name of the object on which the revoke is to be performed
object_type  The object type, which can be one of the following:
  • table
  • sequence
  • schema
  • tablespace
  • language
  • database
  • group
  • function
privileges  Comma separated list of privileges to revoke, from the list below:
  •  INSERT
  •  CREATE
  •  TRUNCATE
  •  CONNECT
  •  TRIGGER
  •  SELECT
  •  USAGE
  •  TEMPORARY
  •  UPDATE
  •  EXECUTE
  •  REFERENCES
  •  DELETE
  •  ALL

maintenance_db  The database to connect to
user  database username if different from config or default
password  user password if any password for a specified user
host  Database host if different from config or default
port  Database port if different from config or default
runas  System user all operations should be performed on behalf of

salt.modules.postgres.psql_query(query, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None, write=False)

Run an SQL-Query and return the results as a list. This command only supports SELECT statements. This limitation can be worked around with a query like this:

WITH updated AS (UPDATE pg_authid SET rolconnlimit = 2000 WHERE rolname = 'rolename' RETURNING rolconnlimit) SELECT * FROM updated;

query  The query string.
user  Database username, if different from config or default.
host  Database host, if different from config or default.
port  Database port, if different from the config or default.
maintenance_db  The database to run the query against.
password  User password, if different from the config or default.
runas  User to run the command as.
write  Mark query as READ WRITE transaction.

CLI Example:
salt '*' postgres.psql_query 'select * from pg_stat_activity'

salt.modules.postgres.role_get(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None, return_password=False)

Return a dict with information about users of a Postgres server.

Set return_password to True to get password hash in the result.

CLI Example:
salt '*' postgres.role_get postgres

salt.modules.postgres.schema_create(dbname, name, owner=None, user=None, db_user=None, db_password=None, db_host=None, db_port=None)

Creates a Postgres schema.

CLI Example:
salt modules.postgres.schema_create dbname name owner='owner' \  
    user='user' \  
    db_user='user' db_password='password' \  
    db_host='hostname' db_port='port'

salt.modules.postgres.schema_exists(dbname, name, user=None, 
    db_user=None, db_password=None, db_host=None, db_port=None)

Checks if a schema exists on the Postgres server.

CLI Example:

```
salt '*' postgres.schema_exists dbname schemaname
```

dbname  Database name we query on
name  Schema name we look for
user  The system user the operation should be performed on behalf of
db_user  database username if different from config or default
db_password  user password if any password for a specified user
db_host  Database host if different from config or default
db_port  Database port if different from config or default

salt.modules.postgres.schema_get(dbname, name, user=None, 
    db_user=None, db_password=None, 
    db_host=None, db_port=None)

Return a dict with information about schemas in a database.

CLI Example:

```
salt '*' postgres.schema_get dbname name
```

dbname  Database name we query on
name  Schema name we look for
user  The system user the operation should be performed on behalf of
db_user  database username if different from config or default
db_password  user password if any password for a specified user
db_host  Database host if different from config or default
db_port  Database port if different from config or default

salt.modules.postgres.schema_list(dbname, user=None, 
    db_user=None, db_password=None, 
    db_host=None, db_port=None)

Return a dict with information about schemas in a Postgres database.

CLI Example:

```
salt '*' postgres.schema_list dbname
```

dbname  Database name we query on
user  The system user the operation should be performed on behalf of
db_user  database username if different from config or default
db_password  user password if any password for a specified user
db_host  Database host if different from config or default
db_port  Database port if different from config or default

salt.modules.postgres.schema_remove(dbname, name, user=None, 
    db_user=None, db_password=None, db_host=None, db_port=None)

Removes a schema from the Postgres server.

CLI Example:
salt '*' postgres.schema_remove dbname schemaname

dbname  Database name we work on
schemaname  The schema's name we'll remove
user  System user all operations should be performed on behalf of
db_user  database username if different from config or default
db_password  user password if any password for a specified user
db_host  Database host if different from config or default
db_port  Database port if different from config or default

salt.modules.postgres.tablespace_alter(name, user=None, host=None, port=None, maintenance_db=None, password=None, new_name=None, new_owner=None, set_option=None, reset_option=None, runas=None)

Change tablespace name, owner, or options.

CLI Example:
salt '*' postgres.tablespace_alter tsname new_owner=otheruser
salt '*' postgres.tablespace_alter index_space new_name=fast_raid
salt '*' postgres.tablespace_alter test set_option="{'seq_page_cost': '1.1'}"
salt '*' postgres.tablespace_alter tsname reset_option=seq_page_cost

New in version 2015.8.0.

salt.modules.postgres.tablespace_create(name, location, options=None, owner=None, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Adds a tablespace to the Postgres server.

CLI Example:
salt '*' postgres.tablespace_create tablespacename '/path/datadir'

New in version 2015.8.0.

salt.modules.postgres.tablespace_exists(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Checks if a tablespace exists on the Postgres server.

CLI Example:
salt '*' postgres.tablespace_exists 'dbname'

New in version 2015.8.0.

salt.modules.postgres.tablespace_list(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Return dictionary with information about tablespaces of a Postgres server.

CLI Example:
salt '*' postgres.tablespace_list

New in version 2015.8.0.

salt.modules.postgres.tablespace_remove(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Removes a tablespace from the Postgres server.

CLI Example:
salt '*' postgres.tablespace_remove tsname

New in version 2015.8.0.

salt.modules.postgres.user_create(username, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, createroles=None, inherit=None, login=None, connlimit=None, encrypted=None, superuser=None, replication=None, rolepassword=None, valid_until=None, groups=None, runas=None)

Creates a Postgres user.

CLI Examples:

salt '*' postgres.user_create 'username' user='user' \
    host='hostname' port='port' password='password' \
    rolepassword='rolepassword' valid_until='valid_until'

salt.modules.postgres.user_exists(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Checks if a user exists on the Postgres server.

CLI Example:

salt '*' postgres.user_exists 'username'

salt.modules.postgres.user_list(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None, return_password=False)

Return a dict with information about users of a Postgres server.

Set return_password to True to get password hash in the result.

CLI Example:

salt '*' postgres.user_list

salt.modules.postgres.user_remove(username, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Removes a user from the Postgres server.

CLI Example:

salt '*' postgres.user_remove 'username'

salt.modules.postgres.user_update(username, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, createroles=None, inherit=None, login=None, connlimit=None, replication=None, rolepassword=None, valid_until=None, groups=None, runas=None)

Updates a Postgres user.

CLI Examples:

salt '*' postgres.user_update 'username' user='user' \
    host='hostname' port='port' password='password' \
    rolepassword='rolepassword' valid_until='valid_until'
salt.modules.postgres.version(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Return the version of a Postgres server.

CLI Example:
salt '*' postgres.version

23.9.353 salt.modules.poudriere

Support for poudriere

salt.modules.poudriere.bulk_build(jail, pkg_file, keep=False)

Run bulk build on poudriere server.

Return number of pkg builds, failures, and errors, on error dump to CLI

CLI Example:
salt -N buildbox_group poudriere.bulk_build 90amd64 /root/pkg_list

salt.modules.poudriere.create_jail(name, arch, version='9.0-RELEASE')

Creates a new poudriere jail if one does not exist

NOTE creating a new jail will take some time the master is not hanging

CLI Example:
salt '*' poudriere.create_jail 90amd64 amd64

salt.modules.poudriere.create_ports_tree()

Not working need to run portfetch non interactive

salt.modules.poudriere.delete_jail(name)

Deletes poudriere jail with name

CLI Example:
salt '*' poudriere.delete_jail 90amd64

salt.modules.poudriere.info_jail(name)

Show information on name poudriere jail

CLI Example:
salt '*' poudriere.info_jail head-amd64

salt.modules.poudriere.is_jail(name)

Return True if jail exists False if not

CLI Example:
salt '*' poudriere.is_jail <jail name>

salt.modules.poudriere.list_jails()

Return a list of current jails managed by poudriere

CLI Example:
salt 'x' poudriere.list_jails

salt.modules.poudriere.list_ports()
    Return a list of current port trees managed by poudriere
    CLI Example:
    salt 'x' poudriere.list_ports

salt.modules.poudriere.make_pkgng_aware(jname)
    Make jail jname pkgng aware
    CLI Example:
    salt 'x' poudriere.make_pkgng_aware <jail name>

salt.modules.poudriere.parse_config(config_file=None)
    Returns a dict of poudriere main configuration definitions
    CLI Example:
    salt 'x' poudriere.parse_config

salt.modules.poudriere.update_jail(name)
    Run freebsd-update on name poudriere jail
    CLI Example:
    salt 'x' poudriere.update_jail freebsd:10:x86:64

salt.modules.poudriere.update_ports_tree(ports_tree)
    Updates the ports tree, either the default or the ports_tree specified
    CLI Example:
    salt 'x' poudriere.update_ports_tree staging

salt.modules.poudriere.version()
    Return poudriere version
    CLI Example:
    salt 'x' poudriere.version

23.9.354 salt.modules.powerpath

powerpath support.
Assumes RedHat
salt.modules.powerpath.add_license(key)
    Add a license
salt.modules.powerpath.has_powerpath()

salt.modules.powerpath.list_licenses()
    returns a list of applied powerpath license keys
salt.modules.powerpath.remove_license(key)
    Remove a license
23.9.355  salt.modules.proxy

This module allows you to manage proxy settings

```python
salt '*' network.get_http_proxy

salt.modules.proxy.get_ftp_proxy(network_service='Ethernet')
  Returns the current ftp proxy settings
  network_service The network service to apply the changes to, this only necessary on macOS
  CLI Example:
```
salt '*' proxy.get_ftp_proxy Ethernet
```

```python
salt.modules.proxy.get_http_proxy(network_service='Ethernet')
  Returns the current http proxy settings
  network_service The network service to apply the changes to, this only necessary on macOS
  CLI Example:
```
salt '*' proxy.get_http_proxy Ethernet
```

```python
salt.modules.proxy.get_https_proxy(network_service='Ethernet')
  Returns the current https proxy settings
  network_service The network service to apply the changes to, this only necessary on macOS
  CLI Example:
```
salt '*' proxy.get_https_proxy Ethernet
```

```python
salt.modules.proxy.get_proxy_bypass(network_service='Ethernet')
  Returns the current domains that can bypass the proxy
  network_service The network service to get the bypass domains from, this is only necessary on macOS
  CLI Example:
```
salt '*' proxy.get_proxy_bypass
```

```python
salt.modules.proxy.get_proxy_win()
  Gets all of the proxy settings in one call, only available on Windows
  CLI Example:
```
salt '*' proxy.get_proxy_win
```

```python
salt.modules.proxy.set_ftp_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)
  Sets the ftp proxy settings
  server The proxy server to use
  port The port used by the proxy server
  user The username to use for the proxy server if required
  password The password to use if required by the server
  network_service The network service to apply the changes to, this only necessary on macOS
  bypass_hosts The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use set_proxy_bypass to edit the bypass hosts.
  CLI Example:
```
salt '*' proxy.set_ftp_proxy example.com 1080 user=proxy_user password=proxy_password
```
salt.modules.proxy.set_http_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)

Sets the http proxy settings. Note: On Windows this will override any other proxy settings you have, the preferred method of updating proxies on windows is using set_proxy.

- `server`: The proxy server to use
- `port`: The port used by the proxy server
- `user`: The username to use for the proxy server if required
- `password`: The password to use if required by the server
- `network_service`: The network service to apply the changes to, this only necessary on macOS
- `bypass_hosts`: The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use set_proxy_bypass to edit the bypass hosts.

CLI Example:
```
salt '*' proxy.set_http_proxy example.com 1080 user=proxy_user password=proxy_pass network_service=Ethernet
```

salt.modules.proxy.set_https_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)

Sets the https proxy settings. Note: On Windows this will override any other proxy settings you have, the preferred method of updating proxies on windows is using set_proxy.

- `server`: The proxy server to use
- `port`: The port used by the proxy server
- `user`: The username to use for the proxy server if required
- `password`: The password to use if required by the server
- `network_service`: The network service to apply the changes to, this only necessary on macOS
- `bypass_hosts`: The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use set_proxy_bypass to edit the bypass hosts.

CLI Example:
```
salt '*' proxy.set_https_proxy example.com 1080 user=proxy_user password=proxy_pass network_service=Ethernet
```

salt.modules.proxy.set_proxy_bypass(domains, network_service='Ethernet')

Sets the domains that can bypass the proxy

- `domains`: An array of domains allowed to bypass the proxy
- `network_service`: The network service to apply the changes to, this only necessary on macOS

CLI Example:
```
salt '*' proxy.set_proxy_bypass "['127.0.0.1', 'localhost']"
```

salt.modules.proxy.set_proxy_win(server, port, types=None, bypass_hosts=None)

Sets the http proxy settings, only works with Windows.

- `server`: The proxy server to use
- `password`: The password to use if required by the server
- `types`: The types of proxy connections should be setup with this server. Valid types are:
  - `http`
  - `https`
  - `ftp`
- `bypass_hosts`: The hosts that are allowed to by pass the proxy.

CLI Example:
```
salt '*' proxy.set_http_proxy example.com 1080 types="[http', 'https']"
```
23.9.356 salt.modules.ps

A salt interface to psutil, a system and process library. See http://code.google.com/p/psutil.

depends

- psutil Python module, version 0.3.0 or later
- python-utmp package (optional)

salt.modules.ps.boot_time(time_format=None)
Return the boot time in number of seconds since the epoch began.

CLI Example:

```
salt '*' ps.boot_time
```

salt.modules.ps.cpu_percent(interval=0.1, per_cpu=False)
Return the percent of time the CPU is busy.

- **interval** the number of seconds to sample CPU usage over
- **per_cpu** if True return an array of CPU percent busy for each CPU, otherwise aggregate all percents into one number

CLI Example:

```
salt '*' ps.cpu_percent
```

salt.modules.ps.cpu_times(per_cpu=False)
Return the percent of time the CPU spends in each state, e.g. user, system, idle, nice, iowait, irq, softirq.

- **per_cpu** if True return an array of percents for each CPU, otherwise aggregate all percents into one number

CLI Example:

```
salt '*' ps.cpu_times
```

salt.modules.ps.disk_io_counters(device=None)
Return disk I/O statistics.

CLI Example:

```
salt '*' ps.disk_io_counters
salt '*' ps.disk_io_counters device=sda1
```

salt.modules.ps.disk_partition_usage(all=False)
Return a list of disk partitions plus the mount point, filesystem and usage statistics.

CLI Example:

```
salt '*' ps.disk_partition_usage
```

salt.modules.ps.disk_partitions(all=False)
Return a list of disk partitions and their device, mount point, and filesystem type.

- **all** if set to False, only return local, physical partitions (hard disk, USB, CD/DVD partitions). If True, return all filesystems.

CLI Example:
salt ' '*' ps.disk_partitions

salt.modules.ps.disk_usage(path)
Given a path, return a dict listing the total available space as well as the free space, and used space.

CLI Example:
salt ' '*' ps.disk_usage /home

salt.modules.ps.get_pid_list()
Return a list of process ids (PIDs) for all running processes.

CLI Example:
salt ' '*' ps.get_pid_list

salt.modules.ps.get_users()
Return logged-in users.

CLI Example:
salt ' '*' ps.get_users

salt.modules.ps.kill_pid(pid, signal=15)
Kill a process by PID.

salt 'minion' ps.kill_pid pid [signal=signal_number]

pid PID of process to kill.
signal Signal to send to the process. See manpage entry for kill for possible values. Default: 15 (SIGTERM).

Example:
Send SIGKILL to process with PID 2000:
salt 'minion' ps.kill_pid 2000 signal=9

salt.modules.ps.lsof(name)
Retrieve the lsof information of the given process name.

CLI Example:
salt ' '*' ps.lsof apache2

salt.modules.ps.netstat(name)
Retrieve the netstat information of the given process name.

CLI Example:
salt ' '*' ps.netstat apache2

salt.modules.ps.network_io_counters(interface=None)
Return network I/O statistics.

CLI Example:
salt ' '*' ps.network_io_counters
salt ' '*' ps.network_io_counters interface=eth0

23.9. execution modules
salt.modules.ps.num_cpus()
Return the number of CPUs.

CLI Example:
salt '*' ps.num_cpus

salt.modules.ps.pgrep(pattern, user=None, full=False, pattern_is_regex=False)
Return the pids for processes matching a pattern.
If full is true, the full command line is searched for a match, otherwise only the name of the command is searched.

salt '*' ps.pgrep pattern [user=username] [full=(true|false)]

**pattern** Pattern to search for in the process list.
**user** Limit matches to the given username. Default: All users.
**full** A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.
**pattern_is_regex** This flag enables ps.pgrep to mirror the regex search functionality found in the pgrep command line utility.

New in version 3001.

**Examples:**
Find all httpd processes on all 'www' minions:
salt 'www.*' ps.pgrep httpd

Find all bash processes owned by user 'tom':
salt '*' ps.pgrep bash user=tom

salt.modules.ps.pkill(pattern, user=None, signal=15, full=False)
Kill processes matching a pattern.

salt '*' ps.pkill pattern [user=username] [signal=signal_number] \[
[full=(true|false)]

**pattern** Pattern to search for in the process list.
**user** Limit matches to the given username. Default: All users.
**signal** Signal to send to the process(es). See manpage entry for kill for possible values. Default: 15 (SIGTERM).
**full** A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.

**Examples:**
Send SIGHUP to all httpd processes on all 'www' minions:
salt 'www.*' ps.pkill httpd signal=1

Send SIGKILL to all bash processes owned by user 'tom':
salt '*' ps.pkill bash signal=9 user=tom

salt.modules.ps.proc_info(pid, attrs=None)
Return a dictionary of information for a process id (PID).

CLI Example:
pid  PID of process to query.
attrs Optional list of desired process attributes. The list of possible attributes can be found here: http://pythonhosted.org/psutil/#psutil.Process

salt.modules.ps.psaux(name)
Retrieve information corresponding to a "ps aux" filtered with the given pattern. It could be just a name or a regular expression (using python search from "re" module).

CLI Example:
salt '*' ps.psaux www-data.+apache2

salt.modules.ps.ss(name)
Retrieve the ss information of the given process name.

CLI Example:
salt '*' ps.ss apache2

New in version 2016.11.6.

salt.modules.ps.swap_memory()
Return a dict that describes swap memory statistics.

Note: This function is only available in psutil version 0.6.0 and above.

CLI Example:
salt '*' ps.swap_memory

salt.modules.ps.top(num_processes=5, interval=3)
Return a list of top CPU consuming processes during the interval. num_processes = return the top N CPU consuming processes interval = the number of seconds to sample CPU usage over

CLI Examples:
salt '*' ps.top
salt '*' ps.top 5 10

salt.modules.ps.total_physical_memory()
Return the total number of bytes of physical memory.

CLI Example:
salt '*' ps.total_physical_memory

salt.modules.ps.virtual_memory()
New in version 2014.7.0.
Return a dict that describes statistics about system memory usage.
Note: This function is only available in psutil version 0.6.0 and above.

CLI Example:
```
salt '*' ps.virtual_memory
```

### 23.9.357 salt.modules.publish

Publish a command from a minion to a target

```python
salt.modules.publish.full_data(tgt, fun, arg=None, tgt_type='glob', returner='', timeout=5)
```

Return the full data about the publication, this is invoked in the same way as the publish function

CLI Example:
```
salt system.example.com publish.full_data '*' cmd.run 'ls -la /tmp'
```

**Attention**

If you need to pass a value to a function argument and that value contains an equal sign, you **must** include the argument name. For example:

```
salt '*' publish.full_data test.kwarg arg='cheese=spam'
```

```python
salt.modules.publish.publish(tgt, fun, arg=None, tgt_type='glob', returner='', timeout=5, via_master=None)
```

Publish a command from the minion out to other minions.

Publications need to be enabled on the Salt master and the minion needs to have permission to publish the command. The Salt master will also prevent a recursive publication loop, this means that a minion cannot command another minion to command another minion as that would create an infinite command loop.

The `tgt_type` argument is used to pass a target other than a glob into the execution, the available options are:

- `glob`
- `pcre`
- `grain`
- `grain_pcre`
- `pillar`
- `pillar_pcre`
- `ipcidr`
- `range`
- `compound`

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Note that for pillar matches must be exact, both in the pillar matcher and the compound matcher. No globbing is supported.

The arguments sent to the minion publish function are separated with commas. This means that for a minion executing a command with multiple args it will look like this:

```
salt system.example.com publish.publish '*' user.add 'foo,1020,1020'
salt system.example.com publish.publish 'os:Fedora' network.interfaces '' grain
```
CLI Example:

```
salt system.example.com publish.publish '*' cmd.run 'ls -la /tmp'
```

**Attention**

If you need to pass a value to a function argument and that value contains an equal sign, you **must** include the argument name. For example:

```
salt '*' publish.publish test.kwarg arg='cheese=spam'
```

Multiple keyword arguments should be passed as a list.

```
salt '*' publish.publish test.kwarg arg=['cheese=spam','spam=cheese']
```

When running via salt-call, the `via_master` flag may be set to specific which master the publication should be sent to. Only one master may be specified. If unset, the publication will be sent only to the first master in minion configuration.

```
salt.modules.publish.runner(fun, arg=None, timeout=5)
```

Execute a runner on the master and return the data from the runner function

CLI Example:

```
salt publish.runner manage.down
```

### 23.9.358 `salt.modules.puppet`

Execute puppet routines

```
salt.modules.puppet.disable(message=None)
```

New in version 2014.7.0.

Disable the puppet agent

```
message
```

New in version 2015.5.2.

Disable message to send to puppet

CLI Example:

```
salt '*' puppet.disable
salt '*' puppet.disable 'Disabled, contact XYZ before enabling'
```

```
salt.modules.puppet.enable()
```

New in version 2014.7.0.

Enable the puppet agent

CLI Example:

```
salt '*' puppet.enable
```

```
salt.modules.puppet.fact(name, puppet=False)
```

Run facter for a specific fact

CLI Example:
salt '*' puppet.fact kernel

salt.modules.puppet.facts(puppet=False)
Run facter and return the results
CLI Example:
salt '*' puppet.facts

salt.modules.puppet.noop(*args, **kwargs)
Execute a puppet noop run and return a dict with the stderr, stdout, return code, etc. Usage is the same as for puppet.run.
CLI Example:
salt '*' puppet.noop
salt '*' puppet.noop tags=basefiles::edit,apache::server
salt '!' puppet.noop debug
salt '!' puppet.noop apply /a/b/manifest.pp modulepath=/a/b/modules
  →tags=basefiles::edit,apache::server

salt.modules.puppet.plugin_sync()
Runs a plugin sync between the puppet master and agent
CLI Example:
salt '!' puppet.plugin_sync

salt.modules.puppet.run(*args, **kwargs)
Execute a puppet run and return a dict with the stderr, stdout, return code, etc. The first positional argument given is checked as a subcommand. Following positional arguments should be ordered with arguments required by the subcommand first, followed by non-keyword arguments. Tags are specified by a tag keyword and comma separated list of values. → [http://docs.puppetlabs.com/puppet/latest/reference/lang_tags.html](http://docs.puppetlabs.com/puppet/latest/reference/lang_tags.html)
CLI Examples:
salt '!' puppet.run
salt '!' puppet.run tags=basefiles::edit,apache::server
salt '!' puppet.run agent onetime no-daemonize no-usecacheonfailure no-splay
  →ignorecache
salt '!' puppet.run debug
salt '!' puppet.run apply /a/b/manifest.pp modulepath=/a/b/modules
  →tags=basefiles::edit,apache::server

salt.modules.puppet.status()
New in version 2014.7.0.
Display puppet agent status
CLI Example:
salt '!' puppet.status

salt.modules.puppet.summary()
New in version 2014.7.0.
Show a summary of the last puppet agent run
CLI Example:
Management of Pure Storage FlashArray

Installation Prerequisites

- You will need the purestorage python package in your python installation path that is running salt.
  
  pip install purestorage

- Configure Pure Storage FlashArray authentication. Use one of the following three methods.
  
  1) From the minion config

  ```
  pure_tags:
  fa:
    san_ip: management vip or hostname for the FlashArray
    api_token: A valid api token for the FlashArray being managed
  ```

  2) From environment (PUREFA_IP and PUREFA_API)

  3) From the pillar (PUREFA_IP and PUREFA_API)

  maintainer Simon Dodsley (simon@purestorage.com)

  maturity new

  requires purestorage

  platform all

New in version 2018.3.0.

```
salt.modules.purefa.hg_create(name, host=None, volume=None)
```

Create a hostgroup on a Pure Storage FlashArray.

Will return False if hostgroup already exists, or if named host or volume do not exist.

New in version 2018.3.0.

- name [string] name of hostgroup (truncated to 63 characters)
- host [string] name of host to add to hostgroup
- volume [string] name of volume to add to hostgroup

CLI Example:

```
salt '*' purefa.hg_create foo host=bar volume=vol
```

```
salt.modules.purefa.hg_delete(name)
```

Delete a hostgroup on a Pure Storage FlashArray (removes all volumes and hosts).

Will return False if hostgroup is already in a deleted state.

New in version 2018.3.0.

- name [string] name of hostgroup

CLI Example:

```
salt '*' purefa.hg_delete foo
```
salt.modules.purefa.hg_remove(name, volume=None, host=None)
Remove a host and/or volume from a hostgroup on a Pure Storage FlashArray.

Will return False if hostgroup does not exist, or named host or volume are not in the hostgroup.

New in version 2018.3.0.
name [string] name of hostgroup
volume [string] name of volume to remove from hostgroup
host [string] name of host to remove from hostgroup

CLI Example:
salt '*' purefa.hg_remove foo volume=test host=bar

salt.modules.purefa.hg_update(name, host=None, volume=None)
Adds entries to a hostgroup on a Pure Storage FlashArray.

Will return False is hostgroup doesn't exist, or host or volume do not exist.

New in version 2018.3.0.
name [string] name of hostgroup
host [string] name of host to add to hostgroup
volume [string] name of volume to add to hostgroup

CLI Example:
salt '*' purefa.hg_update foo host=bar volume=vol

salt.modules.purefa.host_create(name, iqn=None, wwn=None)
Add a host on a Pure Storage FlashArray.

Will return False if host already exists, or the iSCSI or Fibre Channel parameters are not in a valid format. See Pure Storage FlashArray documentation.

New in version 2018.3.0.
name [string] name of host (truncated to 63 characters)
iqn [string] iSCSI IQN of host
wwn [string] Fibre Channel WWN of host

CLI Example:
salt '*' purefa.host_create foo iqn='<Valid iSCSI IQN>' wwn='<Valid WWN>'

salt.modules.purefa.host_delete(name)
Delete a host on a Pure Storage FlashArray (detaches all volumes).

Will return False if the host doesn't exist.

New in version 2018.3.0.
name [string] name of host

CLI Example:
salt '*' purefa.host_delete foo

salt.modules.purefa.host_update(name, iqn=None, wwn=None)
Update a hosts port definitions on a Pure Storage FlashArray.

Will return False if new port definitions are already in use by another host, or are not in a valid format. See Pure Storage FlashArray documentation.

New in version 2018.3.0.
name [string] name of host
iqn [string] Additional iSCSI IQN of host
**wwn** [string] Additional Fibre Channel WWN of host

CLI Example:

```bash
salt '*' purefa.host_update foo iqn='<Valid iSCSI IQN>' wwn='<Valid WWN>'
```

`salt.modules.purefa.pg_create(name, hostgroup=None, host=None, volume=None, enabled=True)`

Create a protection group on a Pure Storage FlashArray.

**Will return False is the following cases:**

- Protection Group already exists
- Protection Group in a deleted state
- More than one type is specified - protection groups are for only hostgroups, hosts or volumes
- Named type for protection group does not exist

New in version 2018.3.0.

**name** [string] name of protection group

**hostgroup** [string] name of hostgroup to add to protection group

**host** [string] name of host to add to protection group

**volume** [string] name of volume to add to protection group

CLI Example:

```bash
salt '*' purefa.pg_create foo [hostgroup=foo | host=bar | volume=vol] enabled=[true | false]
```

`salt.modules.purefa.pg_delete(name, eradicate=False)`

Delete a protection group on a Pure Storage FlashArray.

Will return False if protection group is already in a deleted state.

New in version 2018.3.0.

**name** [string] name of protection group

CLI Example:

```bash
salt '*' purefa.pg_delete foo
```

`salt.modules.purefa.pg_eradicate(name)`

Eradicate a deleted protection group on a Pure Storage FlashArray.

Will return False if protection group is not in a deleted state.

New in version 2018.3.0.

**name** [string] name of protection group

CLI Example:

```bash
salt '*' purefa.pg_eradicate foo
```

`salt.modules.purefa.pg_remove(name, hostgroup=None, host=None, volume=None)`

Remove a hostgroup, host or volume from a protection group on a Pure Storage FlashArray.

**Will return False in the following cases:**

- Protection group does not exist
- Specified type is not currently associated with the protection group

New in version 2018.3.0.

**name** [string] name of protection group

**hostgroup** [string] name of hostgroup to remove from protection group

**host** [string] name of host to remove from hostgroup

**volume** [string] name of volume to remove from hostgroup

CLI Example:
salt.modules.purefa.pg_remove foo [hostgroup=bar | host=test | volume=bar]

salt.modules.purefa.pg_update(name, hostgroup=None, host=None, volume=None)
Update a protection group on a Pure Storage FlashArray.

Will return False in the following cases:
- Protection group does not exist
- Incorrect type selected for current protection group type
- Specified type does not exist

New in version 2018.3.0.

name [string] name of protection group
hostgroup [string] name of hostgroup to add to protection group
host [string] name of host to add to protection group
volume [string] name of volume to add to protection group

CLI Example:
salt '*' purefa.pg_update foo [hostgroup=foo | host=bar | volume=vol]

salt.modules.purefa.snap_create(name, suffix=None)
Create a volume snapshot on a Pure Storage FlashArray.

Will return False if volume selected to snap does not exist.

New in version 2018.3.0.

name [string] name of volume
suffix [string] if specified forces snapshot name suffix. If not specified defaults to timestamp.

CLI Example:
salt '*p' purefa.snap_create foo
salt '*p' purefa.snap_create foo suffix=bar

salt.modules.purefa.snap_delete(name, suffix=None, eradicate=False)
Delete a volume snapshot on a Pure Storage FlashArray.

Will return False if selected snapshot does not exist.

New in version 2018.3.0.

name [string] name of volume
suffix [string] name of snapshot
eradicate [boolean] Eradicate snapshot after deletion if True. Default is False

CLI Example:
salt '*' purefa.snap_delete foo suffix=snap eradicate=True

salt.modules.purefa.snap_eradicate(name, suffix=None)
Eradicate a deleted volume snapshot on a Pure Storage FlashArray.

Will return False if snapshot is not in a deleted state.

New in version 2018.3.0.

name [string] name of volume
suffix [string] name of snapshot

CLI Example:
salt '*' purefa.snap_eradicate foo suffix=snap

salt.modules.purefa.snap_volume_create(name, target, overwrite=False)
Create R/W volume from snapshot on a Pure Storage FlashArray.
Will return False if target volume already exists and overwrite is not specified, or selected snapshot doesn't exist.

New in version 2018.3.0.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>[string]</td>
<td>name of volume snapshot</td>
</tr>
<tr>
<td>target</td>
<td>[string]</td>
<td>name of clone volume</td>
</tr>
<tr>
<td>overwrite</td>
<td>[boolean]</td>
<td>overwrite clone if already exists (default: False)</td>
</tr>
</tbody>
</table>

CLI Example:
```
salt '*' purefa.snap_volume_create foo.bar clone overwrite=True
```

salt.modules.purefa.volume_attach(name, host)

Attach a volume to a host on a Pure Storage FlashArray.

Host and volume must exist or else will return False.

New in version 2018.3.0.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>[string]</td>
<td>name of volume</td>
</tr>
<tr>
<td>host</td>
<td>[string]</td>
<td>name of host</td>
</tr>
</tbody>
</table>

CLI Example:
```
salt '*' purefa.volume_attach foo bar
```

salt.modules.purefa.volume_clone(name, target, overwrite=False)

Clone an existing volume on a Pure Storage FlashArray.

Will return False if source volume doesn't exist, or target volume already exists and overwrite not specified.

New in version 2018.3.0.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>[string]</td>
<td>name of volume</td>
</tr>
<tr>
<td>target</td>
<td>[string]</td>
<td>name of clone volume</td>
</tr>
<tr>
<td>overwrite</td>
<td>[boolean]</td>
<td>overwrite clone if already exists (default: False)</td>
</tr>
</tbody>
</table>

CLI Example:
```
salt '*' purefa.volume_clone foo bar overwrite=True
```

salt.modules.purefa.volume_create(name, size=None)

Create a volume on a Pure Storage FlashArray.

Will return False if volume already exists.

New in version 2018.3.0.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>[string]</td>
<td>name of volume (truncated to 63 characters)</td>
</tr>
<tr>
<td>size</td>
<td>[string]</td>
<td>if specified capacity of volume. If not specified default to 1G. Refer to Pure Storage documentation for formatting rules.</td>
</tr>
</tbody>
</table>

CLI Example:
```
salt '*' purefa.volume_create foo
salt '*' purefa.volume_create foo size=10T
```

salt.modules.purefa.volume_delete(name, eradicate=False)

Delete a volume on a Pure Storage FlashArray.

Will return False if volume doesn't exist is already in a deleted state.

New in version 2018.3.0.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>[string]</td>
<td>name of volume</td>
</tr>
<tr>
<td>eradicate</td>
<td>[boolean]</td>
<td>Eradicate volume after deletion if True. Default is False</td>
</tr>
</tbody>
</table>

CLI Example:
salt '*' purefa.volume_delete foo eradicate=True

salt.modules.purefa.volume_detach(name, host)

Detach a volume from a host on a Pure Storage FlashArray.

Will return False if either host or volume do not exist, or if selected volume isn't already connected to the host.

New in version 2018.3.0.

name [string] name of volume
host [string] name of host

CLI Example:

salt '*' purefa.volume_detach foo bar

salt.modules.purefa.volume_eradicate(name)

Eradicate a deleted volume on a Pure Storage FlashArray.

Will return False if volume is not in a deleted state.

New in version 2018.3.0.

name [string] name of volume

CLI Example:

salt '*' purefa.volume_eradicate foo

salt.modules.purefa.volume_extend(name, size)

Extend an existing volume on a Pure Storage FlashArray.

Will return False if new size is less than or equal to existing size.

New in version 2018.3.0.

name [string] name of volume
size [string] New capacity of volume. Refer to Pure Storage documentation for formatting rules.

CLI Example:

salt '*' purefa.volume_extend foo 10T

23.9.360 salt.modules.purefb

Management of Pure Storage FlashBlade

Installation Prerequisites

- You will need the purity_fb python package in your python installation path that is running salt.

```python
pip install purity_fb
```

- Configure Pure Storage FlashBlade authentication. Use one of the following three methods.

  1) From the minion config

```yaml
pure_tags:
  fb:
    san_ip: management vip or hostname for the FlashBlade
    api_token: A valid api token for the FlashBlade being managed
```

  2) From environment (PUREFB_IP and PUREFB_API)
3) From the pillar (PUREFB_IP and PUREFB_API)

maintainer Simon Dodsley (simon@purestorage.com)
maturity new
requires purity_fb
platform all

New in version 2019.2.0.

```python
salt.modules.purefb.fs_create(name, size=None, proto='NFS', nfs_rules='*(rw,no_root_squash)', snapshot=False)
```

Create a filesystem on a Pure Storage FlashBlade.

Will return False if filesystem already exists.

New in version 2019.2.0.

- **name** [string] name of filesystem (truncated to 63 characters)
- **proto** [string] (Optional) Sharing protocol (NFS, CIFS or HTTP). If not specified default is NFS
- **snapshot** [boolean] (Optional) Are snapshots enabled on the filesystem. Default is False
- **nfs_rules** [string] (Optional) export rules for NFS. If not specified default is *(rw,no_root_squash)*. Refer to Pure Storage documentation for formatting rules.
- **size** [string] if specified capacity of filesystem. If not specified default to 32G. Refer to Pure Storage documentation for formatting rules.

CLI Example:

```bash
salt '*' purefb.fs_create foo proto=CIFS
salt '*' purefb.fs_create foo size=10T
```

```python
salt.modules.purefb.fs_delete(name, eradicate=False)
```

Delete a share on a Pure Storage FlashBlade.

Will return False if filesystem doesn't exist or is already in a deleted state.

New in version 2019.2.0.

- **name** [string] name of filesystem
- **eradicate** [boolean] (Optional) Eradicate filesystem after deletion if True. Default is False

CLI Example:

```bash
salt '*' purefb.fs_delete foo eradicate=True
```

```python
salt.modules.purefb.fs_eradicate(name)
```

Eradicate a deleted filesystem on a Pure Storage FlashBlade.

Will return False if filesystem is not in a deleted state.

New in version 2019.2.0.

- **name** [string] name of filesystem

CLI Example:

```bash
salt '*' purefb.fs_eradicate foo
```

```python
salt.modules.purefb.fs_extend(name, size)
```

Resize an existing filesystem on a Pure Storage FlashBlade.

Will return False if new size is less than or equal to existing size.

New in version 2019.2.0.

- **name** [string] name of filesystem
- **size** [string] New capacity of filesystem. Refer to Pure Storage documentation for formatting rules.
CLI Example:

```shell
salt '*' purefb.fs_extend foo 10T
```

```python
salt.modules.purefb.fs_update(name, rules, snapshot=False)
```

Update filesystem on a Pure Storage FlashBlade.

Allows for change of NFS export rules and enabling/disabled of snapshotting capability.

New in version 2019.2.0.

- **name** [string] name of filesystem
- **rules** [string] NFS export rules for filesystem Refer to Pure Storage documentation for formatting rules.
- **snapshot**: boolean (Optional) Enable/Disable snapshots on the filesystem. Default is False

CLI Example:

```shell
salt '*' purefb.fs_nfs_update foo rules='10.234.112.23(ro), 10.234.112.24(rw)' snapshot=True
```

```python
salt.modules.purefb.snap_create(name, suffix=None)
```

Create a filesystem snapshot on a Pure Storage FlashBlade.

Will return False if filesystem selected to snap does not exist.

New in version 2019.2.0.

- **name** [string] name of filesystem to snapshot
- **suffix** [string] if specified forces snapshot name suffix. If not specified defaults to timestamp.

CLI Example:

```shell
salt '*' purefb.snap_create foo
salt '*' purefb.snap_create foo suffix=bar
```

```python
salt.modules.purefb.snap_delete(name, suffix=None, eradicate=False)
```

Delete a filesystem snapshot on a Pure Storage FlashBlade.

Will return False if selected snapshot does not exist.

New in version 2019.2.0.

- **name** [string] name of filesystem
- **suffix** [string] name of snapshot
- **eradicate** [boolean] Eradicate snapshot after deletion if True. Default is False

CLI Example:

```shell
salt '*' purefb.snap_delete foo suffix=snap eradicate=True
```

```python
salt.modules.purefb.snap_eradicate(name, suffix=None)
```

Eradicate a deleted filesystem snapshot on a Pure Storage FlashBlade.

Will return False if snapshot is not in a deleted state.

New in version 2019.2.0.

- **name** [string] name of filesystem
- **suffix** [string] name of snapshot

CLI Example:

```shell
salt '*' purefb.snap_eradicate foo suffix=snap
```
23.9.361 salt.modules.pushbullet

Module for sending messages to Pushbullet (https://www.pushbullet.com)
New in version 2015.8.0.
Requires an api_key in /etc/salt/minion:

```yaml
pushbullet:
  api_key: 'ABC123abc123ABC123abc123ABC123ab'
```

For example:

```yaml
pushbullet:
  device: "Chrome"
  title: "Example push message"
  body: "Message body."
```

salt.modules.pushbullet.push_note(device=None, title=None, body=None)
Pushing a text note.

Parameters
- **device** -- Pushbullet target device
- **title** -- Note title
- **body** -- Note body

Returns Boolean if message was sent successfully.

CLI Example:

```
salt "*" pushbullet.push_note device="Chrome" title="Example title" body="Example body."
```

23.9.362 salt.modules.pushover_notify

Module for sending messages to Pushover (https://www.pushover.net)
New in version 2016.3.0.

configuration This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```yaml
pushover:
  token: abAHuZyCLtdH8P4zhmFZmgUHUsv1ei8
```

salt.modules.pushover_notify.post_message(user=None, device=None, message=None, title=None, priority=None, expire=None, retry=None, sound=None, api_version=1, token=None)
Send a message to a Pushover user or group.

Parameters
- **user** -- The user or group to send to, must be key of user or group not email address.
- **message** -- The message to send to the PushOver user or group.
- **title** -- Specify who the message is from.
- **priority** -- The priority of the message, defaults to 0.
- **expire** -- The message should expire after N number of seconds.
- **retry** -- The number of times the message should be retried.
- **sound** -- The sound to associate with the message.
• **api_version** -- The PushOver API version, if not specified in the configuration.
  • **token** -- The PushOver token, if not specified in the configuration.

Returns: Boolean if message was sent successfully.

CLI Example:

```bash
salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx' title='Message from Salt' message='Build is done'
```

```bash
salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx' title='Message from Salt' message='Build is done' priority='2' expire='720' retry='5'
```

---

## 23.9.363 salt.modules.pw_group

Manage groups on FreeBSD

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to 'group.info' is not available), see [here](#).

**salt.modules.pw_group.add**

Add the specified group

CLI Example:

```bash
salt '*' group.add foo 3456
```

**salt.modules.pw_group.adduser**

Add a user in the group.

CLI Example:

```bash
salt '*' group.adduser foo bar
```

Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

**salt.modules.pw_group.chgid**

Change the gid for a named group

CLI Example:

```bash
salt '*' group.chgid foo 4376
```

**salt.modules.pw_group.delete**

Remove the named group

CLI Example:

```bash
salt '*' group.delete foo
```

**salt.modules.pw_group.deluser**

Remove a user from the group.

CLI Example:

```bash
salt '*' group.deluser foo bar
```

Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.
salt.modules.pw_group.getent(refresh=False)
    Return info on all groups
    CLI Example:
    ```
salt '*' group.getent
    ```

salt.modules.pw_group.info(name)
    Return information about a group
    CLI Example:
    ```
salt '*' group.info foo
    ```

salt.modules.pw_group.members(name, members_list)
    Replaces members of the group with a provided list.
    New in version 2015.5.4.
    CLI Example:
    ```
salt '*' group.members foo 'user1,user2,user3,...'
    ```
    Replaces a membership list for a local group 'foo'. foo:x:1234:user1,user2,user3,...

23.9.364 salt.modules.pw_user

Manage users with the pw command

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to 'user.info is not available'), see here.

salt.modules.pw_user.add(name, uid=None, gid=None, groups=None, home=None, shell=None,
    unique=True, fullname='', roomnumber='', workphone='', homephone='',
    createhome=True, loginclass=None, **kwargs)
    Add a user to the minion
    CLI Example:
    ```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
    ```

salt.modules.pw_user.chfullname(name, fullname)
    Change the user's Full Name
    CLI Example:
    ```
salt '*' user.chfullname foo "Foo Bar"
    ```

salt.modules.pw_user.chgid(name, gid)
    Change the default group of the user
    CLI Example:
    ```
salt '*' user.chgid foo 4376
    ```

salt.modules.pw_user.chgroups(name, groups, append=False)
    Change the groups to which a user belongs
name  Username to modify

groups List of groups to set for the user. Can be passed as a comma-separated list or a Python list.

append  [False] Set to True to append these groups to the user's existing list of groups. Otherwise, the specified groups will replace any existing groups for the user.

CLI Example:

```
salt '*' user.chgroups foo wheel,root True
```

```
salt.modules.pw_user.chhome(name, home, persist=False)
```
Set a new home directory for an existing user

```
name  Username to modify
home  New home directory to set
persist  [False] Set to True to prevent configuration files in the new home directory from being overwritten by the files from the skeleton directory.
```

CLI Example:

```
salt '*' user.chhome foo /home/users/foo True
```

```
salt.modules.pw_user.chhomephone(name, homephone)
```
Change the user's Home Phone

CLI Example:

```
salt '*' user.chhomephone foo "7735551234"
```

```
salt.modules.pw_user.chloginclass(name, loginclass, root=None)
```
Change the default login class of the user

New in version 2016.3.5.

CLI Example:

```
salt '*' user.chloginclass foo staff
```

```
salt.modules.pw_user.chroomnumber(name, roomnumber)
```
Change the user's Room Number

CLI Example:

```
salt '*' user.chroomnumber foo 123
```

```
salt.modules.pw_user.chshell(name, shell)
```
Change the default shell of the user

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

```
salt.modules.pw_user.chuid(name, uid)
```
Change the uid for a named user

CLI Example:

```
salt '*' user.chuid foo 4376
```

```
salt.modules.pw_user.chworkphone(name, workphone)
```
Change the user's Work Phone

CLI Example:
salt '*' user.chworkphone foo "7735550123"

salt.modules.pw_user.delete(name, remove=False, force=False)
Remove a user from the minion

CLI Example:

salt '*' user.delete name remove=True force=True

salt.modules.pw_user.get_loginclass(name)
Get the login class of the user

New in version 2016.3.0.

CLI Example:

salt '*' user.get_loginclass foo

salt.modules.pw_user.getent(refresh=False)
Return the list of all info for all users

CLI Example:

salt '*' user.getent

salt.modules.pw_user.info(name)
Return user information

CLI Example:

salt '*' user.info root

salt.modules.pw_user.list_groups(name)
Return a list of groups the named user belongs to

CLI Example:

salt '*' user.list_groups foo

salt.modules.pw_user.list_users()
Return a list of all users

CLI Example:

salt '*' user.list_users

salt.modules.pw_user.rename(name, new_name)
Change the username for a named user

CLI Example:

cmd
23.9.365  salt.modules.pyenv

Manage python installations with pyenv.

**Note:** Git needs to be installed and available via PATH if pyenv is to be installed automatically by the module.

New in version 2014.4.0.

**salt.modules.pyenv.default** *(python=None, runas=None)*

Returns or sets the currently defined default python.

- **python=None** The version to set as the default. Should match one of the versions listed by *pyenv.versions*. Leave blank to return the current default.

  CLI Example:

  ```
  salt '*' pyenv.default
  salt '*' pyenv.default 2.0.0-p0
  ```

**salt.modules.pyenv.do** *(cmdline=None, runas=None)*

Execute a python command with pyenv's shims from the user or the system.

  CLI Example:

  ```
  salt '*' pyenv.do 'gem list bundler'
  salt '*' pyenv.do 'gem list bundler' deploy
  ```

**salt.modules.pyenv.do_with_python** *(python, cmdline=None, runas=None)*

Execute a python command with pyenv's shims using a specific python version.

  CLI Example:

  ```
  salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler'
  salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler' deploy
  ```

**salt.modules.pyenv.install** *(runas=None, path=None)*

Install pyenv systemwide

  CLI Example:

  ```
  salt '*' pyenv.install
  ```

**salt.modules.pyenv.install_python** *(python, runas=None)*

Install a python implementation.

- **python** The version of python to install, should match one of the versions listed by *pyenv.list*

  CLI Example:

  ```
  salt '*' pyenv.install_python 2.0.0-p0
  ```

**salt.modules.pyenv.is_installed** *(runas=None)*

Check if pyenv is installed.

  CLI Example:

  ```
  salt '*' pyenv.is_installed
  ```

**salt.modules.pyenv.list_** *(runas=None)*

List the installable versions of python.

  CLI Example:
salt 'quotes' pyenv.list

salt.modules.pyenv.rehash(runas=None)
   Run pyenv rehash to update the installed shims.
   CLI Example:
   ```
   salt 'quotes' pyenv.rehash
   ```

salt.modules.pyenv.uninstall_python(python, runas=None)
   Uninstall a python implementation.
   python The version of python to uninstall. Should match one of the versions listed by pyenv.versions
   CLI Example:
   ```
   salt 'quotes' pyenv.uninstall_python 2.0.0-p0
   ```

salt.modules.pyenv.update(runas=None, path=None)
   Updates the current versions of pyenv and python-Build
   CLI Example:
   ```
   salt 'quotes' pyenv.update
   ```

salt.modules.pyenv.versions(runas=None)
   List the installed versions of python.
   CLI Example:
   ```
   salt 'quotes' pyenv.versions
   ```

23.9.366 salt.modules.qemu_img

Qemu-img Command Wrapper

The qemu img command is wrapped for specific functions
   depends qemu-img
salt.modules.qemu_img.convert(orig, dest, fmt)
   Convert an existing disk image to another format using qemu-img
   CLI Example:
   ```
   salt 'quotes' qemu_img.convert /path/to/original.img /path/to/new.img qcow2
   ```

salt.modules.qemu_img.make_image(location, size, fmt)
   Create a blank virtual machine image file of the specified size in megabytes. The image can be created in any format supported by qemu
   CLI Example:
   ```
   salt 'quotes' qemu_img.make_image /tmp/image.qcow 2048 qcow2
   salt 'quotes' qemu_img.make_image /tmp/image.raw 10240 raw
   ```

23.9. execution modules
23.9.367 salt.modules.qemu_nbd

Qemu Command Wrapper

The qemu system comes with powerful tools, such as qemu-img and qemu-nbd which are used here to build up kvm images.

salt.modules.qemu_nbd.clear(mnt)
Pass in the mnt dict returned from nbd_mount to unmount and disconnect the image from nbd. If all of the partitions are unmounted return an empty dict, otherwise return a dict containing the still mounted partitions

CLI Example:

```
salt '*' qemu_nbd.clear '{"/mnt/foo": "/dev/nbd0p1"}'
```

salt.modules.qemu_nbd.connect(image)
Activate nbd for an image file.

CLI Example:

```
salt '*' qemu_nbd.connect /tmp/image.raw
```

salt.modules.qemu_nbd.init(image, root=None)
Mount the named image via qemu-nbd and return the mounted roots

CLI Example:

```
salt '*' qemu_nbd.init /srv/image.qcow2
```

salt.modules.qemu_nbd.mount(nbd, root=None)
Pass in the nbd connection device location, mount all partitions and return a dict of mount points

CLI Example:

```
salt '*' qemu_nbd.mount /dev/nbd0
```

23.9.368 salt.modules.quota

Module for managing quotas on POSIX-like systems.

salt.modules.quota.get_mode(device)
Report whether the quota system for this device is on or off

CLI Example:

```
salt '*' quota.get_mode
```

salt.modules.quota.off(device)
Turns off the quota system

CLI Example:

```
salt '*' quota.off
```

salt.modules.quota.on(device)
Turns on the quota system

CLI Example:
salt '*' quota.on

salt.modules.quota.report(mount)
    Report on quotas for a specific volume
    CLI Example:
    salt '*' quota.report /media/data

salt.modules.quota.set_(device, **kwargs)
    Calls out to setquota, for a specific user or group
    CLI Example:
    salt '*' quota.set /media/data user=larry block-soft-limit=1048576
    salt '*' quota.set /media/data group=painters file-hard-limit=1000

salt.modules.quota.stats()
    Runs the quotastats command, and returns the parsed output
    CLI Example:
    salt '*' quota.stats

salt.modules.quota.warn()
    Runs the warnquota command, to send warning emails to users who are over their quota limit.
    CLI Example:
    salt '*' quota.warn

23.9.369 salt.modules.rabbitmq

Module to provide RabbitMQ compatibility to Salt. Todo: A lot, need to add cluster support, logging, and minion configuration data.

salt.modules.rabbitmq.add_user(name, password=None, runas=None)
    Add a rabbitMQ user via rabbitmqctl user_add <user> <password>
    CLI Example:
    salt '*' rabbitmq.add_user rabbit_user password

salt.modules.rabbitmq.add_vhost(vhost, runas=None)
    Adds a vhost via rabbitmqctl add_vhost.
    CLI Example:
    salt '*' rabbitmq add_vhost '<vhost_name>'

salt.modules.rabbitmq.change_password(name, password, runas=None)
    Changes a user's password.
    CLI Example:
    salt '*' rabbitmq.change_password rabbit_user password
salt.modules.rabbitmq.check_password(name, password, runas=None)
    Checks if a user's password is valid.
    CLI Example:
    ```
    salt '*' rabbitmq.check_password rabbit_user password
    ```

salt.modules.rabbitmq.clear_password(name, runas=None)
    Removes a user's password.
    CLI Example:
    ```
    salt '*' rabbitmq.clear_password rabbit_user
    ```

salt.modules.rabbitmq.cluster_status(runas=None)
    return rabbitmq cluster_status
    CLI Example:
    ```
    salt '*' rabbitmq.cluster_status
    ```

salt.modules.rabbitmq.delete_policy(vhost, name, runas=None)
    Delete a policy based on rabbitmqctl clear_policy.
    Reference: http://www.rabbitmq.com/ha.html
    CLI Example:
    ```
    salt '*' rabbitmq.delete_policy / HA
    ```

salt.modules.rabbitmq.delete_upstream(name, runas=None)
    Deletes an upstream via rabbitmqctl clear_parameter.
    **Parameters**
    - name (str) -- The name of the upstream to delete.
    - runas (str) -- The name of the user to run the command as.
    CLI Example:
    ```
    salt '*' rabbitmq.delete_upstream upstream_name
    ```

New in version 3000.

salt.modules.rabbitmq.delete_user(name, runas=None)
    Deletes a user via rabbitmqctl delete_user.
    CLI Example:
    ```
    salt '*' rabbitmq.delete_user rabbit_user
    ```

salt.modules.rabbitmq.delete_vhost(vhost, runas=None)
    Deletes a vhost rabbitmqctl delete_vhost.
    CLI Example:
    ```
    salt '*' rabbitmq.delete_vhost '<vhost_name>'
    ```

salt.modules.rabbitmq.disable_plugin(name, runas=None)
    Disable a RabbitMQ plugin via the rabbitmq-plugins command.
    CLI Example:
salt '*' rabbitmq.disable_plugin foo

`salt.modules.rabbitmq.enable_plugin(name, runas=None)`
Enable a RabbitMQ plugin via the rabbitmq-plugins command.

CLI Example:
```
salt '*' rabbitmq.enable_plugin foo
```

`salt.modules.rabbitmq.force_reset(runas=None)`
Forcefully Return a RabbitMQ node to its virgin state

CLI Example:
```
salt '*' rabbitmq.force_reset
```

`salt.modules.rabbitmq.join_cluster(host, user='rabbit', ram_node=None, runas=None)`
Join a rabbit cluster

CLI Example:
```
salt '*' rabbitmq.join_cluster rabbit.example.com rabbit
```

`salt.modules.rabbitmq.list_available_plugins(runas=None)`
Returns a list of the names of all available plugins (enabled and disabled).

CLI Example:
```
salt '*' rabbitmq.list_available_plugins
```

`salt.modules.rabbitmq.list_enabled_plugins(runas=None)`
Returns a list of the names of the enabled plugins.

CLI Example:
```
salt '*' rabbitmq.list_enabled_plugins
```

`salt.modules.rabbitmq.list_permissions(vhost, runas=None)`
Lists permissions for vhost via rabbitmqctl list_permissions

CLI Example:
```
salt '*' rabbitmq.list_permissions /myvhost
```

`salt.modules.rabbitmq.list_policies(vhost='/', runas=None)`
Return a dictionary of policies nested by vhost and name based on the data returned from rabbitmqctl list_policies.

CLI Example:
```
salt '*' rabbitmq.list_policies
```

`salt.modules.rabbitmq.list_queues(runas=None, *args)`
Returns queue details of the / virtual host

CLI Example:
salt '!' rabbitmq.list_queues messages consumers

salt.modules.rabbitmq.list_queues_vhost(vhost, runas=None, *args)
Returns queue details of specified virtual host. This command will consider first parameter as the vhost name and rest will be treated as queueinfoitem. For getting details on vhost /, use list_queues instead.

CLI Example:
salt '!' rabbitmq.list_queues messages consumers

salt.modules.rabbitmq.list_upstreams(runas=None)
Returns a dict of upstreams based on rabbitmqctl list_parameters.

Parameters runas (str) -- The name of the user to run this command as.

CLI Example:
salt '!' rabbitmq.list_upstreams

New in version 3000.

salt.modules.rabbitmq.list_user_permissions(name, runas=None)
List permissions for a user via rabbitmqctl list_user_permissions

CLI Example:
salt '!' rabbitmq.list_user_permissions user

salt.modules.rabbitmq.list_users(runas=None)
Return a list of users based off of rabbitmqctl user_list.

CLI Example:
salt '!' rabbitmq.list_users

salt.modules.rabbitmq.list_vhosts(runas=None)
Return a list of vhost based on rabbitmqctl list_vhosts.

CLI Example:
salt '!' rabbitmq.list_vhosts

salt.modules.rabbitmq.plugin_is_enabled(name, runas=None)
Return whether the plugin is enabled.

CLI Example:
salt '!' rabbitmq.plugin_is_enabled rabbitmq_plugin_name

salt.modules.rabbitmq.policy_exists(vhost, name, runas=None)
Return whether the policy exists based on rabbitmqctl list_policies.

Reference: http://www.rabbitmq.com/ha.html

CLI Example:
salt '!' rabbitmq.policy_exists / HA

salt.modules.rabbitmq.reset(runas=None)
Return a RabbitMQ node to its virgin state

CLI Example:
Salt Documentation, Release 3003.3

```python
salt '*' rabbitmq.reset
```

```python
salt.modules.rabbitmq.set_permissions(vhost, user, conf='.*', write='.*', read='.*', runas=None)
```

Sets permissions for vhost via rabbitmqctl set_permissions

CLI Example:

```bash
salt '*' rabbitmq.set_permissions myvhost myuser
```

```python
salt.modules.rabbitmq.set_policy(vhost, name, pattern, definition, priority=None, runas=None, apply_to=None)
```

Set a policy based on rabbitmqctl set_policy.

Reference: http://www.rabbitmq.com/ha.html

CLI Example:

```bash
salt '*' rabbitmq.set_policy / HA '.*' '{"ha-mode":"all"}'
```

```python
salt.modules.rabbitmq.set_upstream(name, uri, prefetch_count=None, reconnect_delay=None, ack_mode=None, trust_user_id=None, exchange=None, max_hops=None, expires=None, message_ttl=None, ha_policy=None, queue=None, runas=None)
```

Configures an upstream via rabbitmqctl set_parameter. This can be an exchange-upstream, a queue-upstream or both.

Parameters

name *(str)* -- The name of the upstream to configure.

The following parameters apply to federated exchanges and federated queues:

Parameters

- uri *(str)* -- The AMQP URI(s) for the upstream.
- prefetch_count *(int)* -- The maximum number of unacknowledged messages copied over a link at any one time. Default: 1000
- reconnect_delay *(int)* -- The duration (in seconds) to wait before reconnecting to the broker after being disconnected. Default: 1
- ack_mode *(str)* -- Determines how the link should acknowledge messages. If set to on-confirm (the default), messages are acknowledged to the upstream broker after they have been confirmed downstream. This handles network errors and broker failures without losing messages, and is the slowest option. If set to on-publish, messages are acknowledged to the upstream broker after they have been published downstream. This handles network errors without losing messages, but may lose messages in the event of broker failures. If set to no-ack, message acknowledgements are not used. This is the fastest option, but may lose messages in the event of network or broker failures.
- trust_user_id *(bool)* -- Determines how federation should interact with the validated user-id feature. If set to true, federation will pass through any validated user-id from the upstream, even though it cannot validate it itself. If set to false or not set, it will clear any validated user-id it encounters. You should only set this to true if you trust the upstream server (and by extension, all its upstreams) not to forge user-ids.

The following parameters apply to federated exchanges only:

Parameters

- exchange *(str)* -- The name of the upstream exchange. Default is to use the same name as the federated exchange.
- max_hops *(int)* -- The maximum number of federation links that a message published to a federated exchange can traverse before it is discarded. Default is 1. Note that even if max-hops is set to a value greater than 1, messages will never visit the same node twice due to travelling in a loop. However, messages may still be dupli-
cated if it is possible for them to travel from the source to the destination via multiple routes.

- **expires (int)** -- The expiry time (in milliseconds) after which an upstream queue for a federated exchange may be deleted, if a connection to the upstream broker is lost. The default is 'none', meaning the queue should never expire. This setting controls how long the upstream queue will last before it is eligible for deletion if the connection is lost. This value is used to set the "x-expires" argument for the upstream queue.

- **message_ttl (int)** -- The expiry time for messages in the upstream queue for a federated exchange (see expires), in milliseconds. Default is None, meaning messages should never expire. This does not apply to federated queues. This value is used to set the "x-message-ttl" argument for the upstream queue.

- **ha_policy (str)** -- Determines the "x-ha-policy" argument for the upstream queue for a federated exchange (see expires). This is only of interest when connecting to old brokers which determine queue HA mode using this argument. Default is None, meaning the queue is not HA.

The following parameter applies to federated queues only:

**Parameters**

- **queue (str)** -- The name of the upstream queue. Default is to use the same name as the federated queue.

- **runas (str)** -- The name of the user to run the command as.

**CLI Example:**

```bash
salt '*' rabbitmq.set_upstream upstream_name ack_mode=on-confirm max_hops=1 trust_user_id=True uri=amqp://hostname
```

New in version 3000.

**salt.modules.rabbitmq.set_user_tags (name, tags, runas=None)**

Add user tags via rabbitmqctl set_user_tags

**CLI Example:**

```bash
salt '*' rabbitmq.set_user_tags myadmin administrator
```

**salt.modules.rabbitmq.start_app (runas=None)**

Start the RabbitMQ application.

**CLI Example:**

```bash
salt '*' rabbitmq.start_app
```

**salt.modules.rabbitmq.status (runas=None)**

return rabbitmq status

**CLI Example:**

```bash
salt '*' rabbitmq.status
```

**salt.modules.rabbitmq.stop_app (runas=None)**

Stops the RabbitMQ application, leaving the Erlang node running.

**CLI Example:**

```bash
salt '*' rabbitmq.stop_app
```

**salt.modules.rabbitmq.upstream_exists (name, runas=None)**

Return whether the upstream exists based on rabbitmqctl list_parameters.

**Parameters**
• **name** (*str*) -- The name of the upstream to check for.
• **runas** (*str*) -- The name of the user to run the command as.

CLI Example:
```
salt '*' rabbitmq.upstream_exists rabbit_upstream
```

New in version 3000.

salt.modules.rabbitmq.user_exists(*name*, runas=None)

Return whether the user exists based on rabbitmqctl list_users.

CLI Example:
```
salt '*' rabbitmq.user_exists rabbit_user
```

salt.modules.rabbitmq.vhost_exists(*name*, runas=None)

Return whether the vhost exists based on rabbitmqctl list_vhosts.

CLI Example:
```
salt '*' rabbitmq.vhost_exists rabbit_host
```

### 23.9.370 salt.modules.rallydev

Support for RallyDev

New in version 2015.8.0.

Requires a **username** and a **password** in `/etc/salt/minion`:

```
rallydev:
    username: myuser@example.com
    password: 123pass
```

salt.modules.rallydev.list_items(*name*)

List items of a particular type

CLI Examples:
```
salt myminion rallydev.list_<item name>s
salt myminion rallydev.list_users
salt myminion rallydev.list_artifacts
```

salt.modules.rallydev.list_users()

List the users

CLI Example:
```
salt myminion rallydev.list_users
```

salt.modules.rallydev.query_item(*name*, query_string, order='Rank')

Query a type of record for one or more items. Requires a valid query string. See [https://rally1.rallydev.com/slm/doc/webservice/introduction.jsp](https://rally1.rallydev.com/slm/doc/webservice/introduction.jsp) for information on query syntax.

CLI Example:
```
salt myminion rallydev.query_<item name> <query string> [order='Rank']
salt myminion rallydev.query_task '(Name contains github)'
salt myminion rallydev.query_task '(Name contains reactor)' Rank
```
salt.modules.rallydev.query_user(query_string, order='UserName')
    Update a user
    CLI Example:
    ```
salt myminion rallydev.query_user '(Name contains Jo)'
    ```

salt.modules.rallydev.show_artifact(id_)
    Show an artifact
    CLI Example:
    ```
salt myminion rallydev.show_artifact <artifact id>
    ```

salt.modules.rallydev.show_item(name, id_)
    Show an item
    CLI Example:
    ```
salt myminion rallydev.show_<item name> <item id>
    ```

salt.modules.rallydev.show_user(id_)
    Show a user
    CLI Example:
    ```
salt myminion rallydev.show_user <user id>
    ```

salt.modules.rallydev.update_item(name, id_, field=None, value=None, postdata=None)
    Update an item. Either a field and a value, or a chunk of POST data, may be used, but not both.
    CLI Example:
    ```
salt myminion rallydev.update_<item name> <item id> field=<field> value=<value>
salt myminion rallydev.update_<item name> <item id> postdata=<post data>
    ```

salt.modules.rallydev.update_user(id_, field, value)
    Update a user
    CLI Example:
    ```
salt myminion rallydev.update_user <user id> <field> <new value>
    ```

23.9.371 salt.modules.random_org

Module for retrieving random information from Random.org
New in version 2015.5.0.

configuration  This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
random_org:
    api_key: 7be1402d-5719-5bd3-a306-3def9f135da5
    api_version: 1
```
salt.modules.random_org.generateBlobs

List all Slack users.

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **format** -- Specifies the format in which the blobs will be returned. Values allowed are base64 and hex.

Returns

The user list.

CLI Example:

```bash
salt '*' get_integers number=5 min=1 max=6
salt '*' get_integers number=5 min=1 max=6
```

salt.modules.random_org.generateDecimalFractions

Generates true random decimal fractions

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- How many random decimal fractions you need. Must be within the [1,1e4] range.
- **decimalPlaces** -- The number of decimal places to use. Must be within the [1,20] range.
- **replacement** -- Specifies whether the random numbers should be picked with replacement. The default (true) will cause the numbers to be picked with replacement, i.e., the resulting numbers may contain duplicate values (like a series of dice rolls). If you want the numbers picked to be unique (like raffle tickets drawn from a container), set this value to false.

Returns

A list of decimal fraction

CLI Example:

```bash
salt '*' random_org.generateDecimalFractions number=10 decimalPlaces=4
salt '*' random_org.generateDecimalFractions number=10 decimalPlaces=4
  replacement=True
```

salt.modules.random_org.generateGaussians

This method generates true random numbers from a Gaussian distribution (also known as a normal distribution).

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- How many random numbers you need. Must be within the [1,1e4] range.
- **mean** -- The distribution’s mean. Must be within the [-1e6,1e6] range.
- **standardDeviation** -- The distribution’s standard deviation. Must be within the [-1e6,1e6] range.
- **significantDigits** -- The number of significant digits to use. Must be within the [2,20] range.

Returns

The user list.

CLI Example:

```bash
salt '*' random_org.generateGaussians number=10 mean=0.0 standardDeviation=1.0
  significantDigits=8
```

salt.modules.random_org.generateIntegers

23.9. execution modules
Generate random integers

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- The number of integers to generate
- **minimum** -- The lower boundary for the range from which the random numbers will be picked. Must be within the [-1e9,1e9] range.
- **maximum** -- The upper boundary for the range from which the random numbers will be picked. Must be within the [-1e9,1e9] range.
- **replacement** -- Specifies whether the random numbers should be picked with replacement. The default (true) will cause the numbers to be picked with replacement, i.e., the resulting numbers may contain duplicate values (like a series of dice rolls). If you want the numbers picked to be unique (like raffle tickets drawn from a container), set this value to false.
- **base** -- Specifies the base that will be used to display the numbers. Values allowed are 2, 8, 10 and 16. This affects the JSON types and formatting of the resulting data as discussed below.

Returns A list of integers.

CLI Example:

```bash
salt '*' random_org.generateIntegers number=5 minimum=1 maximum=6
salt '*' random_org.generateIntegers number=5 minimum=2 maximum=255 base=2
```

**salt.modules.random_org.generateStrings**(api_key=None, api_version=None, **kwargs)

Generate random strings.

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- The number of strings to generate.
- **length** -- The length of each string. Must be within the [1,20] range. All strings will be of the same length.
- **characters** -- A string that contains the set of characters that are allowed to occur in the random strings. The maximum number of characters is 80.
- **replacement** -- Specifies whether the random strings should be picked with replacement. The default (true) will cause the strings to be picked with replacement, i.e., the resulting list of strings may contain duplicates (like a series of dice rolls). If you want the strings to be unique (like raffle tickets drawn from a container), set this value to false.

Returns A list of strings.

CLI Example:

```bash
salt '*' random_org.generateStrings number=5 length=8 characters='abcdefghijklmnopqrstuvwxyz'
salt '*' random_org.generateStrings number=10 length=16 characters='abcdefghijklmnopqrstuvwxyz'
```

**salt.modules.random_org.generateUUIDs**(api_key=None, api_version=None, **kwargs)

Generate a list of random UUIDs

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- How many random UUIDs you need. Must be within the [1,1e3] range.

Returns A list of UUIDs
CLI Example:

```bash
salt '*' random_org.generateUUIDs number=5
```

**salt.modules.random_org.getUsage(api_key=None, api_version=None)**

Show current usages statistics

**Parameters**

- `api_key` -- The Random.org api key.
- `api_version` -- The Random.org api version.

**Returns**

The current usage statistics.

CLI Example:

```bash
salt '*' random_org.getUsage
salt '*' random_org.getUsage api_key=peWcBiMOS9HRZG15peWcBiMOS9HRZG15 api_version=1
```

### 23.9.372  salt.modules.rbac_solaris

Module for Solaris' Role-Based Access Control

**salt.modules.rbac_solaris.auth_add(user, auth)**

Add authorization to user

- `user` [string] username
- `auth` [string] authorization name

CLI Example:

```bash
salt '*' rbac.auth_add martine solaris.zone.manage
salt '*' rbac.auth_add martine solaris.zone.manage,solaris.mail.mailq
```

**salt.modules.rbac_solaris.auth_get(user, computed=True)**

List authorization for user

- `user` [string] username
- `computed` [boolean] merge results from auths command into data from user_attr

CLI Example:

```bash
salt '*' rbac.auth_get leo
```

**salt.modules.rbac_solaris.auth_list()**

List all available authorization

CLI Example:

```bash
salt '*' rbac.auth_list
```

**salt.modules.rbac_solaris.auth_rm(user, auth)**

Remove authorization from user

- `user` [string] username
- `auth` [string] authorization name

CLI Example:

```bash
salt '*' rbac.auth_rm jorge solaris.zone.manage
salt '*' rbac.auth_rm jorge solaris.zone.manage,solaris.mail.mailq
```

**salt.modules.rbac_solaris.profile_add(user, profile)**

Add profile to user
user [string] username
profile [string] profile name

CLI Example:

```
salt '*' rbac.profile_add martine 'Primary Administrator'
salt '*' rbac.profile_add martine 'User Management,User Security'
```

salt.modules.rbac_solaris.profile_get(user, default_hidden=True)
List profiles for user
user [string] username
default_hidden [boolean] hide default profiles

CLI Example:

```
salt '*' rbac.profile_get leo
salt '*' rbac.profile_get leo default_hidden=False
```

salt.modules.rbac_solaris.profile_list(default_only=False)
List all available profiles
default_only [boolean] return only default profile

CLI Example:

```
salt '*' rbac.profile_list
```

salt.modules.rbac_solaris.profile_rm(user, profile)
Remove profile from user
user [string] username
profile [string] profile name

CLI Example:

```
salt '*' rbac.profile_rm jorge 'Primary Administrator'
salt '*' rbac.profile_rm jorge 'User Management,User Security'
```

salt.modules.rbac_solaris.role_add(user, role)
Add role to user
user [string] username
role [string] role name

CLI Example:

```
salt '*' rbac.role_add martine netcfg
salt '*' rbac.role_add martine netcfg,zfssnap
```

salt.modules.rbac_solaris.role_get(user)
List roles for user
user [string] username

CLI Example:

```
salt '*' rbac.role_get leo
```

salt.modules.rbac_solaris.role_list()
List all available roles

CLI Example:

```
salt '*' rbac.role_list
```

salt.modules.rbac_solaris.role_rm(user, role)
Remove role from user
user [string] username
role [string] role name

CLI Example:
salt '*' rbac.role_rm jorge netcfg
salt '*' rbac.role_rm jorge netcfg,zfssnap

23.9.373 salt.modules.rbenv

Manage ruby installations with rbenv. rbenv is supported on Linux and macOS. rbenv doesn’t work on Windows (and isn’t really necessary on Windows as there is no system Ruby on Windows). On Windows, the RubyInstaller and/or Pik are both good alternatives to work with multiple versions of Ruby on the same box.

http://misheska.com/blog/2013/06/15/using-rbenv-to-manage-multiple-versions-of-ruby/

New in version 0.16.0.

dsalt.modules.rbenv.default(ruby=None, runas=None)
  Returns or sets the currently defined default ruby
  ruby The version to set as the default. Should match one of the versions listed by rbenv.versions. Leave blank to return the current default.

CLI Example:
salt '*' rbenv.default
salt '*' rbenv.default 2.0.0-p0

salt.modules.rbenv.do(cmdline, runas=None, env=None)
  Execute a ruby command with rbenv's shims from the user or the system

CLI Example:
salt '*' rbenv.do 'gem list bundler'
salt '*' rbenv.do 'gem list bundler' deploy

salt.modules.rbenv.do_with_ruby(ruby, cmdline, runas=None)
  Execute a ruby command with rbenv's shims using a specific ruby version

CLI Example:
salt '*' rbenv.do_with_ruby 2.0.0-p0 'gem list bundler'
salt '*' rbenv.do_with_ruby 2.0.0-p0 'gem list bundler' runas=deploy

salt.modules.rbenv.install(runas=None, path=None)
  Install rbenv systemwide

CLI Example:
salt '*' rbenv.install

salt.modules.rbenv.install_ruby(ruby, runas=None)
  Install a ruby implementation.
  ruby The version of Ruby to install, should match one of the versions listed by rbenv.list
  runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

Additional environment variables can be configured in pillar / grains / master:
rbenv:
build_env: 'CONFIGURE_OPTS="--no-tcmalloc" CFLAGS="-fno-tree-dce"'

CLI Example:
salt '*' rbenv.install_ruby 2.0.0-p0

salt.modules.rbenv.is_installed(runas=None)
Check if rbenv is installed

CLI Example:
salt '*' rbenv.is_installed

salt.modules.rbenv.list_(runas=None)
List the installable versions of ruby
runas  The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:
salt '*' rbenv.list

salt.modules.rbenv.rehash(runas=None)
Run rbenv rehash to update the installed shims
runas  The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:
salt '*' rbenv.rehash

salt.modules.rbenv.uninstall_ruby(ruby, runas=None)
Uninstall a ruby implementation.
ruby  The version of ruby to uninstall. Should match one of the versions listed by rbenv.versions.
runas  The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:
salt '*' rbenv.uninstall_ruby 2.0.0-p0

salt.modules.rbenv.update(runas=None, path=None)
Updates the current versions of rbenv and ruby-build
runas  The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:
salt '*' rbenv.update

salt.modules.rbenv.versions(runas=None)
List the installed versions of ruby

CLI Example:
salt '*' rbenv.versions
23.9.374 salt.modules.rdp

Manage RDP Service on Windows servers

salt.modules.rdp.disable()
Disable RDP the service on the server

CLI Example:

```
salt '*' rdp.disable
```

salt.modules.rdp.disconnect_session(session_id)
Disconnect a session.

New in version 2016.11.0.

- **Parameters** session_id -- The numeric Id of the session.
- **Returns** A boolean representing whether the disconnect succeeded.

CLI Example:

```
salt '*' rdp.disconnect_session session_id
salt '*' rdp.disconnect_session 99
```

salt.modules.rdp.enable()
Enable RDP the service on the server

CLI Example:

```
salt '*' rdp.enable
```

salt.modules.rdp.get_session(session_id)
Get information about a session.

New in version 2016.11.0.

- **Parameters** session_id -- The numeric Id of the session.
- **Returns** A dictionary of session information.

CLI Example:

```
salt '*' rdp.get_session session_id
salt '*' rdp.get_session 99
```

salt.modules.rdp.list_sessions(logged_in_users_only=False)
List information about the sessions.

New in version 2016.11.0.

- **Parameters** logged_in_users_only -- If True, only return sessions with users logged in.
- **Returns** A list containing dictionaries of session information.

CLI Example:

```
salt '*' rdp.list_sessions
```

salt.modules.rdp.logoff_session(session_id)
Initiate the logoff of a session.

New in version 2016.11.0.

- **Parameters** session_id -- The numeric Id of the session.
- **Returns** A boolean representing whether the logoff succeeded.

CLI Example:
salt '*> rdp.logoff_session session_id
salt '*> rdp.logoff_session 99

salt.modules.rdp.status()
  Show if rdp is enabled on the server
  CLI Example:
  salt '*> rdp.status

23.9.375 salt.modules.rebootmgr module

  maintainer  Alberto Planas <aplanas@suse.com>
  maturity   new
  depends    None
  platform   Linux

  New in version 3004.

salt.modules.rebootmgr.cancel()
  Cancels an already running reboot.
  CLI Example:
  salt microos rebootmgr cancel

cancel

salt.modules.rebootmgr.get_group()
  The currently set lock group for etcd.
  CLI Example:
  salt microos rebootmgr get_group

get_group

salt.modules.rebootmgr.get_strategy()
  The currently used reboot strategy of rebootmgrd will be printed.
  CLI Example:
  salt microos rebootmgr get_strategy

get_strategy

salt.modules.rebootmgr.get_window()
  The currently set maintenance window will be printed.
  CLI Example:
  salt microos rebootmgr get_window

get_window

salt.modules.rebootmgr.is_active()
  Check if the rebootmgrd is running and active or not.
  CLI Example:
  salt microos rebootmgr is_active

is_active

salt.modules.rebootmgr.lock(machine_id=None, group=None)
Lock a machine. If no group is specified, the local default group will be used. If no machine-id is specified, the local machine will be locked.

**machine_id** The machine-id is a network wide, unique ID. Per default the ID from /etc/machine-id is used.

**group** Group name

CLI Example:

```bash
salt microos rebootmgr lock group=group1
```

**salt.modules.rebootmgr.reboot(order=*)**

Tells rebootmgr to schedule a reboot.

With the [now] option, a forced reboot is done, no lock from etcd is requested and a set maintenance window is ignored. With the [fast] option, a lock from etcd is requested if needed, but a defined maintenance window is ignored.

**order** If specified, can be "now" or "fast"

CLI Example:

```bash
salt microos rebootmgr reboot
salt microos rebootmgt reboot order=now
```

**salt.modules.rebootmgr.set_group(group)***

Set the group, to which this machine belongs to get a reboot lock from etcd.

**group** Group name

CLI Example:

```bash
salt microos rebootmgr set_group group=group_1
```

**salt.modules.rebootmgr.set_max(max_locks, group=None)**

Set the maximal number of hosts in a group which are allowed to reboot at the same time.

**number** Maximal number of hosts in a group

**group** Group name

CLI Example:

```bash
salt microos rebootmgr set_max 4
```

**salt.modules.rebootmgr.set_strategy(strategy=None)**

A new strategy to reboot the machine is set and written into /etc/rebootmgr.conf.

**strategy** If specified, must be one of those options:

- **best-effort** - This is the default strategy. If etcd is running, etcd-lock is used. If no etcd is running, but a maintenance window is specified, the strategy will be maint-window. If no maintenance window is specified, the machine is immediately rebooted (instantly).

- **etcd-lock** - A lock at etcd for the specified lock-group will be acquired before reboot. If a maintenance window is specified, the lock is only acquired during this window.

- **maint-window** - Reboot does happen only during a specified maintenance window. If no window is specified, the instantly strategy is followed.

- **instantly** - Other services will be informed that a reboot will happen. Reboot will be done without getting any locks or waiting for a maintenance window.

- **off** - Reboot requests are temporary ignored. /etc/rebootmgr.conf is not modified.

CLI Example:

```bash
salt microos rebootmgr set_strategy strategy=off
```

**salt.modules.rebootmgr.set_window(time, duration)**

Set the maintenance window.

**time** The format of time is the same as described in systemd.time(7).

**duration** The format of duration is "[XXh][YYm]".
CLI Example:
```
salt microos rebootmgr set_window time="Thu,Fri 2020-10-1,11:12:13" duration=1h
```

```
salt.modules.rebootmgr.status()
```

Returns the current status of rebootmgrd.

**Valid returned values are:**

- 0 - No reboot requested
- 1 - Reboot requested
- 2 - Reboot requested, waiting for maintenance window
- 3 - Reboot requested, waiting for etcd lock.

CLI Example:
```
salt microos rebootmgr status
```

```
salt.modules.rebootmgr.unlock(machine_id=None, group=None)
```

Unlock a machine. If no group is specified, the local default group will be used. If no machine-id is specified, the local machine will be locked.

**machine_id**  
The machine-id is a network wide, unique ID. Per default the ID from /etc/machine-id is used.

**group**  
Group name

CLI Example:
```
salt microos rebootmgr unlock group=group1
```

```
salt.modules.rebootmgr.version()
```

Return the version of rebootmgrd

CLI Example:
```
salt microos rebootmgr version
```

### 23.9.376 salt.modules.redis

Module to provide redis functionality to Salt

New in version 2014.7.0.

**configuration**  
This module requires the redis python module and uses the following defaults which may be overridden in the minion configuration:

```
redis.host: 'salt'
redis.port: 6379
redis.db: 0
redis.password: None
```

```
salt.modules.redismod.bgrewriteaof(host=None, port=None, db=None, password=None)
```

Asynchronously rewrite the append-only file

CLI Example:
```
salt '*' redis.bgrewriteaof
```

```
salt.modules.redismod.bgsave(host=None, port=None, db=None, password=None)
```

Asynchronously save the dataset to disk

CLI Example:
```
salt '*' redis.bgsave
```
salt.modules.redismod.config_get(pattern='*', host=None, port=None, db=None, password=None)
Get redis server configuration values

CLI Example:

```plaintext
salt '*' redis.config_get
salt '*' redis.config_get port
```

salt.modules.redismod.config_set(name, value, host=None, port=None, db=None, password=None)
Set redis server configuration values

CLI Example:

```plaintext
salt '*' redis.config_set masterauth luv_kittens
```

salt.modules.redismod.dbsize(host=None, port=None, db=None, password=None)
Return the number of keys in the selected database

CLI Example:

```plaintext
salt '*' redis.dbsize
```

salt.modules.redismod.delete(\*keys, **connection_args)
Deletes the keys from redis, returns number of keys deleted

CLI Example:

```plaintext
salt '*' redis.delete foo
```

salt.modules.redismod.exists(key, host=None, port=None, db=None, password=None)
Return true if the key exists in redis

CLI Example:

```plaintext
salt '*' redis.exists foo
```

salt.modules.redismod.expire(key, seconds, host=None, port=None, db=None, password=None)
Set a keys time to live in seconds

CLI Example:

```plaintext
salt '*' redis.expire foo 300
```

salt.modules.redismod.expireat(key, timestamp, host=None, port=None, db=None, password=None)
Set a keys expire at given UNIX time

CLI Example:

```plaintext
salt '*' redis.expireat foo 1400000000
```

salt.modules.redismod.flushall(host=None, port=None, db=None, password=None)
Remove all keys from all databases

CLI Example:

```plaintext
salt '*' redis.flushall
```
salt.modules.redismod.flushdb(host=None, port=None, db=None, password=None)
Remove all keys from the selected database

CLI Example:
```
salt '*' redis.flushdb
```

salt.modules.redismod.get_key(key, host=None, port=None, db=None, password=None)
Get redis key value

CLI Example:
```
salt '*' redis.get_key foo
```

salt.modules.redismod.get_master_ip(host=None, port=None, password=None)
Get host information about slave
New in version 2016.3.0.

CLI Example:
```
salt '*' redis.get_master_ip
```

salt.modules.redismod.hdel(key, *fields, **options)
Delete one of more hash fields.
New in version 2017.7.0.

CLI Example:
```
salt '*' redis.hdel foo_hash bar_field1 bar_field2
```

salt.modules.redismod.hexists(key, field, host=None, port=None, db=None, password=None)
Determine if a hash fields exists.
New in version 2017.7.0.

CLI Example:
```
salt '*' redis.hexists foo_hash bar_field
```

salt.modules.redismod.hget(key, field, host=None, port=None, db=None, password=None)
Get specific field value from a redis hash, returns dict

CLI Example:
```
salt '*' redis.hget foo_hash bar_field
```

salt.modules.redismod.hgetall(key, host=None, port=None, db=None, password=None)
Get all fields and values from a redis hash, returns dict

CLI Example:
```
salt '*' redis.hgetall foo_hash
```

salt.modules.redismod.hincrby(key, field, increment=1, host=None, port=None, db=None, password=None)
Increment the integer value of a hash field by the given number.
New in version 2017.7.0.

CLI Example:
salt 'x' redis.hincrby foo_hash bar_field 5

**salt.modules.redismod.hincrbyfloat**

```
key, field, increment=1.0, host=None, port=None, db=None,
password=None)
```

Increment the float value of a hash field by the given number.

New in version 2017.7.0.

CLI Example:

```
salt 'x' redis.hincrbyfloat foo_hash bar_field 5.17
```

**salt.modules.redismod.hlen**

```
key, host=None, port=None, db=None, password=None)
```

Returns number of fields of a hash.

New in version 2017.7.0.

CLI Example:

```
salt 'x' redis.hlen foo_hash
```

**salt.modules.redismod.hmget**

```
key, *fields, **options)
```

Returns the values of all the given hash fields.

New in version 2017.7.0.

CLI Example:

```
salt 'x' redis.hmget foo_hash bar_field1 bar_field2
```

**salt.modules.redismod.hmset**

```
key, **fieldsvals)
```

Sets multiple hash fields to multiple values.

New in version 2017.7.0.

CLI Example:

```
salt 'x' redis.hmset foo_hash bar_field1=bar_value1 bar_field2=bar_value2
```

**salt.modules.redismod.hscan**

```
key, cursor=0, match=None, count=None, host=None, port=None,
db=None, password=None)
```

Incrementally iterate hash fields and associated values.

New in version 2017.7.0.

CLI Example:

```
salt 'x' redis.hscan foo_hash match='field_prefix_*' count=1
```

**salt.modules.redismod.hset**

```
key, field, value, host=None, port=None, db=None, password=None)
```

Set the value of a hash field.

New in version 2017.7.0.

CLI Example:

```
salt 'x' redis.hset foo_hash bar_field bar_value
```

**salt.modules.redismod.hsetnx**

```
key, field, value, host=None, port=None, db=None, password=None)
```

Set the value of a hash field only if the field does not exist.

New in version 2017.7.0.
CLI Example:
```
salt '*' redis.hsetnx foo_hash bar_field bar_value
```

```
salt.modules.redismod.hvals(key, host=None, port=None, db=None, password=None)
```
Return all the values in a hash.
New in version 2017.7.0.
CLI Example:
```
salt '*' redis.hvals foo_hash bar_field1 bar_value1
```

```
salt.modules.redismod.info(host=None, port=None, db=None, password=None)
```
Get information and statistics about the server
CLI Example:
```
salt '*' redis.info
```

```
salt.modules.redismod.key_type(key, host=None, port=None, db=None, password=None)
```
Get redis key type
CLI Example:
```
salt '*' redis.type foo
```

```
salt.modules.redismod.keys(pattern='*', host=None, port=None, db=None, password=None)
```
Get redis keys, supports glob style patterns
CLI Example:
```
salt '*' redis.keys
salt '*' redis.keys test*
```

```
salt.modules.redismod.lastsave(host=None, port=None, db=None, password=None)
```
Get the UNIX time in seconds of the last successful save to disk
CLI Example:
```
salt '*' redis.lastsave
```

```
salt.modules.redismod.llen(key, host=None, port=None, db=None, password=None)
```
Get the length of a list in Redis
CLI Example:
```
salt '*' redis.llen foo_list
```

```
salt.modules.redismod.lrange(key, start, stop, host=None, port=None, db=None, password=None)
```
Get a range of values from a list in Redis
CLI Example:
```
salt '*' redis.lrange foo_list 0 10
```

```
salt.modules.redismod.ping(host=None, port=None, db=None, password=None)
```
Ping the server, returns False on connection errors
CLI Example:
salt 'salt' redis.ping

```
salt.modules.redismod.save(host=None, port=None, db=None, password=None)
Synchronously save the dataset to disk
```

CLI Example:

```
salt 'salt' redis.save
```

salt.modules.redismod.sentinel_get_master_ip(master, host=None, port=None, password=None)
Get ip for sentinel master
New in version 2016.3.0.

CLI Example:

```
salt 'salt' redis.sentinel_get_master_ip 'mymaster'
```

salt.modules.redismod.set_key(key, value, host=None, port=None, db=None, password=None)
Set redis key value

CLI Example:

```
salt 'salt' redis.set_key foo bar
```

salt.modules.redismod.shutdown(host=None, port=None, db=None, password=None)
Synchronously save the dataset to disk and then shut down the server

CLI Example:

```
salt 'salt' redis.shutdown
```

salt.modules.redismod.slaveof(master_host=None, master_port=None, host=None, port=None, db=None, password=None)
Make the server a slave of another instance, or promote it as master

CLI Example:

```
# Become slave of redis-n01.example.com:6379
salt 'salt' redis.slaveof redis-n01.example.com:6379
salt 'salt' redis.slaveof redis-n01.example.com
# Become master
salt 'salt' redis.slaveof
```

salt.modules.redismod.smembers(key, host=None, port=None, db=None, password=None)
Get members in a Redis set

CLI Example:

```
salt 'salt' redis.smembers foo_set
```

salt.modules.redismod.time(host=None, port=None, db=None, password=None)
Return the current server UNIX time in seconds

CLI Example:

```
salt 'salt' redis.time
```

23.9. execution modules
salt.modules.redismod.zcard(key, host=None, port=None, db=None, password=None)
Get the length of a sorted set in Redis

CLI Example:
```
salt '*' redis.zcard foo_sorted
```

salt.modules.redismod.zrange(key, start, stop, host=None, port=None, db=None, password=None)
Get a range of values from a sorted set in Redis by index

CLI Example:
```
salt '*' redis.zrange foo_sorted 0 10
```

23.9.377  salt.modules.reg

Manage the Windows registry

Hives

Hives are the main sections of the registry and all begin with the word HKEY.

- HKEY_LOCAL_MACHINE
- HKEY_CURRENT_USER
- HKEY_USER

Keys

Keys are the folders in the registry. Keys can have many nested subkeys. Keys can have a value assigned to them under the (Default)

When passing a key on the CLI it must be quoted correctly depending on the backslashes being used (\ vs \\\\). The following are valid methods of passing the key on the CLI:

Using single backslashes: "SOFTWARE\Python" 'SOFTWARE\Python' (will not work on a Windows Master)
Using double backslashes: SOFTWARE\Python

Values or Entries

Values or Entries are the name/data pairs beneath the keys and subkeys. All keys have a default name/data pair. The name is (Default) with a displayed value of (value not set). The actual value is Null.
Example

The following example is an export from the Windows startup portion of the registry:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Run]
"RTHDVCPL"=""C:\\Program Files\\Realtek\\Audio\\HDA\\RtkNGUI64.exe" -s"
"NvBackend"=""C:\\Program Files (x86)\\NVIDIA Corporation\\Update Core\\NvBackend.\n"exe"
"BTMTrayAgent"="rundll32.exe "C:\\Program Files (x86)\\Intel\\Bluetooth\\btmshellex.\n.dll",TrayApp"
```

In this example these are the values for each:

**Hive:** HKEY_LOCAL_MACHINE

**Key and subkeys:** SOFTWARE\\Microsoft\\Windows\\CurrentVersion\\Run

**Value:**

- There are 3 value names:
  - RTHDVCPL
  - NvBackend
  - BTMTrayAgent

- Each value name has a corresponding value

**depends**

- salt.utils.win_reg

salt.modules.reg.broadcast_change()

Refresh the windows environment.

---

**Note:** This will only effect new processes and windows. Services will not see the change until the system restarts.

**Returns** True if successful, otherwise False

**Return type** bool

**CLI Example:**

```
salt '*' reg.broadcast_change
```

salt.modules.reg.delete_key_recursive(hive, key, use_32bit_registry=False)

New in version 2015.5.4.

Delete a registry key to include all subkeys and value/data pairs.

**Parameters**

- **hive (str)** -- The name of the hive. Can be one of the following
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC

- **key (str):** The key to remove (looks like a path)

- **use_32bit_registry (bool):** Deletes the 32bit portion of the registry on 64bit installations.
  
On 32bit machines this is ignored.

**Returns**
A dictionary listing the keys that deleted successfully as well as those that failed to delete.

Return type `dict`

CLI Example:
The following example will remove `delete_me` and all its subkeys from the SOFTWARE key in HKEY_LOCAL_MACHINE:

```
salt '*' reg.delete_key_recursive HKLM SOFTWARE\delete_me
```

```
salt.modules.reg.delete_value(hive, key, vname=None, use_32bit_registry=False)
```

Delete a registry value entry or the default value for a key.

**Parameters**

- `hive (str)` -- The name of the hive. Can be one of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- `key (str)` -- The key (looks like a path) to the value name.
- `vname (str)` -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be deleted.
- `use_32bit_registry (bool)` -- Deletes the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

**Returns**

True if successful, otherwise False

**Return type** `bool`

CLI Example:

```
salt '*' reg.delete_value HKEY_CURRENT_USER \SOFTWARE\Salt\version
```

```
salt.modules.reg.import_file(source, use_32bit_registry=False)
```

Import registry settings from a Windows REG file by invoking REG.EXE.

New in version 2018.3.0.

**Parameters**

- `source (str)` -- The full path of the REG file. This can be either a local file path or a URL type supported by salt (e.g. salt://salt_master_path)
- `use_32bit_registry (bool)` -- If the value of this parameter is True then the REG file will be imported into the Windows 32 bit registry. Otherwise the Windows 64 bit registry will be used.

**Returns**

True if successful, otherwise an error is raised

**Return type** `bool`

**Raises**

- `ValueError` -- If the value of source is an invalid path or otherwise causes cp.cache_file to return False
- `CommandExecutionError` -- If reg.exe exits with a non-0 exit code

CLI Example:

```
salt machine1 reg.import_file salt://win/printer_config/110_Canon/postinstall_config.reg
```

```
salt.modules.reg.key_exists(hive, key, use_32bit_registry=False)
```

Check that the key is found in the registry. This refers to keys and not value/data pairs.

**Parameters**

- `hive (str)` -- The hive to connect to
- `key (str)` -- The key to check
• **use_32bit_registry**(bool) -- Look in the 32bit portion of the registry

**Returns**  True if exists, otherwise False

**Return type**  bool

CLI Example:

```bash
salt '*' reg.key_exists HKLM SOFTWARE\Microsoft
```

**salt.modules.reg.list_keys**(hive, key=None, use_32bit_registry=False)

Enumerates the subkeys in a registry key or hive.

**Parameters**

- **hive**(str) -- The name of the hive. Can be one of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC

- **key**(str) -- The key (looks like a path) to the value name. If a key is not passed, the keys under the hive will be returned.

- **use_32bit_registry**(bool) -- Accesses the 32bit portion of the registry on 64 bit installations. On 32bit machines this is ignored.

**Returns**  A list of keys/subkeys under the hive or key.

**Return type**  list

CLI Example:

```bash
salt '*' reg.list_keys HKLM 'SOFTWARE'
```

**salt.modules.reg.list_values**(hive, key=None, use_32bit_registry=False)

Enumerates the values in a registry key or hive.

**Note:** The (Default) value will only be returned if it is set, otherwise it will not be returned in the list of values.

**Parameters**

- **hive**(str) -- The name of the hive. Can be one of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC

- **key**(str) -- The key (looks like a path) to the value name. If a key is not passed, the values under the hive will be returned.

- **use_32bit_registry**(bool) -- Accesses the 32bit portion of the registry on 64 bit installations. On 32bit machines this is ignored.

**Returns**  A list of values under the hive or key.

**Return type**  list

CLI Example:

```bash
salt '*' reg.list_values HKLM 'SYSTEM\CurrentControlSet\Services\Tcpip'
```

**salt.modules.reg.read_value**(hive, key, vname=None, use_32bit_registry=False)

Reads a registry value entry or the default value for a key. To read the default value, don’t pass vname

**Parameters**
- **hive (str)** -- The name of the hive. Can be one of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- **key (str)** -- The key (looks like a path) to the value name.
- **vname (str)** -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be returned.
- **use_32bit_registry (bool)** -- Accesses the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

**Returns**

A dictionary containing the passed settings as well as the value_data if successful. If unsuccessful, sets success to False.

bool: Returns False if the key is not found

If vname is not passed:
- Returns the first unnamed value (Default) as a string.
- Returns none if first unnamed value is empty.

**Return type** dict

CLl Example:
The following will get the value of the version value name in the HKEY_LOCAL_MACHINE\SOFTWARE\Salt key

```
salt '*' reg.read_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version'
```

CLI Example:
The following will get the default value of the HKEY_LOCAL_MACHINE\SOFTWARE\Salt key

```
salt '*' reg.read_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt'
```

**salt.modules.reg.set_value**

Sets a value in the registry. If vname is passed, it will be the value for that value name, otherwise it will be the default value for the specified key.

**Parameters**

- **hive (str)** -- The name of the hive. Can be one of the following
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- **key (str)** -- The key (looks like a path) to the value name.
- **vname (str)** -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be set.
- **vdata (str, int, list, bytes)** -- The value you'd like to set. If a value name (vname) is passed, this will be the data for that value name. If not, this will be the (Default) value for the key.

The type of data this parameter expects is determined by the value type specified in vtype. The correspondence is as follows:
- REG_BINARY: Binary data (str in Py2, bytes in Py3)
- REG_DWORD: int
- REG_EXPAND_SZ: str
- REG_MULTI_SZ: list of str
- REG_QWORD: int
- REG_SZ: str

**Note:** When setting REG_BINARY, string data will be converted to binary.

**Note:** The type for the (Default) value is always REG_SZ and cannot be changed.

**Note:** This parameter is optional. If `vdata` is not passed, the Key will be created with no associated item/value pairs.

- `vtype` (str) -- The value type. The possible values of the vtype parameter are indicated above in the description of the vdata parameter.
- `use_32bit_registry` (bool) -- Sets the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.
- `volatile` (bool) -- When this parameter has a value of True, the registry key will be made volatile (i.e. it will not persist beyond a system reset or shutdown). This parameter only has an effect when a key is being created and at no other time.

**Returns** True if successful, otherwise False

**Return type** bool

**CLI Example:**
This will set the version value to 2015.5.2 in the SOFTWARESalt key in the HKEY_LOCAL_MACHINE hive

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version' →'2015.5.2'
```

**CLI Example:**
This function is strict about the type of vdata. For instance this example will fail because vtype has a value of REG_SZ and vdata has a type of int (as opposed to str as expected).

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'str_data' 1.2
```

**CLI Example:**
In this next example vdata is properly quoted and should succeed.

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'str_data' vtype=REG_SZ vdata="'1.2'"
```

**CLI Example:**
This is an example of using vtype REG_BINARY.

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'bin_data' vtype=REG_BINARY vdata='Salty Data'
```

**CLI Example:**
An example of using vtype REG_MULTI_SZ is as follows:

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'list_data' vtype=REG_MULTI_SZ vdata=['"Salt", "is", "great"]
```

salt.modules.reg.value_exists(hive, key, vname, use_32bit_registry=False)
Check that the value/data pair is found in the registry.

23.9. execution modules 2637
New in version 3000.

Parameters

- **hive** *(str)* -- The hive to connect to
- **key** *(str)* -- The key to check in
- **vname** *(str)* -- The name of the value/data pair you're checking
- **use_32bit_registry** *(bool)* -- Look in the 32bit portion of the registry

Returns True if exists, otherwise False

Return type `bool`

CLI Example:
```
salt '*' reg.value_exists HKLM SOFTWARE\Microsoft\Windows\CurrentVersion\CommonFilesDir
```

23.9.378 **salt.modules.rest_pkg**

Package support for the REST example

```python
salt.modules.rest_pkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)
salt.modules.rest_pkg.installed(name, version=None, refresh=False, fromrepo=None, skip_verify=False, pkgs=None, sources=None, **kwargs)
salt.modules.rest_pkg.list_pkgs(versions_as_list=False, **kwargs)
salt.modules.rest_pkg.remove(name=None, pkgs=None, **kwargs)
salt.modules.rest_pkg.upgrade(refresh=True, skip_verify=True, **kwargs)
salt.modules.rest_pkg.version(*names, **kwargs)
```

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:
```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

23.9.379 **salt.modules.rest_sample_utils**

Utility functions for the rest_sample

```python
salt.modules.rest_sample_utils.fix_outage()
    "Fix" the outage
    CLI Example:
    salt 'rest-sample-proxy' rest_sample.fix_outage

salt.modules.rest_sample_utils.get_test_string()
    Helper function to test cross-calling to the __proxy__ dunder.
    CLI Example:
    salt 'rest-sample-proxy' rest_sample.get_test_string
```
23.9.380  salt.modules.rest_service

Provide the service module for the proxy-minion REST sample

```
salt.modules.rest_service.enabled(name, sig=None)
```

Only the 'redbull' service is 'enabled' in the test

```
salt.modules.rest_service.get_all()
```

Return a list of all available services

New in version 2015.8.0.

CLI Example:

```
salt '*' service.get_all
```

```
salt.modules.rest_service.list_()
```

Return a list of all available services.

CLI Example:

```
salt '*' service.list
```

```
salt.modules.rest_service.restart(name, sig=None)
```

Restart the specified service with rest_sample

New in version 2015.8.0.

CLI Example:

```
salt '*' service.restart <service name>
```

```
salt.modules.rest_service.running(name, sig=None)
```

Return whether this service is running.

New in version 2015.8.0.

```
salt.modules.rest_service.start(name, sig=None)
```

Start the specified service on the rest_sample

New in version 2015.8.0.

CLI Example:

```
salt '*' service.start <service name>
```

```
salt.modules.rest_service.status(name, sig=None)
```

Return the status for a service via rest_sample. If the name contains globbing, a dict mapping service name to True/False values is returned.

New in version 2015.8.0.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Parameters

- **name** (*str*) -- The name of the service to check
- **sig** (*str*) -- Not implemented

Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise

23.9.  execution modules
**Return type** bool

CLI Example:

```
salt '*' service.status <service name>
```

```
salt.modules.rest_service.stop(name, sig=None)
```

Stop the specified service on the rest_sample

New in version 2015.8.0.

CLI Example:

```
salt '*' service.stop <service name>
```

### 23.9.381 salt.modules.restartcheck

checkrestart functionality for Debian and Red Hat Based systems

Identifies services (processes) that are linked against deleted files (for example after downloading an updated binary of a shared library).

Based on checkrestart script from debian-goodies (written by Matt Zimmerman for the Debian GNU/Linux distribution, https://packages.debian.org/debian-goodies) and psdel by Sam Morris.

**codeauthor** Jiri Kotlin <jiri.kotlin@ultimum.io>

```
salt.modules.restartcheck.restartcheck(  
    ignorelist=None, blacklist=None, excludepid=None, **kwargs)
```

Analyzes files openeded by running processes and seeks for packages which need to be restarted.

**Parameters**

- `ignorelist` -- string or list of packages to be ignored.
- `blacklist` -- string or list of file paths to be ignored.
- `excludepid` -- string or list of process IDs to be ignored.
- `verbose` -- boolean, enables extensive output.
- `timeout` -- int, timeout in minute.

**Returns**

```json
{ 'result': False, 'comment': '<reason>' }
```

String with checkrestart output if some package seems to need to be restarted or if no packages need restarting.

**Return type** Dict on error

New in version 2015.8.3.

CLI Example:

```
salt '*' restartcheck.restartcheck
```

### 23.9.382 salt.modules.ret

Module to integrate with the returner system and retrieve data sent to a salt returner

```
salt.modules.ret.get_fun(returner, fun)
```

Return info about last time fun was called on each minion

CLI Example:

```
salt '*' ret.get_fun mysql network.interfaces
```

```
salt.modules.ret.get_jid(returner, jid)
```

Return the information for a specified job id
CLI Example:

```
salt '*' ret.get_jid redis 20421104181954700505
```

`salt.modules.ret.get_jids(returner)`  
Return a list of all job ids  

CLI Example:

```
salt '*' ret.get_jids mysql
```

`salt.modules.ret.get_minions(returner)`  
Return a list of all minions  

CLI Example:

```
salt '*' ret.get_minions mysql
```

### 23.9.383 `salt.modules.rh_ip`

The networking module for RHEL/Fedora based distros

`salt.modules.rh_ip.apply_network_settings(**settings)`  
Apply global network configuration.  

CLI Example:

```
salt '*' ip.apply_network_settings
```

`salt.modules.rh_ip.build_interface(iface, iface_type, enabled, **settings)`  
Build an interface script for a network interface.  

CLI Example:

```
salt '*' ip.build_interface eth0 eth <settings>
```

`salt.modules.rh_ip.build_network_settings(**settings)`  
Build the global network script.  

CLI Example:

```
salt '*' ip.build_network_settings <settings>
```

`salt.modules.rh_ip.build_routes(iface, **settings)`  
Build a route script for a network interface.  

CLI Example:

```
salt '*' ip.build_routes eth0 <settings>
```

`salt.modules.rh_ip.down(iface, iface_type)`  
Shutdown a network interface  

CLI Example:

```
salt '*' ip.down eth0
```
salt.modules.rh_ip.get_interface(iface)
   Return the contents of an interface script
   
   CLI Example:
   
   salt '*' ip.get_interface eth0

salt.modules.rh_ip.get_network_settings()
   Return the contents of the global network script.
   
   CLI Example:
   
   salt '*' ip.get_network_settings

salt.modules.rh_ip.get_routes(iface)
   Return the contents of the interface routes script.
   
   CLI Example:
   
   salt '*' ip.get_routes eth0

salt.modules.rh_ip.up(iface, iface_type)
   Start up a network interface
   
   CLI Example:
   
   salt '*' ip.up eth0

23.9.384 salt.modules.rh_service

Service support for RHEL-based systems, including support for both upstart and sysvinit

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a
different module (or gives an error similar to 'service.start' is not available), see here.

salt.modules.rh_service.available(name, limit='')
   Return True if the named service is available. Use the limit param to restrict results to services of that type.
   
   CLI Examples:
   
   salt '*' service.available sshd
   salt '*' service.available sshd limit=upstart
   salt '*' service.available sshd limit=sysvinit

salt.modules.rh_service.delete(name, **kwargs)
   Delete the named service
   
   New in version 2016.3.
   
   CLI Example:
   
   salt '*' service.delete <service name>

salt.modules.rh_service.disable(name, **kwargs)
   Disable the named service to start at boot
   
   CLI Example:
salt '*' service.disable <service name>

salt.modules.rh_service.disabled(name)
    Check to see if the named service is disabled to start on boot
    CLI Example:
    
    salt '*' service.disabled <service name>

salt.modules.rh_service.enable(name,**kwargs)
    Enable the named service to start at boot
    CLI Example:
    
    salt '*' service.enable <service name>

salt.modules.rh_service.enabled(name,**kwargs)
    Check to see if the named service is enabled to start on boot
    CLI Example:
    
    salt '*' service.enabled <service name>

salt.modules.rh_service.get_all(limit='')
    Return all installed services. Use the limit param to restrict results to services of that type.
    CLI Example:
    
    salt '*' service.get_all
    salt '*' service.get_all limit=upstart
    salt '*' service.get_all limit=sysvinit

salt.modules.rh_service.get_disabled(limit='')
    Return the disabled services. Use the limit param to restrict results to services of that type.
    CLI Example:
    
    salt '*' service.get_disabled
    salt '*' service.get_disabled limit=upstart
    salt '*' service.get_disabled limit=sysvinit

salt.modules.rh_service.get_enabled(limit='')
    Return the enabled services. Use the limit param to restrict results to services of that type.
    CLI Example:
    
    salt '*' service.get_enabled
    salt '*' service.get_enabled limit=upstart
    salt '*' service.get_enabled limit=sysvinit

salt.modules.rh_service.missing(name, limit='')
    The inverse of service.available. Return True if the named service is not available. Use the limit param to restrict results to services of that type.
    CLI Examples:
    
    salt '*' service.missing sshd
    salt '*' service.missing sshd limit=upstart
    salt '*' service.missing sshd limit=sysvinit
salt.modules.rh_service.reload_(name)
Reload the named service

CLI Example:
salt '*' service.reload <service name>

salt.modules.rh_service.restart(name)
Restart the named service

CLI Example:
salt '*' service.restart <service name>

salt.modules.rh_service.start(name)
Start the specified service

CLI Example:
salt '*' service.start <service name>

salt.modules.rh_service.status(name, sig=None)
Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Parameters
- name (str) -- The name of the service to check
- sig (str) -- Signature to use to find the service via ps

Returns
- True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type bool

CLI Example:
salt '*' service.status <service name> [service signature]

salt.modules.rh_service.stop(name)
Stop the specified service

CLI Example:
salt '*' service.stop <service name>

23.9.385 salt.modules.riak

Riak Salt Module

salt.modules.riak.cluster_commit()
Commit Cluster Changes

Changed in version 2015.8.0.

CLI Example:
salt '*' riak.cluster_commit

salt.modules.riak.cluster_join(username, hostname)
Join a Riak cluster
Changed in version 2015.8.0.

**CLI Example:**

```bash
salt '*' riak.cluster_join <user> <host>
```

username - The riak username to join the cluster
hostname - The riak hostname you are connecting to

**salt.modules.riak.cluster_leave(username, hostname)**

Leave a Riak cluster

New in version 2015.8.0.

**CLI Example:**

```bash
salt '*' riak.cluster_leave <username> <host>
```

username - The riak username to join the cluster
hostname - The riak hostname you are connecting to

**salt.modules.riak.cluster_plan()**

Review Cluster Plan

Changed in version 2015.8.0.

**CLI Example:**

```bash
salt '*' riak.cluster_plan
```

**salt.modules.riak.member_status()**

Get cluster member status

Changed in version 2015.8.0.

**CLI Example:**

```bash
salt '*' riak.member_status
```

**salt.modules.riak.services()**

List available services on a node

New in version 2015.8.0.

**CLI Example:**

```bash
salt '*' riak.services
```

**salt.modules.riak.start()**

Start Riak

**CLI Example:**

```bash
salt '*' riak.start
```

**salt.modules.riak.status()**

Current node status

New in version 2015.8.0.

**CLI Example:**

```bash
salt '*' riak.status
```
salt.modules.riak.stop()

Stop Riak

Changed in version 2015.8.0.

CLI Example:
```
salt '*' riak.stop
```

salt.modules.riak.test()

Runs a test of a few standard Riak operations

New in version 2015.8.0.

CLI Example:
```
salt '*' riak.test
```

23.9.386 salt.modules.rpm_lowpkg

Support for rpm

salt.modules.rpm_lowpkg.bin_pkg_info(path, saltenv='base')

New in version 2015.8.0.

Parses RPM metadata and returns a dictionary of information about the package (name, version, etc.).

- **path** Path to the file. Can either be an absolute path to a file on the minion, or a salt fileserver URL (e.g. `salt://path/to/file.rpm`). If a salt fileserver URL is passed, the file will be cached to the minion so that it can be examined.

- **saltenv** [base] Salt fileserver environment from which to retrieve the package. Ignored if `path` is a local file path on the minion.

CLI Example:
```
salt '*' lowpkg.bin_pkg_info /root/salt-2015.5.1-2.el7.noarch.rpm
salt '*' lowpkg.bin_pkg_info salt://salt-2015.5.1-2.el7.noarch.rpm
```

salt.modules.rpm_lowpkg.checksum(*paths, **kwargs)

Return if the signature of a RPM file is valid.

- **root** use root as top level directory (default: "/")

CLI Example:
```
salt '*' lowpkg.checksum /path/to/package1.rpm
salt '*' lowpkg.checksum /path/to/package1.rpm /path/to/package2.rpm
```

salt.modules.rpm_lowpkg.diff(package_path, path)

Return a formatted diff between current file and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

- **Parameters**
  - **package** -- Full pack of the RPM file
  - **path** -- Full path to the installed file

- **Returns** Difference or empty string. For binary files only a notification.

CLI Example:
```
salt '*' lowpkg.diff /path/to/apache2.rpm /etc/apache2/httpd.conf
```
salt.modules.rpm_lowpkg.file_dict(*packages, **kwargs)
List the files that belong to a package, sorted by group. Not specifying any packages will return a list of _every_ file on the system's rpm database (not generally recommended).
root use root as top level directory (default: "/")
CLI Examples:

```
salt '*' lowpkg.file_dict httpd
salt '*' lowpkg.file_dict httpd postfix
salt '*' lowpkg.file_dict
```

salt.modules.rpm_lowpkg.file_list(*packages, **kwargs)
List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's rpm database (not generally recommended).
root use root as top level directory (default: "/")
CLI Examples:

```
salt '*' lowpkg.file_list httpd
salt '*' lowpkg.file_list httpd postfix
salt '*' lowpkg.file_list
```

salt.modules.rpm_lowpkg.info(*packages, **kwargs)
Return a detailed package(s) summary information. If no packages specified, all packages will be returned.

Parameters
- packages --
- attr -- Comma-separated package attributes. If no 'attr' is specified, all available attributes returned.
  Valid attributes are: version, vendor, release, build_date, build_date_time_t, install_date, install_date_time_t, build_host, group, source_rpm, arch, epoch, size, license, signature, packager, url, summary, description.
- all_versions -- Return information for all installed versions of the packages
- root -- use root as top level directory (default: "/")

Returns

CLI Example:

```
salt '*' lowpkg.info apache2 bash
salt '*' lowpkg.info apache2 bash attr=version
salt '*' lowpkg.info apache2 bash attr=version,build_date_iso,size
salt '*' lowpkg.info apache2 bash attr=version,build_date_iso,size all_versions=True
```

salt.modules.rpm_lowpkg.list_pkgs(*packages, **kwargs)
List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

root use root as top level directory (default: "/")

CLI Example:

```
salt '*' lowpkg.list_pkgs
```

salt.modules.rpm_lowpkg.modified(*packages, **flags)
List the modified files that belong to a package. Not specifying any packages will return a list of _all_ modified files on the system's RPM database.

New in version 2015.5.0.
root use root as top level directory (default: "/")
CLI Examples:

```
salt '*' lowpkg.modified httpd
salt '*' lowpkg.modified httpd postfix
salt '*' lowpkg.modified
```

`salt.modules.rpm_lowpkg.owner(paths, **kwargs)`

Return the name of the package that owns the file. Multiple file paths can be passed. If a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

`root` use root as top level directory (default: "/")

CLI Examples:

```
salt '*' lowpkg.owner /usr/bin/apachectl
salt '*' lowpkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

`salt.modules.rpm_lowpkg.verify(packages, **kwargs)`

Runs an rpm -Va on a system, and returns the results in a dict

`root` use root as top level directory (default: "/")

Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the `ignore_types` keyword argument

CLI Example:

```
salt '*' lowpkg.verify
salt '*' lowpkg.verify httpd
salt '*' lowpkg.verify httpd postfix
salt '*' lowpkg.verify httpd postfix ignore_types=['config', 'doc']
```

`salt.modules.rpm_lowpkg.version_cmp(ver1, ver2, ignore_epoch=False)`

New in version 2015.8.9.

Do a cmp-style comparison on two packages. Return -1 if ver1 < ver2, 0 if ver1 == ver2, and 1 if ver1 > ver2. Return None if there was a problem making the comparison.

`ignore_epoch` [False] Set to True to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

#### 23.9.387 salt.modules.rpmbuild_pkgbuild

RPM Package builder system

New in version 2015.8.0.

This system allows for all of the components to build rpms safely in chrooted environments. This also provides a function to generate yum repositories

This module implements the pkgbuild interface

`salt.modules.rpmbuild_pkgbuild.build(runas, tgt, dest_dir, spec, sources, deps, env, template, saltenv='base', log_dir='/var/log/salt/pkgbuild')`

Given the package destination directory, the spec file source and package sources, use mock to safely build the rpm defined in the spec file
CLI Example:

```
salt '*' pkgbuild.build mock epel-7-x86_64 /var/www/html
  https://raw.githubusercontent.com/saltstack/libnacl/master/pkg/rpm/
  → python-libnacl.spec
  https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

This example command should build the libnacl package for rhel 7 using user mock and place it in /var/www/html/ on the minion

```
salt.modules.rpmbuild_pkgbuild.make_repo(repodir, keyid=None, env=None, use_passphrase=False, gnupghome='/etc/salt/gpgkeys', runas='root', timeout=15.0)
```

Make a package repository and optionally sign packages present

Given the repodir, create a yum repository out of the rpms therein and optionally sign it and packages present, the name is directory to turn into a repo. This state is best used with onchanges linked to your package building states.

**repodir** The directory to find packages that will be in the repository.

**keyid** Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with keyid which have been loaded into the minion's Pillar data.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```
gpg_pkg_priv_key: |
  -----BEGIN PGP PRIVATE KEY BLOCK-----
  Version: GnuPG v1
  lQo+bFCiIFQBcADAPCtzz7I5RL3escCMZsPzaEKWe7bIX1em4KCKkB0x47IG54b
  w82PCE8Y1jf/9Uk2m3RKVwp3YcIb74qj6V04ysvVz28UbnhPxsIk0f2c48qc
  .
  Ebe+83CQTwqSXPRTZxMy/b5WXDeM79CkLWvuGpXFor76D+ECM6pv/rawukEcNpnt
  RN5OmgHqvydEn04pWbn8JZQ09Y/XUsO5MHBVzLC8ei5ZIoPZalvX
  =JvW8
  -----END PGP PRIVATE KEY BLOCK-----

gpg_pkg_priv_keyname: gpg_pkg_key.pem

gpg_pkg_pub_key: |
  -----BEGIN PGP PUBLIC KEY BLOCK-----
  Version: GnuPG v1
  mQENBFCiIFQBcADAPCtzz7I5RL3escCMZsPzaEKWe7bIX1em4KCKkB0x47IG54b
  w82PCE8Y1jf/9Uk2m3RKVwp3YcIb74qj6V04ysvVz28UbnhPxsIk0f2c48qc
  .
  .
  bY7t5iwJmQzRMfYInYRt77wkJBPcPjC9FPNebL9vlZcN4zv0KQta+4alcWivvoP
  40Ixe/+tC6QRw2m2dHk6aAeq/J0Sc7lZuFwNA71hF9SzRwFXMsLx4iLki
  inNqW9c=
  =s1CX
  -----END PGP PUBLIC KEY BLOCK-----

gpg_pkg_pub_keyname: gpg_pkg_key.pub
```

**env** Changed in version 2016.3.0.
A dictionary of environment variables to be utilized in creating the repository.

**Note:** This parameter is not used for making *yum* repositories.

**use_passphrase** [False] New in version 2016.3.0.

Use a passphrase with the signing key presented in *keyid*. Passphrase is received from Pillar data which could be passed on the command line with *pillar* parameter.

```python
pillar = '{ "gpg_passphrase" : "my_passphrase" }'
```

New in version 3001.1.

RHEL 8 and above leverages gpg-agent and gpg-preset-passphrase for caching keys, etc.

**gnupghome** [/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with *keyid*.

**runas** [root] New in version 2016.3.0.

User to create the repository as, and optionally sign packages.

**Note:** Ensure the user has correct permissions to any files and directories which are to be utilized.

**timeout** [15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

CLI Example:

```
salt '*' pkgbuild.make_repo /var/www/html/
```

salt.modules.rpmbuild_pkgbuild.make_src_pkg(*dest_dir*, *spec*, *sources*, *env=None*, *template=None*, *saltenv='base'*, *runas='root'*)

Create a source rpm from the given spec file and sources

CLI Example:

```
https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

This example command should build the libnacl SOURCE package and place it in `/var/www/html/` on the minion.

Changed in version 2017.7.0.

**dest_dir** The directory on the minion to place the built package(s)

**spec** The location of the spec file (used for rpms)

**sources** The list of package sources

**env** A dictionary of environment variables to be set prior to execution.

**template** Run the spec file through a templating engine Optional argument, allows for no templating engine used to be if none is desired.

**saltenv** The saltenv to use for files downloaded from the salt filesever

**runas** The user to run the build process as

**Note:** using SHA256 as digest and minimum level dist el6
23.9.388  salt.modules.rsync

Wrapper for rsync

New in version 2014.1.0.

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

salt.modules.rsync.config(conf_path='/etc/rsyncd.conf')

Changed in version 2016.3.0: Return data now contains just the contents of the rsyncd.conf as a string, instead of a dictionary as returned from cmd.run_all.

Returns the contents of the rsync config file

conf_path [/etc/rsyncd.conf] Path to the config file

CLI Example:

```
salt '*' rsync.config
```

salt.modules.rsync.rsync(src, dst, delete=False, force=False, update=False, passwordfile=None, exclude=None, excludefrom=None, dryrun=False, rsh=None, additional_opts=None, saltenv='base')

Changed in version 2016.3.0: Return data now contains just the output of the rsync command, instead of a dictionary as returned from cmd.run_all.

Rsync files from src to dst

src The source location where files will be rsynced from.
dst The destination location where files will be rsynced to.
delete [False] Whether to enable the rsync --delete flag, which will delete extraneous files from dest dirs
force [False] Whether to enable the rsync --force flag, which will force deletion of dirs even if not empty.
update [False] Whether to enable the rsync --update flag, which forces rsync to skip any files which exist on the destination and have a modified time that is newer than the source file.
passwordfile A file that contains a password for accessing an rsync daemon. The file should contain just the password.
exclude Whether to enable the rsync --exclude flag, which will exclude files matching a PATTERN.
excludefrom Whether to enable the rsync --excludefrom flag, which will read exclude patterns from a file.
dryrun [False] Whether to enable the rsync --dry-run flag, which will perform a trial run with no changes made.
rsh Whether to enable the rsync --rsh flag, to specify the remote shell to use.
additional_opts Any additional rsync options, should be specified as a list.
saltenv Specify a salt fileserver environment to be used.

CLI Example:

```
salt '*' rsync.rsync /path/to/src /path/to/dest delete=True update=True
->passwordfile=/etc/pass.crt exclude=exclude/dir
salt '*' rsync.rsync /path/to/src delete=True excludefrom=/xx.ini
salt '*' rsync.rsync /path/to/src delete=True exclude='[exclude1/dir,exclude2/dir]
  --additional_opts=["--partial", "--bwlimit=5000"]'
```

salt.modules.rsync.version()

Changed in version 2016.3.0: Return data now contains just the version number as a string, instead of a dictionary as returned from cmd.run_all.

Returns rsync version

CLI Example:

```
salt '*' rsync.version
```
23.9.389 salt.modules.runit

runit service module (http://smarden.org/runit)

This module is compatible with the service states, so it can be used to maintain services using the provider argument:

```
myservice:
  service:
    - running
    - provider: runit
```

Provides virtual service module on systems using runit as init.

Service management rules (sv command):

- service $n is ENABLED if file SERVICE_DIR/$n/run exists
- service $n is AVAILABLE if ENABLED or if file AVAIL_SVR_DIR/$n/run exists
- service $n is DISABLED if AVAILABLE but not ENABLED

SERVICE_DIR/$n is normally a symlink to a AVAIL_SVR_DIR/$n folder

Service auto-start/stop mechanism:

- sv (auto)starts/stop service as soon as SERVICE_DIR/<service> is created/deleted, both on service creation or a boot time.
- autostart feature is disabled if file SERVICE_DIR/<n>/down exists. This does not affect the current's service status (if already running) nor manual service management.

Service's alias:

Service sva is an alias of service svc when AVAIL_SVR_DIR/sva symlinks to folder AVAIL_SVR_DIR/svc.
svc can't be enabled if it is already enabled through an alias already enabled, since sv files are stored in folder SERVICE_DIR/svc/.

XBPS package management uses a service's alias to provides service alternative(s), such as chrony and openntpd both aliased to ntpd.

salt.modules.runit.add_svc_avail_path(path)
Add a path that may contain available services. Return True if added (or already present), False on error.

* CLI Example:
salt '*' runit.available <service name>

salt.modules.runit.available(name)
Returns True if the specified service is available, otherwise returns False.

name the service's name

* CLI Example:
salt '*' runit.available <service name>

salt.modules.runit.disable(name, stop=False, **kwargs)
Don't start service name at boot Returns True if operation is successful

name the service's name
stop if True, also stops the service

* CLI Example:
salt '*' service.disable <name> [stop=True]

salt.modules.runit.disabled(name)
Return True if the named service is disabled, False otherwise

name the service's name

* CLI Example:
salt 'x' service.disabled <service name>

```
salt.modules.runit.enable(name, start=False, **kwargs)
    Start service name at boot. Returns True if operation is successful
    name  the service's name
    start [False] If True, start the service once enabled.
    CLI Example:
    salt 'x' service.enable <name> [start=True]
```

```
salt.modules.runit.enabled(name)
    Return True if the named service is enabled, False otherwise
    name  the service's name
    CLI Example:
    salt 'x' service.enabled <service name>
```

```
salt.modules.runit.full_restart(name)
    Calls runit.restart()
    name  the service's name
    CLI Example:
    salt 'x' runit.full_restart <service name>
```

```
salt.modules.runit.get_all()
    Return a list of all available services
    CLI Example:
    salt 'x' runit.get_all
```

```
salt.modules.runit.get_disabled()
    Return a list of all disabled services
    CLI Example:
    salt 'x' service.get_disabled
```

```
salt.modules.runit.get_enabled()
    Return a list of all enabled services
    CLI Example:
    salt 'x' service.get_enabled
```

```
salt.modules.runit.get_svc_alias()
    Returns the list of service's name that are aliased and their alias path(s)
```

```
salt.modules.runit.get_svc_avail_path()
    Return list of paths that may contain available services
```

```
salt.modules.runit.get_svc_broken_path(name='*')
    Return list of broken path(s) in SERVICE_DIR that match name
    A path is broken if it is a broken symlink or can not be a runit service
    name  a glob for service name. default is "*"
    CLI Example:
```

23.9. execution modules
salt '*' runit.get_svc_broken_path <service name>

salt.modules.runit.missing(name)
The inverse of runit.available. Returns True if the specified service is not available, otherwise returns False. name the service's name
CLI Example:
salt '*' runit.missing <service name>

salt.modules.runit.reload_(name)
Reload service name the service's name
CLI Example:
salt '*' runit.reload <service name>

salt.modules.runit.remove(name)
Remove the service <name> from system. Returns True if operation is successful. The service will be also stopped. name the service's name
CLI Example:
salt '*' service.remove <name>

salt.modules.runit.restart(name)
Restart service name the service's name
CLI Example:
salt '*' runit.restart <service name>

salt.modules.runit.show(name)
Show properties of one or more units/jobs or the manager name the service's name
CLI Example:
salt '*' service.show <service name>

salt.modules.runit.start(name)
Start service name the service's name
CLI Example:
salt '*' runit.start <service name>

salt.modules.runit.status(name, sig=None)
Return True if service is running name the service's name sig signature to identify with ps
CLI Example:
salt '*' runit.status <service name>

salt.modules.runit.status_autostart(name)
Return True if service <name> is autostarted by sv (file $service_folder/down does not exist) NB: return False if the service is not enabled.
name the service's name
CLI Example:

```
salt '*' runit.status_autostart <service name>
```

salt.modules.runit.stop(name)
Stop service
name the service's name
CLI Example:

```
salt '*' runit.stop <service name>
```

### 23.9.390 salt.modules.rvm

Manage ruby installations and gemsets with RVM, the Ruby Version Manager.

salt.modules.rvm.do(ruby, command, runas=None, cwd=None, env=None)
Execute a command in an RVM controlled environment.
  ruby Which ruby to use
  command The rvm command to execute
  runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
  cwd The directory from which to run the rvm command. Defaults to the user's home directory.
CLI Example:

```
salt '*' rvm.do 2.0.0 <command>
```

salt.modules.rvm.gemset_copy(source, destination, runas=None)
Copy all gems from one gemset to another.
  source The name of the gemset to copy, complete with ruby version
  destination The destination gemset
  runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
CLI Example:

```
salt '*' rvm.gemset_copy foobar bazquo
```

salt.modules.rvm.gemset_create(ruby, gemset, runas=None)
Creates a gemset.
  ruby The ruby version for which to create the gemset
  gemset The name of the gemset to create
  runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
CLI Example:

```
salt '*' rvm.gemset_create 2.0.0 foobar
```

salt.modules.rvm.gemset_delete(ruby, gemset, runas=None)
Delete a gemset
  ruby The ruby version to which the gemset belongs
  gemset The gemset to delete
  runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
CLI Example:
salt ' '*' rvm.gemset_delete 2.0.0 foobar

salt.modules.rvm.gemset_empty(ruby, gemset, runas=None)
Remove all gems from a gemset.
ruby The ruby version to which the gemset belongs
gemset The gemset to empty
runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

salt ' '*' rvm.gemset_empty 2.0.0 foobar

salt.modules.rvm.gemset_list(ruby='default', runas=None)
List all gemsets for the given ruby.
ruby [default] The ruby version for which to list the gemsets
runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

salt ' '*' rvm.gemset_list

salt.modules.rvm.gemset_list_all(runas=None)
List all gemsets for all installed rubies.

Note that you must have set a default ruby before this can work.
runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

salt ' '*' rvm.gemset_list_all

salt.modules.rvm.get(version='stable', runas=None)
Update RVM
version [stable] Which version of RVM to install, (e.g. stable or head)

CLI Example:

salt ' '*' rvm.get

salt.modules.rvm.install(runas=None)
Install RVM system-wide
runas The user under which to run the rvm installer script. If not specified, then it be run as the user under which Salt is running.

CLI Example:

salt ' '*' rvm.install

salt.modules.rvm.install_ruby(ruby, runas=None, opts=None, env=None)
Install a ruby implementation.
ruby The version of ruby to install
runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
env Environment to set for the install command. Useful for exporting compilation flags such as RUBY_CONFIGURE_OPTS
opts List of options to pass to the RVM installer (ie -C, --patch, etc)

CLI Example:
salt '*' rvm.install_ruby 1.9.3-p385

salt.modules.rvm.is_installed(runas=None)
Check if RVM is installed.
CLI Example:
salt '*' rvm.is_installed

salt.modules.rvm.list_(runas=None)
List all rvm-installed rubies
runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
CLI Example:
salt '*' rvm.list

salt.modules.rvm.reinstall_ruby(ruby, runas=None, env=None)
Reinstall a ruby implementation
ruby The version of ruby to reinstall
runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
CLI Example:
salt '*' rvm.reinstall_ruby 1.9.3-p385

salt.modules.rvm.rubygems(ruby, version, runas=None)
Installs a specific rubygems version in the given ruby
ruby The ruby for which to install rubygems
version The version of rubygems to install, or 'remove' to use the version that ships with 1.9
runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
CLI Example:
salt '*' rvm.rubygems 2.0.0 1.8.24

salt.modules.rvm.set_default(ruby, runas=None)
Set the default ruby
ruby The version of ruby to make the default
runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
CLI Example:
salt '*' rvm.set_default 2.0.0

salt.modules.rvm.wrapper(ruby_string, wrapper_prefix, runas=None, *binaries)
Install RVM wrapper scripts
ruby_string Ruby/gemset to install wrappers for
wrapper_prefix What to prepend to the name of the generated wrapper binaries
runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
binaries [None] The names of the binaries to create wrappers for. When nothing is given, wrappers for ruby, gem, rake, irb, rdoc, ri and testrb are generated.
CLI Example:
23.9.391 salt.modules.s3

Connection module for Amazon S3

**configuration** This module accepts explicit s3 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```yaml
s3.keyid: GKTADJGHEIQSXMKKRBJ08H
s3.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

**Warning:** This is literally the pillar key `s3.keyid` or the config option `s3.keyid`, not:

```yaml
s3:
  keyid: blah
```

A `service_url` may also be specified in the configuration:

```yaml
s3.service_url: s3.amazonaws.com
```

A `role_arn` may also be specified in the configuration:

```yaml
s3.role_arn: arn:aws:iam::111111111111:role/my-role-to-assume
```

If a `service_url` is not specified, the default is `s3.amazonaws.com`. This may appear in various documentation as an "endpoint". A comprehensive list for Amazon S3 may be found at:

http://docs.aws.amazon.com/general/latest/gr/rande.html#s3_region

The `service_url` will form the basis for the final endpoint that is used to query the service.

Path style can be enabled:

```yaml
s3.path_style: True
```

This can be useful if you need to use Salt with a proxy for a S3 compatible storage.

You can use either HTTPS protocol or HTTP protocol:

```yaml
s3.https_enable: True
```

SSL verification may also be turned off in the configuration:

```yaml
s3.verify_ssl: False
```

This is required if using S3 bucket names that contain a period, as these will not match Amazon's S3 wildcard certificates. Certificate verification is enabled by default.

AWS region may be specified in the configuration:
**s3.location**: eu-central-1

Default is us-east-1.

This module should be usable to query other S3-like services, such as Eucalyptus.

**depends** requests

```python
salt.modules.s3.delete(bucket, path=None, action=None, key=None, keyid=None, service_url=None,
                      verify_ssl=None, kms_keyid=None, location=None, role_arn=None,
                      path_style=None, https_enable=None)
```

Delete a bucket, or delete an object from a bucket.

CLI Example to delete a bucket:

```
salt myminion s3.delete mybucket
```

CLI Example to delete an object from a bucket:

```
salt myminion s3.delete mybucket remoteobject
```

```python
salt.modules.s3.get(bucket='', path='', return_bin=False, action=None, local_file=None,
                    key=None, keyid=None, service_url=None, verify_ssl=None, kms_keyid=None,
                    location=None, role_arn=None, path_style=None, https_enable=None)
```

List the contents of a bucket, or return an object from a bucket. Set return_bin to True in order to retrieve an object wholesale. Otherwise, Salt will attempt to parse an XML response.

CLI Example to list buckets:

```
salt myminion s3.get
```

CLI Example to list the contents of a bucket:

```
salt myminion s3.get mybucket
```

CLI Example to return the binary contents of an object:

```
salt myminion s3.get mybucket myfile.png return_bin=True
```

CLI Example to save the binary contents of an object to a local file:

```
salt myminion s3.get mybucket myfile.png local_file=/tmp/myfile.png
```

It is also possible to perform an action on a bucket. Currently, S3 supports the following actions:

- acl
- cors
- lifecycle
- policy
- location
- logging
- notification
- tagging
- versions
- requestPayment
- versioning
- website

To perform an action on a bucket:

```
salt myminion s3.get mybucket myfile.png action=acl
```

```python
salt.modules.s3.head(bucket='', path='', key=None, keyid=None, service_url=None, verify_ssl=None,
                     kms_keyid=None, location=None, role_arn=None, path_style=None,
                     https_enable=None)
```

Return the metadata for a bucket, or an object in a bucket.

CLI Examples:
```
salt myminion s3.head mybucket
salt myminion s3.head mybucket myfile.png
```

```python
salt.modules.s3.put(bucket, path=None, return_bin=False, action=None, local_file=None, key=None, keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None, role_arn=None, path_style=None, https_enable=None)
```

Create a new bucket, or upload an object to a bucket.

CLI Example to create a bucket:
```
salt myminion s3.put mybucket
```

CLI Example to upload an object to a bucket:
```
salt myminion s3.put mybucket remotepath local_file=/path/to/file
```

### 23.9.392 `salt.modules.s6`

**s6 service module**

This module is compatible with the `service` states, so it can be used to maintain services using the `provider` argument:

```yaml
myservice:
  service:
    - running
    - provider: s6
```

Note that the `enabled` argument is not available with this provider.

**codeauthor** Marek Skrobakci <skrobul@skrobul.com>

```python
salt.modules.s6.available(name)
```

Returns `True` if the specified service is available, otherwise returns `False`.

CLI Example:
```
salt '*' s6.available foo
```

```python
salt.modules.s6.full_restart(name)
```

Calls `s6.restart()` function

CLI Example:
```
salt '*' s6.full_restart <service name>
```

```python
salt.modules.s6.get_all()
```

Return a list of all available services

CLI Example:
```
salt '*' s6.get_all
```

```python
salt.modules.s6.missing(name)
```

The inverse of `s6.available`. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:
```
salt '*' s6.missing foo
```
salt.modules.s6.reload(name)
Send a HUP to service via s6

    CLI Example:
    
    ```
    salt '*' s6.reload <service name>
    ```

salt.modules.s6.restart(name)
Restart service via s6. This will stop/start service

    CLI Example:
    
    ```
    salt '*' s6.restart <service name>
    ```

salt.modules.s6.start(name)
Starts service via s6

    CLI Example:
    
    ```
    salt '*' s6.start <service name>
    ```

salt.modules.s6.status(name, sig=None)
Return the status for a service via s6, return pid if running

    CLI Example:
    
    ```
    salt '*' s6.status <service name>
    ```

salt.modules.s6.stop(name)
Stops service via s6

    CLI Example:
    
    ```
    salt '*' s6.stop <service name>
    ```

salt.modules.s6.term(name)
Send a TERM to service via s6

    CLI Example:
    
    ```
    salt '*' s6.term <service name>
    ```

23.9.393 salt.modules.salt_proxy

Salt proxy module

New in version 2015.8.3.

Module to deploy and manage salt-proxy processes on a minion.

salt.modules.salt_proxy.configure_proxy(proxyname, start=True)
Create the salt proxy file and start the proxy process if required

    Parameters
    
    - proxynama -- Name to be used for this proxy (should match entries in pillar)
    - start -- Boolean indicating if the process should be started default = True

    CLI Example:
    
    ```
    salt deviceminion salt_proxy.configure_proxy p8000
    ```

23.9. execution modules
salt.modules.salt_proxy.is_running(proxyname)
Check if the salt-proxy process associated with this proxy (name) is running.

Returns True if the process is running False otherwise

Parameters proxyname -- String name of the proxy (p8000 for example)

CLI Example:

```
salt deviceminion salt_proxy.is_running p8000
```

23.9.394 salt.modules.salt_version

Access Salt’s elemental release code-names.
New in version 3000.

Salt’s feature release schedule is based on the Periodic Table, as described in the Version Numbers documentation.

When a feature was added (or removed) in a specific release, it can be difficult to build out future-proof functionality that is dependent on a naming scheme that moves.

For example, a state syntax needs to change to support an option that will be removed in the future, but there are many Minion versions in use across an infrastructure. It would be handy to use some Jinja syntax to check for these instances to perform one state syntax over another.

A simple example might be something like the following:

```{}
{% # a boolean check #}
{% set option_deprecated = salt['salt_version.less_than']('3001') %}
{% if option_deprecated %}
<use old syntax>
{% else %}
<use new syntax>
{% endif %}
```
salt 'system' salt_version.greater_than 'Oxygen'

salt.modules.salt_version.less_than(name)

    Returns a boolean (True) if the minion's current version code name is less than the named version.
    
    name  The release code name to check the version against.
    
    CLI Example:

```
salt 'system' salt_version.less_than 'Oxygen'
```

### 23.9.395 salt.modules.saltcheck

A module for testing the logic of states and highstates on salt minions

**codeauthor**  William Cannon <william.cannon@gmail.com>

**maturity**  new

Saltcheck provides unittest like functionality requiring only the knowledge of salt module execution and yaml. Saltcheck uses salt modules to return data, then runs an assertion against that return. This allows for testing with all the features included in salt modules.

In order to run state and highstate saltcheck tests, a sub-folder in the state directory must be created and named `saltcheck-tests`. Tests for a state should be created in files ending in `.tst` and placed in the `saltcheck-tests` folder. tst files are run through the salt rendering system, enabling tests to be written in yaml (or renderer of choice), and include jinja, as well as the usual grain and pillar information. Like states, multiple tests can be specified in a tst file. Multiple tst files can be created in the `saltcheck-tests` folder, and should be named the same as the associated state. The id of a test works in the same manner as in salt state files and should be unique and descriptive.

New in version 3000: The `saltcheck-tests` folder can be customized using the `saltcheck_test_location` minion configuration setting. This setting is a relative path from the formula's `salt://` path to the test files.

### Usage

**Example Default file system layout:**

```
/srv/salt/apache/
init.sls
config.sls
saltcheck-tests/
init.tst
config.tst
deployment_validation.tst
```

**Alternative example file system layout with custom saltcheck_test_location:**

```
Minion configuration:

```plaintext
saltcheck_test_location: tests/integration/saltcheck
```

Filesystem layout:

```plaintext
/srv/salt/apache/
   init.sls
   config.sls
   tests/integration/saltcheck/
      init.tst
      config.tst
      deployment_validation.tst
```

Tests can be run for each state by name, for all apache/saltcheck/*.tst files, or for all states assigned to the minion in top.sls. Tests may also be created with no associated state. These tests will be run through the use of `saltcheck.run_state_tests`, but will not be automatically run by `saltcheck.run_highstate_tests`.

```plaintext
salt '*' saltcheck.run_state_tests apache,apache.config
salt '*' saltcheck.run_state_tests apache check_all=True
salt '*' saltcheck.run_highstate_tests
salt '*' saltcheck.run_state_tests apache.deployment_validation
```

Saltcheck Keywords

- **module_and_function**: (str) This is the salt module which will be run locally, the same as `salt-call --local <module>`. The `saltcheck.state_apply` module name is special as it bypasses the local option in order to resolve state names when run in a master/minion environment.

- **args**: (list) Optional arguments passed to the salt module

- **kwargs**: (dict) Optional keyword arguments to be passed to the salt module

- **assertion**: (str) One of the supported assertions and required except for `saltcheck.state_apply` Tests which fail the assertion and expected_return, cause saltcheck to exit which a non-zero exit code.

- **expected_return**: (str) Required except by `assertEmpty`, `assertNotEmpty`, `assertTrue`, `assertFalse`. The return of `module_and_function` is compared to this value in the assertion.

- **assertion_section**: (str) Optional keyword used to parse the module_and_function return. If a salt module returns a dictionary as a result, the `assertion_section` value is used to lookup a specific value in that return for the assertion comparison.

- **assertion_section_delimiter**: (str) Optional delimiter to use when splitting a nested structure. Defaults to `:`

- **print_result**: (bool) Optional keyword to show results in the `assertEqual`, `assertNotEqual`, `assertIn`, and `assertNotIn` output. Defaults to True.

- **output_details**: (bool) Optional keyword to display `module_and_function`, `args`, `assertion_section`, and assertion results text in the output. If `print_result` is False, assertion results will be hidden. This is a per test setting, but can be set globally for all tests by adding `saltcheck_output_details: True` in the minion configuration file. Defaults to False

- **pillar_data**: (dict) Optional keyword for passing in pillar data. Intended for use in potential test setup or teardown with the `saltcheck.state_apply` function.
skip: (bool) Optional keyword to skip running the individual test

New in version 3000: Multiple assertions can be run against the output of a single module_and_function call. The assertion, expected_return, assertion_section, and assertion_section_delimiter keys can be placed in a list under an assertions key. See the multiple assertions example below.

Sample Cases/Examples

Basic Example

```python
echo_test_hello:
    module_and_function: test.echo
    args:  
        - "hello"
    kwargs:  
        assertion: assertEqual
        expected_return: 'hello'
```

Example with jinja

```jinja
{% for package in ['apache2', 'openssh'] %}
{% # or another example #}
{% # for package in salt['pillar.get']('packages') #}
test_{{ package }}_latest:
    module_and_function: pkg.upgrade_available
    args:  
        - {{ package }}
    assertion: assertFalse
{% endfor %}
```

Example with setup state including pillar

```python
setup_test_environment:
    module_and_function: saltcheck.state_apply
    args:  
        - common
    pillar_data:  
        data: value

verify_vim:
    module_and_function: pkg.version
    args:  
        - vim
    assertion: assertNotEmpty
```
Example with jinja

```{% for package in ["apache2", "openssh"] %}
[# or another example #]
[# for package in salt['pillar.get']("packages") #]
test_{% for package %}_latest:
  module_and_function: pkg.upgrade_available
  args:
    - {{ package }}
  assertion: assertFalse
{% endfor %}
```

Example with setup state including pillar

```setup_test_environment:
  module_and_function: saltcheck.state_apply
  args:
    - common
  pillar-data:
    data: value

verify_vim:
  module_and_function: pkg.version
  args:
    - vim
  assertion: assertNotEmpty```

Example with skip

```package_latest:
  module_and_function: pkg.upgrade_available
  args:
    - apache2
  assertion: assertFalse
  skip: True```

Example with assertion_section

```validate_shell:
  module_and_function: user.info
  args:
    - root
  assertion: assertEqual
  expected_return: /bin/bash
  assertion_section: shell```
Example with a nested assertion_section

```python
validate_smb_signing:
    module_and_function: lgpo.get
    args:
        - 'Machine'
    kwargs:
        return_full_policy_names: True
    assertion: assertEqual
    expected_return: Enabled
    assertion_section: 'Computer Configuration\Microsoft network client: Digitally sign\ncommunications (always)'
    assertion_section_delimiter: '|' |
```

Example suppressing print results

```python
validate_env_nameNode:
    module_and_function: hadoop.dfs
    args:
        - text
        - /oozie/common/env.properties
    expected_return: nameNode = hdfs://nameservice2
    assertion: assertNotIn
    print_result: False
```

Example with multiple assertions and output_details

```python
multiple_validations:
    module_and_function: network.netstat
    assertions:
        - assertion: assertEqual
          assertion_section: '0:program'
          expected_return: "systemd-resolve"
        - assertion: assertEqual
          assertion_section: '0:proto'
          expected_return: "udp"
    output_details: True
```

Supported assertions

- assertEqual
- assertNotEqual
- assertTrue
- assertFalse
- assertIn
- assertNotIn
- assertGreater
Salt Documentation, Release 3003.3

- assertGreaterEqual
- assertLess
- assertLessEqual
- assertEmpty
- assertNotEmpty

**Warning:** The saltcheck.state_apply function is an alias for state.apply. If using the ACL system saltcheck.* might provide more capability than intended if only saltcheck.run_state_tests and saltcheck.run_highstate_tests are needed.

class salt.modules.saltcheck.SaltCheck(saltenv='base')
This class validates and runs the saltchecks

run_test(test_dict)
Run a single saltcheck test

class salt.modules.saltcheck.StateTestLoader(saltenv='base')
Class loads in test files for a state e.g. state_dir/saltcheck-tests/[1.tst, 2.tst, 3.tst]

add_test_files_for_sls(sls_name, check_all=False)
Detects states used, caches needed files, and adds to test list

load_test_suite()
Load tests either from one file, or a set of files

salt.modules.saltcheck.parallel_scheck(data)
triggers salt-call in parallel

class salt.modules.saltcheck.report_highstate_tests(saltenv=None)
Report on tests for states assigned to the minion through highstate. Quits with the exit code for the number of missing tests.

CLI Example:

```
salt '*' saltcheck.report_highstate_tests
```

New in version 3000.

class salt.modules.saltcheck.run_highstate_tests(saltenv=None, only_fails=False)
Execute all tests for states assigned to the minion through highstate and return results

Parameters
- saltenv (str) -- optional saltenv.Defaults to base
- only_fails (bool) -- boolean to only print failure results

CLI Example:

```
salt '*' saltcheck.run_highstate_tests
```

salt.modules.saltcheck.run_state_tests(state, saltenv=None, check_all=False, only_fails=False)
Execute tests for a salt state and return results Nested states will also be tested

Parameters
- state (str) -- state name for which to run associated .tst test files
- saltenv (str) -- optional saltenv. Defaults to base
- check_all (bool) -- boolean to run all tests in state/saltcheck-tests directory
- only_fails (bool) -- boolean to only print failure results
Tests will be run in parallel by adding "saltcheck_parallel: True" in minion config. When enabled, saltcheck will use up to the number of cores detected. This can be limited by setting the "saltcheck_processes" value to an integer to set the maximum number of parallel processes.

CLI Example:
```
salt '*' saltcheck.run_state_tests postfix,common
```

```
salt.modules.saltcheck.run_state_tests_ssh(state, saltenv=None, check_all=False, only_fails=False)
```

This function is an alias of run_state_tests. Execute tests for a salt state and return results. Nested states will also be tested.

- **param str state**: state name for which to run associated .tst test files
- **param str saltenv**: optional saltenv. Defaults to base
- **param bool check_all**: boolean to run all tests in state/saltcheck-tests directory
- **param bool only_fails**: boolean to only print failure results

CLI Example:
```
salt '*' saltcheck.run_state_tests postfix,common
```

Tests will be run in parallel by adding "saltcheck_parallel: True" in minion config. When enabled, saltcheck will use up to the number of cores detected. This can be limited by setting the "saltcheck_processes" value to an integer to set the maximum number of parallel processes.

```
salt.modules.saltcheck.run_test(**kwargs)
```

Execute one saltcheck test and return result.

**Parameters**

- **arg test (keyword)** --

CLI Example:
```
salt '*' saltcheck.run_test
    test='{"module_and_function": "test.echo", "assertion": "assertEqual", "expected_return": "This works!", "args":["This works!"] }'
```

```
salt.modules.saltcheck.state_apply(state_name, **kwargs)
```

Runs state.apply with given options to set up test data. Intended to be used for optional test setup or teardown.

Reference the state.apply module documentation for arguments and usage options.

CLI Example:
```
salt '*' saltcheck.state_apply postfix
```

### 23.9.396 salt.modules.saltcloudmod

Control a salt cloud system.

```
salt.modules.saltcloudmod.create(name, profile)
```

Create the named vm.

CLI Example:
```
salt <minion-id> saltcloud.create webserver rackspace_centos_512
```
23.9.397 salt.modules.saltutil

The Saltutil module is used to manage the state of the salt minion itself. It is used to manage minion modules as well as automate updates to the salt minion.

depends

- esky Python module for update functionality

salt.modules.saltutil.clear_cache()

Forcibly removes all caches on a minion.

New in version 2014.7.0.

WARNING: The safest way to clear a minion cache is by first stopping the minion and then deleting the cache files before restarting it.

CLI Example:

```
salt '*' saltutil.clear_cache
```

salt.modules.saltutil.clear_job_cache(hours=24)

Forcibly removes job cache folders and files on a minion.

New in version 2018.3.0.

WARNING: The safest way to clear a minion cache is by first stopping the minion and then deleting the cache files before restarting it.

CLI Example:

```
salt '*' saltutil.clear_job_cache hours=12
```

salt.modules.saltutil.cmd(tgt, fun, arg=(), timeout=None, tgt_type='glob', ret='', kwarg=None, ssh=False, **kwargs)

Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.

Assuming this minion is a master, execute a salt command

CLI Example:

```
salt '*' saltutil.cmd
```

salt.modules.saltutil.cmd_iter(tgt, fun, arg=(), timeout=None, tgt_type='glob', ret='', kwarg=None, ssh=False, **kwargs)

Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.

Assuming this minion is a master, execute a salt command

CLI Example:

```
salt '*' saltutil.cmd_iter
```

salt.modules.saltutil.find_cached_job(jid)

Return the data for a specific cached job id. Note this only works if cache_jobs has previously been set to True on the minion.

CLI Example:
salt '!' saltutil.find_cached_job <job id>

**salt.modules.saltutil.find_job(jid)**
Return the data for a specific job id that is currently running.

- **jid**: The job id to search for and return data.

CLI Example:
```
salt '!' saltutil.find_job <job id>
```

Note that the find_job function only returns job information when the job is still running. If the job is currently running, the output looks something like this:
```
# salt my-minion saltutil.find_job 20160503150049487736
my-minion:  
    ----------
    arg:  
        - 30
    fun:  
        test.sleep
    jid:  
        20160503150049487736
    pid:  
        9601
    ret:  
        my-minion
    tgt:  
        my-minion
    tgt_type:  
        glob
    user:  
        root
```

If the job has already completed, the job cannot be found and therefore the function returns an empty dictionary, which looks like this on the CLI:
```
# salt my-minion saltutil.find_job 20160503150049487736
my-minion:  
```

**salt.modules.saltutil.is_running(fun)**
If the named function is running return the data associated with it/them. The argument can be a glob

CLI Example:
```
salt '!' saltutil.is_running state.highstate
```

**salt.modules.saltutil.kill_all_jobs()**
Sends a kill signal (SIGKILL 9) to all currently running jobs

CLI Example:
```
salt '!' saltutil.kill_all_jobs
```

**salt.modules.saltutil.kill_job(jid)**
Sends a kill signal (SIGKILL 9) to the named salt job's process

CLI Example:
salt '***' saltutil.kill_job <job id>

salt.modules.saltutil.list_extmods()
New in version 2017.7.0.
List Salt modules which have been synced externally
CLI Examples:
salt '***' saltutil.list_extmods

salt.modules.saltutil.mmodule(saltenv, fun, *args, **kwargs)
Loads minion modules from an environment so that they can be used in pillars for that environment
CLI Example:
salt '***' saltutil.mmodule base test.ping

salt.modules.saltutil.pillar_refresh(wait=False, timeout=30)
This function is an alias of refresh_pillar.
Signal the minion to refresh the in-memory pillar data. See In-Memory Pillar Data vs. On-Demand Pillar Data.

param wait  Wait for pillar refresh to complete, defaults to False.
type wait  bool, optional
param timeout  How long to wait in seconds, only used when wait is True, defaults to 30.
type timeout  int, optional

return  Boolean status, True when the pillar_refresh event was fired successfully.
CLI Example:
salt '***' saltutil.refresh_pillar
salt '***' saltutil.refresh_pillar wait=True timeout=60

salt.modules.saltutil.refresh_beacons()
Signal the minion to refresh the beacons.
CLI Example:
salt '***' saltutil.refresh_beacons

salt.modules.saltutil.refresh_grains(**kwargs)
New in version 2016.3.6, 2016.11.4, 2017.7.0.
Refresh the minion’s grains without syncing custom grains modules from salt://_grains.

Note: The available execution modules will be reloaded as part of this process, as grains can affect which modules are available.

refresh_pillar  [True] Set to False to keep pillar data from being refreshed.
CLI Examples:
salt '***' saltutil.refresh_grains

salt.modules.saltutil.refresh_matchers()
Signal the minion to refresh its matchers.
CLI Example:
salt 'salt '*'saltutil.refresh_matchers

salt.modules.saltutil.refresh_modules("**kwargs")
    Signal the minion to refresh the module and grain data
    The default is to refresh module asynchronously. To block until the module refresh is complete, set the 'async'
    flag to False.
    CLI Example:
    salt 'salt '*'saltutil.refresh_modules

salt.modules.saltutil.refresh_pillar(wait=False, timeout=30)
    Signal the minion to refresh the in-memory pillar data. See In-Memory Pillar Data vs. On-Demand Pillar Data.
    Parameters
    • **wait** (bool, optional) -- Wait for pillar refresh to complete, defaults to False.
    • **timeout** (int, optional) -- How long to wait in seconds, only used when wait
        is True, defaults to 30.
    Returns Boolean status, True when the pillar_refresh event was fired successfully.
    CLI Example:
    salt 'salt '*'saltutil.refresh_pillar
    salt 'salt '*'saltutil.refresh_pillar wait=True timeout=60

salt.modules.saltutil.regen_keys()
    Used to regenerate the minion keys.
    CLI Example:
    salt 'salt '*'saltutil.regen_keys

salt.modules.saltutil.revoke_auth(preserve_minion_cache=False)
    The minion sends a request to the master to revoke its own key. Note that the minion session will be revoked
    and the minion may not be able to return the result of this command back to the master.
    If the 'preserve_minion_cache' flag is set to True, the master cache for this minion will not be removed.
    CLI Example:
    salt 'salt '*'saltutil.revoke_auth

salt.modules.saltutil.runner(name, arg=None, kwarg=None, full_return=False, saltenv='base',
    jid=None, **kwargs)
    Execute a runner function. This function must be run on the master, either by targeting a minion running on
    a master or by using salt-call on a master.
    New in version 2014.7.0.
    name The name of the function to run
    kwarg Any keyword arguments to pass to the runner function
    CLI Example:
    In this example, assume that master_minion is a minion running on a master.
    salt master_minion saltutil.runner jobs.list_jobs
    salt master_minion saltutil.runner test.arg arg="["baz"]" kwarg="{'foo': 'bar'}"

salt.modules.saltutil.running()
    Return the data on all running salt processes on the minion

23.9. execution modules
CLI Example:
```
salt '*' saltutil.running
```

```
salt.modules.saltutil.signal_job(jid, sig)
```

Sends a signal to the named salt job’s process

CLI Example:
```
salt '*' saltutil.signal_job <job id> 15
```

```
salt.modules.saltutil.sync_all(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
```

Changed in version 2015.8.11,2016.3.2: On masterless minions, pillar modules are now synced, and refreshed when `refresh` is set to `True`.

Sync down all of the dynamic modules from the file server for a specific environment. This function synchronizes custom modules, states, beacons, grains, returners, output modules, renderers, and util.

`refresh` [True] Also refresh the execution modules and recompile pillar data available to the minion. This refresh will be performed even if no new dynamic modules are synced. Set to `False` to prevent this refresh.

**Important:** If this function is executed using a `module.run` state, the SLS file will not have access to newly synced execution modules unless a `refresh` argument is added to the state, like so:

```
load_my_custom_module:
  module.run:
    - name: saltutil.sync_all
    - refresh: True
```

See [here](#) for a more detailed explanation of why this is necessary.

```
extmod_whitelist  [None] dictionary of modules to sync based on type
extmod_blacklist  [None] dictionary of modules to blacklist based on type
```

CLI Examples:

```
salt '*' saltutil.sync_all
salt '*' saltutil.sync_all saltenv=dev
salt '*' saltutil.sync_all saltenv=base,dev
salt '*' saltutil.sync_all extmod_whitelist={'modules': ['custom_module']}
```

```
salt.modules.saltutil.sync_beacons(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
```

New in version 2015.5.1.

Sync beacons from `salt://_beacons` to the minion

`saltenv` The fileserv environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the `top files` will be checked for beacons to sync. If no top files are found, then the `base` environment will be synced.

`refresh` [True] If `True`, refresh the available beacons on the minion. This refresh will be performed even if no new beacons are synced. Set to `False` to prevent this refresh.

```
extmod_whitelist  [None] comma-separated list of modules to sync
extmod_blacklist  [None] comma-separated list of modules to blacklist based on type
```

CLI Example:
salt.modules.saltutil.sync_clouds(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 2017.7.0.
Sync cloud modules from salt://_cloud to the minion
saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new utility modules are synced. Set to False to prevent this refresh.
extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Examples:
salt '*' saltutil.sync_clouds
salt '*' saltutil.sync_clouds saltenv=dev
class
class

salt.modules.saltutil.sync_engines(saltenv=None, refresh=False, extmod_whitelist=None, extmod_blacklist=None)

New in version 2016.3.0.
Sync engine modules from salt://_engines to the minion
saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for engines to sync. If no top files are found, then the base environment will be synced.
refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new engine modules are synced. Set to False to prevent this refresh.
extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Examples:
salt '*' saltutil.sync_engines
class
class

salt.modules.saltutil.sync_executors(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 3000.
Sync executors from salt://_executors to the minion
saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for log handlers to sync. If no top files are found, then the base environment will be synced.
refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new log handlers are synced. Set to False to prevent this refresh.
extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Examples:
salt.modules.saltutil.sync_grains(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 0.10.0.
Sync grains modules from salt://_grains to the minion
saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for grains modules to sync. If no top files are found, then the base environment will be synced.
refresh [True] If True, refresh the available execution modules and recompile pillar data for the minion. This refresh will be performed even if no new grains modules are synced. Set to False to prevent this refresh.
extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Examples:
salt '*' saltutil.sync_grains
salt '*' saltutil.sync_grains saltenv=dev
salt '*' saltutil.sync_grains saltenv=base,dev

salt.modules.saltutil.sync_log_handlers(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 2015.8.0.
Sync log handlers from salt://_log_handlers to the minion
saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for log handlers to sync. If no top files are found, then the base environment will be synced.
refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new log handlers are synced. Set to False to prevent this refresh.
extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Examples:
salt '*' saltutil.sync_log_handlers
salt '*' saltutil.sync_log_handlers saltenv=dev
salt '*' saltutil.sync_log_handlers saltenv=base,dev

salt.modules.saltutil.sync_matchers(saltenv=None, refresh=False, extmod_whitelist=None, extmod_blacklist=None)

New in version 2019.2.0.
Sync engine modules from salt://_matchers to the minion
saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for engines to sync. If no top files are found, then the base environment will be synced.
refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new matcher modules are synced. Set to False to prevent this refresh.
extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist  [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_matchers
salt '*' saltutil.sync_matchers saltenv=base,dev
```

salt.modules.saltutil.sync_modules(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 0.10.0.

Sync execution modules from salt://_modules to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for execution modules to sync. If no top files are found, then the base environment will be synced.

refresh  [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new execution modules are synced. Set to False to prevent this refresh.

**Important:** If this function is executed using a module.run state, the SLS file will not have access to newly synced execution modules unless a refresh argument is added to the state, like so:

```
load_my_custom_module:
  module.run:
    - name: saltutil.sync_modules
    - refresh: True
```

See here for a more detailed explanation of why this is necessary.

extmod_whitelist  [None] comma-separated list of modules to sync

extmod_blacklist  [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt '*' saltutil.sync_modules
salt '*' saltutil.sync_modules saltenv=dev
salt '*' saltutil.sync_modules saltenv=base,dev
```

salt.modules.saltutil.sync_output(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

Sync outputters from salt://_output to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for outputters to sync. If no top files are found, then the base environment will be synced.

refresh  [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to False to prevent this refresh.

extmod_whitelist  [None] comma-separated list of modules to sync

extmod_blacklist  [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_output
salt '*' saltutil.sync_output saltenv=dev
salt '*' saltutil.sync_output saltenv=base,dev
```
salt.modules.saltutil.sync_outputters(
saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

This function is an alias of sync_output.

saltenv  The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for outputters to sync. If no top files are found, then the base environment will be synced.

refresh  [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to False to prevent this refresh.

extmod_whitelist  [None] comma-separated list of modules to sync

extmod_blacklist  [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_output
salt '*' saltutil.sync_output saltenv=dev
salt '*' saltutil.sync_output saltenv=base,dev
```

salt.modules.saltutil.sync_pillar(
saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 2015.8.11,2016.3.2.

Sync pillar modules from the salt://_pillar directory on the Salt fileserver. This function is environment-aware, pass the desired environment to grab the contents of the _pillar directory from that environment. The default environment, if none is specified, is base.

refresh  [True] Also refresh the execution modules available to the minion, and refresh pillar data.

extmod_whitelist  [None] comma-separated list of modules to sync

extmod_blacklist  [None] comma-separated list of modules to blacklist based on type

Note:  This function will raise an error if executed on a traditional (i.e. not masterless) minion

CLI Examples:

```
salt '*' saltutil.sync_pillar
salt '*' saltutil.sync_pillar saltenv=dev
```

salt.modules.saltutil.sync_proxymodules(
saltenv=None, refresh=False, extmod_whitelist=None, extmod_blacklist=None)

New in version 2015.8.2.

Sync proxy modules from salt://_proxy to the minion

saltenv  The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for proxy modules to sync. If no top files are found, then the base environment will be synced.

refresh  [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new proxy modules are synced. Set to False to prevent this refresh.

extmod_whitelist  [None] comma-separated list of modules to sync

extmod_blacklist  [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_proxymodules
salt '*' saltutil.sync_proxymodules saltenv=dev
salt '*' saltutil.sync_proxymodules saltenv=base,dev
```
salt.modules.saltutil.sync_renderers(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 0.10.0.

Sync renderers from salt://_renderers to the minion

saltenv  The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for renderers to sync. If no top files are found, then the base environment will be synced.

refresh  [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new renderers are synced. Set to False to prevent this refresh. Set to False to prevent this refresh.

extmod_whitelist  [None] comma-separated list of modules to sync

extmod_blacklist  [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_renderers
salt '*' saltutil.sync_renderers saltenv=dev
salt '*' saltutil.sync_renderers saltenv=base,dev
```

salt.modules.saltutil.sync_returners(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 0.10.0.

Sync returners from salt://_returners to the minion

saltenv  The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for returners to sync. If no top files are found, then the base environment will be synced.

refresh  [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new returners are synced. Set to False to prevent this refresh.

extmod_whitelist  [None] comma-separated list of modules to sync

extmod_blacklist  [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_returners
salt '*' saltutil.sync_returners saltenv=dev
```

salt.modules.saltutil.sync_sdb(saltenv=None, extmod_whitelist=None, extmod_blacklist=None)

New in version 2015.5.8,2015.8.3.

Sync sdb modules from salt://_sdb to the minion

saltenv  The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for sdb modules to sync. If no top files are found, then the base environment will be synced.

refresh  [False] This argument has no affect and is included for consistency with the other sync functions.

extmod_whitelist  [None] comma-separated list of modules to sync

extmod_blacklist  [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt '*' saltutil.sync_sdb
salt '*' saltutil.sync_sdb saltenv=dev
salt '*' saltutil.sync_sdb saltenv=base,dev
```
salt.modules.saltutil.sync_serializers(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 2019.2.0.

Sync serializers from `salt://_serializers` to the minion

- saltenv: The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
  
  If not passed, then all environments configured in the top files will be checked for serializer modules to sync. If no top files are found, then the base environment will be synced.

- refresh: [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new serializer modules are synced. Set to False to prevent this refresh.

- extmod_whitelist: [None] comma-separated list of modules to sync

- extmod_blacklist: [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_serializers
salt '*' saltutil.sync_serializers saltenv=dev
salt '*' saltutil.sync_serializers saltenv=base,dev
```

salt.modules.saltutil.sync_states(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 0.10.0.

Sync state modules from `salt://_states` to the minion

- saltenv: The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
  
  If not passed, then all environments configured in the top files will be checked for state modules to sync. If no top files are found, then the base environment will be synced.

- refresh: [True] If True, refresh the available states on the minion. This refresh will be performed even if no new state modules are synced. Set to False to prevent this refresh.

- extmod_whitelist: [None] comma-separated list of modules to sync

- extmod_blacklist: [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_states
salt '*' saltutil.sync_states saltenv=dev
salt '*' saltutil.sync_states saltenv=base,dev
```

salt.modules.saltutil.sync_thorium(saltenv=None, refresh=False, extmod_whitelist=None, extmod_blacklist=None)

New in version 2018.3.0.

Sync Thorium modules from `salt://_thorium` to the minion

- saltenv: The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
  
  If not passed, then all environments configured in the top files will be checked for engines to sync. If no top files are found, then the base environment will be synced.

- refresh: True If True, refresh the available execution modules on the minion. This refresh will be performed even if no new Thorium modules are synced. Set to False to prevent this refresh.

- extmod_whitelist: comma-separated list of modules to sync

- extmod_blacklist: comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_thorium
salt '*' saltutil.sync_thorium saltenv=base,dev
```
salt.modules.saltutil.sync_utils(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 2014.7.0.
Sync utility modules from salt://_utils to the minion
saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
If not passed, then all environments configured in the top files will be checked for utility modules to sync. If no top files are found, then the base environment will be synced.
refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new utility modules are synced. Set to False to prevent this refresh.
extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type
CLI Examples:

    salt '*' saltutil.sync_utils
    salt '*' saltutil.sync_utils saltenv=dev
    salt '*' saltutil.sync_utils saltenv=base,dev

salt.modules.saltutil.term_all_jobs()
Sends a termination signal (SIGTERM 15) to all currently running jobs
CLI Example:

    salt '*' saltutil.term_all_jobs

salt.modules.saltutil.term_job(jid)
Sends a termination signal (SIGTERM 15) to the named salt job's process
CLI Example:

    salt '*' saltutil.term_job <job id>

salt.modules.saltutil.update(version=None)
Update the salt minion from the URL defined in opts['update_url'] SaltStack, Inc provides the latest builds here:
update_url: https://repo.saltproject.io/windows/
Be aware that as of 2014-8-11 there's a bug in esky such that only the latest version available in the update_url can be downloaded and installed.
This feature requires the minion to be running a bdist_esky build.
The version number is optional and will default to the most recent version available at opts['update_url'].
Returns details about the transaction upon completion.
CLI Examples:

    salt '*' saltutil.update
    salt '*' saltutil.update 0.10.3

salt.modules.saltutil.wheel(name, *args, **kwargs)
Execute a wheel module and function. This function must be run against a minion that is local to the master.
New in version 2014.7.0.
name The name of the function to run
args Any positional arguments to pass to the wheel function. A common example of this would be the match arg needed for key functions.
New in version 2015.8.11.
**kwargs** Any keyword arguments to pass to the wheel function

CLI Example:

```ruby
salt my-local-minion saltutil.wheel key.accept jerry
salt my-local-minion saltutil.wheel minions.connected
```

**Note:** Since this function must be run against a minion that is running locally on the master in order to get accurate returns, if this function is run against minions that are not local to the master, "empty" returns are expected. The remote minion does not have access to wheel functions and their return data.

### 23.9.398 salt.modules.schedule

Module for managing the Salt schedule on a minion

New in version 2014.7.0.

**salt.modules.schedule.add**(name, **kwargs)

Add a job to the schedule

CLI Example:

```bash
salt '*' schedule.add job1 function='test.ping' seconds=3600
# If function have some arguments, use job_args
salt '*' schedule.add job2 function='cmd.run' job_args="['date >> /tmp/date.log'] ←" seconds=60
```

**salt.modules.schedule.build_schedule_item**(name, **kwargs)

Build a schedule job

CLI Example:

```bash
salt '*' schedule.build_schedule_item job1 function='test.ping' seconds=3600
```

**salt.modules.schedule.copy**(name, target, **kwargs)

Copy scheduled job to another minion or minions.

CLI Example:

```bash
salt '*' schedule.copy jobname target
```

**salt.modules.schedule.delete**(name, **kwargs)

Delete a job from the minion's schedule

CLI Example:

```bash
salt '*' schedule.delete job1
```

**salt.modules.schedule.disable**(**kwargs)

Disable all scheduled jobs on the minion

CLI Example:

```bash
salt '*' schedule.disable
```

**salt.modules.schedule.disable_job**(name, **kwargs)

Disable a job in the minion's schedule
CLI Example:

```bash
salt '*' schedule.disable_job job1
```

```python
salt.modules.schedule.enable(**kwargs)
```

Enable all scheduled jobs on the minion

CLI Example:

```bash
salt '*' schedule.enable
```

```python
salt.modules.schedule.enable_job(name, **kwargs)
```

Enable a job in the minion's schedule

CLI Example:

```bash
salt '*' schedule.enable_job job1
```

```python
salt.modules.schedule.is_enabled(name=None)
```

List a Job only if its enabled

If job is not specified, indicate if the scheduler is enabled or disabled.

New in version 2015.5.3.

CLI Example:

```bash
salt '*' schedule.is_enabled name=job_name
salt '*' schedule.is_enabled
```

```python
salt.modules.schedule.job_status(name)
```

Show the information for a particular job.

CLI Example:

```bash
salt '*' schedule.job_status
```

```python
salt.modules.schedule.list_(show_all=False, show_disabled=True, where=None, return_yaml=True)
```

List the jobs currently scheduled on the minion

CLI Example:

```bash
salt '*' schedule.list

# Show all jobs including hidden internal jobs
salt '*' schedule.list show_all=True

# Hide disabled jobs from list of jobs
salt '*' schedule.list show_disabled=False
```

```python
salt.modules.schedule.modify(name, **kwargs)
```

Modify an existing job in the schedule

CLI Example:

```bash
salt '*' schedule.modify job1 function='test.ping' seconds=3600
```

```python
salt.modules.schedule.move(name, target, **kwargs)
```

Move scheduled job to another minion or minions.
Salt Documentation, Release 3003.3

CLI Example:
```bash
salt '*' schedule.move jobname target
```

```python
salt.modules.schedule.postpone_job(name, current_time, new_time, **kwargs)
```
Postpone a job in the minion's schedule

Current time and new time should be in date string format, default value is %Y-%m-%dT%H:%M:%S.

New in version 2018.3.0.

CLI Example:
```bash
salt '*' schedule.postpone_job job current_time new_time
salt '*' schedule.postpone_job job current_time new_time time_fmt=%Y-%m-%dT%H:%M:%S
```

```python
salt.modules.schedule.purge(**kwargs)
```

Purge all the jobs currently scheduled on the minion

CLI Example:
```bash
salt '*' schedule.purge
```

```python
salt.modules.schedule.reload_()
```

Reload saved scheduled jobs on the minion

CLI Example:
```bash
salt '*' schedule.reload
```

```python
salt.modules.schedule.run_job(name, force=False)
```

Run a scheduled job on the minion immediately

CLI Example:
```bash
salt '*' schedule.run_job job1
salt '*' schedule.run_job job1 force=True
```

Force the job to run even if it is disabled.

```python
salt.modules.schedule.save(**kwargs)
```

Save all scheduled jobs on the minion

CLI Example:
```bash
salt '*' schedule.save
```

```python
salt.modules.schedule.show_next_fire_time(name, **kwargs)
```

Show the next fire time for scheduled job

New in version 2018.3.0.

CLI Example:
```bash
salt '*' schedule.show_next_fire_time job_name
```

```python
salt.modules.schedule.skip_job(name, current_time, **kwargs)
```

Skip a job in the minion's schedule at specified time.
Time to skip should be specified as date string format, default value is %Y-%m-%dT%H:%M:%S.

New in version 2018.3.0.

CLI Example:

```bash
salt '*' schedule.skip_job job time
```

### 23.9.399 salt.modules.scp

**SCP Module**

New in version 2019.2.0.

Module to copy files via SCP

```python
salt.modules.scp_mod.get(remote_path, local_path='', recursive=False, preserve_times=False, **kwargs)
```

Transfer files and directories from remote host to the localhost of the Minion.

- **remote_path** Path to retrieve from remote host. Since this is evaluated by scp on the remote host, shell wildcards and environment variables may be used.
- **recursive**: *False* Transfer files and directories recursively.
- **preserve_times**: *False* Preserve mtime and atime of transferred files and directories.
- **hostname** The hostname of the remote device.
- **port**: *22* The port of the remote device.
- **username** The username required for SSH authentication on the device.
- **password** Used for password authentication. It is also used for private key decryption if `passphrase` is not given.
- **passphrase** Used for decrypting private keys.
- **pkey** An optional private key to use for authentication.
- **key_filename** The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.
- **timeout** An optional timeout (in seconds) for the TCP connect.
- **socket_timeout**: *10* The channel socket timeout in seconds.
- **buff_size**: *16384* The size of the SCP send buffer.
- **allow_agent**: *True* Set to *False* to disable connecting to the SSH agent.
- **look_for_keys**: *True* Set to *False* to disable searching for discoverable private key files in ~/.ssh/
- **banner_timeout** An optional timeout (in seconds) to wait for the SSH banner to be presented.
- **auth_timeout** An optional timeout (in seconds) to wait for an authentication response.
- **auto_add_policy**: *False* Automatically add the host to the known_hosts.

CLI Example:

```bash
salt '*' scp.get /var/tmp/file /tmp/file hostname=10.10.10.1 auto_add_policy=True
```

```python
salt.modules.scp_mod.put(files, remote_path=None, recursive=False, preserve_times=False, saltenv='base', **kwargs)
```

Transfer files and directories to remote host.

- **files** A single path or a list of paths to be transferred.
- **remote_path** The path on the remote device where to store the files.
- **recursive**: *True* Transfer files and directories recursively.
- **preserve_times**: *False* Preserve mtime and atime of transferred files and directories.
- **hostname** The hostname of the remote device.
- **port**: *22* The port of the remote device.
- **username** The username required for SSH authentication on the device.
password  Used for password authentication. It is also used for private key decryption if passphrase is not given.

passphrase  Used for decrypting private keys.

pkey  An optional private key to use for authentication.

key_filename  The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.

timeout  An optional timeout (in seconds) for the TCP connect.

socket_timeout: 10  The channel socket timeout in seconds.

buff_size: 16384  The size of the SCP send buffer.

allow_agent: True  Set to False to disable connecting to the SSH agent.

look_for_keys: True  Set to False to disable searching for discoverable private key files in ~/.ssh/

banner_timeout  An optional timeout (in seconds) to wait for the SSH banner to be presented.

auth_timeout  An optional timeout (in seconds) to wait for an authentication response.

auto_add_policy: False  Automatically add the host to the known_hosts.

CLI Example:

```
salt '*' scp.put /path/to/file /var/tmp/file hostname=server1 auto_add_policy=True
```

### 23.9.400  salt.modules.scsi

SCSI administration module

salt.modules.scsi.ls_(get_size=True)

List SCSI devices, with details

CLI Examples:

```
salt '*' scsi.ls
salt '*' scsi.ls get_size=False
```

get_size [True]  Get the size information for scsi devices. This option should be set to False for older OS distributions (RHEL6 and older) due to lack of support for the `-s` option in lsscsi.

New in version 2015.5.10.

salt.modules.scsi.rescan_all(host)

List scsi devices

CLI Example:

```
salt '*' scsi.rescan_all 0
```

### 23.9.401  salt.modules.sdb

Module for Manipulating Data via the Salt DB API

salt.modules.sdb.delete(uri)

Delete a value from a db, using a uri in the form of sdb://<profile>/<key>. If the uri provided does not start with sdb:// or the value is not successfully deleted, return False.

CLI Example:

```
salt '*' sdb.delete sdb://memcached/foo
```
salt.modules.sdb.get(uri, strict=False)

Get a value from a db, using a uri in the form of sdb://<profile>/<key>. If the uri provided is not valid, then it will be returned as-is, unless strict=True was passed.

CLI Example:

```
salt '*' sdb.get sdb://mymemcached/foo strict=True
```

salt.modules.sdb.get_or_set_hash(uri, length=8, chars='abcdefghijklmnopqrstuvwxyz0123456789!@#$%^&*(-_=+)')

Perform a one-time generation of a hash and write it to sdb. If that value has already been set return the value instead.

This is useful for generating passwords or keys that are specific to multiple minions that need to be stored somewhere centrally.

State Example:

```
some_mysql_user:
  mysql_user:
    - present
    - host: localhost
    - password: '{{ salt['sdb.get_or_set_hash']('some_mysql_user_pass') }}'
```

CLI Example:

```
salt '*' sdb.get_or_set_hash 'SECRET_KEY' 50
```

**Warning:** This function could return strings which may contain characters which are reserved as directives by the YAML parser, such as strings beginning with `. To avoid issues when using the output of this function in an SLS file containing YAML+Jinja, surround the call with single quotes.

salt.modules.sdb.set_(uri, value)

Set a value in a db, using a uri in the form of sdb://<profile>/<key>. If the uri provided does not start with sdb:// or the value is not successfully set, return False.

CLI Example:

```
salt '*' sdb.set sdb://mymemcached/foo bar
```

**23.9.402 salt.modules.seed**

Virtual machine image management tools

salt.modules.seed.apply_(path, id_=None, config=None, approve_key=True, install=True, prep_install=False, pub_key=None, priv_key=None, mount_point=None)

Seed a location (disk image, directory, or block device) with the minion config, approve the minion’s key, and/or install salt-minion.

CLI Example:

```
salt 'minion' seed.apply path id [config=config_data] \
  [gen_key=(true|false)] [approve_key=(true|false)] \
  [install=(true|false)]
```

**path** Full path to the directory, device, or disk image on the target minion’s file system.
id  Minion id with which to seed the path.
config  Minion configuration options. By default, the ‘master’ option is set to the target host’s ‘master’.
approve_key  Request a pre-approval of the generated minion key. Requires that the salt-master be configured to either auto-accept all keys or expect a signing request from the target host. Default: true.
install  Install salt-minion, if absent. Default: true.
prep_install  Prepare the bootstrap script, but don’t run it. Default: false

salt.modules.seed.mkconfig(config=None, tmp=None, id_=None, approve_key=True, pub_key=None, priv_key=None)

Generate keys and config and put them in a tmp directory.

CLI Example:

salt 'minion' seed.mkconfig [config=config_data] [tmp=tmp_dir] \
  [id_=minion_id] [approve_key=(true|false)]

salt.modules.seed.prep_bootstrap(mpt)

Update and get the random script to a random place

CLI Example:

salt '*' seed.prep_bootstrap /tmp

23.9.403  salt.modules.selinux

Execute calls on selinux

Note:  This module requires the semanage, setsebool, and semodule commands to be available on the minion. On RHEL-based distributions, ensure that the policycoreutils and policycoreutils-python packages are installed. If not on a Fedora or RHEL-based distribution, consult the selinux documentation for your distribution to ensure that the proper packages are installed.

salt.modules.selinux.fcontext_add_policy(name, filetype=None, sel_type=None, sel_user=None, sel_level=None)

New in version 2019.2.0.

Adds the SELinux policy for a given filespec and other optional parameters.

Returns the result of the call to semanage.

Note that you don’t have to remove an entry before setting a new one for a given filespec and filetype, as adding one with semanage automatically overwrites a previously configured SELinux context.

name  filespec of the file or directory. Regex syntax is allowed.
file_type  The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also man semanage-fcontext. Defaults to ‘a’ (all files).

sel_type  SELinux context type. There are many.

sel_user  SELinux user. Use semanage login -l to determine which ones are available to you.

sel_level  The MLS range of the SELinux context.

CLI Example:

salt '*' selinux.fcontext_add_policy my-policy

salt.modules.selinux.fcontext_apply_policy(name, recursive=False)

New in version 2017.7.0.
Applies SElinux policies to filespec using `restorecon -R filespec`. Returns dict with changes if successful, the output of the restorecon command otherwise.

- **name** filespec of the file or directory. Regex syntax is allowed.
- **recursive** Recursively apply SElinux policies.

CLI Example:

```
salt '*' selinux.fcontext_apply_policy my-policy
```

### salt.modules.selinux.fcontext_delete_policy

**Signature:**

```python
salt.modules.selinux.fcontext_delete_policy(name, filetype=None, sel_type=None, sel_user=None, sel_level=None)
```

**New in version 2019.2.0.**

Deletes the SELinux policy for a given filespec and other optional parameters.

Returns the result of the call to semanage.

Note that you don’t have to remove an entry before setting a new one for a given filespec and filetype, as adding one with semanage automatically overwrites a previously configured SELinux context.

- **name** filespec of the file or directory. Regex syntax is allowed.
- **file_type** The SELinux filetype specification. Use one of `[a, f, d, c, b, s, l, p]`. See also `man semanage-fcontext`. Defaults to ‘a’ (all files).
- **sel_type** SELinux context type. There are many.
- **sel_user** SELinux user. Use `semanage login -l` to determine which ones are available to you.
- **sel_level** The MLS range of the SELinux context.

CLI Example:

```
salt '*' selinux.fcontext_delete_policy my-policy
```

### salt.modules.selinux.fcontext_get_policy

**Signature:**

```python
salt.modules.selinux.fcontext_get_policy(name, filetype=None, sel_type=None, sel_user=None, sel_level=None)
```

**New in version 2017.7.0.**

Returns the current entry in the SELinux policy list as a dictionary. Returns None if no exact match was found.

Returned keys are:

- filespec (the name supplied and matched)
- filetype (the descriptive name of the filetype supplied)
- sel_user, sel_role, sel_type, sel_level (the selinux context)

- **name** filespec of the file or directory. Regex syntax is allowed.
- **filetype** The SELinux filetype specification. Use one of `[a, f, d, c, b, s, l, p]`. See also `man semanage-fcontext`. Defaults to ‘a’ (all files).

CLI Example:

```
salt '*' selinux.fcontext_get_policy my-policy
```

### salt.modules.selinux.fcontext_policy_is_applied

**Signature:**

```python
salt.modules.selinux.fcontext_policy_is_applied(name, recursive=False)
```

**New in version 2017.7.0.**

Returns an empty string if the SELinux policy for a given filespec is applied, returns string with differences in policy and actual situation otherwise.

- **name** filespec of the file or directory. Regex syntax is allowed.

CLI Example:

```
salt '*' selinux.fcontext_policy_is_applied my-policy
```
salt.modules.selinux.filetype_id_to_string(filetype='a')
New in version 2017.7.0.
Translates SELinux filetype single-letter representation to a more human-readable version (which is also used in `semanage fcontext -l`).

salt.modules.selinux.getconfig()
Return the selinux mode from the config file
CLI Example:
```
salt '*' selinux.getconfig
```

salt.modules.selinux.getenforce()
Return the mode selinux is running in
CLI Example:
```
salt '*' selinux.getenforce
```

salt.modules.selinux.getsebool(boolean)
Return the information on a specific selinux boolean
CLI Example:
```
salt '*' selinux.getsebool virt_use_usb
```

salt.modules.selinux.getsemod(module)
Return the information on a specific selinux module
CLI Example:
```
salt '*' selinux.getsemod mysql
```
New in version 2016.3.0.

salt.modules.selinux.install_semod(module_path)
Install custom SELinux module from file
CLI Example:
```
salt '*' selinux.install_semod [salt://]path/to/module.pp
```
New in version 2016.11.6.

salt.modules.selinux.list_sebool()
Return a structure listing all of the selinux booleans on the system and what state they are in
CLI Example:
```
salt '*' selinux.list_sebool
```

salt.modules.selinux.list_semod()
Return a structure listing all of the selinux modules on the system and what state they are in
CLI Example:
```
salt '*' selinux.list_semod
```
New in version 2016.3.0.
salt.modules.selinux.port_add_policy(name, sel_type=None, protocol=None, port=None, sel_range=None)

New in version 2019.2.0.

Adds the SELinux policy for a given protocol and port.

Returns the result of the call to semanage.

**name**  The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).

**sel_type**  The SELinux Type. Required.

**protocol**  The protocol for the port, tcp or udp. Required if name is not formatted.

**port**  The port or port range. Required if name is not formatted.

**sel_range**  The SELinux MLS/MCS Security Range.

CLI Example:

```
salt '*' selinux.port_add_policy add tcp/8080 http_port_t
salt '*' selinux.port_add_policy add foobar http_port_t protocol=tcp port=8091
```

salt.modules.selinux.port_delete_policy(name, protocol=None, port=None)

New in version 2019.2.0.

Deletes the SELinux policy for a given protocol and port.

Returns the result of the call to semanage.

**name**  The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).

**protocol**  The protocol for the port, tcp or udp. Required if name is not formatted.

**port**  The port or port range. Required if name is not formatted.

CLI Example:

```
salt '*' selinux.port_delete_policy tcp/8080
salt '*' selinux.port_delete_policy foobar protocol=tcp port=8091
```

salt.modules.selinux.port_get_policy(name, sel_type=None, protocol=None, port=None)

New in version 2019.2.0.

Returns the current entry in the SELinux policy list as a dictionary. Returns None if no exact match was found.

Returned keys are:

- sel_type (the selinux type)
- proto (the protocol)
- port (the port(s) and/or port range(s))

**name**  The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).

**sel_type**  The SELinux Type.

**protocol**  The protocol for the port, tcp or udp. Required if name is not formatted.

**port**  The port or port range. Required if name is not formatted.

CLI Example:

```
salt '*' selinux.port_get_policy tcp/80
salt '*' selinux.port_get_policy foobar protocol=tcp port=80
```

salt.modules.selinux.remove_semod(module)

Remove SELinux module

CLI Example:

```
salt '*' selinux.remove_semod module_name
```

New in version 2016.11.6.
salt.modules.selinux.selinux_fs_path()
Return the location of the SELinux VFS directory

CLI Example:
```
salt '*' selinux.selinux_fs_path
```

salt.modules.selinux.setenforce(mode)
Set the SELinux enforcing mode

CLI Example:
```
salt '*' selinux.setenforce enforcing
```

salt.modules.selinux.setsebool(boolean, value, persist=False)
Set the value for a boolean

CLI Example:
```
salt '*' selinux.setsebool virt_use_usb off
```

salt.modules.selinux.setsebools(pairs, persist=False)
Set the value of multiple booleans

CLI Example:
```
salt '*' selinux.setsebools '{virt_use_usb: on, squid_use_tproxy: off}'
```

salt.modules.selinux.setsemod(module, state)
Enable or disable an SELinux module.

CLI Example:
```
salt '*' selinux.setsemod nagios Enabled
```

New in version 2016.3.0.

23.9.404 salt.modules.sensehat

Module for controlling the LED matrix or reading environment data on the SenseHat of a Raspberry Pi.
New in version 2017.7.0.

maintainer Benedikt Werner <1benediktwerner@gmail.com>, Joachim Werner <joe@suse.com>
maturity new
depends sense_hat Python module

The rotation of the Pi can be specified in a pillar. This is useful if the Pi is used upside down or sideways to correct the orientation of the image being shown.

Example:
```
sensehat:
  rotation: 90
```

salt.modules.sensehat.clear(color=None)
Sets the LED matrix to a single color or turns all LEDs off.

CLI Example:
```
salt 'raspberry' sensehat.clear
salt 'raspberry' sensehat.clear '[255, 0, 0]'
```

```
salt.modules.sensehat.get_humidity()
Get the percentage of relative humidity from the humidity sensor.
```

```
salt.modules.sensehat.get_pixel(x, y)
Returns the color of a single pixel on the LED matrix.
x  The x coordinate of the pixel. Ranges from 0 on the left to 7 on the right.
y  The y coordinate of the pixel. Ranges from 0 at the top to 7 at the bottom.
```

Note: Please read the note for get_pixels

```
salt.modules.sensehat.get_pixels()
Returns a list of 64 smaller lists of [R, G, B] pixels representing the currently displayed image on the LED matrix.
```

Note: When using set_pixels the pixel values can sometimes change when you read them again using get_pixels. This is because we specify each pixel element as 8 bit numbers (0 to 255) but when they're passed into the Linux frame buffer for the LED matrix the numbers are bit shifted down to fit into RGB 565. 5 bits for red, 6 bits for green and 5 bits for blue. The loss of binary precision when performing this conversion (3 bits lost for red, 2 for green and 3 for blue) accounts for the discrepancies you see. The get_pixels method provides an accurate representation of how the pixels end up in frame buffer memory after you have called set_pixels.

```
salt.modules.sensehat.get_pressure()
Gets the current pressure in Millibars from the pressure sensor.
```

```
salt.modules.sensehat.get_temperature()
Gets the temperature in degrees Celsius from the humidity sensor. Equivalent to calling get_temperature_from_humidity.
If you get strange results try using get_temperature_from_pressure.
```

```
salt.modules.sensehat.get_temperature_from_humidity()
Gets the temperature in degrees Celsius from the humidity sensor.
```

```
salt.modules.sensehat.get_temperature_from_pressure()
Gets the temperature in degrees Celsius from the pressure sensor.
```

```
salt.modules.sensehat.low_light(low_light=True)
Sets the LED matrix to low light mode. Useful in a dark environment.
```

CLI Example:
```
salt 'raspberry' sensehat.low_light
salt 'raspberry' sensehat.low_light False
```

```
salt.modules.sensehat.set_pixel(x, y, color)
Sets a single pixel on the LED matrix to a specified color.
x  The x coordinate of the pixel. Ranges from 0 on the left to 7 on the right.
y  The y coordinate of the pixel. Ranges from 0 at the top to 7 at the bottom.
color  The new color of the pixel as a list of [R, G, B] values.
```

CLI Example:
salt.modules.sensehat.set_pixel(0, 0, [255, 0, 0])

salt.modules.sensehat.set_pixels(pixels)
Sets the entire LED matrix based on a list of 64 pixel values
pixels A list of 64 [R, G, B] color values.

salt.modules.sensehat.show_image(image)
Displays an 8 x 8 image on the LED matrix.
image The path to the image to display. The image must be 8 x 8 pixels in size.
CLI Example:
salt 'raspberry' sensehat.show_image /tmp/my_image.png

salt.modules.sensehat.show_letter(letter, text_color=None, back_color=None)
Displays a single letter on the LED matrix.
letter The letter to display
text_color The color in which the letter is shown. Defaults to [255, 255, 255] (white).
back_color The background color of the display. Defaults to [0, 0, 0] (black).
CLI Example:
salt 'raspberry' sensehat.show_letter O
salt 'raspberry' sensehat.show_letter X [255, 0, 0]
salt 'raspberry' sensehat.show_letter B [0, 0, 255] [255, 255, 0]

salt.modules.sensehat.show_message(message, msg_type=None, text_color=None, back_color=None, scroll_speed=0.1)
Displays a message on the LED matrix.
message The message to display
msg_type The type of the message. Changes the appearance of the message.
Available types are:
error: red text
warning: orange text
success: green text
info: blue text
scroll_speed The speed at which the message moves over the LED matrix. This value represents the time
paused for between shifting the text to the left by one column of pixels. Defaults to '0.1'.
text_color The color in which the message is shown. Defaults to [255, 255, 255] (white).
back_color The background color of the display. Defaults to [0, 0, 0] (black).
CLI Example:
salt 'raspberry' sensehat.show_message 'Status ok'
salt 'raspberry' sensehat.show_message 'Something went wrong' error
salt 'raspberry' sensehat.show_message 'Red' text_color='[255, 0, 0]'
salt 'raspberry' sensehat.show_message 'Hello world' None '[0, 0, 255]' '[255,0-
255, 0]' 0.2
23.9.405 salt.modules.sensors

Read lm-sensors

New in version 2014.1.3.

salt.modules.sensors.sense(chip, fahrenheit=False)
Gather lm-sensors data from a given chip
To determine the chip to query, use the ‘sensors’ command and see the leading line in the block.
Example:
/usr/bin/sensors
coretemp-isa-0000 Adapter: ISA adapter Physical id 0: +56.0°C (high = +87.0°C, crit = +105.0°C) Core 0: +52.0°C (high = +87.0°C, crit = +105.0°C) Core 1: +50.0°C (high = +87.0°C, crit = +105.0°C) Core 2: +56.0°C (high = +87.0°C, crit = +105.0°C) Core 3: +53.0°C (high = +87.0°C, crit = +105.0°C)
Given the above, the chip is 'coretemp-isa-0000'.

23.9.406 salt.modules.serverdensity_device

Wrapper around Server Density API

New in version 2014.7.0.

salt.modules.serverdensity_device.create(name, **params)
Function to create device in Server Density. For more info, see the API docs.

CLI Example:
salt '*' serverdensity_device.create lama
salt '*' serverdensity_device.create rich_lama group=lama_band installedRAM=32768

salt.modules.serverdensity_device.delete(device_id)
Delete a device from Server Density. For more information, see the API docs.

CLI Example:
salt '*' serverdensity_device.delete 51f7eafdb4bb235e000ae4

salt.modules.serverdensity_device.get_sd_auth(val, sd_auth_pillar_name='serverdensity')
Returns requested Server Density authentication value from pillar.

CLI Example:
salt '*' serverdensity_device.get_sd_auth <val>

salt.modules.serverdensity_device.install_agent(agent_key, agent_version=1)
Function downloads Server Density installation agent, and installs sd-agent with agent_key. Optionally the agent_version would select the series to use (defaults on the v1 one).

CLI Example:
salt '*' serverdensity_device.install_agent c2bddd6689ff46282bd00a07555641498
salt '*' serverdensity_device.install_agent c2bddd6689ff46282bd00a07555641498 2
salt.modules.serverdensity_device.

**ls(**params)**

List devices in Server Density

Results will be filtered by any params passed to this function. For more information, see the API docs on listing and searching.

CLI Example:

```
salt 'salt' serverdensity_device.ls
salt 'salt' serverdensity_device.ls name=lama
salt 'salt' serverdensity_device.ls name=lama group=lama_band installedRAM=32768
```

salt.modules.serverdensity_device.

**update**(device_id, **params)**

Updates device information in Server Density. For more information see the API docs.

CLI Example:

```
salt 'salt' serverdensity_device.update 51f7eafcdba4bb235e000ae4 name=lama
salt 'salt' serverdensity_device.update 51f7eafcdba4bb235e000ae4 name=better_lama group=rock_lamas swapSpace=512
```

23.9.407  **salt.modules.servicenow**

Module for execution of ServiceNow CI (configuration items)

New in version 2016.11.0.

depends servicenow_rest python module

configuration Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'servicenow' key by default, if defined.

For example:

```
servicenow:
  instance_name: ''
  username: ''
  password: ''
```

salt.modules.servicenow.

**delete_record**(table, sys_id)

Delete an existing record

Parameters

- table (str) -- The table name, e.g. sys_user
- sys_id (str) -- The unique ID of the record

CLI Example:

```
salt myminion servicenow.delete_record sys_computer 2134566
```

salt.modules.servicenow.

**non_structured_query**(table, query=None, **kwargs)

Parameters

- table (str) -- The table name, e.g. sys_user
- query (str) -- The query to run (or use keyword arguments to filter data)

CLI Example:
salt myminion servicenow.non_structured_query sys_computer 'role=web'
salt myminion servicenow.non_structured_query sys_computer role=web type=computer

```python
salt.modules.servicenow.set_change_request_state(change_id, state='approved')
```

Set the approval state of a change request/record

**Parameters**

- `change_id` *(str)* -- The ID of the change request, e.g. CHG123545
- `state` *(str)* -- The target state, e.g. approved

**CLI Example:**

```
salt myminion servicenow.set_change_request_state CHG000123 declined
salt myminion servicenow.set_change_request_state CHG000123 approved
```

```python
salt.modules.servicenow.update_record_field(table, sys_id, field, value)
```

Update the value of a record's field in a servicenow table

**Parameters**

- `table` *(str)* -- The table name, e.g. sys_user
- `sys_id` *(str)* -- The unique ID of the record
- `field` *(str)* -- The new value
- `value` *(str)* -- The new value

**CLI Example:**

```
salt myminion servicenow.update_record_field sys_user 2348234 first_name jimmy
```

### 23.9.408 salt.modules.slack_notify

Module for sending messages to Slack

New in version 2015.5.0.

**configuration**  This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```yaml
slack:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

```python
salt.modules.slack_notify.call_hook(message, attachment=None, color='good', short=False, identifier=None, channel=None, username=None, icon_emoji=None)
```

Send message to Slack incoming webhook.

**Parameters**

- `message` -- The topic of message.
- `attachment` -- The message to send to the Slack WebHook.
- `color` -- The color of border of left side
- `short` -- An optional flag indicating whether the value is short enough to be displayed side-by-side with other values.
- `identifier` -- The identifier of WebHook.
- `channel` -- The channel to use instead of the WebHook default.
- `username` -- Username to use instead of WebHook default.
- `icon_emoji` -- Icon to use instead of WebHook default.

**Returns**  Boolean if message was sent successfully.

**CLI Example:**

```
```
salt modules.slack_notify.find_room(name, api_key=None)
Find a room by name and return it.
Parameters
  • name -- The room name.
  • api_key -- The Slack admin api key.
Returns The room object.
CLI Example:
salt '*' slack.find_room name="random"
salt '*' slack.find_room name="random" api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15

salt modules.slack_notify.find_user(name, api_key=None)
Find a user by name and return it.
Parameters
  • name -- The user name.
  • api_key -- The Slack admin api key.
Returns The user object.
CLI Example:
salt '*' slack.find_user name="ThomasHatch"
salt '*' slack.find_user name="ThomasHatch" api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15

salt modules.slack_notify.list_rooms(api_key=None)
List all Slack rooms.
Parameters api_key -- The Slack admin api key.
Returns The room list.
CLI Example:
salt '*' slack.list_rooms
salt '*' slack.list_rooms api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15

salt modules.slack_notify.list_users(api_key=None)
List all Slack users.
Parameters api_key -- The Slack admin api key.
Returns The user list.
CLI Example:
salt '*' slack.list_users
salt '*' slack.list_users api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15

salt modules.slack_notify.post_message(channel, message, from_name, api_key=None, icon=None, attachments=None, blocks=None)
Send a message to a Slack channel.
Changed in version 3003: Added attachments and blocks kwargs
Parameters
  • channel -- The channel name, either will work.
  • message -- The message to send to the Slack channel.
  • from_name -- Specify who the message is from.
• **api_key** -- The Slack api key, if not specified in the configuration.
• **icon** -- URL to an image to use as the icon for this message
• **attachments** -- Any attachments to be sent with the message.
• **blocks** -- Any blocks to be sent with the message.

**Returns**  
Boolean if message was sent successfully.

**CLI Example:**
```
salt '*' slack.post_message channel="Development Room" message="Build is done" from_name="Build Server"
```

## 23.9.409 salt.modules.slackware_service

The service module for Slackware

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see [here](#).

**salt.modules.slackware_service**

**available**(name)

Returns **True** if the specified service is available, otherwise returns **False**.

New in version 3002.

**CLI Example:**
```
salt '*' service.available sshd
```

**disable**(name, **kwargs)**

Disable the named service to start at boot

New in version 3002.

**CLI Example:**
```
salt '*' service.disable <service name>
```

**disabled**(name)

Return **True** if the named service is enabled, false otherwise

New in version 3002.

**CLI Example:**
```
salt '*' service.disabled <service name>
```

**enable**(name, **kwargs)**

Enable the named service to start at boot

New in version 3002.

**CLI Example:**
```
salt '*' service.enable <service name>
```

**enabled**(name, **kwargs)**

Return **True** if the named service is enabled, false otherwise

New in version 3002.

### 23.9. execution modules
CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.slackware_service.force_reload(name)`
Force-reload the named service

New in version 3002.

CLI Example:

```
salt '*' service.force_reload <service name>
```

`salt.modules.slackware_service.get_all()`
Return all available boot services

New in version 3002.

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.slackware_service.get_disabled()`
Return a set of services that are installed but disabled

New in version 3002.

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.slackware_service.get_enabled()`
Return a list of service that are enabled on boot

New in version 3002.

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.slackware_service.missing(name)`
The inverse of service.available. Returns `True` if the specified service is not available, otherwise returns `False`.

New in version 3002.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.slackware_service.reload_(name)`
Reload the named service

New in version 3002.

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.slackware_service.restart(name)`
Restart the named service
New in version 3002.

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.slackware_service.start(name)

Start the specified service

New in version 3002.

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.slackware_service.status(name, sig=None)

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

New in version 3002.

**Parameters**

- **name** *(str)* -- The name of the service to check
- **sig** *(str)* -- Signature to use to find the service via ps

**Returns**

True if running, False otherwise dict: Maps service name to True if running, False otherwise

**Return type** *bool*

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

salt.modules.slackware_service.stop(name)

Stop the specified service

New in version 3002.

CLI Example:

```
salt '*' service.stop <service name>
```

### 23.9.410 salt.modules.slsutil

Utility functions for use with or in SLS files

salt.modules.slsutil.banner(*width=72, commentchar='#', borderchar='=', blockstart=None, blockend=None, title=None, text=None, newline=False)*

Create a standardized comment block to include in a templated file.

A common technique in configuration management is to include a comment block in managed files, warning users not to modify the file. This function simplifies and standardizes those comment blocks.

**Parameters**

- **width** -- The width, in characters, of the banner. Default is 72.
- **commentchar** -- The character to be used in the starting position of each line. This value should be set to a valid line comment character for the syntax of the file in which the banner is being inserted. Multiple character sequences, like ‘//’ are supported. If the file’s syntax does not support line comments (such as XML), use the blockstart and blockend options.
- **borderchar** -- The character to use in the top and bottom border of the comment box. Must be a single character.
Salt Documentation, Release 3003.3

- **blockstart** -- The character sequence to use at the beginning of a block comment. Should be used in conjunction with **blockend**
- **blockend** -- The character sequence to use at the end of a block comment. Should be used in conjunction with **blockstart**
- **title** -- The first field of the comment block. This field appears centered at the top of the box.
- **text** -- The second field of the comment block. This field appears left-justified at the bottom of the box.
- **newline** -- Boolean value to indicate whether the comment block should end with a newline. Default is `False`.

Example 1 - the default banner:

```
{{ salt['slsutil.banner']() }}
```

```
########################################################################
# #
# THIS FILE IS MANAGED BY SALT - DO NOT EDIT #
# #
# The contents of this file are managed by Salt. Any changes to this #
# file may be overwritten automatically and without warning. #
########################################################################
```

Example 2 - a Javadoc-style banner:

```
{{ salt['slsutil.banner'](commentchar=' *', borderchar='*', blockstart='/**', blockend=' */') }}
```

```
/**
  ***********************************************************************
  * *
  * THIS FILE IS MANAGED BY SALT - DO NOT EDIT *
  * *
  * The contents of this file are managed by Salt. Any changes to this *
  * file may be overwritten automatically and without warning. *
  * ***********************************************************************
  *
*/
```

Example 3 - custom text:

```
{{ set copyright='This file may not be copied or distributed without permission of SaltStack, Inc.' }}
{{ salt['slsutil.banner'](title='Copyright 2019 SaltStack, Inc.', text=copyright, width=60) }}
```

```
########################################################################
# #
# Copyright 2019 SaltStack, Inc. #
# #
# This file may not be copied or distributed without #
# permission of SaltStack, Inc. #
########################################################################
```

salt.modules.slsutil.boolstr(value, true='true', false='false')

Convert a boolean value into a string. This function is intended to be used from within file templates to provide an easy way to take boolean values stored in Pillars or Grains, and write them out in the appropriate syntax for a particular file template.
Parameters

- **value** -- The boolean value to be converted
- **true** -- The value to return if `value` is `True`
- **false** -- The value to return if `value` is `False`

In this example, a pillar named `smtp:encrypted` stores a boolean value, but the template that uses that value needs `yes` or `no` to be written, based on the boolean value.

*Note: this is written on two lines for clarity. The same result could be achieved in one line.*

```python
{% set encrypted = salt[pillar.get]('smtp:encrypted', false) %}
use_tls: {{ salt['slsutil.boolstr'](encrypted, 'yes', 'no') }}
```

Result (assuming the value is `True`):

```
use_tls: yes
```

salt.modules.slsutil.deserialize(serializer, stream_or_string, **mod_kwargs)

Deserialise a Python object using one of the available `serializer modules`.

CLI Example:

```bash
salt '*' slsutil.deserialize 'json' '{"foo": "Foo!"}'
salt '*' --no-parse=stream_or_string slsutil.deserialize 'json' \
  stream_or_string='{"foo": "Foo!"}'
```

Jinja Example:

```python
{% set python_object = salt.slsutil.deserialize('json', \
  '{{"foo": "Foo!"}}') %}
```

salt.modules.slsutil.merge(obj_a, obj_b, strategy='smart', renderer='yaml', merge_lists=False)

Merge a data structure into another by choosing a merge strategy

**Strategies:**
- aggregate
- list
- overwrite
- recurse
- smart

CLI Example:

```bash
salt '*' slsutil.merge '{foo: Foo}' '{bar: Bar}'
```

salt.modules.slsutil.merge_all(lst, strategy='smart', renderer='yaml', merge_lists=False)

New in version 2019.2.0.

Merge a list of objects into each other in order

**Parameters**
- **lst** (*Iterable*) -- List of objects to be merged.
- **strategy** (*String*) -- Merge strategy. See `utils.dictupdate`.
- **renderer** (*String*) -- Renderer type. Used to determine strategy when strategy is `smart`
- **merge_lists** (*Bool*) -- Defines whether to merge embedded object lists.

CLI Example:

```bash
$ salt-call --output=text slsutil.merge_all '[[foo: Foo], {foo: Bar}]'
local: {u'foo': u'Bar'}
```
salt.modules.slsutil.renderer(path=None, string=None, default_renderer='jinja|yaml', **kwargs)

Parse a string or file through Salt's renderer system

Changed in version 2018.3.0: Add support for Salt fileserver URIs.

This is an open-ended function and can be used for a variety of tasks. It makes use of Salt's "renderer pipes" system to run a string or file through a pipe of any of the loaded renderer modules.

**Parameters**

- **path** -- The path to a file on Salt's fileserver (any URIs supported by `cp.get_url`) or on the local file system.
- **string** -- An inline string to be used as the file to send through the renderer system. Note, not all renderer modules can work with strings; the 'py' renderer requires a file, for example.
- **default_renderer** -- The renderer pipe to send the file through; this is overridden by a "she-bang" at the top of the file.
- **kwargs** -- Keyword args to pass to Salt's compile_template() function.

Keep in mind the goal of each renderer when choosing a render-pipe; for example, the Jinja renderer processes a text file and produces a string, however the YAML renderer processes a text file and produces a data structure.

One possible use is to allow writing "map files", as are commonly seen in Salt formulas, but without tying the renderer of the map file to the renderer used in the other sls files. In other words, a map file could use the Python renderer and still be included and used by an sls file that uses the default 'jinja|yaml' renderer.

For example, the two following map files produce identical results but one is written using the normal 'jinja|yaml' and the other is using 'py':

```bash
#!jinja|yaml
{% set apache = salt.grains.filter_by(
    ..normal jinja map file here...
}, merge=salt.pillar.get('apache:lookup')) %}
{{ apache | yaml() }}
```

```bash
#!py
def run():
    apache = __salt__.grains.filter_by(
        ..normal map here but as a python dict...
    }, merge=__salt__.pillar.get('apache:lookup'))
    return apache
```

Regardless of which of the above map files is used, it can be accessed from any other sls file by calling this function. The following is a usage example in Jinja:

```bash
{% set apache = salt.slsutil.renderer('map.sls') %}
```

**CLI Example:**

```bash
salt '*' slsutil.renderer salt://path/to/file
salt '*' slsutil.renderer /path/to/file
salt '*' slsutil.renderer /path/to/file.jinja default_renderer='jinja'
salt '*' slsutil.renderer /path/to/file.sls default_renderer='jinja|yaml'
salt '*' slsutil.renderer string='Inline template! {{ saltenv }}'
salt '*' slsutil.renderer string='Hello, {{ name }}.' name='world'
```

salt.modules.slsutil.serialize(serializer, obj, **mod_kwargs)

Serialize a Python object using one of the available serializer modules.

**CLI Example:**
salt '*/' --no-parse-obj slsutil.serialize 'json' obj="{'foo': 'Foo!'}"

Jinja Example:

```
{% set json_string = salt.slsutil.serialize('json', {'foo': 'Foo!'}) %}
```

salt.modules.slsutil.update(dest, upd, recursive_update=True, merge_lists=False)

Merge upd recursively into dest

If merge_lists=True, will aggregate list object types instead of replacing. This behavior is only activated when recursive_update=True.

CLI Example:

```
salt '*/' slsutil.update '{foo: Foo}' '{bar: Bar}'
```

23.9.411 salt.modules.smartos_imgadm

Module for running imgadm command on SmartOS

salt.modules.smartos_imgadm.avail(search=None, verbose=False)

Return a list of available images

- search [string] search keyword
- verbose [boolean (False)] toggle verbose output

CLI Example:

```
salt '*/' imgadm.avail [percona]
salt '*/' imgadm.avail verbose=True
```

salt.modules.smartos_imgadm.delete(uuid)

Remove an installed image

- uuid [string] Specifies uuid to import

CLI Example:

```
salt '*/' imgadm.delete e42f8c84-bbea-11e2-b920-078fab2aab1f
```

salt.modules.smartos_imgadm.docker_to_uuid(uuid)

Get the image uuid from an imported docker image

New in version 2019.2.0.

salt.modules.smartos_imgadm.get(uuid)

Return info on an installed image

- uuid [string] uuid of image

CLI Example:

```
salt '*/' imgadm.get e42f8c84-bbea-11e2-b920-078fab2aab1f
salt '*/' imgadm.get plexinc/pms-docker:plexpass
```

salt.modules.smartos_imgadm.import_image(uuid, verbose=False)

Import an image from the repository

- uuid [string] uuid to import
- verbose [boolean (False)] toggle verbose output

CLI Example:
salt '*' imgadm.import e42f8c84-bbea-11e2-b920-078fab2aab1f [verbose=True]

salt.modules.smartos_imgadm.list_installed(verbosel=False)
Return a list of installed images
verbosel [boolean (False)] toggle verbose output
Changed in version 2019.2.0: Docker images are now also listed

CLI Example:
salt '*' imgadm.list
salt '*' imgadm.list docker=True
salt '*' imgadm.list verbose=True

salt.modules.smartos_imgadm.show(uuid)
Show manifest of a given image
uuidl [string] uuid of image

CLI Example:
salt '*' imgadm.show e42f8c84-bbea-11e2-b920-078fab2aab1f
salt '*' imgadm.show plexinc/pms-docker:plexpass

salt.modules.smartos_imgadm.source_add(source, source_type='imgapi')
Add a new source
source [string] source url to add
source_type [string (imgapi)] source type, either imgapi or docker
New in version 2019.2.0.

CLI Example:
salt '*' imgadm.source_add https://updates.joyent.com
salt '*' imgadm.source_add https://docker.io docker

salt.modules.smartos_imgadm.source_delete(source)
Delete a source
source [string] source url to delete
New in version 2019.2.0.

CLI Example:
salt '*' imgadm.source_delete https://updates.joyent.com

salt.modules.smartos_imgadm.sources(verbosel=False)
Return a list of available sources
verbosel [boolean (False)] toggle verbose output
New in version 2019.2.0.

CLI Example:
salt '*' imgadm.sources

salt.modules.smartos_imgadm.update_installed(uuid='')
Gather info on unknown image(s) (locally installed)
uuid [string] optional uuid of image

CLI Example:
salt '*' imgadm.update [uuid]
salt.modules.smartos_imgadm.vacuum(verbos=False)
   Remove unused images
   verbose [boolean (False)] toggle verbose output
   CLI Example:

   salt '*' imgadm.vacuum [verbos=True]

salt.modules.smartos_imgadm.version()
   Return imgadm version
   CLI Example:

   salt '*' imgadm.version

23.9.412  salt.modules.smartos_nictagadm

Module for running nictagadm command on SmartOS :maintainer: Jorge Schrauwen <sjorge@blackdot.be> :maturity: new :depends: nictagadm binary, dladm binary :platform: smartos

New in version 2016.11.0.

salt.modules.smartos_nictagadm.add(name, mac=1500)
   Add a new nictag
   name [string] name of new nictag
   mac [string] mac of parent interface or 'etherstub' to create a ether stub
   mtu [int] MTU (ignored for etherstubs)
   CLI Example:

   salt '*' nictagadm.add storage0 etherstub
   salt '*' nictagadm.add trunk0 'DE:AD:00:00:BE:EF' 9000

salt.modules.smartos_nictagadm.delete(name, force=False)
   Delete nictag
   name [string] nictag to delete
   force [boolean] force delete even if vms attached
   CLI Example:

   salt '*' nictagadm.exists admin

salt.modules.smartos_nictagadm.exists(*nictag, **kwargs)
   Check if nictags exists
   nictag [string] one or more nictags to check
   verbose [boolean] return list of nictags
   CLI Example:

   salt '*' nictagadm.exists admin

salt.modules.smartos_nictagadm.list_nictags(include_etherstubs=True)
   List all nictags
   include_etherstubs [boolean] toggle include of etherstubs
   CLI Example:

   salt '*' nictagadm.list

salt.modules.smartos_nictagadm.update(name, mac=none, mtu=none)
   Update a nictag

23.9. execution modules
name  [string] name of nictag
mac  [string] optional new mac for nictag
mtu  [int] optional new MTU for nictag

CLI Example:

```
salt '*' nictagadm.update trunk mtu=9000
```

```
salt.modules.smartos_nictagadm.vms(nictag)

List all vms connect to nictag
nictag  [string] name of nictag

CLI Example:

```
salt '*' nictagadm.vms admin
```

23.9.413  salt.modules.smartos_virt

virst compatibility module for managing VMs on SmartOS

```
salt.modules.smartos_virt.get_macs(domain)

Return a list off MAC addresses from the named VM

CLI Example:

```
salt '*' virt.get_macs <domain>
```

```
salt.modules.smartos_virt.init(**kwargs)

Initialize a new VM

CLI Example:

```
salt '*' virt.init image_uuid='...' alias='...' [...]
```

```
salt.modules.smartos_virt.list_active_vms()

Return a list of uuids for active virtual machine on the minion

CLI Example:

```
salt '*' virt.list_active_vms
```

```
salt.modules.smartos_virt.list_domains()

Return a list of virtual machine names on the minion

CLI Example:

```
salt '*' virt.list_domains
```

```
salt.modules.smartos_virt.list_inactive_vms()

Return a list of uuids for inactive virtual machine on the minion

CLI Example:

```
salt '*' virt.list_inactive_vms
```

```
salt.modules.smartos_virt.reboot(domain)

Reboot a domain via ACPI request

CLI Example:

```
salt '＊' virt.reboot <domain>

```python
salt.modules.smartos_virt.setmem(domain, memory)
```
Change the amount of memory allocated to VM. `<memory>` is to be specified in MB.

Note for KVM: this would require a restart of the VM.

CLI Example:
```
salt '＊' virt.setmem <domain> 512
```

```python
salt.modules.smartos_virt.shutdown(domain)
```
Send a soft shutdown signal to the named vm

CLI Example:
```
salt '＊' virt.shutdown <domain>
```

```python
salt.modules.smartos_virt.start(domain)
```
Start a defined domain

CLI Example:
```
salt '＊' virt.start <domain>
```

```python
salt.modules.smartos_virt.stop(domain)
```
Hard power down the virtual machine, this is equivalent to powering off the hardware.

CLI Example:
```
salt '＊' virt.destroy <domain>
```

```python
salt.modules.smartos_virt.vm_info(domain)
```
Return a dict with information about the specified VM on this CN

CLI Example:
```
salt '＊' virt.vm_info <domain>
```

```python
salt.modules.smartos_virt.vm_virt_type(domain)
```
Return VM virtualization type: OS or KVM

CLI Example:
```
salt '＊' virt.vm_virt_type <domain>
```

### 23.9.414 salt.modules.smartos_vmadm

Module for running vmadm command on SmartOS

```python
salt.modules.smartos_vmadm.create(from_file=None, **kwargs)
```
Create a new vm

`from_file` [string] json file to create the vm from -- if present, all other options will be ignored

`kwargs` [string|int|…] options to set for the vm

CLI Example:
salt.modules.smartos_vmadm.create_snapshot(vm, name, key='uuid')
Create snapshot of a vm
  vm [string] vm to be targeted
  name [string]
    snapshot name  The snapname must be 64 characters or less and must only contain alphanumeric characters and characters in the set [-_:%.] to comply with ZFS restrictions.
  key [string [uuid|alias|hostname]] value type of 'vm' parameter
CLI Example:
salt '*' vmadm.create_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.create_snapshot nacl baseline key=alias

salt.modules.smartos_vmadm.delete(vm, key='uuid')
Delete a vm
  vm [string] vm to be deleted
  key [string [uuid|alias|hostname]] value type of 'vm' parameter
CLI Example:
salt '*' vmadm.delete 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.delete nacl key=alias

salt.modules.smartos_vmadm.delete_snapshot(vm, name, key='uuid')
Delete snapshot of a vm
  vm [string] vm to be targeted
  name [string]
    snapshot name  The snapname must be 64 characters or less and must only contain alphanumeric characters and characters in the set [-_:%.] to comply with ZFS restrictions.
  key [string [uuid|alias|hostname]] value type of 'vm' parameter
CLI Example:
salt '*' vmadm.delete_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.delete_snapshot nacl baseline key=alias

salt.modules.smartos_vmadm.get(vm, key='uuid')
Output the JSON object describing a VM
  vm [string] vm to be targeted
  key [string [uuid|alias|hostname]] value type of 'vm' parameter
CLI Example:
salt '*' vmadm.get 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.get nacl key=alias

salt.modules.smartos_vmadm.info(vm, info_type='all', key='uuid')
Lookup info on running kvm
  vm [string] vm to be targeted
  info_type [string [all|block|blockstats|chardev|cpus|kvm|pci|spice|version|vnc]] info type to return
  key [string [uuid|alias|hostname]] value type of 'vm' parameter
CLI Example:
salt '*' vmadm.info 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.info 186da9ab-7392-4f55-91a5-b8f1fe770543 vnc

(continues on next page)
salt.modules.smartos_vmadm.list_vms(search=None, sort=None, order='uuid,type,ram,state,alias', keyed=True)

Return a list of VMs

- `search` [string] vmadm filter property
- `sort` [string] vmadm sort (-s) property
- `order` [string] vmadm order (-o) property -- Default: uuid,type,ram,state,alias
- `keyed` [boolean] specified if the output should be an array (False) or dict (True) For a dict the key is the first item from the order parameter. Note: If key is not unique last vm wins.

CLI Example:

```
salt '*' vmadm.list
salt '*' vmadm.list order=alias,ram,cpu_cap sort=-ram,-cpu_cap
salt '*' vmadm.list search='type=KVM'
```

salt.modules.smartos_vmadm.lookup(search=None, order=None, one=False)

Return a list of VMs using lookup

- `search` [string] vmadm filter property
- `order` [string] vmadm order (-o) property -- Default: uuid,type,ram,state,alias
- `one` [boolean] return only one result (vmadm's -1)

CLI Example:

```
salt '*' vmadm.lookup search='state=running'
salt '*' vmadm.lookup search='state=running' order=uid,alias,hostname
salt '*' vmadm.lookup search='alias=nacl' one=True
```

salt.modules.smartos_vmadm.reboot(vm, force=False, key='uuid')

Reboot a vm

- `vm` [string] vm to be rebooted
- `force` [boolean] force reboot of vm if true
- `key` [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt '*' vmadm.reboot vm=nacl key=alias
salt '*' vmadm.reboot vm=nina.example.org key=hostname
```

salt.modules.smartos_vmadm.receive(uuid, source)

Receive a vm from a directory

- `uuid` [string] uuid of vm to be received
- `source` [string] source directory

CLI Example:

```
salt '*' vmadm.receive 186da9ab-7392-4f55-91a5-b8f1fe770543 /opt/backups
```

salt.modules.smartos_vmadm.reprovision(vm, image, key='uuid')

Reprovision a vm

- `vm` [string] vm to be reprovisioned
- `image` [string] uuid of new image
- `key` [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:
salt.modules.smartos_vmadm.rollback_snapshot(vm, name, key='uuid')
Rollback snapshot of a vm
vm [string] vm to be targeted
name [string]
    snapshot name  The snapshot name must be 64 characters or less and must only contain alphanumeric charac-
ters and characters in the set [_.:%] to comply with ZFS restrictions.
key [string [uuid|alias|hostname]] value type of 'vm' parameter
CLI Example:
salt '*' vmadm.rollback_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.rollback_snapshot nacl baseline key=alias

salt.modules.smartos_vmadm.send(vm, target, key='uuid')
Send a vm to a directory
vm [string] vm to be sent
target [string] target directory
key [string [uuid|alias|hostname]] value type of 'vm' parameter
CLI Example:
salt '*' vmadm.send 186da9ab-7392-4f55-91a5-b8f1fe770543 /opt/backups
salt '*' vmadm.send vm=nacl target=/opt/backups key=alias

salt.modules.smartos_vmadm.start(vm, options=None, key='uuid')
Start a vm
vm [string] vm to be started
options [string] optional additional options
key [string [uuid|alias|hostname]] value type of 'vm' parameter
CLI Example:
salt '*' vmadm.start 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.start 186da9ab-7392-4f55-91a5-b8f1fe770543 'order=c,once=d cdrom=/
~path/to/image.iso,ide'
salt '*' vmadm.start vm=nacl key=alias
salt '*' vmadm.start vm=nina.example.org key=hostname

salt.modules.smartos_vmadm.stop(vm, force=False, key='uuid')
Stop a vm
vm [string] vm to be stopped
force [boolean] force stop of vm if true
key [string [uuid|alias|hostname]] value type of 'vm' parameter
CLI Example:
salt '*' vmadm.stop 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.stop 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt '*' vmadm.stop vm=nacl key=alias
salt '*' vmadm.stop vm=nina.example.org key=hostname

salt.modules.smartos_vmadm.sysrq(vm, action='nmi', key='uuid')
Send non-maskable interrupt to vm or capture a screenshot
vm [string] vm to be targeted
action [string] nmi or screenshot -- Default: nmi
key [string [uuid|alias|hostname]] value type of 'vm' parameter
CLI Example:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>salt '*' vmadm.sysrq 186da9ab-7392-4f55-91a5-b8f1fe770543 nmi</td>
<td>Update a new VM with sysrq</td>
</tr>
<tr>
<td>salt '*' vmadm.sysrq 186da9ab-7392-4f55-91a5-b8f1fe770543 screenshot</td>
<td>Update a VM with screenshot</td>
</tr>
<tr>
<td>salt '*' vmadm.sysrq nacl nmi key=alias</td>
<td>Update VM with alias</td>
</tr>
</tbody>
</table>

salt.modules.smartos_vmadm.update(vm, from_file=None, key='uuid', **kwargs)

Update a new VM

* vm [string] VM to be updated
* from_file [string] JSON file to update the VM with -- if present, all other options will be ignored
* key [string [uuid|alias|hostname]] value type of 'vm' parameter
* kwargs [string|int|... ] options to update for the VM

CLI Example:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>salt '*' vmadm.update vm=186da9ab-7392-4f55-91a5-b8f1fe770543 from_file= /tmp/new_vm.json</td>
<td>Update VM with from file and new parameters</td>
</tr>
<tr>
<td>salt '*' vmadm.update vm=nacl key=alias from_file=/tmp/new_vm.json</td>
<td>Update VM with alias and from file</td>
</tr>
<tr>
<td>salt '*' vmadm.update vm=186da9ab-7392-4f55-91a5-b8f1fe770543 max_physical_memory=1024</td>
<td>Update VM with memory parameter</td>
</tr>
</tbody>
</table>

23.9.415 salt.modules.smbios

Interface to SMBIOS/DMI

(Parsing through dmidecode)

External References

Desktop Management Interface (DMI)
System Management BIOS
DMldecode

salt.modules.smbios.get(string, clean=True)

Get an individual DMI string from SMBIOS info

* string The string to fetch. DMldecode supports:
  - bios-vendor
  - bios-version
  - bios-release-date
  - system-manufacturer
  - system-product-name
  - system-version
  - system-serial-number
  - system-uuid
  - baseboard-manufacturer
  - baseboard-product-name
  - baseboard-version
  - baseboard-serial-number
  - baseboard-asset-tag
  - chassis-manufacturer
  - chassis-type
  - chassis-version
• chassis-serial-number
• chassis-asset-tag
• processor-family
• processor-manufacturer
• processor-version
• processor-frequency

clean

Don’t return well-known false information
(invalid UUID’s, serial 000000000’s, etcetera)

Defaults to True

CLI Example:

```
salt '*' smbios.get system-uuid clean=False
```

```
salt.modules.smbios.records(rec_type=None, fields=None, clean=True)
```

Return DMI records from SMBIOS

type Return only records of type(s) The SMBIOS specification defines the following DMI types:

<table>
<thead>
<tr>
<th>Type</th>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>BIOS</td>

clean

Don't return well-known false information
(invalid UUID's, serial 000000000's, etcetera)
 Defaults to True

CLI Example:

```
salt '*' smbios.records clean=False
salt '*' smbios.records 14
salt '*' smbios.records  4 core_count,thread_count,current_speed
```

23.9.416 salt.modules.smf_service

Service support for Solaris 10 and 11, should work with other systems that use SMF also. (e.g. SmartOS)

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see here.

salt.modules.smf_service.available(name)

Returns True if the specified service is available, otherwise returns False.

We look up the name with the svcs command to get back the FMRI This allows users to use simpler service names

CLI Example:

```
salt '*' service.available net-snmp
```

salt.modules.smf_service.disable(name, **kwargs)

Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name>
```

salt.modules.smf_service.disabled(name)

Check to see if the named service is disabled to start on boot

CLI Example:
Enable the named service to start at boot

CLI Example:

```text
salt '*' service.enable <service name>
```

Check to see if the named service is enabled to start on boot

CLI Example:

```text
salt '*' service.enabled <service name>
```

Return all installed services

CLI Example:

```text
salt '*' service.get_all
```

Return the disabled services

CLI Example:

```text
salt '*' service.get_disabled
```

Return the enabled services

CLI Example:

```text
salt '*' service.get_enabled
```

Return the running services

CLI Example:

```text
salt '*' service.get_running
```

Return the stopped services

CLI Example:

```text
salt '*' service.get_stopped
```

The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```text
salt '*' service.missing net-snmp
```
salt.modules.smf_service.reload(name)
   Reload the named service
   CLI Example:
   ```
   salt '*' service.reload <service name>
   ```

salt.modules.smf_service.restart(name)
   Restart the named service
   CLI Example:
   ```
   salt '*' service.restart <service name>
   ```

salt.modules.smf_service.start(name)
   Start the specified service
   CLI Example:
   ```
   salt '*' service.start <service name>
   ```

salt.modules.smf_service.status(name, sig=None)
   Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.
   Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)
   Parameters
   - name (str): The name of the service to check
   - sig (str): Not implemented
   Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise
   Return type bool
   CLI Example:
   ```
   salt '*' service.status <service name>
   ```

salt.modules.smf_service.stop(name)
   Stop the specified service
   CLI Example:
   ```
   salt '*' service.stop <service name>
   ```

23.9.417 salt.modules.smtp

Module for Sending Messages via SMTP
New in version 2014.7.0.

depends
   - smtplib python module

collection This module can be used by either passing a jid and password directly to send_message, or by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:
The resourcename refers to the resource that is using this account. It is user-definable, and optional. The following configurations are both valid:

```
my-smtp-login:
    smtp.server: smtp.domain.com
    smtp.tls: True
    smtp.sender: admin@domain.com
    smtp.username: myuser
    smtp.password: verybadpass
```

```
another-smtp-login:
    smtp.server: smtp.domain.com
    smtp.tls: True
    smtp.sender: admin@domain.com
    smtp.username: myuser
    smtp.password: verybadpass
```

`salt.modules.smtp.send_msg`(recipient, message, subject='Message from Salt', sender=None, server=None, use_ssl='True', username=None, password=None, profile=None, attachments=None)

Send a message to an SMTP recipient. To send a message to multiple recipients, the recipients should be in a comma-separated Python string. Designed for use in states.

CLI Examples:

```
salt '*' smtp.send_msg 'admin@example.com' 'This is a salt module test' profile='my-smtp-account'
salt '*' smtp.send_msg 'admin@example.com,admin2@example.com' 'This is a salt module test for multiple recipients' profile='my-smtp-account'
salt '*' smtp.send_msg 'admin@example.com' 'This is a salt module test' username='myuser' password='verybadpass' sender='admin@example.com' server='smtp.domain.com'
salt '*' smtp.send_msg 'admin@example.com' 'This is a salt module test' username='myuser' password='verybadpass' sender='admin@example.com' server='smtp.domain.com' attachments=['/var/log/messages']
```

23.9.418 **salt.modules.snapper**

Module to manage filesystem snapshots with snapper

New in version 2016.11.0.

codeauthor Duncan Mac-Vicar P. <dmacvicar@suse.de>
codeauthor Pablo Suárez Hernández <psuarezhernandez@suse.de>
depends dbus Python module.
depends snapper http://snapper.io, available in most distros
maturity new
platform Linux

salt.modules.snapper.changed_files(config='root', num_pre=None, num_post=None)

Returns the files changed between two snapshots

config Configuration name.
num_pre first snapshot ID to compare. Default is last snapshot
num_post last snapshot ID to compare. Default is 0 (current state)

CLI Example:

```
salt '*' snapper.changed_files
salt '*' snapper.changed_files num_pre=19 num_post=20
```

salt.modules.snapper.create_baseline(tag='baseline', config='root')

Creates a snapshot marked as baseline
tag Tag name for the baseline
config Configuration name.

CLI Example:

```
salt '*' snapper.create_baseline
salt '*' snapper.create_baseline my_custom_baseline
```

salt.modules.snapper.create_config(name=None, subvolume=None, fstype=None, template=None, extra_opts=None)

Creates a new Snapper configuration
name Name of the new Snapper configuration.
subvolume Path to the related subvolume.
fstype Filesystem type of the subvolume.
template Configuration template to use. (Default: default)
extra_opts Extra Snapper configuration opts dictionary. It will override the values provided by the given template (if any).

CLI Example:

```
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ fstype=btrfs template="default"
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ fstype=btrfs extra_opts='{"NUMBER_CLEANUP": False}'
```

salt.modules.snapper.create_snapshot(config='root', snapshot_type='single', pre_number=None, description=None, cleanup_algorithm='number', userdata=None, **kwargs)

Creates a snapshot
config Configuration name.
snapshot_type Specifies the type of the new snapshot. Possible values are single, pre and post.
pre_number For post snapshots the number of the pre snapshot must be provided.
description Description for the snapshot. If not given, the salt job will be used.
cleanup_algorithm Set the cleanup algorithm for the snapshot.
number Deletes old snapshots when a certain number of snapshots is reached.
timeline Deletes old snapshots but keeps a number of hourly, daily, weekly, monthly and yearly snapshots.
empty-pre-post Deletes pre/post snapshot pairs with empty diffs.
userdata Set userdata for the snapshot (key-value pairs).

Returns the number of the created snapshot.

CLI Example:

```
salt '*' snapper.create_snapshot
```

23.9. execution modules
salt.modules.snapper.delete_snapshot(snapshots_ids=None, config='root')

Deletes an snapshot

- **config** Configuration name. (Default: root)
- **snapshots_ids** List of the snapshots IDs to be deleted.

CLI Example:

```
salt '*' snapper.delete_snapshot 54
salt '*' snapper.delete_snapshot config=root 54
salt '*' snapper.delete_snapshot config=root snapshots_ids=[54, 55, 56]
```

salt.modules.snapper.diff(config='root', filename=None, num_pre=None, num_post=None)

Returns the differences between two snapshots

- **config** Configuration name.
- **filename** if not provided the showing differences between snapshots for all "text" files
- **num_pre** first snapshot ID to compare. Default is last snapshot
- **num_post** last snapshot ID to compare. Default is 0 (current state)

CLI Example:

```
salt '*' snapper.diff
salt '*' snapper.diff filename=/var/log/snapper.log num_pre=19 num_post=20
```

salt.modules.snapper.diff_jid(jid, config='root')

Returns the changes applied by a jid

- **jid** The job id to lookup
- **config** Configuration name.

CLI Example:

```
salt '*' snapper.diff_jid jid=20160607130930720112
```

salt.modules.snapper.get_config(name='root')

Retrieves all values from a given configuration

CLI Example:

```
salt '*' snapper.get_config
```

salt.modules.snapper.get_snapshot(number=0, config='root')

Get detailed information about a given snapshot

CLI Example:

```
salt '*' snapper.get_snapshot 1
```

salt.modules.snapper.list_configs()

List all available configs

CLI Example:

```
salt '*' snapper.list_configs
```

salt.modules.snapper.list_snapshots(config='root')

List available snapshots

CLI Example:

```
salt '*' snapper.list_snapshots config=myconfig
```
salt.modules.snapper.modify_snapshot(snapshot_id=None, description=None, userdata=None, cleanup=None, config='root')

Modify attributes of an existing snapshot.

**config** Configuration name. (Default: root)

**snapshot_id** ID of the snapshot to be modified.

**cleanup** Change the cleanup method of the snapshot. (str)

**description** Change the description of the snapshot. (str)

**userdata** Change the userdata dictionary of the snapshot. (dict)

CLI Example:

```
salt '*' snapper.modify_snapshot 54 description="my snapshot description"
salt '*' snapper.modify_snapshot 54 description="my snapshot description"
salt '*' snapper.modify_snapshot 54 userdata='{"foo": "bar"}'
salt '*' snapper.modify_snapshot snapshot_id=54 cleanup="number"
```

salt.modules.snapper.run(function, *args, **kwargs)

Runs a function from an execution module creating pre and post snapshots and associating the salt job id with those snapshots for easy undo and cleanup.

**function** Salt function to call.

**config** Configuration name. (default: "root")

**description** A description for the snapshots. (default: None)

**userdata** Data to include in the snapshot metadata. (default: None)

**cleanup_algorithm** Snapper cleanup algorithm. (default: "number")

*args args for the function to call. (default: None)

**kwargs kwargs for the function to call (default: None)

This would run append text to /etc/motd using the file.append module, and will create two snapshots, pre and post with the associated metadata. The jid will be available as salt_jid in the userdata of the snapshot.

You can immediately see the changes

CLI Example:

```
salt '*' snapper.run file.append args=[''/etc/motd", "some text']"
```

salt.modules.snapper.set_config(name='root', **kwargs)

Set configuration values

CLI Example:

```
salt '*' snapper.set_config SYNC_ACL=True
```

Keys are case insensitive as they will be always uppercased to snapper convention. The above example is equivalent to:

```
salt '*' snapper.set_config sync_acl=True
```

salt.modules.snapper.status(config='root', num_pre=None, num_post=None)

Returns a comparison between two snapshots

**config** Configuration name.

**num_pre** first snapshot ID to compare. Default is last snapshot

**num_post** last snapshot ID to compare. Default is 0 (current state)

CLI Example:

```
salt '*' snapper.status
salt '*' snapper.status num_pre=19 num_post=20
```

salt.modules.snapper.status_to_string(dbus_status)

Converts a numeric dbus snapper status into a string
CLI Example:

```
salt '*' snapper.status_to_string <dbus_status>
```

```
salt.modules.snapper.undo(config='root'; files=None, num_pre=None, num_post=None)
```

Undo all file changes that happened between num_pre and num_post, leaving the files into the state of num_pre.

**Warning:** If one of the files has changes after num_post, they will be overwritten. The snapshots are used to determine the file list, but the current version of the files will be overwritten by the versions in num_pre. You can undo changes between num_pre and the current version of the files using num_post=0.

CLI Example:

```
salt '*' snapper.undo
```

```
salt.modules.snapper.undo_jid(jid, config='root')
```

Undo the changes applied by a salt job

- **jid**  The job id to lookup
- **config**  Configuration name.

CLI Example:

```
salt '*' snapper.undo_jid jid=20160607130930720112
```

### 23.9.419 salt.modules.solaris_fmadm

Module for running fmadm and fmdump on Solaris

- **maintainer**  Jorge Schrauwen <sjorge@blackdot.be>
- **maturity**  new
- **platform**  solaris,illumos

New in version 2016.3.0.

```
salt.modules.solaris_fmadm.acquit(fmri)
```

Acquit resource or acquit case

- **fmri**  string  fmri or uuid

CLI Example:

```
salt '*' fmadm.acquit fmri | uuid
```

```
salt.modules.solaris_fmadm.config()
```

Display fault manager configuration

CLI Example:

```
salt '*' fmadm.config
```

```
salt.modules.solaris_fmadm.faulty()
```

Display list of faulty resources

CLI Example:
salt '※' fmadm.faulty

salt.modules.solaris_fmadm.flush(fmri)
Flush cached state for resource

fmri: string fmri

CLI Example:
salt '※' fmadm.flush fmri

salt.modules.solaris_fmadm.healthy()
Return whether fmadm is reporting faults

CLI Example:
salt '※' fmadm.healthy

salt.modules.solaris_fmadm.list_records(after=None, before=None)
Display fault management logs

after [string] filter events after time, see man fmdump for format
before [string] filter events before time, see man fmdump for format

CLI Example:
salt '※' fmadm.list

salt.modules.solaris_fmadm.load(path)
Load specified fault manager module

path: string path of fault manager module

CLI Example:
salt '※' fmadm.load /module/path

salt.modules.solaris_fmadm.repaired(fmri)
Notify fault manager that resource has been repaired

fmri: string fmri

CLI Example:
salt '※' fmadm.repaired fmri

salt.modules.solaris_fmadm.replaced(fmri)
Notify fault manager that resource has been replaced

fmri: string fmri

CLI Example:
salt '※' fmadm.repaired fmri

salt.modules.solaris_fmadm.reset(module, serd=None)
Reset module or sub-component

module: string module to unload
serd [string] serd sub module

CLI Example:
salt '※' fmadm.reset software-response

salt.modules.solaris_fmadm.show(uuid)
Display log details

uuid: string uuid of fault
CLI Example:

```
salt '*' fmadm.show 11b4070f-4358-62fa-9e1e-998f485977e1
```

`salt.modules.solaris_fmadm.unload(module)`
Unload specified fault manager module

**module**: string  module to unload

CLI Example:

```
salt '*' fmadm.unload software-response
```

### 23.9.420 salt.modules.solaris_group

Manage groups on Solaris

**Important**: If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to 'group.info' is not available), see [here](#).

`salt.modules.solaris_group.add(name, gid=None, **kwargs)`
Add the specified group

CLI Example:

```
salt '*' group.add foo 3456
```

`salt.modules.solaris_group.chgid(name, gid)`
Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

`salt.modules.solaris_group.delete(name)`
Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.solaris_group.getent(refresh=False)`
Return info on all groups

CLI Example:

```
salt '*' group.getent
```

`salt.modules.solaris_group.info(name)`
Return information about a group

CLI Example:

```
salt '*' group.info foo
```
23.9.421 salt.modules.solaris_shadow

Manage the password database on Solaris systems

**Important:** If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to `shadow.info` is not available), see here.

salt.modules.solaris_shadow.default_hash()

Returns the default hash used for unset passwords

CLI Example:

```
salt '*' shadow.default_hash
```

salt.modules.solaris_shadow.del_password(name)

Delete the password from name user

CLI Example:

```
salt '*' shadow.del_password username
```

salt.modules.solaris_shadow.gen_password(password, crypt_salt=None, algorithm='sha512')

Generate hashed password

**Note:** When called this function is called directly via remote-execution, the password argument may be displayed in the system's process list. This may be a security risk on certain systems.

- **password**  Plaintext password to be hashed.
- **crypt_salt** Cryptographic salt. If not given, a random 8-character salt will be generated.
- **algorithm**  The following hash algorithms are supported:

  - md5
  - blowfish (not in mainline glibc, only available in distros that add it)
  - sha256
  - sha512 (default)

CLI Example:

```
salt '*' shadow.gen_password 'I_am_password'
salt '*' shadow.gen_password 'I_am_password' crypt_salt='I_am_salt'
    →algorithm=sha256
```

salt.modules.solaris_shadow.info(name)

Return information for the specified user

CLI Example:

```
salt '*' shadow.info root
```

salt.modules.solaris_shadow.set_maxdays(name, maxdays)

Set the maximum number of days during which a password is valid. See man passwd.

CLI Example:
salt '*' shadow.set_maxdays username 90

salt.modules.solaris_shadow.set_mindays(name, mindays)
    Set the minimum number of days between password changes. See man passwd.
    CLI Example:
    salt '*' shadow.set_mindays username 7

salt.modules.solaris_shadow.set_password(name, password)
    Set the password for a named user. The password must be a properly defined hash, the password hash can be
generated with this command: openssl passwd -1 <plaintext password>
    CLI Example:
    salt '*' shadow.set_password root $1$UYCIxa628.9qXjpQCjM4a..

salt.modules.solaris_shadow.set_warndays(name, warndays)
    Set the number of days of warning before a password change is required. See man passwd.
    CLI Example:
    salt '*' shadow.set_warndays username 7

23.9.422 salt.modules.solaris_system

Support for reboot, shutdown, etc

This module is assumes we are using solaris-like shutdown

New in version 2016.3.0.

salt.modules.solaris_system.halt()
    Halt a running system
    CLI Example:
    salt '*' system.halt

salt.modules.solaris_system.init(state)
    Change the system runlevel on sysV compatible systems
    CLI Example:
    state [string] Init state
    salt '*' system.init 3

salt.modules.solaris_system.poweroff()
    Poweroff a running system
    CLI Example:
    salt '*' system.poweroff

salt.modules.solaris_system.reboot(delay=0, message=None)
    Reboot the system
    delay [int] Optional wait time in seconds before the system will be rebooted.
    message [string] Optional message to broadcast before rebooting.
**CLI Example:**

```bash
salt '*' system.reboot
salt '*' system.reboot 60 "=== system upgraded ==="
```

```bash
salt.modules.solaris_system.shutdown(
    delay=0, message=None
)
```

Shut down a running system

- `delay` [int] Optional wait time in seconds before the system will be shut down.
- `message` [string] Optional message to broadcast before rebooting.

**CLI Example:**

```bash
salt '*' system.shutdown
salt '*' system.shutdown 60 "=== disk replacement ==="
```

---

**23.9.423 salt.modules.solaris_user**

Manage users with the useradd command

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to 'user.info' is not available), see [here](#).

```bash
salt.modules.solaris_user.add(
    name, uid=None, gid=None, groups=None, home=None, shell=None,
    unique=True, fullname='', roomnumber='', workphone='', homephone='',
    createhome=True, **kwargs)
```

Add a user to the minion

**CLI Example:**

```bash
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

```bash
salt.modules.solaris_user.chfullname(
    name, fullname
)
```

Change the user's Full Name

**CLI Example:**

```bash
salt '*' user.chfullname foo "Foo Bar"
```

```bash
salt.modules.solaris_user.chgid(
    name, gid
)
```

Change the default group of the user

**CLI Example:**

```bash
salt '*' user.chgid foo 4376
```

```bash
salt.modules.solaris_user.chgroups(
    name, groups, append=False
)
```

Change the groups to which a user belongs

- `name` Username to modify
- `groups` List of groups to set for the user. Can be passed as a comma-separated list or a Python list.
- `append` [False] Set to `True` to append these groups to the user’s existing list of groups. Otherwise, the specified groups will replace any existing groups for the user.

**CLI Example:**

```bash
salt '*' user.chgroups foo wheel,root True
```
salt.modules.solaris_user.chhome(name, home, persist=False)
  Set a new home directory for an existing user
  name  Username to modify
  home  New home directory to set
  persist  [False] Set to True to prevent configuration files in the new home directory from being overwritten by the files from the skeleton directory.
  CLI Example:

```bash
salt '*' user.chhome foo /home/users/foo True
```

salt.modules.solaris_user.chhomephone(name, homephone)
  Change the user's Home Phone
  CLI Example:

```bash
salt '*' user.chhomephone foo "7735551234"
```

salt.modules.solaris_user.chroomnumber(name, roomnumber)
  Change the user's Room Number
  CLI Example:

```bash
salt '*' user.chroomnumber foo 123
```

salt.modules.solaris_user.chshell(name, shell)
  Change the default shell of the user
  CLI Example:

```bash
salt '*' user.chshell foo /bin/zsh
```

salt.modules.solaris_user.chuid(name, uid)
  Change the uid for a named user
  CLI Example:

```bash
salt '*' user.chuid foo 4376
```

salt.modules.solaris_user.chworkphone(name, workphone)
  Change the user's Work Phone
  CLI Example:

```bash
salt '*' user.chworkphone foo "7735550123"
```

salt.modules.solaris_user.delete(name, remove=False, force=False)
  Remove a user from the minion
  CLI Example:

```bash
salt '*' user.delete name remove=True force=True
```

salt.modules.solaris_user.getent(refresh=False)
  Return the list of all info for all users
  CLI Example:

```bash
salt '*' user.getent
```
salt.modules.solaris_user.info(name)
   Return user information
   CLI Example:
   
   salt '*' user.info root

salt.modules.solaris_user.list_groups(name)
   Return a list of groups the named user belongs to
   CLI Example:
   
   salt '*' user.list_groups foo

salt.modules.solaris_user.list_users()
   Return a list of all users
   CLI Example:
   
   salt '*' user.list_users

salt.modules.solaris_user.rename(name, new_name)
   Change the username for a named user
   CLI Example:
   
   salt '*' user.rename name new_name

23.9.424 salt.modules.solarisipspkg

IPS pkg support for Solaris

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

This module provides support for Solaris 11 new package management - IPS (Image Packaging System). This is the default pkg module for Solaris 11 (and later).

If you want to use also other packaging module (e.g. pkgutil) together with IPS, you need to override the pkg provider in sls for each package:

```
mypackage:
   pkg.installed:
      - provider: pkgutil
```

Or you can override it globally by setting the providers parameter in your Minion config file like this:

```
providers:
   pkg: pkgutil
```

Or you can override it globally by setting the providers parameter in your Minion config file like this:

```
providers:
   pkg: pkgutil
```

salt.modules.solarisipspkg.available_version(*names, **kwargs)
   This function is an alias of latest_version.

23.9. execution modules
The available version of packages in the repository. Accepts full or partial FMRI. Partial FMRI is returned if the full FMRI could not be resolved.

If the latest version of a given package is already installed, an empty string will be returned for that package.

Please use pkg.latest_version as pkg.available_version is being deprecated.

Changed in version 2019.2.0: Support for multiple package names added.

CLI Example:

```
salt '*' pkg.latest_version bash
salt '*' pkg.latest_version pkg://solaris/entire
salt '*' pkg.latest_version postfix sendmail
```

```python
salt.modules.solarisipspkg.get_fmri(name, **kwargs)
```

Returns FMRI from partial name. Returns empty string ('') if not found. In case of multiple match, the function returns list of all matched packages.

CLI Example:

```
salt '*' pkg.get_fmri bash
```

```python
salt.modules.solarisipspkg.install(name=None, refresh=False, pkgs=None, version=None, test=False, **kwargs)
```

Install the named package using the IPS pkg command. Accepts full or partial FMRI.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

Multiple Package Installation Options:

**pkgs** A list of packages to install. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install vim
salt '*' pkg.install pkg://solaris/editor/vim
salt '*' pkg.install pkg://solaris/editor/vim refresh=True
salt '*' pkg.install pkgs='["foo", "bar"]'
```

```python
salt.modules.solarisipspkg.is_installed(name, **kwargs)
```

Returns True if the package is installed. Otherwise returns False. Name can be full or partial FMRI. In case of multiple match from partial FMRI name, it returns True.

CLI Example:

```
salt '*' pkg.is_installed bash
```

```python
salt.modules.solarisipspkg.latest_version(*names, **kwargs)
```

The available version of packages in the repository. Accepts full or partial FMRI. Partial FMRI is returned if the full FMRI could not be resolved.

If the latest version of a given package is already installed, an empty string will be returned for that package.

Please use pkg.latest_version as pkg.available_version is being deprecated.

Changed in version 2019.2.0: Support for multiple package names added.

CLI Example:
salt.modules.solarisipspkg.list_pkgs(versions_as_list=False, **kwargs)
List the currently installed packages as a dict:

{'<package_name>': '<version>'}

CLI Example:
salt '*' pkg.list_pkgs

salt.modules.solarisipspkg.list_upgrades(refresh=True, **kwargs)
Lists all packages available for update.

When run in global zone, it reports only upgradable packages for the global zone.
When run in non-global zone, it can report more upgradable packages than pkg update -vn, because pkg update hides packages that require newer version of pkg://solaris/entire (which means that they can be upgraded only from the global zone). If pkg://solaris/entire is found in the list of upgrades, then the global zone should be updated to get all possible updates. Use refresh=True to refresh the package database.
refresh  [True] Runs a full package database refresh before listing. Set to False to disable running the refresh.

Salt 2017.7.0.

In previous versions of Salt, refresh defaulted to False. This was changed to default to True in the 2017.7.0 release to make the behavior more consistent with the other package modules, which all default to True.

CLI Example:
salt '*' pkg.list_upgrades
salt '*' pkg.list_upgrades refresh=False

salt.modules.solarisipspkg.normalize_name(name, **kwargs)
Internal function. Normalizes pkg name to full FMRI before running pkg.install. In case of multiple matches or no match, it returns the name without modifications.

CLI Example:
salt '*' pkg.normalize_name vim

salt.modules.solarisipspkg.purge(name, **kwargs)
Remove specified package. Accepts full or partial FMRI.

Returns a list containing the removed packages.

CLI Example:
salt '*' pkg.purge <package name>

salt.modules.solarisipspkg.refresh_db(full=False, **kwargs)
Updates the remote repos database.

full : False
   Set to True to force a refresh of the pkg DB from all publishers, regardless of the last refresh time.

CLI Example:
**salt documentation, release 3003.3**

```
salt '*' pkg.refresh_db
salt '*' pkg.refresh_db full=True
```

salt.modules.solarisipspkg.remove(*name=None, pkgs=None, **kwargs*)

Remove specified package. Accepts full or partial FMRI. In case of multiple match, the command fails and won't modify the OS.

- name The name of the package to be deleted.
- Multiple Package Options:
  - pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove tcsh
salt '*' pkg.remove pkg://solaris/shell/tcsh
salt '*' pkg.remove pkgs=['"foo", "bar"]'
```

salt.modules.solarisipspkg.search(*name, versions_as_list=False, **kwargs*)

Searches the repository for given pkg name. The name can be full or partial FMRI. All matches are printed. Globbs are also supported.

CLI Example:

```
salt '*' pkg.search bash
```

salt.modules.solarisipspkg.upgrade(*refresh=False, **kwargs*)

Upgrade all packages to the latest possible version. When run in global zone, it updates also all non-global zones. In non-global zones upgrade is limited by dependency constrains linked to the version of pkg://solaris/entire.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

When there is a failure, an explanation is also included in the error message, based on the return code of the pkg update command.

CLI Example:

```
salt '*' pkg.upgrade
```

salt.modules.solarisipspkg.upgrade_available(*name, **kwargs*)

Check if there is an upgrade available for a certain package Accepts full or partial FMRI. Returns all matches found.

CLI Example:

```
salt '*' pkg.upgrade_available apache-22
```

salt.modules.solarisipspkg.version(*names, **kwargs*)

Common interface for obtaining the version of installed packages. Accepts full or partial FMRI. If called using pkg_resource, full FMRI is required. Partial FMRI is returned if the package is not installed.

CLI Example:
23.9.425 salt.modules.solarispkg

Package support for Solaris

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see [here](#).

```python
salt.modules.solarispkg.available_version("names", **kwargs)
```

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

**CLI Example:**

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

**NOTE:** As package repositories are not presently supported for Solaris pkgadd, this function will always return an empty string for a given package.

```python
salt.modules.solarispkg.install(name=None, sources=None, saltenv='base', **kwargs)
```

Install the passed package. Can install packages from the following sources:

- Locally (package already exists on the minion)
- HTTP/HTTPS server
- FTP server
- Salt master

Returns a dict containing the new package names and versions:

```python
{
    '<package>': {
        'old': '<old-version>',
        'new': '<new-version>'
    }
}
```

**CLI Examples:**

```bash
# Installing a data stream pkg that already exists on the minion
salt '*' pkg.install sources='["<pkg name>": "/dir/on/minion/<pkg filename>"]'
salt '*' pkg.install sources='["SMClgcc346": "/var/spool/pkg/gcc-3.4.6-sol10-sparc-local.pkg"]'
```

```bash
# Installing a data stream pkg that exists on the salt master
salt '*' pkg.install sources='["<pkg name>": "/salt://pkgs/<pkg filename>"]'
salt '*' pkg.install sources='["SMClgcc346": "/salt://pkgs/gcc-3.4.6-sol10-sparc-local.pkg"]'
```

**CLI Example:**
# Installing a data stream pkg that exists on a HTTP server

salt '*' pkg.install sources='[{"<pkg name>": "http://packages.server.com/<pkg filename>"}]'

If working with solaris zones and you want to install a package only in the global zone you can pass `current_zone_only=True` to salt to have the package only installed in the global zone. (Behind the scenes this is passing `-G` to the pkgadd command.) Solaris default when installing a package in the global zone is to install it in all zones. This overrides that and installs the package only in the global.

CLI Example:

```
# Installing a data stream package only in the global zone:
salt 'global_zone' pkg.install sources='[{"SMClgcc346": "/var/spool/pkg/gcc-3.4.6-sol10-sparc-local.pkg"}]' current_zone_only=True
```

By default salt automatically provides an adminfile, to automate package installation, with these options set:

```
email=
instance=quit
partial=nocheck
runlevel=nocheck
idepend=nocheck
rdepend=nocheck
space=nocheck
setuid=nocheck
conflict=nocheck
action=nocheck
basedir=default
```

You can override any of these options in two ways. First you can optionally pass any of the options as a kwarg to the module/state to override the default value or you can optionally pass the 'admin_source' option providing your own adminfile to the minions.

Note: You can find all of the possible options to provide to the adminfile by reading the admin man page:

```
man -s 4 admin
```

CLI Example:

```
# Overriding the 'instance' adminfile option when calling the module directly
salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"}]' instance="overwrite"
```

SLS Example:

```
# Overriding the 'instance' adminfile option when used in a state
SMClgcc346:
pkg.installed:
  - sources:
    - SMClgcc346: salt://srv/salt/pkgs/gcc-3.4.6-sol10-sparc-local.pkg
    - instance: overwrite
```

Note: The ID declaration is ignored, as the package name is read from the sources parameter.
Salt Documentation, Release 3003.3

CLI Example:
# Providing your own adminfile when calling the module directly
salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"}]'
,→admin_source='salt://pkgs/<adminfile filename>'
# Providing your own adminfile when using states
<pkg name>:
pkg.installed:
- sources:
- <pkg name>: salt://pkgs/<pkg filename>
- admin_source: salt://pkgs/<adminfile filename>

Note: The ID declaration is ignored, as the package name is read from the sources parameter.
salt.modules.solarispkg.latest_version(*names, **kwargs)
Return the latest version of the named package available for upgrade or installation. If more than one package
name is specified, a dict of name/version pairs is returned.
If the latest version of a given package is already installed, an empty string will be returned for that package.
CLI Example:
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...

NOTE: As package repositories are not presently supported for Solaris pkgadd, this function will always return
an empty string for a given package.
salt.modules.solarispkg.list_pkgs(versions_as_list=False, **kwargs)
List the packages currently installed as a dict:
{'<package_name>': '<version>'}

CLI Example:
salt '*' pkg.list_pkgs

salt.modules.solarispkg.purge(name=None, pkgs=None, **kwargs)
Package purges are not supported, this function is identical to remove().
name The name of the package to be deleted
Multiple Package Options:
pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this
option is passed.
New in version 0.16.0.
Returns a dict containing the changes.
CLI Example:
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'

salt.modules.solarispkg.remove(name=None, pkgs=None, saltenv='base', **kwargs)
Remove packages with pkgrm
23.9. execution modules

2735


**name**  The name of the package to be deleted  
By default salt automatically provides an adminfile, to automate package removal, with these options set:

```plaintext
email=
instance=quit
partial=nocheck
runlevel=nocheck
idepend=nocheck
rdepend=nocheck
space=nocheck
setuid=nocheck
conflict=nocheck
action=nocheck
basedir=default
```

You can override any of these options in two ways. First you can optionally pass any of the options as a kwarg to the module/state to override the default value or you can optionally pass the 'admin_source' option providing your own adminfile to the minions.

Note: You can find all of the possible options to provide to the adminfile by reading the admin man page:

```
man -s 4 admin
```

Multiple Package Options:

**pkgs**  A list of packages to delete. Must be passed as a python list. The **name** parameter will be ignored if this option is passed.
New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```plaintext
salt '*' pkg.remove <package name>
salt '*' pkg.remove SUNWgit
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

```
salt.modules.solarispkg.upgrade_available(name, **kwargs)
  Check whether or not an upgrade is available for a given package

  CLI Example:

  salt '*' pkg.upgrade_available <package name>
```

```
salt.modules.solarispkg.version(*names, **kwargs)
  Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

  CLI Example:

  salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```
23.9.426  salt.modules.solr

Apache Solr Salt Module

Author: Jed Glazner Version: 0.2.1 Modified: 12/09/2011

This module uses HTTP requests to talk to the apache solr request handlers to gather information and report errors. Because of this the minion doesn't necessarily need to reside on the actual slave. However if you want to use the signal function the minion must reside on the physical solr host.

This module supports multi-core and standard setups. Certain methods are master/slave specific. Make sure you set the solr.type. If you have questions or want a feature request please ask.

Coming Features in 0.3

1. Add command for checking for replication failures on slaves
2. Improve match_index_versions since it's pointless on busy solr masters
3. Add additional local fs checks for backups to make sure they succeeded

Override these in the minion config

solr.cores A list of core names e.g. ['core1','core2']. An empty list indicates non-multicore setup.
solr.baseurl The root level URL to access solr via HTTP

solr.request_timeout The number of seconds before timing out an HTTP/HTTPS/FTP request. If nothing is specified then the python global timeout setting is used.
solr.type Possible values are 'master' or 'slave'
solr.backup_path The path to store your backups. If you are using cores and you can specify to append the core name to the path in the backup method.
solr.num_backups For versions of solr >= 3.5. Indicates the number of backups to keep. This option is ignored if your version is less.
solr.init_script The full path to your init script with start/stop options

Required Options for DIH

clean [False] Clear the index before importing
commit [True] Commit the documents to the index upon completion
optimize [True] Optimize the index after commit is complete
verbos [True] Get verbose output

salt.modules.solr.abort_import(handler, host=None, core_name=None, verbose=False)

MASTER ONLY Aborts an existing import command to the specified handler. This command can only be run if the minion is configured with solr.type=master
handler [str] The name of the data import handler.
host [str (None)] The solr host to query. __opts__['host'] is default.
core [str (None)] The core the handler belongs to.
verbose [boolean (False)] Run the command with verbose output.

Return : dict<str,obj>:
CLI Example:
```
salt '*' solr.backup music
```

```python
salt.modules.solr.backup(host=None, core_name=None, append_core_to_path=False)
Tell solr make a backup. This method can be mis-leading since it uses the backup API. If an error happens during the backup you are not notified. The status: 'OK' in the response simply means that solr received the request successfully.

host [str (None)] The solr host to query. __opts__['host'] is default.
core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.
append_core_to_path [boolean (False)] If True add the name of the core to the backup path. Assumes that minion backup path is not None.
```
Return : dict:<str,obj>:

```
{ 'success':boolean, 'data':dict, 'errors':list, 'warnings':list }
```

CLI Example:
```
salt '*' solr.backup music
```

CLI Example:
```
salt '*' solr.core_status None music
```

CLI Example:
```
salt '*' solr.core_status None music
```

```
salt.modules.solr.core_status(host=None, core_name=None)
MULTI-CORE HOSTS ONLY Get the status for a given core or all cores if no core is specified
host [str (None)] The solr host to query. __opts__['host'] is default.
core_name [str] The name of the core to reload
```
Return : dict:<str,obj>:

```
{ 'success':boolean, 'data':dict, 'errors':list, 'warnings':list }
```

CLI Example:
```
salt '*' solr.core_status None music
```

```
salt.modules.solr.delta_import(handler, host=None, core_name=None, options=None, extra=None)
Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with solr.type=master
handler [str] The name of the data import handler.
host [str (None)] The solr host to query. __opts__['host'] is default.
core [str (None)] The core the handler belongs to.
options [dict (__opts__)] A list of options such as clean, optimize commit, verbose, and pause_replication. leave blank to use __opts__Defaults. options will be merged with __opts__options.
extra [dict ({}]] Extra name value pairs to pass to the handler. e.g. ["name=value"]
```
Return : dict:<str,obj>:

```
{ 'success':boolean, 'data':dict, 'errors':list, 'warnings':list }
```

CLI Example:
```
salt '*' solr.delta_import dataimport None music {'clean':True}
```

```
salt.modules.solr.full_import(handler, host=None, core_name=None, options=None, extra=None)
MASTER ONLY Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with solr.type=master
```

```
{ 'success':boolean, 'data':dict, 'errors':list, 'warnings':list }
```

CLI Example:
```
salt '*' solr.full_import dataimport None music {'clean':True}
```

```
salt.modules.solr.full_import(handler, host=None, core_name=None, options=None, extra=None)
MASTER ONLY Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with solr.type=master
```

```
{ 'success':boolean, 'data':dict, 'errors':list, 'warnings':list }
```

 CLI Example:
```
salt '*' solr.full_import dataimport None music {'clean':True}
```
handler [str] The name of the data import handler.
host [str (None)] The solr host to query. __opts__['host'] is default.
core [str (None)] The core the handler belongs to.
options [dict (__opts__)] A list of options such as clean, optimize commit, verbose, and pause_replication.
leave blank to use __opts__ defaults. options will be merged with __opts__
extras [dict ([])] Extra name value pairs to pass to the handler. e.g. ["name=value"]
Return: dict<str,obj>:

CLI Example:
```
salt '*' solr.full_import dataimport None music {'clean':True}
```
salt.modules.solr.full_import

salt.modules.solr.full_import

salt.modules.solr.import_status (handler, host=None, core_name=None, verbose=False)
Submit an import command to the specified handler using specified options. This command can only be run
if the minion is configured with solr.type: 'master'
handler [str] The name of the data import handler.
host [str (None)] The solr host to query. __opts__['host'] is default.
core [str (None)] The core the handler belongs to.
verbose [boolean (False)] Specifies verbose output
Return: dict<str,obj>:

CLI Example:
```
salt '*' solr.import_status dataimport None music False
```
salt.modules.solr.import_status

salt.modules.solr.is_replication_enabled (host=None, core_name=None)
SLAVE CALL Check for errors, and determine if a slave is replicating or not.
host [str (None)] The solr host to query. __opts__['host'] is default.
core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores
or if you want to check all cores.
Return: dict<str,obj>:

CLI Example:
```
salt '*' solr.is_replication_enabled music
```
salt.modules.solr.is_replication_enabled

salt.modules.solr.lucene_version(core_name=None)
Get the lucene version that solr is using. If you are running a multi-core setup you should specify a core name
since all the cores run under the same servlet container, they will all have the same version.
core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores
or if you want to check all cores.
Return: dict<str,obj>:

CLI Example:
```
salt '*' solr.lucene_version
```
salt.modules.solr.lucene_version

salt.modules.solr.match_index_versions (host=None, core_name=None)
SLAVE CALL Verifies that the master and the slave versions are in sync by comparing the index version. If
you are constantly pushing updates the index the master and slave versions will seldom match. A solution to
this is pause indexing every so often to allow the slave to replicate and then call this method before allowing
indexing to resume.

host  [str (None)] The solr host to query. __opts__['host'] is default.
core_name  [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores
or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.match_index_versions music
```

salt.modules.solr.optimize (host=None, core_name=None)

Search queries fast, but it is a very expensive operation. The ideal process is to run this with a master/slave
configuration. Then you can optimize the master, and push the optimized index to the slaves. If you are
running a single solr instance, or if you are going to run this on a slave be aware than search performance will
be horrible while this command is being run. Additionally it can take a LONG time to run and your HTTP
request may timeout. If that happens adjust your timeout settings.

host  [str (None)] The solr host to query. __opts__['host'] is default.
core_name  [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores
or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.optimize music
```

salt.modules.solr.ping (host=None, core_name=None)

Does a health check on solr, makes sure solr can talk to the indexes.

host  [str (None)] The solr host to query. __opts__['host'] is default.
core_name  [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores
or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.ping music
```

salt.modules.solr.reload_core (host=None, core_name=None)

MULTI-CORE HOSTS ONLY Load a new core from the same configuration as an existing registered core. While the "new" core is initializing, the "old" one will continue to accept requests. Once it has finished, all
new request will go to the "new" core, and the "old" core will be unloaded.

host  [str (None)] The solr host to query. __opts__['host'] is default.
core_name  [str] The name of the core to reload

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:
salt '*' solr.reload_core None music

Return data is in the following format:

```json
{'success':bool, 'data':dict, 'errors':list, 'warnings':list}
```

salt.modules.solr.reload_import_config(handler, host=None, core_name=None, verbose=False)

MASTER ONLY re-loads the handler config XML file. This command can only be run if the minion is a 'master' type

- **handler** [str] The name of the data import handler.
- **host** [str (None)] The solr host to query. __opts__['host'] is default.
- **core** [str (None)] The core the handler belongs to.
- **verbose** [boolean (False)] Run the command with verbose output.

Return : dict<str,obj>:

```json
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```bash
salt '*' solr.reload_import_config dataimport None music {'clean':True}
```

salt.modules.solr.replication_details(host=None, core_name=None)

Get the full replication details.

- **host** [str (None)] The solr host to query. __opts__['host'] is default.
- **core_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```json
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```bash
salt '*' solr.replication_details music
```

salt.modules.solr.set_is_polling(polling, host=None, core_name=None)

SLAVE CALL Prevent the slaves from polling the master for updates.

- **polling** [boolean] True will enable polling. False will disable it.
- **host** [str (None)] The solr host to query. __opts__['host'] is default.
- **core_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```json
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```bash
salt '*' solr.set_is_polling False
```

salt.modules.solr.set_replication_enabled(status, host=None, core_name=None)

MASTER ONLY Sets the master to ignore poll requests from the slaves. Useful when you don't want the slaves replicating during indexing or when clearing the index.

- **status** [boolean] Sets the replication status to the specified state.
- **host** [str (None)] The solr host to query. __opts__['host'] is default.
- **core_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to set the status on all cores.
Return: dict<str,obj>:

```python
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.set_replication_enabled false, None, music
```

salt.modules.solr.signal(signal=None)

Signals Apache Solr to start, stop, or restart. Obviously this is only going to work if the minion resides on the solr host. Additionally Solr doesn't ship with an init script so one must be created.

signal [str (None)] The command to pass to the apache solr init valid values are 'start', 'stop', and 'restart'

CLI Example:

```
salt '*' solr.signal restart
```

salt.modules.solr.version(core_name=None)

Gets the solr version for the core specified. You should specify a core here as all the cores will run under the same servlet container and so will all have the same version.

core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return: dict<str,obj>:

```python
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.version
```

### 23.9.427 salt.modules.solrcloud

Module for solrcloud configuration

New in version 2017.7.0.

For now, module is limited to http-exposed API. It doesn't implement config upload via Solr zkCli

salt.modules.solrcloud.BOOL_PROPS_LIST = ['transient', 'loadOnStartup']

Collections options type definition Reference: https://cwiki.apache.org/confluence/display/solr/Collections+API#CollectionsAPI-api1

salt.modules.solrcloud.DICT_OPTIONS_LIST = ['properties']

Collection unmodifiable options Reference: https://cwiki.apache.org/confluence/display/solr/Collections+API#CollectionsAPI-modifycoll

salt.modules.solrcloud.alias_exists(alias_name, **kwags)

Check alias existence

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.alias_exists my_alias
```

salt.modules.solrcloud.alias_get_collections(alias_name, **kwags)

Get collection list for an alias

Additional parameters (kwargs) may be passed, they will be proxied to http.query
Salt Documentation, Release 3003.3

CLI Example:
```
salt '*' solrcloud.alias_get my_alias
```

salt.modules.solrcloud.alias_set_collections(alias_name, collections=None, **kwargs)
Define an alias
Additional parameters (kwargs) may be passed, they will be proxied to http.query
CLI Example:
```
salt '*' solrcloud.alias_set my_alias collections=[collection1, collection2]
```

salt.modules.solrcloud.cluster_status(**kwargs)
Get cluster status
Additional parameters (kwargs) may be passed, they will be proxied to http.query
CLI Example:
```
salt '*' solrcloud.cluster_status
```

salt.modules.solrcloud.collection_backup(collection_name, location, backup_name=None, **kwargs)
Create a backup for a collection.
Additional parameters (kwargs) may be passed, they will be proxied to http.query
CLI Example:
```
salt '*' solrcloud.core_backup collection_name /mnt/nfs_backup
```

salt.modules.solrcloud.collection_backup_all(location, backup_name=None, **kwargs)
Create a backup for all collection present on the server.
Additional parameters (kwargs) may be passed, they will be proxied to http.query
CLI Example:
```
salt '*' solrcloud.core_backup /mnt/nfs_backup
```

salt.modules.solrcloud.collection_check_options(options)
Check collections options
CLI Example:
```
salt '*' solrcloud.collection_check_options '{"replicationFactor":4}"
```

salt.modules.solrcloud.collection_create(collection_name, options=None, **kwargs)
Create a collection,
Additional parameters (kwargs) may be passed, they will be proxied to http.query
CLI Example:
```
salt '*' solrcloud.collection_create collection_name
```

Collection creation options may be passed using the "options" parameter. Do not include option "name" since it already specified by the mandatory parameter "collection_name"
```
salt '*' solrcloud.collection_create collection_name options={"replicationFactor":2, "numShards":3}
```
Cores options may be passed using the "properties" key in options. Do not include property "name"

```bash
salt '*' solrcloud.collection_create collection_name options={"replicationFactor":2, "numShards":3, "properties":{"dataDir":/srv/solr/hugePartitionSollection"}}
```

```
salt.modules.solrcloud.collection_creation_options()
Get collection option list that can only be defined at creation

CLI Example:
```bash
salt '*' solrcloud.collection_creation_options
```

```
salt.modules.solrcloud.collection_exists(collection_name, **kwargs)
Check if a collection exists

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
```bash
salt '*' solrcloud.collection_exists collection_name
```

```
salt.modules.solrcloud.collection_get_options(collection_name, **kwargs)
Get collection options

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
```bash
salt '*' solrcloud.collection_get_options collection_name
```

```
salt.modules.solrcloud.collection_list(**kwargs)
List all collections

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
```bash
salt '*' solrcloud.collection_list
```

```
salt.modules.solrcloud.collection_reload(collection, **kwargs)
Check if a collection exists

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
```bash
salt '*' solrcloud.collection_reload collection_name
```

```
salt.modules.solrcloud.collection_set_options(collection_name, options, **kwargs)
Change collection options

Additional parameters (kwargs) may be passed, they will be proxied to http.query

Note that not every parameter can be changed after collection creation

CLI Example:
```bash
salt '*' solrcloud.collection_set_options collection_name options={ "replicationFactor":4 }
```
salt.modules.solrcloud.log = <SaltLoggingClass salt.modules.solrcloud (GARBAGE)>
Core properties type definition. Reference: https://cwiki.apache.org/confluence/display/solr/Defining+core.properties

23.9.428 salt.modules.splunk

Module for interop with the Splunk API
New in version 2016.3.0.

depends

- splunk-sdk python module

configuration Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'splunk' key by default, if defined.

For example:

```yaml
splunk:
  username: alice
  password: abc123
  host: example.splunkcloud.com
  port: 8080
```

salt.modules.splunk.create_user(email, profile='splunk', **kwargs)
create a splunk user by name/email

CLI Example:

```bash
salt myminion splunk.create_user user@example.com roles=['user'] realname='Test User' name=testuser
```

salt.modules.splunk.delete_user(email, profile='splunk')
Delete a splunk user by email

CLI Example:

```bash
salt myminion splunk_user.delete 'user@example.com'
```

salt.modules.splunk.get_user(email, profile='splunk', **kwargs)
Get a splunk user by name/email

CLI Example:

```bash
salt myminion splunk.get_user 'user@example.com' user_details=false
salt myminion splunk.get_user 'user@example.com' user_details=true
```

salt.modules.splunk.list_users(profile='splunk')
List all users in the splunk DB

CLI Example:

```bash
salt myminion splunk.list_users
```

salt.modules.splunk.update_user(email, profile='splunk', **kwargs)
Create a splunk user by email

CLI Example:
23.9.429  **salt.modules.splunk_search**

Module for interop with the Splunk API

New in version 2015.5.0.

**depends**

- splunk-sdk python module

**configuration** Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'splunk' key by default, if defined.

For example:

```yaml
splunk:
    username: alice
    password: abc123
    host: example.splunkcloud.com
    port: 8080
```

salt.modules.splunk_search.**create**(name, profile='splunk', **kwargs)

Create a splunk search

CLI Example:

```bash
splunk_search.create 'my search name' search='error msg'
```

salt.modules.splunk_search.**delete**(name, profile='splunk')

Delete a splunk search

CLI Example:

```bash
splunk_search.delete 'my search name'
```

salt.modules.splunk_search.**get**(name, profile='splunk')

Get a splunk search

CLI Example:

```bash
splunk_search.get 'my search name'
```

salt.modules.splunk_search.**list** (profile='splunk')

List splunk searches (names only)

CLI Example:

```bash
splunk_search.list
```

salt.modules.splunk_search.**list_all**(prefix=None, app=None, owner=None, description_contains=None, name_not_contains=None, profile='splunk')

Get all splunk search details. Produces results that can be used to create an sls file.

if app or owner are specified, results will be limited to matching saved searches.

if description_contains is specified, results will be limited to those where "description_contains in description" is true if name_not_contains is specified, results will be limited to those where "name_not_contains not in name" is true.

If prefix parameter is given, alarm names in the output will be prepended with the prefix; alarms that have the prefix will be skipped. This can be used to convert existing alarms to be managed by salt, as follows:
CLI Example:
1. **Make a "backup" of all existing searches** $ salt-call splunk_search.list_all --out=txt | sed "s/local: //" > legacy_searches.sls
2. **Get all searches with new prefixed names** $ salt-call splunk_search.list_all "prefix="MANAGED BY SALT"" --out=txt | sed "s/local: //" > managed_searches.sls
3. **Insert the managed searches into splunk** $ salt-call state.sls managed_searches.sls
4. Manually verify that the new searches look right
5. Delete the original searches $ sed s/present/absent/ legacy_searches.sls > remove_legacy_searches.sls $ salt-call state.sls remove_legacy_searches.sls
6. Get all searches again, verify no changes $ salt-call splunk_search.list_all --out=txt | sed "s/local: //" > final_searches.sls $ diff final_searches.sls managed_searches.sls

salt.modules.splunk_search.update(name, profile='splunk', **kwargs)

Update a splunk search

CLI Example:
splunk_search.update 'my search name' sharing=app

### 23.9.430 salt.modules.sqlite3

Support for SQLite3

salt.modules.sqlite3.fetch(db=None, sql=None)

Retrieve data from an sqlite3 db (returns all rows, be careful!)

CLI Example:

```
salt '*' sqlite3.fetch /root/test.db 'SELECT * FROM test;'
```

salt.modules.sqlite3.indexes(db=None)

Show all indices in the database, for people with poor spelling skills

CLI Example:

```
salt '*' sqlite3.indexes /root/test.db
```

salt.modules.sqlite3.indices(db=None)

Show all indices in the database

CLI Example:

```
salt '*' sqlite3.indices /root/test.db
```

salt.modules.sqlite3.modify(db=None, sql=None)

Issue an SQL query to sqlite3 (with no return data), usually used to modify the database in some way (insert, delete, create, etc)

CLI Example:

```
salt '*' sqlite3.modify /root/test.db 'CREATE TABLE test(id INT, testdata TEXT);'
```

salt.modules.sqlite3.sqlite_version()

Return version of sqlite

CLI Example:

```
salt '*' sqlite3.sqlite_version
```
salt.modules.sqlite3.tables(db=None)
    Show all tables in the database
    CLI Example:
    ```
salt '*' sqlite3.tables /root/test.db
    ```

salt.modules.sqlite3.version()
    Return version of pysqlite
    CLI Example:
    ```
salt '*' sqlite3.version
    ```

23.9.431 salt.modules.ssh
    Manage client ssh components

    **Note:** This module requires the use of MD5 hashing. Certain security audits may not permit the use of MD5. For those cases, this module should be disabled or removed.

salt.modules.ssh.auth_keys(user=None, config='.ssh/authorized_keys', fingerprint_hash_type=None)
    Return the authorized keys for users
    CLI Example:
    ```
salt '*' ssh.auth_keys
salt '*' ssh.auth_keys root
salt '*' ssh.auth_keys user=root
salt '*' ssh.auth_keys user="[user1, user2]"
    ```

salt.modules.ssh.check_key(user=None, key=None, enc=None, comment=None, options=None, config='.ssh/authorized_keys', cache_keys=None, fingerprint_hash_type=None)
    Check to see if a key needs updating, returns "update", "add" or "exists"
    CLI Example:
    ```
salt '*' ssh.check_key <user> <key> <enc> <comment> <options>
    ```

salt.modules.ssh.check_key_file(user=None, source=None, config='.ssh/authorized_keys', saltenv='base', fingerprint_hash_type=None)
    Check a keyfile from a source destination against the local keys and return the keys to change
    CLI Example:
    ```
salt '*' ssh.check_key_file root salt://ssh/keyfile
    ```

salt.modules.ssh.check_known_host(user=None, hostname=None, key=None, fingerprint=None, config=None, port=None, fingerprint_hash_type=None)
    Check the record in known_hosts file, either by its value or by fingerprint (it's enough to set up either key or fingerprint, you don't need to set up both).
    If provided key or fingerprint doesn't match with stored value, return "update", if no value is found for a given host, return "add", otherwise return "exists".
    If neither key, nor fingerprint is defined, then additional validation is not performed.
Salt Documentation, Release 3003.3

CLI Example:
```
salt '*' ssh.check_known_host <user> <hostname> key='AAAA...FAaQ=='
```

```
salt.modules.ssh.get_known_host_entries(user, hostname, config=None, port=None, fingerprint_hash_type=None)
```

New in version 2018.3.0.

Return information about known host entries from the config file, if any. If there are no entries for a matching hostname, return None.

CLI Example:
```
salt '*' ssh.get_known_host_entries <user> <hostname>
```

```
salt.modules.ssh.hash_known_hosts(user=None, config=None)
```

Hash all the hostnames in the known hosts file.

New in version 2014.7.0.

**user** hash known hosts of this user

**config** path to known hosts file: can be absolute or relative to user's home directory

CLI Example:
```
salt '*' ssh.hash_known_hosts
```

```
salt.modules.ssh.host_keys(keydir=None, private=True, certs=True)
```

Return the minion's host keys

CLI Example:
```
salt '*' ssh.host_keys
salt '*' ssh.host_keys keydir=/etc/ssh
salt '*' ssh.host_keys keydir=/etc/ssh private=False
salt '*' ssh.host_keys keydir=/etc/ssh certs=False
```

```
salt.modules.ssh.key_is_encrypted(key)
```

New in version 2015.8.7.

Function to determine whether or not a private key is encrypted with a passphrase.

Checks key for a Proc-Type header with ENCRYPTED in the value. If found, returns True, otherwise returns False.

CLI Example:
```
salt '*' ssh.key_is_encrypted /root/id_rsa
```

```
salt.modules.ssh.recv_known_host_entries(hostname, enc=None, port=None, hash_known_hosts=True, timeout=5, fingerprint_hash_type=None)
```

New in version 2018.3.0.

Retrieve information about host public keys from remote server

**hostname** The name of the remote host (e.g. "github.com")

**enc** Defines what type of key is being used, can be ed25519, ecdsa ssh-rsa or ssh-dss

**port** Optional parameter, denoting the port of the remote host on which an SSH daemon is running. By default the port 22 is used.

**hash_known_hosts** [True] Hash all hostnames and addresses in the known hosts file.
timeout [int] Set the timeout for connection attempts. If timeout seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

fingerprint_hash_type The fingerprint hash type that the public key fingerprints were originally hashed with. This defaults to sha256 if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0: default changed from md5 to sha256

CLI Example:

```
salt '*' ssh.recv_known_host_entries <hostname> enc=<enc> port=<port>
```

salt.modules.ssh.rm_auth_key(user, key, config='.ssh/authorized_keys', fingerprint_hash_type=None)

Remove an authorized key from the specified user's authorized key file

CLI Example:

```
salt '*' ssh.rm_auth_key <user> <key>
```

salt.modules.ssh.rm_auth_key_from_file(user, source, config='.ssh/authorized_keys', saltenv='base', fingerprint_hash_type=None)

Remove an authorized key from the specified user's authorized key file, using a file as source

CLI Example:

```
salt '*' ssh.rm_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.pub
```

salt.modules.ssh.rm_known_host(user=None, hostname=None, config=None, port=None)

Remove all keys belonging to hostname from a known_hosts file.

CLI Example:

```
salt '*' ssh.rm_known_host <user> <hostname>
```

salt.modules.ssh.set_auth_key(user, key, enc='ssh-rsa', comment='', options=None, config='.ssh/authorized_keys', cache_keys=None, fingerprint_hash_type=None)

Add a key to the authorized_keys file. The "key" parameter must only be the string of text that is the encoded key. If the key begins with "ssh-rsa" or ends with user@host, remove those from the key before passing it to this function.

CLI Example:

```
salt '*' ssh.set_auth_key <user> '<key>' enc='dsa'
```

salt.modules.ssh.set_auth_key_from_file(user, source, config='.ssh/authorized_keys', saltenv='base', fingerprint_hash_type=None)

Add a key to the authorized_keys file, using a file as the source.

CLI Example:

```
salt '*' ssh.set_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.pub
```

salt.modules.ssh.set_known_host(user=None, hostname=None, fingerprint=None, key=None, port=None, enc=None, config=None, hash_known_hosts=True, timeout=5, fingerprint_hash_type=None)

Download SSH public key from remote host "hostname", optionally validate its fingerprint against "fingerprint" variable and save the record in the known_hosts file.
If such a record does already exists in there, do nothing.

**user**  The user who owns the ssh authorized keys file to modify

**hostname**  The name of the remote host (e.g. "github.com")

**fingerprint**  The fingerprint of the key which must be present in the known_hosts file (optional if key specified)

**key**  The public key which must be presented in the known_hosts file (optional if fingerprint specified)

**port**  optional parameter, denoting the port of the remote host, which will be used in case, if the public key will be requested from it. By default the port 22 is used.

**enc**  Defines what type of key is being used, can be ed25519, ecdsa ssh-rsa or ssh-dss

**config**  The location of the authorized keys file relative to the user’s home directory, defaults to ".ssh/known_hosts". If no user is specified, defaults to "/etc/ssh/ssh_known_hosts". If present, must be an absolute path when a user is not specified.

**hash_known_hosts**  [True] Hash all hostnames and addresses in the known hosts file.

**timeout**  [int] Set the timeout for connection attempts. If timeout seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

New in version 2016.3.0.

**fingerprint_hash_type**  The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to sha256 if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0: default changed from md5 to sha256

CLI Example:
```bash
salt '*' ssh.set_known_host <user> fingerprint='xx:xx:...:xx' enc='ssh-rsa' config=''.ssh/known_hosts'
```

**salt.modules.ssh.user_keys()**

Return the user’s ssh keys on the minion

New in version 2014.7.0.

CLI Example:
```bash
salt '*' ssh.user_keys
salt '*' ssh.user_keys user=user1
salt '*' ssh.user_keys user=user1 pubfile=/home/user1/.ssh/id_rsa.pub prvfile=/
              ~home/user1/.ssh/id_rsa
salt '*' ssh.user_keys user=user1 prvfile=False
salt '*' ssh.user_keys user=['user1','user2'] pubfile=ids_rsa.pub prvfile=ids_rsa
```

As you can see you can tell Salt not to read from the user’s private (or public) key file by setting the file path to False. This can be useful to prevent Salt from publishing private data via Salt Mine or others.

**23.9.432 salt.modules.ssh_pkg**

Service support for the REST example

**salt.modules.ssh_pkg.install()**

```bash
salt.modules.ssh_pkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)
```

**salt.modules.ssh_pkg.list_pkgs()**

```bash
salt.modules.ssh_pkg.list_pkgs(versions_as_list=False, **kwargs)
```

**salt.modules.ssh_pkg.remove()**

```bash
salt.modules.ssh_pkg.remove(name=None, pkgs=None, **kwargs)
```
23.9.433 salt.modules.ssh_service

Provide the service module for the proxy-minion SSH sample. versionadded:: 2015.8.2

salt.modules.ssh_service.enabled(name, sig=None)
   Only the 'redbull' service is 'enabled' in the test

salt.modules.ssh_service.get_all()
   Return a list of all available services

   CLI Example:
   salt '*' service.get_all

salt.modules.ssh_service.list_()
   Return a list of all available services.

   CLI Example:
   salt '*' service.list

salt.modules.ssh_service.restart(name, sig=None)
   Restart the specified service with rest_sample

   CLI Example:
   salt '*' service.restart <service name>

salt.modules.ssh_service.running(name, sig=None)
   Return whether this service is running.

salt.modules.ssh_service.start(name, sig=None)
   Start the specified service on the ssh_sample

   CLI Example:
   salt '*' service.start <service name>

salt.modules.ssh_service.status(name, sig=None)
   Return the status for a service via ssh_sample. If the name contains globbing, a dict mapping service name to True/False values is returned.

   Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

   Parameters
   - name (str) -- The name of the service to check
   - sig (str) -- Not implemented

   Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise

   Return type bool

   CLI Example:
   salt '*' service.status <service name>

salt.modules.ssh_service.stop(name, sig=None)
   Stop the specified service on the rest_sample

   CLI Example:
   salt '*' service.stop <service name>
23.9.434 salt.modules.state

Control the state system on the minion.

State Caching

When a highstate is called, the minion automatically caches a copy of the last high data. If you then run a highstate with cache=True it will use that cached highdata and won't hit the fileserver except for salt:// links in the states themselves.

```
salt.modules.state.apply_(mods=None, **kwargs)
```

New in version 2015.5.0.

This function will call `state.highstate` or `state.sls` based on the arguments passed to this function. It exists as a more intuitive way of applying states.

APPLYING ALL STATES CONFIGURED IN TOP.SLS (A.K.A. HIGHSTATE)

To apply all configured states, simply run `state.apply`:

```
salt '*' state.apply
```

The following additional arguments are also accepted when applying all states configured in top.sls:

- `test` Run states in test-only (dry-run) mode
- `mock` The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

- `pillar` Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.apply stuff pillar={"foo": "bar"}
```

**Note:** Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

- `exclude` Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing sls or id keys. Glob-patterns may be used to match multiple states.

```
salt '*' state.apply exclude=bar,baz
salt '*' state.apply exclude=foo*
salt '*' state.apply exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_exclude'}]"
```

- `queue` [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

  This option starts a new thread for each queued state run, so use this option sparingly.

- `localconfig` Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

```
salt '*' state.apply localconfig=/path/to/minion.yml
```
Salt Documentation, Release 3003.3

APPLYING INDIVIDUAL SLS FILES (A.K.A. STATE.SLS)
To apply individual SLS files, pass them as a comma-separated list:
# Run the states configured in salt://stuff.sls (or salt://stuff/init.sls)
salt '*' state.apply stuff
# Run the states configured in salt://stuff.sls (or salt://stuff/init.sls)
# and salt://pkgs.sls (or salt://pkgs/init.sls).
salt '*' state.apply stuff,pkgs
# Run the states configured in a more deeply nested directory such as salt://my/
,→organized/stuff.sls (or salt://my/organized/stuff/init.sls)
salt '*' state.apply my.organized.stuff

The following additional arguments are also accepted when applying individual SLS files:
test Run states in test-only (dry-run) mode
mock The mock option allows for the state run to execute without actually calling any states. This then returns
a mocked return which will show the requisite ordering as well as fully validate the state run.
New in version 2015.8.4.
pillar Custom Pillar values, passed as a dictionary of key-value pairs
salt '*' state.apply stuff pillar='{"foo": "bar"}'

Note: Values passed this way will override Pillar values set via pillar_roots or an external Pillar
source.
queue [False] Instead of failing immediately when another state run is in progress, queue the new state run
to begin running once the other has finished.
This option starts a new thread for each queued state run, so use this option sparingly.
concurrent [False] Execute state runs concurrently instead of serially
Warning: This flag is potentially dangerous. It is designed for use when multiple state runs can
safely be run at the same time. Do not use this flag for performance optimization.
saltenv Specify a salt fileserver environment to be used when applying states
Changed in version 0.17.0: Argument name changed from env to saltenv
Changed in version 2014.7.0: If no saltenv is specified, the minion config will be checked for an
environment parameter and if found, it will be used. If none is found, base will be used. In prior
releases, the minion config was not checked and base would always be assumed when the saltenv was
not explicitly set.
pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion
config file using the pillarenv option. When neither the pillarenv minion config option nor this
CLI argument is used, all Pillar environments will be merged together.
localconfig Optionally, instead of using the minion config, load minion opts from the file specified by this
argument, and then merge them with the options from the minion config. This functionality allows
for specific states to be run with their own custom minion configuration, including different pillars,
file_roots, etc.
salt '*' state.apply stuff localconfig=/path/to/minion.yml

sync_mods If specified, the desired custom module types will be synced prior to running the SLS files:
2754

Chapter 23. Salt Module Reference


New in version 2017.7.8, 2018.3.3, 2019.2.0.

```
salt '*' state.apply stuff sync_mods=states,modules
salt '*' state.apply stuff sync_mods=all
```

**Note:** This option is ignored when no SLS files are specified, as a `highstate` automatically syncs all custom module types.

New in version 2017.7.8, 2018.3.3, 2019.2.0.

```
salt.modules.state.check_request(name=None)
``` New in version 2015.5.0.

Return the state request information, if any

CLI Example:

```
salt '*' state.check_request
```

```
salt.modules.state.clear_cache()
``` Clear out cached state files, forcing even cache runs to refresh the cache on the next state execution.

Remember that the state cache is completely disabled by default, this execution only applies if cache=True is used in states

CLI Example:

```
salt '*' state.clear_cache
```

```
salt.modules.state.clear_request(name=None)
``` New in version 2015.5.0.

Clear out the state execution request without executing it

CLI Example:

```
salt '*' state.clear_request
```

```
salt.modules.state.disable(states)
``` Disable state runs.

CLI Example:

```
salt '*' state.disable highstate
salt '*' state.disable highstate,test.succeed_without_changes
```

**Note:** To disable a state file from running provide the same name that would be passed in a state.sls call.

```
salt '*' state.disable bind.config
```

```
salt.modules.state.enable(states)
``` Enable state function or sls run

CLI Example:

```
salt '*' state.enable highstate
salt '*' state.enable test.succeed_without_changes
```
Note: To enable a state file from running provide the same name that would be passed in a state.sls call.
salt '*' state.disable bind.config

salt.modules.state.event(tagmatch='*', count=1, quiet=False, sock_dir=None, pretty=False, node='minion')
Watch Salt’s event bus and block until the given tag is matched
New in version 2016.3.0.
Changed in version 2019.2.0: tagmatch can now be either a glob or regular expression.
This is useful for utilizing Salt’s event bus from shell scripts or for taking simple actions directly from the CLI.
Enable debug logging to see ignored events.

Parameters
• tagmatch -- the event is written to stdout for each tag that matches this glob or regular expression.
• count -- this number is decremented for each event that matches the tagmatch parameter; pass -1 to listen forever.
• quiet -- do not print to stdout; just block
• sock_dir -- path to the Salt master’s event socket file.
• pretty -- Output the JSON all on a single line if False (useful for shell tools); pretty-print the JSON output if True.
• node -- Watch the minion-side or master-side event bus.

CLI Example:
salt-call --local state.event pretty=True

salt.modules.state.get_pauses(jid=None)
Get a report on all of the currently paused state runs and pause run settings. Optionally send in a jid if you only desire to see a single pause data set.

salt.modules.state.high(data, test=None, queue=False, **kwargs)
Execute the compound calls stored in a single set of high data
This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.

CLI Example:
salt '*' state.high '{{"vim": {"pkg": ["installed"]}}}'

salt.modules.state.highstate(test=None, queue=False, **kwargs)
Retrieve the state data from the salt master for this minion and execute it
test  Run states in test-only (dry-run) mode
pillar  Custom Pillar values, passed as a dictionary of key-value pairs

salt '*' state.highstate stuff pillar='{"foo": "bar"}''

Note: Values passed this way will override Pillar values set via pillar_roots or an external Pillar source.

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See here for details.
pillar_enc Specify which renderer to use to decrypt encrypted data located within the pillar value. Currently, only gpg is supported.
New in version 2016.3.0.

**exclude** Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing sls or id keys. Glob-patterns may be used to match multiple states.

```
salt '*' state.highstate exclude=bar,baz
salt '*' state.highstate exclude=foo*
salt '*' state.highstate exclude="[{'id': 'id_toExclude'}, {'sls': 'sls_to_exclude'}]"
```

**saltenv** Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from env to saltenv.

Changed in version 2014.7.0: If no saltenv is specified, the minion config will be checked for a saltenv parameter and if found, it will be used. If none is found, base will be used. In prior releases, the minion config was not checked and base would always be assumed when the saltenv was not explicitly set.

**pillarenv** Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.

**queue** [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

**localconfig** Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

**mock** The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

CLI Examples:

```
salt '*' state.highstate
salt '*' state.highstate whitelist=sls1_to_run,sls2_to_run
salt '*' state.highstate exclude=sls_to_exclude
salt '*' state.highstate exclude="[{'id': 'id_toExclude'}, {'sls': 'sls_to_exclude'}]"
salt '*' state.highstate pillar="{foo: 'Foo!', bar: 'Bar!'}"
```

salt.modules.state.id_exists(**kwargs**) Tests for the existence of a specific ID or list of IDs within the specified SLS file(s). Similar to state.sls_exists, returns True or False. The default environment is base, use saltenv to specify a different environment.

New in version 2019.2.0.

**saltenv** Specify a salt fileserver environment from which to look for the SLS files specified in the mods argument

CLI Example:

```
salt '*' state.id_exists create_myfile,update_template filestate saltenv=dev
```

salt.modules.state.list_disabled() List the states which are currently disabled

CLI Example:
salt '*' state.list_disabled

salt.modules.state.low(data, queue=False, **kwargs)
Execute a single low data call

This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.

CLI Example:

```
salt '*' state.low '{"state": "pkg", "fun": "installed", "name": "vi"}'
```

salt.modules.state.orchestrate(mods, saltenv='base', test=None, exclude=None, pillar=None, pillarenv=None)

New in version 2016.11.0.

Execute the orchestrate runner from a masterless minion.

See also:

More Orchestrate documentation
- Full Orchestrate Tutorial
- Docs for the salt state module salt.states.saltmod

CLI Examples:

```
salt-call --local state.orchestrate webserver
salt-call --local state.orchestrate webserver saltenv=dev test=True
salt-call --local state.orchestrate webserver saltenv=dev pillarenv=aws
```

salt.modules.state.pause(jid, state_id=None, duration=None)

Set up a state id pause, this instructs a running state to pause at a given state id. This needs to pass in the jid of the running state and can optionally pass in a duration in seconds. If a state_id is not passed then the jid referenced will be paused at the beginning of the next state run.

The given state id is the id got a given state execution, so given a state that looks like this:

```
vim:
  pkg.installed: []
```

The state_id to pass to pause is vim

CLI Examples:

```
salt '*' state.pause 20171130110407769519
salt '*' state.pause 20171130110407769519 vim
salt '*' state.pause 20171130110407769519 vim 20
```

salt.modules.state.pkg(pkg_path, pkg_sum, hash_type, test=None, **kwargs)

Execute a packaged state run, the packaged state run will exist in a tarball available locally. This packaged state can be generated using salt-ssh.

CLI Example:

```
salt '*' state.pkg /tmp/salt_state.tgz 760a9353810e36f6d81416366fc426dc md5
```

salt.modules.state.request(mods=None, **kwargs)

New in version 2015.5.0.

Request that the local admin execute a state run via salt-call state.run_request. All arguments match those of state.apply.

CLI Example:
Salt Documentation, Release 3003.3

salt '*' state.request
salt '*' state.request stuff
salt '*' state.request stuff,pkgs

salt.modules.state.resume(jid, state_id=None)
Remove a pause from a jid, allowing it to continue. If the state_id is not specified then the a general pause will
be resumed.
The given state_id is the id got a given state execution, so given a state that looks like this:
vim:
pkg.installed: []

The state_id to pass to rm_pause is vim
CLI Examples:
salt '*' state.resume 20171130110407769519
salt '*' state.resume 20171130110407769519 vim

salt.modules.state.run_request(name='default', **kwargs)
New in version 2015.5.0.
Execute the pending state request
CLI Example:
salt '*' state.run_request

salt.modules.state.running(concurrent=False)
Return a list of strings that contain state return data if a state function is already running. This function is
used to prevent multiple state calls from being run at the same time.
CLI Example:
salt '*' state.running

salt.modules.state.show_highstate(queue=False, **kwargs)
Retrieve the highstate data from the salt master and display it
Custom Pillar data can be passed with the pillar kwarg.
CLI Example:
salt '*' state.show_highstate

salt.modules.state.show_low_sls(mods, test=None, queue=False, **kwargs)
Display the low data from a specific sls. The default environment is base, use saltenv to specify a different
environment.
saltenv Specify a salt fileserver environment to be used when applying states
pillar Custom Pillar values, passed as a dictionary of key-value pairs
salt '*' state.show_low_sls stuff pillar='{"foo": "bar"}'

Note: Values passed this way will override Pillar values set via pillar_roots or an external Pillar
source.

23.9. execution modules

2759


pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.

CLI Example:

```
salt '*' state.show_low_sls foo
salt '*' state.show_low_sls foo saltenv=dev
```

salt.modules.state.show_lowstate(queue=False, **kwargs)
List out the low data that will be applied to this minion

CLI Example:

```
salt '*' state.show_lowstate
```

salt.modules.state.show_sls(mods, test=None, queue=False, **kwargs)
Display the state data from a specific sls or list of sls files on the master. The default environment is base, use saltenv to specify a different environment.

This function does not support top files. For top.sls please use show_top instead.

Custom Pillar data can be passed with the pillar kwarg.

saltenviron Specify a salt fileserver environment to be used when applying states

pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.

CLI Example:

```
salt '*' state.show_sls core,edit.vim saltenv=dev
```

salt.modules.state.show_state_usage(queue=False, **kwargs)
Retrieve the highstate data from the salt master to analyse used and unused states

Custom Pillar data can be passed with the pillar kwarg.

CLI Example:

```
salt '*' state.show_state_usage
```

salt.modules.state.show_states(queue=False, **kwargs)
Returns the list of states that will be applied on highstate.

CLI Example:

```
salt '*' state.show_states
```

New in version 2019.2.0.

salt.modules.state.show_top(queue=False, **kwargs)
Return the top data that the minion will use for a highstate

CLI Example:

```
salt '*' state.show_top
```

salt.modules.state.single(fun, name, test=None, queue=False, **kwargs)
Execute a single state function with the named kwargs, returns False if insufficient data is sent to the command

By default, the values of the kwargs will be parsed as YAML. So, you can specify lists values, or lists of single entry key-value maps, as you would in a YAML salt file. Alternatively, JSON format of keyword values is also supported.
CLI Example:

```bash
salt '*' state.single pkg.installed name=vim
```

```python
salt.modules.state.sls(mods, test=None, exclude=None, queue=False, sync_mods=None, **kwargs)
```

Execute the states in one or more SLS files.

- `mods`: Run states in test-only (dry-run) mode
- `pillar`: Custom Pillar values, passed as a dictionary of key-value pairs
  ```bash
  salt '*' state.sls stuff pillar='{"foo": "bar"}'
  ```

**Note:** Values passed this way will override existing Pillar values set via pillar_roots or an external Pillar source. Pillar values that are not included in the kwarg will not be overwritten.

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See [here](#) for details.

- `pillar_enc`: Specify which renderer to use to decrypt encrypted data located within the pillar value. Currently, only gpg is supported.
  
  New in version 2016.3.0.

- `exclude`: Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing sls or id keys. Glob-patterns may be used to match multiple states.
  ```bash
  salt '*' state.sls foo,bar,baz exclude=bar,baz
  ```

  ```bash
  salt '*' state.sls foo,bar,baz exclude=ba*
  ```

  ```bash
  salt '*' state.sls foo,bar,baz exclude='[{{'id': 'id_to_exclude'}, {{'sls': "sls_to_exclude"}}]'
  ```

- `queue`: [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

  This option starts a new thread for each queued state run, so use this option sparingly.

- `concurrent`: [False] Execute state runs concurrently instead of serially.

**Warning:** This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do not use this flag for performance optimization.

- `saltenv`: Specify a salt fileserver environment to be used when applying states

  Changed in version 0.17.0: Argument name changed from env to saltenv.

  Changed in version 2014.7.0: If no saltenv is specified, the minion config will be checked for an environment parameter and if found, it will be used. If none is found, base will be used. In prior releases, the minion config was not checked and base would always be assumed when the saltenv was not explicitly set.

- `pillarenv`: Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.

- `localconfig`: Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

- `mock`: The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.
New in version 2015.8.4.

**sync_mods** If specified, the desired custom module types will be synced prior to running the SLS files:

```bash
salt '*' state.sls stuff sync_mods=states,modules
salt '*' state.sls stuff sync_mods=all
```

New in version 2017.7.8, 2018.3.3, 2019.2.0.

CLI Example:

```bash
# Run the states configured in salt://example.sls (or salt://example/init.sls)
salt '*' state.apply example

# Run the states configured in salt://core.sls (or salt://core/init.sls) # and salt://edit/vim.sls (or salt://edit/vim/init.sls)
salt '*' state.sls core,edit.vim

# Run the states configured in a more deeply nested directory such as salt://my/
 → nested/state.sls (or salt://my/nested/state/init.sls)
salt '*' state.sls my.nested.state

salt '*' state.sls core exclude="[['id': 'id_to_exclude'], ['sls': 'sls_to_exclude
 → ...']]"
salt '*' state.sls myslsfile pillar="{'foo': 'Foo!', bar: 'Bar!'}"
```

`salt.modules.state.sls_exists(mods, test=None, queue=False, **kwargs)`

Tests for the existence of a specific SLS or list of SLS files on the master. Similar to `state.show_sls`, rather than returning state details, returns True or False. The default environment is `base`, use `saltenv` to specify a different environment.

New in version 2019.2.0.

**saltenv** Specify a salt fileserver environment from which to look for the SLS files specified in the `mods` argument

CLI Example:

```bash
salt '*' state.sls_exists core,edit.vim saltenv=dev
```

`salt.modules.state.sls_id(id_, mods, test=None, queue=False, **kwargs)`

Call a single ID from the named module(s) and handle all requisites

The state ID comes before the module ID(s) on the command line.

**id** ID to call

**mods** Comma-delimited list of modules to search for given id and its requisites

New in version 2014.7.0.

**saltenv** [base] Specify a salt fileserver environment to be used when applying states

**pillarenv** Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

**pillar** Custom Pillar values, passed as a dictionary of key-value pairs

```bash
salt '*' state.sls_id my_state my_module pillar='{"foo": "bar"}"
```

**Note:** Values passed this way will override existing Pillar values set via `pillar_roots` or an external Pillar source. Pillar values that are not included in the kwarg will not be overwritten.

New in version 2018.3.0.

CLI Example:
salt.modules.state.soft_kill(jid, state_id=None)

Set up a state run to die before executing the given state id, this instructs a running state to safely exit at a given state id. This needs to pass in the jid of the running state. If a state_id is not passed then the jid referenced will be safely exited at the beginning of the next state run.

The given state id is the id got a given state execution, so given a state that looks like this:

```
vim:
    pkg.installed: []
```

The state_id to pass to `soft_kill` is `vim`

CLI Examples:

```
salt '*' state.soft_kill 20171130110407769519
salt '*' state.soft_kill 20171130110407769519 vim
```

salt.modules.state.template(tem, queue=False, **kwargs)

Execute the information stored in a template file on the minion.

This function does not ask a master for a SLS file to render but instead directly processes the file at the provided path on the minion.

CLI Example:

```
salt '*' state.template '<Path to template on the minion>'
```

salt.modules.state.template_str(tem, queue=False, **kwargs)

Execute the information stored in a string from an sls template

CLI Example:

```
salt '*' state.template_str '<Template String>'
```

salt.modules.state.test(*args, **kwargs)

New in version 3001.

Alias for `state.apply` with the kwarg `test` forced to `True`.

This is a nicety to avoid the need to type out `test=True` and the possibility of a typo causing changes you do not intend.

salt.modules.state.top(topfn, test=None, queue=False, **kwargs)

Execute a specific top file instead of the default. This is useful to apply configurations from a different environment (for example, dev or prod), without modifying the default top file.

queue [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

saltenv Specify a salt fileserver environment to be used when applying states

pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

New in version 2017.7.0.

CLI Example:
23.9.435 salt.modules.status

Module for returning various status data about a minion. These data can be useful for compiling into stats later.

salt.modules.status.all_status()
Return a composite of all status data and info for this minion. Warning: There is a LOT here!

CLI Example:

salt '*' status.all_status

salt.modules.status.cpuinfo()
Changed in version 2016.3.2: Return the CPU info for this minion
Changed in version 2016.11.4: Added support for AIX
Changed in version 2018.3.0: Added support for NetBSD and OpenBSD

CLI Example:

salt '*' status.cpuinfo

salt.modules.status.cpustats()
Return the CPU stats for this minion

Changed in version 2016.11.4: Added support for AIX
Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

salt '*' status.cpustats

salt.modules.status.custom()
Return a custom composite of status data and info for this minion, based on the minion config file. An example config like might be:

```
status.cpustats.custom: ['cpu', 'ctxt', 'btime', 'processes']
```

Where status refers to status.py, cpustats is the function where we get our data, and custom is this function It is followed by a list of keys that we want returned.

This function is meant to replace all_status(), which returns anything and everything, which we probably don't want.

By default, nothing is returned. Warning: Depending on what you include, there can be a LOT here!

CLI Example:

salt '*' status.custom

salt.modules.status.diskstats()
Changed in version 2016.3.2: Return the disk stats for this minion
Changed in version 2016.11.4: Added support for AIX
CLI Example:

```
salt '*' status.diskstats
```

**salt.modules.status.diskusage(**args**)

Return the disk usage for this minion

Usage:

```
salt '*' status.diskusage [paths and/or filesystem types]
```

CLI Example:

```
salt '*' status.diskusage # usage for all filesystems
salt '*' status.diskusage /tmp # usage for / and /tmp
salt '*' status.diskusage ext? # usage for ext[234] filesystems
salt '*' status.diskusage / ext? # usage for / and all ext filesystems
```

**salt.modules.status.loadavg()

Return the load averages for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.loadavg
:raises CommandExecutionError: If the system cannot report loadaverages to Python
```

**salt.modules.status.master**(master=**None**, connected=True)

New in version 2014.7.0.

Return the connection status with master. Fire an event if the connection to master is not as expected. This function is meant to be run via a scheduled job from the minion. If master_ip is an FQDN/Hostname, it must be resolvable to a valid IPv4 address.

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.master
```

**salt.modules.status.meminfo()

Return the memory info for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```
salt '*' status.meminfo
```

**salt.modules.status.netdev()

Changed in version 2016.3.2: Return the network device stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.netdev
```
salt.modules.status.netstats()
Return the network stats for this minion

Changed in version 2016.11.4: Added support for AIX
Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```
salt '*' status.netstats
```

salt.modules.status.nproc()
Return the number of processing units available on this system

Changed in version 2016.11.4: Added support for AIX
Changed in version 2018.3.0: Added support for Darwin, FreeBSD and OpenBSD

CLI Example:

```
salt '*' status.nproc
```

class status.pid(sig)
Return the PID or an empty string if the process is running or not. Pass a signature to use to find the process via ps. Note you can pass a Python-compatible regular expression to return all pids of processes matching the regexp.

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.pid <sig>
```

class status.ping_master(master)
New in version 2016.3.0.
Sends ping request to the given master. Fires '__master_failback' event on success. Returns bool result.

CLI Example:

```
salt '*' status.ping_master localhost
```

class status.procs()
Return the process data

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.procs
```

class status.proxy_reconnect(proxy_name, opts=None)
Forces proxy minion reconnection when not alive.

proxy_name The virtual name of the proxy module.

CLI Example:

```
salt '*' status.proxy_reconnect rest_sample
```

class status.time_(format=\"%A, %d. %B %Y %I:%M%p\")
New in version 2016.3.0.
Return the current time on the minion, formatted based on the format parameter.

Default date format: Monday, 27. July 2015 07:55AM

CLI Example:

```bash
salt '*' status.time
salt '*' status.time '%s'
```

`salt.modules.status.uptime()`

Return the uptime for this system.

- Changed in version 2015.8.9: The uptime function was changed to return a dictionary of easy-to-read key/value pairs containing uptime information, instead of the output from a `cmd.run` call.
- Changed in version 2016.11.0: Support for OpenBSD, FreeBSD, NetBSD, MacOS, and Solaris
- Changed in version 2016.11.4: Added support for AIX

CLI Example:

```bash
salt '*' status.uptime
```

`salt.modules.status.version()`

Return the system version for this minion

- Changed in version 2016.11.4: Added support for AIX
- Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```bash
salt '*' status.version
```

`salt.modules.status.vmstats()`

Changed in version 2016.3.2: Return the virtual memory stats for this minion

- Changed in version 2016.11.4: Added support for AIX

CLI Example:

```bash
salt '*' status.vmstats
```

`salt.modules.status.w()`

Return a list of logged in users for this minion, using the `w` command

CLI Example:

```bash
salt '*' status.w
```
23.9.436 salt.modules.statuspage

StatusPage

Handle requests for the StatusPage API.

In the minion configuration file, the following block is required:

```yaml
statuspage:
    api_key: <API_KEY>
    page_id: <PAGE_ID>
```

New in version 2017.7.0.

salt.modules.statuspage.create(endpoint='incidents', api_url=None, page_id=None,
                                api_key=None, api_version=None, **kwargs)

Insert a new entry under a specific endpoint.

- **endpoint**: incidents Insert under this specific endpoint.
- **page_id**: Page ID. Can also be specified in the config file.
- **api_key**: API key. Can also be specified in the config file.
- **api_version**: 1 API version. Can also be specified in the config file.
- **api_url**: Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```
salt 'minion' statuspage.create endpoint='components' name='my component' group_id='993vgplshj12'
```

Example output:

```
minion:  ---------
    comment:  
    out:  ---------
        created_at:  2017-01-05T19:35:27.135Z
        description:  None
        group_id:  993vgplshj12
        id:  mjkmttsldkdc
        name:  my component
        page_id:  ksdhgfyiuhaa
        position:  7
        status:  operational
        updated_at:  2017-01-05T19:35:27.135Z
    result:  True
```

salt.modules.statuspage.delete(endpoint='incidents', id=None, api_url=None, page_id=None,
                                api_key=None, api_version=None)

Remove an entry from an endpoint.
endpoint: incidents  Request a specific endpoint.
page_id  Page ID. Can also be specified in the config file.
api_key  API key. Can also be specified in the config file.
api_version: 1  API version. Can also be specified in the config file.
api_url  Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```
salt 'minion' statuspage.delete endpoint='components' id='ftgks51sfs2d'
```

Example output:

```
minion:
    ----------
    comment:  
    out:
        None
    result:
        True
```

```
salt.modules.statuspage.retrieve(endpoint='incidents', api_url=None, page_id=None, api_key=None, api_version=None)
```

Retrieve a specific endpoint from the Statuspage API.

CLI Example:

```
salt 'minion' statuspage.retrieve components
```

Example output:

```
minion:
    ----------
    comment:  
    out:  
        |
            ----------
            backfilled:
            False
            created_at:  
                2015-01-26T20:25:02.702Z
            id:
                kh2qwjheqdc36
            impact:
                major
            impact_override:  
                None
            incident_updates:  
                |
                    ----------
                    affected_components:  
                        None
                    body:  
                        We are currently investigating this issue.
            created_at:  
```

(continues on next page)
just testing some stuff
salt.modules.statuspage.update(endpoint='incidents', id=None, api_url=None, page_id=None, api_key=None, api_version=None, **kwargs)

Update attribute(s) of a specific endpoint.

- **id** The unique ID of the endpoint entry.
- **endpoint** The incident Endpoint name.
- **page_id** Page ID. Can also be specified in the config file.
- **api_key** API key. Can also be specified in the config file.
- **api_version** 1 API version. Can also be specified in the config file.
- **api_url** Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```bash
salt 'minion' statuspage.update id=dz95yz2nd4l status=resolved
```

Example output:

```
minion:  
       --------
       comment: 
       out:      
           --------
           created_at: 2017-01-03T15:25:30.718Z
           description: None
           group_id: 993vgplshj12
           id: dz95yz2nd4l
           name: Management Portal
           page_id: xzwjjdw87vpf
           position: 11
           status: resolved
           updated_at: 2017-01-05T15:34:27.676Z
result: True
```

### 23.9.437 salt.modules.supervisord

Provide the service module for system supervisord or supervisord in a virtualenv

salt.modules.supervisord.add(name, user=None, conf_file=None, bin_env=None)

Activates any updates in config for process/group.

- **name** user to run supervisorctl as
- **user** path to supervisord config file
- **conf_file** path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```bash
salt '*' supervisord.add <name>
```

salt.modules.supervisord.custom(command, user=None, conf_file=None, bin_env=None)

Run any custom supervisord command
user user to run supervisorctl as
conf_file path to supervisord config file
bin_env path to supervisorctl bin or path to virtualenv with supervisor installed
CLI Example:

```
salt '*' supervisord.custom "mstop '*gunicorn*'"
```

**salt.modules.supervisord.options**(name, conf_file=None)
New in version 2014.1.0.
Read the config file and return the config options for a given process
name Name of the configured process
conf_file path to supervisord config file
CLI Example:

```
salt '*' supervisord.options foo
```

**salt.modules.supervisord.remove**(name, user=None, conf_file=None, bin_env=None)
Removes process/group from active config
user user to run supervisorctl as
conf_file path to supervisord config file
bin_env path to supervisorctl bin or path to virtualenv with supervisor installed
CLI Example:

```
salt '*' supervisord.remove <name>
```

**salt.modules.supervisord.reread**(user=None, conf_file=None, bin_env=None)
Reload the daemon's configuration files
user user to run supervisorctl as
conf_file path to supervisord config file
bin_env path to supervisorctl bin or path to virtualenv with supervisor installed
CLI Example:

```
salt '*' supervisord.reread
```

**salt.modules.supervisord.restart**(name='all', user=None, conf_file=None, bin_env=None)
Restart the named service. Process group names should not include a trailing asterisk.
user user to run supervisorctl as
conf_file path to supervisord config file
bin_env path to supervisorctl bin or path to virtualenv with supervisor installed
CLI Example:

```
salt '*' supervisord.restart <service>
salt '*' supervisord.restart <group>:
```

**salt.modules.supervisord.start**(name='all', user=None, conf_file=None, bin_env=None)
Start the named service. Process group names should not include a trailing asterisk.
user user to run supervisorctl as
conf_file path to supervisord config file
bin_env path to supervisorctl bin or path to virtualenv with supervisor installed
CLI Example:

```
salt '*' supervisord.start <service>
salt '*' supervisord.start <group>:
```

**salt.modules.supervisord.status**(name=None, user=None, conf_file=None, bin_env=None)
List programs and its state
user  user to run supervisorctl as
conf_file  path to supervisord config file
bin_env  path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisorctl.status
```

salt.modules.supervisord.status_bool(name, expected_state=None, user=None, conf_file=None, bin_env=None)
Check for status of a specific supervisord process and return boolean result.

- name  name of the process to check
- expected_state  search for a specific process state. If set to None - any process state will match.
- user  user to run supervisorctl as
- conf_file  path to supervisord config file
- bin_env  path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisorctl.status_bool nginx expected_state='RUNNING'
```

salt.modules.supervisord.status_raw(name=None, user=None, conf_file=None, bin_env=None)
Display the raw output of status

- user  user to run supervisorctl as
- conf_file  path to supervisord config file
- bin_env  path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisorctl.status_raw
```

salt.modules.supervisord.stop(name='all', user=None, conf_file=None, bin_env=None)
Stop the named service. Process group names should not include a trailing asterisk.

- user  user to run supervisorctl as
- conf_file  path to supervisord config file
- bin_env  path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisorctl.stop <service>
salt '*' supervisorctl.stop <group>:
```

salt.modules.supervisord.update(user=None, conf_file=None, bin_env=None, name=None)
Reload config and add/remove/update as necessary

- user  user to run supervisorctl as
- conf_file  path to supervisord config file
- bin_env  path to supervisorctl bin or path to virtualenv with supervisor installed
- name  name of the process group to update. if none then update any process group that has changes

CLI Example:

```
salt '*' supervisorctl.update
```

23.9. execution modules
23.9.438  salt.modules.suse_apache

Support for Apache

Please note: The functions in here are SUSE-specific. Placing them in this separate file will allow them to load only on SUSE systems, while still loading under the apache namespace.

salt.modules.suse_apache.a2dismod(mod)
Runs a2dismod for the given mod.

CLI Example:

```python
salt '*' apache.a2dismod vhost_alias
```

salt.modules.suse_apache.a2enmod(mod)
Runs a2enmod for the given mod.

CLI Example:

```python
salt '*' apache.a2enmod vhost_alias
```

salt.modules.suse_apache.check_mod_enabled(mod)
Checks to see if the specific apache mod is enabled.
This will only be functional on operating systems that support `a2enmod -l` to list the enabled mods.

CLI Example:

```python
salt '*' apache.check_mod_enabled status
```

23.9.439  salt.modules.svn

Subversion SCM

salt.modules.svn.add(cwd, targets, user=None, username=None, password=None, *opts)
Add files to be tracked by the Subversion working-copy checkout

cwd  The path to the Subversion repository

targets  [None] files and directories to pass to the command as arguments

user  [None] Run svn as a user other than what the minion runs as

username  [None] Connect to the Subversion server as another user

password  [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```python
salt '*' svn.add /path/to/repo /path/to/new/file
```

salt.modules.svn.checkout(cwd, remote, target=None, user=None, username=None, password=None, *opts)
Download a working copy of the remote Subversion repository directory or file

cwd  The path to the Subversion repository

remote  [None] URL to checkout

target  [None] The name to give the file or directory working copy Default: svn uses the remote basename

user  [None] Run svn as a user other than what the minion runs as

username  [None] Connect to the Subversion server as another user

password  [None] Connect to the Subversion server with this password

New in version 0.17.0.
CLI Example:
```
salt '*' svn.checkout /path/to/repo svn://remote/repo
```

salt.modules.svn.commit(cwd, targets=None, msg=None, user=None, username=None, password=None, *opts)
Commit the current directory, files, or directories to the remote Subversion repository

cwd  The path to the Subversion repository

targets  [None] files and directories to pass to the command as arguments Default: svn uses '

msg  [None] Message to attach to the commit log

user  [None] Run svn as a user other than what the minion runs as

username  [None] Connect to the Subversion server as another user

password  [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:
```
salt '*' svn.commit /path/to/repo
```

salt.modules.svn.diff(cwd, targets=None, user=None, username=None, password=None, *opts)
Return the diff of the current directory, files, or directories from the remote Subversion repository

cwd  The path to the Subversion repository

targets  [None] files and directories to pass to the command as arguments Default: svn uses '

user  [None] Run svn as a user other than what the minion runs as

username  [None] Connect to the Subversion server as another user

password  [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:
```
salt '*' svn.diff /path/to/repo
```

salt.modules.svn.export(cwd, remote, target=None, user=None, username=None, password=None, revision='HEAD', *opts)
Create an unversioned copy of a tree.

cwd  The path to the Subversion repository

remote  [None] URL and path to file or directory checkout

target  [None] The name to give the file or directory working copy Default: svn uses the remote basename

user  [None] Run svn as a user other than what the minion runs as

username  [None] Connect to the Subversion server as another user

password  [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:
```
salt '*' svn.export /path/to/repo svn://remote/repo
```

salt.modules.svn.info(cwd, targets=None, user=None, username=None, password=None, fmt='str')
Display the Subversion information from the checkout.

cwd  The path to the Subversion repository

targets  [None] files, directories, and URLs to pass to the command as arguments svn uses '.' by default

user  [None] Run svn as a user other than what the minion runs as

username  [None] Connect to the Subversion server as another user

password  [None] Connect to the Subversion server with this password

New in version 0.17.0.

fmt  [str] How to fmt the output from info. (str, xml, list, dict)
CLI Example:

```bash
salt '*' svn.info /path/to/svn/repo
```

salt.modules.svn.remove(cwd, targets=None, user=None, username=None, password=None, *opts)

Remove files and directories from the Subversion repository

cwd The path to the Subversion repository

targets [None] files, directories, and URLs to pass to the command as arguments

msg [None] Message to attach to the commit log

user [None] Run svn as a user other than what the minion runs as

username [None] Connect to the Subversion server as another user

password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```bash
salt '*' svn.remove /path/to/repo /path/to/repo/remove
```

salt.modules.svn.status(cwd, targets=None, user=None, username=None, password=None, *opts)

Display the status of the current directory, files, or directories in the Subversion repository

cwd The path to the Subversion repository

targets [None] files, directories, and URLs to pass to the command as arguments Default: svn uses '.'

user [None] Run svn as a user other than what the minion runs as

username [None] Connect to the Subversion server as another user

password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```bash
salt '*' svn.status /path/to/repo
```

salt.modules.svn.switch(cwd, remote, target=None, user=None, username=None, password=None, *opts)

New in version 2014.1.0.

Switch a working copy of a remote Subversion repository directory

cwd The path to the Subversion repository

remote [None] URL to switch

target [None] The name to give the file or directory working copy Default: svn uses the remote basename

user [None] Run svn as a user other than what the minion runs as

username [None] Connect to the Subversion server as another user

password [None] Connect to the Subversion server with this password

CLI Example:

```bash
salt '*' svn.switch /path/to/repo svn://remote/repo
```

salt.modules.svn.update(cwd, targets=None, user=None, username=None, password=None, *opts)

Update the current directory, files, or directories from the remote Subversion repository

cwd The path to the Subversion repository

targets [None] files and directories to pass to the command as arguments Default: svn uses '.'

user [None] Run svn as a user other than what the minion runs as

password [None] Connect to the Subversion server with this password

New in version 0.17.0.

username [None] Connect to the Subversion server as another user

CLI Example:
23.9.440 salt.modules.swarm

Docker Swarm Module using Docker’s Python SDK

   codeauthor  Tyler Jones <jonestyler806@gmail.com>

New in version 2018.3.0.

The Docker Swarm Module is used to manage and create Docker Swarms.

Dependencies

- Docker installed on the host
- Docker python sdk >= 2.5.1

Docker Python SDK

`pip install -U docker`

salt.modules.swarm.joinswarm(remote_addr=<class 'int'>, listen_addr=<class 'int'>, token=<class 'str'>)

Join a Swarm Worker to the cluster

remote_addr  The manager node you want to connect to for the swarm
listen_addr  Listen address used for inter-manager communication if the node gets promoted to manager, as well as determining the networking interface used for the VXLAN Tunnel Endpoint (VTEP)
token  Either the manager join token or the worker join token. You can get the worker or manager token via `salt '*' swarm.swarm_tokens`

CLI Example:

```
salt '*' swarm.joinswarm remote_addr=192.168.50.10 listen_addr='0.0.0.0' token='SWMTKN-1-64tux2g8701r84ofq93zpccih9pe081akq45owe9ts61f30x4t-06trjugdu7x2z47j938s54i1'
```

salt.modules.swarm.leave_swarm(force=<class 'bool'>)

Force the minion to leave the swarm

force  Will force the minion/worker/manager to leave the swarm

CLI Example:

```
salt '*' swarm.leave_swarm force=False
```

salt.modules.swarm.node_ls(server=<class 'str'>)

Displays Information about Swarm Nodes with passing in the server

server  The minion/server name

CLI Example:

```
salt '*' swarm.node_ls server=minion1
```
salt.modules.swarm.remove_node(node_id=<class 'str'>, force=<class 'bool'>)

Remove a node from a swarm and the target needs to be a swarm manager
node_id  The node id from the return of swarm.node_ls
force  Forcefully remove the node/minion from the service
CLI Example:

```
salt '*' swarm.remove_node node_id=z4gjbe9rwmqahc2a91snvolm5 force=false
```

salt.modules.swarm.remove_service(service=<class 'str'>)

Remove Swarm Service
service  The name of the service
CLI Example:

```
salt '*' swarm.remove_service service=Test_Service
```

salt.modules.swarm.service_create(image=<class 'str'>, name=<class 'str'>, command=<class 'str'>, hostname=<class 'str'>, replicas=<class 'int'>, target_port=<class 'int'>, published_port=<class 'int'>)

Create Docker Swarm Service Create
image  The docker image
name  Is the service name
command  The docker command to run in the container at launch
hostname  The hostname of the containers
replicas  How many replicas you want running in the swarm
target_port  The target port on the container
published_port  port that's published on the host/os
CLI Example:

```
salt '*' swarm.service_create image=httpd name=Test_Service ☑
command=none hostname=salthttpd replicas=6 target_port=80 published_port=80
```

salt.modules.swarm.swarm_init(advertise_addr=<class 'str'>, listen_addr=<class 'int'>, force_new_cluster=<class 'bool'>)

Initialize Docker on Minion as a Swarm Manager
advertise_addr  The ip of the manager
listen_addr  Listen address used for inter-manager communication, as well as determining the networking
interface used for the VXLAN Tunnel Endpoint (VTEP). This can either be an address/port combination
in the form 192.168.1.1:4567, or an interface followed by a port number, like eth0:4567
force_new_cluster  Force a new cluster if True is passed
CLI Example:

```
salt '*' swarm.swarm_init advertise_addr='192.168.50.10' listen_addr='0.0.0.0' ☑
force_new_cluster=False
```

salt.modules.swarm.swarm_service_info(service_name=<class 'str'>)

Swarm Service Information
service_name  The name of the service that you want information on about the service
CLI Example:

```
salt '*' swarm.swarm_service_info service_name=Test_Service
```

salt.modules.swarm.swarm_tokens()

Get the Docker Swarm Manager or Worker join tokens

CLI Example:
salt Documentation, Release 3003.3

```
salt '*' swarm.swarm_tokens
```

**salt.modules.swarm.update_node**

```
salt.modules.swarm.update_node(availability=<class 'str'>, node_name=<class 'str'>, role=<class 'str'>, node_id=<class 'str'>, version=<class 'int'>)
```

Updates docker swarm nodes/needs to target a manager node/minion

- **availability** Drained or Active
- **node_name** minion/node
- **role** role of manager or worker
- **node_id** The Id that can be obtained via swarm.node_ls
- **version** Is obtained by swarm.node_ls

CLI Example:

```
salt '*' swarm.update_node availability=drain node_name=minion2 role=worker node_id=3k9x7t8m4pel9c0nqr3iajnzp version=19
```

### 23.9.441 salt.modules.swift

Module for handling OpenStack Swift calls

Author: Anthony Stanton <anthony.stanton@gmail.com>

Inspired by the S3 and Nova modules

#### depends

- swiftclient Python module

#### configuration

This module is not usable until the user, tenant, auth URL, and password or auth_key are specified either in a pillar or in the minion's config file. For example:

```
keystone.user: admin
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
keystone.password: verybadpass
# or
keystone.auth_key: 203802934809284k2j34lkj2l3kj43k
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles. For example:

```
openstack1:
  keystone.user: admin
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
  keystore.password: verybadpass
  # or
  keystone.auth_key: 203802934809284k2j34lkj2l3kj43k

openstack2:
  keystone.user: admin
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
  keystore.password: verybadpass
  # or
  keystone.auth_key: 303802934809284k2j34lkj2l3kj43k
```

With this configuration in place, any of the swift functions can make use of a configuration profile by declaring it explicitly. For example:

### 23.9. execution modules
NOTE: For Rackspace cloud files setting keystone.auth_version = 1 is recommended.

salt.modules.swift.delete(cont, path=None, profile=None)
Delete a container, or delete an object from a container.

CLI Example to delete a container:
```
salt myminion swift.delete mycontainer
```

CLI Example to delete an object from a container:
```
salt myminion swift.delete mycontainer remoteobject
```

salt.modules.swift.get(cont=None, path=None, local_file=None, return_bin=False, profile=None)
List the contents of a container, or return an object from a container. Set return_bin to True in order to retrieve an object wholesale. Otherwise, Salt will attempt to parse an XML response.

CLI Example to list containers:
```
salt myminion swift.get
```

CLI Example to list the contents of a container:
```
salt myminion swift.get mycontainer
```

CLI Example to return the binary contents of an object:
```
salt myminion swift.get mycontainer myfile.png return_bin=True
```

CLI Example to save the binary contents of an object to a local file:
```
salt myminion swift.get mycontainer myfile.png local_file=/tmp/myfile.png
```

salt.modules.swift.head()

salt.modules.swift.put(cont, path=None, local_file=None, profile=None)
Create a new container, or upload an object to a container.

CLI Example to create a container:
```
salt myminion swift.put mycontainer
```

CLI Example to upload an object to a container:
```
salt myminion swift.put mycontainer remotepath local_file=/path/to/file
```
23.9.442 salt.modules.sysbench

The 'sysbench' module is used to analyze the performance of the minions, right from the master! It measures various system parameters such as CPU, Memory, File I/O, Threads and Mutex.

salt.modules.sysbench.cpu()
Tests for the CPU performance of minions.

CLI Examples:
```
salt '*' sysbench.cpu
```

salt.modules.sysbench.fileio()
This tests for the file read and write operations. Various modes of operations are
- sequential write
- sequential rewrite
- sequential read
- random read
- random write
- random read and write
The test works with 32 files with each file being 1Gb in size. The test consumes a lot of time. Be patient!

CLI Examples:
```
salt '*' sysbench.fileio
```

salt.modules.sysbench.memory()
This tests the memory for read and write operations.

CLI Examples:
```
salt '*' sysbench.memory
```

salt.modules.sysbench.mutex()
Tests the implementation of mutex

CLI Examples:
```
salt '*' sysbench.mutex
```

salt.modules.sysbench.ping()

salt.modules.sysbench.threads()
This tests the performance of the processor's scheduler

CLI Example:
```
salt '*' sysbench.threads
```
23.9.443  salt.modules.sysfs

Module for interfacing with SysFS

See also:

https://www.kernel.org/doc/Documentation/filesystems/sysfs.txt

New in version 2016.3.0.

salt.modules.sysfs.attr (key, value=None)

Access/write a SysFS attribute. If the attribute is a symlink, its destination is returned

Returns  value or bool

CLI Example:

```
salt '*' sysfs.attr block/sda/queue/logical_block_size
```

salt.modules.sysfs.interfaces(root)

Generate a dictionary with all available interfaces relative to root. Symlinks are not followed.

CLI Example:

```
salt '*' sysfs.interfaces block/bcache0/bcache
```

Output example:

```
{
  "r": [
    "state",
    "partial_stripes_expensive",
    "writeback_rate_debug",
    "stripe_size",
    "dirty_data",
    "stats_total/cache_hits",
    "stats_total/cache_bypass_misses",
    "stats_total/bypassed",
    "stats_total/cache_readaheads",
    "stats_total/cache_hit_ratio",
    "stats_total/cache_miss_collisions",
    "stats_total/cache_misses",
    "stats_total/cache_bypass_hits",
  ],
  "rw": [
    "writeback_rate",
    "writeback_rate_update_seconds",
    "cache_mode",
    "writeback_delay",
    "label",
    "writeback_running",
    "writeback_metadata",
    "running",
    "writeback_rate_p_term_inverse",
    "sequential_cutoff",
    "writeback_percent",
    "writeback_rate_d_term",
    "readahead"
  ],
  "w": [
    "stop",
  ],
}
```

(continues on next page)
Note:
• 'r' interfaces are read-only
• 'w' interfaces are write-only (e.g. actions)
• 'rw' are interfaces that can both be read or written

salt.modules.sysfs.read(key, root='')
Read from SysFS
Parameters  key -- file or path in SysFS; if key is a list then root will be prefixed on each key
Returns the full (tree of) SysFS attributes under key
CLI Example:
```
salt '*' sysfs.read class/net/em1/statistics
```

salt.modules.sysfs.target(key, full=False)
Return the basename of a SysFS key path
Parameters
  • key -- the location to resolve within SysFS
  • full -- full path instead of basename
Returns fullpath or basename of path
CLI Example:
```
salt '*' sysfs.read class/ttyS0
```

salt.modules.sysfs.write(key, value)
Write a SysFS attribute/action
CLI Example:
```
salt '*' sysfs.write devices/system/cpu/cpu0/cpufreq/scaling_governor →'performance'
```

23.9.444 salt.modules.syslog_ng

Module for getting information about syslog-ng

maintainer Tibor Benke <btibi@sch.bme.hu>
maturity new
depends cmd
platform all

This module is capable of managing syslog-ng instances which were installed via a package manager or from source. Users can use a directory as a parameter in the case of most functions, which contains the syslog-ng and syslog-ng-ctl binaries.
Syslog-ng can be installed via a package manager or from source. In the latter case, the syslog-ng and syslog-ng-ctl binaries are not available from the PATH, so users should set location of the sbin directory with `syslog_ng.set_binary_path`.

Similarly, users can specify the location of the configuration file with `syslog_ng.set_config_file`, then the module will use it. If it is not set, syslog-ng uses the default configuration file.

```python
class salt.modules.syslog_ng.Argument(value="")
    A TypedParameterValue has one or more Arguments. For example this can be the value of key_file.
    Does not need examples.
    build()

class salt.modules.syslog_ng.Buildable(iterable, join_body_on=",", append_extra_newline=True)
    Base class of most classes, which have a build method.
    It contains a common build function.
    Does not need examples.
    build()
    build_body()
    build_header()
    build_tail()
    build()
    build_body()
    build_header()
    build_tail()

class salt.modules.syslog_ng.GivenStatement(value, add_newline=True)
    This statement returns a string without modification. It can be used to use existing configuration snippets.
    Does not need examples.
    build()
    build()

class salt.modules.syslog_ng.NamedStatement(type=",", options=None)
    It represents a configuration statement, which has a name, e.g. a source.
    Does not need examples.

class salt.modules.syslog_ng.Option(type=",", params=None)
    A Statement class contains Option instances.
    An instance of Option can represent a file(), tcp(), udp(), etc. option.
    Does not need examples.
    add_parameter(param)
    build()
    build()

class salt.modules.syslog_ng.Parameter(iterable=None, join_body_on="")
    An Option has one or more Parameter instances.
    Does not need examples.

class salt.modules.syslog_ng.ParameterValue(iterable=None, join_body_on="")
    A TypedParameter can have one or more values.
```
Does not need examples.

class salt.modules.syslog_ng.SimpleParameter(value='')
A Parameter is a SimpleParameter, if it's just a simple type, like a string.

For example:

destination d_file {
    file('/var/log/messages');
};

/\var/\log/messages is a SimpleParameter.

Does not need examples.

build()
    Builds the textual representation of the whole configuration object with its children.

class salt.modules.syslog_ng.SimpleParameterValue(value='')
A ParameterValue which holds a simple type, like a string or a number.

For example in ip(127.0.0.1) 127.0.0.1 is a SimpleParameterValue.

Does not need examples.

build()
    Builds the textual representation of the whole configuration object with its children.

class salt.modules.syslog_ng.Statement(type='', id='', options=None, has_name=True)
It represents a syslog-ng configuration statement, e.g. source, destination, filter.

Does not need examples.

add_child(option)
build_header()
    Builds the header of a syslog-ng configuration object.

build_tail()
    Builds the tail of a syslog-ng configuration object.

does not need examples.

exception salt.modules.syslog_ng.SyslogNgError

class salt.modules.syslog_ng.TypedParameter(type='', values=None)
A Parameter, which has a type:

destination d_tcp {
    tcp(
        ip(127.0.0.1)
    );
};

ip(127.0.0.1) is a TypedParameter.

Does not need examples.

add_value(value)
build()
    Builds the textual representation of the whole configuration object with its children.
class salt.modules.syslog_ng.TypedParameterValue
(type='', arguments=None)

We have to go deeper...

A TypedParameter can have a 'parameter', which also have a type. For example key_file and cert_file:

```python
source demo_tls_source {
    tcp(
        ip(0.0.0.0)
        port(1999)
        tls(
            key_file('/opt/syslog-ng/etc/syslog-ng/key.d/syslog-ng.key')
            cert_file('/opt/syslog-ng/etc/syslog-ng/cert.d/syslog-ng.cert')
        )
    );
}
```

Does not need examples.

add_argument(arg)

build()

Builds the textual representation of the whole configuration object with its children.

class salt.modules.syslog_ng.UnnamedStatement
(type, options=None)

It represents a configuration statement, which doesn't have a name, e.g. a log path.

Does not need examples.

class salt.modules.syslog_ng.config
(name, config, write=True)

Builds syslog-ng configuration. This function is intended to be used from the state module, users should not use it directly!

name : the id of the Salt document or it is the format of <statement name>.id config : the parsed YAML code write : if True, it writes the config into the configuration file, otherwise just returns it

CLI Example:

```
salt '*' syslog_ng.config name='s_local' config="[{'tcp':[{'ip':'127.0.0.1','port':1233}]})"
```

salt.modules.syslog_ng.config_test(syslog_ng_sbin_dir=None, cfgfile=None)

Runs syntax check against cfgfile. If syslog_ng_sbin_dir is specified, it is added to the PATH during the test.

CLI Example:

```
salt '*' syslog_ng.config_test
salt '*' syslog_ng.config_test /home/user/install/syslog-ng/sbin
salt '*' syslog_ng.config_test /home/user/install/syslog-ng/sbin /etc/syslog-ng/ →syslog-ng.conf
```

salt.modules.syslog_ng.get_config_file()

Returns the configuration directory, which contains syslog-ng.conf.

CLI Example:

```
salt '*' syslog_ng.get_config_file
```

salt.modules.syslog_ng.modules(syslog_ng_sbin_dir=None)

Returns the available modules. If syslog_ng_sbin_dir is specified, it is added to the PATH during the execution of the command syslog-ng.

CLI Example:
salt '*' syslog-ng.modules
salt '*' syslog-ng.modules /home/user/install/syslog-ng/sbin

salt.modules.syslog_ng.reload_(name)
Reloads syslog-ng. This function is intended to be used from states.

If syslog_ng.set_config_file, is called before, this function will use the set binary path.

CLI Example:
salt '*' syslog-ng.reload

salt.modules.syslog_ng.set_binary_path(name)
Sets the path, where the syslog-ng binary can be found. This function is intended to be used from states.

If syslog-ng is installed via a package manager, users don’t need to use this function.

CLI Example:
salt '*' syslog-ng.set_binary_path name=/usr/sbin

salt.modules.syslog_ng.set_config_file(name)
Sets the configuration’s name. This function is intended to be used from states.

CLI Example:
salt '*' syslog-ng.set_config_file name=/etc/syslog-ng

salt.modules.syslog_ng.set_parameters(version=None, binary_path=None, config_file=None, *args, **kwargs)
Sets variables.

CLI Example:
salt '*' syslog-ng.set_parameters version='3.6'
salt '*' syslog-ng.set_parameters binary_path=/home/user/install/syslog-ng/sbin
  config_file=/home/user/install/syslog-ng/etc/syslog-ng.conf

salt.modules.syslog_ng.start(name=None, user=None, group=None, chroot=None, caps=None, no_caps=False, pidfile=None, enable_core=False, fd_limit=None, verbose=False, debug=False, trace=False, yydebug=False, persistent_file=None, control=None, worker_threads=None)
Ensures, that syslog-ng is started via the given parameters. This function is intended to be used from the state module.

Users shouldn’t use this function, if the service module is available on their system. If syslog_ng.set_config_file, is called before, this function will use the set binary path.

CLI Example:
salt '*' syslog-ng.start

salt.modules.syslog_ng.stats(syslog_ng_sbin_dir=None)
Returns statistics from the running syslog-ng instance. If syslog_ng_sbin_dir is specified, it is added to the PATH during the execution of the command syslog-ng-ctl.

CLI Example:
salt '*' syslog-ng.stats
salt '*' syslog-ng.stats /home/user/install/syslog-ng/sbin
salt.modules.syslog_ng.stop\(name=None\)
Kills syslog-ng. This function is intended to be used from the state module.

Users shouldn’t use this function, if the service module is available on their system. If `syslog_ng.set_config_file` is called before, this function will use the set binary path.

CLI Example:
```
salt '*' syslog_ng.stop
```

salt.modules.syslog_ng.version\(syslog_ng_sbin_dir=None\)
Returns the version of the installed syslog-ng. If `syslog_ng_sbin_dir` is specified, it is added to the PATH during the execution of the command syslog-ng.

CLI Example:
```
salt '*' syslog_ng.version
salt '*' syslog_ng.version /home/user/install/syslog-ng/sbin
```

salt.modules.syslog_ng.write_config\(config, newlines=2\)
Writes the given parameter config into the config file. This function is intended to be used from states.

If `syslog_ng.set_config_file`, is called before, this function will use the set config file.

CLI Example:
```
salt '*' syslog_ng.write_config config='# comment'
```

salt.modules.syslog_ng.write_version\(name\)
Removes the previous configuration file, then creates a new one and writes the name line. This function is intended to be used from states.

If `syslog_ng.set_config_file`, is called before, this function will use the set config file.

CLI Example:
```
salt '*' syslog_ng.write_version name="3.6"
```

23.9.445  salt.modules.sysmod

The sys module provides information about the available functions on the minion

salt.modules.sysmod.argspec\(module=\)"
Return the argument specification of functions in Salt execution modules.

CLI Example:
```
salt '*' sys.argspec pkg.install
salt '*' sys.argspec sys
salt '*' sys.argspec
```

Module names can be specified as globs.
New in version 2015.5.0.
```
salt '*' sys.argspec 'pkg.**'
```

salt.modules.sysmod.doc\('args\)
Return the docstrings for all modules. Optionally, specify a module or a function to narrow the selection.
The strings are aggregated into a single document on the master for easy reading.

Multiple modules/functions can be specified.

CLI Example:

```
salt '*' sys.doc
salt '*' sys.doc sys
salt '*' sys.doc sys.doc
salt '*' sys.doc network.traceroute user.info
```

Modules can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.doc 'sys.*'
salt '*' sys.doc 'sys.list_*'
```

`salt.modules.sysmod.list_functions(*args, **kwargs)`

List the functions for all modules. Optionally, specify a module or modules from which to list.

CLI Example:

```
salt '*' sys.list_functions
salt '*' sys.list_functions sys
salt '*' sys.list_functions sys user
```

New in version 0.12.0.

```
salt '*' sys.list_functions 'module.specific_function'
```

Function names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_functions 'sys.list_*'
```

`salt.modules.sysmod.list_modules(*args)`

List the modules loaded on the minion

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.list_modules
```

Module names can be specified as globs.

```
salt '*' sys.list_modules 's*'```

`salt.modules.sysmod.list_renderers(*args)`

List the renderers loaded on the minion

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.list_renderers
```

Render names can be specified as globs.
salt 'sys.list_renderers' 'yaml'
salt.modules.sysmod.list_returner_functions('args, **kwargs')
   List the functions for all returner modules. Optionally, specify a returner module or modules from which to list.
   New in version 2014.7.0.
   CLI Example:
   
   salt 'sys.list_returner_functions'
salt 'sys.list_returner_functions mysql'
salt 'sys.list_returner_functions mysql etcd'

   Returner names can be specified as globs.
   New in version 2015.5.0.
   
   salt 'sys.list_returner_functions 'sqlite3.get_*'

salt.modules.sysmod.list_returners('args')
   List the returners loaded on the minion
   New in version 2014.7.0.
   CLI Example:
   
   salt 'sys.list_returners'

   Returner names can be specified as globs.
   New in version 2015.5.0.
   
   salt 'sys.list_returners 's*'

salt.modules.sysmod.list_runner_functions('args, **kwargs')
   List the functions for all runner modules. Optionally, specify a runner module or modules from which to list.
   New in version 2014.7.0.
   CLI Example:
   
   salt 'sys.list_runner_functions'
salt 'sys.list_runner_functions state'
salt 'sys.list_runner_functions state virt'

   Runner function names can be specified as globs.
   New in version 2015.5.0.
   
   salt 'sys.list_runner_functions 'state.*' 'virt.*'

salt.modules.sysmod.list_runners('args')
   List the runners loaded on the minion
   New in version 2014.7.0.
   CLI Example:
   
   salt 'sys.list_runners
Runner names can be specified as globs.
New in version 2015.5.0.

```
salt '*' sys.list_runners 'm*' 
```

```
salt.modules.sysmod.list_state_functions(\"args, \"**kwargs\")
```
List the functions for all state modules. Optionally, specify a state module or modules from which to list.
New in version 2014.7.0.

CLI Example:
```
salt '*' sys.list_state_functions
salt '*' sys.list_state_functions file
salt '*' sys.list_state_functions pkg user
```

State function names can be specified as globs.
New in version 2015.5.0.

```
salt '*' sys.list_state_functions 'file.*'
salt '*' sys.list_state_functions 'file.s*' 
```

New in version 2016.9.

```
salt '*' sys.list_state_functions 'module.specific_function'
```

```
salt.modules.sysmod.list_state_modules(\"args\")
```
List the modules loaded on the minion
New in version 2014.7.0.

CLI Example:
```
salt '*' sys.list_state_modules
```

State module names can be specified as globs.
New in version 2015.5.0.

```
salt '*' sys.list_state_modules 'mysql_*'
```

```
salt.modules.sysmod.reload_modules()
```
Tell the minion to reload the execution modules

CLI Example:
```
salt '*' sys.reload_modules 
```

```
salt.modules.sysmod.renderer_doc(\"args\")
```
Return the docstrings for all renderers. Optionally, specify a renderer or a function to narrow the selection.
The strings are aggregated into a single document on the master for easy reading.
Multiple renderers can be specified.
New in version 2015.5.0.

CLI Example:
Renderer names can be specified as globs.

```
salt '*' sys.renderer_doc c* j*
```

salt.modules.sysmod.returner_argspec()

Return the argument specification of functions in Salt returner modules.

New in version 2015.5.0.

CLI Example:

```
salt '* sys.returner_argspec xmpp
salt '* sys.returner_argspec xmpp smtp
salt '* sys.returner_argspec
```

Returner names can be specified as globs.

```
salt '* sys.returner_argspec 'sqlite3.*'
```

salt.modules.sysmod.returner_doc()

Return the docstrings for all returners. Optionally, specify a returner or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple returners/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '* sys.returner_doc
salt '* sys.returner_doc sqlite3
salt '* sys.returner_doc sqlite3.get_fun
salt '* sys.returner_doc sqlite3.get_fun etcd.get_fun
```

Returner names can be specified as globs.

New in version 2015.5.0.

```
salt '* sys.returner_doc 'sqlite3.get_*'
```

salt.modules.sysmod.runner_argspec()

Return the argument specification of functions in Salt runner modules.

New in version 2015.5.0.

CLI Example:

```
salt '* sys.runner_argspec state
salt '* sys.runner_argspec http
salt '* sys.runner_argspec
```

Runner names can be specified as globs.

```
salt '* sys.runner_argspec 'winrepo.*'
```
salt.modules.sysmod.runner_doc(*args)
Return the docstrings for all runners. Optionally, specify a runner or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.
Multiple runners/functions can be specified.
New in version 2014.7.0.

CLI Example:
```
salt '*' sys.runner_doc
salt '*' sys.runner_doc cache
salt '*' sys.runner_doc cache.grains
salt '*' sys.runner_doc cache.grains mine.get
```

Runner names can be specified as globs.
New in version 2015.5.0.
```
salt '*' sys.runner_doc 'cache.clear_*'
```

salt.modules.sysmod.state_argspec(module="")
Return the argument specification of functions in Salt state modules.
New in version 2015.5.0.

CLI Example:
```
salt '*' sys.state_argspec pkg.installed
salt '*' sys.state_argspec file
salt '*' sys.state_argspec
```

State names can be specified as globs.
```
salt '*' sys.state_argspec 'pkg.*'
```

salt.modules.sysmod.state_doc(*args)
Return the docstrings for all states. Optionally, specify a state or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.
Multiple states/functions can be specified.
New in version 2014.7.0.

CLI Example:
```
salt '*' sys.state_doc
salt '*' sys.state_doc service
salt '*' sys.state_doc service.running
salt '*' sys.state_doc service.running ipables.append
```

State names can be specified as globs.
New in version 2015.5.0.
```
salt '*' sys.state_doc 'service.*' 'iptables.*'
```

salt.modules.sysmod.state_schema(module="")
Return a JSON Schema for the given state function(s)
New in version 2016.3.0.
23.9.446  salt.modules.sysrc

sysrc module for FreeBSD

**salt.modules.sysrc.get(**kwargs**)**
Return system rc configuration variables

CLI Example:
```
salt '*' sysrc.get includeDefaults=True
```

**salt.modules.sysrc.remove**(name,**kwargs**)
Remove system rc configuration variables

CLI Example:
```
salt '*' sysrc.remove name=sshd_enable
```

**salt.modules.sysrc.set**(name,value,**kwargs**)
Set system rc configuration variables

CLI Example:
```
salt '*' sysrc.set name=sshd_flags value="-p 2222"
```

23.9.447  salt.modules.system

Support for reboot, shutdown, etc on POSIX-like systems.

**Note:** If you have configured a wrapper such as molly-guard to intercept interactive shutdown commands, be aware that calling system.halt, system.poweroff, system.reboot, and system.shutdown with salt-call will hang indefinitely while the wrapper script waits for user input. Calling them with salt will work as expected.

**salt.modules.system.get_computer_desc()**
Get PRETTY_HOSTNAME value stored in /etc/machine-info If this file doesn't exist or the variable doesn't exist return False.

Returns Value of PRETTY_HOSTNAME if this does not exist False.

Return type str

CLI Example:
```
salt '*' system.get_computer_desc
```

**salt.modules.system.get_computer_name()**
Get hostname.

CLI Example:
salt 'system' network.get_hostname

salt.modules.system.get_reboot_required_witnessed()
Determine if at any time during the current boot session the salt minion witnessed an event indicating that a reboot is required.

Returns True if the a reboot request was witnessed, False otherwise
Return type bool
CLI Example:
salt '*' system.get_reboot_required_witnessed

salt.modules.system.get_system_date(utc_offset=None)
Get the system date

Parameters utc_offset (str) -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use "+0000". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

Returns Returns the system date.
Return type str
CLI Example:
salt '*' system.get_system_date

salt.modules.system.get_system_date_time(utc_offset=None)
Get the system date/time.

Parameters utc_offset (str) -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use "+0000". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

Returns Returns the system time in YYYY-MM-DD hh:mm:ss format.
Return type str
CLI Example:
salt '*' system.get_system_date_time "'-0500'"

salt.modules.system.get_system_time(utc_offset=None)
Get the system time.

Parameters utc_offset (str) -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use "+0000". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

Returns Returns the system time in HH:MM:SS AM/PM format.
Return type str
CLI Example:
salt '*' system.get_system_time

salt.modules.system.halt()
Halt a running system
CLI Example:
salt '*' system.halt

salt.modules.system.has_settable_hwclock()
Returns True if the system has a hardware clock capable of being set from software.
CLI Example:
```
salt '*' system.has_settable_hwclock
```

```python
salt.modules.system.init(runlevel)
```
Change the system runlevel on sysV compatible systems
CLI Example:
```
salt '*' system.init 3
```

```python
salt.modules.system.poweroff()
```
Poweroff a running system
CLI Example:
```
salt '*' system.poweroff
```

```python
salt.modules.system.reboot(at_time=None)
```
Reboot the system
at_time  The wait time in minutes before the system will be rebooted.
CLI Example:
```
salt '*' system.reboot
```

```python
salt.modules.system.set_computer_desc(desc)
```
Set PRETTY_HOSTNAME value stored in /etc/machine-info This will create the file if it does not exist. If it is unable to create or modify this file returns False.

**Parameters**
- `desc (str)` -- The computer description

**Returns**
- False on failure. True if successful.

CLI Example:
```
salt '*' system.set_computer_desc "Michael's laptop"
```

```python
salt.modules.system.set_computer_name(hostname)
```
Modify hostname.

CLI Example:
```
salt '*' system.set_computer_name master.saltstack.com
```

```python
salt.modules.system.set_reboot_required_witnessed()
```
This function is used to remember that an event indicating that a reboot is required was witnessed. This function writes to a temporary filesystem so the event gets cleared upon reboot.

**Returns**
- True if successful, otherwise False

**Return type**
- bool

```
salt '*' system.set_reboot_required_witnessed
```

```python
salt.modules.system.set_system_date(newdate, utc_offset=None)
```
Set the system date. Use <mm-dd-yy> format for the date.

**Parameters**
- `newdate (str)` -- The date to set. Can be any of the following formats:
  - YYYY-MM-DD
  - MM-DD-YYYY
  - MM-DD-Y
  - MM/DD/YYYY
  - MM/DD/Y
```

Chapter 23. Salt Module Reference
CLI Example:

```bash
salt '*' system.set_system_date '03-28-13'
```

```python
salt.modules.system.set_system_date_time(years=None, months=None, days=None,
                                          hours=None, minutes=None, seconds=None,
                                          utc_offset=None)
```

Set the system date and time. Each argument is an element of the date, but not required. If an element is not passed, the current system value for that element will be used. For example, if you don't pass the year, the current system year will be used. (Used by set_system_date and set_system_time)

Updates hardware clock, if present, in addition to software (kernel) clock.

**Parameters**

- **years** *(int)* -- Years digit, ie: 2015
- **months** *(int)* -- Months digit: 1 - 12
- **days** *(int)* -- Days digit: 1 - 31
- **hours** *(int)* -- Hours digit: 0 - 23
- **minutes** *(int)* -- Minutes digit: 0 - 59
- **seconds** *(int)* -- Seconds digit: 0 - 59
- **utc_offset** *(str)* -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use “+0000”. Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

**Returns**

True if successful. Otherwise False.

**Return type** bool

CLI Example:

```bash
salt '*' system.set_system_date_time 2015 5 12 11 37 53 '-0500'
```

```python
salt.modules.system.set_system_time(newtime,
                                    utc_offset=None)
```

Set the system time.

**Parameters**

- **newtime** *(str)* -- The time to set. Can be any of the following formats. - HH:MM:SS AM/PM - HH:MM AM/PM - HH:MM:SS (24 hour) - HH:MM (24 hour)

Note that the salt command line parser parses the date/time before we obtain the argument (preventing us from doing utc) Therefore the argument must be passed in as a string. Meaning you may have to quote the text twice from the command line.

- **utc_offset** *(str)* -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use “+0000”. Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

**Returns**

Returns True if successful. Otherwise False.

**Return type** bool

CLI Example:

```bash
salt '*' system.set_system_time '11:20'
```

```python
salt.modules.system.shutdown(at_time=None)
```

Shutdown a running system

**at_time** The wait time in minutes before the system will be shutdown.

CLI Example:

```bash
salt '*' system.shutdown 5
```
23.9.448 salt.modules.system_profiler

System Profiler Module

Interface with macOS's command-line System Profiler utility to get information about package receipts and installed applications.

New in version 2015.5.0.

salt.modules.system_profiler.applications()
Return the results of a call to system_profiler -xml -detail full SPApplicationsDataType as a dictionary. Top-level keys of the dictionary are the names of each set of install receipts, since there can be multiple receipts with the same name. Contents of each key are a list of dictionaries.

Note that this can take a long time depending on how many applications are installed on the target Mac.

CLI Example:

```bash
salt '*' systemprofiler.applications
```

salt.modules.system_profiler.receipts()
Return the results of a call to system_profiler -xml -detail full SPInstallHistoryDataType as a dictionary. Top-level keys of the dictionary are the names of each set of install receipts, since there can be multiple receipts with the same name. Contents of each key are a list of dictionaries.

CLI Example:

```bash
salt '*' systemprofiler.receipts
```

23.9.449 salt.modules.systemd_service

Provides the service module for systemd

New in version 0.10.0.

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see here.

**Important:** This is an implementation of virtual 'service' module. As such, you must call it under the name 'service' and NOT 'systemd'. You can see that also in the examples below.

salt.modules.systemd_service.available(name)
New in version 0.10.4.
Check that the given service is available taking into account template units.

CLI Example:

```bash
salt '*' service.available sshd
```

salt.modules.systemd_service.disable(name, no_block=False, root=None, **kwargs)
Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon's control group. This is
done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemctl-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Disable the named service to not start when the system boots
no_block [False] Set to True to start the service using --no-block.

New in version 2017.7.0.
root Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.disable <service name>
```

salt.modules.systemd_service.disabled(name, root=None)
Return if the named service is disabled from starting on boot
root Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.disabled <service name>
```

salt.modules.systemd_service.enable(name, no_block=False, unmask=False, unmask_runtime=False, root=None, **kwargs)
Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemctl-run(1) is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemctl-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Enable the named service to start when the system boots
no_block [False] Set to True to start the service using --no-block.

New in version 2017.7.0.
unmask [False] Set to True to remove an indefinite mask before attempting to enable the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before enabling. This behavior is no longer the default.
unmask_runtime [False] Set to True to remove a runtime mask before attempting to enable the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before enabling. This behavior is no longer the default.
root Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.enable <service name>
```

salt.modules.systemd_service.enabled(name, root=None, **kwargs)
Return if the named service is enabled to start on boot
root Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.enabled <service name>
```

salt.modules.systemd_service.execs(root=None)
New in version 2014.7.0.

Return a list of all files specified as ExecStart for all services.
root Enable/disable/mask unit files in the specified root directory

CLI Example:
New in version 3001.

Call systemd-firstboot to configure basic settings of the system
locale Set primary locale (LANG=)
locale_message Set message locale (LC_MESSAGES=)
keymap Set keymap
timezone Set timezone
hostname Set host name
machine_id Set machine ID
root Operate on an alternative filesystem root

CLI Example:
salt '*' service.firstboot keymap=ja locale=ja_JP.UTF-8

salt.modules.systemd_service.force_reload(name, no_block=True, unmask=False, unmask_runtime=False)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd=>205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

New in version 0.12.0.

Force-reload the specified service with systemd
no_block [False] Set to True to start the service using --no-block.

New in version 2017.7.0.

unmask [False] Set to True to remove an indefinite mask before attempting to force-reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before force-reloading. This behavior is no longer the default.

unmask_runtime [False] Set to True to remove a runtime mask before attempting to force-reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before force-reloading. This behavior is no longer the default.

CLI Example:
salt '*' service.force_reload <service name>

salt.modules.systemd_service.get_all(root=None)

Return a list of all available services

root Enable/disable/mask unit files in the specified root directory

CLI Example:
salt '*' service.get_all

salt.modules.systemd_service.get_disabled(root=None)

Return a list of all disabled services

root Enable/disable/mask unit files in the specified root directory

CLI Example:
salt '*' service.get_disabled

salt.modules.systemd_service.get_enabled(root=None)
Return a list of all enabled services

- root: Enable/disable/mask unit files in the specified root directory

CLI Example:

salt '*' service.get_enabled

salt.modules.systemd_service.get_running()
Return a list of all running services, so far as systemd is concerned

CLI Example:

salt '*' service.get_running

salt.modules.systemd_service.get_static(root=None)
New in version 2015.8.5.

Return a list of all static services

- root: Enable/disable/mask unit files in the specified root directory

CLI Example:

salt '*' service.get_static

salt.modules.systemd_service.mask(name, runtime=False, root=None)
New in version 2015.8.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Mask the specified service with systemd

- runtime: [False] Set to True to mask this service only until the next reboot

New in version 2015.8.5.

- root: Enable/disable/mask unit files in the specified root directory

CLI Example:

salt '*' service.mask foo
salt '*' service.mask foo runtime=True

salt.modules.systemd_service.masked(name, runtime=False, root=None)
New in version 2015.8.0.

Changed in version 2015.8.5: The return data for this function has changed. If the service is masked, the return value will now be the output of the systemctl is-enabled command (so that a persistent mask can be distinguished from a runtime mask). If the service is not masked, then False will be returned.

Changed in version 2017.7.0: This function now returns a boolean telling the user whether a mask specified by the new runtime argument is set. If runtime is False, this function will return True if an indefinite mask is set for the named service (otherwise False will be returned). If runtime is False, this function will return True if a runtime mask is set, otherwise False.

Check whether or not a service is masked
**runtime** [False] Set to **True** to check for a runtime mask

New in version 2017.7.0: In previous versions, this function would simply return the output of `systemctl is-enabled` when the service was found to be masked. However, since it is possible to both have both indefinite and runtime masks on a service simultaneously, this function now only checks for runtime masks if this argument is set to **True**. Otherwise, it will check for an indefinite mask.

**root** Enable/disable/mask unit files in the specified root directory

**CLI Examples:**

```
salt '*' service.masked foo
salt '*' service.masked foo runtime=True
```

**salt.modules.systemd_service.missing**(name)

New in version 2014.1.0.

The inverse of `service.available`. Returns **True** if the specified service is not available, otherwise returns **False**.

**CLI Example:**

```
salt '*' service.missing sshd
```

**salt.modules.systemd_service.offline()**

New in version 3004.

Check if systemd is working in offline mode, where is not possible to talk with PID 1.

**CLI Example:**

```
salt '*' service.offline
```

**salt.modules.systemd_service.reload**(name, **no_block=False**, **unmask=False**, **unmask_runtime=False**)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a config option called `systemd.scope`, with a value of **False** (no quotes).

Reload the specified service with systemd

**no_block** [False] Set to **True** to reload the service using --no-block.

New in version 2017.7.0.

**unmask** [False] Set to **True** to remove an indefinite mask before attempting to reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before reloading. This behavior is no longer the default.

**unmask_runtime** [False] Set to **True** to remove a runtime mask before attempting to reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before reloading. This behavior is no longer the default.

**CLI Example:**

```
salt '*' service.reload <service name>
```

**salt.modules.systemd_service.restart**(name, **no_block=False**, **unmask=False**, **unmask_runtime=False**)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands run by this function from the salt-minion daemon's control group. This is
done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Restart the specified service with systemd

no_block [False] Set to True to start the service using --no-block.

New in version 2017.7.0.

unmask [False] Set to True to remove an indefinite mask before attempting to restart the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before restarting. This behavior is no longer the default.

unmask_runtime [False] Set to True to remove a runtime mask before attempting to restart the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before restarting. This behavior is no longer the default.

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.systemd_service.show(name, root=None)

Show properties of one or more units/jobs or the manager

root Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.show <service name>
```

salt.modules.systemd_service.start(name, no_block=False, unmask=False, unmask_runtime=False)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Start the specified service with systemd

no_block [False] Set to True to start the service using --no-block.

New in version 2017.7.0.

unmask [False] Set to True to remove an indefinite mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before starting. This behavior is no longer the default.

unmask_runtime [False] Set to True to remove a runtime mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before starting. This behavior is no longer the default.

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.systemd_service.status(name, sig=None)

Return the status for a service via systemd. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Parameters

- name (str) -- The name of the service to check
**sig** *(str)* -- Not implemented

Returns
True if running, False otherwise
dict: Maps service name to True if running, False otherwise

Return type **bool**

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

**salt.modules.systemd_service** *(name, no_block=False)*

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Stop the specified service with systemd

`no_block` [False] Set to True to start the service using --no-block.

New in version 2017.7.0.

CLI Example:

```
salt '*' service.stop <service name>
```

**salt.modules.systemd_service** *(name)*

New in version 0.15.0.

Reloads systemctl, an action needed whenever unit files are updated.

CLI Example:

```
salt '*' service.systemctl_reload
```

**salt.modules.systemd_service** *(name, runtime=False, root=None)*

New in version 2015.5.0.

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Unmask the specified service with systemd

`runtime` [False] Set to True to unmask this service only until the next reboot

New in version 2017.7.0: In previous versions, this function would remove whichever mask was identified by running systemctl is-enabled on the service. However, since it is possible to both have both indefinite and runtime masks on a service simultaneously, this function now removes a runtime mask only when this argument is set to True, and otherwise removes an indefinite mask.

`root` Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.unmask foo
salt '*' service.unmask foo runtime=True
```
23.9.450 salt.modules.telegram

Module for sending messages via Telegram.

configuration In order to send a message via the Telegram, certain configuration is required in
/etc/salt/minion on the relevant minions or in the pillar. Some sample configs might look like:

```
telegram.chat_id: '123456789'
telegram.token: '00000000:xxxxxxxxxxxxxxxxxxxxxxxxx'
```

salt.modules.telegram.post_message(message, chat_id=None, token=None)

Send a message to a Telegram chat.

Parameters

- `message` -- The message to send to the Telegram chat.
- `chat_id` -- (optional) The Telegram chat id.
- `token` -- (optional) The Telegram API token.

Returns

Boolean if message was sent successfully.

CLI Example:

```
salt '*' telegram.post_message message="Hello Telegram!"
```

23.9.451 salt.modules.telemetry

Connection module for Telemetry

New in version 2016.3.0.

https://github.com/mongolab/mongolab-telemetry-api-docs/blob/master/alerts.md

configuration This module accepts explicit telemetry credentials or can also read api key credentials

In the minion's config file:

```
telemetry.telemetry_api_keys:
  - abc123  # Key 1
  - efg321  # Backup Key 1

 telemetey_api_base_url: https://telemetry-api.mongolab.com/v0
```

depends requests

salt.modules.telemetry.create_alarm(deployment_id, metric_name, data, api_key=None, profile='telemetry')

create an telemetry alarms.

data is a dict of alert configuration data.

Returns (bool success, str message) tuple.

CLI Example:

```
salt myminion telemetry.create_alarm rs-ds033197 {} profile=telemetry
```

salt.modules.telemetry.delete_alarms(deployment_id, alert_id=None, metric_name=None, api_key=None, profile='telemetry')

delete an alert specified by alert_id or if not specified blows away all the alerts in the current deployment.

Returns (bool success, str message) tuple.

CLI Example:
salt myminion telemetry.delete_alarms rs-ds033197 profile=telemetry

salt.modules.telemetry.get_alarms(deployment_id, profile='telemetry')
get all the alarms set up against the current deployment
Returns dictionary of alarm information
CLI Example:
salt myminion telemetry.get_alarms rs-ds033197 profile=telemetry

salt.modules.telemetry.get_alert_config(deployment_id, metric_name=None, api_key=None, profile='telemetry')
Get all alert definitions associated with a given deployment or if metric_name is specified, obtain the specific alert config
Returns dictionary or list of dictionaries.
CLI Example:
salt myminion telemetry.get_alert_config rs-ds033197 currentConnections
salt myminion telemetry.get_alert_config rs-ds033197 profile=telemetry

salt.modules.telemetry.get_notification_channel_id(notify_channel, profile='telemetry')
Given an email address, creates a notification-channels if one is not found and also returns the corresponding notification channel id.
notify_channel  Email escalation policy
profile  A dict of telemetry config information.
CLI Example:
salt myminion telemetry.get_notification_channel_id userx@company.com

salt.modules.telemetry.update_alarm(deployment_id, metric_name, data, api_key=None, profile='telemetry')
update an telemetry alarms. data is a dict of alert configuration data.
Returns (bool success, str message) tuple.
CLI Example:
salt myminion telemetry.update_alarm rs-ds033197 {} profile=telemetry

23.9.452 salt.modules.temp

Simple module for creating temporary directories and files
This is a thin wrapper around Python's tempfile module
New in version 2015.8.0.
salt.modules.temp.dir(suffix='', prefix='tmp', parent=None)
Create a temporary directory
CLI Example:
```
salt '*' temp.dir
salt '*' temp.dir prefix='mytemp-' parent='/var/run/'
```

```python
salt.modules.temp.file(suffix='', prefix='tmp', parent=None)
Create a temporary file

CLI Example:
```
salt '*' temp.file
salt '*' temp.file prefix='mytemp-' parent='/var/run/'
```

## 23.9.453 salt.modules.test

Module for running arbitrary tests

```python
salt.modules.test.arg(*args, **kwargs)
Print out the data passed into the function *args and kwargs, this is used to both test the publication data and CLI argument passing, but also to display the information available within the publication data.

Returns {
"args": args, 
"kwargs": kwargs
}
```

CLI Example:
```
salt '*' test.arg 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

```python
salt.modules.test.arg_clean(*args, **kwargs)
Like test.arg but cleans kwargs of the __pub* items

CLI Example:
```
salt '*' test.arg_clean 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

```python
salt.modules.test.arg_repr(*args, **kwargs)
Print out the data passed into the function *args and kwargs, this is used to both test the publication data and CLI argument passing, but also to display the information available within the publication data.

Returns {
"args": repr(args), 
"kwargs": repr(kwargs)
}
```

CLI Example:
```
salt '*' test.arg_repr 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

```python
salt.modules.test.arg_type(*args, **kwargs)
Print out the types of the args and kwargs. This is used to test the types of the args and kwargs passed down to the Minion

Return type dict

CLI Example:
```
salt '*' test.arg_type 1 'int'
```

```python
salt.modules.test.assertion(assertion)
Assert the given argument

CLI Example:
```
salt '*' test.assertion False
```

```python
salt.modules.test.attr_call()
Call grains.items via the attribute
```
salt.modules.test.**collatz**(start)

Execute the collatz conjecture from the passed starting number, returns the sequence and the time it took to compute. Used for performance tests.

CLI Example:

```
salt '*' test.collatz 3
```

salt.modules.test.**conf_test()**

Return the value for test.foo in the minion configuration file, or return the default value

CLI Example:

```
salt '*' test.conf_test
```

salt.modules.test.**cross_test**(func, args=None)

Execute a minion function via the __salt__ object in the test module, used to verify that the Minion functions can be called via the __salt__ module.

CLI Example:

```
salt '*' test.cross_test file.gid_to_group 0
```

salt.modules.test.**echo**(text)

Return a string - used for testing the connection

CLI Example:

```
salt '*' test.echo 'foo bar baz quo qux'
```

salt.modules.test.**exception**(message='Test Exception')

Raise an exception

Optionally provide an error message or output the full stack.

CLI Example:

```
salt '*' test.exception 'Oh noes!'
```

salt.modules.test.**false_()**

Always return False

CLI Example:

```
salt '*' test.false
```

salt.modules.test.**fib**(num)

Return the num-th Fibonacci number, and the time it took to compute in seconds. Used for performance tests.

This function is designed to have terrible performance.

CLI Example:

```
salt '*' test.fib 3
```
salt.modules.test.get_opts()  
Return the configuration options passed to this minion  

CLI Example:  
```
salt '*' test.get_opts
```

salt.modules.test.kwarg(**kwargs)  
Print out the data passed into the function **kwargs, this is used to both test the publication data and CLI kwarg passing, but also to display the information available within the publication data.  

CLI Example:  
```
salt '*' test.kwarg num=1 txt="two" env='a: 1, b: "hello"'
```

salt.modules.test.missing_func()  

salt.modules.test.module_report()  
Return a dict containing all of the execution modules with a report on the overall availability via different references  

CLI Example:  
```
salt '*' test.module_report
```

salt.modules.test.not_loaded()  
List the modules that were not loaded by the salt loader system  

CLI Example:  
```
salt '*' test.not_loaded
```

salt.modules.test.opts_pkg()  
Return an opts package with the grains and opts for this Minion. This is primarily used to create the options used for Master side state compiling routines  

CLI Example:  
```
salt '*' test.opts_pkg
```

salt.modules.test.outputter(data)  
Test the outputter, pass in data to return  

CLI Example:  
```
salt '*' test.outputter foobar
```

salt.modules.test.ping()  
Used to make sure the minion is up and responding. Not an ICMP ping.  
Returns True.  

CLI Example:  
```
salt '*' test.ping
```

salt.modules.test.provider(module)  
Pass in a function name to discover what provider is being used  

CLI Example:
salt '!' test.provider service

salt.modules.test.providers()
    Return a dict of the provider names and the files that provided them
    CLI Example:
    ```
salt '!' test.providers
    ```

salt.modules.test.raise_exception(name, *args, **kwargs)
    Raise an exception. Built-in exceptions and those in salt.exceptions can be raised by this test function. If no matching exception is found, then no exception will be raised and this function will return False.
    This function is designed to test Salt's exception and return code handling.
    CLI Example:
    ```
salt '!' test.raise_exception TypeError "An integer is required"
salt '!' test.raise_exception salt.exceptions.CommandExecutionError "Something → went wrong"
    ```

salt.modules.test.rand_sleep(max=60)
    Sleep for a random number of seconds, used to test long-running commands and minions returning at differing intervals
    CLI Example:
    ```
salt '!' test.rand_sleep 60
    ```

salt.modules.test.rand_str(size=9999999999, hash_type=None)
    This function has been renamed to test.random_hash. This function will stay to ensure backwards compatibility, but please switch to using the preferred name test.random_hash.

salt.modules.test.random_hash(size=9999999999, hash_type=None)
    New in version 2015.5.2.
    Changed in version 2018.3.0: Function has been renamed from test.rand_str to test.random_hash
    Generates a random number between 1 and size, then returns a hash of that number. If no hash_type is passed, the hash_type specified by the Minion's hash_type config option is used.
    CLI Example:
    ```
salt '!' test.random_hash
salt '!' test.random_hash hash_type=sha512
    ```

salt.modules.test.retnode(code=42)
    Test that the returncode system is functioning correctly
    CLI Example:
    ```
salt '!' test.retnode 42
    ```

salt.modules.test.sleep(length)
    Instruct the minion to initiate a process that will sleep for a given period of time.
    CLI Example:
    ```
salt '!' test.sleep 20
    ```
salt.modules.test.stack()
Return the current stack trace

CLI Example:

```text
salt '*' test.stack
```

salt.modules.test.true_()
Always return True

CLI Example:

```text
salt '*' test.true
```

salt.modules.test.try_(module, return_try_exception=False, **kwargs)
Try to run a module command. On an exception return None. If return_try_exception is set to True, return the exception. This can be helpful in templates where running a module might fail as expected.

Jinja Example:

```text
{% for i in range(0,230) %}
    {{ salt['test.try'] (module='ipmi.get_users', bmc_host='172.2.2.\rightarrow'+i)|yaml(False) }}
{% endfor %}
```

salt.modules.test/tty('args', **kwargs)
Deprecated! Moved to cmd.tty

CLI Example:

```text
salt '*' test.tty tty0 'This is a test'
salt '*' test.tty pts3 'This is a test'
```

salt.modules.test.version()
Return the version of salt on the minion

CLI Example:

```text
salt '*' test.version
```

salt.modules.test.versions()
This function is an alias of versions_report.
Returns versions of components used by salt

CLI Example:

```text
salt '*' test.versions_report
```

salt.modules.test.versions_information()
Report the versions of dependent and system software

CLI Example:

```text
salt '*' test.versions_information
```

salt.modules.test.versions_report()
Returns versions of components used by salt

CLI Example:

```text
```
**23.9.454 salt.modules.test_virtual**

Module for running arbitrary tests with a __virtual__ function

```python
salt.modules.test_virtual.ping()
```

**23.9.455 salt.modules.testinframod**

This module exposes the functionality of the TestInfra library for use with SaltStack in order to verify the state of your minions. In order to allow for the addition of new resource types in TestInfra this module dynamically generates wrappers for the various resources by iterating over the values in the __all__ variable exposed by the testinfra.modules namespace.

**exception** `salt.modules.testinframod.InvalidArgumentError`

```python
salt.modules.testinframod.camel_to_snake_case(camel_input)
```

Converts camelCase (or CamelCase) to snake_case. From https://codereview.stackexchange.com/questions/185966/functions-to-convert-camelcase-strings-to-snake-case

- **Parameters**
  - `camel_input (str)` -- The camelcase or CamelCase string to convert to snake_case
  - :return str

```python
salt.modules.testinframod.snake_to_camel_case(snake_input, uppercamel=False)
```

Converts snake_case to camelCase (or CamelCase if uppercamel is True). Inspired by https://codereview.stackexchange.com/questions/85311/transform-snake-case-to-camelcase

- **Parameters**
  - `snake_input (str)` -- The input snake_case string to convert to camelCase
  - `uppercamel (bool)` -- Whether or not to convert to CamelCase instead
  - :return str

**23.9.456 salt.modules.textfsm_mod**

**TextFSM**

New in version 2018.3.0.

Execution module that processes plain text and extracts data using TextFSM templates. The output is presented in JSON serializable data, and can be easily re-used in other modules, or directly inside the renderer (Jinja, Mako, Genshi, etc.).

- **depends**
  - textfsm Python library

**Note:** Install textfsm library: `pip install textfsm`.

```python
salt.modules.textfsm_mod.extract(template_path, raw_text=None, raw_text_file=None, saltenv='base')
```

Extracts the data entities from the unstructured raw text sent as input and returns the data mapping, processing using the TextFSM template.

- **template_path** The path to the TextFSM template. This can be specified using the absolute path to the file, or using one of the following URL schemes:
- `salt://`, to fetch the template from the Salt fileservar.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

**raw_text**: `None` The unstructured text to be parsed.

**raw_text_file**: `None` Text file to read, having the raw text to be parsed using the TextFSM template. Supports the same URL schemes as the `template_path` argument.

**saltenv**: `base` Salt fileservar environment from which to retrieve the file. Ignored if `template_path` is not a `salt://` URL.

**CLI Example:**

```bash
salt '*' textfsm.extract salt://textfsm/juniper_version_template raw_text_file=s3://junos_ver.txt
salt '*' textfsm.extract http://some-server/textfsm/juniper_version_template raw_text_file='Hostname: router.abc ... snip ...'
```

**Jinja template example:**

```jinja
{% set raw_text = 'Hostname: router.abc ... snip ...' %}
{% set textfsm_extract = salt.textfsm.extract('https://some-server/textfsm/juniper_version_template', raw_text) %}
```

**Raw text example:**

```plaintext
Hostname: router.abc
Model: mx960
JUNOS Base OS boot [9.1S3.5]
JUNOS Base OS Software Suite [9.1S3.5]
JUNOS Kernel Software Suite [9.1S3.5]
JUNOS Crypto Software Suite [9.1S3.5]
JUNOS Packet Forwarding Engine Support (M/T Common) [9.1S3.5]
JUNOS Packet Forwarding Engine Support (MX Common) [9.1S3.5]
JUNOS Online Documentation [9.1S3.5]
JUNOS Routing Software Suite [9.1S3.5]
```

**TextFSM Example:**

```plaintext
Value Chassis (\S+)
Value Required Model (\S+)
Value Boot (.*)
Value Base (.*)
Value Kernel (.*)
Value Crypto (.*)
Value Documentation (.*)
Value Routing (.*

Start
# Support multiple chassis systems.
^\S+:$$ => Continue.Record
^\${Chassis}:$$
^Model: \${Model}
^JUNOS Base OS boot \[${Boot}\]
^JUNOS Software Release \[${Base}\]
^JUNOS Base OS Software Suite \[${Base}\]
^JUNOS Kernel Software Suite \[${Kernel}\]
^JUNOS Crypto Software Suite \[${Crypto}\]
```

(continues on next page)
Output example:

```json
{
    "comment": "",
    "result": true,
    "out": [
        {
            "kernel": "9.1S3.5",
            "documentation": "9.1S3.5",
            "boot": "9.1S3.5",
            "crypto": "9.1S3.5",
            "chassis": "",
            "routing": "9.1S3.5",
            "base": "9.1S3.5",
            "model": "mx960"
        }
    ]
}
```

`salt.modules.textfsm_mod.index(command, platform=None, platform_grain_name=None, platform_column_name=None, output=None, output_file=None, textfsm_path=None, index_file=None, saltenv='base', include_empty=False, include_pat=None, exclude_pat=None)`

Dynamically identify the template required to extract the information from the unstructured raw text.

The output has the same structure as the `extract` execution function, the difference being that `index` is capable to identify what template to use, based on the platform details and the `command`.

- **command** The command executed on the device, to get the output.
- **platform** The platform name, as defined in the TextFSM index file.

**Note:** For ease of use, it is recommended to define the TextFSM indexfile with values that can be matches using the grains.

- **platform_grain_name** The name of the grain used to identify the platform name in the TextFSM index file.

**Note:** This option can be also specified in the minion configuration file or pillar as `textfsm_platform_grain`.

**Note:** This option is ignored when `platform` is specified.

- **platform_column_name** The column name used to identify the platform, exactly as specified in the TextFSM index file. Default: `Platform`.

**Note:** This is field is case sensitive, make sure to assign the correct value to this option, exactly as defined in the index file.

**Note:** This option can be also specified in the minion configuration file or pillar as...
textfsm_platform_column_name.

**output**  The raw output from the device, to be parsed and extract the structured data.

**output_file**  The path to a file that contains the raw output from the device, used to extract the structured data. This option supports the usual Salt-specific schemes: file://, salt://, http://, https://, ftp://, s3://, swift://.

**textfsm_path**  The path where the TextFSM templates can be found. This can be either absolute path on the server, either specified using the following URL schemes: file://, salt://, http://, https://, ftp://, s3://, swift://.

**Note:** This needs to be a directory with a flat structure, having an index file (whose name can be specified using the `index_file` option) and a number of TextFSM templates.

**index_file:**  `index`  The name of the TextFSM index file, under the `textfsm_path`. Default: index.

**Note:** This option can be also specified in the minion configuration file or pillar as `textfsm_index_file`.

**saltenv:**  `base`  Salt fileserver environment from which to retrieve the file. Ignored if `textfsm_path` is not a salt:// URL.

**include_empty:**  `False`  Include empty files under the `textfsm_path`.

**include_pat**  Glob or regex to narrow down the files cached from the given path. If matching with a regex, the regex must be prefixed with E@, otherwise the expression will be interpreted as a glob.

**exclude_pat**  Glob or regex to exclude certain files from being cached from the given path. If matching with a regex, the regex must be prefixed with E@, otherwise the expression will be interpreted as a glob.

**Note:** If used with `include_pat`, files matching this pattern will be excluded from the subset of files defined by `include_pat`.

**CLI Example:**

```
salt '*' textfsm.index 'sh ver' platform=Juniper output_file=salt://textfsm/
       juniper_version_example textfsm_path=salt://textfsm/
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_version_
       example textfsm_path=ftp://textfsm/ platform_column_name=Vendor
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_version_
       example textfsm_path=https://some-server/textfsm/ platform_column_name=Vendor
       platform_grain_name=vendor
```

TextFSM index file example:

```
salt://textfsm/index

Template, Hostname, Vendor, Command
juniper_version_template, .*, Juniper, sh[[ow]] ve[[rsion]]
```

The usage can be simplified, by defining (some of) the following options: `textfsm_platform_grain`, `textfsm_path`, `textfsm_platform_column_name`, or `textfsm_index_file`, in the (proxy) minion configuration file or pillar.

**Configuration example:**
And the CLI usage becomes as simple as:

```
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_version_example
```

Usage inside a Jinja template:

```
{%- set command = 'sh ver' -%}
{%- set output = salt.net.cli(command) -%}
{%- set textfsm_extract = salt.textfsm.index(command, output=output) -%}
```

### 23.9.457 salt.modules.timezone

Module for managing timezone on POSIX-like systems.

#### salt.modules.timezone.get_hwclock()

Get current hardware clock setting (UTC or localtime)

CLI Example:

```
salt '*' timezone.get_hwclock
```

#### salt.modules.timezone.get_offset()

Get current numeric timezone offset from UTC (i.e. -0700)

CLI Example:

```
salt '*' timezone.get_offset
```

#### salt.modules.timezone.get_zone()

Get current timezone (i.e. America/Denver)

Changed in version 2016.11.4.

**Note:** On AIX operating systems, Posix values can also be returned 'CST6CDT,M3.2.0/2:00:00,M11.1.0/2:00:00'

CLI Example:

```
salt '*' timezone.get_zone
```

#### salt.modules.timezone.get_zonecode()

Get current timezone (i.e. PST, MDT, etc)

CLI Example:

```
salt '*' timezone.get_zonecode
```

#### salt.modules.timezone.set_hwclock(

Sets the hardware clock to be either UTC or localtime

CLI Example:

```
salt 'salt '*' timezone.set_hwclock UTC

salt.modules.timezone.set_zone(timezone)
Unlinks, then symlinks /etc/localtime to the set timezone.
The timezone is crucial to several system processes, each of which SHOULD be restarted (for instance, whatever you system uses as its cron and syslog daemons). This will not be automagically done and must be done manually!

CLI Example:

salt 'salt '*' timezone.set_zone 'America/Denver'"

Changed in version 2016.11.4.

Note: On AIX operating systems, Posix values are also allowed, see below

salt 'salt '*' timezone.set_zone 'CST6CDT,M3.2.0/2:00:00,M11.1.0/2:00:00'"

salt.modules.timezone.zone_compare(timezone)
Compares the given timezone name with the system timezone name. Checks the hash sum between the given timezone, and the one set in /etc/localtime. Returns True if names and hash sums match, and False if not. Mostly useful for running state checks.

Changed in version 2016.3.0.

Note: On Solaris-link operating systems only a string comparison is done.

Changed in version 2016.11.4.

Note: On AIX operating systems only a string comparison is done.

CLI Example:

salt 'salt '*' timezone.zone_compare 'America/Denver'"

23.9.458 salt.modules.tls

A salt module for SSL/TLS. Can create a Certificate Authority (CA) or use Self-Signed certificates.

depends PyOpenSSL Python module (0.10 or later, 0.14 or later for X509 extension support)

collection Add the following values in /etc/salt/minion for the CA module to function properly:

| ca.cert_base_path | '/etc/pki' |

CLI Example #1: Creating a CA, a server request and its signed certificate:

```
# salt-call tls.create_ca my_little 
ds=5  
CN='My Little CA' 
C=US 
```
ST=Utah 
L=Salt Lake City 
O=Saltstack 
emailAddress=pleasedontemail@example.com

Created Private Key: "/etc/pki/my_little/my_little_ca_cert.key"
Created CA "my_little_ca": "/etc/pki/my_little_ca/my_little_ca_cert.crt"

# salt-call tls.create_csr my_little CN=www.example.com
Created Private Key: "/etc/pki/my_little/certs/www.example.com.key"
Created CSR for "www.example.com": "/etc/pki/my_little/certs/www.example.com.csr"

# salt-call tls.create_ca_signed_cert my_little CN=www.example.com
Created Certificate for "www.example.com": "/etc/pki/my_little/certs/www.example.com.crt"

CLI Example #2: Creating a client request and its signed certificate

# salt-call tls.create_csr my_little CN=DBReplica_No.1 cert_type=client
Created Private Key: "/etc/pki/my_little/certs//DBReplica_No.1.key."
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.csr."

# salt-call tls.create_ca_signed_cert my_little CN=DBReplica_No.1
Created Certificate for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.crt

CLI Example #3: Creating both a server and client req + cert for the same CN

# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \
    cert_type=client
Created Private Key: "/etc/pki/my_little/certs/MasterDBReplica_No.2.key."
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/MasterDBReplica_No.2.csr."

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2
Created Certificate for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.crt

# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \
    cert_type=server
Certificate "MasterDBReplica_No.2" already exists
(doh!)

# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \
    cert_type=server type_ext=True
Created Private Key: "/etc/pki/my_little/certs/DBReplica_No.1_client.key."
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1_client.csr.

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2
Certificate "MasterDBReplica_No.2" already exists
(DOH!)

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2 \
    cert_type=server type_ext=True
for "MasterDBReplica_No.2": "/etc/pki/my_little/certs/
    "MasterDBReplica_No.2_server.crt"

CLI Example #4: Create a server req + cert with non-CN filename for the cert

```
# salt-call tls.create_csr my_little CN=www.anothersometh.ing \
cert_type=server type_ext=True
Created Private Key: "/etc/pki/my_little/certs/www.anothersometh.ing_server.key."
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/www.anothersometh.ing_
    server.csr."
# salt-call tls_create_ca_signed_cert my_little CN=www.anothersometh.ing \
cert_type=server cert_filename="something_completely_different"
Created Certificate for "www.anothersometh.ing": /etc/pki/my_little/certs/something_
    completely_different.crt
```
salt.modules.tls.ca_exists(ca_name, cacert_path=None, ca_filename=None)
    Verify whether a Certificate Authority (CA) already exists
    ca_name name of the CA
cacert_path absolute path to ca certificates root directory
ca_filename alternative filename for the CA

    New in version 2015.5.3.
    CLI Example:

```
salt '*' tls.ca_exists test_ca /etc/certs
```
salt.modules.tls.cert_base_path(cacert_path=None)
    Return the base path for certs from CLI or from options
cacert_path absolute path to ca certificates root directory

    CLI Example:

```
salt '*' tls.cert_base_path
```
salt.modules.tls.cert_info(cert, digest='sha256')
    Return information for a particular certificate
cert path to the certificate PEM file or string
digest what digest to use for fingerprinting

    Changed in version 2018.3.4.
    CLI Example:

```
salt '*' tls.cert_info /dir/for/certs/cert.pem
```
salt.modules.tls.create_ca(ca_name, bits=2048, days=365, CN='localhost', C='US', ST='Utah',
    L='Salt Lake City', O='SaltStack', OU=None, emailAddress=None, fix-
    mode=False, cacert_path=None, ca_filename=None, digest='sha256', onlyif=None, unless=None, replace=False)

    Create a Certificate Authority (CA)
    ca_name name of the CA
    bits number of RSA key bits, default is 2048
days number of days the CA will be valid, default is 365
CN common name in the request, default is "localhost"
C country, default is "US"
ST state, default is "Utah"
L locality, default is "Centerville", the city where SaltStack originated

23.9. execution modules
O  organization, default is "SaltStack"
OU  organizational unit, default is None
emailAddress  email address for the CA owner, default is None
cacert_path  absolute path to ca certificates root directory
c_file  alternative filename for the CA
	new in version 2015.5.3.
digest  The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'
replace  Replace this certificate even if it exists
	new in version 2015.5.1.

Writes out a CA certificate based upon defined config values. If the file already exists, the function just returns assuming the CA certificate already exists.

If the following values were set:

```python
c.cert_base_path='\etc/pki'
c.name='koji'
```

the resulting CA, and corresponding key, would be written in the following location with appropriate permissions:

```bash
/\etc/pki/koji\koji\cert\crt
/\etc/pki/koji\koji\cert\key
```

CLI Example:

```
salt '*' tls.create_ca test_ca
```

salt.modules.tls.create_ca_signed_cert(ca_name, CN, days=365, cacert_path=None, 
c_filename=None, cert_path=None, 
cert_filename=None, digest='sha256', cert_type=None, 
type_ext=False, replace=False)

Create a Certificate (CERT) signed by a named Certificate Authority (CA)

If the certificate file already exists, the function just returns assuming the CERT already exists.

The CN must match an existing CSR generated by create_csr. If it does not, this method does nothing.

c_name  name of the CA
CN  common name matching the certificate signing request
days  number of days certificate is valid, default is 365 (1 year)
cacert_path  absolute path to ca certificates root directory
c_filename  alternative filename for the CA
	new in version 2015.5.3.
cert_path  full path to the certificates directory
cert_filename  alternative filename for the certificate, useful when using special characters in the CN. If this option is set it will override the certificate filename output effects of cert_type. type_ext will be completely overridden.
	new in version 2015.5.3.
digest  The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'
replace  Replace this certificate even if it exists
	new in version 2015.5.1.
cert_type  string. Either 'server' or 'client' (see create_csr() for details).
If `create_csr(type_ext=True)` this function must be called with the same `cert_type` so it can find the CSR file.

Note: `create_csr()` defaults to `cert_type='server'`; therefore, if it was also called with `type_ext`, `cert_type` becomes a required argument for `create_ca_signed_cert()`

**type_ext** bool. If set True, use `cert_type` as an extension to the CN when formatting the filename.

- e.g.: `some_subject_CN_server.crt` or `some_subject_CN_client.crt`

This facilitates the context where both types are required for the same subject

If `cert_filename` is not `None`, setting `type_ext` has no effect

If the following values were set:

```
ca.cert_base_path='/etc/pki'
cn='koji'
CN='test.egavas.org'
```

the resulting signed certificate would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.crt
```

CLI Example:

```
salt '*' tls.create_ca_signed_cert test localhost
```

salt.modules.tls.**create_csr**(ca_name, bits=2048, CN='localhost', C='US', ST='Utah', L='Salt Lake City', O='SaltStack', OU=None, emailAddress=None, subjectAltName=None, cacert_path=None, ca_filename=None, csr_path=None, csr_filename=None, digest='sha256', type_ext=False, cert_type='server', replace=False)

Create a Certificate Signing Request (CSR) for a particular Certificate Authority (CA)

da.cert_base_path='/', ca_name='koji', CN='test.egavas.org'

the resulting signed certificate would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.crt
```

New in version 2015.8.0.

**cert_type** Specify the general certificate type. Can be either *server* or *client*. Indicates the set of common extensions added to the CSR.
server: {
  'basicConstraints': 'CA:FALSE',
  'extendedKeyUsage': 'serverAuth',
  'keyUsage': 'digitalSignature, keyEncipherment'
}

client: {
  'basicConstraints': 'CA:FALSE',
  'extendedKeyUsage': 'clientAuth',
  'keyUsage': 'nonRepudiation, digitalSignature, keyEncipherment'
}

type_ext boolean. Whether or not to extend the filename with CN_[cert_type] This can be useful if a server
and client certificate are needed for the same CN. Defaults to False to avoid introducing an unexpected
file naming pattern

The files normally named some_subject_CN.csr and some_subject_CN.key will then be saved

replace Replace this signing request even if it exists

New in version 2015.5.1.
Writs out a Certificate Signing Request (CSR) If the file already exists, the function just returns assuming the
CSR already exists.

If the following values were set:

ca.cert_base_path='/etc/pki'
cia_name='koji'
CN='test.egavas.org'

the resulting CSR, and corresponding key, would be written in the following location with appropriate per-
missions:

/etc/pki/koji/certs/test.egavas.org.csr
/etc/pki/koji/certs/test.egavas.org.key

CLI Example:
salt '*' tls.create_csr test

salt.modules.tls.create_empty_crl(ca_name, cacert_path=None, ca_filename=None,
crl_file=None, digest='sha256')
Create an empty Certificate Revocation List.

New in version 2015.8.0.
ca_name name of the CA
cacert_path absolute path to ca certificates root directory
c_filename alternative filename for the CA

crl_file full path to the CRL file
digest The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL
(by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'

CLI Example:
salt '*' tls.create_empty_crl ca_name='koji' ca_filename='ca' 0
→        crl_file='/etc/openvpn/team1/crl.pem'

salt.modules.tls.create_pkcs12(ca_name, CN, passphrase='', cacert_path=None, replace=False)
Create a PKCS#12 browser certificate for a particular Certificate (CN)
ca_name  name of the CA
CN  common name matching the certificate signing request
passphrase  used to unlock the PKCS#12 certificate when loaded into the browser
cacert_path  absolute path to ca certificates root directory
replace  Replace this certificate even if it exists

New in version 2015.5.1.
If the following values were set:

```python
c.a.cert_base_path='/etc/pki'
c.a_name='koji'
CN='test.egavas.org'
```

the resulting signed certificate would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.p12
```

CLI Example:

```
salt '*' tls.create_pkcs12 test localhost
```

salt.modules.tls.create_self_signed_cert(tls_dir='tls', bits=2048, days=365, CN='localhost',  
C='US', ST='Utah', L='Salt Lake City',  
O='SaltStack', OU=None, emailAddress=None,  
cacert_path=None, cert_filename=None, digest='sha256', replace=False)

Create a Self-Signed Certificate (CERT)
tls_dir  location appended to the ca.cert_base_path, default is 'tls'
bits  number of RSA key bits, default is 2048
CN  common name in the request, default is "localhost"
C country, default is "US"
ST state, default is "Utah"
L locality, default is "Centerville", the city where SaltStack originated
O organization, default is "SaltStack" NOTE: Must the same as CA certificate or an error will be raised
OU organizational unit, default is None
eMailAddress  email address for the request, default is None
cacert_path  absolute path to ca certificates root directory
digest  The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL
(by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'
replace  Replace this certificate even if it exists

New in version 2015.5.1.
Writes out a Self-Signed Certificate (CERT). If the file already exists, the function just returns.
If the following values were set:

```python
c.a.cert_base_path='/etc/pki'
tls_dir='koji'
CN='test.egavas.org'
```

the resulting CERT, and corresponding key, would be written in the following location with appropriate permissions:

```
/etc/pki/koji/certs/test.egavas.org.crt
/etc/pki/koji/certs/test.egavas.org.key
```

CLI Example:
salt '*' tls.create_self_signed_cert

Passing options from the command line:
salt 'minion' tls.create_self_signed_cert CN='test.mysite.org'

salt.modules.tls.get_ca(ca_name, as_text=False, cacert_path=None)
    Get the certificate path or content
    ca_name  name of the CA
    as_text  if true, return the certificate content instead of the path
    cacert_path  absolute path to ca certificates root directory
    CLI Example:
salt '*' tls.get_ca test_ca as_text=False cacert_path=/etc/certs

salt.modules.tls.get_ca_signed_cert(ca_name, CN='localhost', as_text=False, cacert_path=None, cert_filename=None)
    Get the certificate path or content
    ca_name  name of the CA
    CN  common name of the certificate
    as_text  if true, return the certificate content instead of the path
    cacert_path  absolute path to certificates root directory
    cert_filename  alternative filename for the certificate, useful when using special characters in the CN
    New in version 2015.5.3.
    CLI Example:
salt '*' tls.get_ca_signed_cert test_ca CN=localhost as_text=False cacert_path=/
    → etc/certs

salt.modules.tls.get_ca_signed_key(ca_name, CN='localhost', as_text=False, cacert_path=None, key_filename=None)
    Get the certificate path or content
    ca_name  name of the CA
    CN  common name of the certificate
    as_text  if true, return the certificate content instead of the path
    cacert_path  absolute path to certificates root directory
    key_filename  alternative filename for the key, useful when using special characters
    New in version 2015.5.3.
    CLI Example:
salt '*' tls.get_ca_signed_key test_ca CN=localhost as_text=False cacert_path=/
    → etc/certs

salt.modules.tls.get_expiration_date(cert, date_format='%Y-%m-%d')
    New in version 2019.2.0.
    Get a certificate's expiration date
    cert  Full path to the certificate
    date_format  By default this will return the expiration date in YYYY-MM-DD format, use this to specify a different strftime format string. Note that the expiration time will be in UTC.
    CLI Examples:
salt 'salt '*' tls.get_expiration_date /path/to/foo.crt
salt '* salt get_expiration_date /path/to/foo.crt date_format=%d/%m/%Y'

salt.modules.tls.get_extensions(cert_type)
Fetch X509 and CSR extension definitions from tls:extensions: (common|server|client) or set them to standard defaults.
New in version 2015.8.0.
cert_type: The type of certificate such as server or client.
CLI Example:
salt '*' tls.get_extensions client

salt.modules.tls.maybe_fix_ssl_version(ca_name, cacert_path=None, ca_filename=None)
Check that the X509 version is correct (was incorrectly set in previous salt versions). This will fix the version if needed.
ca_name ca authority name
cacert_path absolute path to ca certificates root directory
cacert_filename alternative filename for the CA
New in version 2015.5.3.
CLI Example:
salt '*' tls.maybe_fix_ssl_version test_ca /etc/certs

salt.modules.tls.revoke_cert(ca_name, CN, cacert_path=None, ca_filename=None, cert_path=None, cert_filename=None, crl_file=None, digest='sha256')
Revoke a certificate.
New in version 2015.8.0.
ca_name Name of the CA.
CN Common name matching the certificate signing request.
cacert_path Absolute path to ca certificates root directory.
cacert_filename Alternative filename for the CA.
cert_path Path to the cert file.
cert_filename Alternative filename for the certificate, useful when using special characters in the CN.
crl_file Full path to the CRL file.
digest The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'
CLI Example:
salt '*' tls.revoke_cert ca_name='koji' CN='koji' cacert_path=None, ca_filename=None, cert_path=None, cert_filename=None, crl_file='/etc/openvpn/team1/crl.pem'

salt.modules.tls.set_ca_path(cacert_path)
If wanted, store the aforementioned cacert_path in context to be used as the basepath for further operations
CLI Example:
salt '*' tls.set_ca_path /etc/certs

salt.modules.tls.validate(cert, ca_name, crl_file)
Validate a certificate against a given CA/CRL.
cert path to the certificate PEM file or string
23.9.459  salt.modules.tomcat

Support for Tomcat

This module uses the manager webapp to manage Apache tomcat webapps. If the manager webapp is not configured some of the functions won’t work.

configuration

- Java bin path should be in default path
- If ipv6 is enabled make sure you permit manager access to ipv6 interface "0:0:0:0:0:0:1"
- If you are using tomcat.tar.gz it has to be installed or symlinked under /opt, preferably using name tomcat
- "tomcat.signal start/stop" works but it does not use the startup scripts

The following grains/pillar should be set:

```
tomcat-manager:
  user: <username>
  passwd: <password>
```

or the old format:

```
tomcat-manager.user: <username>
tomcat-manager.passwd: <password>
```

Also configure a user in the conf/tomcat-users.xml file:

```
<?xml version='1.0' encoding='utf-8'?>
<tomcat-users>
  <role rolename="manager-script"/>
  <user username="tomcat" password="tomcat" roles="manager-script"/>
</tomcat-users>
```

Note:
- if you use only this module for deployments you’ve might want to strict access to the manager only from localhost for more info: http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring_Manager_Application_Access
- Tested on:
  JVM Vendor: Sun Microsystems Inc.
  JVM Version: 1.6.0_43-b01
  OS Architecture: amd64
  OS Name: Linux
  OS Version: 2.6.32-358.el6.x86_64
  Tomcat Version: Apache Tomcat/7.0.37
salt.modules.tomcat.deploy_war

```
war absolute path to WAR file (should be accessible by the user running tomcat) or a path supported by the
salt.modules.cp.get_file function
context the context path to deploy
force [False] set True to deploy the webapp even one is deployed in the context
url [http://localhost:8080/manager] the URL of the server manager webapp
saltenv [base] the environment for WAR file in used by salt.modules.cp.get_url function
timeout [180] timeout for HTTP request
temp_war_location [None] use another location to temporarily copy to war file by default the system's temp
directory is used
version [''] Specify the war version. If this argument is provided, it overrides the version encoded in the war
file name, if one is present.
```

Examples:
```
salt '*' tomcat.deploy_war salt://salt-2015.8.6.war version=2015.08.r6
```

CLI Examples:
```
cp module

salt '*' tomcat.deploy_war salt://application.war /api
salt '*' tomcat.deploy_war salt://application.war /api no
salt '*' tomcat.deploy_war salt://application.war /api yes http://localhost:8080/
        →manager

minion local file system

salt '*' tomcat.deploy_war /tmp/application.war /api
salt '*' tomcat.deploy_war /tmp/application.war /api no
salt '*' tomcat.deploy_war /tmp/application.war /api yes http://localhost:8080/
        →manager
```

salt.modules.tomcat.extract_war_version

```
Extract the version from the war file name. There does not seem to be a standard for encoding the version into
the war file name
```

Examples:
```
/path/salt-2015.8.6.war -> 2015.8.6
/path/V6R2013xD5.war -> None
```

salt.modules.tomcat.fullversion

```
Return all server information from catalina.sh version
```

CLI Example:
```
salt '*' tomcat.fullversion
```

salt.modules.tomcat.leaks

```
Find memory leaks in tomcat
```

CLI Example:
```
salt '*' tomcat.leaks
```

23.9. execution modules
CLI Examples:

```bash
salt '*' tomcat.leaks
```

```bash
salt.modules.tomcat.ls(url='http://localhost:8080/manager', timeout=180)
```

list all the deployed webapps

- `url` [http://localhost:8080/manager] the URL of the server manager webapp
- `timeout` [180] timeout for HTTP request

CLI Examples:

```bash
salt '*' tomcat.ls
salt '*' tomcat.ls http://localhost:8080/manager
```

```bash
salt.modules.tomcatpasswd(passwd='', user='', alg='sha1', realm=None)
```

This function replaces the $CATALINA_HOME/bin/digest.sh script convert a clear-text password to the $CATALINA_BASE/conf/tomcat-users.xml format

CLI Examples:

```bash
salt '*' tomcat.passwd secret
salt '*' tomcat.passwd secret tomcat sha1 'Protected Realm'
```

```bash
salt.modules.tomcat.reload_(app, url='http://localhost:8080/manager', timeout=180)
```

Reload the webapp

- `app` the webapp context path
- `url` [http://localhost:8080/manager] the URL of the server manager webapp
- `timeout` [180] timeout for HTTP request

CLI Examples:

```bash
salt '*' tomcat.reload /jenkins
salt '*' tomcat.reload /jenkins http://localhost:8080/manager
```

```bash
salt.modules.tomcat.serverinfo(url='http://localhost:8080/manager', timeout=180)
```

return details about the server

- `url` [http://localhost:8080/manager] the URL of the server manager webapp
- `timeout` [180] timeout for HTTP request

CLI Examples:

```bash
salt '*' tomcat.serverinfo
salt '*' tomcat.serverinfo http://localhost:8080/manager
```

```bash
salt.modules.tomcat.sessions(app, url='http://localhost:8080/manager', timeout=180)
```

return the status of the webapp sessions

- `app` the webapp context path
- `url` [http://localhost:8080/manager] the URL of the server manager webapp
- `timeout` [180] timeout for HTTP request

CLI Examples:

```bash
salt '*' tomcat.sessions /jenkins
salt '*' tomcat.sessions /jenkins http://localhost:8080/manager
```

```bash
salt.modules.tomcat.signal(signal=None)
```

Signals catalina to start, stop, securestart, forcestop.

CLI Example:
salt '*' tomcat.signal start

salt.modules.tomcat.start(app, url='http://localhost:8080/manager', timeout=180)
    Start the webapp
    app  the webapp context path
    url [http://localhost:8080/manager] the URL of the server manager webapp
    timeout  timeout for HTTP request
    CLI Examples:
    
salt '*' tomcat.start /jenkins
salt '*' tomcat.start /jenkins http://localhost:8080/manager

salt.modules.tomcat.status(url='http://localhost:8080/manager', timeout=180)
    Used to test if the tomcat manager is up
    url [http://localhost:8080/manager] the URL of the server manager webapp
    timeout  [180] timeout for HTTP request
    CLI Examples:

    salt '*' tomcat.status
    salt '*' tomcat.status http://localhost:8080/manager

salt.modules.tomcat.status_webapp(app, url='http://localhost:8080/manager', timeout=180)
    return the status of the webapp (stopped | running | missing)
    app  the webapp context path
    url [http://localhost:8080/manager] the URL of the server manager webapp
    timeout  [180] timeout for HTTP request
    CLI Examples:

    salt '*' tomcat.status_webapp /jenkins
    salt '*' tomcat.status_webapp /jenkins http://localhost:8080/manager

salt.modules.tomcat.stop(app, url='http://localhost:8080/manager', timeout=180)
    Stop the webapp
    app  the webapp context path
    url [http://localhost:8080/manager] the URL of the server manager webapp
    timeout  [180] timeout for HTTP request
    CLI Examples:

    salt '*' tomcat.stop /jenkins
    salt '*' tomcat.stop /jenkins http://localhost:8080/manager

salt.modules.tomcat.undeploy(app, url='http://localhost:8080/manager', timeout=180)
    Undeploy a webapp
    app  the webapp context path
    url [http://localhost:8080/manager] the URL of the server manager webapp
    timeout  [180] timeout for HTTP request
    CLI Examples:

    salt '*' tomcat.undeploy /jenkins
    salt '*' tomcat.undeploy /jenkins http://localhost:8080/manager

salt.modules.tomcat.version()
    Return server version from catalina.sh version
    CLI Example:
23.9.460 salt.modules.trafficserver

Apache Traffic Server execution module.
New in version 2015.8.0.

traffic_ctl is used to execute individual Traffic Server commands and to script multiple commands in a shell.

salt.modules.trafficserver.alarms()
List all alarm events that have not been acknowledged (cleared).

salt.modules.trafficserver.bounce_cluster()

salt.modules.trafficserver.bounce_local(drain=False)

   drain This option modifies the restart behavior such that traffic_server is not shut down until the number of active client connections drops to the number given by the proxy.config.restart.active_client_threshold configuration variable.

salt.modules.trafficserver.clear_alarms(alarm)
Clear (acknowledge) an alarm event. The arguments are “all” for all current alarms, a specific alarm number (e.g. “1”), or an alarm string identifier (e.g. “MGMT_ALARM_PROXY_CONFIG_ERROR”).

salt.modules.trafficserver.clear_cluster()
Clears accumulated statistics on all nodes in the cluster.

salt.modules.trafficserver.clear_node()
Clears accumulated statistics on the local node.

salt.modules.trafficserver.match_config(regex)
Display the current values of all configuration variables whose names match the given regular expression.
New in version 2016.11.0.

salt.modules.trafficserver.match_metric(regex)
Display the current values of all metrics whose names match the given regular expression.
New in version 2016.11.0.

```python
salt '*' trafficserver.match_metric regex
```

`salt.modules.trafficserver.offline(path)`
Mark a cache storage device as offline. The storage is identified by a path which must match exactly a path specified in storage.config. This removes the storage from the cache and redirects requests that would have used this storage to other storage. This has exactly the same effect as a disk failure for that storage. This does not persist across restarts of the traffic_server process.

```bash
salt '*' trafficserver.offline /path/to/cache
```

`salt.modules.trafficserver.read_config(*args)`
Read Traffic Server configuration variable definitions.
New in version 2016.11.0.

```bash
salt '*' trafficserver.read_config proxy.config.http.keep_alive_post_out
```

`salt.modules.trafficserver.read_metric(*args)`
Read Traffic Server one or more metrics.
New in version 2016.11.0.

```bash
salt '*' trafficserver.read_metric proxy.process.http.tcp_hit_count_stat
```

`salt.modules.trafficserver.refresh()`
Initiate a Traffic Server configuration file reread. Use this command to update the running configuration after any configuration file modification.

The timestamp of the last reconfiguration event (in seconds since epoch) is published in the proxy.node.config.reconfigure_time metric.

```bash
salt '*' trafficserver.refresh
```

`salt.modules.trafficserver.restart_cluster()`
Restart the traffic_manager process and the traffic_server process on all the nodes in a cluster.

```bash
salt '*' trafficserver.restart_cluster
```

`salt.modules.trafficserver.restart_local(drain=False)`
Restart the traffic_manager and traffic_server processes on the local node.

**drain** This option modifies the restart behavior such that traffic_server is not shut down until the number of active client connections drops to the number given by the proxy.config.restart.active_client_threshold configuration variable.

```bash
salt '*' trafficserver.restart_local
salt '*' trafficserver.restart_local drain=True
```

`salt.modules.trafficserver.set_config(variable, value)`
Set the value of a Traffic Server configuration variable.

**variable** Name of a Traffic Server configuration variable.

**value** The new value to set.
New in version 2016.11.0.

```bash
salt '*' trafficserver.set_config proxy.config.http.keep_alive_post_out 0
```
salt.modules.trafficserver.shutdown()
Shut down Traffic Server on the local node.

```
salt '*' trafficserver.shutdown
```

salt.modules.trafficserver.startup()
Start Traffic Server on the local node.

```
salt '*' trafficserver.start
```

salt.modules.trafficserver.status()
Show the current proxy server status, indicating if we're running or not.

```
salt '*' trafficserver.status
```

salt.modules.trafficserver.zero_cluster()
Reset performance statistics to zero across the cluster.

```
salt '*' trafficserver.zero_cluster
```

salt.modules.trafficserver.zero_node()
Reset performance statistics to zero on the local node.

```
salt '*' trafficserver.zero_node
```

23.9.461  salt.modules.transactional_update module

Transactional update

New in version 3004.

A transactional system, like MicroOS, can present some challenges when the user decided to manage it via Salt.

MicroOS provide a read-only rootfs and a tool, transactional-update, that takes care of the management of the system (updating, upgrading, installation or reboot, among others) in an atomic way.

Atomicity is the main feature of MicroOS, and to guarantee this property, this model leverages snapper, zypper, btrfs and overlayfs to create snapshots that will be updated independently of the currently running system, and that are activated after the reboot. This implies, for example, that some changes made on the system are not visible until the next reboot, as those changes are living in a different snapshot of the file system.

This model presents a lot of problems with the traditional Salt model, where the inspections (like 'is this package installed?') are executed in order to determine if a subsequent action is required (like 'install this package').

Let's consider this use case, to see how it works on a traditional system, and in a transactional system:

1) Check if apache is installed
2) If it is not installed, install it
3) Check that a vhost is configured for apache
4) Make sure that apache2.service is enabled
5) If the configuration changes, restart apache2.service

In the traditional system everything will work as expected. The system can see if the package is present or not, install it if it isn’t, and a re-check will shows that is already present. The same will happen to the configuration file...
in `/etc/apache2`, that will be available as soon the package gets installed. Salt can inspect the current form of this file, and add the missing bits if required. Salt can annotate that a change is present, and restart the service.

In a transactional system we will have multiple issues. The first one is that Salt can only see the content of the snapshot where the system booted from. Later snapshots may contain different content, including the presence of `apache`. If Salt decides to install `apache` calling `zypper`, it will fail, as this will try to write into the read-only `roofs`. Even if Salt would call `transactional-update pkg install`, the package would only be present in the new transaction (snapshot), and will not be found in the currently running system when later Salt tries to validate the presence of the package in the current one.

Any change in `/etc` alone will have also problems, as the changes will be alive in a different overlay, only visible after the reboot. And, finally, the service can only be enabled and restarted if the service file is already present in the current `/etc`.

**General strategy**

`transactional-update` is the reference tool used for the administration of transactional systems. Newer versions of this tool support the execution of random commands in the new transaction, the continuation of a transaction, the automatic detection of changes in new transactions and the merge of `/etc` overlays.

**Continue a transaction**

One prerequisite already present is the support for branching from a different snapshot than the current one in `snapper`.

With this feature we can represent in `transactional-update` the action of creating a transaction snapshot based on one that is planned to be the active one after the reboot. This feature removes a lot of user complains (like, for example, losing changes that are stored in a transaction not yet activated), but also provide a more simple model to work with.

So, for example, if the user have this scenario:

```
+---------+ ========= +-------+
-T.1- | - | T.2 | - | T.3 |
+---------+ ========= +-------+
```

where T.2 is the current active one, and T.3 is an snapshot generated from T.2 with a new package (`apache2`), and is marked to be the active after the reboot.

Previously, if the user (that is still on T.2) created a new transaction, maybe for adding a new package (`tomcat`, for example), the new T.4 will be based on the content of T.2 again, and not T.3, so the new T.4 will have lost the changes of T.3 (i.e. `apache2` will not be present in T.4).

With the `--continue` parameter, `transactional-update` will create T.4 based on T.3, and nothing will be lost.
Command execution inside a new transaction

With `transactional-update run` we will create a new transaction based on the current one (T.2), where we can send interactive commands that can modify the new transaction, and as commented, with `transactional-update --continue run`, we will create a new transaction based on the last created (T.3).

The `run` command can execute any application inside the new transaction namespace. This module uses this feature to execute the different Salt execution modules, via `call()`. Or even the full `salt-thin` or `salt-call` via `sls()`, `apply()`, `single()` or `highstate`.

**transactional-update** will drop empty snapshots

The option `--drop-if-no-change` is used to detect whether there is any change in the file system on the read-only subvolume of the new transaction will be added. If a change is present, the new transaction will remain, if not it will be discarded.

For example:

```
transactional-update --continue --drop-if-no-change run zypper in apache2
```

If we are in the scenario described before, `apache2` is already present in T.3. In this case a new transaction, T.4, will be created based on T.3, `zypper` will detect that the package is already present and no change will be produced on T.4. At the end of the execution, `transactional-update` will validate that T.3 and T.4 are equivalent and T.4 will be discarded.

If the command is:

```
transactional-update --continue --drop-if-no-change run zypper in tomcat
```

the new T.4 will be indeed different from T.3, and will remain after the transaction is closed.

With this feature, every time that we call any function of this execution module, we will minimize the amount of transaction, while maintaining the idempotence so some operations.

Report for pending transaction

A change in the system will create a new transaction, that needs to be activated via a reboot. With `pending_transaction()` we can check if a reboot is needed. We can execute the reboot using the `reboot()` function, that will follow the plan established by the functions of the `rebootmgr` execution module.

**/etc** overlay merge when no new transaction is created

In a transactional model, `/etc` is an overlay file system. Changes done during the update are only present in the new transaction, and so will only be available after the reboot. Or worse, if the transaction gets dropped, because there is no change in the `rootfs`, the changes in `/etc` will be dropped too! This is designed like that in order to make the configuration files for the new package available only when new package is also available to the user. So, after the reboot.

This makes sense for the case when, for example, `apache2` is not present in the current transaction, but we installed it. The new snapshot contains the `apache2` service, and the configuration files in `/etc` will be accessible only after the reboot.
But this model presents an issue. If we use `transactional-update --continue --drop-if-no-change run <command>`, where `<command>` does not make any change in the read-only subvolume, but only in `/etc` (which is also read-write in the running system), the new overlay with the changes in `/etc` will be dropped together with the transaction.

To fix this, `transactional-update` will detect that when no change has been made on the read-only subvolume, but done in the overlay, the transaction will be dropped and the changes in the overlay will be merged back into `/etc` overlay of the current transaction.

**Using the execution module**

With this module we can create states that leverage Salt into this kind of systems:

```
# Install apache (low-level API)
salt-call transactional_update.pkg_install apache2

# We can call any execution module
salt-call transactional_update.call pkg.install apache2

# Or via a state
salt-call transactional_update.single pkg.installed name=apache2

# We can also execute a zypper directly
salt-call transactional_update run "zypper in apache2" snapshot="continue"

# We can reuse SLS states
salt-call transactional_update.apply install_and_configure_apache

# Or apply the full highstate
salt-call transactional_update.highstate

# Is there any change done in the system?
salt-call transactional_update pending_transaction

# If so, reboot via rebootmgr
salt-call transactional_update run reboot

# We can enable the service
salt-call service.enable apache2

# If apache2 is available, this will work too
salt-call service.restart apache2
```
Fixing some expectations

This module alone is an improvement over the current state, but is easy to see some limitations and problems:

Is not a fully transparent approach

The user needs to know if the system is transactional or not, as not everything can be expressed inside a transaction (for example, restarting a service inside transaction is not allowed).

Two step for service restart

In the apache2 example from the beginning we can observe the biggest drawback. If the package `apache2` is missing, the new module will create a new transaction, will execute pkg.install inside the transaction (creating the salt-thin, moving it inside and delegating the execution to transactional-update CLI as part of the full state). Inside the transaction we can do too the required changes in /etc for adding the new vhost, and we can enable the service via systemctl inside the same transaction.

At this point we will not merge the /etc overlay into the current one, and we expect from the user call the `reboot` function inside this module, in order to activate the new transaction and start the apache2 service.

In the case that the package is already there, but the configuration for the vhost is required, the new transaction will be dropped and the /etc overlay will be visible in the live system. Then from outside the transaction, via a different call to Salt, we can command a restart of the apache2 service.

We can see that in both cases we break the user expectation, where a change on the configuration will trigger automatically the restart of the associated service. In a transactional scenario we need two different steps: or a reboot, or a restart from outside of the transaction.

```python
class salt.modules.transactional_update.TransactionalUpdateHighstate(
    opts, pillar=None, wrapper=None, fsclient=None)

salt.modules.transactional_update.apply_(mods=None, **kwargs)
```

Apply an state inside a transaction.

This function will call transactional_update.highstate or transactional_update.sls based on the arguments passed to this function. It exists as a more intuitive way of applying states.

For a formal description of the possible parameters accepted in this function, check `state.apply_` documentation.

activate_transaction If at the end of the transaction there is a pending activation (i.e there is a new snapshot in the system), a new reboot will be scheduled (default False)

CLI Example:

```bash
salt microos transactional_update.apply
salt microos transactional_update.apply stuff
```
salt.modules.transactional_update.bootloader(self_update=False, snapshot=None)

Reinstall the bootloader

Same as grub.cfg, but will also rewrite the bootloader itself.

**self_update** Check for newer transactional-update versions.

**snapshot** Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update bootloader snapshot="continue"
```

salt.modules.transactional_update.call(function, *args, **kwargs)

Executes a Salt function inside a transaction.

The chroot does not need to have Salt installed, but Python is required.

**function** Salt execution module function

**activate_transaction** If at the end of the transaction there is a pending activation (i.e there is a new snapshot in the system), a new reboot will be scheduled (default False)

CLI Example:

```
salt microos transactional_update.call test.ping
salt microos transactional_update.call ssh.set_auth_key user key=mykey
salt microos transactional_update.call pkg.install emacs activate_transaction=True
```

salt.modules.transactional_update.cleanup(self_update=False)

Run both cleanup-snapshots and cleanup-overlays.

Identical to calling both cleanup-snapshots and cleanup-overlays.

**self_update** Check for newer transactional-update versions.

CLI Example:

```
salt microos transactional_update.cleanup
```

salt.modules.transactional_update.cleanup_overlays(self_update=False)

Remove unused overlay layers.

Removes all unreferenced (and thus unused) /etc overlay directories in /var/lib/overlay.

**self_update** Check for newer transactional-update versions.

CLI Example:

```
salt microos transactional_update.cleanup_overlays
```

salt.modules.transactional_update.cleanup_snapshots(self_update=False)

Mark unused snapshots for snapper removal.

If the current root filesystem is identical to the active root filesystem (means after a reboot, before transactional-update creates a new snapshot with updates), all old snapshots without a cleanup algorithm get a cleanup algorithm set. This is to make sure, that old snapshots will be deleted by snapper. See the section about cleanup algorithms in snapper(8).

**self_update** Check for newer transactional-update versions.

CLI Example:

```
salt microos transactional_update.cleanup_snapshots
```

23.9. execution modules
Salt Documentation, Release 3003.3

salt.modules.transactional_update.dup(self_update=False, snapshot=None)
    Call 'zypper dup'

    If new updates are available, a new snapshot is created and zypper dup --no-allow-vendor-change is used to
    update the snapshot. Afterwards, the snapshot is activated and will be used as the new root filesystem during
    next boot.

    self_update  Check for newer transactional-update versions.
    snapshot  Use the given snapshot or, if no number is given, the current default snapshot as a base for the next
              snapshot. Use "continue" to indicate the last snapshot done.

    CLI Example:

    salt microos transactional_update dup snapshot="continue"

salt.modules.transactional_update.grub_cfg(self_update=False, snapshot=None)
    Regenerate grub.cfg

    grub2-mkconfig(8) is called to create a new /boot/grub2/grub.cfg configuration file for the bootloader.

    self_update  Check for newer transactional-update versions.
    snapshot  Use the given snapshot or, if no number is given, the current default snapshot as a base for the next
              snapshot. Use "continue" to indicate the last snapshot done.

    CLI Example:

    salt microos transactional_update grub_cfg snapshot="continue"

salt.modules.transactional_update.highstate(activate_transaction=False, queue=False, **kwargs)
    Retrieve the state data from the salt master for this minion and execute it inside a transaction.

    For a formal description of the possible parameters accepted in this function, check state.highstate document-
    ation.

    activate_transaction  If at the end of the transaction there is a pending activation (i.e there is a new snapshot
                           in the system), a new reboot will be scheduled (default False)
    queue  Instead of failing immediately when another state run is in progress, queue the new state run to begin
           running once the other has finished.

    This option starts a new thread for each queued state run, so use this option sparingly. (Default: False)

    CLI Example:

    salt microos transactional_update.highstate
    salt microos transactional_update.highstate pillar='{"foo": "bar"}'
    salt microos transactional_update.highstate activate_transaction=True

salt.modules.transactional_update.in_transaction()
    Check if Salt is executing while in a transaction

    CLI Example:

    salt microos transactional_update in_transaction

salt.modules.transactional_update.initrd(self_update=False, snapshot=None)
    Regenerate initrd

    A new initrd is created in a snapshot.

    self_update  Check for newer transactional-update versions.
    snapshot  Use the given snapshot or, if no number is given, the current default snapshot as a base for the next
              snapshot. Use "continue" to indicate the last snapshot done.

    CLI Example:
Salt Documentation, Release 3003.3

```bash
salt microos transactional_update initrd snapshot="continue"
```

**salt.modules.transactional_update.kdump** *(self_update=False, snapshot=None)*

Regenerate kdump initrd

* `self_update` Check for newer transactional-update versions.
* `snapshot` Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```bash
salt microos transactional_update kdump snapshot="continue"
```

**salt.modules.transactional_update.migration** *(self_update=False, snapshot=None)*

Updates systems registered via SCC / SMT

On systems which are registered against the SUSE Customer Center (SCC) or SMT, a migration to a new version of the installed products can be made with this option.

* `self_update` Check for newer transactional-update versions.
* `snapshot` Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```bash
salt microos transactional_update migration snapshot="continue"
```

**salt.modules.transactional_update.patch** *(self_update=False, snapshot=None)*

Call 'zypper patch'

If new updates are available, a new snapshot is created and zypper patch is used to update the snapshot. Afterwards, the snapshot is activated and will be used as the new root filesystem during next boot.

* `self_update` Check for newer transactional-update versions.
* `snapshot` Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```bash
salt microos transactional_update patch snapshot="continue"
```

**salt.modules.transactional_update.pending_transaction()**

Check if there is a pending transaction

CLI Example:

```bash
salt microos transactional_update pending_transaction
```

**salt.modules.transactional_update.pkg_install** *(pkg=None, pkgs=None, args=None, self_update=False, snapshot=None)*

Install individual packages

Installs additional software. See the install description in the "Package Management Commands" section of zypper's man page for all available arguments.

* `pkg` Package name to install
* `pkgs` List of packages names to install
* `args` String or list of extra parameters for zypper
* `self_update` Check for newer transactional-update versions.
* `snapshot` Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:
salt.microos.transactional_update pkg_install pkg=emacs snapshot="continue"
salt.modules.transactional_update.pkg_remove(pkg=None, pkgs=None, args=None, self_update=False, snapshot=None)
Remove individual packages
Removes installed software. See the remove description in the "Package Management Commands" section of zypper's man page for all available arguments.
pkg Package name to install
pkgs List of packages names to install
args String or list of extra parameters for zypper
self_update Check for newer transactional-update versions.
snapshot Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.
CLI Example:
salt microos transactional_update pkg_remove pkg=vim snapshot="continue"
salt.modules.transactional_update.pkg_update(pkg=None, pkgs=None, args=None, self_update=False, snapshot=None)
Updates individual packages
Update selected software. See the update description in the "Update Management Commands" section of zypper's man page for all available arguments.
pkg Package name to install
pkgs List of packages names to install
args String or list of extra parameters for zypper
self_update Check for newer transactional-update versions.
snapshot Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.
CLI Example:
salt microos transactional_update pkg_update pkg=emacs snapshot="continue"
salt.modules.transactional_update.reboot(self_update=False)
Reboot after update
Trigger a reboot after updating the system.
Several different reboot methods are supported, configurable via the REBOOT_METHOD configuration option in transactional-update.conf(5). By default rebootmgrd(8) will be used to reboot the system according to the configured policies if the service is running, otherwise systemctl reboot will be called.
self_update Check for newer transactional-update versions.
CLI Example:
salt microos transactional_update reboot
salt.modules.transactional_update.rollback(snapshot=None)
Set the current, given or last working snapshot as default snapshot
Sets the default root file system. On a read-only system the root file system is set directly using btrfs. On read-write systems snapper(8) rollback is called.
If no snapshot number is given, the current root file system is set as the new default root file system. Otherwise number can either be a snapshot number (as displayed by snapper list) or the word last. last will try to reset to the latest working snapshot.
snapshot Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "last" to indicate the last working snapshot done.
salt modules.transactional_update.run(command, self_update=False, snapshot=None)
Run a command in a new snapshot

Execute the command inside a new snapshot. By default this snapshot will remain, but if `--drop-if-no-change` is set, the new snapshot will be dropped if there is no change in the file system.

- **command** Command with parameters that will be executed (as string or array)
- **self_update** Check for newer transactional-update versions.
- **snapshot** Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update run "mkdir /tmp/dir" snapshot="continue"
```

salt.modules.transactional_update.single(fun, name, test=None, activate_transaction=False, queue=False, **kwargs)
Execute a single state function with the named kwargs, returns False if insufficient data is sent to the command

By default, the values of the kwargs will be parsed as YAML. So, you can specify lists values, or lists of single entry key-value maps, as you would in a YAML salt file. Alternatively, JSON format of keyword values is also supported.

- **activate_transaction** If at the end of the transaction there is a pending activation (i.e there is a new snapshot in the system), a new reboot will be scheduled (default False)
- **queue** Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly. (Default: False)

CLI Example:

```
salt microos transactional_update.single pkg.installed name=emacs
salt microos transactional_update.single pkg.installed name=emacs activate_transaction=True
```

salt.modules.transactional_update.sls(mods, saltenv='base', test=None, exclude=None, activate_transaction=False, queue=False, **kwargs)
Execute the states in one or more SLS files inside a transaction.

- **saltenv** Specify a salt fileserver environment to be used when applying states
- **mods** List of states to execute
- **test** Run states in test-only (dry-run) mode
- **exclude** Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing sls or id keys. Glob-patterns may be used to match multiple states.
- **activate_transaction** If at the end of the transaction there is a pending activation (i.e there is a new snapshot in the system), a new reboot will be scheduled (default False)
- **queue** Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly. (Default: False)

For a formal description of the possible parameters accepted in this function, check state.sls documentation.

CLI Example:

```
salt microos transactional_update.sls stuff pillar='{"foo": "bar"}'
salt microos transactional_update.sls stuff activate_transaction=True
```
**salt.modules.transactional_update.transactional()**

Check if the system is a transactional system

CLI Example:

```
salt microos transactional_update transactional
```

**salt.modules.transactional_update.up(self_update=False, snapshot=None)**

Call ‘zypper up’

If new updates are available, a new snapshot is created and zypper up is used to update the snapshot. Afterwards, the snapshot is activated and will be used as the new root filesystem during next boot.

- **self_update** Check for newer transactional-update versions.
- **snapshot** Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use “continue” to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update up snapshot="continue"
```

### 23.9.462 salt.modules.travisci

Commands for working with travisci.

- **depends** pyOpenSSL >= 16.0.0

**salt.modules.travisci.verify_webhook(signature, body)**

Verify the webhook signature from travisci

- **signature** The signature header from the webhook header
- **body** The full payload body from the webhook post

**Note:** The body needs to be the urlencoded version of the body.

CLI Example:

```
salt '*' travisci.verify_webhook 'M6NucCX5722bxisQs7e...' 'payload=%7B%22id%22...'
```

### 23.9.463 salt.modules.tuned

Interface to Red Hat tuned-adm module

- **maintainer** Syed Ali <alicsyed@gmail.com>
- **maturity** new
- **depends** tuned-adm
- **platform** Linux

**salt.modules.tuned.active()**

Return current active profile

CLI Example:

```
salt '*' tuned.active
```
salt.modules.tuned.list()  
List the profiles available  
CLI Example:  
```
salt '*' tuned.list
```

salt.modules.tuned.off()  
Turn off all profiles  
CLI Example:  
```
salt '*' tuned.off
```

salt.modules.tuned.profile(profile_name)  
Activate specified profile  
CLI Example:  
```
salt '*' tuned.profile virtual-guest
```

23.9.464 salt.modules.twilio_notify  
Module for notifications via Twilio  
New in version 2014.7.0.  

depends  
• twilio python module  
configuration  
Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config (with pillar_opts set to True).  
For example:  
```
my-twilio-account:  
twilio.account_sid: AC32a3c83990934481add5ce1659f04d2  
twilio.auth_token: mytoken
```

salt.modules.twilio_notify.send_sms(profile, body, to, from_)  
Send an sms  
CLI Example:  
```
twilio.send_sms my-twilio-account 'Test sms' '+18019999999' '+18011111111'
```

23.9.465 salt.modules.udev  
Manage and query udev info  
New in version 2015.8.0.  

salt.modules.udev.env(dev)  
Return all environment variables udev has for dev  
CLI Example:  
```
salt '*' udev.env /dev/sda  
salt '*' udev.env /sys/class/net/eth0
```

23.9. execution modules
salt.modules.udev.exportdb()

Return all the udev database

CLI Example:

```bash
salt '*' udev.exportdb
```

salt.modules.udev.info(dev)

Extract all info delivered by udevadm

CLI Example:

```bash
salt '*' udev.info /dev/sda
salt '*' udev.info /sys/class/net/eth0
```

salt.modules.udev.links(dev)

Return all udev-created device symlinks

CLI Example:

```bash
salt '*' udev.links /dev/sda
salt '*' udev.links /sys/class/net/eth0
```

salt.modules.udev.name(dev)

Return the actual dev name(s?) according to udev for dev

CLI Example:

```bash
salt '*' udev.dev /dev/sda
salt '*' udev.dev /sys/class/net/eth0
```

salt.modules.udev.path(dev)

Return the physical device path(s?) according to udev for dev

CLI Example:

```bash
salt '*' udev.path /dev/sda
salt '*' udev.path /sys/class/net/eth0
```

---

23.9.466 salt.modules.upstart_service

Module for the management of upstart systems. The Upstart system only supports service starting, stopping and restarting.

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to "service.start is not available"), see [here](#).

Currently (as of Ubuntu 12.04) there is no tool available to disable Upstart services (like update-rc.d). This[1] is the recommended way to disable an Upstart service. So we assume that all Upstart services that have not been disabled in this manner are enabled.

But this is broken because we do not check to see that the dependent services are enabled. Otherwise we would have to do something like parse the output of "initctl show-config" to determine if all service dependencies are enabled to start on boot. For example, see the "start on" condition for the lightdm service below[2]. And this would be too hard. So we wait until the upstart developers have solved this problem. :) This is to say that an Upstart service that is enabled may not really be enabled.
Also, when an Upstart service is enabled, should the dependent services be enabled too? Probably not. But there should be a notice about this, at least.

[2] example upstart configuration file:

```bash
lightdm
  emits login-session-start
  emits desktop-session-start
  emits desktop-shutdown
start on (((filesystem and runlevel \[!06\]) and started dbus) and (drm-device-added→
  →card0 PRIMARY_DEVICE_FOR_DISPLAY=1 or stopped udev-fallback-graphics)) or runlevel→
  →PREVLEVEL=S)
stop on runlevel \[016\]
```

Warning: This module should not be used on Red Hat systems. For these, the `rh_service` module should be used, as it supports the hybrid upstart/sysvinit system used in RHEL/CentOS 6.

```bash
salt.modules.upstart_service.available(name)
Returns True if the specified service is available, otherwise returns False.

CLI Example:
salt '*' service.available sshd
```

```bash
salt.modules.upstart_service.disable(name, **kwargs)
Disable the named service from starting on boot

CLI Example:
salt '*' service.disable <service name>
```

```bash
salt.modules.upstart_service.disabled(name)
Check to see if the named service is disabled to start on boot

CLI Example:
salt '*' service.disabled <service name>
```

```bash
salt.modules.upstart_service.enabled(name, **kwargs)
Enable the named service to start at boot

CLI Example:
salt '*' service.enable <service name>
```

```bash
salt.modules.upstart_service.enabled(name, **kwargs)
Check to see if the named service is enabled to start on boot

CLI Example:
salt '*' service.enabled <service name>
```

```bash
salt.modules.upstart_service.force_reload(name)
Force-reload the named service

CLI Example:
```
```
salt 'service.*' force_reload <service name>

salt.modules.upstart_service.full_restart(name)
Do a full restart (stop/start) of the named service

CLI Example:
salt 'service.*' full_restart <service name>

salt.modules.upstart_service.get_all()
Return all installed services

CLI Example:
salt 'service.*' get_all

salt.modules.upstart_service.get_disabled()
Return the disabled services

CLI Example:
salt 'service.*' get_disabled

salt.modules.upstart_service.get_enabled()
Return the enabled services

CLI Example:
salt 'service.*' get_enabled

salt.modules.upstart_service.missing(name)
The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.

CLI Example:
salt 'service.*' missing sshd

salt.modules.upstart_service.reload_(name)
Reload the named service

CLI Example:
salt 'service.*' reload <service name>

salt.modules.upstart_service.restart(name)
Restart the named service

CLI Example:
salt 'service.*' restart <service name>

salt.modules.upstart_service.start(name)
Start the specified service

CLI Example:
salt 'service.*' start <service name>
salt.modules.upstart_service.status\(name, \text{sig=None}\)
Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

**Parameters**
- **name** (str) -- The name of the service to check
- **sig** (str) -- Signature to use to find the service via ps

**Returns**
True if running, False otherwise dict: Maps service name to True if running, False otherwise

**Return type** bool

CLI Example:
```
salt '*' service.status <service name> [service signature]
```

salt.modules.upstart_service.stop\(name)\)
Stop the specified service

CLI Example:
```
salt '*' service.stop <service name>
```

23.9.467 salt.modules.uptime

Wrapper around uptime API

salt.modules.uptime.check_exists\(name)\)
Check if a given URL is in being monitored by uptime

CLI Example:
```
salt '*' uptime.check_exists http://example.org
```

salt.modules.uptime.checks_list\()\)
List URL checked by uptime

CLI Example:
```
salt '*' uptime.checks_list
```

salt.modules.uptime.create\(name, **params\)
Create a check on a given URL.

Additional parameters can be used and are passed to API (for example interval, maxTime, etc). See the documentation [https://github.com/fzaninotto/uptime](https://github.com/fzaninotto/uptime) for a full list of the parameters.

CLI Example:
```
salt '*' uptime.create http://example.org
```

salt.modules.uptime.delete\(name)\)
Delete a check on a given URL

CLI Example:
```
salt '*' uptime.delete http://example.org
```
23.9.468  salt.modules.useradd

Manage users with the useradd command

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to `'user.info is not available`), see here.

```
salt.modules.useradd.add(name, uid=None, gid=None, groups=None, home=None, shell=None,
unique=True, system=False, fullname='', roomnumber='', workphone='',
homephone='', other='', createhome=True, loginclass=None, nologinit=False,
root=None, usergroup=None)
```

Add a user to the minion

- **name**  Username LOGIN to add
- **uid**  User ID of the new account
- **gid**  Name or ID of the primary group of the new account
- **groups**  List of supplementary groups of the new account
- **home**  Home directory of the new account
- **shell**  Login shell of the new account
- **unique**  If not True, the user account can have a non-unique UID
- **system**  Create a system account
- **fullname**  GECOS field for the full name
- **roomnumber**  GECOS field for the room number
- **workphone**  GECOS field for the work phone
- **homephone**  GECOS field for the home phone
- **other**  GECOS field for other information
- **createhome**  Create the user's home directory
- **loginclass**  Login class for the new account (OpenBSD)
- **nologinit**  Do not add the user to the lastlog and faillog databases
- **root**  Directory to chroot into
- **usergroup**  Create and add the user to a new primary group of the same name

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

```
salt.modules.useradd.chfullname(name, fullname, root=None)
```

Change the user's Full Name

- **name**  User to modify
- **fullname**  GECOS field for the full name
- **root**  Directory to chroot into

CLI Example:

```
salt '*' user.chfullname foo "Foo Bar"
```

```
salt.modules.useradd.chgid(name, gid, root=None)
```

Change the default group of the user

- **name**  User to modify
- **gid**  Force use GID as new primary group
- **root**  Directory to chroot into

CLI Example:

```
salt '*' user.chgid foo 4376
```

```
salt.modules.useradd.chgroups(name, groups, append=False, root=None)
```

Change the groups to which this user belongs
name  User to modify

groups  Groups to set for the user

append  [False] If True, append the specified group(s). Otherwise, this function will replace the user's groups with the specified group(s).

root  Directory to chroot into

CLI Examples:

```
salt '*' user.chgroups foo wheel,root
salt '*' user.chgroups foo wheel,root  append=True
```

salt.modules.useradd.chhome(name, home, persist=False, root=None)

Change the home directory of the user, pass True for persist to move files to the new home directory if the old home directory exist.

name  User to modify

home  New home directory for the user account

persist  Move contents of the home directory to the new location

root  Directory to chroot into

CLI Example:

```
salt '*' user.chhome foo /home/users/foo True
```

salt.modules.useradd.chhomephone(name, homephone, root=None)

Change the user's Home Phone

name  User to modify

homephone  GECOS field for the home phone

root  Directory to chroot into

CLI Example:

```
salt '*' user.chhomephone foo 7735551234
```

salt.modules.useradd.chloginclass(name, loginclass, root=None)

Change the default login class of the user

name  User to modify

loginclass  Login class for the new account

root  Directory to chroot into

Note: This function only applies to OpenBSD systems.

CLI Example:

```
salt '*' user.chloginclass foo staff
```

salt.modules.useradd.chother(name, other, root=None)

Change the user's other GECOS attribute

name  User to modify

other  GECOS field for other information

root  Directory to chroot into

CLI Example:

```
salt '*' user.chother foobar
```

salt.modules.useradd.chroomnumber(name, roomnumber, root=None)

Change the user's Room Number

CLI Example:
salt 'x' user.chroomnumber foo 123

salt.modules.useradd.chshell(name, shell, root=None)
   Change the default shell of the user
   name  User to modify
   shell New login shell for the user account
   root  Directory to chroot into
   CLI Example:

   salt 'x' user.chshell foo /bin/zsh

salt.modules.useradd.chuid(name, uid, root=None)
   Change the uid for a named user
   name  User to modify
   uid   New UID for the user account
   root  Directory to chroot into
   CLI Example:

   salt 'x' user.chuid foo 4376

salt.modules.useradd.chworkphone(name, workphone, root=None)
   Change the user's Work Phone
   name  User to modify
   workphone  GECOS field for the work phone
   root  Directory to chroot into
   CLI Example:

   salt 'x' user.chworkphone foo 7735550123

salt.modules.useradd.delete(name, remove=False, force=False, root=None)
   Remove a user from the minion
   name  Username to delete
   remove Remove home directory and mail spool
   force  Force some actions that would fail otherwise
   root  Directory to chroot into
   CLI Example:

   salt 'x' user.delete name remove=True force=True

salt.modules.useradd.get_loginclass(name)
   Get the login class of the user
   name  User to get the information

   Note: This function only applies to OpenBSD systems.

   CLI Example:

   salt 'x' user.get_loginclass foo

salt.modules.useradd.getent(refresh=False, root=None)
   Return the list of all info for all users
   refresh  Force a refresh of user information
   root  Directory to chroot into
   CLI Example:
salt '*s' user.getent

salt.modules.useradd.info(name, root=None)
Return user information
name User to get the information
root Directory to chroot into
CLI Example:
salt 's' user.info root

salt.modules.useradd.list_groups(name)
Return a list of groups the named user belongs to
name User to get the information
CLI Example:
salt 's' user.list_groups foo

salt.modules.useradd.list_users(root=None)
Return a list of all users
root Directory to chroot into
CLI Example:
salt 's' user.list_users

salt.modules.useradd.primary_group(name)
Return the primary group of the named user
New in version 2016.3.0.
name User to get the information
CLI Example:
salt 's' user.primary_group saltadmin

salt.modules.useradd.rename(name, new_name, root=None)
Change the username for a named user
name User to modify
new_name New value of the login name
root Directory to chroot into
CLI Example:
salt 's' user.rename name new_name

23.9.469  salt.modules.uwsgi

maintainer Peter Baumgartner <pete@lincolnloop.com>
maturity new
platform all
salt.modules.uwsgi.stats(socket)
Return the data from uwsgi --connect-and-read as a dictionary.
socket The socket the uWSGI stats server is listening on
CLI Example:
23.9.470  salt.modules.vagrant

Work with virtual machines managed by Vagrant.

New in version 2018.3.0.

Mapping between a Salt node id and the Vagrant machine name (and the path to the Vagrantfile where it is defined) is stored in a Salt sdb database on the Vagrant host (minion) machine. In order to use this module, sdb must be configured. An SQLite database is the recommended storage method. The URI used for the sdb lookup is "sdb://vagrant_sdb_data".

requirements:

- the VM host machine must have salt-minion, Vagrant and a vm provider installed.
- the VM host must have a valid definition for sdb://vagrant_sdb_data

Configuration example:

```yaml
# file /etc/salt/minion.d/vagrant_sdb.conf
vagrant_sdb_data:
  driver: sqlite3
  database: /var/cache/salt/vagrant.sqlite
  table: sdb
  create_table: True
```

salt.modules.vagrant.destroy(name)

Destroy and delete a virtual machine. (vagrant destroy -f)

This also removes the salt_id name defined by vagrant.init.

CLI Example:

```
salt <host> vagrant.destroy <salt_id>
```

salt.modules.vagrant.get_machine_id(machine, cwd)

returns the salt_id name of the Vagrant VM

Parameters

- **machine** -- the Vagrant machine name
- **cwd** -- the path to Vagrantfile

Returns salt_id name

salt.modules.vagrant.get_ssh_config(name, network_mask='', get_private_key=False)

Retrieve hints of how you might connect to a Vagrant VM.

Parameters

- **name** -- the salt_id of the machine
- **network_mask** -- a CIDR mask to search for the VM's address
- **get_private_key** -- (default: False) return the key used for ssh login

Returns a dict of ssh login information for the VM

CLI Example:

```
salt <host> vagrant.get_ssh_config <salt_id>
salt my_laptop vagrant.get_ssh_config quail1 network_mask=10.0.0.0/8 get_private_key=True
```
The returned dictionary contains:

- key_filename: the name of the private key file on the VM host computer
- ssh_username: the username to be used to log in to the VM
- ssh_host: the IP address used to log in to the VM. (This will usually be 127.0.0.1)
- ssh_port: the TCP port used to log in to the VM. (This will often be 2222)
- [ip_address: ] (if network_mask is defined. see below)
- [private_key: ] (if get_private_key is True) the private key for ssh_username

About network_mask:

Vagrant usually uses a redirected TCP port on its host computer to log in to a VM using ssh. This redirected port and its IP address are "ssh_port" and "ssh_host". The ssh_host is usually the localhost (127.0.0.1). This makes it impossible for a third machine (such as a salt-cloud master) to contact the VM unless the VM has another network interface defined. You will usually want a bridged network defined by having a config.vm.network "public_network" statement in your Vagrantfile.

The IP address of the bridged adapter will typically be assigned by DHCP and unknown to you, but you should be able to determine what IP network the address will be chosen from. If you enter a CIDR network mask, Salt will attempt to find the VM's address for you. The host machine will send an "ifconfig" command to the VM (using ssh to ssh_host:ssh_port) and return the IP address of the first interface it can find which matches your mask.

salt.modules.vagrant.get_vm_info(name)

get the information for a VM.

Parameters
name -- salt_id name

Returns dictionary of {'machine': x, 'cwd': y, ...}.

salt.modules.vagrant.init(name, cwd=None, machine='', runas=None, start=False, vagrant_provider='', vm=None)

Initialize a new Vagrant VM.

This inputs all the information needed to start a Vagrant VM. These settings are stored in a Salt sdb database on the Vagrant host minion and used to start, control, and query the guest VMs. The salt_id assigned here is the key field for that database and must be unique.

Parameters

- name -- The salt_id name you will use to control this VM
- cwd -- The path to the directory where the Vagrantfile is located
- machine -- The machine name in the Vagrantfile. If blank, the primary machine will be used.
- runas -- The username on the host who owns the Vagrant work files.
- start -- (default: False) Start the virtual machine now.
- vagrant_provider -- The name of a Vagrant VM provider (if not the default).
- vm -- Optionally, all the above information may be supplied in this dictionary.

Returns A string indicating success, or False.

CLI Example:

```bash
salt <host> vagrant.init <salt_id> /path/to/Vagrantfile
salt my_laptop vagrant.init x1 /projects/bevy_master machine=quail1
```

salt.modules.vagrant.list_active_vms(cwd=None)

Return a list of machine names for active virtual machine on the host, which are defined in the Vagrantfile at the indicated path.

CLI Example:

```bash
salt '*' vagrant.list_active_vms cwd=/projects/project_1
```

salt.modules.vagrant.list_domains()

Return a list of the salt_id names of all available Vagrant VMs on this host without regard to the path where
they are defined.

CLI Example:

```sh
salt '*' vagrant.list_domains --log-level=info
```

The log shows information about all known Vagrant environments on this machine. This data is cached and may not be completely up-to-date.

salt.modules.vagrant.list_inactive_vms(cwd=None)

Return a list of machine names for inactive virtual machine on the host, which are defined in the Vagrantfile at the indicated path.

CLI Example:

```sh
salt '*' virt.list_inactive_vms cwd=/projects/project_1
```

salt.modules.vagrant.pause(name)

Pause (vagrant suspend) the named VM.

CLI Example:

```sh
salt <host> vagrant.pause <salt_id>
```

salt.modules.vagrant.reboot(name, provision=False)

Reboot a VM. (vagrant reload)

CLI Example:

```sh
salt <host> vagrant.reboot <salt_id> provision=True
```

Parameters

- **name** -- The salt_id name you will use to control this VM
- **provision** -- (False) also re-run the Vagrant provisioning scripts.

salt.modules.vagrant.shutdown(name)

Send a soft shutdown (vagrant halt) signal to the named vm.

This does the same thing as vagrant.stop. Other-VM control modules use "stop" and "shutdown" to differentiate between hard and soft shutdows.

CLI Example:

```sh
salt <host> vagrant.shutdown <salt_id>
```

salt.modules.vagrant.start(name)

Start (vagrant up) a virtual machine defined by salt_id name. The machine must have been previously defined using "vagrant.init".

CLI Example:

```sh
salt <host> vagrant.start <salt_id>
```

salt.modules.vagrant.stop(name)

Hard shutdown the virtual machine. (vagrant halt)

CLI Example:

```sh
salt <host> vagrant.stop <salt_id>
```
salt.modules.vagrant.version()
Return the version of Vagrant on the minion

CLI Example:
```
salt '*' vagrant.version
```

salt.modules.vagrant.vm_state(name='', cwd=None)
Return list of information for all the vms indicating their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs defined by the Vagrantfile in the cwd directory.

CLI Example:
```
salt '*' vagrant.vm_state <name> cwd=/projects/project_1
```
returns a list of dictionaries with machine name, state, provider, and salt_id name.

```
datum = {'machine': '', # Vagrant machine name,
          'state': '', # string indicating machine state, like 'running'
          'provider': '', # the Vagrant VM provider
          'name': ''} # salt_id name
```

Known bug: if there are multiple machines in your Vagrantfile, and you request the status of the primary machine, which you defined by leaving the machine parameter blank, then you may receive the status of all of them. Please specify the actual machine name for each VM if there are more than one.

23.9.471 salt.modules.varnish
Support for Varnish
New in version 2014.7.0.

Note: These functions are designed to work with all implementations of Varnish from 3.x onwards

salt.modules.varnish.ban(ban_expression)
Add ban to the varnish cache

CLI Example:
```
salt '*' varnish.ban ban_expression
```

salt.modules.varnish.ban_list()
List varnish cache current bans

CLI Example:
```
salt '*' varnish.ban_list
```

salt.modules.varnish.param_set(param, value)
Set a param in varnish cache

CLI Example:
```
salt '*' varnish.param_set param value
```
salt.modules.varnish.\texttt{param\_show}(param=None)
Show params of varnish cache

\begin{verbatim}
salt '*' varnish.param_show param
\end{verbatim}

salt.modules.varnish.\texttt{purge}()
Purge the varnish cache

\begin{verbatim}
salt '*' varnish.purge
\end{verbatim}

salt.modules.varnish.\texttt{version}()
Return server version from varnishd -V

\begin{verbatim}
salt '*' varnish.version
\end{verbatim}

\section*{23.9.472 salt.modules.vault}
Functions to interact with Hashicorp Vault.

\begin{itemize}
  \item maintainer SaltStack
  \item maturity new
  \item platform all
\end{itemize}

\textbf{note} If you see the following error, you'll need to upgrade \texttt{requests} to at least 2.4.2

\begin{verbatim}
<timestamp> [salt.pillar][CRITICAL][14337] Pillar render error: Failed to load ext_pillar vault: {'error': "request() got an unexpected keyword argument 'json'"}
\end{verbatim}

\textbf{configuration} The salt-master must be configured to allow peer-runner configuration, as well as configuration for the module.

Add this segment to the master configuration file, or /etc/salt/master.d/vault.conf:

\begin{verbatim}
vault:
  url: https://vault.service.domain:8200
  verify: /etc/ssl/certs/ca-certificates.crt
  role_name: minion_role
  namespace: vault_enterprice_namespace
  auth:
    method: approle
    role_id: 11111111-2222-3333-4444-1111111111111
    secret_id: 11111111-1111-1111-1111-1111111111111
  policies:
    - saltstack/minions
    - saltstack/minion/{minion}
    ... more policies
  keys:
    - n63/TbrQuL3xaIW7ZpuXj/tI5fnK1/MbVxO4vT3wVYD2A
    - S90wCvMRhErEA4NVVELYB56w/M6+urgUr24xGK44UyY3
    - Flj4b7Jkq856S6GkboiySla30xyY8dWjvW3fCwA+SraYl
\end{verbatim}

(continues on next page)
url  Url to your Vault installation. Required.

verify  For details please see https://requests.readthedocs.io/en/master/user/advanced/
    #ssl-cert-verification

    New in version 2018.3.0.

namespaces  Optional Vault Namespace. Used with Vault enterprise

    For detail please see: https://www.vaultproject.io/docs/enterprise/namespaces

    New in version 3004.

generate  Role name for minion tokens created. If omitted, minion tokens will be created without any role, thus being able to inherit any master token policy (including token creation capabilities). Optional.

    For details please see: https://www.vaultproject.io/api/auth/token/index.html#create-token

    Example configuration: https://www.nomadproject.io/docs/vault-integration/index.html#vault-token-role-configuration

auth  Currently only token and approle auth types are supported. Required.

    Approle is the preferred way to authenticate with Vault as it provide some advanced options to control authentication process. Please visit Vault documentation for more info: https://www.vaultproject.io/docs/auth/approle.html

    The token must be able to create tokens with the policies that should be assigned to minions. You can still use the token auth via a OS environment variable via this config example:

    ```
    vault:
    url: https://vault.service.domain:8200
    auth:
    method: token
    token: sdb://osenv/VAULT_TOKEN
    osenv:
    driver: env
    ```

    And then export the VAULT_TOKEN variable in your OS:

    ```
    export VAULT_TOKEN=11111111-1111-1111-1111-1111111111111
    ```

    Configuration keys `uses` or `ttl` may also be specified under auth to configure the tokens generated on behalf of minions to be reused for the defined number of uses or length of time in seconds. These settings may also be configured on the minion when allow_minion_override is set to True in the master config.

    Defining `uses` will cause the salt master to generate a token with that number of uses rather than a single use token. This multi-use token will be cached on the minion. The type of minion cache can be specified with `token_backend: session` or `token_backend: disk`. The value of `session` is the default, and will store the vault information in memory only for that session. The value of `disk` will write to an on disk file, and persist between state runs (most helpful for multi-use tokens).
vault:
  auth:
    method: token
    token: xxxxxx
    uses: 10
    ttl: 43200
    allow_minion_override: True
    token_backend: disk
  .. versionchanged:: 3001

**policies** Policies that are assigned to minions when requesting a token. These can either be static, eg `saltstack/minions`, or templated with grain values, eg `my-policies/{grains[os]}.{minion}`. Is shorthand for `grains[id]`, eg `saltstack/minion/{minion}`.

**Important:** See [Is Targeting using Grain Data Secure?](#) for important security information. In short, everything except `grains[id]` is minion-controlled.

If a template contains a grain which evaluates to a list, it will be expanded into multiple policies. For example, given the template `saltstack/by-role/{grains[roles]}`, and a minion having these grains:

```plaintext
grains:
  roles:
    - web
    - database
```

The minion will have the policies `saltstack/by-role/web` and `saltstack/by-role/database`.

**Note:** List members which do not have simple string representations, such as dictionaries or objects, do not work and will throw an exception. Strings and numbers are examples of types which work well.

Optional. If `policies` is not configured, `saltstack/minions` and `saltstack/{minion}` are used as defaults.

**keys** List of keys to use to unseal vault server with the `vault.unseal` runner.

Add this segment to the master configuration file, or `/etc/salt/master.d/peer_run.conf`:

```plaintext
peer_run:
  .*:
    - vault.generate_token

salt.modules.vault.clear_token_cache()
```

Changed in version 3001.

Delete minion Vault token cache file

CLI Example:

```
salt '*' vault.clear_token_cache
```
salt.modules.vault.delete_secret(path)
Delete secret at the path in vault. The vault policy used must allow this.

CLI Example:
```
salt '*' vault.delete_secret "secret/my/secret"
```

salt.modules.vault.destroy_secret(path, *args)
New in version 3001.
Destroy specified secret version at the path in vault. The vault policy used must allow this. Only supported on Vault KV version 2

CLI Example:
```
salt '*' vault.destroy_secret "secret/my/secret" 1 2
```

salt.modules.vault.list_secrets(path, default=<class 'salt.exceptions.CommandExecutionError'>)
Changed in version 3001: The default argument has been added. When the path or path/key combination is not found, an exception will be raised, unless a default is provided.

List secret keys at the path in vault. The vault policy used must allow this. The path should end with a trailing slash.

CLI Example:
```
salt '*' vault.list_secrets "secret/my/"
```

salt.modules.vault.read_secret(path, key=None, metadata=False, default=<class 'salt.exceptions.CommandExecutionError'>)
Changed in version 3001: The default argument has been added. When the path or path/key combination is not found, an exception will be raised, unless a default is provided.

Return the value of key at path in vault, or entire secret

Parameters metadata -- Optional - If using KV v2 backend, display full results, including metadata

New in version 3001.

Jinja Example:
```
my-secret: {{ salt['vault'].read_secret('secret/my/secret', 'some-key') }}

my-secret: {{ salt['vault'].read_secret('/secret/my/secret', 'some-key', metadata=True)['data'] }}
```

```
{% set supersecret = salt['vault'].read_secret('secret/my/secret') %}

secrets:
  first: {{ supersecret.first }}
  second: {{ supersecret.second }}
```

salt.modules.vault.write_raw(path, raw)
Set raw data at the path in vault. The vault policy used must allow this.

CLI Example:
```
salt '*' vault.write_raw "secret/my/secret" \{"user":"foo","password": "bar"\}
```

salt.modules.vault.write_secret(path, **kwargs)
Set secret at the path in vault. The vault policy used must allow this.

CLI Example:
23.9.473 salt.modules.vbox_guest

VirtualBox Guest Additions installer

salt.modules.vbox_guest.additions_install(**kwargs)
Install VirtualBox Guest Additions. Uses the CD, connected by VirtualBox.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press 'Host+D' ('Host' is usually 'Right Ctrl').

See https://www.virtualbox.org/manual/ch04.html#idp52733088 for more details.

CLI Example:

```bash
salt '*' vbox_guest.additions_install
salt '*' vbox_guest.additions_install reboot=True
salt '*' vbox_guest.additions_install upgrade_os=True
```

**Parameters**
- **reboot** (bool) -- reboot computer to complete installation
- **upgrade_os** (bool) -- upgrade OS (to ensure the latests version of kernel and developer tools are installed)

**Returns** version of VirtualBox Guest Additions or string with error

salt.modules.vbox_guest.additions_mount()
Mount VirtualBox Guest Additions CD to the temp directory.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press 'Host+D' ('Host' is usually 'Right Ctrl').

CLI Example:

```bash
salt '*' vbox_guest.additions_mount
```

**Returns** True or OSError exception

salt.modules.vbox_guest.additions_remove(**kwargs)
Remove VirtualBox Guest Additions.

Firstly it tries to uninstall itself by executing '/opt/VBoxGuestAdditions-VERSION/uninstall.run uninstall'. It uses the CD, connected by VirtualBox if it fails.

CLI Example:

```bash
salt '*' vbox_guest.additions_remove
salt '*' vbox_guest.additions_remove force=True
```

**Parameters** **force** (bool) -- force VirtualBox Guest Additions removing

**Returns** True if VirtualBox Guest Additions were removed successfully else False

salt.modules.vbox_guest.additions_umount(mount_point)
Unmount VirtualBox Guest Additions CD from the temp directory.

CLI Example:

```bash
salt '*' vbox_guest.additions_umount
```
Parameters **mount_point** -- directory VirtualBox Guest Additions is mounted to

Returns True or an string with error

salt.modules.vbox_guest.additions_version()

Check VirtualBox Guest Additions version.

CLI Example:

    salt '*' vbox_guest.additions_version

Returns version of VirtualBox Guest Additions or False if they are not installed

salt.modules.vbox_guest.grant_access_to_shared_folders_to(name, users=None)

Grant access to auto-mounted shared folders to the users.

User is specified by its name. To grant access for several users use argument users. Access will be denied to the users not listed in users argument.

CLI Example:

    salt '*' vbox_guest.grant_access_to_shared_folders_to fred
    salt '*' vbox_guest.grant_access_to_shared_folders_to users ['fred', 'roman']

Parameters

- **name** (str) -- name of the user to grant access to auto-mounted shared folders to
- **users** (list of str) -- list of names of users to grant access to auto-mounted shared folders to (if specified, name will not be taken into account)

Returns list of users who have access to auto-mounted shared folders

salt.modules.vbox_guest.list_shared_folders_users()

List users who have access to auto-mounted shared folders.

CLI Example:

    salt '*' vbox_guest.list_shared_folders_users

Returns list of users who have access to auto-mounted shared folders

23.9.474  salt.modules.vboxmanage

Support for VirtualBox using the VBoxManage command

New in version 2016.3.0.

If the vboxdrv kernel module is not loaded, this module can automatically load it by configuring autoload_vboxdrv in /etc/salt/minion:

    autoload_vboxdrv: True

The default for this setting is False.

    depends virtualbox

salt.modules.vboxmanage.clonemedium(medium, uuid_in=None, file_in=None, uuid_out=None, file_out=None, mformat=None, variant=None, existing=False, **kwargs)

Clone a new VM from an existing VM

23.9.  execution modules
CLI Example:

```bash
salt 'hypervisor' vboxmanage.clonemedium <name> <new_name>
```

salt.modules.vboxmanage.clonevm(name=None, uuid=None, new_name=None, snapshot_uuid=None, snapshot_name=None, mode='machine', options=None, basefolder=None, new_uuid=None, register=False, groups=None, **kwargs)

Clone a new VM from an existing VM

CLI Example:

```bash
salt 'hypervisor' vboxmanage.clonevm <name> <new_name>
```

salt.modules.vboxmanage.create(name, groups=None, ostype=None, register=True, basefolder=None, new_uuid=None, **kwargs)

Create a new VM

CLI Example:

```bash
salt 'hypervisor' vboxmanage.create <name>
```

salt.modules.vboxmanage.destroy(name)

Unregister and destroy a VM

CLI Example:

```bash
salt '*' vboxmanage.destroy my_vm
```

salt.modules.vboxmanage.list_items(item, details=False, group_by='UUID')

Return a list of a specific type of item. The following items are available:
- vms
- runningvms
- ostypes
- hostdvs
- hostfloppies
- innets
- bridgedifs
- hostonlyifs
- natnets
- dhcpservers
- hostinfo
- hostcpuids
- hddbackends
- hdds
- dvds
- floppies
- ushost
- usbfilters
- systemproperties
- extpacks
- groups
- webcams
- screenshotformats

CLI Example:

```bash
salt 'hypervisor' vboxmanage.items <item>
salt 'hypervisor' vboxmanage.items <item> details=True
salt 'hypervisor' vboxmanage.items <item> details=True group_by=Name
```

Some items do not display well, or at all, unless details is set to True. By default, items are grouped by the UUID field, but not all items contain that field. In those cases, another field must be specified.

salt.modules.vboxmanage.list_nodes()  
Return a list of registered VMs

CLI Example:

```bash
salt '*' vboxmanage.list_nodes
```

salt.modules.vboxmanage.list_nodes_full()  
Return a list of registered VMs, with detailed information

CLI Example:

```bash
salt '*' vboxmanage.list_nodes_full
```

salt.modules.vboxmanage.list_nodes_min()  
Return a list of registered VMs, with minimal information
CLI Example:

```
salt '*' vboxmanage.list_nodes_min
```

```
salt.modules.vboxmanage.list_ostypes()
List the available OS Types
```

CLI Example:

```
salt '*' vboxmanage.list_ostypes
```

```
salt.modules.vboxmanage.register(filename)
Register a VM
```

CLI Example:

```
salt '*' vboxmanage.register my_vm_filename
```

```
salt.modules.vboxmanage.start(name)
Start a VM
```

CLI Example:

```
salt '*' vboxmanage.start my_vm
```

```
salt.modules.vboxmanage.stop(name)
Stop a VM
```

CLI Example:

```
salt '*' vboxmanage.stop my_vm
```

```
salt.modules.vboxmanage.unregister(name, delete=False)
Unregister a VM
```

CLI Example:

```
salt '*' vboxmanage.unregister my_vm_filename
```

```
salt.modules.vboxmanage.vboxcmd()
Return the location of the VBoxManage command
```

CLI Example:

```
salt '*' vboxmanage.vboxcmd
```

### 23.9.475 salt.modules.vcenter

Module used to access the vcenter proxy connection methods

```
salt.modules.vcenter.get_details()
```
23.9.476 salt.modules.victorops

Support for VictorOps

New in version 2015.8.0.

Requires an `api_key` in `/etc/salt/minion`:

```yaml
victorops:
  api_key: '280d4699-a817-4719-ba6f-ca56e573e44f'
```

```python
salt.modules.victorops.create_event(message_type=None, routing_key='everybody', **kwargs)
```

Create an event in VictorOps. Designed for use in states.

The following parameters are required:

- **message_type** -- One of the following values: INFO, WARNING, ACKNOWLEDGEMENT, CRITICAL, RECOVERY.

The following parameters are optional:

- **routing_key** -- The key for where messages should be routed. By default, sent to 'everyone' route.
- **entity_id** -- The name of alerting entity. If not provided, a random name will be assigned.
- **timestamp** -- Timestamp of the alert in seconds since epoch. Defaults to the time the alert is received at VictorOps.
- **param timestamp_fmt** The date format for the timestamp parameter.
- **state_start_time** -- The time this entity entered its current state (seconds since epoch). Defaults to the time alert is received.
- **state_start_time_fmt** -- The date format for the timestamp parameter.
- **state_message** -- Any additional status information from the alert item.
- **entity_is_host** -- Used within VictorOps to select the appropriate display format for the incident.
- **entity_display_name** -- Used within VictorOps to display a human-readable name for the entity.
- **ack_message** -- A user entered comment for the acknowledgment.
- **ack_author** -- The user that acknowledged the incident.

**Returns**

A dictionary with result, entity_id, and message if result was failure.

CLI Example:

```shell
salt myminion victorops.create_event message_type='CRITICAL' routing_key='everyone', entity_id='hostname/diskspace'
salt myminion victorops.create_event message_type='ACKNOWLEDGEMENT' routing_key='everyone', entity_id='hostname/diskspace' ack_message='Acknowledged', ack_author='username'
salt myminion victorops.create_event message_type='RECOVERY' routing_key='everyone', entity_id='hostname/diskspace'
```

The following parameters are required: `message_type`
23.9.477 salt.modules.virt

Work with virtual machines managed by libvirt

depends
  • libvirt Python module
  • libvirt client
  • qemu-img
  • grep

Connection

The connection to the virtualization host can be either setup in the minion configuration, pillar data or overridden for each individual call.

By default, the libvirt connection URL will be guessed: the first available libvirt hypervisor driver will be used. This can be overridden like this:

```
virt:
  connection:
    uri: lxc:///
```

If the connection requires an authentication like for ESXi, this can be defined in the minion pillar data like this:

```
virt:
  connection:
    uri: esx://10.1.1.101/?no_verify=1&auto_answer=1
    auth:
      username: user
      password: secret
```

Connecting with SSH protocol

Libvirt can connect to remote hosts using SSH using one of the ssh, libssh and libssh2 transports. Note that libssh2 is likely to fail as it doesn’t read the known_hosts file. Libvirt may also have been built without libssh or libssh2 support.

To use the SSH transport, on the minion setup an SSH agent with a key authorized on the remote libvirt machine.

Per call connection setup

New in version 2019.2.0.

All the calls requiring the libvirt connection configuration as mentioned above can override this configuration using connection, username and password parameters.

This means that the following will list the domains on the local LXC libvirt driver, whatever the virt:connection is.

```
salt 'hypervisor' virt.list_domains connection=lxc:/// 
```

The calls not using the libvirt connection setup are:
• seed_non_shared_migrate
• virt_type
• is_*hyper
• all migration functions
• libvirt ESX URI format
• libvirt URI format
• libvirt authentication configuration

Units

Units specification

New in version 3002.

The string should contain a number optionally followed by a unit. The number may have a decimal fraction. If the unit is not given then MiB are set by default. Units can optionally be given in IEC style (such as MiB), although the standard single letter style (such as M) is more convenient.

Valid units include:

<table>
<thead>
<tr>
<th>Standard</th>
<th>IEC</th>
<th>Standard</th>
<th>IEC</th>
<th>Factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unit</td>
<td>Unit</td>
<td>Name</td>
<td>Name</td>
<td>Factor</td>
</tr>
<tr>
<td>B</td>
<td>Bytes</td>
<td>1</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>K</td>
<td>KiB</td>
<td>Kilobytes</td>
<td>Kibibytes</td>
<td>2**10</td>
</tr>
<tr>
<td>M</td>
<td>MiB</td>
<td>Megabytes</td>
<td>Mebibytes</td>
<td>2**20</td>
</tr>
<tr>
<td>G</td>
<td>GiB</td>
<td>Gigabytes</td>
<td>Gibibytes</td>
<td>2**30</td>
</tr>
<tr>
<td>T</td>
<td>TiB</td>
<td>Terabytes</td>
<td>Tebibytes</td>
<td>2**40</td>
</tr>
<tr>
<td>P</td>
<td>PiB</td>
<td>Petabytes</td>
<td>Pebibytes</td>
<td>2**50</td>
</tr>
<tr>
<td>E</td>
<td>EiB</td>
<td>Exabytes</td>
<td>Exbibytes</td>
<td>2**60</td>
</tr>
<tr>
<td>Z</td>
<td>ZiB</td>
<td>Zettabytes</td>
<td>Zebibytes</td>
<td>2**70</td>
</tr>
<tr>
<td>Y</td>
<td>YiB</td>
<td>Yottabytes</td>
<td>Yobibytes</td>
<td>2**80</td>
</tr>
</tbody>
</table>

Additional decimal based units:

<table>
<thead>
<tr>
<th>Unit</th>
<th>Factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>KB</td>
<td>10**3</td>
</tr>
<tr>
<td>MB</td>
<td>10**6</td>
</tr>
<tr>
<td>GB</td>
<td>10**9</td>
</tr>
<tr>
<td>TB</td>
<td>10**12</td>
</tr>
<tr>
<td>PB</td>
<td>10**15</td>
</tr>
<tr>
<td>EB</td>
<td>10**18</td>
</tr>
<tr>
<td>ZB</td>
<td>10**21</td>
</tr>
<tr>
<td>YB</td>
<td>10**24</td>
</tr>
</tbody>
</table>

salt.modules.virt.all_capabilities(**kwargs)

Return the host and domain capabilities in a single call.

New in version 3001.

Parameters

- **connection** -- libvirt connection URI, overriding defaults
• **username** -- username to connect with, overriding defaults
• **password** -- password to connect with, overriding defaults

CLI Example:
```
salt '*' virt.all_capabilities
```

salt.modules.virt.capabilities(**kwargs)
Return the hypervisor connection capabilities.

Parameters
• **connection** -- libvirt connection URI, overriding defaults
• **username** -- username to connect with, overriding defaults
• **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt '*' virt.capabilities
```

salt.modules.virt.cpu_baseline(full=False, migratable=False, out='libvirt', **kwargs)
Return the optimal 'custom' CPU baseline config for VM's on this minion

New in version 2016.3.0.

Parameters
• **full** -- Return all CPU features rather than the ones on top of the closest CPU model
• **migratable** -- Exclude CPU features that are unmigratable (libvirt 2.13+)
• **out** -- 'libvirt' (default) for usable libvirt XML definition, 'salt' for nice dict
• **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

• **username** -- username to connect with, overriding defaults

New in version 2019.2.0.

• **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt '*' virt.cpu_baseline
```

salt.modules.virt.create_xml_path(path, **kwargs)
Start a transient domain based on the XML-file path passed to the function

Parameters
• **path** -- path to a file containing the libvirt XML definition of the domain
• **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

• **username** -- username to connect with, overriding defaults

New in version 2019.2.0.

• **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt '*' virt.create_xml_path <path to XML file on the node>
```

salt.modules.virt.create_xml_str(xml, **kwargs)
Start a transient domain based on the XML passed to the function

Parameters
Salt Documentation, Release 3003.3

- **xml** -- libvirt XML definition of the domain
  New in version 2019.2.0.
- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.create_xml_str <XML in string format>
```

salt.modules.virt.ctrl_alt_del(vm_, **kwargs)

Sends CTRL+ALT+DEL to a VM

Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.ctrl_alt_del <domain>
```

salt.modules.virt.define_vol_xml_path(path, pool=None, **kwargs)

Define a volume based on the XML-file path passed to the function

Parameters

- **path** -- path to a file containing the libvirt XML definition of the volume
  New in version 3001.
- **pool** -- storage pool name to define the volume in. If defined, this parameter will override the configuration setting.
  New in version 3001.
- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.define_vol_xml_path <path to XML file on the node>
```

salt.modules.virt.define_vol_xml_str(xml, pool=None, **kwargs)

Define a volume based on the XML passed to the function

Parameters

- **xml** -- libvirt XML definition of the storage volume
- **pool** -- storage pool name to define the volume in. If defined, this parameter will override the configuration setting.
  New in version 3001.
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```bash
class '*' virt.define_vol_xml_str <XML in string format>
```

The storage pool where the disk image will be defined is `default` unless changed with the pool parameter or a configuration like this:

```yaml
virt:
  storagepool: mine
```

```python
salt.modules.virt.define_xml_path(path, **kwargs)

Define a persistent domain based on the XML-file path passed to the function

Parameters

- **path** -- path to a file containing the libvirt XML definition of the domain
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```bash
class '*' virt.define_xml_path <path to XML file on the node>
```

```python
salt.modules.virt.define_xml_str(xml, **kwargs)

Define a persistent domain based on the XML passed to the function

Parameters

- **xml** -- libvirt XML definition of the domain
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```bash
class '*' virt.define_xml_str <XML in string format>
```

```python
salt.modules.virt.delete_snapshots(name, *names, **kwargs)

Delete one or more snapshots of the given VM.

Parameters

- **name** -- domain name
- **names** -- names of the snapshots to remove
- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

New in version 2016.3.0.

**CLI Example:**

```
salt '*' virt.delete_snapshots <domain> all=True
salt '*' virt.delete_snapshots <domain> <snapshot>
salt '*' virt.delete_snapshots <domain> <snapshot1> <snapshot2> ...
```

salt.modules.virt.domain_capabilities(**kwargs)

Return the domain capabilities given an emulator, architecture, machine or virtualization type.

New in version 2019.2.0.

**Parameters**

- **emulator** -- return the capabilities for the given emulator binary
- **arch** -- return the capabilities for the given CPU architecture
- **machine** -- return the capabilities for the given emulated machine type
- **domain** -- return the capabilities for the given virtualization type.
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

The list of the possible emulator, arch, machine and domain can be found in the host capabilities output.

If none of the parameters is provided, the libvirt default one is returned.

**CLI Example:**

```
salt '*' virt.domain_capabilities arch='x86_64' domain='kvm'
```

salt.modules.virt.freecpu(**kwargs)

Return an int representing the number of unallocated cpus on this hypervisor

**Parameters**

- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

**CLI Example:**

```
salt '*' virt.freecpu
```

salt.modules.virt.freemem(**kwargs)

Return an int representing the amount of memory (in MB) that has not been given to virtual machines on this node

**Parameters**

- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```python
salt '* virt.freemem
```

```
salt.modules.virt.full_info(**kwargs)
Return the node_info, vm_info and freemem
Parameters
- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```python
salt '* virt.full_info
```

```
salt.modules.virt.get_disks(vm_, **kwargs)
Return the disks of a named vm
Parameters
- **vm** -- name of the domain
- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```python
salt '* virt.get_disks <domain>
```

```
salt.modules.virt.get_graphics(vm_, **kwargs)
Returns the information on vnc for a given vm
Parameters
- **vm** -- name of the domain
- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```python
salt '* virt.get_graphics <domain>
```
salt.modules.virt.get_hypervisor()

Returns the name of the hypervisor running on this node or None.

Detected hypervisors:
- kvm
- xen
- bhyve

CLI Example:
```
salt '*' virt.get_hypervisor
```

New in version 2019.2.0: the function and the kvm, xen and bhyve hypervisors support

salt.modules.virt.get_loader(vm_, **kwargs)

Returns the information on the loader for a given vm

Parameters
- vm -- name of the domain
- connection -- libvirt connection URI, overriding defaults
- username -- username to connect with, overriding defaults
- password -- password to connect with, overriding defaults

CLI Example:
```
salt '*' virt.get_loader <domain>
```

New in version 2019.2.0.

salt.modules.virt.get_macs(vm_, **kwargs)

Return a list off MAC addresses from the named vm

Parameters
- vm -- name of the domain
- connection -- libvirt connection URI, overriding defaults
- username -- username to connect with, overriding defaults
- password -- password to connect with, overriding defaults

CLI Example:
```
salt '*' virt.get_macs <domain>
```

New in version 2019.2.0.

salt.modules.virt.get_nics(vm_, **kwargs)

Return info about the network interfaces of a named vm

Parameters
- vm -- name of the domain
- connection -- libvirt connection URI, overriding defaults
- username -- username to connect with, overriding defaults
- password -- password to connect with, overriding defaults

CLI Example:
salt '*' virt.get_nics <domain>

salt.modules.virt.get_profiles(hypervisor=None, **kwargs)

Return the virt profiles for hypervisor.

Currently there are profiles for:

- nic
- disk

Parameters

- **hypervisor** -- override the default machine type.
- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

salt '*' virt.get_profiles
salt '*' virt.get_profiles hypervisor=vmware

salt.modules.virt.get_xml(vm_, **kwargs)

Returns the XML for a given vm

Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

salt '*' virt.get_xml <domain>

salt.modules.virt.init(name, cpu, mem, nic='default', interfaces=None, hypervisor=None, start=True, disk='default', disks=None, saltenv='base', seed=True, install=True, pub_key=None, priv_key=None, seed_cmd='seed.apply', graphics=None, os_type=None, arch=None, boot=None, boot_dev=None, numatune=None, hypervisor_features=None, clock=None, serials=None, consoles=None, stop_on_reboot=False, host_devices=None, **kwargs)

Initialize a new vm

Parameters

- **name** -- name of the virtual machine to create
- **cpu** -- Number of virtual CPUs to assign to the virtual machine or a dictionary with detailed information to configure cpu model and topology, numa node tuning, cpu tuning and iotthreads allocation. The structure of the dictionary is documented in cpu parameters definition.
cpu:
  placement: static

New in version 3003.

- mem -- Amount of memory to allocate to the virtual machine in MiB. Since 3002, a dictionary can be used to contain detailed configuration which support memory allocation or tuning. Supported parameters are boot, current, max, slots, hard_limit, soft_limit, swap_hard_limit, min_guarantee, hugepages, nosharepages, locked, source, access, allocation and discard. The structure of the dictionary is documented in Memory parameter definition. Both decimal and binary base are supported. Detail unit specification is documented in Units specification. Please note that the value for slots must be an integer.
{  
  'boot': 1g,  
  'current': 1g,  
  'max': 1g,  
  'slots': 10,  
  'hard_limit': '1024',  
  'soft_limit': '512m',  
  'swap_hard_limit': '1g',  
  'min_guarantee': '512mib',  
  'hugepages': [{  
    'nodeset': '0-3,^2',  
    'size': '1g'}],  
  'nodeset': '2',  
  'size': '2m'}

Changed in version 3002.

- **nic** -- NIC profile to use (Default: 'default'). The profile interfaces can be customized / extended with the interfaces parameter. If set to None, no profile will be used.

- **interfaces** -- List of dictionaries providing details on the network interfaces to create. These data are merged with the ones from the nic profile. The structure of each dictionary is documented in Network Interfaces Definitions.

    New in version 2019.2.0.

- **hypervisor** -- the virtual machine type. By default the value will be computed according to the virtual host capabilities.

- **start** -- True to start the virtual machine after having defined it (Default: True)

- **disk** -- Disk profile to use (Default: 'default'). If set to None, no profile will be used.

- **disks** -- List of dictionaries providing details on the disk devices to create. These data are merged with the ones from the disk profile. The structure of each dictionary is documented in Disks Definitions.

    New in version 2019.2.0.

- **saltenv** -- Fileserver environment (Default: 'base'). See cp module for more details

- **seed** -- True to seed the disk image. Only used when the image parameter is provided. (Default: True)

- **install** -- install salt minion if absent (Default: True)

- **pub_key** -- public key to seed with (Default: None)

- **priv_key** -- public key to seed with (Default: None)

- **seed_cmd** -- Salt command to execute to seed the image. (Default: 'seed.apply')

- **graphics** -- Dictionary providing details on the graphics device to create. (Default: None) See Graphics Definition for more details on the possible values.

    New in version 2019.2.0.

- **os_type** -- type of virtualization as found in the //os/type element of the libvirt definition. The default value is taken from the host capabilities, with a preference for hvm.

    New in version 2019.2.0.

- **arch** -- architecture of the virtual machine. The default value is taken from the host
capabilities, but x86_64 is prefed over i686.

New in version 2019.2.0.
- **config** -- minion configuration to use when seeding. See seed module for more details
- **boot_dev** -- String of space-separated devices to boot from (Default: 'hd')
- **serial_type** -- Serial device type. One of 'pty', 'tcp' (Default: None)
- **telnet_port** -- Telnet port to use for serial device of type tcp.
- **console** -- True to add a console device along with serial one (Default: True)
- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults
- **stop_on_reboot** -- If set to True the guest will stop instead of rebooting. This is specially useful when creating a virtual machine with an installation cdrom or an autoinstallation needing a special first boot configuration. Defaults to False

New in version 3003.
- **boot** -- Specifies kernel, initial ramdisk and kernel command line parameters for the virtual machine. This is an optional parameter, all of the keys are optional within the dictionary. The structure of the dictionary is documented in Boot parameters definition. If a remote path is provided to kernel or initrd, salt will handle the downloading of the specified remote file and modify the XML accordingly. To boot VM with UEFI, specify loader and nvram path or specify 'efi': True if your libvirtd version is >= 5.2.0 and QEMU >= 3.0.0.

New in version 3000.

```
{ 
    'kernel': '/root/f8-i386-vmlinuz',
    'initrd': '/root/f8-i386-initrd',
    'cmdline': 'console=ttyS0 ks=http://example.com/f8-i386/os/',
    'loader': '/usr/share/OVMF/OVMF_CODE.fd',
    'nvram': '/usr/share/OVMF/OVMF_VARS.ms.fd'
}
```

- **boot_dev** -- Space separated list of devices to boot from sorted by decreasing priority. Values can be hd, fd, cdrom or network.

By default, the value will "hd".
- **numatune** -- The optional numatune element provides details of how to tune the performance of a NUMA host via controlling NUMA policy for domain process. The optional memory element specifies how to allocate memory for the domain process on a NUMA host. memnode elements can specify memory allocation policies per each guest NUMA node. The definition used in the dictionary can be found at cpu parameters definition.

New in version 3003.

```
{ 
    'memory': { 'mode': 'strict', 'nodeset': '0-11' },
    'memnodes': { 0: { 'mode': 'strict', 'nodeset': '0-11' }, 1: { 'mode': 'preferred', 'nodeset': '2' } }
}
```

(continues on next page)
- **hypervisor_features** -- Enable or disable hypervisor-specific features on the virtual machine.

  New in version 3003.

  ```yaml
  hypervisor_features:
    kvm-hint-dedicated: True
  ```

- **clock** -- Configure the guest clock. The value is a dictionary with the following keys:

  - **adjustment** time adjustment in seconds or reset
  - **utc** set to `False` to use the host local time as the guest clock. Defaults to `True`.
  - **timezone** synchronize the guest to the corresponding timezone
  - **timers** a dictionary associating the timer name with its configuration. This configuration is a dictionary with the properties `track`, `tickpolicy`, `catchup`, `frequency`, `mode`, `present`, `slew`, `threshold` and `limit`. See `libvirt time keeping documentation` for the possible values.

  New in version 3003.

  Set the clock to local time using an offset in seconds.

  ```yaml
clock:
  adjustment: 3600 utc: False
  ```

  Set the clock to a specific time zone:

  ```yaml
clock:
  timezone: CEST
  ```

  Tweak guest timers:

  ```yaml
clock:
  timers:
    tsc:
      frequency: 3504000000
      mode: native
    rtc:
      track: wall
      tickpolicy: catchup
      slew: 4636
      threshold: 123
      limit: 2342
    hpet:
      present: False
  ```

- **serials** -- Dictionary providing details on the serials connection to create. (Default: `None`) See `Serials and Consoles Definitions` for more details on the possible values.

  New in version 3003.

- **consoles** -- Dictionary providing details on the consoles device to create. (Default: `None`) See `Serials and Consoles Definitions` for more details on the possible values.

  New in version 3003.

- **host_devices** -- List of host devices to passthrough to the guest. The value is a list of device names as provided by the `node_devices()` function. (Default: `None`)

  New in version 3003.
cpu parameters definition

The cpu parameters dictionary can contain the following properties:

- **cpuset** a comma-separated list of physical CPU numbers that domain process and virtual CPUs can be pinned to by default. e.g. 1-4, ^3 cpuset 3 is excluded.
- **current** the number of virtual cpus available at startup
- **placement** indicate the CPU placement mode for domain process. the value can be either static or auto
- **vcpus** specify the state of individual vcpu. Possible attribute for each individual vcpu include: id, enabled, hotpluggable and order. Valid ids are from 0 to the maximum vCPU count minus 1. enabled takes boolean values which controls the state of the vcpu. hotpluggable take boolean value which controls whether given vCPU can be hotplugged and hotunplugged. order takes an integer value which specifies the order to add the online vCPUs.
- **match** The cpu attribute match attribute specifies how strictly the virtual CPU provided to the guest matches the CPU requirements, possible values are minimum, exact or strict.
- **check** Optional cpu attribute check attribute can be used to request a specific way of checking whether the virtual CPU matches the specification, possible values are none, partial and full.
- **mode** Optional cpu attribute mode attribute may be used to make it easier to configure a guest CPU to be as close to host CPU as possible, possible values are custom, host-model and host-passthrough.
- **model** specifies CPU model requested by the guest. An optional fallback attribute can be used to forbid libvirt falls back to the closest model supported by the hypervisor, possible values are allow or forbid. vendor_id attribute can be used to set the vendor id seen by the guest, the length must be exactly 12 characters long.
- **vendor** specifies CPU vendor requested by the guest.
- **topology** specifies requested topology of virtual CPU provided to the guest. Four possible attributes, sockets, dies, cores, and threads, accept non-zero positive integer values. They refer to the number of CPU sockets per NUMA node, number of dies per socket, number of cores per die, and number of threads per core, respectively.
- **features** A dictionary contains a set of cpu features to fine-tune features provided by the selected CPU model. Use cpu feature name as the key and the policy as the value. policy Attribute takes force, require, optional, disable or forbid.
- **cache** describes the virtual CPU cache. Optional attribute level takes an integer value which describes cache level mode attribute supported three possible values: emulate, passthrough, disable
- **numa** specify the guest numa topology. cell element specifies a NUMA cell or a NUMA node, cpus specifies the CPU or range of CPUs that are part of the node, memory specifies the size of the node memory. All cells should have id attribute in case referring to some cell is necessary in the code. optional attribute memAccess control whether the memory is to be mapped as shared or private, discard attribute which fine tunes the discard feature for given numa node, possible values are True or False. distances element define the distance between NUMA cells and sibling sub-element is used to specify the distance value between sibling NUMA cells.
- **vcpupin** The optional vcpupin element specifies which of host's physical CPUs the domain vCPU will be pinned to.
- **emulatorpin** The optional emulatorpin element specifies which of host physical CPUs the "emulator", a subset of a domain not including vCPU or iothreads will be pinned to.
- **iothreadpin** The optional iothreadpin element specifies which of host physical CPUs the IOThreads will be pinned to.
- **shares** The optional shares element specifies the proportional weighted share for the domain.
- **period** The optional period element specifies the enforcement interval (unit: microseconds).
- **quota** The optional quota element specifies the maximum allowed bandwidth (unit: microseconds).
- **global_period** The optional global_period element specifies the enforcement CFS scheduler interval (unit: microseconds) for the whole domain in contrast with period which enforces the interval per vCPU.
- **global_quota** The optional global_quota element specifies the maximum allowed bandwidth (unit: microseconds) within a period for the whole domain.
- **emulator_period** The optional emulator_period element specifies the enforcement interval (unit: microseconds).
emulator_quota The optional emulator_quota element specifies the maximum allowed bandwidth (unit: microseconds) for domain’s emulator threads (those excluding vCPUs).

iothread_period The optional iothread_period element specifies the enforcement interval (unit: microseconds) for IOThreads.

iothread_quota The optional iothread_quota element specifies the maximum allowed bandwidth (unit: microseconds) for IOThreads.

vcpusched specify the scheduler type for vCPUs. The value is a list of dictionaries with the scheduler key (values batch, idle, fifo, rr) and the optional priority and vcpus keys. The priority value usually is a positive integer and the vcpus value is a cpu set like 1-4,^3,6 or simply the cpu id.

iothreadsched specify the scheduler type for IO threads. The value is a list of dictionaries with the scheduler key (values batch, idle, fifo, rr) and the optional priority and vcpus keys. The priority value usually is a positive integer and the vcpus value is a cpu set like 1-4,^3,6 or simply the cpu id.

emulatorsched specify the scheduler type (values batch, idle, fifo, rr) for particular the emulator. The value is a dictionary with the scheduler key (values batch, idle, fifo, rr) and the optional priority and vcpus keys. The priority value usually is a positive integer.

cachetune Optional cachetune element can control allocations for CPU caches using the resctrl on the host.

monitor The optional element monitor creates the cache monitor(s) for current cache allocation.

memorytune Optional memorytune element can control allocations for memory bandwidth using the resctrl on the host.

iothreads Number of threads for supported disk devices to perform I/O requests. iothread id will be numbered from 1 to the provided number (Default: None).

Boot parameters definition

The boot parameters dictionary can contains the following properties:

- **kernel** The URL or path to the kernel to run the virtual machine with.
- **initrd** The URL or path to the initrd file to run the virtual machine with.
- **cmdline** The parameters to pass to the kernel provided in the kernel property.
- **loader** The path to the UEFI binary loader to use.

New in version 3001.

nvram The path to the UEFI data template. The file will be copied when creating the virtual machine.

New in version 3001.

efi A boolean value.

New in version 3001.

Memory parameter definition

Memory parameter can contain the following properties:

- **boot** The maximum allocation of memory for the guest at boot time
- **current** The actual allocation of memory for the guest
- **max** The run time maximum memory allocation of the guest
- **slots** specifies the number of slots available for adding memory to the guest
- **hard_limit** the maximum memory the guest can use
- **soft_limit** memory limit to enforce during memory contention
- **swap_hard_limit** the maximum memory plus swap the guest can use
- **min_guarantee** the guaranteed minimum memory allocation for the guest
- **hugepages** memory allocated using hugepages instead of the normal native page size. It takes a list of dictionaries with nodeset and size keys. For example "hugepages": [{"nodeset": "1-4, ^3", "size": "2m"}, {"nodeset": "3", "size": "1g"}].
- **nosharepages** boolean value to instruct hypervisor to disable shared pages (memory merge, KSM) for this domain
locked boolean value that allows memory pages belonging to the domain will be locked in host's memory and the host will not be allowed to swap them out, which might be required for some workloads such as real-time.

source possible values are file which utilizes file memorybacking, anonymous by default and memfd backing. (QEMU/KVM only)

access specify if the memory is to be shared or private. This can be overridden per numa node by memAccess.

allocation specify when to allocate the memory by supplying either immediate or ondemand.

discard boolean value to ensure the memory content is discarded just before guest shuts down (or when DIMM module is unplugged). Please note that this is just an optimization and is not guaranteed to work in all cases (e.g. when hypervisor crashes). (QEMU/KVM only)

Network Interfaces Definitions

Network interfaces dictionaries can contain the following properties:

name Name of the network interface. This is only used as a key to merge with the profile data
type Network type. One of 'bridge', 'network'
source The network source, typically the bridge or network name
mac The desired mac address, computed if None (Default: None).
model The network card model (Default: depends on the hypervisor)

Disks Definitions

Disk dictionaries can contain the following properties:

name Name of the disk. This is mostly used in the name of the disk image and as a key to merge with the profile data
format Format of the disk image, like 'qcow2', 'raw', 'vmdk'. (Default: depends on the hypervisor)
size Disk size in MiB
pool Path to the folder or name of the pool where disks should be created. (Default: depends on hypervisor and the virt:storagepool configuration)

Changed in version 3001.

If the value contains no '/', it is considered a pool name where to create a volume. Using volumes will be mandatory for some pools types like rdb, iscsi, etc.

model One of the disk busses allowed by libvirt (Default: depends on hypervisor)

See the libvirt disk element documentation for the allowed bus types.

image Path to the image to use for the disk. If no image is provided, an empty disk will be created (Default: None)

Note that some pool types do not support uploading an image. This list can evolve with libvirlit versions.

overlay_image True to create a Qcow2 disk image with image as backing file. If False the file pointed to by the image property will simply be copied. (Default: False)

Changed in version 3001.

This property is only valid on path-based disks, not on volumes. To create a volume with a backing store, set the backing_store_path and backing_store_format properties.

backing_store_path Path to the backing store image to use. This can also be the name of a volume to use as backing store within the same pool.

New in version 3001.

backing_store_format Image format of the disk or volume to use as backing store. This property is mandatory when using backing_store_path to avoid problems

New in version 3001.
source_file  Absolute path to the disk image to use. Not to be confused with `image` parameter. This parameter is useful to use disk images that are created outside of this module. Can also be `None` for devices that have no associated image like cdroms.

Changed in version 3001.

For volume disks, this can be the name of a volume already existing in the storage pool.

device  Type of device of the disk. Can be one of 'disk', 'cdrom', 'floppy' or 'lun'. (Default: 'disk')

hostname_property  When using ZFS volumes, setting this value to a ZFS property ID will make Salt store the name of the virtual machine inside this property. (Default: `None`)

sparse_volume  Boolean to specify whether to use a thin provisioned ZFS volume.

Example profile for a bhyve VM with two ZFS disks. The first is cloned from the specified image. The second disk is a thin provisioned volume.

```
virt:
  disk:
    two_zvols:
      - system:
          image: zroot/bhyve/CentOS-7-x86_64-v1@v1.0.5
          hostname_property: virt:hostname
          pool: zroot/bhyve/guests
        - data:
            pool: tank/disks
            size: 20G
            hostname_property: virt:hostname
            sparse_volume: True
```

io  I/O control policy. String value amongst `native`, `threads` and `io_uring`. (Default: `native`)

New in version 3003.

iothread_id  I/O thread id to assign the disk to. (Default: none assigned)

New in version 3003.

**Graphics Definition**

The graphics dictionary can have the following properties:

type  Graphics type. The possible values are `none`, 'spice', 'vnc' and other values allowed as a libvirt graphics type (Default: `None`)

See the libvirt [graphics element](https://libvirt.org/) documentation for more details on the possible types.

port  Port to export the graphics on for vnc, spice and rdp types.

tls_port  Port to export the graphics over a secured connection for spice type.

listen  Dictionary defining on what address to listen on for vnc, spice and rdp. It has a type property with address and `None` as possible values, and an address property holding the IP or hostname to listen on.

By default, not setting the `listen` part of the dictionary will default to listen on all addresses.
Serials and Consoles Definitions

Serial dictionaries can contain the following properties:

- **type** Type of the serial connection, like 'tcp', 'pty', 'file', 'udp', 'dev', 'pipe', 'unix'.
- **path** Path to the source device. Can be a log file, a host character device to pass through, a unix socket, a named pipe path.
- **host** The serial UDP or TCP host name. (Default: 23023)
- **port** The serial UDP or TCP port number. (Default: 23023)
- **protocol** Name of the TCP connection protocol. (Default: telnet)
- **tls** Boolean value indicating whether to use hypervisor TLS certificates environment for TCP devices.
- **target_port** The guest device port number starting from 0
- **target_type** The guest device type. Common values are `serial`, `virtio` or `usb-serial`, but more are documented in the libvirt documentation.

CLI Example

```python
salt 'hypervisor' virt.init vm_name 4 512 salt://path/to/image.raw
salt 'hypervisor' virt.init vm_name 4 512 /var/lib/libvirt/images/img.raw
salt 'hypervisor' virt.init vm_name 4 512 nic=profile disk=profile
```

The disk images will be created in an image folder within the directory defined by the `virt:images` option. Its default value is `/srv/salt-images/` but this can changed with such a configuration:

```yaml
virt:
  images: /data/my/vm/images/
```

salt.modules.virt.is_hyper()  
Returns a bool whether or not this node is a hypervisor of any kind

CLI Example:

```python
salt '*/' virt.is_hyper
```

salt.modules.virt.list_active_vms(**kwargs)  
Return a list of names for active virtual machine on the minion

**Parameters**

- **connection** -- libvirt connection URI, overriding defaults  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults  
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
  New in version 2019.2.0.

CLI Example:

```python
salt '* ' virt.list_active_vms
```

salt.modules.virt.list_domains(**kwargs)  
Return a list of available domains.

**Parameters**

- **connection** -- libvirt connection URI, overriding defaults  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.list_domains
```

`salt.modules.virt.list_inactive_vms(**kwargs)`
Return a list of names for inactive virtual machine on the minion

Parameters
- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.list_inactive_vms
```

`salt.modules.virt.list_networks(**kwargs)`
List all virtual networks.

Parameters
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.list_networks
```

`salt.modules.virt.list_pools(**kwargs)`
List all storage pools.

Parameters
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.list_pools
```

`salt.modules.virt.list_snapshots(domain=None, **kwargs)`
List available snapshots for certain vm or for all.

Parameters
- **domain** -- domain name
- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
• **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:

```bash
salt '*' virt.list_snapshots
salt '*' virt.list_snapshots <domain>
```

```bash
salt.modules.virt.migrate(vm_, target, ssh=False, **kwargs)
```

Shared storage migration

**Parameters**

- **vm** -- domain name
- **target** -- target libvirt URI or host name
- **ssh** -- True to connect over ssh

Deprecated since version 3002.

- **kwargs** --
  - live: Use live migration. Default value is True.
  - persistent: Leave the domain persistent on destination host. Default value is True.
  - undefinesource: Undefine the domain on the source host. Default value is True.
  - offline: If set to True it will migrate the domain definition without starting the domain on destination and without stopping it on source host. Default value is False.
  - max_bandwidth: The maximum bandwidth (in MiB/s) that will be used.
  - max_downtime: Set maximum tolerable downtime for live-migration. The value represents a number of milliseconds the guest is allowed to be down at the end of live migration.
  - parallel_connections: Specify a number of parallel network connections to be used to send memory pages to the destination host.
  - compressed: Activate compression.
  - comp_methods: A comma-separated list of compression methods. Supported methods are "mt" and "xbzrle" and can be used in any combination. QEMU defaults to "xbzrle".
  - comp_mt_level: Set compression level. Values are in range from 0 to 9, where 1 is maximum speed and 9 is maximum compression.
  - comp_mt_threads: Set number of compress threads on source host.
  - comp_mt_dthreads: Set number of decompress threads on target host.
  - comp_xbzrle_cache: Set the size of page cache for xbzrle compression in bytes.
  - copy_storage: Migrate non-shared storage. It must be one of the following values: all (full disk copy) or incremental (Incremental copy)
  - postcopy: Enable the use of post-copy migration.
  - postcopy_bandwidth: The maximum bandwidth allowed in post-copy phase. (MiB/s)
  - password: Password to connect with target host

New in version 3002.

CLI Example:

```bash
salt '*' virt.migrate <domain> <target hypervisor URI>
salt src virt.migrate guest qemu+ssh://dst/system
salt src virt.migrate guest qemu+tls://dst/system
salt src virt.migrate guest qemu+tcp://dst/system
```
A tunnel data migration can be performed by setting this in the configuration:

```
virt:
    tunnel: True
```

For more details on tunnelled data migrations, report to [https://libvirt.org/migration.html#transporttunnel](https://libvirt.org/migration.html#transporttunnel)

```
salt.modules.virt.migrate_non_shared(vm_, target, ssh=False, **kwargs)
```

Attempt to execute non-shared storage "all" migration

**Parameters**

- `vm` -- domain name
- `target` -- target libvirt host name
- `ssh` -- True to connect over ssh

Deprecated since version 3002.

- `kwargs` --
  - `live` -- Use live migration. Default value is True.
  - `persistent` -- Leave the domain persistent on destination host. Default value is True.
  - `undefinesource` -- Undefine the domain on the source host. Default value is True.
  - `offline` -- If set to True it will migrate the domain definition without starting the domain on destination and without stopping it on source host. Default value is False.
  - `max_bandwidth` -- The maximum bandwidth (in MiB/s) that will be used.
  - `max_downtime` -- Set maximum tolerable downtime for live-migration. The value represents a number of milliseconds the guest is allowed to be down at the end of live migration.
  - `parallel_connections` -- Specify a number of parallel network connections to be used to send memory pages to the destination host.
  - `compressed` -- Activate compression.
  - `comp_methods` -- A comma-separated list of compression methods. Supported methods are "mt" and "xbzrle" and can be used in any combination. QEMU defaults to "xbzrle".
  - `comp_mt_level` -- Set compression level. Values are in range from 0 to 9, where 1 is maximum speed and 9 is maximum compression.
  - `comp_mt_threads` -- Set number of compress threads on source host.
  - `comp_mtdthreads` -- Set number of decompress threads on target host.
  - `comp_xbzrle_cache` -- Set the size of page cache for xbzrle compression in bytes.
  - `postcopy` -- Enable the use of post-copy migration.
  - `postcopy_bandwidth` -- The maximum bandwidth allowed in post-copy phase (MiB/s)
  - `username` -- Username to connect with target host
  - `password` -- Password to connect with target host

New in version 3002.

CLI Example:

```
salt '*' virt.migrate_non_shared <vm name> <target hypervisor>
```

A tunnel data migration can be performed by setting this in the configuration:

```
virt:
    tunnel: True
```

For more details on tunnelled data migrations, report to [https://libvirt.org/migration.html#transporttunnel](https://libvirt.org/migration.html#transporttunnel)
salt.modules.virt.migrate_non_shared_inc(vm_, target, ssh=False, **kwargs)

Attempt to execute non-shared storage "inc" migration

Parameters

- **vm** -- domain name
- **target** -- target libvirt host name
- **ssh** -- True to connect over ssh

Deprecated since version 3002.

- **kwargs** --
  - live: Use live migration. Default value is True.
  - persistent: Leave the domain persistent on destination host. Default value is True.
  - undefinesource: Undefine the domain on the source host. Default value is True.
  - offline: If set to True it will migrate the domain definition without starting the domain on destination and without stopping it on source host. Default value is False.
  - max_bandwidth: The maximum bandwidth (in MiB/s) that will be used.
  - max_downtime: Set maximum tolerable downtime for live-migration. The value represents a number of milliseconds the guest is allowed to be down at the end of live migration.
  - parallel_connections: Specify a number of parallel network connections to be used to send memory pages to the destination host.
  - compressed: Activate compression.
  - comp_methods: A comma-separated list of compression methods. Supported methods are "mt" and "xbzrle" and can be used in any combination. QEMU defaults to "xbzrle".
  - comp_mt_level: Set compression level. Values are in range from 0 to 9, where 1 is maximum speed and 9 is maximum compression.
  - comp_mt_threads: Set number of compress threads on source host.
  - comp_xbzrle_cache: Set the size of page cache for xbzrle compression in bytes.
  - postcopy: Enable the use of post-copy migration.
  - postcopy_bandwidth: The maximum bandwidth allowed in post-copy phase (MiB/s)
  - username: Username to connect with target host
  - password: Password to connect with target host

New in version 3002.

CLI Example:

```bash
salt '*' virt.migrate_non_shared_inc <vm name> <target hypervisor>
```

A tunnel data migration can be performed by setting this in the configuration:

```
virt:
  tunnel: True
```

For more details on tunnelled data migrations, report to [https://libvirt.org/migration.html#transporttunnel](https://libvirt.org/migration.html#transporttunnel)

salt.modules.virt.migrate_start_postcopy(vm_)

Starts post-copy migration. This function has to be called while live migration is in progress and it has been initiated with the postcopy=True option.

CLI Example:
salt 'x' virt.migrate_start_postcopy <domain>

salt.modules.virt.nesthash(value=None)
    create default dict that allows arbitrary level of nesting

salt.modules.virt.network_define(name, bridge, forward, ipv4_config=None, ipv6_config=None, vport=None, tag=None, autostart=True, start=True, mtu=None, domain=None, nat=None, interfaces=None, addresses=None, physical_function=None, dns=None, **kwargs)

Create libvirt network.

Parameters

- **name** -- Network name.
- **bridge** -- Bridge name.
- **forward** -- Forward mode (bridge, router, nat).

Change in version 3003: a `None` value creates an isolated network with no forwarding at all

- **vport** -- Virtualport type. The value can also be a dictionary with `type` and `parameters` keys. The `parameters` value is a dictionary of virtual port parameters.

```
- vport:
    type: openvswitch
    parameters:
        interfaceid: 09b11c53-8b5c-4eeb-8f00-d84eea0aaa4f
```

Change in version 3003: possible dictionary value

- **tag** -- Vlan tag. The value can also be a dictionary with the `tags` and optional `trunk` keys. `trunk` is a boolean value indicating whether to use VLAN trunking. `tags` is a list of dictionaries with keys `id` and `nativeMode`. The `nativeMode` value can be one of `tagged` or `untagged`.

```
- tag:
    trunk: True
    tags:
      - id: 42
        nativeMode: untagged
      - id: 47
```

Change in version 3003: possible dictionary value

- **autostart** -- Network autostart (default True).
- **start** -- Network start (default True).
- **ipv4_config**(dict or None) -- IP v4 configuration. Dictionary describing the IP v4 setup like IP range and a possible DHCP configuration. The structure is documented in `net-define-ip`.

New in version 3000.

- **ipv6_config**(dict or None) -- IP v6 configuration. Dictionary describing the IP v6 setup like IP range and a possible DHCP configuration. The structure is documented in `net-define-ip`.

New in version 3000.

- **connection** -- libvirt connection URI, overriding defaults.
- **username** -- username to connect with, overriding defaults.
- **password** -- password to connect with, overriding defaults.
- **mtu** -- size of the Maximum Transmission Unit (MTU) of the network. (default None)
New in version 3003.

- **domain** -- DNS domain name of the DHCP server. The value is a dictionary with a mandatory `name` property and an optional `localOnly` boolean one. (default `None`)

```
- domain:
  name: lab.acme.org
  localOnly: True
```

New in version 3003.

- **nat** -- addresses and ports to route in NAT forward mode. The value is a dictionary with optional keys `address` and `port`. Both values are a dictionary with `start` and `end` values. (default `None`)

```
- forward: nat
  nat:
    address:
      start: 1.2.3.4
      end: 1.2.3.10
    port:
      start: 500
      end: 1000
```

New in version 3003.

- **interfaces** -- whitespace separated list of network interfaces devices that can be used for this network. (default `None`)

```
- forward: passthrough
  interfaces: "eth10 eth11 eth12"
```

New in version 3003.

- **addresses** -- whitespace separated list of addresses of PCI devices that can be used for this network in `hostdev` forward mode. (default `None`)

```
- forward: hostdev
  interfaces: "0000:04:00.1 0000:e3:01.2"
```

New in version 3003.

- **physical_function** -- device name of the physical interface to use in `hostdev` forward mode. (default `None`)

```
- forward: hostdev
  physical_function: "eth0"
```

New in version 3003.

- **dns** -- virtual network DNS configuration. The value is a dictionary described in `net-define-dns`. (default `None`)

```
- dns:
  forwarders:
    - domain: example.com
      addr: 192.168.1.1
    - addr: 8.8.8.8
    - domain: www.example.com
  txt:
    example.com: "v=spf1 a -all"
    _http.tcp.example.com: "name=value,paper=A4"
  hosts:
```

(continues on next page)
**IP configuration definition**

Both the IPv4 and IPv6 configuration dictionaries can contain the following properties:

- **cidr**  
  CIDR notation for the network. For example '192.168.124.0/24'

- **dhcp_ranges**  
  A list of dictionaries with 'start' and 'end' properties.

- **hosts**  
  A list of dictionaries with 'ip' property and optional 'name', 'mac' and 'id' properties.

  New in version 3003.

- **bootp**  
  A dictionary with a 'file' property and an optional 'server' one.

  New in version 3003.

- **tftp**  
  The path to the TFTP root directory to serve.

  New in version 3003.

**DNS configuration definition**

The DNS configuration dictionary contains the following optional properties:

- **forwarders**  
  List of alternate DNS forwarders to use. Each item is a dictionary with the optional 'domain' and 'addr' keys. If both are provided, the requests to the domain are forwarded to the server at the addr. If only 'domain' is provided the requests matching this domain will be resolved locally. If only 'addr' is provided all requests will be forwarded to this DNS server.

- **txt**  
  Dictionary of TXT fields to set.

- **hosts**  
  Dictionary of host DNS entries. The key is the IP of the host, and the value is a list of hostnames for it.

- **srvs**  
  List of SRV DNS entries. Each entry is a dictionary with the mandatory 'name' and 'protocol' keys. Entries can also have 'target', 'port', 'priority', 'domain' and 'weight' optional properties.

**CLI Example:**

```
salt '*' virt.network_define network main bridge openvswitch
```

New in version 2019.2.0.

**salt.modules.virt.network_get_xml(name, **kwargs)**

Return the XML definition of a virtual network

**Parameters**

- **name** -- libvirt network name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 3000.

**CLI Example:**
salt '*' virt.network_get_xml default

```python
salt.modules.virt.network_info(name=None, **kwargs)
```

Return information on a virtual network provided its name.

**Parameters**
- `name` -- virtual network name
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

If no name is provided, return the infos for all defined virtual networks.

New in version 2019.2.0.

CLI Example:
```
salt '*' virt.network_info default
```

salt.modules.virt.network_set_autostart(name, state='on', **kwargs)

Set the autostart flag on a virtual network so that the network will start with the host system on reboot.

**Parameters**
- `name` -- virtual network name
- `state` -- ‘on’ to auto start the network, anything else to mark the virtual network not to be started when the host boots
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt "*' virt.network_set_autostart <pool> <on | off>
```

salt.modules.virt.network_start(name, **kwargs)

Start a defined virtual network.

**Parameters**
- `name` -- virtual network name
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt '*' virt.network_start default
```

salt.modules.virt.network_stop(name, **kwargs)

Stop a defined virtual network.

**Parameters**
- `name` -- virtual network name
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
salt '*' virt.network_stop default

salt.modules.virt.network_undefine(name, **kwargs)

Remove a defined virtual network. This does not stop the virtual network.

Parameters
- name -- virtual network name
- connection -- libvirt connection URI, overriding defaults
- username -- username to connect with, overriding defaults
- password -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
salt '*' virt.network_undefine default

salt.modules.virt.network_update(name, bridge, forward, ipv4_config=None, ipv6_config=None, vport=None, tag=None, mtu=None, domain=None, nat=None, interfaces=None, addresses=None, physical_function=None, dns=None, test=False, **kwargs)

Update a virtual network if needed.

Parameters
- name -- Network name.
- bridge -- Bridge name.
- forward -- Forward mode (bridge, router, nat). A None value creates an isolated network with no forwarding at all.
- vport -- Virtualport type. The value can also be a dictionary with type and parameters keys. The parameters value is a dictionary of virtual port parameters.

```python
- vport:
  type: openvswitch
  parameters:
    interfaceid: 09b11c53-8b5c-4eeb-8f00-d84eae0aaa4f
```

- tag -- Vlan tag. The value can also be a dictionary with the tags and optional trunk keys. trunk is a boolean value indicating whether to use VLAN trunking. tags is a list of dictionaries with keys id and nativeMode. The nativeMode value can be one of tagged or untagged.

```python
- tag:
  trunk: True
  tags:
  - id: 42
    nativeMode: untagged
  - id: 47
```

- ipv4_config(dict or None) -- IP v4 configuration. Dictionary describing the IP v4 setup like IP range and a possible DHCP configuration. The structure is documented in net-define-ip.
- ipv6_config(dict or None) -- IP v6 configuration. Dictionary describing the IP v6 setup like IP range and a possible DHCP configuration. The structure is documented in net-define-ip.
- connection -- libvirt connection URI, overriding defaults.
- username -- username to connect with, overriding defaults.
- password -- password to connect with, overriding defaults.
- mtu -- size of the Maximum Transmission Unit (MTU) of the network. (default None)
- **domain** -- DNS domain name of the DHCP server. The value is a dictionary with a mandatory `name` property and an optional `localOnly` boolean one. (default None)

  ```
  - domain:
      name: lab.acme.org
      localOnly: True
  ```

- **nat** -- addresses and ports to route in NAT forward mode. The value is a dictionary with optional keys `address` and `port`. Both values are a dictionary with `start` and `end` values. (default None)

  ```
  - forward: nat
    - nat:
        address:
            start: 1.2.3.4
            end: 1.2.3.10
        port:
            start: 500
            end: 1000
  ```

- **interfaces** -- whitespace separated list of network interfaces devices that can be used for this network. (default None)

  ```
  - forward: passthrough
    - interfaces: "eth10 eth11 eth12"
  ```

- **addresses** -- whitespace separated list of addresses of PCI devices that can be used for this network in `hostdev` forward mode. (default None)

  ```
  - forward: hostdev
    - interfaces: "0000:04:00.1 0000:e3:01.2"
  ```

- **physical_function** -- device name of the physical interface to use in `hostdev` forward mode. (default None)

  ```
  - forward: hostdev
    - physical_function: "eth0"
  ```

- **dns** -- virtual network DNS configuration. The value is a dictionary described in `net-define-dns`. (default None)

  ```
  - dns:
      forwarders:
        - domain: example.com
        - addr: 192.168.1.1
        - addr: 8.8.8.8
        - domain: www.example.com
      txt:
        example.com: "v=spf1 a -all"
        _http.tcp.example.com: "name=value,paper=A4"
      hosts:
        192.168.1.2:
        - mirror.acme.lab
        - test.acme.lab
      srvs:
        - name: ldap
          protocol: tcp
          domain: ldapserver.example.com
          target: .
          port: 389
  ```
New in version 3003.

salt.modules.virt.node_devices(**kwargs)
List the host available devices.

Parameters
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 3003.

salt.modules.virt.node_info(**kwargs)
Return a dict with information about this node

Parameters
- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.node_info
```

salt.modules.virt.pause(vm_, **kwargs)
Pause the named vm

Parameters
- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.pause <domain>
```

salt.modules.virt.pool_build(name, **kwargs)
Build a defined libvirt storage pool.

Parameters
- **name** -- libvirt storage pool name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt '*' virt.pool_build default
```
salt.modules.virt.pool_capabilities(**kwargs)

Return the hypervisor connection storage pool capabilities.

The returned data are either directly extracted from libvirt or computed. In the latter case some pool types could be listed as supported while they are not. To distinguish between the two cases, check the value of the computed property.

Parameters

- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 3000.

CLI Example:

```bash
salt '*' virt.pool_capabilities
```

salt.modules.virt.pool_define(name, ptype, target=None, permissions=None, source_devices=None, source_dir=None, source_initiator=None, source_adapter=None, source_hosts=None, source_auth=None, source_name=None, source_format=None, transient=False, start=True, **kwargs)

Create libvirt pool.

Parameters

- **name** -- Pool name
- **ptype** -- Pool type. See libvirt documentation for the possible values.
- **target** -- Pool full path target
- **permissions** -- Permissions to set on the target folder. This is mostly used for filesystem-based pool types. See Permissions definition for more details on this structure.
- **source_devices** -- List of source devices for pools backed by physical devices. (Default: None)

Each item in the list is a dictionary with path and optionally part_separator keys. The path is the qualified name for iSCSI devices.

Report to this libvirt page for more information on the use of part_separator
- **source_dir** -- Path to the source directory for pools of type dir, netfs or gluster. (Default: None)
- **source_initiator** -- Initiator IQN for libiscsi-direct pool types. (Default: None)

New in version 3000.
- **source_adapter** -- SCSI source definition. The value is a dictionary with type, name, parent, managed, parent_wwnn, parent_wwpn, parent_fabric_wwn, wwnn, wwpn and parent_address keys.

The parent_address value is a dictionary with unique_id and address keys. The address represents a PCI address and is itself a dictionary with domain, bus, slot and function properties. Report to this libvirt page for the meaning and possible values of these properties.
- **source_hosts** -- List of source for pools backed by storage from remote servers. Each item is the hostname optionally followed by the port separated by a colon. (Default: None)
- **source_auth** -- Source authentication details. (Default: None)

The value is a dictionary with type, username and secret keys. The type can be one of ceph for Ceph RBD or chap for iSCSI sources.

The secret value links to a libvirt secret object. It is a dictionary with type and
value keys. The type value can be either uuid or usage.

Examples:

```python
code
source_auth={
    'type': 'ceph',
    'username': 'admin',
    'secret': {
        'type': 'uuid',
        'value': '2ec115d7-3a88-3ceb-bc12-0ac909a6fd87'
    }
}

code
source_auth={
    'type': 'chap',
    'username': 'myname',
    'secret': {
        'type': 'usage',
        'value': 'mycluster_myname'
    }
}
```

Since 3000, instead the source authentication can only contain username and password properties. In this case the libvirt secret will be defined and used. For Ceph authentications a base64 encoded key is expected.

- **source_name** -- Identifier of name-based sources.
- **source_format** -- String representing the source format. The possible values are depending on the source type. See libvirt documentation for the possible values.
- **start** -- Pool start (default True)
- **transient** -- When True, the pool will be automatically undefined after being stopped. Note that a transient pool will force start to True. (Default: False)
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

Permissions definition

The permissions are described by a dictionary containing the following keys:

- **mode** The octal representation of the permissions. (Default: 0711)
- **owner** the numeric user ID of the owner. (Default: from the parent folder)
- **group** the numeric ID of the group. (Default: from the parent folder)
- **label** the SELinux label. (Default: None)

CLI Example:

Local folder pool:

```bash
salt '*' virt.pool_define somepool dir target=/srv/mypool
  → permissions="{'mode': '0744', 'owner': 107, 'group': 107}"`
```

CIFS backed pool:

```bash
salt '*' virt.pool_define myshare netfs source_format=cifs
  → source_dir=samba_share source_hosts=['example.com'] target=/mnt/
cifs`
```
New in version 2019.2.0.

```python
salt.modules.virt.pool_delete(name, **kwargs)
```
Delete the resources of a defined libvirt storage pool.

**Parameters**
- `name` -- libvirt storage pool name
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt '*' virt.pool_delete default
```

```python
salt.modules.virt.pool_get_xml(name, **kwargs)
```
Return the XML definition of a virtual storage pool.

**Parameters**
- `name` -- libvirt storage pool name
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

New in version 3000.

CLI Example:
```
salt '*' virt.pool_get_xml default
```

```python
salt.modules.virt.pool_info(name=None, **kwargs)
```
Return information on a storage pool provided its name.

**Parameters**
- `name` -- libvirt storage pool name
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

If no name is provided, return the infos for all defined storage pools.

New in version 2019.2.0.

CLI Example:
```
salt '*' virt.pool_info default
```

```python
salt.modules.virt.pool_list_volumes(name, **kwargs)
```
List the volumes contained in a defined libvirt storage pool.

**Parameters**
- `name` -- libvirt storage pool name
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt "*'" virt.pool_list_volumes <pool>
```

```python
salt.modules.virt.pool_refresh(name, **kwargs)
```
Refresh a defined libvirt storage pool.
Parameters

- `name` -- libvirt storage pool name
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```salt
salt '*' virt.pool_refresh default
```

```
salt.modules.virt.pool_set_autostart(name, state='on', **kwargs)
```

Set the autostart flag on a libvirt storage pool so that the storage pool will start with the host system on reboot.

Parameters

- `name` -- libvirt storage pool name
- `state` -- 'on' to auto start the pool, anything else to mark the pool not to be started when the host boots
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```salt
salt "*" virt.pool_set_autostart <pool> <on | off>
```

```
salt.modules.virt.pool_start(name, **kwargs)
```

Start a defined libvirt storage pool.

Parameters

- `name` -- libvirt storage pool name
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```salt
salt '*' virt.pool_start default
```

```
salt.modules.virt.pool_stop(name, **kwargs)
```

Stop a defined libvirt storage pool.

Parameters

- `name` -- libvirt storage pool name
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```salt
salt '*' virt.pool_stop default
```

```
salt.modules.virt.pool_undefine(name, **kwargs)
```

Remove a defined libvirt storage pool. The pool needs to be stopped before calling.

Parameters

- `name` -- libvirt storage pool name
- `connection` -- libvirt connection URI, overriding defaults
• **username** -- username to connect with, overriding defaults
• **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pool_undefine default
```

```
salt.modules.virt.pool_update(name, ptype, target=None, permissions=None,
    source_devices=None, source_dir=None, source_initiator=None,
    source_adapter=None, source_hosts=None, source_auth=None,
    source_name=None, source_format=None, test=False, **kwargs)
```

Update a libvirt storage pool if needed. If called with test=True, this is also reporting whether an update would be performed.

Parameters

- **name** -- Pool name
- **ptype** -- Pool type. See libvirt documentation for the possible values.
- **target** -- Pool full path target
- **permissions** -- Permissions to set on the target folder. This is mostly used for filesystem-based pool types. See Permissions definition for more details on this structure.
- **source_devices** -- List of source devices for pools backed by physical devices. (Default: None)

Each item in the list is a dictionary with path and optionally part_separator keys. The path is the qualified name for iSCSI devices.

Report to this libvirt page for more information on the use of part_separator
- **source_dir** -- Path to the source directory for pools of type dir, netfs or gluster. (Default: None)
- **source_initiator** -- Initiator IQN for libiscsi-direct pool types. (Default: None)

New in version 3000.

- **source_adapter** -- SCSI source definition. The value is a dictionary with type, name, parent, managed, parent_wwnn, parent_wwpn, parent_fabric_wwn, wwnn, wwpn and parent_address keys.

The parent_address value is a dictionary with unique_id and address keys. The address represents a PCI address and is itself a dictionary with domain, bus, slot and function properties. Report to this libvirt page for the meaning and possible values of these properties.
- **source_hosts** -- List of source for pools backed by storage from remote servers. Each item is the hostname optionally followed by the port separated by a colon. (Default: None)
- **source_auth** -- Source authentication details. (Default: None)

The value is a dictionary with type, username and secret keys. The type can be one of ceph for Ceph RBD or chap for iSCSI sources.

The secret value links to a libvirt secret object. It is a dictionary with type and value keys. The type value can be either uuid or usage.

Examples:

```
source_auth={
    'type': 'ceph',
    'username': 'admin',
    'secret': {
```
Since 3000, instead the source authentication can only contain `username` and `password` properties. In this case the libvirt secret will be defined and used. For Ceph authentications a base64 encoded key is expected.

- **source_name** -- identifier of name-based sources.
- **source_format** -- String representing the source format. The possible values are depending on the source type. See `libvirt documentation` for the possible values.
- **test** -- run in dry-run mode if set to `True`
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

**Example:**

Local folder pool:

```bash
salt '*' virt.pool_update somepool dir target=/srv/mypool 
  → permissions="{'mode': '0744', 'owner': 107, 'group': 107 }"
```

CIFS backed pool:

```bash
salt '*' virt.pool_update myshare netfs source_format=cifs 
  → source_dir=samba_share source_hosts="['example.com']" target=/mnt/ 
  → cifs
```

New in version 3000.

```bash
salt.modules.virt.purge(vm_, dirs=False, removable=False, **kwargs)
```

Recursively destroy and delete a persistent virtual machine, pass `True` for `dir's` to also delete the directories containing the virtual machine disk images - USE WITH EXTREME CAUTION!

**Parameters**

- **vm** -- domain name
- **dirs** -- pass `True` to remove containing directories
- **removable** -- pass `True` to remove removable devices

New in version 2019.2.0.

- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

New in version 2019.2.0.
• `password` -- password to connect with, overriding defaults

    New in version 2019.2.0.

    CLI Example:

    ```
salt '*' virt.purge <domain>
    ```

`salt.modules.virt.reboot(name, **kwargs)`

Reboot a domain via ACPI request

**Parameters**

- `vm` -- domain name
- `connection` -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- `username` -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- `password` -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

    CLI Example:

    ```
salt '*' virt.reboot <domain>
    ```

`salt.modules.virt.reset(vm_, **kwargs)`

Reset a VM by emulating the reset button on a physical machine

**Parameters**

- `vm` -- domain name
- `connection` -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- `username` -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- `password` -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

    CLI Example:

    ```
salt '*' virt.reset <domain>
    ```

`salt.modules.virt.resume(vm_, **kwargs)`

Resume the named vm

**Parameters**

- `vm` -- domain name
- `connection` -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- `username` -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- `password` -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

    CLI Example:

    ```
salt '*' virt.resume <domain>
    ```

`salt.modules.virt.revert_snapshot(name, vm_snapshot=None, cleanup=False, **kwargs)`

Revert snapshot to the previous from current (if available) or to the specific.
Parameters

- `name` -- domain name
- `vm_snapshot` -- name of the snapshot to revert
- `cleanup` -- Remove all newer than reverted snapshots. Values: True or False (default False).
- `connection` -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- `username` -- username to connect with, overriding defaults
  New in version 2019.2.0.
- `password` -- password to connect with, overriding defaults
  New in version 2019.2.0.
New in version 2016.3.0.

CLI Example:

```bash
salt '*' virt.revert <domain>
salt '*' virt.revert <domain> <snapshot>
```

salt.modules.virt.seed_non_shared_migrate(disks, force=False)

Non shared migration requires that the disks be present on the migration destination, pass the disks information via this function, to the migration destination before executing the migration.

Parameters

- `disks` -- the list of disk data as provided by virt.get_disks
- `force` -- skip checking the compatibility of source and target disk images if True. (default: False)

CLI Example:

```bash
salt '*' virt.seed_non_shared_migrate <disks>
```

salt.modules.virt.set_autostart(vm_, state='on', **kwargs)

Set the autostart flag on a VM so that the VM will start with the host system on reboot.

Parameters

- `vm` -- domain name
- `state` -- 'on' to auto start the pool, anything else to mark the pool not to be started when the host boots
- `connection` -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- `username` -- username to connect with, overriding defaults
  New in version 2019.2.0.
- `password` -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```bash
salt "*" virt.set_autostart <domain> <on | off>
```

salt.modules.virt.setmem(vm_, memory, config=False, **kwargs)

Changes the amount of memory allocated to VM. The VM must be shutdown for this to work.

Parameters

- `vm` -- name of the domain
- `memory` -- memory amount to set in MB
- `config` -- if True then libvirt will be asked to modify the config as well
- `connection` -- libvirt connection URI, overriding defaults
New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

CLI Example:
```
salt '*' virt.setmem <domain> <size>
salt '*' virt.setmem my_domain 768
```

```
salt.modules.virt.setvcpus(vm_, vcpus, config=False, **kwargs)
Changes the amount of vcpus allocated to VM. The VM must be shutdown for this to work.

If config is True then we ask libvirt to modify the config as well

Parameters
- **vm** -- name of the domain
- **vcpus** -- integer representing the number of CPUs to be assigned
- **config** -- if True then libvirt will be asked to modify the config as well
- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt '*' virt.setvcpus <domain> <amount>
salt '*' virt.setvcpus my_domain 4
```

```
salt.modules.virt.shutdown(vm_, **kwargs)
Send a soft shutdown signal to the named vm

Parameters
- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt '*' virt.shutdown <domain>
```

```
salt.modules.virt.snapshot(domain, name=None, suffix=None, **kwargs)
Create a snapshot of a VM.

Parameters
- **domain** -- domain name
- **name** -- Name of the snapshot. If the name is omitted, then will be used original domain name with ISO 8601 time as a suffix.
- **suffix** -- Add suffix for the new name. Useful in states, where such snapshots can be distinguished from manually created.
```
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:

```salt '*' virt.snapshot <domain>```

salt.modules.virt.start(name, **kwargs)

Start a defined domain

Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

New in version 2019.2.0.

CLI Example:

```salt '*' virt.start <domain>```

salt.modules.virt.stop(name, **kwargs)

Hard power down the virtual machine, this is equivalent to pulling the power.

Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

New in version 2019.2.0.

CLI Example:

```salt '*' virt.stop <domain>```

salt.modules.virt.undefine(vm_, **kwargs)

Remove a defined vm, this does not purge the virtual machine image, and this only works if the vm is powered down

Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
• **password** -- password to connect with, overriding defaults

   New in version 2019.2.0.

   CLI Example:

   ```
   salt '*' virt.undefine <domain>
   ```

   salt.modules.virt.update(name, cpu=0, mem=0, disk_profile=None, disks=None, nic_profile=None, interfaces=None, graphics=None, live=True, boot=None, numatune=None, test=False, boot_dev=None, hypervisor_features=None, clock=None, serials=None, consoles=None, stop_on_reboot=False, host_devices=None, **kwargs)

   Update the definition of an existing domain.

   **Parameters**

   • **name** -- Name of the domain to update
   • **cpu** -- Number of virtual CPUs to assign to the virtual machine or a dictionary with detailed information to configure cpu model and topology, numa node tuning, cpu tuning and iothreads allocation. The structure of the dictionary is documented in cpu parameters definition.

   To update any cpu parameters specify the new values to the corresponding tag. To remove any element or attribute, specify None object. Please note that None object is mapped to null in yaml, use null in sls file instead.

   • **mem** -- Amount of memory to allocate to the virtual machine in MiB. Since 3002, a dictionary can be used to contain detailed configuration which support memory allocation or tuning. Supported parameters are boot, current, max, slots, hard_limit, soft_limit, swap_hard_limit, min_guarantee, hugepages, nosharepages, locked, source, access, allocation and discard. The structure of the dictionary is documented in Memory parameter definition. Both decimal and binary base are supported. Detail unit specification is documented in Units specification. Please note that the value for slots must be an integer.

   To remove any parameters, pass a None object, for instance: ‘soft_limit’: None. Please note that None is mapped to null in sls file, pass null in sls file instead.

   ```
   - mem:
     hard_limit: null
     soft_limit: null
   ```

   Changed in version 3002.

   • **disk_profile** -- disk profile to use
   • **disks** -- Disk definitions as documented in the init() function. If neither the profile nor this parameter are defined, the disk devices will not be changed. However to clear disks set this parameter to empty list.

   • **nic_profile** -- network interfaces profile to use
   • **interfaces** -- Network interface definitions as documented in the init() function. If neither the profile nor this parameter are defined, the interface devices will not be changed. However to clear network interfaces set this parameter to empty list.

   • **graphics** -- The new graphics definition as defined in Graphics Definition. If not set, the graphics will not be changed. To remove a graphics device, set this parameter to {'type': 'none'}.

   • **live** -- False to avoid trying to live update the definition. In such a case, the new definition is applied at the next start of the virtual machine. If True, not all aspects of the definition can be live updated, but as much as possible will be attempted. (Default: True)

   • **connection** -- libvirt connection URI, overriding defaults
• **username** -- username to connect with, overriding defaults
• **password** -- password to connect with, overriding defaults
• **boot** -- Specifies kernel, initial ramdisk and kernel command line parameters for the virtual machine. This is an optional parameter, all of the keys are optional within the dictionary.

Refer to *Boot parameters definition* for the complete boot parameter description.

To update any boot parameters, specify the new path for each. To remove any boot parameters, pass `None` object, for instance: `{ kernel: None }` or `{ efi: False }`. Please note that `None` is mapped to `null` in sls file, pass `null` in sls file instead.

SLS file Example:

```yaml
- boot:
    loader: null
    nvram: null
```

New in version 3000.

• **boot_dev** -- Space separated list of devices to boot from sorted by decreasing priority. Values can be `hd`, `fd`, `cdrom` or `network`.

By default, the value will "hd".

New in version 3002.

• **numatune** -- The optional numatune element provides details of how to tune the performance of a NUMA host via controlling NUMA policy for domain process. The optional memory element specifies how to allocate memory for the domain process on a NUMA host. memnode elements can specify memory allocation policies per each guest NUMA node. The definition used in the dictionary can be found at *cpu parameters definition*.

To update any numatune parameters, specify the new value. To remove any numatune parameters, pass a `None` object, for instance: `{ numatune: None }`. Please note that `None` is mapped to `null` in sls file, pass `null` in sls file instead.

New in version 3003.

• **serials** -- Dictionary providing details on the serials connection to create. (Default: `None`) See *Serials and Consoles Definitions* for more details on the possible values.

New in version 3003.

• **consoles** -- Dictionary providing details on the consoles device to create. (Default: `None`) See *Serials and Consoles Definitions* for more details on the possible values.

New in version 3003.

• **stop_on_reboot** -- If set to `True` the guest will stop instead of rebooting. This is specially useful when creating a virtual machine with an installation cdrom or an autoinstallation needing a special first boot configuration. Defaults to `False`

New in version 3003.

• **test** -- run in dry-run mode if set to `True`

New in version 3001.

• **hypervisor_features** -- Enable or disable hypervisor-specific features on the virtual machine.

New in version 3003.
hypervisor_features:
  kvm-hint-dedicated: True

- **clock** -- Configure the guest clock. The value is a dictionary with the following keys:
  - `adjustment` time adjustment in seconds or `reset`
  - `utc` set to `False` to use the host local time as the guest clock. Defaults to `True`.
  - `timezone` synchronize the guest to the corresponding timezone
  - `timers` a dictionary associating the timer name with its configuration. This configuration is a dictionary with the properties `track`, `tickpolicy`, `catchup`, `frequency`, `mode`, `present`, `slew`, `threshold` and `limit`. See [libvirt time keeping documentation](https://libvirt.org/html/virt-time.html) for the possible values.

New in version 3003.

Set the clock to local time using an offset in seconds .. code-block:: yaml

```yaml
clock:
  adjustment: 3600 utc: False
```

Set the clock to a specific time zone:

```yaml
clock:
  timezone: CEST
```

Tweak guest timers:

```yaml
clock:
  timers:
    tsc:
      frequency: 3504000000
      mode: native
    rtc:
      track: wall
      tickpolicy: catchup
      slew: 4636
      threshold: 123
      limit: 2342
    hpet:
      present: False
```

- **host_devices** -- List of host devices to passthrough to the guest. The value is a list of device names as provided by the `node_devices()` function. (Default: `None`)

New in version 3003.

Returns

Returns a dictionary indicating the status of what has been done. It is structured in the following way:

```yaml
{
  'definition': True,
  'cpu': True,
  'mem': True,
  'disks': {'attached': [list of actually attached disks],
            'detached': [list of actually detached disks]},
  'nics': {'attached': [list of actually attached nics],
           'detached': [list of actually detached nics]},
  'errors': ['error messages for failures']
}
```

New in version 2019.2.0.

CLI Example:
salt '*' virt.update domain cpu=2 mem=1024

salt.modules.virt.virt_type()
Returns the virtual machine type as a string

CLI Example:
salt '*' virt.virt_type

salt.modules.virt.vm_cputime(vm_=None, **kwargs)
Return cputime used by the vms on this hyper in a list of dicts:

Parameters
- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

```
[ 'your-vm': {
   'cputime' <int>
   'cputime_percent' <int>
   },
   ...
]  
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:
salt '*' virt.vm_cputime

salt.modules.virt.vm_diskstats(vm_=None, **kwargs)
Return disk usage counters used by the vms on this hyper in a list of dicts:

Parameters
- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

```
[ 'your-vm': {
   'rd_req' : 0,
   'rd_bytes' : 0,
   'wr_req' : 0,
   'wr_bytes' : 0,
   'errs' : 0
}  
```

(continues on next page)
If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:
```
salt '*' virt.vm_blockstats
```

```
salt.modules.virt.vm_info(vm_=None,**kwargs)
```

Return detailed information about the vms on this hyper in a list of dicts:

**Parameters**
- `vm` -- name of the domain
- `connection` -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- `username` -- username to connect with, overriding defaults
  New in version 2019.2.0.
- `password` -- password to connect with, overriding defaults
  New in version 2019.2.0.

```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:
```
salt '*' virt.vm_info
```

```
salt.modules.virt.vm_netstats(vm_=None,**kwargs)
```

Return combined network counters used by the vms on this hyper in a list of dicts:

**Parameters**
- `vm` -- domain name
- `connection` -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- `username` -- username to connect with, overriding defaults
  New in version 2019.2.0.
- `password` -- password to connect with, overriding defaults
  New in version 2019.2.0.
If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:
```bash
code
salt '*' virt.vm_netstats
```

salt.modules.virt.vm_state(**kwargs)
Return list of all the vms and their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

Parameters

- **vm** -- name of the domain
- **connection** -- libvirt connection URI, overriding defaults
  - New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  - New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  - New in version 2019.2.0.

CLI Example:
```bash
code
salt '*' virt.vm_state <domain>
```

salt.modules.virt.volume_define(pool, name, size, allocation=0, format=None, type=None, permissions=None, backing_store=None, nocow=False, **kwargs)
Create libvirt volume.

Parameters

- **pool** -- name of the pool to create the volume in
- **name** -- name of the volume to define
- **size** -- capacity of the volume to define in MiB
- **allocation** -- allocated size of the volume in MiB. Defaults to 0.
- **format** -- volume format. The allowed values are depending on the pool type. Check the virt.pool_capabilities output for the possible values and the default.
- **type** -- type of the volume. One of file, block, dir, network, netdiri, ploop or None. By default, the type is guessed by libvirt from the pool type.
- **permissions** -- Permissions to set on the target folder. This is mostly used for filesystem-based pool types. See Permissions definition for more details on this structure.
- **backing_store** -- dictionary describing a backing file for the volume. It must contain a path property pointing to the base volume and a format property defining
the format of the base volume.

The base volume format will not be guessed for security reasons and is thus mandatory.

- **nocow** -- disable COW for the volume.
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

**CLI Example:**

**Volume on ESX:**

```
salt '*' virt.volume_define "[local-storage]" myvm/myvm.vmdk vmdk 8192
```

**QCOW2 volume with backing file:**

```
salt '*' virt.volume_define default myvm.qcow2 qcow2 8192
```

```
-> permissions={"mode": '0775', 'owner': '123', 'group': '345"}
```

```
-> backing_store={"path": '/path/to/base.img', 'format': 'raw"]
```

```
-> nocow=True
```

New in version 3001.

**salt.modules.virt.volume_delete(pool, volume, **kwargs)**

Delete a libvirt managed volume.

**Parameters**

- **pool** -- libvirt storage pool name
- **volume** -- name of the volume to delete
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 3000.

**CLI Example:**

```
salt "*" virt.volume_delete <pool> <volume>
```

**salt.modules.virt.volume_infos(pool=None, volume=None, **kwargs)**

Provide details on a storage volume. If no volume name is provided, the infos all the volumes contained in the pool are provided. If no pool is provided, the infos of the volumes of all pools are output.

**Parameters**

- **pool** -- libvirt storage pool name (default: None)
- **volume** -- name of the volume to get infos from (default: None)
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 3000.

**CLI Example:**

```
salt "*" virt.volume_infos <pool> <volume>
```

**salt.modules.virt.volume_upload(pool, volume, file, offset=0, length=0, sparse=False, **kwargs)**

Create libvirt volume.

**Parameters**

- **pool** -- name of the pool to create the volume in
• **name** -- name of the volume to define
• **file** -- the file to upload to the volume
• **offset** -- where to start writing the data in the volume
• **length** -- amount of bytes to transfer to the volume
• **sparse** -- set to True to preserve data sparseness.
• **connection** -- libvirt connection URI, overriding defaults
• **username** -- username to connect with, overriding defaults
• **password** -- password to connect with, overriding defaults

**CLI Example:**

```
salt '*' virt.volume_upload default myvm.qcow2 /path/to/disk.qcow2
```

New in version 3001.

---

### 23.9.478 salt.modules.virtualenv

Create virtualenv environments.

New in version 0.17.0.

```
salt.modules.virtualenv_mod.create(path, venv_bin=None, system_site_packages=False, distribute=False, clear=False, python=None, extra_search_dir=None, never_download=None, prompt=None, pip=False, symlinks=None, upgrade=None, user=None, use_vt=False, saltenv='base', **kwargs)
```

Create a virtualenv

- **path** The path to the virtualenv to be created
- **venv_bin** The name (and optionally path) of the virtualenv command. This can also be set globally in the minion config file as `virtualenv.venv_bin`. Defaults to `virtualenv`.
- **system_site_packages** [False] Passthrough argument given to virtualenv or pyvenv
- **distribute** [False] Passthrough argument given to virtualenv
- **pip** [False] Install pip after creating a virtual environment. Implies distribute=True
- **clear** [False] Passthrough argument given to virtualenv or pyvenv
- **python** [None (default)] Passthrough argument given to virtualenv
- **extra_search_dir** [None (default)] Passthrough argument given to virtualenv
- **never_download** [None (default)] Passthrough argument given to virtualenv if True
- **prompt** [None (default)] Passthrough argument given to virtualenv if not None
- **symlinks** [None] Passthrough argument given to pyvenv if True
- **upgrade** [None] Passthrough argument given to pyvenv if True
- **user** [None] Set ownership for the virtualenv

**Note:** On Windows you must also pass a `password` parameter. Additionally, the user must have permissions to the location where the virtual environment is being created

- **runas** [None] Set ownership for the virtualenv

Deprecated since version 2014.1.0: user should be used instead

- **use_vt** [False] Use VT terminal emulation (see output while installing)

New in version 2015.5.0.

- **saltenv** ['base'] Specify a different environment. The default environment is base.

New in version 2014.1.0.
Note: The **runas** argument is deprecated as of 2014.1.0. **user** should be used instead.

CLI Example:

```
salt '*' virtualenv.create /path/to/new/virtualenv
```

Example of using **--always-copy** environment variable (in case your fs doesn't support symlinks).

This will copy files into the virtualenv instead of symlinking them.

```
.. code-block:: yaml

  - env:
    - VIRTUALENV_ALWAYS_COPY: 1
```

salt.modules.virtualenv_mod.get_distribution_path(venv, distribution)

Return the path to a distribution installed inside a virtualenv

- **venv** Path to the virtualenv.
- **distribution** Name of the distribution. Note, all non-alphanumeric characters will be converted to dashes.

CLI Example:

```
salt '*' virtualenv.get_distribution_path /path/to/my/venv my_distribution
```

salt.modules.virtualenv_mod.get_resource_content(venv, package=None, resource=None)

Return the content of a package resource installed inside a virtualenv

- **venv** Path to the virtualenv
- **package** Name of the package in which the resource resides
- **resource** Name of the resource of which the content is to be returned

CLI Example:

```
salt '*' virtualenv.get_resource_content /path/to/my/venv my_package my/resource.xml
```

salt.modules.virtualenv_mod.get_resource_path(venv, package=None, resource=None)

Return the path to a package resource installed inside a virtualenv

- **venv** Path to the virtualenv
- **package** Name of the package in which the resource resides
- **resource** Name of the resource of which the path is to be returned

CLI Example:

```
salt '*' virtualenv.get_resource_path /path/to/my/venv my_package my/resource.xml
```

salt.modules.virtualenv_mod.get_site_packages(venv)

Return the path to the site-packages directory of a virtualenv
venv  Path to the virtualenv.

CLI Example:

salt 'saltstack' virtualenv.get_site_packages /path/to/my/venv

salt.modules.virtualenv_mod.virtualenv_ver(venv_bin, user=None, **kwargs)
return virtualenv version if exists

23.9.479 salt.modules.vmctl

Manage vms running on the OpenBSD VMM hypervisor using vmctl(8).

New in version 2019.2.0.

codeauthor Jasper Lievisse Adriaanse <jasper@openbsd.org>

Note: This module requires the vmd service to be running on the OpenBSD target machine.

salt.modules.vmctl.create_disk(name, size)
Create a VMM disk with the specified name and size.
  size: Size in megabytes, or use a specifier such as M, G, T.

CLI Example:

salt 'saltstack' vmctl.create_disk /path/to/disk.img size=10G

salt.modules.vmctl.load(path)
Load additional configuration from the specified file.
  path  Path to the configuration file.

CLI Example:

salt 'saltstack' vmctl.load path=/etc/vm.switches.conf

salt.modules.vmctl.reload()
Remove all stopped VMs and reload configuration from the default configuration file.

CLI Example:

salt 'saltstack' vmctl.reload

salt.modules.vmctl.reset(all=False, vms=False, switches=False)
Reset the running state of VMM or a subsystem.
  all:  Reset the running state.
  switches: Reset the configured switches.
  vms:  Reset and terminate all VMs.

CLI Example:

salt 'saltstack' vmctl.reset all=True

salt.modules.vmctl.start(name=None, id=None, bootpath=None, disk=None, disks=None, local_iface=False, memory=None, nics=0, switch=None)
Starts a VM defined by the specified parameters. When both a name and id are provided, the id is ignored.
  name:  Name of the defined VM.
  id:  VM id.
  bootpath:  Path to a kernel or BIOS image to load.
  disk:  Path to a single disk to use.
disks: List of multiple disks to use.
local_iface: Whether to add a local network interface. See "LOCAL INTERFACES" in the vmctl(8) manual page for more information.
memory: Memory size of the VM specified in megabytes.
switch: Add a network interface that is attached to the specified virtual switch on the host.

CLI Example:

```bash
salt '*' vmctl.start 2 # start VM with id 2
salt '*' vmctl.start name=web1 bootpath='/bsd.rd' nics=2 memory=512M disk='/disk.img'
```

salt.modules.vmctl.status(name=None, id=None)
List VMs running on the host, or only the VM specified by id. When both a name and id are provided, the id is ignored.

name: Name of the defined VM.
id: VM id.

CLI Example:

```bash
salt '*' vmctl.status # to list all VMs
salt '*' vmctl.status name=web1 # to get a single VM
```

salt.modules.vmctl.stop(name=None, id=None)
Stop (terminate) the VM identified by the given id or name. When both a name and id are provided, the id is ignored.

name: Name of the defined VM.
id: VM id.

CLI Example:

```bash
salt '*' vmctl.stop name=alpine
```

23.9.480 salt.modules.vsphere
Manage VMware vCenter servers and ESXi hosts.
New in version 2015.8.4.

codeauthor Alexandru Bleotu <alexandru.bleotu@morganstaley.com>

Dependencies

- pyVmomi Python Module
- ESXCLI

pyVmomi

PyVmomi can be installed via pip:

```bash
pip install pyVmomi
```

Note: Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi
Salt Documentation, Release 3003.3

6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See Issue #29537 for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original vSphere Execution Module was developed against.

**vSphere Automation SDK**

vSphere Automation SDK can be installed via pip:

```
pip install --upgrade pip setuptools
pip install --upgrade git+https://github.com/vmware/vsphere-automation-sdk-python.git
```

**Note:** The SDK also requires OpenSSL 1.0.1+ if you want to connect to vSphere 6.5+ in order to support TLS 1.1 & 1.2.

In order to use the tagging functions in this module, vSphere Automation SDK is necessary to install.

The module is currently in version 1.0.3 (as of 8/26/2019)

**ESXCLI**

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for vSphere 5.5 and vSphere 6.0.

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host’s syslog configuration.

**Note:** Be aware that some functionality in this execution module may depend on the type of license attached to a vCenter Server or ESXi host(s).

For example, certain services are only available to manipulate service state or policies with a VMware vSphere Enterprise or Enterprise Plus license, while others are available with a Standard license. The **ntpd** service is restricted to an Enterprise Plus license, while **ssh** is available via the Standard license.

Please see the [vSphere Comparison page](https://www.vmware.com/support/pubs) for more information.
**About**

This execution module was designed to be able to handle connections both to a vCenter Server, as well as to an ESXi host. It utilizes the pyVmomi Python library and the ESXCLI package to run remote execution functions against either the defined vCenter server or the ESXi host.

Whether or not the function runs against a vCenter Server or an ESXi host depends entirely upon the arguments passed into the function. Each function requires a host location, username, and password. If the credentials provided apply to a vCenter Server, then the function will be run against the vCenter Server. For example, when listing hosts using vCenter credentials, you’ll get a list of hosts associated with that vCenter Server:

```
# salt my-minion vsphere.list_hosts <vcenter-ip> <vcenter-user> <vcenter-password>
```

```
my-minion:
  - esxi-1.example.com
  - esxi-2.example.com
```

However, some functions should be used against ESXi hosts, not vCenter Servers. Functionality such as getting a host's coredump network configuration should be performed against a host and not a vCenter server. If the authentication information you're using is against a vCenter server and not an ESXi host, you can provide the host name that is associated with the vCenter server in the command, as a list, using the `host_names` or `esxi_host` kwarg. For example:

```
# salt my-minion vsphere.get_coredump_network_config <vcenter-ip> <vcenter-user> <vcenter-password> esxi_hosts='[esxi-1.example.com, esxi-2.example.com]'
```

```
my-minion:
  esxi-1.example.com:
    Coredump Config:
      enabled: False
  esxi-2.example.com:
    Coredump Config:
      enabled: True
      host_vnic: vmk0
      ip: coredump-location.example.com
      port: 6500
```

You can also use these functions against an ESXi host directly by establishing a connection to an ESXi host using the host's location, username, and password. If ESXi connection credentials are used instead of vCenter credentials, the `host_names` and `esxi_hosts` arguments are not needed.

```
# salt my-minion vsphere.get_coredump_network_config esxi-1.example.com root <host-password>
```

```
local:
  10.4.28.150:
    Coredump Config:
```

(continues on next page)
enabled:
  True
host_vnic:
  vmk0
ip:
  coredump-location.example.com
port:
  6500

```python
salt.modules.vsphere.add_capacity_to_diskgroup(
    cache_disk_id,
    capacity_disk_ids,
    safety_checks=True,
    service_instance=None
)
```

Adds capacity disks to the disk group with the specified cache disk.

- `cache_disk_id` The canonical name of the cache disk.
- `capacity_disk_ids` A list containing canonical names of the capacity disks to add.
- `safety_checks` Specify whether to perform safety check or to skip the checks and try performing the required task. Default value is True.
- `service_instance` Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```python
salt '*' vsphere.add_capacity_to_diskgroup
  cache_disk_id='naa.000000000000001'
  capacity_disk_ids=['naa.000000000000002', 'naa.000000000000003']
```

```python
salt.modules.vsphere.add_host_to_dvs(
    host, username, password, vmknic_name, vmnic_name, dvs_name, target_portgroup_name, uplink_portgroup_name, protocol=None, port=None, host_names=None, verify_ssl=True
)
```

Adds an ESXi host to a vSphere Distributed Virtual Switch and migrates the desired adapters to the DVS from the standard switch.

- `host` The location of the vCenter server.
- `username` The username used to login to the vCenter server.
- `password` The password used to login to the vCenter server.
- `vmknic_name` The name of the virtual NIC to migrate.
- `vmnic_name` The name of the physical NIC to migrate.
- `dvs_name` The name of the Distributed Virtual Switch.
- `target_portgroup_name` The name of the distributed portgroup in which to migrate the virtual NIC.
- `uplink_portgroup_name` The name of the uplink portgroup in which to migrate the physical NIC.
- `protocol` Optionally set to alternate protocol if the vCenter server or ESX/ESXi host is not using the default protocol. Default protocol is https.
- `port` Optionally set to alternate port if the vCenter server or ESX/ESXi host is not using the default port. Default port is 443.
- `host_names`: An array of VMware host names to migrate
- `verify_ssl` Verify the SSL certificate. Default: True

CLI Example:

```python
salt some_host vsphere.add_host_to_dvs
  host='vsphere.corp.com'
  username='administrator@vsphere.corp.com'
  password='vsphere_password'
  vmknic_name='vmk0'
  vmnic_name='vmnic0'
  dvs_name='DSwitch'
  target_portgroup_name='DPortGroup'
  uplink_portgroup_name='DSwitch1-DVUplinks-181'
  protocol='https'
  port='443',
  host_names=['esxi1.corp.com', 'esxi2.corp.com', 'esxi3.corp.com']
```

Return Example:
<table>
<thead>
<tr>
<th>Host</th>
<th>DVS</th>
<th>Portgroup</th>
<th>Status</th>
<th>Uplink</th>
<th>VMKNIC</th>
<th>VMNIC</th>
</tr>
</thead>
<tbody>
<tr>
<td>esxi1.corp.com</td>
<td>DSwitch</td>
<td>DPortGroup</td>
<td>True</td>
<td>DSwitch-DVUplinks-181</td>
<td>vmk0</td>
<td>vmnic0</td>
</tr>
<tr>
<td>esxi2.corp.com</td>
<td>DSwitch</td>
<td>DPortGroup</td>
<td>True</td>
<td>DSwitch-DVUplinks-181</td>
<td>vmk0</td>
<td>vmnic0</td>
</tr>
<tr>
<td>esxi3.corp.com</td>
<td>DSwitch</td>
<td>DPortGroup</td>
<td>True</td>
<td>DSwitch-DVUplinks-181</td>
<td>vmk0</td>
<td>vmnic0</td>
</tr>
<tr>
<td>message:</td>
<td></td>
<td></td>
<td>success: True</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This was very difficult to figure out. VMware's PyVmomi documentation at [this link](https://github.com/vmware/pyvmomi/blob/master/docs/vim/DistributedVirtualSwitch.rst) (which is a copy of the official documentation here: [this link](https://www.vmware.com/support/developer/converter-sdk/conv60_ apireference/vim.DistributedVirtualSwitch.html)) says to create the DVS, create distributed portgroups, and then add the host to the DVS specifying which physical NIC to use as the port backing. However, if the physical NIC is in use as the only link from the host to vSphere, this will fail with an unhelpful “busy” error.

There is, however, a Powershell PowerCLI cmdlet called Add-VDSwitchPhysicalNetworkAdapter that does
what we want. I used Onyx (https://labs.vmware.com/flings/onyx) to sniff the SOAP stream from Powershell to our vSphere server and got this snippet out:

```xml
<UpdateNetworkConfig xmlns="urn:vim25">
  <This type="HostNetworkSystem">networkSystem-187</This>
  <config>
    <vswitch>
      <changeOperation>edit</changeOperation>
      <name>vSwitch0</name>
      <spec>
        <numPorts>7812</numPorts>
      </spec>
    </vswitch>
    <proxySwitch>
      <changeOperation>edit</changeOperation>
      <uuid>73 a4 05 50 b0 d2 7e b9-38 80 5d 24 65 8f da 70</uuid>
      <spec>
        <backing xsi:type="DistributedVirtualSwitchHostMemberPnicBacki ng">
          <pnicSpec><pnicDevice>vmnic0</pnicDevice></pnicSpec>
        </backing>
      </spec>
    </proxySwitch>
    <portgroup>
      <changeOperation>remove</changeOperation>
      <spec>
        <name>Management Network</name><vlanId>-1</vlanId><vswitchName /></spec>
    </portgroup>
    <vnic>
      <changeOperation>edit</changeOperation>
      <device>vmk0</device>
      <portgroup />
      <spec>
        <distributedVirtualPort>
          <switchUuid>73 a4 05 50 b0 d2 7e b9-38 80 5d 24 65 8f da 70</switchUuid>
          <portgroupKey>dvportgroup-191</portgroupKey>
        </distributedVirtualPort>
      </spec>
    </vnic>
  </config>
  <changeMode>modify</changeMode>
</UpdateNetworkConfig>
```

The SOAP API maps closely to PyVmomi, so from there it was (relatively) easy to figure out what Python to write.

```
salt.modules.vsphere.add_license(key, description, safety_checks=True, service_instance=None)
```

Adds a license to the vCenter or ESXi host

- **key** License key.
- **description** License description added in as a label.
- **safety_checks** Specify whether to perform safety check or to skip the checks and try performing the required task
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.
salt '*' vsphere.add_license key=<license_key> desc='License desc'

salt.modules.vsphere.assign_default_storage_policy_to_datastore(policy, datastore, service_instance=None)

Assigns a storage policy as the default policy to a datastore.

- **policy**: Name of the policy to assign.
- **datastore**: Name of the datastore to assign. The datastore needs to be visible to the VMware entity the proxy points to.
- **service_instance**: Service instance (vim.ServiceInstance) of the vCenter. Default is None.

salt '*' vsphere.assign_storage_policy_to_datastore policy='policy name' datastore=ds1

salt.modules.vsphere.assign_license(license_key, license_name, entity, entity_display_name, safety_checks=True, service_instance=None)

Assigns a license to an entity

- **license_key**: Key of the license to assign. See _get_entity docstrings for format.
- **license_name**: Display name of license
- **entity**: Dictionary representation of an entity
- **entity_display_name**: Entity name used in logging
- **safety_checks**: Specify whether to perform safety check or to skip the checks and try performing the required task. Default is False.
- **service_instance**: Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

salt '*' vsphere.assign_license license_key=00000:0000 license_name=test entity={type:cluster,datacenter:dc,cluster:cl}

salt.modules.vsphere.attach_tag(object_id, tag_id, managed_obj='ClusterComputeResource', server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None)

Attach an existing tag to an input object.

The tag needs to meet the cardinality (CategoryModel.cardinality) and associability (CategoryModel.associable_types) criteria in order to be eligible for attachment. If the tag is already attached to the object, then this method is a no-op and an error will not be thrown. To invoke this method, you need the attach tag privilege on the tag and the read privilege on the object.

**CLI Example:**

salt vm_minion vsphere.attach_tag domain-c2283

---urn:vmomi:InventoryServiceTag:b55ecc77-f4a5-49f8-ab52-38865467cfbe:GLOBAL

**Parameters**

- **object_id (str)** -- The identifier of the input object.
- **tag_id (str)** -- The identifier of the tag object.
- **managed_obj (str)** -- Classes that contain methods for creating and deleting resources typically contain a class attribute specifying the resource type for the resources being created and deleted.
- **server (basestring)** -- Target DNS or IP of vCenter center.
- **username (basestring)** -- Username associated with the vCenter center.
- **password (basestring)** -- Password associated with the vCenter center.
- **verify_ssl (boolean)** -- Verify the SSL certificate. Default: True
- **ca_bundle (basestring)** -- Path to the ca bundle to use when verifying SSL certificates.

**Returns** The list of all tag identifiers that correspond to the tags attached to the given object.
Return type  list of tags
Raise Unauthorized if you do not have the privilege to read the object.
Raise Unauthenticated if the user can not be authenticated.

salt.modules.vsphere.compare_vm_configs(new_config, current_config)
Compares virtual machine current and new configuration, the current is the one which is deployed now, and
the new is the target config. Returns the differences between the objects in a dictionary, the keys are the
configuration parameter keys and the values are differences objects: either list or recursive difference
new_config: New config dictionary with every available parameter
current_config: Currently deployed configuration

salt.modules.vsphere.configure_host_cache(enabled, datastore=None, swap_size_MiB=None, service_instance=None)
Configures the host cache on the selected host.
enabled: Boolean flag specifying whether the host cache is enabled.
datastore: Name of the datastore that contains the host cache. Must be set if enabled is true.
swap_size_MiB: Swap size in Mibibytes. Needs to be set if enabled is true. Must be smaller than the datastore
size.
service_instance: Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

salt.modules.vsphere.coredump_network_enable(host, username, password, enabled, protocol=None, port=None, esxi_hosts=None, credstore=None)
Enable or disable ESXi core dump collection. Returns True if coredump is enabled and returns False if core
dump is not enabled. If there was an error, the error will be the value printed in the Error key dictionary for
the given host.
host: The location of the host.
username: The username used to login to the host, such as root.
password: The password used to login to the host.
enabled: Python True or False to enable or disable coredumps.
protocol: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is
https.
port: Optionally set to alternate port if the host is not using the default port. Default port is 443.
esxi_hosts: If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more
ESXi machines.
credstore: Optionally set to path to the credential store file.

CLI Example:
```
# Used for ESXi host connection information
salt '*' vsphere.coredump_network_enable my.esxi.host root bad-password True
# Used for connecting to a vCenter Server
salt '*' vsphere.coredump_network_enable my.vcenter.location root bad-password True esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.create_cluster(cluster_dict, datacenter=None, cluster=None, service_instance=None)
Creates a cluster.

Note: cluster_dict['name'] will be overridden by the cluster param value
config_dict: Dictionary with the config values of the new cluster.
datacenter: Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default
value is None.

```python
# esxdatacenter proxy
salt '*' vsphere.create_cluster cluster_dict=${cluster_dict} cluster=cl1
# esxcluster proxy
salt '*' vsphere.create_cluster cluster_dict=${cluster_dict}
```

```python
salt.modules.vsphere.create_datacenter(datacenter_name, service_instance=None)
```

Creates a datacenter.

Supported proxies: esxdatacenter
datacenter_name The datacenter name
service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```python
salt '*' vsphere.create_datacenter dc1
```

```python
cache_disk_id The canonical name of the disk to be used as a cache. The disk must be ssd.
capacity_disk_ids A list containing canonical names of the capacity disks. Must contain at least one id. Default is True.
safety_checks Specify whether to perform safety check or to skip the checks and try performing the required task. Default value is True.
```

```python
service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.
```

```python
salt '*' vsphere.create_diskgroup cache_disk_id='naa.000000000000001'
capacity_disk_ids=['naa.000000000000002', 'naa.000000000000003']
```

```python
salt.modules.vsphere.create_dvportgroup(portgroup_dict, portgroup_name, dvs, service_instance=None)
```

Creates a distributed virtual portgroup.

Note: The portgroup_name param will override any name already set in portgroup_dict.
portgroup_dict Dictionary with the config values the portgroup should be created with (example in salt.states.dvs).
portgroup_name Name of the portgroup to be created.
dvs Name of the DVS that will contain the portgroup.
service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```python
salt '*' vsphere.create_dvportgroup portgroup_dict=<dict>
    portgroup_name=pg1 dvs=dvs1
```

```python
dvs dict representation of the new DVS (example in salt.states.dvs)
dvs_name Name of the DVS to be created.
service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.
```

```python
salt '*' vsphere.create_dvs dvs dict=dvs_dict dvs_name=dvs_name
```

```python
salt.modules.vsphere.create_storage_policy(policy_name, policy_dict, service_instance=None)
```

23.9. execution modules
Creates a storage policy.

Supported capability types: scalar, set, range.

- **policy_name** Name of the policy to create. The value of the argument will override any existing name in `policy_dict`.
- **policy_dict** Dictionary containing the changes to apply to the policy. (example in `salt.states.pbm`)
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt 'vcenter' vsphere.create_storage_policy policy_name='policy name'
policy_dict="$policy_dict"
```

salt.modules.vsphere.create_tag(name, description, category_id, server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None)

Create a tag under a category with given description.

CLI Example:
```
salt vm_minion vsphere.create_tag
```

**Parameters**
- **server** (basestring) -- Target DNS or IP of vCenter client.
- **username** (basestring) -- Username associated with the vCenter client.
- **password** (basestring) -- Password associated with the vCenter client.
- **name** (str) -- Name of tag category to create (ex. Machine, OS, Availability, etc.)
- **description** (str) -- Given description of tag category.
- **category_id** (str) -- Value of category_id representative of the category created previously.
- **verify_ssl** (boolean) -- Verify the SSL certificate. Default: True
- **ca_bundle** (basestring) -- Path to the ca bundle to use when verifying SSL certificates.

**Returns** The identifier of the created tag.

**Return type** str

**Raise**
- AlreadyExists if the name provided in the create_spec is the name of an already existing tag in the input category.
- InvalidArgument if any of the input information in the create_spec is invalid.
- Unauthorized if you do not have the privilege to create tag.

salt.modules.vsphere.create_tag_category(name, description, cardinality, server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None)

Create a category with given cardinality.

CLI Example:
```
salt vm_minion vsphere.create_tag_category
```

**Parameters**
- **name** (str) -- Name of tag category to create (ex. Machine, OS, Availability, etc.)
- **description** (str) -- Given description of tag category.
- **cardinality** (str) -- The associated cardinality (SINGLE, MULTIPLE) of the category.
- **server** (basestring) -- Target DNS or IP of vCenter center.
- **username** (basestring) -- Username associated with the vCenter center.
- **password** (basestring) -- Password associated with the vCenter center.
- `verify_ssl` *(boolean)* -- Verify the SSL certificate. Default: True
- `ca_bundle` *(basestring)* -- Path to the ca bundle to use when verifying SSL certificates.

Returns Identifier of the created category.
Return type `str`

Raise `AlreadyExists` if the name provided in the create_spec is the name of an already existing category.
Raise `InvalidArgument` if any of the information in the create_spec is invalid.
Raise `Unauthorized` if you do not have the privilege to create a category.

```
salt.modules.vsphere.create_vm(vm_name, cpu, memory, image, version, datacenter, datastore, placement, interfaces, disks, scsi_devices, serial_ports=None, ide_controllers=None, sata_controllers=None, cd_drives=None, advanced_configs=None, service_instance=None)
```

Creates a virtual machine container.

CLI Example:
```
salt vm_minion vsphere.create_vm vm_name=vmname cpu='{count: 2, nested: True}' ...
```

- `vm_name` Name of the virtual machine
- `cpu` Properties of CPUs for freshly created machines
- `memory` Memory size for freshly created machines
- `image` Virtual machine guest OS version identifier `VirtualMachineGuestOsIdentifier`
- `version` Virtual machine container hardware version
- `datacenter` Datacenter where the virtual machine will be deployed (mandatory)
- `datastore` Datastore where the virtual machine files will be placed
- `placement` Resource pool or cluster or host or folder where the virtual machine will be deployed
- `interfaces` interfaces
  - `adapter`: 'Network adapter 1'  
    - `name`: vlan100  
    - `switch_type`: distributed or standard  
    - `adapter_type`: vmxnet3 or vmxnet, vmxnet2, vmxnet3, e1000, e1000e  
    - `mac`: '00:11:22:33:44:55'  
    - `connectable`:  
      - `allow_guest_control`: True  
      - `connected`: True  
      - `start_connected`: True

- `disks` disks
  - `adapter`: 'Hard disk 1'  
    - `size`: 16  
    - `unit`: GB  
    - `address`: '0:0'  
    - `controller`: 'SCSI controller 0'  
    - `thin_provision`: False  
    - `eagerly_scrub`: False  
    - `datastore`: 'myshare'  
    - `filename`: 'vm/mydisk.vmdk'

- `scsi_devices`
scsi_devices:
  controller: 'SCSI controller 0'
  type: paravirtual
  bus_sharing: no_sharing

serial_ports

serial_ports:
  adapter: 'Serial port 1'
  type: network
  backing:
    uri: 'telnet://something:port'
    direction: <client|server>
    filename: 'service_uri'
  connectable:
    allow_guest_control: True
    connected: True
    start_connected: True
  yield: False

cd_drives

cd_drives:
  adapter: 'CD/DVD drive 0'
  controller: 'IDE 0'
  device_type: datastore_iso_file
  datastore_iso_file:
    path: path_to_iso
  connectable:
    allow_guest_control: True
    connected: True
    start_connected: True

advanced_config Advanced config parameters to be set for the virtual machine

salt.modules.vsphere.create_vmfs_datastore(datastore_name, disk_id, vmfs_major_version,
                                          safety_checks=True, service_instance=None)

Creates a ESXi host disk group with the specified cache and capacity disks.

datastore_name The name of the datastore to be created.
disk_id The disk id (canonical name) on which the datastore is created.
vmfs_major_version The VMFS major version.
safety_checks Specify whether to perform safety check or to skip the checks and try performing the required
task. Default is True.
service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

salt '*' vsphere.create_vmfs_datastore datastore_name=ds1 disk_id=
  vmfs_major_version=5

salt.modules.vsphere.delete_advanced_configs(vm_name, datacenter, advanced_configs,
                                              service_instance=None)

Removes extra config parameters from a virtual machine

vm_name Virtual machine name
datacenter Datacenter name where the virtual machine is available
advanced_configs List of advanced config values to be removed
service_instance vCenter service instance for connection and configuration

salt.modules.vsphere.delete_tag(tag_id, server=None, username=None, password=None,
                                 service_instance=None, verify_ssl=None, ca_bundle=None)
Delete a tag.

CLI Example:
```
salt vm_minion vsphere.delete_tag
```

Parameters
- **tag_id** *(str)* -- The identifier of tag to be deleted. The parameter must be an identifier for the resource type: `com.vmware.cis.tagging.Tag`.
- **server** *(basestring)* -- Target DNS or IP of vCenter center.
- **username** *(basestring)* -- Username associated with the vCenter center.
- **password** *(basestring)* -- Password associated with the vCenter center.
- **verify_ssl** *(boolean)* -- Verify the SSL certificate. Default: True
- **ca_bundle** *(basestring)* -- Path to the ca bundle to use when verifying SSL certificates.

Raise **AlreadyExists** if the name provided in the create_spec is the name of an already existing category.
Raise **InvalidArgument** if any of the information in the create_spec is invalid.
Raise **Unauthorized** if you do not have the privilege to create a category.

```
salt.modules.vsphere.delete_tag_category(category_id, server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None)
```

Delete a category.

CLI Example:
```
salt vm_minion vsphere.delete_tag_category
```

Parameters
- **category_id** *(str)* -- The identifier of category to be deleted. The parameter must be an identifier for the resource type: `com.vmware.cis.tagging.Category`.
- **server** *(basestring)* -- Target DNS or IP of vCenter center.
- **username** *(basestring)* -- Username associated with the vCenter center.
- **password** *(basestring)* -- Password associated with the vCenter center.
- **verify_ssl** *(boolean)* -- Verify the SSL certificate. Default: True
- **ca_bundle** *(basestring)* -- Path to the ca bundle to use when verifying SSL certificates.

Raise **NotFound** if the tag for the given tag_id does not exist in the system.
Raise **Unauthorized** if you do not have the privilege to delete the tag.
Raise **Unauthenticated** if the user can not be authenticated.

```
salt.modules.vsphere.delete_vm(name, datacenter, placement=None, power_off=False, service_instance=None)
```

Deletes a virtual machine defined by name and placement

**name** Name of the virtual machine
**datacenter** Datacenter of the virtual machine
**placement** Placement information of the virtual machine
**service_instance** vCenter service instance for connection and configuration

```
salt '*' vsphere.delete_vm name=my_vm datacenter=my_datacenter
```

```
salt.modules.vsphere.disconnect(service_instance)
```

Disconnects from a vCenter or ESXi host

**Note:** Should be used by state functions, not invoked directly.
service_instance  Service instance (vim.ServiceInstance)

CLI Example:

See note above.

salt.modules.vsphere.enable_firewall_ruleset(host, username, password, ruleset_enable, ruleset_name, protocol=None, port=None, esxi_hosts=None, credstore=None)

Enable or disable an ESXi firewall rule set.

- **host**  The location of the host.
- **username**  The username used to login to the host, such as `root`.
- **password**  The password used to login to the host.
- **ruleset_enable**  True to enable the ruleset, false to disable.
- **ruleset_name**  Name of ruleset to target.
- **protocol**  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- **port**  Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **esxi_hosts**  If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.
- **credstore**  Optionally set to path to the credential store file.

Returns  A standard cmd.run_all dictionary, per host.

CLI Example:

```shell
# Used for ESXi host connection information
salt '*' vsphere.enable_firewall_ruleset my.esxi.host root bad-password True → 'syslog'

# Used for connecting to a vCenter Server
salt '*' vsphere.enable_firewall_ruleset my.vcenter.location root bad-password → True 'syslog' esxi_hosts=['esxi-1.host.com, esxi-2.host.com']
```

salt.modules.vsphere.erase_disk_partitions(disk_id=None, scsi_address=None, service_instance=None)

Erases the partitions on a disk. The disk can be specified either by the canonical name, or by the `scsi_address`. 

- **disk_id**  Canonical name of the disk. Either `disk_id` or `scsi_address` needs to be specified (`disk_id` supersedes `scsi_address`).
- **scsi_address**  Scsi address of the disk. `disk_id` or `scsi_address` needs to be specified (`disk_id` supersedes `scsi_address`).
- **service_instance**  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```shell
salt '*' vsphere.erase_disk_partitions scsi_address='vmhba0:C0:T0:L0'
salt '*' vsphere.erase_disk_partitions disk_id='naa.000000000000001'
```

salt.modules.vsphere.esxcli_cmd(cmd_str, host=None, username=None, password=None, protocol=None, port=None, esxi_hosts=None, credstore=None)

Run an ESXCLI command directly on the host or list of hosts.

- **host**  The location of the host.
- **username**  The username used to login to the host, such as `root`.
- **password**  The password used to login to the host.
- **cmd_str**  The ESXCLI command to run. Note: This should not include the `-s`, `-u`, `-p`, `-h`, `--protocol`, or `--portnumber` arguments that are frequently passed when using a bare ESXCLI command from the command line. Those arguments are handled by this function via the other args and kwargs.
- **protocol**  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- **port**  Optionally set to alternate port if the host is not using the default port. Default port is 443.
esxi_hosts  If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more
ESXi machines.
credstore  Optionally set to path to the credential store file.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.esxcli_cmd my.esxi.host root bad-password
    →'system coredump network get'

# Used for connecting to a vCenter Server
salt '*' vsphere.esxcli_cmd my.vcenter.location root bad-password
    →'system coredump network get' esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.get_advanced_configs (vm_name, datacenter, service_instance=None)
Returns extra config parameters from a virtual machine advanced config list
vm_name  Virtual machine name
datacenter  Datacenter name where the virtual machine is available
service_instance  vCenter service instance for connection and configuration

salt.modules.vsphere.get_coredump_network_config (host, username, password, protocol=None, port=None, esxi_hosts=None, credstore=None)
Retrieve information on ESXi or vCenter network dump collection and format it into a dictionary.
host  The location of the host.
username  The username used to login to the host, such as root.
password  The password used to login to the host.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
esxi_hosts  If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more
ESXi machines.
credstore  Optionally set to path to the credential store file.

Returns  A dictionary with the network configuration, or, if getting the network config failed, a
an error message retrieved from the standard cmd.run_all dictionary, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.get_coredump_network_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_coredump_network_config my.vcenter.location root bad-password
    →'esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.get_firewall_status (host, username, password, protocol=None, port=None, esxi_hosts=None, credstore=None)
Show status of all firewall rule sets.
host  The location of the host.
username  The username used to login to the host, such as root.
password  The password used to login to the host.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
esxi_hosts  If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more
ESXi machines.
credstore  Optionally set to path to the credential store file.
Returns

Nested dictionary with two top level keys `rulesets` and `success`.

- `success` will be True or False depending on query results.
- `rulesets` will list the rulesets and their statuses if `success` was true, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.get_firewall_status my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_firewall_status my.vcenter.location root bad-password
```

```

salt.modules.vsphere.get_host_cache

This function returns the host cache configuration on the proxy host.

- `service_instance` Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```python
salt '*' vsphere.get_host_cache
```

salt.modules.vsphere.get_host_datetime

Get the date/time information for a given host or list of host_names.

- `host` The location of the host.
- `username` The username used to login to the host, such as `root`.
- `password` The password used to login to the host.
- `protocol` Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- `port` Optionally set to alternate port if the host is not using the default port. Default port is `443`.
- `host_names` List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to get date/time information.

If `host_names` is not provided, the date/time information will be retrieved for the `host` location instead. This is useful when service instance connection information is used for a single ESXi host.

- `verify_ssl` Verify the SSL certificate. Default: True

CLI Example:

```python
# Used for single ESXi host connection information
salt '*' vsphere.get_host_datetime my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_host_datetime my.vcenter.location root bad-password
```

salt.modules.vsphere.get_ntp_config

Get the NTP configuration information for a given host or list of host_names.

- `host` The location of the host.
- `username` The username used to login to the host, such as `root`.
- `password` The password used to login to the host.
- `protocol` Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- `port` Optionally set to alternate port if the host is not using the default port. Default port is `443`.
- `host_names` List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to get ntp configuration information.
If host_names is not provided, the NTP configuration will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify_ssl** Verify the SSL certificate. Default: True

**CLI Example:**

```
# Used for single ESXi host connection information
salt '*' vsphere.get_ntp_config my.esxi.host root bad-password
```

```
# Used for connecting to a vCenter Server
salt '*' vsphere.get_ntp_config my.vcenter.location root bad-password
--host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.get_proxy_type()

Returns the proxy type retrieved either from the pillar of from the proxy minion's config. Returns <undefined> otherwise.

**CLI Example:**

```
salt '*' vsphere.get_proxy_type
```

salt.modules.vsphere.get_service_instance_via_proxy(service_instance=None)

Returns a service instance to the proxied endpoint (vCenter/ESXi host).

**service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

**Note:** Should be used by state functions not invoked directly.

**CLI Example:**

See note above

salt.modules.vsphere.get_service_policy(host, username, password, service_name, protocol=None, port=None, host_names=None, verify_ssl=True)

Get the service name’s policy for a given host or list of hosts.

**host** The location of the host.

**username** The username used to login to the host, such as root.

**password** The password used to login to the host.

**service_name** The name of the service for which to retrieve the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to get service
policy information.

If host_names is not provided, the service policy information will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify_ssl**  Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_service_policy my.esxi.host root bad-password 'ssh'

# Used for connecting to a vCenter Server
salt '*' vsphere.get_service_policy my.vcenter.location root bad-password 'ntpd'  
   host_names='[esxi-1.host.com, esxi-2.host.com]'
```

```python
salt.modules.vsphere.get_service_running(host, username, password, service_name, protocol=None, port=None, host_names=None, verify_ssl=True)
```

Get the service name’s running state for a given host or list of hosts.

**host**  The location of the host.

**username**  The username used to login to the host, such as root.

**password**  The password used to login to the host.

**service_name**  The name of the service for which to retrieve the policy. Supported service names are:
- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

**protocol**  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port**  Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host_names**  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to get the service's running state.

If host_names is not provided, the service's running state will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify_ssl**  Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_service_running my.esxi.host root bad-password 'ssh'

# Used for connecting to a vCenter Server
salt '*' vsphere.get_service_running my.vcenter.location root bad-password 'ntpd'  
   host_names='[esxi-1.host.com, esxi-2.host.com]'
```

```python
salt.modules.vsphere.get_ssh_key(host, username, password, protocol=None, port=None, certificate_verify=None)
```

Chapter 23. Salt Module Reference
Retrieve the authorized_keys entry for root. This function only works for ESXi, not vCenter.

Parameters
- **host** -- The location of the ESXi Host
- **username** -- Username to connect as
- **password** -- Password for the ESXi web endpoint
- **protocol** -- defaults to https, can be http if ssl is disabled on ESXi
- **port** -- defaults to 443 for https
- **certificate_verify** -- If true require that the SSL connection present a valid certificate. Default: True

Returns True if upload is successful

CLI Example:

```bash
salt '*' vsphere.get_ssh_key my.esxi.host root bad-password certificate_verify=True
```

salt.modules.vsphere.get_syslog_config(host, username, password, protocol=None, port=None, esxi_hosts=None, credstore=None)

Retrieve the syslog configuration.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **esxi_hosts** If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.
- **credstore** Optionally set to path to the credential store file.

Returns Dictionary with keys and values corresponding to the syslog configuration, per host.

CLI Example:

```bash
# Used for ESXi host connection information
salt '*' vsphere.get_syslog_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_syslog_config my.vcenter.location root bad-password
  <<- esxi_hosts=['[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.get_vm(name, datacenter=None, vm_properties=None, traversal_spec=None, parent_ref=None, service_instance=None)

Returns vm object properties.

- **name** Name of the virtual machine.
- **datacenter** Datacenter name
- **vm_properties** List of vm properties.
- **traversal_spec** Traversal Spec object(s) for searching.
- **parent_ref** Container Reference object for searching under a given object.
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

salt.modules.vsphere.get_vm_config(name, datacenter=None, objects=True, service_instance=None)

Queries and converts the virtual machine properties to the available format from the schema. If the objects attribute is True the config objects will have extra properties, like ‘object’ which will include the vim.vm.device.VirtualDevice, this is necessary for deletion and update actions.

- **name** Name of the virtual machine
- **datacenter** Datacenter’s name where the virtual machine is available

23.9. execution modules
objects Indicates whether to return the vmware object properties (eg. object, key) or just the properties which can be set

service_instance vCenter service instance for connection and configuration

salt.modules.vsphere.get_vm_config_file(name, datacenter, placement, datastore, service_instance=None)

Queries the virtual machine config file and returns vim.host.DatastoreBrowser.SearchResults object on success None on failure

name Name of the virtual machine
datacenter Datacenter name
datastore Datastore where the virtual machine files are stored
service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

salt.modules.vsphere.get_vmotion_enabled(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)

Get the VMotion enabled status for a given host or a list of host_names. Returns True if VMotion is enabled, False if it is not enabled.

host The location of the host.
username The username used to login to the host, such as root.
password The password used to login to the host.
protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port Optionally set to alternate port if the host is not using the default port. Default port is 443.
host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to check if VMotion is enabled.

If host_names is not provided, the VMotion status will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_vmotion_enabled my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_vmotion_enabled my.vcenter.location root bad-password

    -> host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.get_vsan_eligible_disks(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)

Returns a list of VSAN-eligible disks for a given host or list of host_names.

host The location of the host.
username The username used to login to the host, such as root.
password The password used to login to the host.
protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port Optionally set to alternate port if the host is not using the default port. Default port is 443.
host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to check if any VSAN-eligible disks are available.

If host_names is not provided, the VSAN-eligible disks will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl Verify the SSL certificate. Default: True

CLI Example:
```
salt '*' vsphere.get_vsan_eligible_disks my.esxi.host root bad-password

salt '*' vsphere.get_vsan_eligible_disks my.vcenter.location root bad-password
```

```
salt.modules.vsphere.get_vsan_enabled(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)
```

Get the VSAN enabled status for a given host or a list of host_names. Returns True if VSAN is enabled, False if it is not enabled, and None if a VSAN Host Config is unset, per host.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to check if VSAN enabled.

If host_names is not provided, the VSAN status will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

- **verify_ssl** Verify the SSL certificate. Default: True

**CLI Example:**

```
salt '*' vsphere.get_vsan_enabled my.esxi.host root bad-password
salt '*' vsphere.get_vsan_enabled my.vcenter.location root bad-password
```

```
salt.modules.vsphere.list_assigned_licenses(entity, entity_display_name, license_keys=None, service_instance=None)
```

Lists the licenses assigned to an entity

- **entity** Dictionary representation of an entity. See _get_entity docstrings for format.
- **entity_display_name** Entity name used in logging
- **license_keys** List of license keys to be retrieved. Default is None.
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

**CLI Example:**

```
salt vm_minion vsphere.list_assigned_licenses domain-c2283
```

```
salt '*' vsphere.list_assigned_licenses
    entity={type:cluster, datacenter:dc, cluster:cl}
    entity_display_name=cl
```

```
salt.modules.vsphere.list_attached_tags(object_id, managed_obj='ClusterComputeResource', server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None)
```

List existing tags a user has access to.

**CLI Example:**

```
salt vm_minion vsphere.list_attached_tags domain-c2283
```

- **object_id** (str) -- The identifier of the input object.
• **managed_obj**(str) -- Classes that contain methods for creating and deleting resources typically contain a class attribute specifying the resource type for the resources being created and deleted.

• **server**(basestring) -- Target DNS or IP of vCenter center.

• **username**(basestring) -- Username associated with the vCenter center.

• **password**(basestring) -- Password associated with the vCenter center.

• **verify_ssl**(boolean) -- Verify the SSL certificate. Default: True

• **ca_bundle**(basestring) -- Path to the ca bundle to use when verifying SSL certificates.

**Returns** The list of all tag identifiers that correspond to the tags attached to the given object.

**Return type** list of tags

**Raise** Unauthorized if you do not have the privilege to read the object.

**Raise** Unauthenticated if the user can not be authenticated.

```python
salt.modules.vsphere.list_capability_definitions(service_instance=None)
```

Returns a list of the metadata of all capabilities in the vCenter.

**service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```python
salt '*' vsphere.list_capabilities
```

```python
salt.modules.vsphere.list_cluster(datacenter=None, cluster=None, service_instance=None)
```

Returns a dict representation of an ESX cluster.

**datacenter** Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default value is None.

**cluster** Name of cluster. Ignored if already contained by proxy details. Default value is None.

**service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```python
# vcenter proxy
salt '*' vsphere.list_cluster datacenter=dc1 cluster=cl1

# esxdatacenter proxy
salt '*' vsphere.list_cluster cluster=cl1

# esxcluster proxy
salt '*' vsphere.list_cluster
```

```python
salt.modules.vsphere.list_clusters(host, username, password, protocol=None, port=None, verify_ssl=True)
```

Returns a list of clusters for the specified host.

**host** The location of the host.

**username** The username used to login to the host, such as root.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**verify_ssl** Verify the SSL certificate. Default: True

**CLI Example:**

```bash
salt '*' vsphere.list_clusters 1.2.3.4 root bad-password
```

```python
salt.modules.vsphere.list_datacenters(host, username, password, protocol=None, port=None, verify_ssl=True)
```

Returns a list of datacenters for the specified host.

**host** The location of the host.

**username** The username used to login to the host, such as root.

**password** The password used to login to the host.
protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port Optionally set to alternate port if the host is not using the default port. Default port is 443.
verify_ssl Verify the SSL certificate. Default: True
CLI Example:

```
salt '*' vsphere.list_datacenters 1.2.3.4 root bad-password
```

salt.modules.vsphere.list_datacenters_via_proxy(datacenter_names=None, service_instance=None)

Returns a list of dict representations of VMware datacenters. Connection is done via the proxy details.

Supported proxies: esxdatacenter
datacenter_names List of datacenter names. Default is None.
service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.list_datacenters_via_proxy
salt '*' vsphere.list_datacenters_via_proxy dc1
salt '*' vsphere.list_datacenters_via_proxy dc1,dc2
salt '*' vsphere.list_datacenters_via_proxy datacenter_names=[dc1, dc2]
```

salt.modules.vsphere.list_datastore_clusters(host, username, password, protocol=None, port=None, verify_ssl=True)

Returns a list of datastore clusters for the specified host.

host The location of the host.
username The username used to login to the host, such as root.
password The password used to login to the host.
protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port Optionally set to alternate port if the host is not using the default port. Default port is 443.
verify_ssl Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_datastore_clusters 1.2.3.4 root bad-password
```

salt.modules.vsphere.list_datastores(host, username, password, protocol=None, port=None, verify_ssl=True)

Returns a list of datastores for the specified host.

host The location of the host.
username The username used to login to the host, such as root.
password The password used to login to the host.
protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port Optionally set to alternate port if the host is not using the default port. Default port is 443.
verify_ssl Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_datastores 1.2.3.4 root bad-password
```

salt.modules.vsphere.list_datastores_via_proxy(datastore_names=None, backing_disk_ids=None, backing_disk_scsi_addresses=None, service_instance=None)

Returns a list of dict representations of the datastores visible to the proxy object. The list of datastores can be
filtered by datastore names, backing disk ids (canonical names) or backing disk scsi addresses.

Supported proxy types: esxi, esxcluster, esxdatacenter

datastore_names List of the names of datastores to filter on
backing_disk_ids List of canonical names of the backing disks of the datastores to filer. Default is None.
backing_disk_scsi_addresses List of scsi addresses of the backing disks of the datastores to filter. Default is None.
service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```python
salt '*' vsphere.list_datastores_via_proxy
salt '*' vsphere.list_datastores_via_proxy datastore_names=[ds1, ds2]
```

salt.modules.vsphere.list_default_storage_policy_of_datastore(datastore, service_instance=None)

Returns a list of datastores assign the storage policies.

datastore Name of the datastore to assign. The datastore needs to be visible to the VMware entity the proxy points to.
service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```python
salt '*' vsphere.list_default_storage_policy_of_datastore datastore=ds1
```  

salt.modules.vsphere.list_default_vsan_policy(service_instance=None)

Returns the default vsan storage policy.

```python
salt '*' vsphere.list_storage_policies
salt '*' vsphere.list_storage_policy policy_names=[policy_name]
```  

salt.modules.vsphere.list_disk_partitions(disk_id=None, scsi_address=None, service_instance=None)

Lists the partitions on a disk. The disk can be specified either by the canonical name, or by the scsi_address. 

disk_id Canonical name of the disk. Either disk_id or scsi_address needs to be specified (disk_id supersedes scsi_address.
scsi_address Scsi address of the disk. disk_id or scsi_address needs to be specified (disk_id supersedes scsi_address.
service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```python
salt '*' vsphere.list_disk_partitions scsi_address='vmhba0:C0:T0:L0'
salt '*' vsphere.list_disk_partitions disk_id='naa.000000000000001'
```  

salt.modules.vsphere.list_diskgroups(cache_disk_ids=None, service_instance=None)

Returns a list of disk group dict representation on an ESXi host. The list of disk groups can be filtered by the cache disks canonical names. If no filtering is applied, all disk groups are returned.

cache_disk_ids: List of cache disk canonical names of the disk groups to be retrieved. Default is None.
use_proxy_details Specify whether to use the proxy minion's details instead of the arguments
service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```python
salt '*' vsphere.list_diskgroups
salt '*' vsphere.list_diskgroups cache_disk_ids='[naa.000000000000001]'
```  

salt.modules.vsphere.list_disks(disk_ids=None, scsi_addresses=None, service_instance=None)

Returns a list of dict representations of the disks in an ESXi host. The list of disks can be filtered by disk canonical names or scsi addresses.
**disk_ids**: List of disk canonical names to be retrieved. Default is None.
**scsi_addresses**: List of scsi addresses of disks to be retrieved. Default is None.
**service_instance**: Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.list_disks
dsalt '*' vsphere.list_disks disk_ids='[naa.00, naa.001]'
salt '*' vsphere.list_disks
  scsi_addresses='[vmhba0:C0:T0:L0, vmhba1:C0:T0:L0]'
```

**salt.modules.vsphere.list_dvportgroups** *(dvs=None, portgroup_names=None, service_instance=None)*

Returns a list of distributed virtual switch portgroups. The list can be filtered by the portgroup names or by the DVS.

- **dvs**: Name of the DVS containing the portgroups. Default value is None.
- **portgroup_names**: List of portgroup names to look for. If None, all portgroups are returned. Default value is None.
- **service_instance**: Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.list_dvportgroups
dsalt '*' vsphere.list_dvportgroups dvs=dvs1
salt '*' vsphere.list_dvportgroups portgroup_names=[pg1]
salt '*' vsphere.list_dvportgroups dvs=dvs1 portgroup_names=[pg1]
```

**salt.modules.vsphere.list_dvs** *(host, username, password, protocol=None, port=None, verify_ssl=True)*

Returns a list of distributed virtual switches for the specified host.

- **host**: The location of the host.
- **username**: The username used to login to the host, such as root.
- **password**: The password used to login to the host.
- **protocol**: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port**: Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **verify_ssl**: Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_dvs 1.2.3.4 root bad-password
```

**salt.modules.vsphere.list_dvss** *(datacenter=None, dvs_names=None, service_instance=None)*

Returns a list of distributed virtual switches (DVSs). The list can be filtered by the datacenter or DVS names.

- **datacenter**: The datacenter to look for DVSs in. Default value is None.
- **dvs_names**: List of DVS names to look for. If None, all DVSs are returned. Default value is None.

```
salt '*' vsphere.list_dvss
dsalt '*' vsphere.list_dvss dvs_names=[dvs1,dvs2]
```

**salt.modules.vsphere.list_folders** *(host, username, password, protocol=None, port=None, verify_ssl=True)*

Returns a list of folders for the specified host.

- **host**: The location of the host.
- **username**: The username used to login to the host, such as root.
- **password**: The password used to login to the host.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
verify_ssl  Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_folders 1.2.3.4 root bad-password
```

```
salt.modules.vsphere.list_hosts(host, username, password, protocol=None, port=None, verify_ssl=True)
```

Returns a list of hosts for the specified VMware environment.

- **host**  The location of the host.
- **username**  The username used to login to the host, such as root.
- **password**  The password used to login to the host.
- **protocol**  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port**  Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **verify_ssl**  Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_hosts 1.2.3.4 root bad-password
```

```
salt.modules.vsphere.list_hosts_via_proxy(hostnames=None, datacenter=None, cluster=None, service_instance=None)
```

Returns a list of hosts for the specified VMware environment. The list of hosts can be filtered by datacenter name and/or cluster name

- **hostnames**  Hostnames to filter on.
- **datacenter_name**  Name of datacenter. Only hosts in this datacenter will be retrieved. Default is None.
- **cluster_name**  Name of cluster. Only hosts in this cluster will be retrieved. If a datacenter is not specified the first cluster with this name will be considered. Default is None.
- **service_instance**  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.list_hosts_via_proxy
```

```
salt '*' vsphere.list_hosts_via_proxy hostnames=[esxi1.example.com]
```

```
salt '*' vsphere.list_hosts_via_proxy datacenter=dc1 cluster=cluster1
```

```
salt.modules.vsphere.list_licenses(service_instance=None)
```

Lists all licenses on a vCenter.

- **service_instance**  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.list_licenses
```

```
salt.modules.vsphere.list_networks(host, username, password, protocol=None, port=None, verify_ssl=True)
```

Returns a list of networks for the specified host.

- **host**  The location of the host.
- **username**  The username used to login to the host, such as root.
- **password**  The password used to login to the host.
- **protocol**  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port**  Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **verify_ssl**  Verify the SSL certificate. Default: True

CLI Example:
salt '*' vsphere.list_networks 1.2.3.4 root bad-password

salt.modules.vsphere.list_non_ssds(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)

Returns a list of Non-SSD disks for the given host or list of host_names.

**Note:** In the pyVmomi StorageSystem, ScsiDisks may, or may not have an ssd attribute. This attribute indicates if the ScsiDisk is SSD backed. As this option is optional, if a relevant disk in the StorageSystem does not have \texttt{ssd = true}, it will end up in the \texttt{non_ssds} list here.

- **host** The location of the host.
- **username** The username used to login to the host, such as \texttt{root}.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is \texttt{https}.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to retrieve Non-SSD disks.

If host_names is not provided, Non-SSD disks will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

- **verify_ssl** Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.list_non_ssds my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.list_non_ssds my.vcenter.location root bad-password host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.list_resourcepools(host, username, password, protocol=None, port=None, verify_ssl=True)

Returns a list of resource pools for the specified host.

- **host** The location of the host.
- **username** The username used to login to the host, such as \texttt{root}.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is \texttt{https}.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **verify_ssl** Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_resourcepools 1.2.3.4 root bad-password
```

salt.modules.vsphere.list_ssds(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)

Returns a list of SSDs for the given host or list of host_names.

- **host** The location of the host.
- **username** The username used to login to the host, such as \texttt{root}.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is \texttt{https}.

23.9. execution modules
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to retrieve SSDs.

If host_names is not provided, SSDs will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl  Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.list_ssds my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.list_ssds my.vcenter.location root bad-password host_→names=['esxi-1.host.com, esxi-2.host.com']
```

salt.modules.vsphere.list_storage_policies(policy_names=None, service_instance=None)
Returns a list of storage policies.

policy_names  Names of policies to list. If None, all policies are listed. Default is None.

service_instance  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```yaml
salt '*' vsphere.list_storage_policies

salt '*' vsphere.list_storage_policy policy_names=[policy_name]
```

salt.modules.vsphere.list_tag_categories(server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None)
List existing categories a user has access to.

CLI Example:

```
salt vm_minion vsphere.list_tag_categories
```

Parameters

- **server** (basestring) -- Target DNS or IP of vCenter center.
- **username** (basestring) -- Username associated with the vCenter center.
- **password** (basestring) -- Password associated with the vCenter center.
- **verify_ssl** (boolean) -- Verify the SSL certificate. Default: True
- **ca_bundle** (basestring) -- Path to the ca bundle to use when verifying SSL certificates.

Returns  Value(s) of category_id.

Return type  list of str

salt.modules.vsphere.list_tags(server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None)
List existing tags a user has access to.

CLI Example:

```
salt vm_minion vsphere.list_tags
```

Parameters

- **server** (basestring) -- Target DNS or IP of vCenter center.
- **username** (basestring) -- Username associated with the vCenter center.
- **password** (basestring) -- Password associated with the vCenter center.
- **verify_ssl** (boolean) -- Verify the SSL certificate. Default: True
- **ca_bundle** *(basestring)* -- Path to the ca bundle to use when verifying SSL certificates.

  **Returns** Value(s) of tag_id.

  **Return type** list of str

**salt.modules.vsphere.list_uplink_dvportgroup**(dvs, service_instance=None)

  Returns the uplink portgroup of a distributed virtual switch.

  **dvs** Name of the DVS containing the portgroup.

  **service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

  ```
salt '*!' vsphere.list_uplink_dvportgroup dvs=dvs_name
  ```

**salt.modules.vsphere.list_vapps**(host, username, password, protocol=None, port=None, verify_ssl=True)

  Returns a list of vApps for the specified host.

  **host** The location of the host.

  **username** The username used to login to the host, such as root.

  **password** The password used to login to the host.

  **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

  **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

  **verify_ssl** Verify the SSL certificate. Default: True

  **CLI Example:**

  ```
  # List vapps from all minions
  salt '*!' vsphere.list_vapps 1.2.3.4 root bad-password
  ```

**salt.modules.vsphere.list_vms**(host, username, password, protocol=None, port=None, verify_ssl=True)

  Returns a list of VMs for the specified host.

  **host** The location of the host.

  **username** The username used to login to the host, such as root.

  **password** The password used to login to the host.

  **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

  **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

  **verify_ssl** Verify the SSL certificate. Default: True

  **CLI Example:**

  ```
  salt '*!' vsphere.list_vms 1.2.3.4 root bad-password
  ```

**salt.modules.vsphere.power_off_vm**(name, datacenter=None, service_instance=None)

  Powers off a virtual machine specified by its name.

  **name** Name of the virtual machine

  **datacenter** Datacenter of the virtual machine

  **service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

  ```
salt '*!' vsphere.power_off_vm name=my_vm
  ```

**salt.modules.vsphere.power_on_vm**(name, datacenter=None, service_instance=None)

  Powers on a virtual machine specified by its name.

  **name** Name of the virtual machine

  **datacenter** Datacenter of the virtual machine

  **service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.
```python
salt '*' vsphere.power_on_vm name=my_vm
```

salt.modules.vsphere.register_vm(name, datacenter, placement, vmx_path, service_instance=None)

Registers a virtual machine to the inventory with the given vmx file. Returns comments and change list.

name: Name of the virtual machine

datacenter: Datacenter of the virtual machine

placement: Placement dictionary of the virtual machine, host or cluster

vmx_path: Full path to the vmx file, datastore name should be included

service_instance: Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```python
salt '*' vsphere.remove_capacity_from_diskgroup
    cache_disk_id='naa.000000000000001'
    capacity_disk_ids=['naa.000000000000002', 'naa.000000000000003']
```

salt.modules.vsphere.remove_datastore(datastore, service_instance=None)

Removes a datastore. If multiple datastores an error is raised.

datastore: Datastore name

service_instance: Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```python
salt '*' vsphere.remove_datastore ds_name
```

salt.modules.vsphere.remove_diskgroup(cache_disk_id, data_accessibility=True, service_instance=None)

Remove the diskgroup with the specified cache disk.

cache_disk_id: The canonical name of the cache disk.

data_accessibility: Specifies whether to ensure data accessibility. Default value is True.

service_instance: Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```python
salt '*' vsphere.remove_diskgroup cache_disk_id='naa.000000000000001'
```

salt.modules.vsphere.remove_dvportgroup(portgroup, dvs, service_instance=None)

Removes a distributed virtual portgroup.

portgroup: Name of the portgroup to be removed.

dvs: Name of the DVS containing the portgroups.

service_instance: Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```python
salt '*' vsphere.remove_dvportgroup portgroup=pg1 dvs=dvs1
```

salt.modules.vsphere.rename_datastore(datastore_name, new_datastore_name, service_instance=None)

Renames a datastore. The datastore needs to be visible to the proxy.

datastore_name: Current datastore name.
new_datastore_name  New datastore name.

service_instance  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```bash
salt '*' vsphere.rename_datastore old_name new_name
```

```
salt.modules.vsphere.reset_syslog_config(host, username, password, protocol=None, port=None, syslog_config=None, esxi_hosts=None, credstore=None)
```

Reset the syslog service to its default settings.

Valid syslog_config values are logdir, loghost, logdir-unique, default-rotate, default-size, default-timeout, or all for all of these.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **syslog_config** List of parameters to reset, provided as a comma-delimited string, or 'all' to reset all syslog configuration parameters. Required.
- **esxi_hosts** If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.
- **credstore** Optionally set to path to the credential store file.

**Returns** Dictionary with a top-level key of 'success' which indicates if all the parameters were reset, and individual keys for each parameter indicating which succeeded or failed, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.reset_syslog_config my.esxi.host root bad-password
-> syslog_config='logdir,loghost'
```

```
# Used for connecting to a vCenter Server
salt '*' vsphere.reset_syslog_config my.vcenter.location root bad-password
-> syslog_config='logdir,loghost' esxi_hosts=['[esxi-1.host.com, esxi-2.host.com]']
```

```
salt.modules.vsphere.service_restart(host, username, password, service_name, protocol=None, port=None, host_names=None, verify_ssl=True)
```

Restart the named service for the given host or list of hosts.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **service_name** The name of the service for which to set the policy. Supported service names are:
  - DCUI
  - TSM
  - SSH
  - lbtd
  - lsassd
  - lwiod
  - netlogond
  - ntpd
  - sfcbd-watchdog
• snmpd  
• vprobed  
• vpxa  
• xorg

protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port  Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to restart the service.

If host_names is not provided, the service will be restarted for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl  Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.service_restart my.esxi.host root bad-password 'ntpd'

# Used for connecting to a vCenter Server
salt '*' vsphere.service_restart my.vcenter.location root bad-password 'ntpd'  
  → host_names=['esxi-1.host.com, esxi-2.host.com']!
```

salt.modules.vsphere.service_start(host, username, password, service_name, protocol=None, port=None, host_names=None, verify_ssl=True)

Start the named service for the given host or list of hosts.

host  The location of the host.

username  The username used to login to the host, such as root.

password  The password used to login to the host.

service_name  The name of the service for which to set the policy. Supported service names are:

• DCUI  
• TSM  
• SSH  
• lbtld  
• lsassd  
• lwiod  
• netlogond  
• ntpd  
• sfcbd-watchdog  
• snmpd  
• vprobed  
• vpxa  
• xorg

protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port  Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to start the service.

If host_names is not provided, the service will be started for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl  Verify the SSL certificate. Default: True

CLI Example:
salt.modules.vsphere.service_stop(host, username, password, service_name, protocol=None, port=None, host_names=None, verify_ssl=True)

Stop the named service for the given host or list of hosts.

* host The location of the host.
* username The username used to login to the host, such as root.
* password The password used to login to the host.
* service_name The name of the service for which to set the policy. Supported service names are:
  - DCUI
  - TSM
  - SSH
  - lbtd
  - lsassd
  - lwiod
  - netlogond
  - ntpd
  - sfcbd-watchdog
  - snmpd
  - vprobed
  - vpxa
  - xorg

* protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
* port Optionally set to alternate port if the host is not using the default port. Default port is 443.
* host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to stop the service.

If host_names is not provided, the service will be stopped for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

* verify_ssl Verify the SSL certificate. Default: True

CLI Example:

```text
# Used for single ESXi host connection information
salt '*' vsphere.service_start my.esxi.host root bad-password 'ntpd'

# Used for connecting to a vCenter Server
salt '*' vsphere.service_start my.vcenter.location root bad-password 'ntpd'
← host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.set_advanced_configs(vm_name, datacenter, advanced_configs, service_instance=None)

Appends extra config parameters to a virtual machine advanced config list

* vm_name Virtual machine name
* datacenter Datacenter name where the virtual machine is available
* advanced_configs Dictionary with advanced parameter key value pairs
* service_instance vCenter service instance for connection and configuration
salt.modules.vsphere.set_coredump_network_config(host, username, password, dump_ip, protocol=None, port=None, host_vnic='vmk0', dump_port=6500, esxi_hosts=None, credstore=None)

Set the network parameters for a network coredump collection. Note that ESXi requires that the dumps first be enabled (see coredump_network_enable) before these parameters may be set.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **dump_ip** IP address of host that will accept the dump.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **esxi_hosts** If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.
- **host_vnic** Host VNic port through which to communicate. Defaults to vmk0.
- **dump_port** TCP port to use for the dump, defaults to 6500.
- **credstore** Optionally set to path to the credential store file.

**Returns** A standard cmd.run_all dictionary with a success key added, per host. success will be True if the set succeeded, False otherwise.

**CLI Example:**

```
# Used for ESXi host connection information
salt '*' vsphere.set_coredump_network_config my.esxi.host root bad-password 'dump_ip.host.com'

# Used for connecting to a vCenter Server
salt '*' vsphere.set_coredump_network_config my.vcenter.location root bad-password 'dump_ip.host.com' esxi_hosts='[esxi-1.host.com, esxi-2.host.com]' 
```

salt.modules.vsphere.set_ntp_config(host, username, password, ntp_servers, protocol=None, port=None, host_names=None, verify_ssl=True)

Set NTP configuration for a given host or list of host_names.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **ntp_servers** A list of servers that should be added to and configured for the specified host's NTP configuration.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to configure ntp servers.

If host_names is not provided, the NTP servers will be configured for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

- **verify_ssl** Verify the SSL certificate. Default: True

**CLI Example:**

```
# Used for single ESXi host connection information
salt '*' vsphere.ntp_configure my.esxi.host root bad-password '[192.174.1.100,192.174.1.200]'
```

(continues on next page)
salt.modules.vsphere.set_service_policy(host, username, password, service_name, service_policy, protocol=None, port=None, host_names=None, verify_ssl=True)

Set the service name's policy for a given host or list of hosts.

- **host**: The location of the host.
- **username**: The username used to login to the host, such as `root`.
- **password**: The password used to login to the host.
- **service_name**: The name of the service for which to set the policy. Supported service names are:
  - DCUI
  - TSM
  - SSH
  - lbtd
  - lsassd
  - lwiod
  - netlogond
  - ntpd
  - sfcbd-watchdog
  - snmpd
  - vprobed
  - vpxa
  - xorg
- **service_policy**: The policy to set for the service. For example, 'automatic'.
- **protocol**: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- **port**: Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_names**: List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to set the service policy.

If host_names is not provided, the service policy information will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

- **verify_ssl**: Verify the SSL certificate. Default: True

CLI Example:

```bash
# Used for single ESXi host connection information
salt '*' vsphere.set_service_policy my.esxi.host root bad-password 'ntpd' => 'automatic'

# Used for connecting to a vCenter Server
salt '*' vsphere.set_service_policy my.vcenter.location root bad-password 'ntpd' => 'automatic!' host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.set_syslog_config(host, username, password, syslog_config, config_value, protocol=None, port=None, firewall=True, reset_service=True, esxi_hosts=None, credstore=None)

Set the specified syslog configuration parameter. By default, this function will reset the syslog service after the configuration is set.

- **host**: ESXi or vCenter host to connect to.
- **username**: User to connect as, usually root.
**password**  Password to connect with.

**syslog_config**  Name of parameter to set (corresponds to the command line switch for esxcli without the double dashes (--))

Valid syslog_config values are logdir, loghost, default-rotate`, `default-size, default-timeout, and logdir-unique.

**config_value**  Value for the above parameter. For loghost, URLs or IP addresses to use for logging. Multiple log servers can be specified by listing them, comma-separated, but without spaces before or after commas.

**protocol**  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port**  Optionally set to alternate port if the host is not using the default port. Default port is 443.

**firewall**  Enable the firewall rule set for syslog. Defaults to True.

**reset_service**  After a successful parameter set, reset the service. Defaults to True.

**esxi_hosts**  If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

**credstore**  Optionally set to path to the credential store file.

**Returns**  Dictionary with a top-level key of 'success' which indicates if all the parameters were reset, and individual keys for each parameter indicating which succeeded or failed, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.set_syslog_config my.esxi.host root bad-password
  → loghost ssl://localhost:5432,tcp://10.1.0.1:1514

# Used for connecting to a vCenter Server
salt '*' vsphere.set_syslog_config my.vcenter.location root bad-password
  → loghost ssl://localhost:5432,tcp://10.1.0.1:1514
  esxi_hosts= '[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.syslog_service_reload(host, username, password, protocol=None, port=None, esxi_hosts=None, credstore=None)

Reload the syslog service so it will pick up any changes.

**host**  The location of the host.

**username**  The username used to login to the host, such as root.

**password**  The password used to login to the host.

**protocol**  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port**  Optionally set to alternate port if the host is not using the default port. Default port is 443.

**esxi_hosts**  If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

**credstore**  Optionally set to path to the credential store file.

**Returns**  A standard cmd.run_all dictionary. This dictionary will at least have a retcode key. If retcode is 0 the command was successful.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.syslog_service_reload my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.syslog_service_reload my.vcenter.location root bad-password
  → esxi_hosts= '[esxi-1.host.com, esxi-2.host.com]'
```

(continues on next page)
salt.modules.vsphere.system_info(host, username, password, protocol=None, port=None, verify_ssl=True)

Return system information about a VMware environment.

- **host** The location of the host.
- **username** The username used to login to the host, such as `root`.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **verify_ssl** Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.system_info 1.2.3.4 root bad-password
```

salt.modules.vsphere.test_vcenter_connection(service_instance=None)

Checks if a connection is to a vCenter

CLI Example:

```
salt '*' vsphere.test_vcenter_connection
```

salt.modules.vsphere.unregister_vm(name, datacenter, placement=None, power_off=False, service_instance=None)

Unregisters a virtual machine defined by name and placement

- **name** Name of the virtual machine
- **datacenter** Datacenter of the virtual machine
- **placement** Placement information of the virtual machine
- **service_instance** vCenter service instance for connection and configuration

CLI Example:

```
salt '*' vsphere.unregister_vm name=my_vm datacenter=my_datacenter
```

salt.modules.vsphere.update_cluster(cluster_dict, datacenter=None, cluster=None, service_instance=None)

Updates a cluster.

- **config_dict** Dictionary with the config values of the new cluster.
- **datacenter** Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default value is None.
- **cluster** Name of cluster. Ignored if already contained by proxy details. Default value is None.
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
# esxdatacenter proxy
salt '*' vsphere.update_cluster cluster_dict=$cluster_dict cluster=cl1

# esxcluster proxy
salt '*' vsphere.update_cluster cluster_dict=$cluster_dict
```

salt.modules.vsphere.update_dvportgroup(portgroup_dict, portgroup, dvs, service_instance=True)

Updates a distributed virtual portgroup.

- **portgroup_dict** Dictionary with the values the portgroup should be update with (example in salt.states.dvs).
- **portgroup** Name of the portgroup to be updated.
- **dvs** Name of the DVS containing the portgroups.
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.
salt.modules.vsphere.update_dvportgroup(portgroup_dict=<dict>, portgroup=pg1)
salt.modules.vsphere.update_dvportgroup(portgroup_dict=<dict>, portgroup=pg1, dvs=dvs1)

salt.modules.vsphere.update_dvs(dvs_dict, dvs, service_instance=None)

Updates a distributed virtual switch (DVS).

**Note:** Updating the product info, capability, uplinks of a DVS is not supported so the corresponding entries in dvs_dict will be ignored.

dvs_dict Dictionary with the values the DVS should be update with (example in salt.states.dvs)
dvs Name of the DVS to be updated.
service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

salt.modules.vsphere.update_host_datetime(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)

Update the date/time on the given host or list of host_names. This function should be used with caution since network delays and execution delays can result in time skews.

**host** The location of the host.

**username** The username used to login to the host, such as root.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should update their date/time.

If host_names is not provided, the date/time will be updated for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify_ssl** Verify the SSL certificate. Default: True

**CLI Example:**

```bash
# Used for single ESXi host connection information
salt '*' vsphere.update_date_time my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.update_date_time my.vcenter.location root bad-password
∩
←host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.update_host_password(host, username, password, new_password, protocol=None, port=None, verify_ssl=True)

Update the password for a given host.

**Note:** Currently only works with connections to ESXi hosts. Does not work with vCenter servers.
salt documentation, release 3003.3

verify_ssl

Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.update_host_password my.esxi.host root original-bad-password new--bad-password
```

salt_modules.vsphere.update_storage_policy(policies, policy_dict, service_instance=None)

Updates a storage policy.

Supported capability types: scalar, set, range.

- **policy**: Name of the policy to update.
- **policy_dict**: Dictionary containing the changes to apply to the policy. (example in salt.states.pbm)
- **service_instance**: Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.update_storage_policy policy='policy name' policy_dict="$policy_dict"
```

salt_modules.vsphere.update_vm(vm_name, cpu=None, memory=None, image=None, version=None, interfaces=None, disks=None, scsi_devices=None, serial_ports=None, datacenter=None, datastore=None, cd_dvd_drives=None, sata_controllers=None, advanced_configs=None, service_instance=None)

Updates the configuration of the virtual machine if the config differs.

- **vm_name**: Virtual Machine name to be updated
- **cpu**: CPU configuration options
- **memory**: Memory configuration options
- **version**: Virtual machine container hardware version
- **image**: Virtual machine guest OS version identifier VirtualMachineGuestOsIdentifier
- **interfaces**: Network interfaces configuration options
- **disks**: Disks configuration options
- **scsi_devices**: SCSI devices configuration options
- **serial_ports**: Serial ports configuration options
- **datacenter**: Datacenter where the virtual machine is available
- **datastore**: Datastore where the virtual machine config files are available
- **cd_dvd_drives**: CD/DVD drives configuration options
- **advanced_configs**: Advanced config parameters to be set for the virtual machine
- **service_instance**: vCenter service instance for connection and configuration

salt_modules.vsphere.upload_ssh_key(host, username, password, ssh_key=None, ssh_key_file=None, protocol=None, port=None, certificate_verify=None)

Upload an ssh key for root to an ESXi host via http PUT. This function only works for ESXi, not vCenter. Only one ssh key can be uploaded for root. Uploading a second key will replace any existing key.

**Parameters**

- **host**: The location of the ESXi Host
- **username**: Username to connect as
- **password**: Password for the ESXi web endpoint
- **ssh_key**: Public SSH key, will be added to authorized_keys on ESXi
- **ssh_key_file**: File containing the SSH key. Use 'ssh_key' or ssh_key_file, but not both.
- **protocol**: defaults to https, can be http if ssl is disabled on ESXi
- **port**: defaults to 443 for https
- **certificate_verify**: If true require that the SSL connection present a valid certificate. Default: True

**Returns** Dictionary with a 'status' key. True if upload is successful. If upload is unsuccessful, 'status' key will be False and an 'Error' key will have an informative message.
CLI Example:

```bash
salt '*' vsphere.upload_ssh_key my.esxi.host root bad-password ssh_key_file='/etc/salt/my_keys/my_key.pub'
```

salt.modules.vsphere.vmotion_disable

```
(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)
```

Disable vMotion for a given host or list of host_names.

- **host** The location of the host.
- **username** The username used to login to the host, such as `root`.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts should disable VMotion.

If `host_names` is not provided, VMotion will be disabled for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

- **verify_ssl** Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vmotion_disable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vmotion_disable my.vcenter.location root bad-password host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.vmotion_enable

```
(host, username, password, protocol=None, port=None, host_names=None, device='vmk0', verify_ssl=True)
```

Enable vMotion for a given host or list of host_names.

- **host** The location of the host.
- **username** The username used to login to the host, such as `root`.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter which hosts should enable VMotion.

If `host_names` is not provided, VMotion will be enabled for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

- **device** The device that uniquely identifies the VirtualNic that will be used for VMotion for each host. Defaults to `vmk0`.
- **verify_ssl** Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vmotion_enable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vmotion_enable my.vcenter.location root bad-password host_names='[esxi-1.host.com, esxi-2.host.com]'
```
salt.modules.vsphere.vsan_add_disks(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)

Add any VSAN-eligible disks to the VSAN System for the given host or list of host_names.

- **host**: The location of the host.
- **username**: The username used to login to the host, such as root.
- **password**: The password used to login to the host.
- **protocol**: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port**: Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_names**: List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts need to add any VSAN-eligible disks to the host’s VSAN system.

If host_names is not provided, VSAN-eligible disks will be added to the host’s VSAN system for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify_ssl**: Verify the SSL certificate. Default: True

**CLI Example**:

```
# Used for single ESXi host connection information
salt '*' vsphere.vsan_add_disks my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vsan_add_disks my.vcenter.location root bad-password
  host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.vsan_disable(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)

Disable VSAN for a given host or list of host_names.

- **host**: The location of the host.
- **username**: The username used to login to the host, such as root.
- **password**: The password used to login to the host.
- **protocol**: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port**: Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_names**: List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should disable VSAN.

If host_names is not provided, VSAN will be disabled for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify_ssl**: Verify the SSL certificate. Default: True

**CLI Example**:

```
# Used for single ESXi host connection information
salt '*' vsphere.vsan_disable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vsan_disable my.vcenter.location root bad-password
  host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.vsan_enable(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)

Enable VSAN for a given host or list of host_names.

- **host**: The location of the host.
- **username**: The username used to login to the host, such as root.
- **password**: The password used to login to the host.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
host_names  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should enable VSAN.

If host_names is not provided, VSAN will be enabled for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl  Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vsan_enable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vsan_enable my.vcenter.location root bad-password  
  host_names='[esxi-1.host.com, esxi-2.host.com]'
```

23.9.481 salt.modules.webutil

Support for htpasswd command. Requires the apache2-utils package for Debian-based distros.

New in version 2014.1.0.

The functions here will load inside the webutil module. This allows other functions that don't use htpasswd to use the webutil module name.

salt.modules.webutil.useradd(pwfile, user, password, opts='', runas=None)

Add a user to htpasswd file using the htpasswd command. If the htpasswd file does not exist, it will be created.

- **pwfile**  Path to htpasswd file
- **user**  User name
- **password**  User password
- **opts**  Valid options that can be passed are:
  - *n*  Don't update file; display results on stdout.
  - *m*  Force MD5 encryption of the password (default).
  - *d*  Force CRYPT encryption of the password.
  - *p*  Do not encrypt the password (plaintext).
  - *s*  Force SHA encryption of the password.
- **runas**  The system user to run htpasswd command with

CLI Examples:

```
salt '*' webutil.useradd /etc/httpd/htpasswd larry badpassword
salt '*' webutil.useradd /etc/httpd/htpasswd larry badpass  
  opts=ns
```

salt.modules.webutil.userdel(pwfile, user, runas=None, all_results=False)

Delete a user from the specified htpasswd file.

- **pwfile**  Path to htpasswd file
- **user**  User name
- **runas**  The system user to run htpasswd command with
- **all_results**  Return stdout, stderr, and retcode, not just stdout

CLI Examples:

```
salt '*' webutil.userdel /etc/httpd/htpasswd larry
```

salt.modules.webutil.verify(pwfile, user, password, opts='', runas=None)

Return True if the htpasswd file exists, the user has an entry, and their password matches.
pwfile  Fully qualified path to htpasswd file
user  User name
password  User password
opts  Valid options that can be passed are:
  • m Force MD5 encryption of the password (default).
  • d Force CRYPT encryption of the password.
  • p Do not encrypt the password (plaintext).
  • s Force SHA encryption of the password.
runas  The system user to run htpasswd command with

CLI Examples:

salt '*' webutil.verify /etc/httpd/htpasswd larry maybepassword
salt '*' webutil.verify /etc/httpd/htpasswd larry maybepassword opts=ns

23.9.482  salt.modules.win_auditpol

A salt module for modifying the audit policies on the machine

Though this module does not set group policy for auditing, it displays how all auditing configuration is applied on
the machine, either set directly or via local or domain group policy.

New in version 2018.3.4.

New in version 2019.2.1.

This module allows you to view and modify the audit settings as they are applied on the machine. The audit settings
are broken down into nine categories:

• Account Logon
• Account Management
• Detailed Tracking
• DS Access
• Logon/Logoff
• Object Access
• Policy Change
• Privilege Use
• System

The get_settings function will return the subcategories for all nine of the above categories in one dictionary
along with their auditing status.

To modify a setting you only need to specify the subcategory name and the value you wish to set. Valid settings are:

• No Auditing
• Success
• Failure
• Success and Failure

CLI Example:
# Get current state of all audit settings
salt * auditpol.get_settings

# Get the current state of all audit settings in the "Account Logon" category
salt * auditpol.get_settings category="Account Logon"

# Get current state of the "Credential Validation" setting
salt * auditpol.get_setting name="Credential Validation"

# Set the state of the "Credential Validation" setting to Success and Failure
salt * auditpol.set_setting name="Credential Validation" value="Success and Failure"

# Set the state of the "Credential Validation" setting to No Auditing
salt * auditpol.set_setting name="Credential Validation" value="No Auditing"

salt.modules.win_auditpol.get_setting(name)
Get the current configuration for the named audit setting

Parameters
name (str) -- The name of the setting to retrieve

Returns
The current configuration for the named setting

Return type
str

Raises

- **KeyError** -- On invalid setting name
- **CommandExecutionError** -- If an error is encountered retrieving the settings

CLI Example:

# Get current state of the "Credential Validation" setting
salt * auditpol.get_setting "Credential Validation"

salt.modules.win_auditpol.get_settings(category='All')
Get the current configuration for all audit settings specified in the category

Parameters
category (str) -- One of the nine categories to return. Can also be All to return the settings for all categories. Valid options are:

- Account Logon
- Account Management
- Detailed Tracking
- DS Access
- Logon/Logoff
- Object Access
- Policy Change
- Privilege Use
- System
- All

Default value is All

Returns
A dictionary containing all subcategories for the specified category along with their current configuration

Return type
dict

Raises

- **KeyError** -- On invalid category
- **CommandExecutionError** -- If an error is encountered retrieving the settings

CLI Example:
# Get current state of all audit settings
salt * auditipol.get_settings

# Get the current state of all audit settings in the "Account Logon"
# category
salt * auditipol.get_settings "Account Logon"

salt.modules.win_auditpol.set_setting(name, value)
Set the configuration for the named audit setting
Parameters
- **name (str)** -- The name of the setting to configure
- **value (str)** -- The configuration for the named value. Valid options are:
  - No Auditing
  - Success
  - Failure
  - Success and Failure
Returns True if successful
Return type bool
Raises
- **KeyError** -- On invalid name or value
- **CommandExecutionError** -- If an error is encountered modifying the setting

CLI Example:

```
# Set the state of the "Credential Validation" setting to Success and
# Failure
salt * auditipol.set_setting "Credential Validation" "Success and Failure"
```

# Set the state of the "Credential Validation" setting to No Auditing
salt * auditipol.set_setting "Credential Validation" "No Auditing"

23.9.483 salt.modules.win_autoruns
Module for listing programs that automatically run on startup (very alpha...not tested on anything but my Win 7x64)

salt.modules.win_autoruns.list()
Get a list of automatically running programs

CLI Example:

```
salt * autoruns.list
```

23.9.484 salt.modules.win_certutil
This module allows you to install certificates into the windows certificate manager.

```
salt * certutil.add_store salt://cert.cer "TrustedPublisher"
```

salt.modules.win_certutil.add_store(source, store, retcode=False, saltenv='base')
Add the given cert into the given Certificate Store
- **source** The source certificate file this can be in the form salt:///path/to/file
- **store** The certificate store to add the certificate to
- **retcode** If true, return the retcode instead of stdout. Default is **False**
**saltenv**  The salt environment to use this is ignored if the path is local

CLI Example:
```
salt '*' certutil.add_store salt://cert.cer TrustedPublisher
```

*salt.modules.win_certutil.dele_store*(source, store, retcode=False, saltenv='base')

Delete the given cert into the given Certificate Store

- **source**  The source certificate file this can be in the form salt://path/to/file
- **store**  The certificate store to delete the certificate from
- **retcode**  If true, return the retcode instead of stdout. Default is False
- **saltenv**  The salt environment to use this is ignored if the path is local

CLI Example:
```
salt '*' certutil.del_store salt://cert.cer TrustedPublisher
```

*salt.modules.win_certutil.get_cert_serial*(cert_file)

Get the serial number of a certificate file

- **cert_file**  The certificate file to find the serial for

CLI Example:
```
salt '*' certutil.get_cert_serial <certificate name>
```

*salt.modules.win_certutil.get_stored_cert_serials*(store)

Get all of the certificate serials in the specified store

- **store**  The store to get all the certificate serials from

CLI Example:
```
salt '*' certutil.get_stored_cert_serials <store>
```

### 23.9.485  salt.modules.win_dacl

Manage DACLs on Windows

**depends**
- winreg Python module

*salt.modules.win_dacl.add_ace*(path, objectType, user, permission, acetype, propagation)

add an ace to an object

- **path**  path to the object (i.e. c:\temp\file, HKEY_LOCAL_MACHINE\SOFTWARE\KEY, etc)
- **user**  user to add
- **permission**  permissions for the user acetype: either allow/deny for each user/permission (ALLOW, DENY)
- **propagation**  how the ACE applies to children for Registry Keys and Directories(KEY, KEY&SUBKEYS, SUBKEYS)

CLI Example:
```
allow domain\fakeuser full control on HKLM\SOFTWARE\somekey, propagate to this key and subkeys
salt 'myminion' win_dacl.add_ace 'HKEY_LOCAL_MACHINE\SOFTWARE\somekey' →'Registry' 'domain\fakeuser' 'FULLCONTROL' 'ALLOW' 'KEY&SUBKEYS'
```

*salt.modules.win_dacl.check_ace*(path, objectType, user, permission=None, acetype=None, propagation=None, exactPermissionMatch=False)

Checks a path to verify the ACE (access control entry) specified exists

**Parameters**
- **path**  -- path to the file/reg key
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **user** -- user that the ACL is for
- **permission** -- permission to test for (READ, FULLCONTROL, etc)
- **acetype** -- the type of ACE (ALLOW or DENY)
- **propagation** -- the propagation type of the ACE (FILES, FOLDERS, KEY, KEY&SUBKEYS, SUBKEYS, etc)
- **exactPermissionMatch** -- the ACL must match exactly, IE if READ is specified, the user must have READ exactly and not FULLCONTROL (which also has the READ permission obviously)

Returns (dict): 'Exists' true if the ACE exists, false if it does not

CLI Example:
```
salt 'minion-id' win_dacl.check_ace c: emp directory <username> fullcontrol
```

salt.modules.win_dacl.check_inheritance(*path*, *objectType*, *user=None*)

Check a specified path to verify if inheritance is enabled

Parameters
- **path** -- path of the registry key or file system object to check
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **user** -- if provided, will consider only the ACEs for that user

Returns (bool): 'Inheritance' of True/False

CLI Example:
```
salt 'minion-id' win_dacl.check_inheritance c: emp directory <username>
```

class salt.modules.win_dacl.daclConstants

DACL constants used throughout the module

- **getAceTypeBit(t)**
  returns the acetype bit of a text value

- **getAceTypeText(t)**
  returns the textual representation of a acetype bit

- **getObjectTypeBit(t)**
  returns the bit value of the string object type

- **getPermissionBit(t, m)**
  returns a permission bit of the string permission value for the specified object type

- **getPermissionText(t, m)**
  returns the permission textual representation of a specified permission bit/object type

- **getPropagationBit(t, p)**
  returns the propagation bit of a text value

- **getPropagationText(t, p)**
  returns the textual representation of a propagation bit

- **getSecurityHkey(s)**
  returns the necessary string value for an HKEY for the win32security module

- **processPath(path, objectType)**
  processes a path/object type combo and returns: registry types with the correct HKEY text representation files/directories with environment variables expanded

salt.modules.win_dacl.disable_inheritance(*path*, *objectType*, *copy=True*)

Disable inheritance on an object

23.9. execution modules
Parameters
- **path** -- The path to the object
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **copy** -- True will copy the Inherited ACEs to the DACL before disabling inheritance

Returns (dict): A dictionary containing the results

CLI Example:
```
salt 'minion-id' win_dacl.disable_inheritance c: emp directory
```

**salt.modules.win_dacl.enable_inheritance**(path, objectType, clear=False)
enable/disable inheritance on an object

Parameters
- **path** -- The path to the object
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **clear** -- True will remove non-Inherited ACEs from the ACL

Returns (dict): A dictionary containing the results

CLI Example:
```
salt 'minion-id' win_dacl.enable_inheritance c: emp directory
```

**salt.modules.win_dacl.get**(path, objectType, user=None)
Get the ACL of an object. Will filter by user if one is provided.

Parameters
- **path** -- The path to the object
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **user** -- A user name to filter by

Returns (dict): A dictionary containing the ACL

CLI Example:
```
salt 'minion-id' win_dacl.get c: emp directory
```

**salt.modules.win_dacl.rm_ace**(path, objectType, user, permission=None, acetype=None, propagation=None)
remove an ace to an object

path: path to the object (i.e. c:\temp\file, HKEY_LOCAL_MACHINE\SOFTWARE\KEY, etc)
user: user to remove permission: permissions for the user acetypes: either allow/deny for each user/permission (ALLOW, DENY) propagation: how the ACE applies to children for Registry Keys and Directories(KEY, KEY&SUBKEYS, SUBKEYS)

If any of the optional parameters are omitted (or set to None) they act as wildcards.

CLI Example:
```
remove allow domain\fakeuser full control on HKLM\SOFTWARE\somekey propagated
→ to this key and subkeys
salt 'myminion' win_dacl.rm_ace 'Registry' 'HKEY_LOCAL_MACHINE\SOFTWARE\'
→somekey' 'domain\fakeuser' 'FULLCONTROL' 'ALLOW' 'KEY&SUBKEYS'
```
23.9.486 salt.modules.win_disk

Module for gathering disk information on Windows

    depends
    • win32api Python module

sican disks.

salt.modules.win_disk.usage()

Return usage information for volumes mounted on this minion

    CLI Example:

    salt '*' disk.usage

23.9.487 salt.modules.win_dism

Install features/packages for Windows using DISM, which is useful for minions not running server versions of Windows. Some functions are only available on Windows 10.

salt.modules.win_dism.add_capability(capability, source=None, limit_access=False, image=None, restart=False)

Install a capability

    Parameters
    • capability (str) -- The capability to install
    • source (Optional[str]) -- The optional source of the capability. Default is set by group policy and can be Windows Update.
    • limit_access (Optional[bool]) -- Prevent DISM from contacting Windows Update for the source package
    • image (Optional[str]) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
    • restart (Optional[bool]) -- Reboot the machine if required by the install

    Raises
    • NotImplementedError -- For all versions of Windows that are not Windows 10 and later. Server editions of Windows use ServerManager instead.

    Returns A dictionary containing the results of the command

    Return type dict

    CLI Example:

    salt '*' dism.add_capability Tools.Graphics.DirectX~~~~0.0.1.0

sican features.

salt.modules.win_dism.add_feature(feature, package=None, source=None, limit_access=False, enable_parent=False, image=None, restart=False)

Install a feature using DISM

    Parameters
    • feature (str) -- The feature to install
    • package (Optional[str]) -- The parent package for the feature. You do not have to specify the package if it is the Windows Foundation Package. Otherwise, use package to specify the parent package of the feature
    • source (Optional[str]) -- The optional source of the capability. Default is set by group policy and can be Windows Update
    • limit_access (Optional[bool]) -- Prevent DISM from contacting Windows Update for the source package
    • enable_parent (Optional[bool]) -- True will enable all parent features of the specified feature
- **image (Optional[str])** -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart (Optional[bool])** -- Reboot the machine if required by the install

Returns A dictionary containing the results of the command

Return type dict

CLI Example:

```
salt '*' dism.add_feature NetFx3
```

salt.modules.win_dism.add_package(**package**, **ignore_check=False**, **prevent_pending=False**, **image=None**, **restart=False**) Install a package using DISM

Parameters

- **package (str)** -- The package to install. Can be a .cab file, a .msu file, or a folder

Note: An .msu package is supported only when the target image is offline, either mounted or applied.

- **ignore_check (Optional[bool])** -- Skip installation of the package if the applicability checks fail
- **prevent_pending (Optional[bool])** -- Skip the installation of the package if there are pending online actions
- **image (Optional[str])** -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart (Optional[bool])** -- Reboot the machine if required by the install

Returns A dictionary containing the results of the command

Return type dict

CLI Example:

```
salt '*' dism.add_package C:\Packages\package.cab
```

salt.modules.win_dism.available_capabilities(**image=None**) List the capabilities available on the system

Parameters

- **image (Optional[str])** -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

Returns A list of available capabilities

Return type list

CLI Example:

```
salt '*' dism.installed_capabilities
```

salt.modules.win_dism.available_features(**image=None**) List the features available on the system

Parameters

- **image (Optional[str])** -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

Returns A list of available features

Return type list

CLI Example:

```
salt '*' dism.available_features
```
salt.modules.win_dism.get_capabilities(image=None)
List all capabilities on the system

Parameters:
- **image** *(Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Raises:
- **NotImplementedError** -- For all versions of Windows that are not Windows 10 and later. *Server editions of Windows use ServerManager instead.*

Returns:
- A list of capabilities

Return type: list

CLI Example:
```
salt '*' dism.get_capabilities
```

salt.modules.win_dism.get_features(package=None, image=None)
List features on the system or in a package

Parameters:
- **package** *(Optional[str]*) -- The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. You cannot use this command to get package information for .msu files.
- **image** *(Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Returns:
- A list of features

Return type: list

CLI Example:
```
# Return all features on the system
salt '*' dism.get_features

# Return all features in package.cab
salt '*' dism.get_features C:\packages\package.cab

# Return all features in the calc package
salt '*' dism.get_features Microsoft.Windows.Calc.Demo~6595b6144ccf1df~x86-en-1.0.0.0
```

salt.modules.win_dism.installed_capabilities(image=None)
List the capabilities installed on the system

Parameters:
- **image** *(Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Raises:
- **NotImplementedError** -- For all versions of Windows that are not Windows 10 and later. *Server editions of Windows use ServerManager instead.*

Returns:
- A list of installed capabilities

Return type: list

CLI Example:
```
salt '*' dism.installed_capabilities
```

salt.modules.win_dism.installed_features(image=None)
List the features installed on the system
Parameters  

**image** *(Optional*[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Returns  
A list of installed features
Return type  
*list*

CLI Example:

```
salt '*' dism.installed_features
```

salt.modules.win_dism.**installed_packages**(image=None)
List the packages installed on the system

Parameters  

**image** *(Optional*[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Returns  
A list of installed packages
Return type  
*list*

CLI Example:

```
salt '*' dism.installed_packages
```

salt.modules.win_dism.**package_info**(package, image=None)
Display information about a package

Parameters  

- **package** *(str)* -- The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. You cannot use this command to get package information for .msu files
- **image** *(Optional*[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Returns  
A dictionary containing the results of the command
Return type  
*dict*

CLI Example:

```
salt '*' dism.package_info C:\packages\package.cab
```

salt.modules.win_dism.**remove_capability**(capability, image=None, restart=False)
Uninstall a capability

Parameters  

- **capability** *(str)* -- The capability to be removed
- **image** *(Optional*[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** *(Optional*[bool]*) -- Reboot the machine if required by the install

Raises  

- **NotImplementedError** -- For all versions of Windows that are not Windows 10 and later. Server editions of Windows use ServerManager instead.

Returns  
A dictionary containing the results of the command
Return type  
*dict*

CLI Example:

```
salt '*' dism.remove_capability Tools.Graphics.DirectX~~~~0.0.1.0
```

salt.modules.win_dism.**remove_feature**(feature, remove_payload=False, image=None, restart=False)
Disables the feature.

Parameters  

- **feature** *(str)* -- The feature to uninstall
- **remove_payload** *(Optional*[bool]*) -- Remove the feature's payload. Must...
supply source when enabling in the future.
• image (Optional[\text{str}]) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
• restart (Optional[\text{bool}]) -- Reboot the machine if required by the install.

Returns: A dictionary containing the results of the command
Return type: dict

CLI Example:
salt '*' dism.remove_feature NetFx3

salt.modules.win_dism.remove_package (package, image=None, restart=False)
Uninstall a package

Parameters
• package (str) -- The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. This can also be the name of a package as listed in \text{dism\_installed\_packages}
• image (Optional[\text{str}]) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
• restart (Optional[\text{bool}]) -- Reboot the machine if required by the install.

Returns: A dictionary containing the results of the command
Return type: dict

CLI Example:

# Remove the Calc Package
salt '*' dism.remove_package Microsoft.Windows.Calc.Demo-6595b6144ccf1df-x86-en-1.0.0.0

# Remove the package.cab (does not remove C:\packages\package.cab)
salt '*' dism.remove_package C:\packages\package.cab

23.9.488 salt.modules.win_dns_client

Module for configuring DNS Client on Windows systems

salt.modules.win_dns_client.add_dns (ip, interface='Local Area Connection', index=1)
Add the DNS server to the network interface (index starts from 1)

Note: if the interface DNS is configured by DHCP, all the DNS servers will be removed from the interface and the requested DNS will be the only one

CLI Example:
salt '*' win_dns_client.add_dns <ip> <interface> <index>

salt.modules.win_dns_client.dns_dhcp (interface='Local Area Connection')
Configure the interface to get its DNS servers from the DHCP server

CLI Example:
salt '*' win_dns_client.dns_dhcp <interface>

salt.modules.win_dns_client.get_dns_config (interface='Local Area Connection')
Get the type of DNS configuration (dhcp / static).

Parameters
• interface (str) -- The name of the network interface. This is the
in the Network Connection Details for the device

**Description**

Returns True if DNS is configured, otherwise False

Return type bool

CLI Example:

```
salt '*' win_dns_client.get_dns_config 'Local Area Connection'
```

salt.modules.win_dns_client.get_dns_servers(interface='Local Area Connection')

Return a list of the configured DNS servers of the specified interface

Parameters

- `interface` *(str)* -- The name of the network interface. This is the name as appears in the Control Panel under Network Connections *(it)*

Returns A list of dns servers

Return type list

CLI Example:

```
salt '*' win_dns_client.get_dns_servers 'Local Area Connection'
```

salt.modules.win_dns_client.rm_dns(ip, interface='Local Area Connection')

Remove the DNS server from the network interface

CLI Example:

```
salt '*' win_dns_client.rm_dns <ip> <interface>
```

---

### 23.9.489 salt.modules.win_dsc

Module for working with Windows PowerShell DSC ( Desired State Configuration )

This module is Alpha

This module applies DSC Configurations in the form of PowerShell scripts or MOF ( Managed Object Format ) schema files.

Use the *psget* module to manage PowerShell resources.

The idea is to leverage Salt to push DSC configuration scripts or MOF files to the Minion.

**depends**

- PowerShell 5.0

salt.modules.win_dsc.apply_config(path, source=None, salt_env='base')

Run an compiled DSC configuration (a folder containing a .mof file). The folder can be cached from the salt master using the source option.

Parameters

- `path` *(str)* -- Local path to the directory that contains the .mof configuration file to apply. Required.

- `source` *(str)* -- Path to the directory that contains the .mof file on the file_roots. The source directory will be copied to the path directory and then executed. If the path and source directories differ, the source directory will be applied. If source is not passed, the config located at path will be applied. Optional.

- `salt_env` *(str)* -- The salt environment to use when copying your source. Default is 'base'

Returns True if successful, otherwise False
Return type  bool

CLI Example:

To apply a config that already exists on the system

```
salt '*' dsc.apply_config C:\DSC\WebsiteConfiguration
```

To cache a configuration from the master and apply it:

```
salt '*' dsc.apply_config C:\DSC\WebsiteConfiguration salt://dsc/configs/WebsiteConfiguration
```

salt.modules.win_dsc.compile_config(path, source=None, config_name=None, config_data=None, config_data_source=None, script_parameters=None, salt_env='base')

Compile a config from a PowerShell script (.ps1)

Parameters

- **path (str)** -- Path (local) to the script that will create the .mof configuration file. If no source is passed, the file must exist locally. Required.
- **source (str)** -- Path to the script on *file_roots* to cache at the location specified by path. The source file will be cached locally and then executed. If source is not passed, the config script located at path will be compiled. Optional.
- **config_name (str)** -- The name of the Configuration within the script to apply. If the script contains multiple configurations within the file a config_name must be specified. If the config_name is not specified, the name of the file will be used as the config_name to run. Optional.
- **config_data (str)** -- Configuration data in the form of a hash table that will be passed to the ConfigurationData parameter when the config_name is compiled. This can be the path to a .psd1 file containing the proper hash table or the PowerShell code to create the hash table.

New in version 2017.7.0.

- **config_data_source (str)** -- The path to the .psd1 file on *file_roots* to cache at the location specified by config_data. If this is specified, config_data must be a local path instead of a hash table.

New in version 2017.7.0.

- **script_parameters (str)** -- Any additional parameters expected by the configuration script. These must be defined in the script itself.

New in version 2017.7.0.

- **salt_env (str)** -- The salt environment to use when copying the source. Default is ‘base’

Returns  A dictionary containing the results of the compilation

Return type  dict

CLI Example:

To compile a config from a script that already exists on the system:

```
salt '*' dsc.compile_config C:\DSC\WebsiteConfig.ps1
```

To cache a config script to the system from the master and compile it:

```
salt '*' dsc.compile_config C:\DSC\WebsiteConfig.ps1 salt://dsc/configs/WebsiteConfig.ps1
```

salt.modules.win_dsc.get_config()
Get the current DSC Configuration

23.9.  execution modules
Returns A dictionary representing the DSC Configuration on the machine

Return type dict

Raises CommandExecutionError -- On failure

CLI Example:

```
salt '*' dsc.get_config
```

salt.modules.win_dsc.get_config_status()
Get the status of the current DSC Configuration

Returns

A dictionary representing the status of the current DSC Configuration on the machine

Return type dict

CLI Example:

```
salt '*' dsc.get_config_status
```

salt.modules.win_dsc.get_lcm_config()
Get the current Local Configuration Manager settings

Returns

A dictionary representing the Local Configuration Manager settings on the machine

Return type dict

CLI Example:

```
salt '*' dsc.get_lcm_config
```

salt.modules.win_dsc.remove_config(reset=False)
Remove the current DSC Configuration. Removes current, pending, and previous dsc configurations.

New in version 2017.7.5.

Parameters reset (bool) -- Attempts to reset the DSC configuration by removing the following from C:\Windows\System32\Configuration:

- File: DSCStatusHistory.mof
- File: DSCEngineCache.mof
- Dir: ConfigurationStatus

Default is False

Warning: remove_config may fail to reset the DSC environment if any of the files in the ConfigurationStatus directory. If you wait a few minutes and run again, it may complete successfully.

Returns True if successful

Return type bool

Raises CommandExecutionError -- On failure

CLI Example:

```
salt '*' dsc.remove_config True
```

salt.modules.win_dsc.restore_config()
Reapplies the previous configuration.

New in version 2017.7.5.

Note: The current configuration will be come the previous configuration. If run a second time back-to-back it is like toggling between two configs.
Returns  True if successfully restored
Return type  bool
Raises  \texttt{CommandExecutionError} -- On failure

CLI Example:

```bash
salt '*' dsc.restore_config
```

\texttt{salt.modules.win\_dsc.run\_config(path=\textasciitilde, source=\textasciitilde, config\_name=\textasciitilde, config\_data=\textasciitilde, config\_data\_source=\textasciitilde, script\_parameters=\textasciitilde, salt\_env=\textasciitilde) }

Compile a DSC Configuration in the form of a PowerShell script (.ps1) and apply it. The PowerShell script can be cached from the master using the \texttt{source} option. If there is more than one config within the PowerShell script, the desired configuration can be applied by passing the name in the \texttt{config\_name} option.

This command would be the equivalent of running \texttt{dsc.compile\_config} followed by \texttt{dsc.apply\_config}.

Parameters

- \texttt{path (str)} -- The local path to the PowerShell script that contains the DSC Configuration. Required.
- \texttt{source (str)} -- The path to the script on \texttt{file\_roots} to cache at the location specified by \texttt{path}. The source file will be cached locally and then executed. If source is not passed, the config script located at \texttt{path} will be compiled. Optional.
- \texttt{config\_name (str)} -- The name of the Configuration within the script to apply. If the script contains multiple configurations within the file a \texttt{config\_name} must be specified. If the \texttt{config\_name} is not specified, the name of the file will be used as the \texttt{config\_name} to run. Optional.
- \texttt{config\_data (str)} -- Configuration data in the form of a hash table that will be passed to the \texttt{ConfigurationData} parameter when the \texttt{config\_name} is compiled. This can be the path to a .psd1 file containing the proper hash table or the PowerShell code to create the hash table.

New in version 2017.7.0.
- \texttt{config\_data\_source (str)} -- The path to the .psd1 file on \texttt{file\_roots} to cache at the location specified by \texttt{config\_data}. If this is specified, \texttt{config\_data} must be a local path instead of a hash table.

New in version 2017.7.0.
- \texttt{script\_parameters (str)} -- Any additional parameters expected by the configuration script. These must be defined in the script itself.

New in version 2017.7.0.
- \texttt{salt\_env (str)} -- The salt environment to use when copying the source. Default is ‘base’

Returns  True if successfully compiled and applied, otherwise False
Return type  bool

CLI Example:

To compile a config from a script that already exists on the system:

```bash
salt '*' dsc.run_config C:\DSC\WebsiteConfig.ps1
```

To cache a config script to the system from the master and compile it:

```bash
salt '*' dsc.run_config C:\DSC\WebsiteConfig.ps1 salt://dsc/configs/WebsiteConfig.ps1
```
```python
salt.modules.win_dsc.set_lcm_config(config_mode=None, config_mode_fq=None, refresh_freq=None, reboot_if_needed=None, action_after_reboot=None, refresh_mode=None, certificate_id=None, configuration_id=None, allow_module_overwrite=None, debug_mode=False, status_retention_days=None)
```

For detailed descriptions of the parameters see: [https://msdn.microsoft.com/en-us/PowerShell/DSC/metaConfig](https://msdn.microsoft.com/en-us/PowerShell/DSC/metaConfig)

**config_mode (str):** How the LCM applies the configuration. Valid values are:
- ApplyOnly
- ApplyAndMonitor
- ApplyAndAutoCorrect

**config_mode_freq (int):** How often, in minutes, the current configuration is checked and applied. Ignored if config_mode is set to ApplyOnly. Default is 15.

**refresh_mode (str):** How the LCM gets configurations. Valid values are:
- Disabled
- Push
- Pull

**refresh_freq (int):** How often, in minutes, the LCM checks for updated configurations. (pull mode only)
Default is 30.

**reboot_if_needed (bool):** Reboot the machine if needed after a configuration is applied. Default is False.

**action_after_reboot (str):** Action to take after reboot. Valid values are:
- ContinueConfiguration
- StopConfiguration

**certificate_id (guid):** A GUID that specifies a certificate used to access the configuration: (pull mode)

**configuration_id (guid):** A GUID that identifies the config file to get from a pull server. (pull mode)

**allow_module_overwrite (bool):** New configs are allowed to overwrite old ones on the target node.

**debug_mode (str):** Sets the debug level. Valid values are:
- None
- ForceModuleImport
- All

**status_retention_days (int):** Number of days to keep status of the current config.

**Note:** Either `config_mode_freq` or `refresh_freq` needs to be a multiple of the other. See documentation on MSDN for more details.

**Returns** True if successful, otherwise False

**Return type** `bool`

**CLI Example:**
```
salt '*' dsc.set_lcm_config ApplyOnly
```

```python
salt.modules.win_dsc.test_config()
```

Tests the current applied DSC Configuration

**Returns** True if successfully applied, otherwise False

**Return type** `bool`

**CLI Example:**
```
salt '*' dsc.test_config
```
23.9.490 salt.modules.win_file

Manage information about files on the minion, set/read user, group data, modify the ACL of files/directories

depends

- win32api
- win32file
- win32con
- salt.utils.win_dacl

exception salt.modules.win_file.WindowsError

salt.modules.win_file.check_perms(path, ret=None, owner=None, grant_perms=None, deny_perms=None, inheritance=True, reset=False)

Check owner and permissions for the passed directory. This function checks the permissions and sets them, returning the changes made. Used by the file state to populate the return dict

Parameters

- path (str) -- The full path to the directory.
- ret (dict) -- A dictionary to append changes to and return. If not passed, will create a new dictionary to return.
- owner (str) -- The owner to set for the directory.
- grant_perms (dict) -- A dictionary containing the user/group and the basic permissions to check/grant, i.e: {'user': {'perms': 'basic_permission'}}. Default is None.
- deny_perms (dict) -- A dictionary containing the user/group and permissions to check/deny. Default is None.
- inheritance (bool) -- True will check if inheritance is enabled and enable it. `'False` will check if inheritance is disabled and disable it. Default is True.
- reset (bool) -- True will show what permissions will be removed by resetting the DACL. False will do nothing. Default is False.

Returns

A dictionary of changes that have been made

Return type

dict

CLI Example:

```
# To see changes to `C:\Temp` if the 'Users' group is given 'read & execute'
salt '*' file.check_perms C:\Temp {} Administrators "{'Users': {'perms': 'read_execute'}}"

# Locally using salt-call
salt-call file.check_perms C:\Temp {} Administrators "{'Users': {'perms': 'read_execute', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.check_perms C:\Temp {} Administrators "{'jsnuffy': {'perms': [ 'read_attributes', 'read_ea'], 'applies_to': 'files_only'}}"
```

salt.modules.win_file.chgrp(path, group)

Change the group of a file

Under Windows, this will do nothing.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).
Salt, therefore, remaps this function to do nothing while still being compatible with Unix behavior. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to set the 'primary group' of a file, use `file.chpgrp`.

To set group permissions use `file.set_perms`.

Parameters

- **path** (`str`) -- The path to the file or directory
- **group** (`str`) -- The group (unused)

Returns

None

CLI Example:

```
salt '*' file.chpgrp c:\temp\test.txt administrators
```

**salt.modules.win_file.chown**

Chown a file, pass the file the desired user and group

Under Windows, the group parameter will be ignored.

This is because while files in Windows do have a 'primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

If you do want to change the 'primary group' property and understand the implications, pass the Windows only parameter, pgroup, instead.

Parameters

- **path** (`str`) -- The path to the file or directory
- **user** (`str`) -- The name of the user to own the file
- **group** (`str`) -- The group (not used)
- **pgroup** (`str`) -- The primary group to assign
- **follow_symlinks** (`bool`) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns

True if successful, otherwise error

Return type

`bool`

CLI Example:

```
salt '*' file.chown c:\temp\test.txt myusername
salt '*' file.chown c:\temp\test.txt myusername pgroup=Administrators
salt '*' file.chown c:\temp\test.txt myusername pgroup='None'
```

**salt.modules.win_file.chpgrp**

Change the group of a file

Under Windows, this will set the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

Parameters

- **path** (`str`) -- The path to the file or directory
- **pgroup** (`str`) -- The primary group to assign

Returns

True if successful, otherwise error

Return type

`bool`

CLI Example:

```
salt '*' file.chpgrp c:\temp\test.txt Administrators
salt '*' file.chpgrp c:\temp\test.txt "'None'"
```
salt.modules.win_file.get_attributes(path)
Return a dictionary object with the Windows file attributes for a file.

Parameters
  path (str) -- The path to the file or directory

Returns
  A dictionary of file attributes

Return type
  dict

CLI Example:
```bash
salt '*' file.get_attributes c:\temp\a.txt
```

salt.modules.win_file.get_gid(path, follow_symlinks=True)
Return the id of the group that owns a given file

Under Windows, this will return the uid of the file.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing
on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g.
Services For Unix, NFS services).
Salt, therefore, remaps this function to provide functionality that somewhat resembles Unix behavior for API
compatibility reasons. When managing Windows systems, this function is superfluous and will generate an
info level log entry if used directly.

If you do actually want to access the 'primary group' of a file, use file.get_pgid.

Parameters
  • path (str) -- The path to the file or directory
  • follow_symlinks (bool) -- If the object specified by path is a symlink, get
    attributes of the linked file instead of the symlink itself. Default is True

Returns
  The gid of the owner

Return type
  str

CLI Example:
```bash
salt '*' file.get_gid c:\temp\test.txt
```

salt.modules.win_file.get_group(path, follow_symlinks=True)
Return the group that owns a given file

Under Windows, this will return the user (owner) of the file.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing
on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g.
Services For Unix, NFS services).
Salt, therefore, remaps this function to provide functionality that somewhat resembles Unix behavior for API
compatibility reasons. When managing Windows systems, this function is superfluous and will generate an
info level log entry if used directly.

If you do actually want to access the 'primary group' of a file, use file.get_pgroup.

Parameters
  • path (str) -- The path to the file or directory
  • follow_symlinks (bool) -- If the object specified by path is a symlink, get
    attributes of the linked file instead of the symlink itself. Default is True

Returns
  The name of the owner

Return type
  str

CLI Example:
```bash
salt '*' file.get_group c:\temp\test.txt
```

salt.modules.win_file.get_mode(path)
Return the mode of a file
Right now we're just returning None because Windows doesn't have a mode like Linux.

**Parameters**
- **path**(str) -- The path to the file or directory
- **Returns** None

**CLI Example:**
```
salt '*' file.get_mode /etc/passwd
```

salt.modules.win_file.get_pgid(path, follow_symlinks=True)

- Return the id of the primary group that owns a given file (Windows only)

This function will return the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

**Parameters**
- **path**(str) -- The path to the file or directory
- **follow_symlinks**(bool) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

**Returns** The gid of the primary group
**Return type** str

**CLI Example:**
```
salt '*' file.get_pgid c:\temp\test.txt
```

salt.modules.win_file.get_pgroup(path, follow_symlinks=True)

- Return the name of the primary group that owns a given file (Windows only)

This function will return the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

The return value may be 'None', e.g. if the user is not on a domain. This is a valid group - do not confuse this with the Salt/Python value of None which means no value was returned. To be certain, use the get_pgid function which will return the SID, including for the system 'None' group.

**Parameters**
- **path**(str) -- The path to the file or directory
- **follow_symlinks**(bool) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

**Returns** The name of the primary group
**Return type** str

**CLI Example:**
```
salt '*' file.get_pgroup c:\temp\test.txt
```

salt.modules.win_file.get_uid(path, follow_symlinks=True)

- Return the id of the user that owns a given file

Symlinks are followed by default to mimic Unix behavior. Specify follow_symlinks=False to turn off this behavior.

**Parameters**
- **path**(str) -- The path to the file or directory
- **follow_symlinks**(bool) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

**Returns** The uid of the owner
**Return type** str
CLI Example:
```
salt '*' file.get_uid c:\temp\test.txt
salt '*' file.get_uid c:\temp\test.txt follow_symlinks=False
```

salt.modules.win_file.get_user(path, follow_symlinks=True)
Return the user that owns a given file

Symlinks are followed by default to mimic Unix behavior. Specify `follow_symlinks=False` to turn off this behavior.

Parameters
- **path** *(str)* -- The path to the file or directory
- **follow_symlinks** *(bool)* -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns  The name of the owner
Return type  *str*

CLI Example:
```
salt '*' file.get_user c:\temp\test.txt
salt '*' file.get_user c:\temp\test.txt follow_symlinks=False
```

salt.modules.win_file.gid_to_group(gid)
Convert the group id to the group name on this system

Under Windows, because groups are just another ACL entity, this function behaves the same as `uid_to_user`.

For maintaining Windows systems, this function is superfluous and only exists for API compatibility with Unix. Use the `uid_to_user` function instead; an info level log entry will be generated if this function is used directly.

Parameters  **gid** *(str)* -- The gid of the group
Returns  The name of the group
Return type  *str*

CLI Example:
```
salt '*' file.gid_to_group S-1-5-21-626487655-2533044672-482107328-1010
```

salt.modules.win_file.group_to_gid(group)
Convert the group to the gid on this system

Under Windows, because groups are just another ACL entity, this function behaves the same as `user_to_uid`, except if None is given, "" is returned.

For maintaining Windows systems, this function is superfluous and only exists for API compatibility with Unix. Use the `user_to_uid` function instead; an info level log entry will be generated if this function is used directly.

Parameters  **group** *(str)* -- The name of the group
Returns  The gid of the group
Return type  *str*

CLI Example:
```
salt '*' file.group_to_gid administrators
```

salt.modules.win_file.is_link(path)
Check if the path is a symlink

This is only supported on Windows Vista or later.

Inline with Unix behavior, this function will raise an error if the path is not a symlink, however, the error raised will be a `SaltInvocationError`, not an `OSError`.

23.9. execution modules 2977
Parameters **path** *(str)* -- The path to a file or directory

Returns True if path is a symlink, otherwise False

Return type **bool**

CLI Example:

```py
salt '*' file.is_link /path/to/link
```

**salt.modules.win_file.lchown**(path, user, group=None, pgroup=None)

Chown a file, pass the file the desired user and group without following any symlinks.

Under Windows, the group parameter will be ignored.

This is because while files in Windows do have a 'primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

If you do want to change the 'primary group' property and understand the implications, pass the Windows only parameter, pgroup, instead.

To set the primary group to 'None', it must be specified in quotes. Otherwise Salt will interpret it as the Python value of None and no primary group changes will occur. See the example below.

Parameters

- **path** *(str)* -- The path to the file or directory
- **user** *(str)* -- The name of the user to own the file
- **group** *(str)* -- The group (not used)
- **pgroup** *(str)* -- The primary group to assign

Returns True if successful, otherwise error

Return type **bool**

CLI Example:

```py
salt '*' file.lchown c:\temp\test.txt myusername
salt '*' file.lchown c:\temp\test.txt myusername pgroup=Administrators
salt '*' file.lchown c:\temp\test.txt myusername "pgroup='None'"
```

**salt.modules.win_file.makedirs**(path, owner=None, grant_perms=None, deny_perms=None, inheritance=True, reset=False)

Ensure that the parent directory containing this path is available.

Parameters

- **path** *(str)* -- The full path to the directory.

Note: The path must end with a trailing slash otherwise the directory(s) will be created up to the parent directory. For example if path is `C:\temp\test`, then it would be treated as `C:\temp\` but if the path ends with a trailing slash like `C:\temp\test\`, then it would be treated as `C:\temp\test\`

- **owner** *(str)* -- The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM.
- **grant_perms** *(dict)* -- A dictionary containing the user/group and the basic permissions to grant, ie: `{user': {'perms': 'basic_permission'}}. You can also set the applies_to setting here. The default is this_folder_subfolders_files. Specify another applies_to setting like this:

```py
{'user': {'perms': 'full_control', 'applies_to': 'this_folder'}
```

To set advanced permissions use a list for the **perms** parameter, ie:
salt.modules.win_file.makedirs_perms(path, owner=None, grant_perms=None, deny_perms=None, inheritance=True, reset=True)

Set owner and permissions for each directory created.

Parameters

- **path** *(str)* -- The full path to the directory.
- **owner** *(str)* -- The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM.
- **grant_perms** *(dict)* -- A dictionary containing the user/group and the basic permissions to grant, ie: `{user: {'perms': 'basic_permission'}}`. You can also set the applies_to setting here. The default is `this_folder_subfolders_files`. Specify another applies_to setting like this:

  ```
  {'user': {'perms': 'full_control', 'applies_to': 'this_folder'}}
  ```

To set advanced permissions use a list for the `perms` parameter, ie:

```
{'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder'}}
```

- **deny_perms** *(dict)* -- A dictionary containing the user/group and permissions to deny along with the applies_to setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.
- **inheritance** *(bool)* -- If True the object will inherit permissions from the parent, if False, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created.

- **reset** *(bool)* -- If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False.

New in version 2018.3.0.

**Returns** True if successful, otherwise raises an error

**Return type** bool

---

**CLI Example:**

```python
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.makedirs_perms C:\Temp\ Administrators "{'Users': {'perms': 'read_→execute'}}"

# Locally using salt call
salt-call file.makedirs_perms C:\Temp\ Administrators "{'Users': {'perms': 'read_→execute', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.makedirs_perms C:\Temp\ Administrators "{'jsnuffy': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder_files'}}"
```

---

salt.modules.win_file.mkdir *(path, owner=None, grant_perms=None, deny_perms=None, inheritance=True, reset=False)*

Ensure that the directory is available and permissions are set.

**Parameters**

- **path** *(str)* -- The full path to the directory.
- **owner** *(str)* -- The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM.
- **grant_perms** *(dict)* -- A dictionary containing the user/group and the basic permissions to grant, ie: `{user: {'perms': 'basic_permission'}}`. You can also set the applies_to setting here. The default is this_folder_subfolders_files. Specify another applies_to setting like this:

  ```python
  {'user': {'perms': 'full_control', 'applies_to': 'this_folder'}
  →}
  ```

  To set advanced permissions use a list for the perms parameter, ie:

  ```python
  {'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder'}
  →}
  ```

- **deny_perms** *(dict)* -- A dictionary containing the user/group and permissions to deny along with the applies_to setting. Use the same format used for the grant_perms parameter. Remember, deny permissions supersede grant permissions.
- **inheritance** *(bool)* -- If True the object will inherit permissions from the parent, if False, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created.
- **reset** *(bool)* -- If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False.

New in version 2018.3.0.

**Returns** True if successful
Return type **bool**  
Raises **CommandExecutionError** -- If unsuccessful

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.mkdir C:\Temp\ Administrators "{'Users': {'perms': 'read_execute'}}"

# Locally using salt call
salt-call file.mkdir C:\Temp\ Administrators "{ 'Users': {'perms': 'read_execute',
                                    'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.mkdir C:\Temp\ Administrators "{'jsnuffy': {'perms': ['read_
attributes', 'read_ea'], 'applies_to': 'this_folder_only'}}"
```

salt.modules.win_file.readlink(path)

Return the path that a symlink points to

This is only supported on Windows Vista or later.

Inline with Unix behavior, this function will raise an error if the path is not a symlink, however, the error raised will be a SaltInvocationError, not an OSError.

**Parameters**  
`path` *(str)* -- The path to the symlink

**Returns**  
The path that the symlink points to

**Return type** **str**

CLI Example:

```
salt '*' file.readlink /path/to/link
```

salt.modules.win_file.remove(path, force=False)

Remove the named file or directory

**Parameters**

- `path` *(str)* -- The path to the file or directory to remove.
- `force` *(bool)* -- Remove even if marked Read-Only. Default is False

**Returns**  
True if successful, False if unsuccessful

**Return type** **bool**

CLI Example:

```
salt '*' file.remove C:\Temp
```

salt.modules.win_file.set_attributes(path, archive=None, hidden=None, normal=None, notIndexed=None, readonly=None, system=None, temporary=None)

Set file attributes for a file. Note that the normal attribute means that all others are false. So setting it will clear all others.

**Parameters**

- `path` *(str)* -- The path to the file or directory
- `archive` *(bool)* -- Sets the archive attribute. Default is None
- `hidden` *(bool)* -- Sets the hidden attribute. Default is None
- `normal` *(bool)* -- Resets the file attributes. Cannot be used in conjunction with any other attribute. Default is None
- `notIndexed` *(bool)* -- Sets the indexed attribute. Default is None
- `readonly` *(bool)* -- Sets the readonly attribute. Default is None
- `system` *(bool)* -- Sets the system attribute. Default is None
- `temporary` *(bool)* -- Sets the temporary attribute. Default is None

**Returns**  
True if successful, otherwise False

**Return type** **bool**
CLI Example:

```
salt '*' file.set_attributes c:\temp\a.txt normal=True
salt '*' file.set_attributes c:\temp\a.txt readonly=True hidden=True
```

**salt.modules.win_file.set_mode** *(path, mode)*

Set the mode of a file

This just calls `get_mode`, which returns `None` because we don’t use mode on Windows

Parameters

- **path** -- The path to the file or directory
- **mode** -- The mode (not used)

Returns `None`

CLI Example:

```
salt '*' file.set_mode /etc/passwd 0644
```

**salt.modules.win_file.set_perms** *(path, grant_perms=None, deny_perms=None, inheritance=True, reset=False)*

Set permissions for the given path

Parameters

- **path** *(str)* -- The full path to the directory.
- **grant_perms** *(dict)* -- A dictionary containing the user/group and the basic permissions to grant, ie: `{user}: {'perms': 'basic_permission'}`. You can also set the `applies_to` setting here. The default for `applies_to` is `this_folder_subfolders_files`. Specify another `applies_to` setting like this:

  ```
  {'user': {'perms': 'full_control', 'applies_to': 'this_folder'}}
  ```

To set advanced permissions use a list for the `perms` parameter, ie:

```
{'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder'}}
```

To see a list of available attributes and `applies_to` settings see the documentation for `salt.utils.win_dacl`.

A value of `None` will make no changes to the `grant` portion of the DACL. Default is `None`.

- **deny_perms** *(dict)* -- A dictionary containing the user/group and permissions to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.

  A value of `None` will make no changes to the `deny` portion of the DACL. Default is `None`.

- **inheritance** *(bool)* -- If `True` the object will inherit permissions from the parent, if `False`, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created. Default is `False`.

- **reset** *(bool)* -- If `True` the existing DCL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

Returns `True` if successful

Return type `bool`
**Raises** *CommandExecutionError* -- If unsuccessful

CLI Example:

```plaintext
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.set_perms C:.Temp "{'Users': {'perms': 'read_execute'}}"

# Locally using salt call
salt-call file.set_perms C:Temp "{'Users': {'perms': 'read_execute', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.set_perms C:Temp "{'jsnuffy': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder_only'}}"
```

**salt.modules.win_file.stats**(*path*, *hash_type='sha256', follow_symlinks=True*)

Return a dict containing the stats about a given file

Under Windows, *gid* will equal *uid* and *group* will equal *user*.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing
on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g.
Services For Unix, NFS services).

Salt, therefore, remaps these properties to keep some kind of compatibility with Unix behavior. If the 'primary
group' is required, it can be accessed in the *pgroup* and *pgid* properties.

Parameters

- **path** *(str)* -- The path to the file or directory
- **hash_type** *(str)* -- The type of hash to return
- **follow_symlinks** *(bool)* -- If the object specified by *path* is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns A dictionary of file/directory stats

Return type **dict**

CLI Example:

```plaintext
salt '*' file.stats /etc/passwd
```

**salt.modules.win_file.symlink**(*src*, *link*)

Create a symbolic link to a file

This is only supported with Windows Vista or later and must be executed by a user with the SeCreateSymbolicLink privilege.

The behavior of this function matches the Unix equivalent, with one exception - invalid symlinks cannot be
created. The source path must exist. If it doesn't, an error will be raised.

Parameters

- **src** *(str)* -- The path to a file or directory
- **link** *(str)* -- The path to the link

Returns True if successful, otherwise False

Return type **bool**

CLI Example:

```plaintext
salt '*' file.symlink /path/to/file /path/to/link
```

**salt.modules.win_file.uid_to_user**(*uid*)

Convert a uid to a user name

Parameters **uid** *(str)* -- The user id to lookup

Returns The name of the user

Return type **str**
CLI Example:

```
salt '*' file.uid_to_user S-1-5-21-626487655-2533044672-482107328-1010
```

```
salt.modules.win_file.user_to_uid(user)
```

Convert user name to a uid

**Parameters**

- **user (str)** -- The user to lookup

**Returns**

The user id of the user

**Return type**

`str`

CLI Example:

```
salt '*' file.user_to_uid myusername
```

23.9.491 `salt.modules.win_firewall`

Module for configuring Windows Firewall using `netsh`

```
salt.modules.win_firewall.add_rule(name, localport, protocol='tcp', action='allow', dir='in', remoteip='any')
```

New in version 2015.5.0.

Add a new inbound or outbound rule to the firewall policy

**Parameters**

- **name (str)** -- The name of the rule. Must be unique and cannot be "all". Required.
- **localport (int)** -- The port the rule applies to. Must be a number between 0 and 65535. Can be a range. Can specify multiple ports separated by commas. Required.
- **protocol (Optional [str])** -- The protocol. Can be any of the following:
  - A number between 0 and 255
  - icmpv4
  - icmpv6
  - tcp
  - udp
  - any
- **action (Optional [str])** -- The action the rule performs. Can be any of the following:
  - allow
  - block
  - bypass
- **dir (Optional [str])** -- The direction. Can be in or out.
- **remoteip (Optional [str])** -- The remote IP. Can be any of the following:
  - any
  - localsubnet
  - dns
  - dhcp
  - wins
  - defaultgateway
  - Any valid IPv4 address (192.168.0.12)
  - Any valid subnet (192.168.1.0/24)
  - Any valid range of IP addresses (192.168.0.1-192.168.0.12)
  - A list of valid IP addresses

Can be combinations of the above separated by commas.

**Returns**

True if successful

**Return type**

`bool`
Raises `CommandExecutionError` -- If the command fails

CLI Example:

```shell
salt '*' firewall.add_rule 'test' '8080' 'tcp'
salt '*' firewall.add_rule 'test' '1' 'icmpv4'
salt '*' firewall.add_rule 'test_remote_ip' '8000' 'tcp' 'allow' 'in' '192.168.0.1 →'
```

```python
salt.modules.win_firewall.delete_rule(name=None, localport=None, protocol=None, dir=None, remoteip=None)
```

New in version 2015.8.0.

Delete an existing firewall rule identified by name and optionally by ports, protocols, direction, and remote IP.

**Parameters**

- `name` *(str)* -- The name of the rule to delete. If the name `all` is used you must specify additional parameters.
- `localport` *(Optional*[str]*) -- The port of the rule. If protocol is not specified, protocol will be set to `tcp`
- `protocol` *(Optional*[str]*) -- The protocol of the rule. Default is `tcp` when `localport` is specified
- `dir` *(Optional*[str]*) -- The direction of the rule.
- `remoteip` *(Optional*[str]*) -- The remote IP of the rule.

**Returns**

True if successful

**Return type** `bool`

**Raises `CommandExecutionError`** -- If the command fails

CLI Example:

```shell
# Delete incoming tcp port 8080 in the rule named 'test'
salt '*' firewall.delete_rule 'test' '8080' 'tcp' 'in'

# Delete the incoming tcp port 8000 from 192.168.0.1 in the rule named # 'test_remote_ip'
salt '*' firewall.delete_rule 'test_remote_ip' '8000' 'tcp' 'in' '192.168.0.1'

# Delete all rules for local port 80:
salt '*' firewall.delete_rule all 80 tcp

# Delete a rule called 'allow80':
salt '*' firewall.delete_rule allow80
```

```python
salt.modules.win_firewall.disable(profile='allprofiles')
```

Disable firewall profile

**Parameters**

- `profile` *(Optional*[str]*) -- The name of the profile to disable. Default is `allprofiles`. Valid options are:
  - `allprofiles`
  - `domainprofile`
  - `privateprofile`
  - `publicprofile`

**Returns**

True if successful

**Return type** `bool`

**Raises `CommandExecutionError`** -- If the command fails

CLI Example:

```shell
salt '*' firewall.disable
```

```python
salt.modules.win_firewall.enable(profile='allprofiles')
```

New in version 2015.5.0.
Enable firewall profile

**Parameters**

`profile (Optional[str])` -- The name of the profile to enable. Default is `allprofiles`. Valid options are:

- `allprofiles`
- `domainprofile`
- `privateprofile`
- `publicprofile`

**Returns**

True if successful

**Return type** bool

**Raises** `CommandExecutionError` -- If the command fails

CLI Example:

```
salt '*' firewall.enable
```

```
salt.modules.win_firewall.get_all_profiles(store='local')
```

Gets all properties for all profiles in the specified store

New in version 2018.3.4.

New in version 2019.2.0.

**Parameters**

- `store (str)` -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - `lgpo`
  - `local`

  Default is `local`

**Returns**

A dictionary containing the specified settings for each profile

**Return type** dict

CLI Example:

```
# Get all firewall settings for all profiles
salt '*' firewall.get_all_settings

# Get all firewall settings for all profiles as defined by local group policy
salt '*' firewall.get_all_settings lgpo
```

```
salt.modules.win_firewall.get_all_settings(domain, store='local')
```

Gets all the properties for the specified profile in the specified store

New in version 2018.3.4.

New in version 2019.2.0.

**Parameters**

- `profile (str)` -- The firewall profile to query. Valid options are:
  - `domain`
  - `public`
  - `private`

- `store (str)` -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - `lgpo`
  - `local`

  Default is `local`

**Returns**

A dictionary containing the specified settings

**Return type** dict

CLI Example:
salt.modules.win_firewall.get_config()
Get the status of all the firewall profiles

- Returns A dictionary of all profiles on the system
- Return type dict
- Raises CommandExecutionError -- If the command fails

CLI Example:
salt '*' firewall.get_config

salt.modules.win_firewall.get_rule(name='all')
New in version 2015.5.0.
Display all matching rules as specified by name

- Parameters name (Optional[str]) -- The full name of the rule. all will return all rules.
  Default is all
- Returns A dictionary of all rules or rules that match the name exactly
- Return type dict
- Raises CommandExecutionError -- If the command fails

CLI Example:
salt '*' firewall.get_rule 'MyAppPort'

salt.modules.win_firewall.get_settings(profile, section, store='local')
Get the firewall property from the specified profile in the specified store as returned by netsh advfirewall.

New in version 2018.3.4.
New in version 2019.2.0.

- Parameters
  - profile (str) -- The firewall profile to query. Valid options are:
    - domain
    - public
    - private
  - section (str) -- The property to query within the selected profile. Valid options are:
    - firewallpolicy : inbound/outbound behavior
    - logging : firewall logging settings
    - settings : firewall properties
    - state : firewalls state (on | off)
  - store (str) -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
    - lgpo
    - local
  Default is local
- Returns A dictionary containing the properties for the specified profile
- Return type dict
- Raises
  - CommandExecutionError -- If an error occurs
• `ValueError` -- If the parameters are incorrect

CLI Example:

```bash
# Get the inbound/outbound firewall settings for connections on the
# local domain profile
salt * win_firewall.get_settings domain firewallpolicy

# Get the inbound/outbound firewall settings for connections on the
# domain profile as defined by local group policy
salt * win_firewall.get_settings domain firewallpolicy lgpo
```

`salt.modules.win_firewall.rule_exists(name)`

New in version 2016.11.6.
Checks if a firewall rule exists in the firewall policy

**Parameters**

- `name (str)` -- The name of the rule

**Returns**

True if exists, otherwise False

**Return type**

`bool`

CLI Example:

```bash
# Is there a rule named RemoteDesktop
salt * firewall.rule_exists RemoteDesktop
```

`salt.modules.win_firewall.set_firewall_settings(profile, inbound=None, outbound=None, store='local')`

Set the firewall inbound/outbound settings for the specified profile and store

New in version 2018.3.4.
New in version 2019.2.0.

**Parameters**

- `profile (str)` -- The firewall profile to query. Valid options are:
  - domain
  - public
  - private
- `inbound (str)` -- The inbound setting. If `None` is passed, the setting will remain unchanged. Valid values are:
  - blockinbound
  - blockinboundalways
  - allowinbound
  - notconfigured
  Default is `None`
- `outbound (str)` -- The outbound setting. If `None` is passed, the setting will remain unchanged. Valid values are:
  - allowoutbound
  - blockoutbound
  - notconfigured
  Default is `None`
- `store (str)` -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local
  Default is `local`

**Returns**

True if successful

**Return type**

`bool`

**Raises**

- `CommandExecutionError` -- If an error occurs
• **ValueError** -- If the parameters are incorrect

CLI Example:

```python
# Set the inbound setting for the domain profile to block inbound connections
salt '*' firewall.set_firewall_settings domain='domain' inbound='blockinbound'

# Set the outbound setting for the domain profile to allow outbound connections
salt '*' firewall.set_firewall_settings domain='domain' outbound='allowoutbound'

# Set inbound/outbound settings for the domain profile in the group policy to block inbound and allow outbound
salt '*' firewall.set_firewall_settings domain='domain' inbound='blockinbound' outbound='allowoutbound' store='lgpo'
```

`salt.modules.win_firewall.set_logging_settings(profile, setting, value, store='local')`

Configure logging settings for the Windows firewall.

New in version 2018.3.4.
New in version 2019.2.0.

**Parameters**

- **profile (str)** -- The firewall profile to configure. Valid options are:
  - domain
  - public
  - private

- **setting (str)** -- The logging setting to configure. Valid options are:
  - allowedconnections
  - droppedconnections
  - filename
  - maxfilesize

- **value (str)** -- The value to apply to the setting. Valid values are dependent upon the setting being configured. Valid options are:
  - allowedconnections:
    - enable
    - disable
    - notconfigured
  - droppedconnections:
    - enable
    - disable
    - notconfigured
  - filename:
    - Full path and name of the firewall log file
    - notconfigured
  - maxfilesize:
    - 1 - 32767
    - notconfigured

**Note**: `notconfigured` can only be used when using the `lgpo` store.

- **store (str)** -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - `lgpo`
  - `local`
  
Default is `local`
Returns True if successful
Return type bool
Raises
• CommandExecutionError -- If an error occurs
• ValueError -- If the parameters are incorrect

CLI Example:

```bash
# Log allowed connections and set that in local group policy
salt * firewall.set_logging_settings domain allowedconnections enable lgpo

# Don't log dropped connections
salt * firewall.set_logging_settings profile=private setting=droppedconnections →value=disable

# Set the location of the log file
salt * firewall.set_logging_settings domain filename C:\windows\logs\firewall.log

# You can also use environment variables
salt * firewall.set_logging_settings domain filename %systemroot%\system32\ →LogFiles\Firewall\pfirewall.log

# Set the max file size of the log to 2048 Kb
salt * firewall.set_logging_settings domain maxfilesize 2048
```

salt.modules.win_firewall.set_settings(profile, setting, value, store='local')
Configure firewall settings.

New in version 2018.3.4.
New in version 2019.2.0.

Parameters

• **profile** *(str)* -- The firewall profile to configure. Valid options are:
  - domain
  - public
  - private

• **setting** *(str)* -- The firewall setting to configure. Valid options are:
  - localfirewallrules
  - localconsecrules
  - inboundusernotification
  - remotemanagement
  - unicastresponsetomulticast

• **value** *(str)* -- The value to apply to the setting. Valid options are
  - enable
  - disable
  - notconfigured

Note: notconfigured can only be used when using the lgpo store

• **store** *(str)* -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local

Default is local

Returns True if successful
Return type bool
Raises
- **CommandExecutionError** -- If an error occurs
- **ValueError** -- If the parameters are incorrect

CLI Example:

```bash
# Merge local rules with those distributed through group policy
salt * firewall.set_settings domain localfirewallrules enable

# Allow remote management of Windows Firewall
salt * firewall.set_settings domain remotemanagement enable
```

```python
salt.modules.win_firewall.set_state(profile, state, store='local')
```

Configure the firewall state.

New in version 2018.3.4.
New in version 2019.2.0.

**Parameters**

- `profile (str)` -- The firewall profile to configure. Valid options are:
  - domain
  - public
  - private
- `state (str)` -- The firewall state. Valid options are:
  - on
  - off
  - notconfigured

**Note:** `notconfigured` can only be used when using the lgpo store

- `store (str)` -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local
  
  Default is local

**Returns**

- **True** if successful

**Return type**

- **bool**

**Raises**

- **CommandExecutionError** -- If an error occurs
- **ValueError** -- If the parameters are incorrect

CLI Example:

```bash
# Turn the firewall off when the domain profile is active
salt * firewall.set_state domain off

# Turn the firewall on when the public profile is active and set that in
# the local group policy
salt * firewall.set_state public on lgpo
```
23.9.492 salt.modules.win_groupadd

Manage groups on Windows

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to 'group.info' is not available), see here.

```python
salt.modules.win_groupadd.add(name, **kwargs)
Add the specified group

Parameters

- name (str) -- The name of the group to add
- **kwargs

Returns

True if successful, otherwise False

Return type: bool

CLI Example:

```
salt '*' group.add foo
```
```
```

```python
salt.modules.win_groupadd.adduser(name, username, **kwargs)
Add a user to a group

Parameters

- name (str) -- The name of the group to modify
- username (str) -- The name of the user to add to the group

Returns

True if successful, otherwise False

Return type: bool

CLI Example:

```
salt '*' group.adduser foo username
```
```
```

```python
salt.modules.win_groupadd.delete(name, **kwargs)
Remove the named group

Parameters

- name (str) -- The name of the group to remove

Returns

True if successful, otherwise False

Return type: bool

CLI Example:

```
salt '*' group.delete foo
```
```
```

```python
salt.modules.win_groupadd.deluser(name, username, **kwargs)
Remove a user from a group

Parameters

- name (str) -- The name of the group to modify
- username (str) -- The name of the user to remove from the group

Returns

True if successful, otherwise False

Return type: bool

CLI Example:

```
salt '*' group.deluser foo username
```
```
```

```python
salt.modules.win_groupadd.getent(refresh=False)
Return info on all groups

Parameters

- refresh (bool) -- Refresh the info for all groups in __context__. If False only the groups in __context__ will be returned. If True the __context__ will be refreshed with current data and returned. Default is False

Returns

A list of groups and their information

CLI Example:

```
```
salt '*' group.getent

salt.modules.win_groupadd.info(name)
Return information about a group
  Parameters name (str) -- The name of the group for which to get information
  Returns A dictionary of information about the group
  Return type dict
  CLI Example:
  salt '*' group.info foo

salt.modules.win_groupadd.list_groups(refresh=False)
Return a list of groups
  Parameters refresh (bool) -- Refresh the info for all groups in __context__. If False only
    the groups in __context__ will be returned. If True, the __context__ will be re-
    freshed with current data and returned. Default is False
  Returns A list of groups on the machine
  Return type list
  CLI Example:
  salt '*' group.list_groups

salt.modules.win_groupadd.members(name, members_list, **kwargs)
Ensure a group contains only the members in the list
  Parameters
    • name (str) -- The name of the group to modify
    • members_list (str) -- A single user or a comma separated list of users. The group
      will contain only the users specified in this list.
  Returns True if successful, otherwise False
  Return type bool
  CLI Example:
  salt '*' group.members foo 'user1,user2,user3'

23.9.493 salt.modules.win_iis

Microsoft IIS site management via WebAdministration powershell module
  maintainer Shane Lee <slee@saltstack.com>, Robert Booth <rbooth@saltstack.com>
  platform Windows
  depends PowerShell
  depends WebAdministration module (PowerShell) (IIS)
New in version 2016.3.0.

salt.modules.win_iis.create_app(name, site, sourcepath, apppool=None)
Create an IIS application.

Note: This function only validates against the application name, and will return True even if the application
already exists with a different configuration. It will not modify the configuration of an existing application.
• name (str) -- The IIS application.
• site (str) -- The IIS site name.
• sourcepath (str) -- The physical path.
• apppool (str) -- The name of the IIS application pool.

Returns: True if successful, otherwise False
Return type: bool

CLI Example:

salt '*' win_iis.create_app name='app0' site='site0' sourcepath='C:\site0' apppool='site0'

salt.modules.win_iis.create_apppool(name)
Create an IIS application pool.

Note: This function only validates against the application pool name, and will return True even if the application pool already exists with a different configuration. It will not modify the configuration of an existing application pool.

Parameters:

- name (str) -- The name of the IIS application pool.

Returns: True if successful, otherwise False
Return type: bool

CLI Example:

salt '*' win_iis.create_apppool name='MyTestPool'

salt.modules.win_iis.create_backup(name)
Backup an IIS Configuration on the System.

New in version 2017.7.0.

Note: Backups are stored in the $env:Windir\System32\inetsrv\backup folder.

Parameters:

- name (str) -- The name to give the backup

Returns: True if successful, otherwise False
Return type: bool

CLI Example:

salt '*' win_iis.create_backup good_config_20170209

salt.modules.win_iis.create_binding(site, hostheader='', ipaddress='*', port=80, protocol='http', sslflags=None)
Create an IIS Web Binding.

Note: This function only validates against the binding ipaddress:port:hostheader combination, and will return True even if the binding already exists with a different configuration. It will not modify the configuration of an existing binding.

Parameters:

- site (str) -- The IIS site name.
- hostheader (str) -- The host header of the binding. Usually a hostname.
- ipaddress (str) -- The IP address of the binding.
- **port** *(int)* -- The TCP port of the binding.
- **protocol** *(str)* -- The application protocol of the binding.
- **sslflags** *(str)* -- The flags representing certificate type and storage of the binding.

**Returns** True if successful, otherwise False

**Return type** `bool`

**CLI Example:**
```
salt '*' win_iis.create_binding site='site0' hostheader='example.com' ipaddress='*' port='80'
```

salt.modules.win_iis.create_cert_binding(*name, site, hostheader='', ipaddress='', port=443, sslflags=0*)

Assign a certificate to an IIS Web Binding.

New in version 2016.11.0.

**Note:** The web binding that the certificate is being assigned to must already exist.

**Parameters**
- **name** *(str)* -- The thumbprint of the certificate.
- **site** *(str)* -- The IIS site name.
- **hostheader** *(str)* -- The host header of the binding.
- **ipaddress** *(str)* -- The IP address of the binding.
- **port** *(int)* -- The TCP port of the binding.
- **sslflags** *(int)* -- Flags representing certificate type and certificate storage of the binding.

**Returns** True if successful, otherwise False

**Return type** `bool`

**CLI Example:**
```
salt '*' win_iis.create_cert_binding name='AAA000' site='site0' hostheader='example.com' ipaddress='*' port='443'
```

salt.modules.win_iis.create_site(*name, sourcepath, apppool='', hostheader='', ipaddress='', port=80, protocol='http'*

Create a basic website in IIS.

**Note:** This function only validates against the site name, and will return True even if the site already exists with a different configuration. It will not modify the configuration of an existing site.

**Parameters**
- **name** *(str)* -- The IIS site name.
- **sourcepath** *(str)* -- The physical path of the IIS site.
- **apppool** *(str)* -- The name of the IIS application pool.
- **hostheader** *(str)* -- The host header of the binding. Usually the hostname or website name, ie: www.contoso.com
- **ipaddress** *(str)* -- The IP address of the binding.
- **port** *(int)* -- The TCP port of the binding.
- **protocol** *(str)* -- The application protocol of the binding. (http, https, etc.)

**Returns** True if successful, otherwise False

**Return type** `bool`
Note: If an application pool is specified, and that application pool does not already exist, it will be created.

CLI Example:

```bash
salt '*' win_iis.create_site name='My Test Site' sourcepath='c:\stage' apppool='TestPool'
```

```python
salt.modules.win_iis.create_vdir(name, site, sourcepath, app='/')
```

Create an IIS virtual directory.

Note: This function only validates against the virtual directory name, and will return True even if the virtual directory already exists with a different configuration. It will not modify the configuration of an existing virtual directory.

```python
Parameters
- **name (str)** -- The virtual directory name.
- **site (str)** -- The IIS site name.
- **sourcepath (str)** -- The physical path.
- **app (str)** -- The IIS application.

Returns True if successful, otherwise False
Return type bool
```

CLI Example:

```bash
salt '*' win_iis.create_vdir name='vd0' site='site0' sourcepath='C:\inetpub\vdirs\vd0'
```

```python
salt.modules.win_iis.get_container_setting(name, container, settings)
```

Get the value of the setting for the IIS container.

New in version 2016.11.0.

```python
Parameters
- **name (str)** -- The name of the IIS container.
- **container (str)** -- The type of IIS container. The container types are: AppPools, Sites, SslBindings
- **settings (dict)** -- A dictionary of the setting names and their values.

Returns A dictionary of the provided settings and their values.
Return type dict
```

CLI Example:

```bash
salt '*' win_iis.get_container_setting name='MyTestPool' container='AppPools' settings="["processModel.identityType"]"
```

```python
salt.modules.win_iis.get_webapp_settings(name, site, settings)
```

New in version 2017.7.0.

Get the value of the setting for the IIS web application.

Note: Params are case sensitive

```python
Parameters
- **name (str)** -- The name of the IIS web application.
```
- **site** *(str)* -- The site name contains the web application. Example: Default Web Site
- **settings** *(str)* -- A dictionary of the setting names and their values. Available settings: physicalPath, applicationPool, userName, password

Returns A dictionary of the provided settings and their values.

Return type *dict*

CLI Example:

```bash
salt '*' win_iis.get_webapp_settings name='app0' site='Default Web Site' settings='[physicalPath', 'applicationPool']"
```

salt.modules.win_iis.get_webconfiguration_settings(name, settings)

Get the webconfiguration settings for the IIS PSPath.

**Parameters**
- **name** *(str)* -- The PSPPath of the IIS webconfiguration settings.
- **settings** *(list)* -- A list of dictionaries containing setting name and filter.

Returns A list of dictionaries containing setting name, filter and value.

Return type *dict*

CLI Example:

```bash
salt '*' win_iis.get_webconfiguration_settings name='IIS: /' settings='["name": 'enabled', 'filter': 'system.webServer/security/authentication/anonymousAuthentication']"
```

salt.modules.win_iis.list_apppools()

List all configured IIS application pools.

Returns A dictionary of IIS application pools and their details.

Return type *dict*

CLI Example:

```bash
salt '*' win_iis.list_apppools
```

salt.modules.win_iis.list_apps(site)

Get all configured IIS applications for the specified site.

**Parameters** **site** *(str)* -- The IIS site name.

Returns: A dictionary of the application names and properties.

CLI Example:

```bash
salt '*' win_iis.list_apps site
```

salt.modules.win_iis.list_backups()

List the IIS Configuration Backups on the System.

New in version 2017.7.0.

**Note:** Backups are made when a configuration is edited. Manual backups are stored in the $env:WinDir\System32\inetsrv\backup folder.

Returns A dictionary of IIS Configurations backed up on the system.

Return type *dict*

CLI Example:
salt '!' win_iis.list_backups

salt.modules.win_iis.list_bindings(site)
Get all configured IIS bindings for the specified site.
Parameters site (str) -- The name of the IIS Site
Returns A dictionary of the binding names and properties.
Return type dict
CLI Example:
salt '!' win_iis.list_bindings site

salt.modules.win_iis.list_cert_bindings(site)
List certificate bindings for an IIS site.
New in version 2016.11.0.
Parameters site (str) -- The IIS site name.
Returns A dictionary of the binding names and properties.
Return type dict
CLI Example:
salt '!' win_iis.list_bindings site

salt.modules.win_iis.list_sites()
List all the currently deployed websites.
Returns A dictionary of the IIS sites and their properties.
Return type dict
CLI Example:
salt '!' win_iis.list_sites

salt.modules.win_iis.list_vdirs(site, app='/')
Get all configured IIS virtual directories for the specified site, or for the combination of site and application.
Parameters
- site (str) -- The IIS site name.
- app (str) -- The IIS application.
Returns A dictionary of the virtual directory names and properties.
Return type dict
CLI Example:
salt '!' win_iis.list_vdirs site

salt.modules.win_iis.list_worker_processes(apppool)
Returns a list of worker processes that correspond to the passed application pool.
New in version 2017.7.0.
Parameters apppool (str) -- The application pool to query
Returns A dictionary of worker processes with their process IDs
Return type dict
CLI Example:
salt '!' win_iis.list_worker_processes 'My App Pool'

salt.modules.win_iis.modify_binding(site, binding, hostheader=None, ipaddress=None, port=None, sslflags=None)
Modify an IIS Web Binding. Use site and binding to target the binding.
New in version 2017.7.0.
Parameters

- **site** *(str)* -- The IIS site name.
- **binding** *(str)* -- The binding to edit. This is a combination of the IP address, port, and hostheader. It is in the following format: ipaddress:port:hostheader. For example, *:80: or *:80:salt.com
- **hostheader** *(str)* -- The host header of the binding. Usually the hostname.
- **ipaddress** *(str)* -- The IP address of the binding.
- **port** *(int)* -- The TCP port of the binding.
- **sslflags** *(str)* -- The flags representing certificate type and storage of the binding.

Returns True if successful, otherwise False

Return type **bool**

CLI Example:
The following will set the host header of binding *:80: for site*0 to example.com

```
salt '*' win_iis.modify_binding site='site0' binding='*:80:' hostheader='example.com'
```

salt.modules.win_iis.modify_site*(name, sourcepath=None, apppool=None)*

Modify a basic website in IIS.

New in version 2017.7.0.

Parameters

- **name** *(str)* -- The IIS site name.
- **sourcepath** *(str)* -- The physical path of the IIS site.
- **apppool** *(str)* -- The name of the IIS application pool.

Returns True if successful, otherwise False.

Return type **bool**

Note: If an application pool is specified, and that application pool does not already exist, it will be created.

CLI Example:

```
salt '*' win_iis.modify_site name='My Test Site' sourcepath='c:\new_path' apppool='NewTestPool'
```

salt.modules.win_iis.remove_app*(name, site)*

Remove an IIS application.

Parameters

- **name** *(str)* -- The application name.
- **site** *(str)* -- The IIS site name.

Returns True if successful, otherwise False.

Return type **bool**

CLI Example:

```
salt '*' win_iis.remove_app name='app0' site='site0'
```

salt.modules.win_iis.remove_apppool*(name)*

Remove an IIS application pool.

Parameters **name** *(str)* -- The name of the IIS application pool.

Returns True if successful, otherwise False.

Return type **bool**

CLI Example:

```
salt '*' win_iis.remove_apppool name='MyTestPool'
```
salt.modules.win_iis.remove_backup(name)
Remove an IIS Configuration backup from the System.

New in version 2017.7.0.
Parameters
  name (str) -- The name of the backup to remove
Returns True if successful, otherwise False
Return type bool

CLI Example:
salt '*' win_iis.remove_backup backup_20170209

salt.modules.win_iis.remove_binding(site, hostheader='', ipaddress='*', port=80)
Remove an IIS binding.
Parameters
  • site (str) -- The IIS site name.
  • hostheader (str) -- The host header of the binding.
  • ipaddress (str) -- The IP address of the binding.
  • port (int) -- The TCP port of the binding.
Returns True if successful, otherwise False
Return type bool

CLI Example:
salt '*' win_iis.remove_binding site='site0' hostheader='example.com' ipaddress='*' port='80'

salt.modules.win_iis.remove_cert_binding(name, site, hostheader='', ipaddress='', port=443)
Remove a certificate from an IIS Web Binding.
New in version 2016.11.0.

Note: This function only removes the certificate from the web binding. It does not remove the web binding itself.

Parameters
  • name (str) -- The thumbprint of the certificate.
  • site (str) -- The IIS site name.
  • hostheader (str) -- The host header of the binding.
  • ipaddress (str) -- The IP address of the binding.
  • port (int) -- The TCP port of the binding.
Returns True if successful, otherwise False
Return type bool

CLI Example:
salt '*' win_iis.remove_cert_binding name='AAA000' site='site0' hostheader='example.com' ipaddress='*' port='443'

salt.modules.win_iis.remove_site(name)
Delete a website from IIS.
Parameters
  name (str) -- The IIS site name.
Returns True if successful, otherwise False
Return type bool

Note: This will not remove the application pool used by the site.
CLI Example:
```
salt '*' win_iis.remove_site name='My Test Site'
```

```
salt.modules.win_iis.remove_vdir(name, site, app=')
Remove an IIS virtual directory.

Parameters

• **name** *(str)* -- The virtual directory name.
• **site** *(str)* -- The IIS site name.
• **app** *(str)* -- The IIS application.

Returns  True if successful, otherwise False

Return type  bool
```

CLI Example:
```
salt '*' win_iis.remove_vdir name='vdir0' site='site0'
```

```
salt.modules.win_iis.restart_apppool(name)
Restart an IIS application pool.

New in version 2016.11.0.

Parameters  **name** *(str)* -- The name of the IIS application pool.

Returns  True if successful, otherwise False

Return type  bool
```

CLI Example:
```
salt '*' win_iis.restart_apppool name='MyTestPool'
```

```
salt.modules.win_iis.restart_site(name)
Restart a Web Site in IIS.

New in version 2017.7.0.

Parameters  **name** *(str)* -- The name of the website to restart.

Returns  True if successful, otherwise False

Return type  bool
```

CLI Example:
```
salt '*' win_iis.restart_site name='My Test Site'
```

```
salt.modules.win_iis.set_container_setting(name, container, settings)
Set the value of the setting for an IIS container.

New in version 2016.11.0.

Parameters

• **name** *(str)* -- The name of the IIS container.
• **container** *(str)* -- The type of IIS container. The container types are: AppPools, Sites, SslBindings
• **settings** *(dict)* -- A dictionary of the setting names and their values.

Returns  True if successful, otherwise False

Return type  bool
```

CLI Example:
```
salt '*' win_iis.set_container_setting name='MyTestPool' container='AppPools' settings="{'managedPipeLineMode': 'Integrated'}"
```

```
salt.modules.win_iis.set_webapp_settings(name, site, settings)
Configure an IIS application.

New in version 2017.7.0.

Configure an IIS application.
Note: This function only configures an existing app. Params are case sensitive.

Parameters

• **name** *(str)* -- The IIS application.
• **site** *(str)* -- The IIS site name.
• **settings** *(str)* -- A dictionary of the setting names and their values. - physicalPath: The physical path of the webapp. - applicationPool: The application pool for the webapp. - userName: "connectAs" user - password: "connectAs" password for user

Returns A boolean representing whether all changes succeeded.
Return type *bool*

CLI Example:

```bash
salt '*' win_iis.set_webapp_settings name='app0' site='site0' settings="{"physicalPath": 'C:\site0', 'apppool': 'site0'}"
```

salt.modules.win_iis.set_webconfiguration_settings *(name, settings)*

Set the value of the setting for an IIS container.

Parameters

• **name** *(str)* -- The PSPath of the IIS webconfiguration settings.
• **settings** *(list)* -- A list of dictionaries containing setting name, filter and value.

Returns True if successful, otherwise False
Return type *bool*

CLI Example:

```bash
salt '*' win_iis.set_webconfiguration_settings name='IIS:\' settings="[{'name': 'enabled', 'filter': 'system.webServer/security/authentication/anonymousAuthentication', 'value': False}]"
```

salt.modules.win_iis.start_apppool *(name)*

Start an IIS application pool.

New in version 2017.7.0.

Parameters **name** *(str)* -- The name of the App Pool to start.

Returns True if successful, otherwise False
Return type *bool*

CLI Example:

```bash
salt '*' win_iis.start_apppool name='MyTestPool'
```

salt.modules.win_iis.start_site *(name)*

Start a Web Site in IIS.

New in version 2017.7.0.

Parameters **name** *(str)* -- The name of the website to start.

Returns True if successful, otherwise False
Return type *bool*

CLI Example:

```bash
salt '*' win_iis.start_site name='My Test Site'
```

salt.modules.win_iis.stop_apppool *(name)*

Stop an IIS application pool.

New in version 2017.7.0.
salt.modules.win_iis.stop_apppool(name)
 Parameters name (str) -- The name of the App Pool to stop.
 Returns True if successful, otherwise False
 Return type bool

CLI Example:
```
salt '*' win_iis.stop_apppool name='MyTestPool'
```

salt.modules.win_iis.stop_site(name)
 Stop a Web Site in IIS.
 New in version 2017.7.0.
 Parameters name (str) -- The name of the website to stop.
 Returns True if successful, otherwise False
 Return type bool

CLI Example:
```
salt '*' win_iis.stop_site name='My Test Site'
```

23.9.494 salt.modules.win_ip

The networking module for Windows based systems

salt.modules.win_ip.disable(iface)
 Disable an interface

CLI Example:
```
salt -G 'os_family:Windows' ip.disable 'Local Area Connection #2'
```

salt.modules.win_ip.enable(iface)
 Enable an interface

CLI Example:
```
salt -G 'os_family:Windows' ip.enable 'Local Area Connection #2'
```

salt.modules.win_ip.get_all_interfaces()
 Return configs for all interfaces

CLI Example:
```
salt -G 'os_family:Windows' ip.get_all_interfaces
```

salt.modules.win_ip.get_default_gateway()
 Set DNS source to DHCP on Windows

CLI Example:
```
salt -G 'os_family:Windows' ip.get_default_gateway
```

salt.modules.win_ip.get_interface(iface)
 Return the configuration of a network interface

CLI Example:
```
salt -G 'os_family:Windows' ip.get_interface 'Local Area Connection'
```
salt.modules.win_ip.get_subnet_length(mask)
Convenience function to convert the netmask to the CIDR subnet length

CLI Example:
```
salt -G 'os_family:Windows' ip.get_subnet_length 255.255.255.0
```

salt.modules.win_ip.is_disabled(iface)
Returns True if interface is disabled, otherwise False

CLI Example:
```
salt -G 'os_family:Windows' ip.is_disabled 'Local Area Connection #2'
```

salt.modules.win_ip.is_enabled(iface)
Returns True if interface is enabled, otherwise False

CLI Example:
```
salt -G 'os_family:Windows' ip.is_enabled 'Local Area Connection #2'
```

salt.modules.win_ip.raw_interface_configs()
Return raw configs for all interfaces

CLI Example:
```
salt -G 'os_family:Windows' ip.raw_interface_configs
```

salt.modules.win_ip.set_dhcp_all(iface)
Set both IP Address and DNS to DHCP

CLI Example:
```
salt -G 'os_family:Windows' ip.set_dhcp_all 'Local Area Connection'
```

salt.modules.win_ip.set_dhcp_dns(iface)
Set DNS source to DHCP on Windows

CLI Example:
```
salt -G 'os_family:Windows' ip.set_dhcp_dns 'Local Area Connection'
```

salt.modules.win_ip.set_dhcp_ip(iface)
Set Windows NIC to get IP from DHCP

CLI Example:
```
salt -G 'os_family:Windows' ip.set_dhcp_ip 'Local Area Connection'
```

salt.modules.win_ip.set_static_dns(iface, *addrs)
Set static DNS configuration on a Windows NIC

Parameters
- **iface** *(str)* -- The name of the interface to set
- **addrs** -- One or more DNS servers to be added. To clear the list of DNS servers pass an empty list ([]). If undefined or None no changes will be made.

Returns A dictionary containing the new DNS settings

Return type *dict*

CLI Example:
salt -G 'os_family:Windows' ip.set_static_dns 'Local Area Connection' '192.168.1.1' →
salt -G 'os_family:Windows' ip.set_static_dns 'Local Area Connection' '192.168.1.252' '192.168.1.253'

salt.modules.win_ip.set_static_ip(iface, addr, gateway=None, append=False)
Set static IP configuration on a Windows NIC
iface The name of the interface to manage
addr IP address with subnet length (ex. 10.1.2.3/24). The ip.get_subnet_length function can be used to calculate the subnet length from a netmask.
gateway [None] If specified, the default gateway will be set to this value.
append [False] If True, this IP address will be added to the interface. Default is False, which overrides any existing configuration for the interface and sets addr as the only address on the interface.

CLI Example:
salt -G 'os_family:Windows' ip.set_static_ip 'Local Area Connection' 10.1.2.3/24
→gateway=10.1.2.1
salt -G 'os_family:Windows' ip.set_static_ip 'Local Area Connection' 10.1.2.4/24
→append=True

23.9.495 salt.modules.win_lgpo
Manage Local Policy on Windows
This module allows configuring local group policy (i.e. gpedit.msc) on a Windows server.
New in version 2016.11.0.

Administrative Templates
Administrative template policies are dynamically read from ADMX/ADML files on the server.

Windows Settings
Policies contained in the "Windows Settings" section of the gpedit.msc GUI are statically defined in this module. Each policy is configured for the section (Machine/User) in the module’s _policy_info class. The _policy_info class contains a "policies" dict on how the module will configure the policy, where the policy resides in the GUI (for display purposes), data validation data, data transformation data, etc.

Current known limitations
- At this time, start/shutdown scripts policies are displayed, but are not configurable.
- Not all "Security Settings" policies exist in the _policy_info class

depends
- pywin32 Python module
- lxml
- uuid
- struct
salt.utils.win_reg

salt.modules.win_lgpo.get(policy_class=None, return_full_policy_names=True, hierarchical_return=False, adml_language='en-US', return_not_configured=False)

Get a policy value

Parameters

- **policy_class** *(str)* -- Some policies are both user and computer, by default all policies will be pulled, but this can be used to retrieve only a specific policy class User/USER/user = retrieve user policies Machine/MACHINE/machine/Computer/COMPUTER/computer = retrieve machine/computer policies

- **return_full_policy_names** *(bool)* -- True/False to return the policy name as it is seen in the gpedit.msc GUI or to only return the policy key/id.

- **hierarchical_return** *(bool)* -- True/False to return the policy data in the hierarchy as seen in the gpedit.msc GUI. The default of False will return data split only into User/Computer configuration sections

- **adml_language** *(str)* -- The ADML language to use for processing display/descriptive names and enumeration values of ADMX template data, defaults to en-US

- **return_not_configured** *(bool)* -- Include Administrative Template policies that are 'Not Configured' in the return data

Returns

A dictionary containing the policy values for the specified class

Return type **dict**

CLI Example:

```bash
salt '*' lgpo.get machine return_full_policy_names=True
```

salt.modules.win_lgpo.get_policy(policy_name, policy_class, adml_language='en-US', return_value_only=True, return_full_policy_names=True, hierarchical_return=False)

Get the current settings for a single policy on the machine

Parameters

- **policy_name** *(str)* -- The name of the policy to retrieve. Can be the any of the names or aliases returned by lgpo.get_policy_info
- **policy_class** *(str)* -- The policy class. Must be one of machine or user
- **adml_language** *(str)* -- The language code for the adml file to use for localization. The default is en-US
- **return_value_only** *(bool)* -- True will return only the value for the policy, without the name of the policy. return_full_policy_names and hierarchical_return will be ignored. Default is True

- **return_full_policy_names** *(bool)* -- Returns the full policy name regardless of what was passed in policy_name

Note: This setting applies to sub-elements of the policy if they exist. The value passed in policy_name will always be used as the policy name when this setting is False

Returns

A dictionary containing the policy settings

Return type **dict**

CLI Example:

```bash
# Using the policy id
salt '*' lgpo.get_policy LockoutDuration machine
```

(continues on next page)
salt * lgpo.get_policy AutoUpdateCfg machine

# Using the full name
salt * lgpo.get_policy "Account lockout duration" machine
salt * lgpo.get_policy "Configure Automatic Updates" machine

# Using full path and name
salt * lgpo.get_policy "Windows Components\Windows Update\Configure Automatic Updates" machine

salt.modules.win_lgpo.get_policy_info(policy_name, policy_class, adml_language='en-US')

Returns information about a specified policy

Parameters

- **policy_name** *(str)* -- The name of the policy to lookup
- **policy_class** *(str)* -- The class of policy, i.e. machine, user, both
- **adml_language** *(str)* -- The ADML language to use for Administrative Template data lookup

Returns Information about the specified policy

Return type dict

CLI Example:
salt '*' lgpo.get_policy_info 'Maximum password age' machine

You can use lgpo.get_policy_info to get all the possible names that could be used in a state file or from the command line (along with elements that need to be set/etc). The key is to match the text you see in the gpedit.msc gui exactly, including quotes around words or phrases. The "full path" style is really only needed when there are multiple policies that use the same base name. For example, Access data sources across domains exists in ~10 different paths. If you put that through get_policy_info you'll get back a message that it is used for multiple policies and you need to be more specific.

CLI Example:
salt-call --local lgpo.get_policy_info ShellRemoveOrderPrints_2 machine

local:

    message: Policy:ShellRemoveOrderPrints_2
        policy_aliases:
            - Turn off the "Order Prints" picture task
              - ShellRemoveOrderPrints_2
            - System\Internet Communication Management\Internet Communication
              - settings\Turn off the "Order Prints" picture task
        policy_class: machine
        policy_elements:
        policy_found: True
        policy_name: ShellRemoveOrderPrints_2
        rights_assignment: False

Escaping can get tricky in cmd/Powershell. The following is an example of escaping in Powershell using backquotes:
```
PS>salt-call --local lgpo.get_policy_info "Turn off the \"Order Prints\" picture task" machine

local: -----------
message: policy_aliases:
  - Turn off the "Order Prints" picture task
  - ShellRemoveOrderPrints_2
  - System\Internet Communication Management\Internet Communication settings\Turn off the "Order Prints" picture task
policy_class: machine
policy_elements:
policy_found: True
policy_name: Turn off the "Order Prints" picture task
rights_assignment: False
```

This function can then be used to get the options available for specifying Group Policy Objects to be used in state files. Based on the above any of these should be usable:

```
internet_communications_settings:
  lgpo.set:
    - computer_policy:
      Turn off the "Order Prints" picture task: Enabled
```

```internet_communications_settings:
  lgpo.set:
    - computer_policy:
      ShellRemoveOrderPrints_2: Enabled
```

When using the full path, it might be a good idea to use single quotes around the path:

```internet_communications_settings:
  lgpo.set:
    - computer_policy:
      'System\Internet Communication Management\Internet Communication settings\Turn off the "Order Prints" picture task': 'Enabled'
```

If you struggle to find the policy from get_policy_info using the name as you see in gpedit.msc, the names such as "ShellRemoveOrderPrints_2" come from the .admx files. If you know nothing about .admx/.adml relationships (ADML holds what you see in the GUI, ADMX holds the more technical details), then this may be a little bit too much info, but here is an example with the above policy using Powershell:

```
PS>Get-ChildItem -Path C:\Windows\PolicyDefinitions -Recurse -Filter *.adml | %
  Select-String "Order Prints"
```

(continues on next page)
C:\windows\PolicyDefinitions\en-US\ICM.adml:157: If you enable this policy setting, the task "Order Prints Online" is removed from Picture Tasks in File Explorer folders.

From this grep, we can see id "ShellRemoveOrderPrints" is the ID of the string used to describe this policy, then we search for it in the ADMX:

```
PS>Get-ChildItem -Path C:\Windows\PolicyDefinitions -Recurse -Filter *.admx | % Select-String "ShellRemoveOrderPrints"
C:\windows\PolicyDefinitions\ICM.admx:661: <policy name="ShellRemoveOrderPrints_1" class="User" displayName="$(string.ShellRemoveOrderPrints_Help)"
key="Software\Microsoft\Windows\CurrentVersion\Policies\Explorer" valueName="NoOnlinePrintsWizard">
C:\windows\PolicyDefinitions\ICM.admx:671: <policy name="ShellRemoveOrderPrints_2" class="Machine" displayName="$(string.ShellRemoveOrderPrints_Help)"
key="Software\Microsoft\Windows\CurrentVersion\Policies\Explorer" valueName="NoOnlinePrintsWizard">
```

Now we have two to pick from. And if you notice the class="Machine" and class="User" (which details if it is a computer policy or user policy respectively) the ShellRemoveOrderPrints_2 is the "short name" we could use to pass through get_policy_info to see what the module itself is expecting.

```
salt.modules.win_lgpo.set_(computer_policy=None, user_policy=None, cumulative_rights_assignments=True, adm_language='en-US')
```

Set a local server policy.

**Parameters**

- **computer_policy (dict)** -- A dictionary of "policyname: value" pairs of computer policies to set. 'value' should be how it is displayed in the gpedit GUI, i.e. if a setting can be 'Enabled'/"Disabled", then that should be passed

Administrative Template data may require dicts within dicts, to specify each element of the Administrative Template policy. Administrative Templates policies are always cumulative.

Policy names can be specified in a number of ways based on the type of policy:

**Windows Settings Policies:**

These policies can be specified using the GUI display name or the key name from the _policy_info class in this module. The GUI display name is also contained in the _policy_info class in this module.

**Administrative Template Policies:**

These can be specified using the policy name as displayed in the GUI (case sensitive). Some policies have the same name, but a different location (for example, "Access data sources across domains"). These can be differentiated by the "path" in the GUI (for example, "Windows Components\Internet Explorer\Internet Control Panel\Security Page\Internet Zone\Access data sources across domains").

Additionally, policies can be specified using the "name" and "id" attributes from the ADMX files.

For Administrative Templates that have policy elements, each element can be specified using the text string as seen in

23.9. execution modules
the GUI or using the ID attribute from the ADMX file. Due to
the way some of the GUI text is laid out, some policy element
names could include descriptive text that appears lbefore the
policy element in the GUI.

Use the get_policy_info function for the policy name to view
the element ID/names that the module will accept.

- **user_policy** *(dict)* -- The same setup as the computer_policy, except with data
to configure the local user policy.

- **cumulative_rights_assignments** *(bool)* -- Determine how user rights as-
  signment policies are configured.

  If True, user right assignment specifications are simply added to the existing policy.
  If False, only the users specified will get the right (any existing will have the right
  revoked).

- **adml_language** *(str)* -- The language files to use for looking up Administrative
  Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US'
  (U.S. English).

Returns True is successful, otherwise False
Return type *bool*

CLI Example:

```
salt '...' lgpo.set computer_policy="{'LockoutDuration': 2, 'RestrictAnonymous':
  'Enabled', 'AuditProcessTracking': 'Success, Failure'}"
```

salt.modules.win_lgpo.set_computer_policy *(name, setting, cumulative_rights_assignments=True,
adml_language='en-US')*

Set a single computer policy

Parameters
- **name** *(str)* -- The name of the policy to configure
- **setting** *(str)* -- The setting to configure the named policy with
- **cumulative_rights_assignments** *(bool)* -- Determine how user rights as-
  signment policies are configured. If True, user right assignment specifications are
  simply added to the existing policy. If False, only the users specified will get the right
  (any existing will have the right revoked)
- **adml_language** *(str)* -- The language files to use for looking up Administrative
  Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US'
  (U.S. English).

Returns True if successful, otherwise False
Return type *bool*

CLI Example:

```
salt '...' lgpo.set_computer_policy LockoutDuration 1440
```

salt.modules.win_lgpo.set_user_policy *(name, setting, adml_language='en-US')*

Set a single user policy

Parameters
- **name** *(str)* -- The name of the policy to configure
- **setting** *(str)* -- The setting to configure the named policy with
- **adml_language** *(str)* -- The language files to use for looking up Administrative
  Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US'
  (U.S. English).

Returns True if successful, Otherwise False
Return type *bool*
23.9.496  salt.modules.win_license

This module allows you to manage windows licensing via slmgr.vbs

```python
salt '*' license.install XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
```

salt.modules.win_license.**activate**()

Attempt to activate the current machine via Windows Activation

CLI Example:

```python
salt '*' license.activate
```

salt.modules.win_license.**info**()

Return information about the license, if the license is not correctly activated this will return None.

CLI Example:

```python
salt '*' license.info
```

salt.modules.win_license.**install**(product_key)

Install the given product key

CLI Example:

```python
salt '*' license.install XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
```

salt.modules.win_license.**installed**(product_key)

Check to see if the product key is already installed.

Note: *This is not 100% accurate as we can only see the last 5 digits of the license.*

CLI Example:

```python
salt '*' license.installed XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
```

salt.modules.win_license.**licensed**()

Return true if the current machine is licensed correctly

CLI Example:

```python
salt '*' license.licensed
```

salt.modules.win_license.**uninstall**()

Uninstall the current product key

CLI Example:

```python
salt '*' license.uninstall
```
23.9.497  `salt.modules.win_network`

Module for gathering and managing network information

```
salt.modules.win_network.connect( host, port=None, **kwargs)
```
Test connectivity to a host using a particular port from the minion.

New in version 2016.3.0.

CLI Example:

```
salt '*' network.connect archlinux.org 80
salt '*' network.connect archlinux.org 80 timeout=3
salt '*' network.connect archlinux.org 80 timeout=3 family=ipv4
salt '*' network.connect google-public-dns-a.google.com port=53 proto=udp family=ipv4 timeout=3
```

```
salt.modules.win_network.dig(host)
```
Performs a DNS lookup with dig

Note: dig must be installed on the Windows minion

CLI Example:

```
salt '*' network.dig archlinux.org
```

```
salt.modules.win_network.get_route(ip)
```
Return routing information for given destination ip

New in version 2016.11.5.

CLI Example:

```
salt '*' network.get_route 10.10.10.10
```

```
salt.modules.win_network.hw_addr(iface)
```
Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```
salt '*' network.hw_addr 'Wireless Connection #1'
```

```
salt.modules.win_network.hwaddr(iface)
```
This function is an alias of hw_addr.

Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```
salt '*' network.hw_addr 'Wireless Connection #1'
```

```
salt.modules.win_network.in_subnet(cidr)
```
Returns True if host is within specified subnet, otherwise False

CLI Example:

```
salt '*' network.in_subnet 10.0.0.0/16
```
salt.modules.win_network.interfaces()  
Return a dictionary of information about all the interfaces on the minion

CLI Example:
```
salt '*' network.interfaces
```

salt.modules.win_network.interfaces_names()  
Return a list of all the interfaces names

CLI Example:
```
salt '*' network.interfaces_names
```

salt.modules.win_network.ip_addrs(interface=None, include_loopback=False, cidr=None, type=None)  
Returns a list of IPv4 addresses assigned to the host.

- **interface**  Only IP addresses from that interface will be returned.
- **include_loopback**  [False] Include loopback 127.0.0.1 IPv4 address.
- **cidr**  Describes subnet using CIDR notation and only IPv4 addresses that belong to this subnet will be returned.

Changed in version 2019.2.0.

- **type**  If option set to 'public' then only public addresses will be returned. Ditto for 'private'.

Changed in version 2019.2.0.

CLI Example:
```
salt '*' network.ip_addrs
salt '*' network.ip_addrs cidr=10.0.0.0/8
salt '*' network.ip_addrs cidr=192.168.0.0/16 type=private
```

salt.modules.win_network.ip_addrs6(interface=None, include_loopback=False, cidr=None)  
Returns a list of IPv6 addresses assigned to the host.

- **interface**  Only IP addresses from that interface will be returned.
- **include_loopback**  [False] Include loopback ::1 IPv6 address.
- **cidr**  Describes subnet using CIDR notation and only IPv6 addresses that belong to this subnet will be returned.

Changed in version 2019.2.0.

CLI Example:
```
salt '*' network.ip_addrs6
salt '*' network.ip_addrs6 cidr=2000::/3
```

salt.modules.win_network.ipaddrs(interface=None, include_loopback=False, cidr=None, type=None)  
This function is an alias of ip_addrs.

Returns a list of IPv4 addresses assigned to the host.

- **interface**  Only IP addresses from that interface will be returned.
- **include_loopback**  [False] Include loopback 127.0.0.1 IPv4 address.
- **cidr**  Describes subnet using CIDR notation and only IPv4 addresses that belong to this subnet will be returned.

Changed in version 2019.2.0.

- **type**  If option set to 'public' then only public addresses will be returned. Ditto for 'private'.

Changed in version 2019.2.0.

CLI Example:
salt.modules.win_network.ipaddrs6(interface=None, include_loopback=False, cidr=None)

This function is an alias of ip_addrs6.

Returns a list of IPv6 addresses assigned to the host.

- **interface** Only IP addresses from that interface will be returned.
- **include_loopback** [False] Include loopback ::1 IPv6 address.
- **cidr** Describes subnet using CIDR notation and only IPv6 addresses that belong to this subnet will be returned.

Changed in version 2019.2.0.

CLI Example:
```
salt '*' network.ip_addrs6
salt '*' network.ip_addrs6 cidr=2000::/3
```

salt.modules.win_network.is_private(ip_addr)

Check if the given IP address is a private address

New in version 2019.2.0.

CLI Example:
```
salt '*' network.is_private 10.0.0.3
```

salt.modules.win_network.netstat()

Return information on open ports and states

CLI Example:
```
salt '*' network.netstat
```

salt.modules.win_network.nslookup(host)

Query DNS for information about a domain or ip address

CLI Example:
```
salt '*' network.nslookup archlinux.org
```

salt.modules.win_network.ping(host, timeout=False, return_boolean=False)

Performs a ping to a host

CLI Example:
```
salt '*' network.ping archlinux.org
```

New in version 2016.11.0.

Return a True or False instead of ping output.

```
salt '*' network.ping archlinux.org return_boolean=True
```

Set the time to wait for a response in seconds.

```
salt '*' network.ping archlinux.org timeout=3
```
salt.modules.win_network.subnets()
Returns a list of subnets to which the host belongs

CLI Example:
```
salt '* network.subnets
```

salt.modules.win_network.traceroute(host)
Perform a traceroute to a 3rd party host

CLI Example:
```
salt '*' network.traceroute archlinux.org
```

23.9.498 salt.modules.win_ntp

Management of NTP servers on Windows

New in version 2014.1.0.

salt.modules.win_ntp.get_servers()
Get list of configured NTP servers

CLI Example:
```
salt '*' ntp.get_servers
```

salt.modules.win_ntp.set_servers(*servers)
Set Windows to use a list of NTP servers

CLI Example:
```
salt '*' ntp.set_servers 'pool.ntp.org' 'us.pool.ntp.org'
```

23.9.499 salt.modules.win_path

Manage the Windows System PATH

Note that not all Windows applications will rehash the PATH environment variable, Only the ones that listen to the WM_SETTINGCHANGE message http://support.microsoft.com/kb/104011

salt.modules.win_path.add(path, index=None, **kwargs)
Add the directory to the SYSTEM path in the index location. Returns True if successful, otherwise False.

path Directory to add to path
index Optionally specify an index at which to insert the directory
rehash [True] If the registry was updated, and this value is set to True, sends a WM_SETTINGCHANGE broadcast to refresh the environment variables. Set this to False to skip this broadcast.

CLI Examples:
```
# Will add to the beginning of the path
salt '*' win_path.add 'c:\python27' 0

# Will add to the end of the path
salt '*' win_path.add 'c:\python27' index='-1'
```

salt.modules.win_path.exists(path)
Check if the directory is configured in the SYSTEM path Case-insensitive and ignores trailing backslash
**Returns** boolean True if path exists, False if not

CLI Example:
```
salt '*' win_path.exists 'c:\python27'
salt '*' win_path.exists 'c:\python27\'
salt '*' win_path.exists 'C:\pyThon27'
```

salt.modules.win_path.get_path()
Returns a list of items in the SYSTEM path

CLI Example:
```
salt '*' win_path.get_path
```

salt.modules.win_path.rehash()
Send a WMSETTINGCHANGE Broadcast to Windows to refresh the Environment variables for new processes.

**Note:** This will only affect new processes that aren't launched by services. To apply changes to the path to services, the host must be restarted. The salt-minion, if running as a service, will not see changes to the environment until the system is restarted. See MSDN Documentation

CLI Example:
```
salt '*' win_path.rehash
```

salt.modules.win_path.remove(path, **kwargs)
Remove the directory from the SYSTEM path

**Returns** boolean True if successful, False if unsuccessful

**rehash** [True] If the registry was updated, and this value is set to True, sends a WMSETTINGCHANGE broadcast to refresh the environment variables. Set this to False to skip this broadcast.

CLI Example:
```
# Will remove C:\Python27 from the path
salt '*' win_path.remove 'c:\\python27'
```

### 23.9.500 salt.modules.win_pkg
A module to manage software on Windows

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *pkg.install* is not available), see here.

The following functions require the existence of a windows repository metadata DB, typically created by running `pkg.refresh_db`:

- `pkg.get_repo_data`
- `pkg.install`
- `pkg.latest_version`
- `pkg.list_available`
• `pkg.list_pkgs`
• `pkg.list_upgrades`
• `pkg.remove`

If a metadata DB does not already exist and one of these functions is run, then one will be created from the repo SLS files that are present.

As the creation of this metadata can take some time, the `winrepo_cache_expire_min` minion config option can be used to suppress refreshes when the metadata is less than a given number of seconds old.

**Note:** Version numbers can be version number string, latest and Not Found, where Not Found means this module was not able to determine the version of the software installed, it can also be used as the version number in sls definitions file in these cases. Versions numbers are sorted in order of 0, Not Found, order version numbers, ..., latest.

```python
salt.modules.win_pkg.compare_versions(ver1='', oper='==', ver2='')
```

Compare software package versions. Made public for use with Jinja

- **Parameters**
  - `ver1` (str) -- A software version to compare
  - `oper` (str) -- The operand to use to compare
  - `ver2` (str) -- A software version to compare

- **Returns** True if the comparison is valid, otherwise False

- **Return type** bool

**CLI Example:**

```
salt '*' pkg.compare_versions 1.2 >= 1.3
```

```python
salt.modules.win_pkg.genrepo(**kwargs)
```

Generate package metadata db based on files within the winrepo_source_dir

- **Kwargs:**
  - `saltenv` (str): Salt environment. Default: `base`
  - `verbose` (bool): Return verbose data structure which includes 'success_list', a list of all sls files and the package names contained within. Default False.
  - `failhard` (bool): If True, an error will be raised if any repo SLS files failed to process. If False, no error will be raised, and a dictionary containing the full results will be returned.

- **Note:** Hidden directories (directories beginning with '.', such as '.git') will be ignored.

- **Returns** A dictionary of the results of the command

- **Return type** dict

**CLI Example:**

```
salt-run pkg.genrepo
salt -G 'os:windows' pkg.genrepo verbose=true failhard=false
salt -G 'os:windows' pkg.genrepo saltenv=base
```

```python
salt.modules.win_pkg.get_package_info(name, saltenv='base')
```

Return package info. Returns empty map if package not available.

```python
salt.modules.win_pkg.get_repo_data(saltenv='base')
```

Returns the existing package metadata db. Will create it, if it does not exist, however will not refresh it.

- **Parameters** `saltenv` (str) -- Salt environment. Default base
Returns  A dict containing contents of metadata db.
Return type  dict
CLI Example:
```
salt '*' pkg.get_repo_data
```

```
salt.modules.win_pkg.install(name=None, refresh=False, pkgs=None, **kwargs)
```
Install the passed package(s) on the system using winrepo

Parameters

- **name (str)** -- The name of a single package, or a comma-separated list of packages to install. (no spaces after the commas)
- **refresh (bool)** -- Boolean value representing whether or not to refresh the winrepo db. Default False.
- **pkgs (list)** -- A list of packages to install from a software repository. All packages listed under pkgs will be installed via a single command.

You can specify a version by passing the item as a dict:

CLI Example:
```
# will install the latest version of foo and bar
salt '*' pkg.install pkgs='["foo", "bar"]'
# will install the latest version of foo and version 1.2.3 of bar
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3"}]'
```

Kwargs:

- **version (str)**: The specific version to install. If omitted, the latest version will be installed. Recommend for use when installing a single package.

If passed with a list of packages in the pkgs parameter, the version will be ignored.

CLI Example:
```
# Version is ignored
salt '*' pkg.install pkgs='["foo", 'bar']" version=1.2.3
```

If passed with a comma separated list in the name parameter, the version will apply to all packages in the list.

CLI Example:
```
# Version 1.2.3 will apply to packages foo and bar
salt '*' pkg.install foo,bar version=1.2.3
```

- **extra_install_flags (str)**: Additional install flags that will be appended to the install_flags defined in the software definition file. Only applies when single package is passed.

- **saltenv (str)**: Salt environment. Default 'base'

- **report_reboot_exit_codes (bool)**: If the installer exits with a recognized exit code indicating that a reboot is required, the module function

  ``
  win_system.set_reboot_required_witnessed
  ``

  will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, 3010 is the only recognized exit code. The value of this param defaults to True.

  New in version 2016.11.0.

Returns
Return a dict containing the new package names and versions. If the package is already installed, an empty dict is returned.

If the package is installed by pkg.install:

```python
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

Return type  dict

The following example will refresh the winrepo and install a single package, 7zip.

CLI Example:

```bash
salt '*' pkg.install 7zip refresh=True
```

CLI Example:

```bash
salt '*' pkg.install 7zip
salt '*' pkg.install 7zip,filezilla
salt '*' pkg.install pkgs='"7zip","filezilla"'
```

WinRepo Definition File Examples:

The following example demonstrates the use of cache_file. This would be used if you have multiple installers in the same directory that use the same install.ini file and you don't want to download the additional installers.

```yaml
ntp:
  4.2.8:
    installer: 'salt://win/repo/ntp/ntp-4.2.8-win32-setup.exe'
    full_name: Meinberg NTP Windows Client
    locale: en_US
    reboot: False
    cache_file: 'salt://win/repo/ntp/install.ini'
    install_flags: '/USEFILE=C:\salt\var\cache\salt\minion\files\base\win\repo\ntp\install.ini'
    uninstaller: 'NTP/uninst.exe'
```

The following example demonstrates the use of cache_dir. It assumes a file named install.ini resides in the same directory as the installer.

```yaml
ntp:
  4.2.8:
    installer: 'salt://win/repo/ntp/ntp-4.2.8-win32-setup.exe'
    full_name: Meinberg NTP Windows Client
    locale: en_US
    reboot: False
    cache_dir: True
    install_flags: '/USEFILE=C:\salt\var\cache\salt\minion\files\base\win\repo\ntp\install.ini'
    uninstaller: 'NTP/uninst.exe'
```

salt.modules.win_pkg.latest_version(*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.
Note: Since this is looking for the latest version available, a refresh_db will be triggered by default. This can take some time. To avoid this set refresh to False.

**Parameters**

names (str) -- A single or multiple names to lookup

**Kwargs:**
saltenv (str): Salt environment. Default base refresh (bool): Refresh package metadata. Default True

**Returns**
A dictionary of packages with the latest version available

**Return type**

dict

**CLI Example:**

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

**salt.modules.win_pkg.list_available(**names**, **kwargs**)

Return a list of available versions of the specified package.

**Parameters**

names (str) -- One or more package names

**Kwargs:**
saltenv (str): The salt environment to use. Default base.
refresh (bool): Refresh package metadata. Default False.
return_dict_always (bool): Default False dict when a single package name is queried.

**Returns**
The package name with its available versions

**Return type**

dict

```
[<package name>: [version, version], ]
```

**CLI Example:**

```
salt '*' pkg.list_available <package name> return_dict_always=True
salt '*' pkg.list_available <package name01> <package name02>
```

**salt.modules.win_pkg.list_pkgs(versions_as_list=False, include_components=True, include_updates=True, **kwargs**)

List the packages currently installed.

**Note:** To view installed software as displayed in the Add/Remove Programs, set include_components and include_updates to False.

**Parameters**

- versions_as_list (bool) -- Returns the versions as a list
- include_components (bool) -- Include sub components of installed software. Default is True
- include_updates (bool) -- Include software updates and Windows updates. Default is True

**Kwargs:**
saltenv (str): The salt environment to use. Default base
refresh (bool): Refresh package metadata. Default False

**Returns**
A dictionary of installed software with versions installed

**Return type**
dict
{'<package_name>': '<version>'}

CLI Example:
```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

salt.modules.win_pkg.list_upgrades(refresh=True, **kwargs)
List all available package upgrades on this system

Parameters
- refresh (bool) -- Refresh package metadata. Default True

Kwargs:
- saltenv (str): Salt environment. Default base

Returns:
A dictionary of packages with available upgrades

Return type: dict

CLI Example:
```
salt '*' pkg.list_upgrades
```

salt.modules.win_pkg.purge(name=None, pkgs=None, **kwargs)
Package purges are not supported on Windows, this function is identical to remove().

Note: At some point in the future, pkg.purge may direct the installer to remove all configs and settings for software packages that support that option.

New in version 0.16.0.

Parameters
- name (str) -- The name of the package to be deleted.
- version (str) -- The version of the package to be deleted. If this option is used in combination with the pkgs option below, then this version will be applied to all targeted packages.
- pkgs (list) -- A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Kwargs:
- saltenv (str): Salt environment. Default base
- refresh (bool): Refresh package metadata. Default False

Returns:
A dict containing the changes.

Return type: dict

CLI Example:
```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.win_pkg.refresh_db(**kwargs)
Generates the local software metadata database (winrepo.p) on the minion. The database is stored in a serialized format located by default at the following location:

C:\salt\var\cache\salt\minion\files\base\win\repo-ng\winrepo.p

This module performs the following steps to generate the software metadata database:
- Fetch the package definition files (.sls) from winrepo_source_dir (default salt://win/repo-ng) and cache them in <cachedir>/files/<saltenv><winrepo_source_dir>(default: C:\salt\var\cache\salt\minion\files\base\win\repo-ng)
- Call `pkg.genrepo` to parse the package definition files and generate the repository metadata database file (`winrepo.p`)
- Return the report received from `pkg.genrepo`

The default winrepo directory on the master is `/srv/salt/win/repo-ng`. All files that end with `.sls` in this and all subdirectories will be used to generate the repository metadata database (`winrepo.p`).

**Note:**
- Hidden directories (directories beginning with `.', such as `git`) will be ignored.

**Note:** There is no need to call `pkg.refresh_db` every time you work with the pkg module. Automatic refresh will occur based on the following minion configuration settings:
  - `winrepo_cache_expire_min`
  - `winrepo_cache_expire_max`

However, if the package definition files have changed, as would be the case if you are developing a new package definition, this function should be called to ensure the minion has the latest information about packages available to it.

**Warning:** Directories and files fetched from `<winrepo_source_dir>` (`/srv/salt/win/repo-ng`) will be processed in alphabetical order. If two or more software definition files contain the same name, the last one processed replaces all data from the files processed before it.

For more information see [Windows Software Repository](https://docs.saltstack.com/en/latest/ref/module/salt.modules.html#salt.modules.win_pkg.remove)

### Arguments:

- `saltenv` (str): Salt environment. Default: `base`
- `verbose` (bool): Return a verbose data structure which includes 'success_list', a list of all sls files and the package names contained within. Default is `False`
- `failhard` (bool): If `True`, an error will be raised if any repo SLS files fails to process. If `False`, no error will be raised, and a dictionary containing the full results will be returned.

**Returns**
- A dictionary containing the results of the database refresh.

**Return type**
- dict

**Note:** A result with a `total: 0` generally means that the files are in the wrong location on the master. Try running the following command on the minion: `salt-call -l debug pkg.refresh saltenv=base`

**Warning:** When calling this command from a state using `module.run` be sure to pass `failhard: False`. Otherwise the state will report failure if it encounters a bad software definition file.

### CLI Example:

```
salt '*' pkg.refresh_db
salt '*' pkg.refresh_db saltenv=base
```

`salt.modules.win_pkg.remove(name=None, pkgs=None, **kwargs)`

Remove the passed package(s) from the system using winrepo

New in version 0.16.0.
Parameters

- **name (str)** -- The name(s) of the package(s) to be uninstalled. Can be a single package or a comma delimited list of packages, no spaces.
- **pkgs (list)** -- A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Kwargs:

  - **version (str)**: The version of the package to be uninstalled. If this option is used to to uninstall multiple packages, then this version will be applied to all targeted packages. Recommended using only when uninstalling a single package. If this parameter is omitted, the latest version will be uninstalled.
  - **saltenv (str)**: Salt environment. Default base
  - **refresh (bool)**: Refresh package metadata. Default False

Returns

Returns a dict containing the changes.

If the package is removed by pkg.remove:

```json
{"<package>": {"old": '<old-version>', 'new': '<new-version>'}}
```

If the package is already uninstalled:

```json
{"<package>": {"current": 'not installed'}}
```

Return type dict

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.win_pkg.upgrade(**kwargs)
Upgrade all software. Currently not implemented

---

Note: This feature is not yet implemented for Windows.

Returns Empty dict, until implemented

Return type dict

CLI Example:

```salt '*' pkg.upgrade```

salt.modules.win_pkg.upgrade_available(name, **kwargs)
Check whether or not an upgrade is available for a given package

Parameters **name (str)** -- The name of a single package

Returns True if new version available, otherwise False

Return type bool

CLI Example:

```salt '*' pkg.upgrade_available <package name>```
salt.modules.win_pkg.version(*names, **kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

    Parameters
        name (str) -- One or more package names
    
    Kwarg:

    Returns
        version string when a single package is specified. dict: The package name(s) with the installed versions.
    
    Return type
        str

    ["<version>", "<version>"] OR
    
    "<package name>: [<version>, <version>]

    CLI Example:

    salt '*' pkg.version <package name>
    salt '*' pkg.version <package name01> <package name02>

23.9.501 salt.modules.win_pki

    platform
        Windows
    
    depends
        • PowerShell 4
        • PKI Client Module (Windows 8+ / Windows Server 2012+)

New in version 2016.11.0.

salt.modules.win_pki.export_cert(name, thumbprint, cert_format='cer', context='LocalMachine', store='My', password='')

Export the certificate to a file from the given certificate store.

    Parameters
        • name (str) -- The destination path for the exported certificate file.
        • thumbprint (str) -- The thumbprint value of the target certificate.
        • cert_format (str) -- The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
        • context (str) -- The name of the certificate store location context.
        • store (str) -- The name of the certificate store.
        • password (str) -- The password of the certificate. Only applicable to pfx format.
            Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.

    Returns
        A boolean representing whether all changes succeeded.
    
    Return type
        bool

    CLI Example:

    salt '*' win_pki.export_cert name='C:\certs\example.cer' thumbprint='AAA000'
salt.modules.win_pki.get_cert_file(name, cert_format='cer', password='')
Get the details of the certificate file.

Parameters
- **name** *(str)* -- The filesystem path of the certificate file.
- **cert_format** *(str)* -- The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
- **password** *(str)* -- The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.

Returns A dictionary of the certificate thumbprints and properties.
Return type dict

CLI Example:
```
salt '*' win_pki.get_cert_file name='C:\certs\example.cer'
```

salt.modules.win_pki.get_certs(context='LocalMachine', store='My')
Get the available certificates in the given store.

Parameters
- **context** *(str)* -- The name of the certificate store location context.
- **store** *(str)* -- The name of the certificate store.

Returns A dictionary of the certificate thumbprints and properties.
Return type dict

CLI Example:
```
salt '*' win_pki.get_certs
```

salt.modules.win_pki.get_stores()
Get the certificate location contexts and their corresponding stores.

Returns A dictionary of the certificate location contexts and stores.
Return type dict

CLI Example:
```
salt '*' win_pki.get_stores
```

salt.modules.win_pki.import_cert(name, cert_format='cer', context='LocalMachine', store='My', exportable=True, password='', saltenv='base')
Import the certificate file into the given certificate store.

Parameters
- **name** *(str)* -- The path of the certificate file to import.
- **cert_format** *(str)* -- The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
- **context** *(str)* -- The name of the certificate store location context.
- **store** *(str)* -- The name of the certificate store.
- **exportable** *(bool)* -- Mark the certificate as exportable. Only applicable to pfx format.
- **password** *(str)* -- The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.
- **saltenv** *(str)* -- The environment the file resides in.

Returns A boolean representing whether all changes succeeded.
Return type bool

CLI Example:
```
salt '*' win_pki.import_cert name='salt://cert.cer'
```
salt.modules.win_pki.remove_cert(thumbprint, context='LocalMachine', store='My')

Remove the certificate from the given certificate store.

Parameters
- thumbprint (str) -- The thumbprint value of the target certificate.
- context (str) -- The name of the certificate store location context.
- store (str) -- The name of the certificate store.

Returns A boolean representing whether all changes succeeded.
Return type bool

CLI Example:
salt '*' win_pki.remove_cert thumbprint='AAA000'

salt.modules.win_pki.test_cert(thumbprint, context='LocalMachine', store='My', untrusted_root=False, dns_name='', eku='')

Check the certificate for validity.

Parameters
- thumbprint (str) -- The thumbprint value of the target certificate.
- context (str) -- The name of the certificate store location context.
- store (str) -- The name of the certificate store.
- untrusted_root (bool) -- Whether the root certificate is required to be trusted in chain building.
- dns_name (str) -- The DNS name to verify as valid for the certificate.
- eku (str) -- The enhanced key usage object identifiers to verify for the certificate chain.

Returns A boolean representing whether the certificate was considered valid.
Return type bool

CLI Example:
salt '*' win_pki.test_cert thumbprint='AAA000' dns_name='example.test'

23.9.502 salt.modules.win_powercfg

This module allows you to control the power settings of a windows minion via powercfg.

New in version 2015.8.0.

# Set monitor to never turn off on Battery power
salt '*' powercfg.set_monitor_timeout 0 power=dc
# Set disk timeout to 120 minutes on AC power
salt '*' powercfg.set_disk_timeout 120 power=ac

salt.modules.win_powercfg.get_disk_timeout(scheme=None)

Get the current disk timeout of the given scheme.

Parameters scheme (str) -- The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
- SCHEME_BALANCED - Balanced
- SCHEME_MAX - Power saver
- SCHEME_MIN - High performance

Returns A dictionary of both the AC and DC settings
Return type dict

CLI Example:
salt '*' powercfg.get_disk_timeout
salt.modules.win_powercfg.get_hibernate_timeout(scheme=None)
Get the current hibernate timeout of the given scheme
scheme (str): The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
- SCHEME_BALANCED - Balanced
- SCHEME_MAX - Power saver
- SCHEME_MIN - High performance
Returns: A dictionary of both the AC and DC settings
Return type: dict
CLI Example:
```
salt '*' powercfg.get_hibernate_timeout
```

salt.modules.win_powercfg.get_monitor_timeout(scheme=None)
Get the current monitor timeout of the given scheme
Parameters:
scheme (str) -- The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
- SCHEME_BALANCED - Balanced
- SCHEME_MAX - Power saver
- SCHEME_MIN - High performance
Returns: A dictionary of both the AC and DC settings
Return type: dict
CLI Example:
```
salt '*' powercfg.get_monitor_timeout
```

salt.modules.win_powercfg.get_standby_timeout(scheme=None)
Get the current standby timeout of the given scheme
scheme (str): The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
- SCHEME_BALANCED - Balanced
- SCHEME_MAX - Power saver
- SCHEME_MIN - High performance
Returns: A dictionary of both the AC and DC settings
Return type: dict
CLI Example:
```
salt '*' powercfg.get_standby_timeout
```

salt.modules.win_powercfg.set_disk_timeout(timeout, power='ac', scheme=None)
Set the disk timeout in minutes for the given power scheme
Parameters:
- timeout (int) -- The amount of time in minutes before the disk will timeout
- power (str) -- Set the value for AC or DC power. Default is ac. Valid options are:
  - ac (AC Power)
  - dc (Battery)
- scheme (str) -- The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - SCHEME_BALANCED - Balanced
  - SCHEME_MAX - Power saver
  - SCHEME_MIN - High performance
Returns: True if successful, otherwise False
Return type: bool
CLI Example:

```
# Sets the disk timeout to 30 minutes on battery
salt '*' powercfg.set_disk_timeout 30 power=dc
```

salt.modules.win_powercfg.set_hibernate_timeout(timeout, power='ac', scheme=None)
Set the hibernate timeout in minutes for the given power scheme

Parameters

- **timeout** (int) -- The amount of time in minutes before the computer hibernates
- **power** (str) -- Set the value for AC or DC power. Default is ac. Valid options are:
  - ac (AC Power)
  - dc (Battery)
- **scheme** (str) -- The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - SCHEME_BALANCED - Balanced
  - SCHEME_MAX - Power saver
  - SCHEME_MIN - High performance

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
# Sets the hibernate timeout to 30 minutes on Battery
salt '*' powercfg.set_hibernate_timeout 30 power=dc
```

salt.modules.win_powercfg.set_monitor_timeout(timeout, power='ac', scheme=None)
Set the monitor timeout in minutes for the given power scheme

Parameters

- **timeout** (int) -- The amount of time in minutes before the monitor will timeout
- **power** (str) -- Set the value for AC or DC power. Default is ac. Valid options are:
  - ac (AC Power)
  - dc (Battery)
- **scheme** (str) -- The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - SCHEME_BALANCED - Balanced
  - SCHEME_MAX - Power saver
  - SCHEME_MIN - High performance

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
# Sets the monitor timeout to 30 minutes
salt '*' powercfg.set_monitor_timeout 30
```

salt.modules.win_powercfg.set_standby_timeout(timeout, power='ac', scheme=None)
Set the standby timeout in minutes for the given power scheme

Parameters

- **timeout** (int) -- The amount of time in minutes before the computer sleeps
- **power** (str) -- Set the value for AC or DC power. Default is ac. Valid options are:
  - ac (AC Power)
  - dc (Battery)
- **scheme** (str) -- The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - SCHEME_BALANCED - Balanced
  - SCHEME_MAX - Power saver
  - SCHEME_MIN - High performance
Returns True if successful, otherwise False

Return type bool

CLI Example:

```bash
# Sets the system standby timeout to 30 minutes on Battery
salt '*' powercfg.set_standby_timeout 30 power=dc
```

23.9.503 salt.modules.win_psget

Module for managing PowerShell through PowerShellGet (PSGet)

depends

- PowerShell 5.0
- PSGet

Support for PowerShell

salt.modules.win_psget.avail_modules(desc=False)
List available modules in registered Powershell module repositories.

Parameters desc (bool) -- If True, the verbose description will be returned.

CLI Example:

```bash
salt 'win01' psget.avail_modules
salt 'win01' psget.avail_modules desc=True
```

salt.modules.win_psget.bootstrap()

Make sure that nuget-anycpu.exe is installed. This will download the official nuget-anycpu.exe from the internet.

CLI Example:

```bash
salt 'win01' psget.bootstrap
```

salt.modules.win_psget.get_repository(name)

Get the details of a local PSGet repository

Parameters name (str) -- Name of the repository

CLI Example:

```bash
salt 'win01' psget.get_repository MyRepo
```

salt.modules.win_psget.install(name, minimum_version=None, required_version=None, scope=None, repository=None)

Install a Powershell module from powershell gallery on the system.

Parameters

- name (str) -- Name of a Powershell module
- minimum_version (str) -- The maximum version to install, e.g. 1.23.2
- required_version (str) -- Install a specific version
- scope (str) -- The scope to install the module to, e.g.CurrentUser, Computer
- repository (str) -- The friendly name of a private repository, e.g. MyRepo

CLI Example:

```bash
salt 'win01' psget.install PowerPlan
```

salt.modules.win_psget.list_modules(desc=False)

List currently installed PSGet Modules on the system.
Parameters `desc` (bool) -- If True, the verbose description will be returned.

CLI Example:
```
salt 'win01' psget.list_modules
salt 'win01' psget.list_modules desc=True
```

```
salt.modules.win_psget.register_repository(name, location, installation_policy=None)
```
Register a PSGet repository on the local machine

Parameters
- `name` (str) -- The name for the repository
- `location` (str) -- The URI for the repository
- `installation_policy` (str) -- The installation policy for packages, e.g. Trusted, Untrusted

CLI Example:
```
salt 'win01' psget.register_repository MyRepo https://myrepo.mycompany.com/ →packages
```

```
salt.modules.win_psget.remove(name)
```
Remove a Powershell DSC module from the system.

Parameters `name` (str) -- Name of a Powershell DSC module

CLI Example:
```
salt 'win01' psget.remove PowerPlan
```

```
salt.modules.win_psget.update(name, maximum_version=None, required_version=None)
```
Update a PowerShell module to a specific version, or the newest

Parameters
- `name` (str) -- Name of a Powershell module
- `maximum_version` (str) -- The maximum version to install, e.g. 1.23.2
- `required_version` (str) -- Install a specific version

CLI Example:
```
salt 'win01' psget.update PowerPlan
```

### 23.9.504 salt.modules.win_servermanager

Manage Windows features via the ServerManager powershell module. Can list available and installed roles/features. Can install and remove roles/features.

- **maintainer** Shane Lee <slee@saltstack.com>
- **platform** Windows Server 2008R2 or greater
- **depends** PowerShell module ServerManager

```
salt.modules.win_servermanager.install(feature, recurse=False, restart=False, source=None, exclude=None)
```
Install a feature

**Note:** Some features require reboot after un/installation, if so until the server is restarted other features can not be installed!
Note: Some features take a long time to complete un/installation, set -t with a long timeout

Parameters

- **feature**(str, list) -- The name of the feature(s) to install. This can be a single feature, a string of features in a comma delimited list (no spaces), or a list of features.
  
  New in version 2018.3.0: Added the ability to pass a list of features to be installed.

- **recurse**(Optional[bool]) -- Install all sub-features. Default is False

- **restart**(Optional[bool]) -- Restarts the computer when installation is complete, if required by the role/feature installed. Will also trigger a reboot if an item in exclude requires a reboot to be properly removed. Default is False

- **source**(Optional[str]) -- Path to the source files if missing from the target system. None means that the system will use windows update services to find the required files. Default is None

- **exclude**(Optional[str]) -- The name of the feature to exclude when installing the named feature. This can be a single feature, a string of features in a comma-delimited list (no spaces), or a list of features.

  Warning: As there is no exclude option for the Add-WindowsFeature or Install-WindowsFeature PowerShell commands the features named in exclude will be installed with other sub-features and will then be removed. If the feature named in `exclude` is not a sub-feature of one of the installed items it will still be removed.

Returns  A dictionary containing the results of the install

Return type  dict

CLI Example:

```bash
# Install the Telnet Client passing a single string
salt '*' win_servermanager.install Telnet-Client

# Install the TFTP Client and the SNMP Service passing a comma-delimited string. Install all sub-features
salt '*' win_servermanager.install TFTP-Client,SNMP-Service recurse=True

# Install the TFTP Client from d:\side-by-side
salt '*' win_servermanager.install TFTP-Client source=d:\side-by-side

# Install the XPS Viewer, SNMP Service, and Remote Access passing a list. Install all sub-features, but exclude the Web Server
salt '*' win_servermanager.install "['XPS-Viewer', 'SNMP-Service', 'RemoteAccess']" recurse=True exclude="Web-Server"
```

```
salt.modules.win_servermanager.list_available()
List available features to install

Returns  A list of available features as returned by the Get-WindowsFeature PowerShell command

Return type  str

CLI Example:

```bash
salt '*' win_servermanager.list_available
```

```
salt.modules.win_servermanager.list_installed()
```
List installed features. Supported on Windows Server 2008 and Windows 8 and newer.

**Returns** A dictionary of installed features

**Return type** dict

CLI Example:
```
salt '*' win_servermanager.list_installed
```

salt.modules.win_servermanager.remove(feature, remove_payload=False, restart=False)

Remove an installed feature

**Note:** Some features require a reboot after installation/uninstallation. If one of these features are modified, then other features cannot be installed until the server is restarted. Additionally, some features take a while to complete installation/uninstallation, so it is a good idea to use the `-t` option to set a longer timeout.

**Parameters**

- **feature (str, list)** -- The name of the feature(s) to remove. This can be a single feature, a string of features in a comma delimited list (no spaces), or a list of features.
  
  New in version 2018.3.0: Added the ability to pass a list of features to be removed.

- **remove_payload (Optional[bool])** -- True will cause the feature to be removed from the side-by-side store (%SystemDrive%\Windows\WinSxS). Default is False

- **restart (Optional[bool])** -- Restarts the computer when uninstall is complete, if required by the role/feature removed. Default is False

**Returns** A dictionary containing the results of the uninstall

**Return type** dict

CLI Example:
```
salt -t 600 '*' win_servermanager.remove Telnet-Client
```

### 23.9.505 salt.modules.win_service

Windows Service module.

Changed in version 2016.11.0: Rewritten to use PyWin32

salt.modules.win_service.available(name)

Check if a service is available on the system.

**Parameters**

- **name (str)** -- The name of the service to check

**Returns** True if the service is available, False otherwise

**Return type** bool

CLI Example:
```
salt '*' service.available <service name>
```

salt.modules.win_service.create(name, bin_path, exe_args=None, display_name=None, description=None, service_type='own', start_type='manual', start_delayed=False, error_control='normal', load_order_group=None, dependencies=None, account_name='\LocalSystem', account_password=None, run_interactive=False, **kwargs)

Create the named service.

New in version 2015.8.0.
Parameters

- **name (str)** -- Specifies the service name. This is not the display_name
- **bin_path (str)** -- Specifies the path to the service binary file. Backslashes must be escaped, eg: `C:\path\to\binary.exe`
- **exe_args (str)** -- Any additional arguments required by the service binary.
- **display_name (str)** -- The name to be displayed in the service manager. If not passed, the name will be used
- **description (str)** -- A description of the service
- **service_type (str)** -- Specifies the service type. Default is `own`. Valid options are as follows:
  - kernel: Driver service
  - filesystem: File system driver service
  - adapter: Adapter driver service (reserved)
  - recognizer: Recognizer driver service (reserved)
  - own (default): Service runs in its own process
  - share: Service shares a process with one or more other services
- **start_type (str)** -- Specifies the service start type. Valid options are as follows:
  - boot: Device driver that is loaded by the boot loader
  - system: Device driver that is started during kernel initialization
  - auto: Service that automatically starts
  - manual (default): Service must be started manually
  - disabled: Service cannot be started
- **start_delayed (bool)** -- Set the service to Auto(Delayed Start). Only valid if the start_type is set to Auto. If service_type is not passed, but the service is already set to Auto, then the flag will be set. Default is `False`
- **error_control (str)** -- The severity of the error, and action taken, if this service fails to start. Valid options are as follows:
  - normal (normal): Error is logged and a message box is displayed
  - severe: Error is logged and computer attempts a restart with the last known good configuration
  - critical: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure
  - ignore: Error is logged and startup continues, no notification is given to the user
- **load_order_group (str)** -- The name of the load order group to which this service belongs
- **dependencies (list)** -- A list of services or load ordering groups that must start before this service
- **account_name (str)** -- The name of the account under which the service should run. For `own` type services this should be in the `domain\username` format. The following are examples of valid built-in service accounts:
  - NT Authority\LocalService
  - NT Authority\NetworkService
  - NT Authority\LocalSystem
  - .\LocalSystem
- **account_password (str)** -- The password for the account name specified in account_name. For the above built-in accounts, this can be None. Otherwise a password must be specified.
- **run_interactive (bool)** -- If this setting is True, the service will be allowed to interact with the user. Not recommended for services that run with elevated privileges.

Returns A dictionary containing information about the new service

Return type dict

CLI Example:
salt '*/' service.create <service name> <path to exe> display_name='<display name>'

salt.modules.win_service.create_win_salt_restart_task()
    Create a task in Windows task scheduler to enable restarting the salt-minion
    Returns True if successful, otherwise False
    Return type bool
    CLI Example:
    salt '*/' service.create_win_salt_restart_task()

salt.modules.win_service.delete(name, timeout=90)
    Delete the named service
    Parameters
    • name (str) -- The name of the service to delete
    • timeout (int) -- The time in seconds to wait for the service to be deleted before returning. This is necessary because a service must be stopped before it can be deleted. Default is 90 seconds
    Returns True if successful, otherwise False. Also returns True if the service is not present
    Return type bool
    CLI Example:
    salt '*/' service.delete <service name>

salt.modules.win_service.disable(name, **kwargs)
    Disable the named service to start at boot
    Parameters name (str) -- The name of the service to disable
    Returns True if disabled, False otherwise
    Return type bool
    CLI Example:
    salt '*/' service.disable <service name>

salt.modules.win_service.disabled(name)
    Check to see if the named service is disabled to start on boot
    Parameters name (str) -- The name of the service to check
    Returns True if the service is disabled
    Return type bool
    CLI Example:
    salt '*/' service.disabled <service name>

salt.modules.win_service.enable(name, start_type='auto', start_delayed=False, **kwargs)
    Enable the named service to start at boot
    Parameters
    • name (str) -- The name of the service to enable.
    • start_type (str) -- Specifies the service start type. Valid options are as follows:
    - boot: Device driver that is loaded by the boot loader
    - system: Device driver that is started during kernel initialization
    - auto: Service that automatically starts
    - manual: Service must be started manually
    - disabled: Service cannot be started
- **start_delayed** *(bool)* -- Set the service to Auto(Delayed Start). Only valid if the start_type is set to Auto. If service_type is not passed, but the service is already set to Auto, then the flag will be set.

  Returns True if successful, False otherwise

  Return type bool

  CLI Example:

  ```
  salt '*' service.enable <service name>
  ```

salt.modules.win_service.enabled *(name, **kwargs)*
Check to see if the named service is enabled to start on boot

  Parameters name *(str)* -- The name of the service to check

  Returns True if the service is set to start

  Return type bool

  CLI Example:

  ```
  salt '*' service.enabled <service name>
  ```

salt.modules.win_service.execute_salt_restart_task()
Run the Windows Salt restart task

  Returns True if successful, otherwise False

  Return type bool

  CLI Example:

  ```
  salt '*' service.execute_salt_restart_task()
  ```

salt.modules.win_service.get_all()
Return all installed services

  Returns a list of all services on the system.

  Return type list

  CLI Example:

  ```
  salt '*' service.get_all
  ```

salt.modules.win_service.get_disabled()
Return a list of disabled services. Disabled is defined as a service that is marked ‘Disabled’ or ‘Manual’.

  Returns A list of disabled services.

  Return type list

  CLI Example:

  ```
  salt '*' service.get_disabled
  ```

salt.modules.win_service.get_enabled()
Return a list of enabled services. Enabled is defined as a service that is marked to Auto Start.

  Returns A list of enabled services

  Return type list

  CLI Example:

  ```
  salt '*' service.get_enabled
  ```

salt.modules.win_service.get_service_name(*args)*
The Display Name is what is displayed in Windows when services.msc is executed. Each Display Name has an associated Service Name which is the actual name of the service. This function allows you to discover the Service Name by returning a dictionary of Display Names and Service Names, or filter by adding arguments of Display Names.
If no args are passed, return a dict of all services where the keys are the service Display Names and the values are the Service Names.

If arguments are passed, create a dict of Display Names and Service Names

Returns  A dictionary of display names and service names
Return type  dict

CLI Examples:

```
salt '*' service.get_service_name
salt '*' service.get_service_name 'Google Update Service (gupdate)' 'DHCP Client'
```

salt.modules.win_service.getsid(name)
Return the SID for this windows service

Parameters  name (str) -- The name of the service for which to return the SID
Returns  A string representing the SID for the service
Return type  str

CLI Example:

```
salt '*' service.getsid <service name>
```

salt.modules.win_service.info(name)
Get information about a service on the system

Parameters  name (str) -- The name of the service. This is not the display name. Use get_service_name to find the service name.
Returns  A dictionary containing information about the service.
Return type  dict

CLI Example:

```
salt '*' service.info spooler
```

salt.modules.win_service.missing(name)
The inverse of service.available.

Parameters  name (str) -- The name of the service to check
Returns  True if the service is missing, False otherwise
Return type  bool

CLI Example:

```
salt '*' service.missing <service name>
```

salt.modules.win_service.modify(name,  bin_path=None,  exe_args=None,  display_name=None,  description=None,  service_type=None,  start_type=None,  startDelayed=None,  error_control=None,  load_order_group=None,  dependencies=None,  account_name=None,  account_password=None,  run_interactive=None)
Modify a service's parameters. Changes will not be made for parameters that are not passed.

New in version 2016.11.0.

Parameters
- name (str) -- The name of the service. Can be found using the service.get_service_name function
- bin_path (str) -- The path to the service executable. Backslashes must be escaped, eg: C:\path\to\binary.exe
- exe_args (str) -- Any arguments required by the service executable
- display_name (str) -- The name to display in the service manager
- description (str) -- The description to display for the service
• **service_type** *(str)* -- Specifies the service type. Default is `own`. Valid options are as follows:
  - kernel: Driver service
  - filesystem: File system driver service
  - adapter: Adapter driver service (reserved)
  - recognizer: Recognizer driver service (reserved)
  - own (default): Service runs in its own process
  - share: Service shares a process with one or more other services

• **start_type** *(str)* -- Specifies the service start type. Valid options are as follows:
  - boot: Device driver that is loaded by the boot loader
  - system: Device driver that is started during kernel initialization
  - auto: Service that automatically starts
  - manual: Service must be started manually
  - disabled: Service cannot be started

• **start_delayed** *(bool)* -- Set the service to Auto(Delayed Start). Only valid if the `start_type` is set to `Auto`. If `service_type` is not passed, but the service is already set to `Auto`, then the flag will be set.

• **error_control** *(str)* -- The severity of the error, and action taken, if this service fails to start. Valid options are as follows:
  - normal: Error is logged and a message box is displayed
  - severe: Error is logged and computer attempts a restart with the last known good configuration
  - critical: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure
  - ignore: Error is logged and startup continues, no notification is given to the user

• **load_order_group** *(str)* -- The name of the load order group to which this service belongs

• **dependencies** *(list)* -- A list of services or load ordering groups that must start before this service

• **account_name** *(str)* -- The name of the account under which the service should run. For `own` type services this should be in the `domain\username` format. The following are examples of valid built-in service accounts:
  - NT Authority\LocalService
  - NT Authority\NetworkService
  - NT Authority\LocalSystem
  - LocalSystem

• **account_password** *(str)* -- The password for the account name specified in `account_name`. For the above built-in accounts, this can be None. Otherwise a password must be specified.

• **run_interactive** *(bool)* -- If this setting is True, the service will be allowed to interact with the user. Not recommended for services that run with elevated privileges.

**Returns** a dictionary of changes made

**Return type** *dict*

**CLI Example:**

```bash
salt '*' service.modify spooler start_type=disabled
```

**salt.modules.win_service.restart**(name, timeout=90)

Restart the named service. This issues a stop command followed by a start.

**Parameters**

• **name** -- The name of the service to restart.
Note: If the name passed is `salt-minion` a scheduled task is created and executed to restart the salt-minion service.

- **timeout (int)** -- The time in seconds to wait for the service to stop and start before returning. Default is 90 seconds

  Note: The timeout is cumulative meaning it is applied to the stop and then to the start command. A timeout of 90 could take up to 180 seconds if the service is long in stopping and starting

  New in version 2017.7.9, 2018.3.4.

Returns True if successful, otherwise False
Return type bool

CLI Example:
```
salt '*' service.restart <service name>
```

```python
class win_service:
    @staticmethod
    def start(name, timeout=90):
        ...# Start the specified service.
```

**Warning:** You cannot start a disabled service in Windows. If the service is disabled, it will be changed to Manual start.

Parameters
- **name (str)** -- The name of the service to start
- **timeout (int)** -- The time in seconds to wait for the service to start before returning.
  Default is 90 seconds

  New in version 2017.7.9, 2018.3.4.

Returns True if successful, otherwise False. Also returns True if the service is already started
Return type bool

CLI Example:
```
salt '*' service.start <service name>
```

```python
class win_service:
    @staticmethod
    def status(name, *args, **kwargs):
        ...# Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

    Parameters name (str) -- The name of the service to check

    Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise

    Return type bool

    CLI Example:
    ```
salt '*' service.status <service name>
    ```
```

```python
class win_service:
    @staticmethod
    def stop(name, timeout=90):
        ...# Stop the specified service

    Parameters name (str) -- The name of the service to stop

    Returns True if successful, otherwise False

    Return type bool

    CLI Example:
    ```
salt '*' service.stop <service name>
    ```
```
- **name** (*str*) -- The name of the service to stop
- **timeout** (*int*) -- The time in seconds to wait for the service to stop before returning.
  Default is 90 seconds

Returns

**True** if successful, otherwise **False**. Also returns **True** if the service is already stopped

Return type: *bool*

CLI Example:

```
salt '*' service.stop <service name>
```

### 23.9.506 salt.modules.win_shadow

Manage the shadow file

**Important:** If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to 'shadow.info' is not available), see [here](#).

salt.modules.win_shadow.info(*name*)

Return information for the specified user. This is just returns dummy data so that salt states can work.

**Parameters**

- **name** (*str*) -- The name of the user account to show.

CLI Example:

```
salt '*' shadow.info root
```

salt.modules.win_shadow.require_password_change(*name*)

Require the user to change their password the next time they log in.

**Parameters**

- **name** -- The name of the user account to require a password change.

**Returns**

**True** if successful. **False** if unsuccessful.

Return type: *bool*

CLI Example:

```
salt '*' shadow.require_password_change <username>
```

salt.modules.win_shadow.set_expire(*name, expire*)

Set the expiration date for a user account.

**Parameters**

- **name** -- The name of the user account to edit.
- **expire** -- The date the account will expire.

**Returns**

**True** if successful. **False** if unsuccessful.

Return type: *bool*

CLI Example:

```
salt '*' shadow.set_expire <username> 2016/7/1
```

salt.modules.win_shadow.set_password(*name, password*)

Set the password for a named user.

**Parameters**

- **name** (*str*) -- The name of the user account
- **password** (*str*) -- The new password

**Returns**

**True** if successful. **False** if unsuccessful.
Return type  bool
CLI Example:
```bash
salt '*' shadow.set_password root mysecretpassword
```

```python
salt.modules.win_shadow.unlock_account(name)
```

Unlocks a user account.

- **Parameters**
  - name -- The name of the user account to unlock.
- **Returns**
  - True if successful. False if unsuccessful.
- **Return type**  bool

CLI Example:
```bash
salt '*' shadow.unlock_account <username>
```

### 23.9.507  salt.modules.win_smtp_server

Module for managing IIS SMTP server configuration on Windows servers. The Windows features 'SMTP-Server' and 'Web-WMI' must be installed.

- **depends**  wmi

```python
salt.modules.win_smtp_server.get_connection_ip_list(as_wmi_format=False,
server='SmtpSvc/1')
```

Get the IPGrant list for the SMTP virtual server.

- **Parameters**
  - as_wmi_format (bool) -- Returns the connection IPs as a list in the format WMI expects.
  - server (str) -- The SMTP server name.
- **Returns**
  - A dictionary of the IP and subnet pairs.
- **Return type**  dict

CLI Example:
```bash
salt '*' win_smtp_server.get_connection_ip_list
```

```python
salt.modules.win_smtp_server.get_log_format(server='SmtpSvc/1')
```

Get the active log format for the SMTP virtual server.

- **Parameters**
  - server (str) -- The SMTP server name.
- **Returns**
  - A string of the log format name.
- **Return type**  str

CLI Example:
```bash
salt '*' win_smtp_server.get_log_format
```

```python
salt.modules.win_smtp_server.get_log_format_types()
```

Get all available log format names and ids.

- **Returns**
  - A dictionary of the log format names and ids.
- **Return type**  dict

CLI Example:
```bash
salt '*' win_smtp_server.get_log_format_types
```

```python
salt.modules.win_smtp_server.get_relay_ip_list(server='SmtpSvc/1')
```

Get the RelayIpList list for the SMTP virtual server.

- **Parameters**
  - server (str) -- The SMTP server name.
- **Returns**
  - A list of the relay IPs.
Return type list

Note: A return value of None corresponds to the restrictive ‘Only the list below’ GUI parameter with an empty access list, and setting an empty list/tuple corresponds to the more permissive ‘All except the list below’ GUI parameter.

CLI Example:

```python
salt '*' win_smtp_server.get_relay_ip_list
```

```python
salt.modules.win_smtp_server.get_server_setting(settings, server='SmtpSvc/1')
Get the value of the setting for the SMTP virtual server.

Parameters
• settings (str) -- A list of the setting names.
• server (str) -- The SMTP server name.

Returns A dictionary of the provided settings and their values.
Return type dict

CLI Example:

```python
salt '*' win_smtp_server.get_server_setting settings="["MaxRecipients"]"
```

```python
salt.modules.win_smtp_server.get_servers()
Get the SMTP virtual server names.

Returns A list of the SMTP virtual servers.
Return type list

CLI Example:

```python
salt '*' win_smtp_server.get_servers
```

```python
salt.modules.win_smtp_server.set_connection_ip_list(addresses=None,
grant_by_default=False,
server='SmtpSvc/1')
Set the IPGrant list for the SMTP virtual server.

Parameters
• addresses (str) -- A dictionary of IP + subnet pairs.
• grant_by_default (bool) -- Whether the addresses should be a blacklist or whitelist.
• server (str) -- The SMTP server name.

Returns A boolean representing whether the change succeeded.
Return type bool

CLI Example:

```python
salt '*' win_smtp_server.set_connection_ip_list addresses="{"127.0.0.1": "255.255.255"}
```

```python
salt.modules.win_smtp_server.set_log_format(log_format, server='SmtpSvc/1')
Set the active log format for the SMTP virtual server.

Parameters
• log_format (str) -- The log format name.
• server (str) -- The SMTP server name.

Returns A boolean representing whether the change succeeded.
Return type bool

CLI Example:

```python
```
salt '*' win_smtp_server.set_log_format 'Microsoft IIS Log File Format'

salt.modules.win_smtp_server.set_relay_ip_list(addresses=None, server='SmtpSvc/1')

Set the RelayIpList list for the SMTP virtual server.

Due to the unusual way that Windows stores the relay IPs, it is advisable to retrieve the existing list you wish to set from a pre-configured server.

For example, setting '127.0.0.1' as an allowed relay IP through the GUI would generate an actual relay IP list similar to the following:

```
['24.0.0.128', '32.0.0.128', '60.0.0.128', '68.0.0.128', '1.0.0.0', '76.0.0.0', '0.0.0.0', '1.0.0.0', '1.0.0.0', '2.0.0.0', '2.0.0.0', '4.0.0.0', '0.0.0.0', '76.0.0.128', '0.0.0.0', '0.0.0.0', '0.0.0.0', '0.0.0.0', '255.255.255.255', '127.0.0.1']
```

Note: Setting the list to None corresponds to the restrictive 'Only the list below' GUI parameter with an empty access list configured, and setting an empty list/tuple corresponds to the more permissive 'All except the list below' GUI parameter.

Parameters

- **addresses (str)** -- A list of the relay IPs. The order of the list is important.
- **server (str)** -- The SMTP server name.

Returns A boolean representing whether the change succeeded.

Return type bool

CLI Example:

```
salt '*' win_smtp_server.set_relay_ip_list addresses="['192.168.1.1', '172.16.1.1']"
```

salt.modules.win_smtp_server.set_server_setting(settings, server='SmtpSvc/1')

Set the value of the setting for the SMTP virtual server.

Note: The setting names are case-sensitive.

Parameters

- **settings (str)** -- A dictionary of the setting names and their values.
- **server (str)** -- The SMTP server name.

Returns A boolean representing whether all changes succeeded.

Return type bool

CLI Example:
salt 'x' win_smtp_server.set_server_setting settings="{'MaxRecipients': '500'}"

23.9.508 salt.modules.win_snmp

Module for managing SNMP service settings on Windows servers. The Windows feature 'SNMP-Service' must be installed.

salt.modules.win_snmp.get_agent_service_types()
Get the sysServices types that can be configured.

Returns A list of service types.
Return type list

CLI Example:
salt 'x' win_snmp.get_agent_service_types

salt.modules.win_snmp.get_agent_settings()
Determine the value of the SNMP sysContact, sysLocation, and sysServices settings.

Returns A dictionary of the agent settings.
Return type dict

CLI Example:
salt 'x' win_snmp.get_agent_settings

salt.modules.win_snmp.get_auth_traps_enabled()
Determine whether the host is configured to send authentication traps.

Returns True if traps are enabled, otherwise False
Return type bool

CLI Example:
salt 'x' win_snmp.get_auth_traps_enabled

salt.modules.win_snmp.get_community_names()
Get the current accepted SNMP community names and their permissions.

Community names managed normally will denote the permission instead:

TestCommunity: 
Read Only

Returns A dictionary of community names and permissions.
Return type dict

CLI Example:
salt 'x' win_snmp.get_community_names

salt.modules.win_snmp.get_permission_types()
Get the permission types that can be configured for communities.

Returns A list of permission types.
Return type list
CLI Example:

```bash
salt '*' win_snmp.get_permission_types
```

**salt.modules.win_snmp.set_agent_settings**(*contact=None, location=None, services=None*)

Manage the SNMP sysContact, sysLocation, and sysServices settings.

**Parameters**

- `contact` *(str, optional)* -- The SNMP contact.
- `location` *(str, optional)* -- The SNMP location.
- `services` *(list, optional)* -- A list of selected services. The possible service names can be found via `win_snmp.get_agent_service_types`. To disable all services pass a list of None, ie: `['None']`

**Returns**

True if successful, otherwise False

**Return type** `bool`

CLI Example:

```bash
salt '*' win_snmp.set_agent_settings contact='Contact Name' location='Place'
→ services=['Physical']
```

**salt.modules.win_snmp.set_auth_traps_enabled**(*status=True*)

Manage the sending of authentication traps.

**Parameters**

- `status` *(bool)* -- True to enable traps. False to disable.

**Returns**

True if successful, otherwise False

**Return type** `bool`

CLI Example:

```bash
salt '*' win_snmp.set_auth_traps_enabled status='True'
```

**salt.modules.win_snmp.set_community_names**(*communities*)

Manage the SNMP accepted community names and their permissions.

**Note:** Settings managed by Group Policy will always take precedence over those set using the SNMP interface. Therefore if this function finds Group Policy settings it will raise a CommandExecutionError

**Parameters**

- `communities` *(dict)* -- A dictionary of SNMP community names and permissions. The possible permissions can be found via `win_snmp.get_permission_types`.

**Returns**

True if successful, otherwise False

**Return type** `bool`

**Raises** `CommandExecutionError` -- If SNMP settings are being managed by Group Policy

CLI Example:

```bash
salt '*' win_snmp.set_community_names communities="{'TestCommunity': 'Read Only'}"
```
23.9.509  salt.modules.win_status

Module for returning various status data about a minion. These data can be useful for compiling into stats later, or for problem solving if your minion is having problems.

New in version 0.12.0.

depends
  • wmi

salt.modules.win_status.cpuload()
New in version 2015.8.0.
Return the processor load as a percentage
CLI Example:
salt '*>' status.cpuload

salt.modules.win_status.cpustats()
  Return information about the CPU.
  
  **Returns**
  dict: A dictionary containing information about the CPU stats
  
  **CLI Example:**
  ```
  salt '*' status.cpustats
  ```

salt.modules.win_status.diskusage(human_readable=False, path=None)
  New in version 2015.8.0.
  
  Return the disk usage for this minion
  
  human_readable [False] If True, usage will be in KB/MB/GB etc.
  
  **CLI Example:**
  ```
  salt '*' status.diskusage path=c:/salt
  ```

salt.modules.win_status.loadavg()
  Returns counter information related to the load of the machine
  
  **Returns**
  A dictionary of counters
  
  **Return type**
  dict
  
  **CLI Example:**
  ```
  salt '*' status.loadavg
  ```

salt.modules.win_status.master(master=None, connected=True)
  New in version 2015.5.0.
  
  Fire an event if the minion gets disconnected from its master. This function is meant to be run via a scheduled job from the minion. If master_ip is an FQDN/Hostname, it must be resolvable to a valid IPv4 address.
  
  **CLI Example:**
  ```
  salt '*' status.master
  ```

salt.modules.win_status.meminfo()
  Return information about physical and virtual memory on the system
  
  **Returns**
  A dictionary of information about memory on the system
  
  **Return type**
  dict
  
  **CLI Example:**
  ```
  salt '*' status.meminfo
  ```

salt.modules.win_status.procs(count=False)
  Return the process data
  
  count [False] If True, this function will simply return the number of processes.
  
  **New in version 2015.8.0.**
  
  **CLI Example:**
  ```
  salt '*' status.procs
  ```

salt.modules.win_status.saltmem(human_readable=False)
  New in version 2015.8.0.
  
  Returns the amount of memory that salt is using
human_readable [False] return the value in a nicely formatted number

CLI Example:

```python
salt '*' status.saltmem
salt '*' status.saltmem human_readable=True
```

salt.modules.win_status.uptime(human_readable=False)

New in version 2015.8.0.

Return the system uptime for the machine

Parameters human_readable (bool) -- Return uptime in human readable format if True, otherwise return seconds. Default is False

Note: Human readable format is days, hours:min:sec. Days will only be displayed if more than 0

Returns The uptime in seconds or human readable format depending on the value of human_readable

Return type str

CLI Example:

```python
salt '*' status.uptime
salt '*' status.uptime human_readable=True
```

salt.modules.win_status.vmstats()

Return information about the virtual memory on the machine

Returns A dictionary of virtual memory stats

Return type dict

CLI Example:

```python
salt * status.vmstats
```

23.9.510 salt.modules.win_system

Module for managing Windows systems and getting Windows system information. Support for reboot, shutdown, join domain, rename

depends

- pywintypes
- win32api
- win32con
- win32net
- wmi

salt.modules.win_system.get_computer_desc()

Get the Windows computer description

Returns Returns the computer description if found. Otherwise returns False.

Return type str

CLI Example:

```python
salt 'minion-id' system.get_computer_desc
```
salt.modules.win_system.get_computer_description()
This function is an alias of get_computer_desc.
Get the Windows computer description

Returns: str: Returns the computer description if found. Otherwise returns False.
CLI Example:
salt 'minion-id' system.get_computer_desc

salt.modules.win_system.get_computer_name()
Get the Windows computer name

Returns Returns the computer name if found. Otherwise returns False.
Return type str

CLI Example:
salt 'minion-id' system.get_computer_name

salt.modules.win_system.get_domain_workgroup()
Get the domain or workgroup the computer belongs to.

New in version 2015.5.7.
New in version 2015.8.2.

Returns The name of the domain or workgroup
Return type str

CLI Example:
salt 'minion-id' system.get_domain_workgroup

salt.modules.win_system.get_hostname()
Get the hostname of the windows minion

New in version 2016.3.0.

Returns Returns the hostname of the windows minion
Return type str

CLI Example:
salt 'minion-id' system.get_hostname

salt.modules.win_system.get_pending_component_servicing()
Determine whether there are pending Component Based Servicing tasks that require a reboot.

New in version 2016.11.0.

Returns True if there are pending Component Based Servicing tasks, otherwise False
Return type bool

CLI Example:
salt '*' system.get_pending_component_servicing

salt.modules.win_system.get_pending_computer_name()
Get a pending computer name. If the computer name has been changed, and the change is pending a system reboot, this function will return the pending computer name. Otherwise, None will be returned. If there was an error retrieving the pending computer name, False will be returned, and an error message will be logged to the minion log.

Returns Returns the pending name if pending restart. Returns None if not pending restart.
Return type str

CLI Example:
salt 'minion-id' system.get_pending_computer_name

salt.modules.win_system.get_pending_domain_join()
    Determine whether there is a pending domain join action that requires a reboot.
    New in version 2016.11.0.
    Returns True if there is a pending domain join action, otherwise False
    Return type bool
    CLI Example:
    
salt 'minion-id' system.get_pending_domain_join

salt.modules.win_system.get_pending_file_rename()
    Determine whether there are pending file rename operations that require a reboot.
    New in version 2016.11.0.
    Returns True if there are pending file rename operations, otherwise False
    Return type bool
    CLI Example:
    
salt 'minion-id' system.get_pending_file_rename

salt.modules.win_system.get_pending_reboot()
    Determine whether there is a reboot pending.
    New in version 2016.11.0.
    Returns True if the system is pending reboot, otherwise False
    Return type bool
    CLI Example:
    
salt 'minion-id' system.get_pending_reboot

salt.modules.win_system.get_pending_reboot_details()
    Determine which check is signalling that the system is pending a reboot. Useful in determining why your
    system is signalling that it needs a reboot.
    New in version 3001.
    Returns A dictionary of the results of each system that would indicate a pending reboot
    Return type dict
    CLI Example:
    
salt 'minion-id' system.get_pending_reboot_details

salt.modules.win_system.get_pending_servermanager()
    Determine whether there are pending Server Manager tasks that require a reboot.
    New in version 2016.11.0.
    Returns True if there are pending Server Manager tasks, otherwise False
    Return type bool
    CLI Example:
    
salt 'minion-id' system.get_pending_servermanager

salt.modules.win_system.get_pending_update()
    Determine whether there are pending updates that require a reboot.
    New in version 2016.11.0.
    Returns True if there are pending updates, otherwise False
Return type `bool`

CLI Example:
```
salt '*' system.get_pending_update
```

```
salt.modules.win_system.get_pending_windows_update()
```
Check the Windows Update system for a pending reboot state.

This leverages the Windows Update System to determine if the system is pending a reboot.

New in version 3001.

Returns `True` if the Windows Update system reports a pending update, otherwise `False`

Return type `bool`

CLI Example:
```
salt '*' system.get_pending_windows_update
```

```
salt.modules.win_system.get_reboot_required_witnessed()
```
Determine if at any time during the current boot session the salt minion witnessed an event indicating that a reboot is required.

This function will return `True` if an install completed with exit code 3010 during the current boot session and can be extended where appropriate in the future.

New in version 2016.11.0.

Returns `True` if the Requires reboot registry flag is set to 1, otherwise `False`

Return type `bool`

CLI Example:
```
salt '*' system.get_reboot_required_witnessed
```

```
salt.modules.win_system.get_system_date()
```
Get the Windows system date

Returns Returns the system date

Return type `str`

CLI Example:
```
salt '*' system.get_system_date
```

```
salt.modules.win_system.get_system_info()
```
Get system information.

Note: Not all system info is available across all versions of Windows. If it is not available on an older version, it will be skipped

Returns Dictionary containing information about the system to include name, description, version, etc...

Return type `dict`

CLI Example:
```
  salt 'minion-id' system.get_system_info
```

```
salt.modules.win_system.get_system_time()
```
Get the system time.

Returns Returns the system time in HH:MM:SS AM/PM format.

Return type `str`
CLI Example:
```
salt 'minion-id' system.get_system_time
```

```
salt.modules.win_system.halt(timeout=5, in_seconds=False)
```
Halt a running system.

**Parameters**
- `timeout (int)` -- Number of seconds before halting the system. Default is 5 seconds.
- `in_seconds (bool)` -- Whether to treat timeout as seconds or minutes.

New in version 2015.8.0.

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:
```
salt 'minion-id' system.halt 5 True
```

```
salt.modules.win_system.init(runlevel)
```
Change the system runlevel on sysV compatible systems. Not applicable to Windows

CLI Example:
```
salt '*' system.init 3
```

```
salt.modules.win_system.join_domain(domain, username=None, password=None, account_ou=None, account_exists=False, restart=False)
```
Join a computer to an Active Directory domain. Requires a reboot.

**Parameters**
- `domain (str)` -- The domain to which the computer should be joined, e.g. example.com
- `username (str)` -- Username of an account which is authorized to join computers to the specified domain. Needs to be either fully qualified like user@domain.tld or simply user
- `password (str)` -- Password of the specified user
- `account_ou (str)` -- The DN of the OU below which the account for this computer should be created when joining the domain, e.g. ou=computers, ou=departm_432,dc=my-company,dc=com
- `account_exists (bool)` -- If set to True the computer will only join the domain if the account already exists. If set to False the computer account will be created if it does not exist, otherwise it will use the existing account. Default is False
- `restart (bool)` -- True will restart the computer after a successful join. Default is False

New in version 2015.8.2/2015.5.7.

**Returns** Returns a dictionary if successful, otherwise False

**Return type** dict

CLI Example:
```
salt 'minion-id' system.join_domain domain='domain.tld' \ 
  username='joinuser' password='joinpassword' \ 
  account_ou='ou=clients,ou=org,dc=domain,dc=tld' \ 
  account_exists=False, restart=True
```

```
salt.modules.win_system.lock()
```
Lock the workstation.

**Returns** True if successful, otherwise False

**Return type** bool
CLI Example:

```bash
salt 'minion-id' system.lock
```

**salt.modules.win_system.poweroff**(*timeout=5, in_seconds=False*)

Power off a running system.

**Parameters**

- **timeout** (*int*) -- Number of seconds before powering off the system. Default is 5 seconds.
- **in_seconds** (*bool*) -- Whether to treat timeout as seconds or minutes.

New in version 2015.8.0.

**Returns**  True if successful, otherwise False

**Return type**  bool

CLI Example:

```bash
salt '*' system.poweroff 5
```

**salt.modules.win_system.reboot**(*timeout=5, in_seconds=False, wait_for_reboot=False, only_on_pending_reboot=False*)

Reboot a running system.

**Parameters**

- **timeout** (*int*) -- The number of minutes/seconds before rebooting the system. Use of minutes or seconds depends on the value of **in_seconds**. Default is 5 minutes.
- **in_seconds** (*bool*) -- **True** will cause the **timeout** parameter to be in seconds. **False** will be in minutes. Default is **False**.

New in version 2015.8.0.

- **wait_for_reboot** (*bool*) -- **True** will sleep for **timeout** + 30 seconds after reboot has been initiated. This is useful for use in a highstate. For example, you may have states that you want to apply only after the reboot. Default is **False**.

New in version 2015.8.0.

- **only_on_pending_reboot** (*bool*) -- If this is set to **True**, then the reboot will only proceed if the system reports a pending reboot. Setting this parameter to **True** could be useful when calling this function from a final housekeeping state intended to be executed at the end of a state run (using **order: last**). Default is **False**.

**Returns**  True if successful (a reboot will occur), otherwise False

**Return type**  bool

CLI Example:

```bash
salt '*' system.reboot 5
salt '*' system.reboot 5 True
```

Invoking this function from a final housekeeping state:

```
final_housekeeping:
  module.run:
    - name: system.reboot
      only_on_pending_reboot: True
      order: last
```

**salt.modules.win_system.set_computer_desc**(*desc=None*)

Set the Windows computer description

**Parameters**  **desc** (*str*) -- The computer description

**Returns**  Description if successful, otherwise False

**Return type**  str
CLI Example:

```
salt 'minion-id' system.set_computer_desc 'This computer belongs to Dave!'
```

salt.modules.win_system.set_computer_description(desc=None)

This function is an alias of set_computer_desc.

Set the Windows computer description

Args:

- **desc (str)**: The computer description

Returns: str: Description if successful, otherwise False

CLI Example:

```
salt 'minion-id' system.set_computer_desc 'This computer belongs to Dave!' ...
```

salt.modules.win_system.set_computer_name(name)

Set the Windows computer name

Parameters **name (str)** -- The new name to give the computer. Requires a reboot to take effect.

Returns: Returns a dictionary containing the old and new names if successful. False if not.

Return type: dict

CLI Example:

```
salt 'minion-id' system.set_computer_name 'DavesComputer'
```

salt.modules.win_system.set_domain_workgroup(workgroup)

Set the domain or workgroup the computer belongs to.

New in version 3001.

Returns: True if successful, otherwise False

Return type: bool

CLI Example:

```
salt 'minion-id' system.set_domain_workgroup LOCAL
```

salt.modules.win_system.set_hostname(hostname)

Set the hostname of the windows minion, requires a restart before this will be updated.

New in version 2016.3.0.

Parameters **hostname (str)** -- The hostname to set

Returns: True if successful, otherwise False

Return type: bool

CLI Example:

```
salt 'minion-id' system.set_hostname newhostname
```

salt.modules.win_system.set_reboot_required_witnessed()

This function is used to remember that an event indicating that a reboot is required was witnessed. This function relies on the salt-minion's ability to create the following volatile registry key in the HKLM hive:

```
SYSTEM\CurrentControlSet\Services\salt-minion\Volatile-Data
```

Because this registry key is volatile, it will not persist beyond the current boot session. Also, in the scope of this key, the name 'Reboot required' will be assigned the value of 1.

For the time being, this function is being used whenever an install completes with exit code 3010 and can be extended where appropriate in the future.

New in version 2016.11.0.
Returns True if successful, otherwise False
Return type bool

CLI Example:
```
salt '*' system.set_reboot_required_witnessed
```

**salt.modules.win_system.set_system_date**(newdate)
Set the Windows system date. Use <mm-dd-yy> format for the date.

**Parameters**

- **newdate** (str) -- The date to set. Can be any of the following formats:
  - YYYY-MM-DD
  - MM-DD-YYYY
  - MM-DD-YY
  - MM/DD/YYYY
  - MM/DD/YY
  - YYYY/MM/DD

**Returns** True if successful, otherwise False
Return type bool

CLI Example:
```
salt '*' system.set_system_date '03-28-13'
```

**salt.modules.win_system.set_system_date_time**(years=None, months=None, days=None, hours=None, minutes=None, seconds=None)
Set the system date and time. Each argument is an element of the date, but not required. If an element is not passed, the current system value for that element will be used. For example, if you don’t pass the year, the current system year will be used. (Used by set_system_date and set_system_time)

**Parameters**

- **years** (int) -- Years digit, ie: 2015
- **months** (int) -- Months digit: 1 - 12
- **days** (int) -- Days digit: 1 - 31
- **hours** (int) -- Hours digit: 0 - 23
- **minutes** (int) -- Minutes digit: 0 - 59
- **seconds** (int) -- Seconds digit: 0 - 59

**Returns** True if successful, otherwise False
Return type bool

CLI Example:
```
salt '*' system.set_system_date_ time 2015 5 12 11 37 53
```

**salt.modules.win_system.set_system_time**(newtime)
Set the system time.

**Parameters**

- **newtime** (str) -- The time to set. Can be any of the following formats:
  - HH:MM:SS AM/PM
  - HH:MM AM/PM
  - HH:MM:SS (24 hour)
  - HH:MM (24 hour)

**Returns** True if successful, otherwise False
Return type bool

CLI Example:
```
salt 'minion-id' system.set_system_time 12:01
```

**salt.modules.win_system.shutdown**(message=None, timeout=5, force_close=True, reboot=False, in_seconds=False, only_on_pending_reboot=False)
Shutdown a running system.

**Parameters**
- **message (str)** -- The message to display to the user before shutting down.
- **timeout (int)** -- The length of time (in seconds) that the shutdown dialog box should be displayed. While this dialog box is displayed, the shutdown can be aborted using the `system.shutdown_abort` function.

If timeout is not zero, `InitiateSystemShutdown` displays a dialog box on the specified computer. The dialog box displays the name of the user who called the function, the message specified by the lpMessage parameter, and prompts the user to log off. The dialog box beeps when it is created and remains on top of other windows (system modal). The dialog box can be moved but not closed. A timer counts down the remaining time before the shutdown occurs.

If timeout is zero, the computer shuts down immediately without displaying the dialog box and cannot be stopped by `system.shutdown_abort`.

Default is 5 minutes
- **in_seconds (bool)** -- True will cause the timeout parameter to be in seconds. False will be in minutes. Default is False.
  New in version 2015.8.0.
- **force_close (bool)** -- True will force close all open applications. False will display a dialog box instructing the user to close open applications. Default is True.
- **reboot (bool)** -- True restarts the computer immediately after shutdown. False powers down the system. Default is False.
- **only_on_pending_reboot (bool)** -- If this is set to True, then the shutdown will only proceed if the system reports a pending reboot. To optionally shutdown in a highstate, consider using the shutdown state instead of this module.
  Returns True if successful (a shutdown or reboot will occur), otherwise False
  Return type bool

CLI Example:

```bash
salt '*' system.shutdown "System will shutdown in 5 minutes"
```

salt.modules.win_system.shutdown_abort()

Abort a shutdown. Only available while the dialog box is being displayed to the user. Once the shutdown has initiated, it cannot be aborted.

Returns True if successful, otherwise False
Return type bool

CLI Example:

```bash
salt 'minion-id' system.shutdown_abort
```

salt.modules.win_system.shutdown_hard()

Shutdown a running system with no timeout or warning.

Returns True if successful, otherwise False
Return type bool

CLI Example:

```bash
salt '*' system.shutdown_hard
```

salt.modules.win_system.start_time_service()

Start the Windows time service

Returns True if successful, otherwise False
Return type bool
CLI Example:

```
salt '*' system.start_time_service
```

```
salt.modules.win_system.stop_time_service()
```

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' system.stop_time_service
```

```
salt.modules.win_system.unjoin_domain(username=None, password=None, domain=None, workgroup='WORKGROUP', disable=False, restart=False)
```

Unjoin a computer from an Active Directory Domain. Requires a restart.

**Parameters**

- **username (str)** -- Username of an account which is authorized to manage computer accounts on the domain. Needs to be a fully qualified name like `user@domain.tld` or `domain.tld\user`. If the domain is not specified, the passed domain will be used. If the computer account doesn't need to be disabled after the computer is unjoined, this can be `None`.
- **password (str)** -- The password of the specified user
- **domain (str)** -- The domain from which to unjoin the computer. Can be `None`
- **workgroup (str)** -- The workgroup to join the computer to. Default is `WORKGROUP` New in version 2015.8.2/2015.5.7.
- **disable (bool)** -- True to disable the computer account in Active Directory. Default is `False`
- **restart (bool)** -- True will restart the computer after successful unjoin. Default is `False`

New in version 2015.8.2/2015.5.7.

**Returns** Returns a dictionary if successful, otherwise `False`

**Return type** dict

CLI Example:

```
salt 'minion-id' system.unjoin_domain restart=True
```

```
salt 'minion-id' system.unjoin_domain username='unjoinuser' \  
password='unjoinpassword' disable=True \  
restart=True
```

---

**23.9.511 salt.modules.win_task**

Windows Task Scheduler Module .. versionadded:: 2016.3.0

A module for working with the Windows Task Scheduler. You can add and edit existing tasks. You can add and clear triggers and actions. You can list all tasks, folders, triggers, and actions.

```
salt.modules.win_task.add_action(name=None, location='\', action_type='Execute', **kwargs)
```

Add an action to a task.

**Parameters**

- **name (str)** -- The name of the task to which to add the action.
- **location (str)** -- A string value representing the location of the task. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).
• **action_type** *(str)* -- The type of action to add. There are three action types. Each one requires its own set of Keyword Arguments (kwargs). Valid values are:
  - Execute
  - Email
  - Message

Required arguments for each action_type:

**Execute**

Execute a command or an executable

**cmd** *(str)*: (required) The command or executable to run.

**arguments** *(str)*: (optional) Arguments to be passed to the command or executable.

To launch a script the first command will need to be the interpreter for the script. For example, to run a vbscript you would pass `cscript.exe` in the `cmd` parameter and pass the script in the `arguments` parameter as follows:

  • `cmd='cscript.exe' arguments='c:\scripts\myscript.vbs'`

Batch files do not need an interpreter and may be passed to the `cmd` parameter directly.

**start_in** *(str)*: (optional) The current working directory for the command.

**Email**

Send and email. Requires `server`, `from`, and `to` or `cc`.

**from** *(str)*: The sender

**reply_to** *(str)*: Who to reply to

**to** *(str)*: The recipient

**cc** *(str)*: The CC recipient

**bcc** *(str)*: The BCC recipient

**subject** *(str)*: The subject of the email

**body** *(str)*: The Message Body of the email

**server** *(str)*: The server used to send the email

**attachments** *(list)*: A list of attachments. These will be the paths to the files to attach. ie: `attachments=['C:\attachment1.txt', 'C:\attachment2.txt']`

**Message**

Display a dialog box. The task must be set to "Run only when user is logged on" in order for the dialog box to display. Both parameters are required.

**title** *(str)*: The dialog box title.

**message** *(str)*: The dialog box message body

**Returns** A dictionary containing the task configuration

**Return type** *dict*

CLI Example:

```shell
salt 'minion-id' task.add_action <task_name> cmd='del /Q /S C:\\Temp'
```

salt.modules.win_task.add_trigger(name=None, location='\', trigger_type=None, trigger_enabled=True, start_date=None, start_time=None, end_date=None, end_time=None, random_delay=None, repeat_interval=None, repeat_duration=None, repeat_stop_at_duration_end=False, execution_time_limit=None, delay=None, **kwargs)

Add a trigger to a Windows Scheduled task
Note: Arguments are parsed by the YAML loader and are subject to yaml’s idiosyncrasies. Therefore, time values in some formats (%H:%M:%S and %H:%M) should to be quoted. See YAML IDIOSYNCRASIES for more details.

Parameters

- **name (str)** -- The name of the task to which to add the trigger.
- **location (str)** -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).
- **trigger_type (str)** -- The type of trigger to create. This is defined when the trigger is created and cannot be changed later. Options are as follows:
  - Event
  - Once
  - Daily
  - Weekly
  - Monthly
  - MonthlyDay
  - OnIdle
  - OnTaskCreation
  - OnBoot
  - OnLogon
  - OnSessionChange
- **trigger_enabled (bool)** -- Boolean value that indicates whether the trigger is enabled.
- **start_date (str)** -- The date when the trigger is activated. If no value is passed, the current date will be used. Can be one of the following formats:
  - %Y-%m-%d
  - %m-%d-%y
  - %m-%d-%Y
  - %m/%d/%y
  - %m/%d/%Y
  - %Y/%m/%d
- **start_time (str)** -- The time when the trigger is activated. If no value is passed, midnight will be used. Can be one of the following formats:
  - %I:%M:%S %p
  - %I:%M %p
  - %H:%M:%S
  - %H:%M
- **end_date (str)** -- The date when the trigger is deactivated. The trigger cannot start the task after it is deactivated. Can be one of the following formats:
  - %Y-%m-%d
  - %m-%d-%y
  - %m-%d-%Y
  - %m/%d/%y
  - %m/%d/%Y
  - %Y/%m/%d
- **end_time (str)** -- The time when the trigger is deactivated. If this is not passed with end_date it will be set to midnight. Can be one of the following formats:
  - %I:%M:%S %p
  - %I:%M %p
  - %H:%M:%S
  - %H:%M
- **random_delay (str)** -- The delay time that is randomly added to the start time of
the trigger. Valid values are:
- 30 seconds
- 1 minute
- 30 minutes
- 1 hour
- 8 hours
- 1 day

Note: This parameter applies to the following trigger types
- Once
- Daily
- Weekly
- Monthly
- MonthlyDay

- **repeat_interval** *(str)* -- The amount of time between each restart of the task. Valid values are:
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour

- **repeat_duration** *(str)* -- How long the pattern is repeated. Valid values are:
  - Indefinitely
  - 15 minutes
  - 30 minutes
  - 1 hour
  - 12 hours
  - 1 day

- **repeat_stop_at_duration_end** *(bool)* -- Boolean value that indicates if a running instance of the task is stopped at the end of the repetition pattern duration.

- **execution_time_limit** *(str)* -- The maximum amount of time that the task launched by the trigger is allowed to run. Valid values are:
  - 30 minutes
  - 1 hour
  - 2 hours
  - 4 hours
  - 8 hours
  - 12 hours
  - 1 day
  - 3 days (default)

- **delay** *(str)* -- The time the trigger waits after its activation to start the task. Valid values are:
  - 15 seconds
  - 30 seconds
  - 1 minute
  - 30 minutes
  - 1 hour
  - 8 hours
  - 1 day

Note: This parameter applies to the following trigger types:
- OnLogon
- OnBoot
kwargs

There are optional keyword arguments determined by the type of trigger being defined. They are as follows:

Event

The trigger will be fired by an event.

subscription (str): An event definition in xml format that fires the trigger. The easiest way to get this would is to create an event in Windows Task Scheduler and then copy the xml text.

Once

No special parameters required.

Daily

The task will run daily.

days_interval (int): The interval between days in the schedule. An interval of 1 produces a daily schedule. An interval of 2 produces an every-other day schedule. If no interval is specified, 1 is used. Valid entries are 1 - 999.

Weekly

The task will run weekly.

weeks_interval (int): The interval between weeks in the schedule. An interval of 1 produces a weekly schedule. An interval of 2 produces an every-other week schedule. If no interval is specified, 1 is used. Valid entries are 1 - 52.

days_of_week (list): Sets the days of the week on which the task runs. Should be a list. ie: ['Monday', 'Wednesday', 'Friday']. Valid entries are the names of the days of the week.

Monthly

The task will run monthly.

months_of_year (list): Sets the months of the year during which the task runs. Should be a list. ie: ['January', 'July']. Valid entries are the full names of all the months.

days_of_month (list): Sets the days of the month during which the task runs. Should be a list. ie: [1, 15, 'Last']. Options are all days of the month 1 - 31 and the word 'Last' to indicate the last day of the month.

last_day_of_month (bool): Boolean value that indicates that the task runs on the last day of the month regardless of the actual date of that day.

Note: You can set the task to run on the last day of the month by either including the word 'Last' in the list of days, or setting the parameter 'last_day_of_month' equal to True.

MonthlyDay

The task will run monthly on the specified day.

months_of_year (list): Sets the months of the year during which the task runs. Should be a list. ie: ['January', 'July']. Valid entries are the full names of all the months.

weeks_of_month (list): Sets the weeks of the month during which the task runs. Should be a list. ie: ['First', 'Third']. Valid options are:
  • First
  • Second
  • Third
  • Fourth
last_week_of_month (bool): Boolean value that indicates that the task runs on the last week of the month.

days_of_week (list): Sets the days of the week during which the task runs. Should be a list. ie: ['Monday', 'Wednesday', 'Friday']. Valid entries are the names of the days of the week.

OnIdle
No special parameters required.

OnTaskCreation
No special parameters required.

OnBoot
No special parameters required.

OnLogon
No special parameters required.

OnSessionChange
The task will be triggered by a session change.

  session_user_name (str): Sets the user for the Terminal Server session. When a session state change is detected for this user, a task is started. To detect session status change for any user, do not pass this parameter.

  state_change (str): Sets the kind of Terminal Server session change that would trigger a task launch. Valid options are:
  • ConsoleConnect: When you connect to a user session (switch users)
  • ConsoleDisconnect: When you disconnect a user session (switch users)
  • RemoteConnect: When a user connects via Remote Desktop
  • RemoteDisconnect: When a user disconnects via Remote Desktop
  • SessionLock: When the workstation is locked
  • SessionUnlock: When the workstation is unlocked

Returns True if successful, otherwise False

Return type bool

CLI Example:
```
salt 'minion-id' task.add_trigger <task_name> trigger_type=Once trigger_enabled=True start_date=2016/12/1 start_time="12:01"
```

salt.modules.win_task.clear_triggers(name, location='\')
Remove all triggers from the task.

Parameters
  • name (str) -- The name of the task from which to clear all triggers.
  • location (str) -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns True if successful, otherwise False

Return type bool

CLI Example:
```
salt 'minion-id' task.clear_trigger <task_name>
```

salt.modules.win_task.create_folder(name, location='\')
Create a folder in which to create tasks.

Parameters
  • name (str) -- The name of the folder. This will be displayed in the task scheduler.
  • location (str) -- A string value representing the location in which to create the folder. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns True if successful, otherwise False

Return type bool
CLI Example:

```
salt 'minion-id' task.create_folder <folder_name>
```

`salt.modules.win_task.create_task(name, location='\', user_name='System', password=None, force=False, **kwargs)`

Create a new task in the designated location. This function has many keyword arguments that are not listed here. For additional arguments see:

- `edit_task()`
- `add_action()`
- `add_trigger()`

**Parameters**

- `name` *(str)* -- The name of the task. This will be displayed in the task scheduler.
- `location` *(str)* -- A string value representing the location in which to create the task. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).
- `user_name` *(str)* -- The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.
- `password` *(str)* -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.
- `force` *(bool)* -- If the task exists, overwrite the existing task.

**Returns**  
`True` if successful, otherwise `False`

**Return type**  
`bool`

CLI Example:

```
salt 'minion-id' task.create_task <task_name> user_name=System force=True action_type=Execute cmd='del /Q /S C:\\Temp' trigger_type=Once start_date=2016-12-10 start_time=01:00
```

`salt.modules.win_task.create_task_from_xml(name, location='\'; xml_text=None, xml_path=None, user_name='System', password=None)`

Create a task based on XML. Source can be a file or a string of XML.

**Parameters**

- `name` *(str)* -- The name of the task. This will be displayed in the task scheduler.
- `location` *(str)* -- A string value representing the location in which to create the task. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).
- `xml_text` *(str)* -- A string of xml representing the task to be created. This will be overridden by `xml_path` if passed.
- `xml_path` *(str)* -- The path to an XML file on the local system containing the xml that defines the task. This will override `xml_text`.
- `user_name` *(str)* -- The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.
- `password` *(str)* -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.

**Returns**  
`True` if successful, otherwise `False`  
`str`: A string with the error message if there is an error

**Return type**  
`bool`

**Raises**

- `ArgumentValueError` -- If arguments are invalid
- `CommandExecutionError` --
salt 'minion-id' task.delete_folder <folder_name>

salt.modules.win_task.delete_folder(name, location='\\')
Delete a folder from the task scheduler.

Parameters
- **name** *(str)* -- The name of the folder to delete.
- **location** *(str)* -- A string value representing the location of the folder. Default is `\` which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns True if successful, otherwise False

Return type **bool**

CLI Example:
salt 'minion-id' task.delete_folder <folder_name>

salt.modules.win_task.delete_task(name, location='\\')
Delete a task from the task scheduler.

Parameters
- **name** *(str)* -- The name of the task to delete.
- **location** *(str)* -- A string value representing the location of the task. Default is `\` which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns True if successful, otherwise False

Return type **bool**

CLI Example:
salt 'minion-id' task.delete_task <task_name>

salt.modules.win_task.edit_task(name=None, location='\\', user_name=None, password=None, description=None, enabled=None, hidden=None, run_if_idle=None, idle_duration=None, idle_wait_timeout=None, idle_stop_on_end=None, idle_restart=None, ac_only=None, stop_if_on_batteries=None, wake_to_run=None, run_if_network=None, network_id=None, network_name=None, allow_demand_start=None, start_when_available=None, restart_every=None, restart_count=3, execution_time_limit=None, force_stop=None, delete_after=None, multiple_instances=None, **kwargs)

Edit the parameters of a task. Triggers and Actions cannot be edited yet.

Parameters
- **name** *(str)* -- The name of the task. This will be displayed in the task scheduler.
- **location** *(str)* -- A string value representing the location in which to create the task. Default is `\` which is the root for the task scheduler (C:\Windows\System32\tasks).
- **user_name** *(str)* -- The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.
- **password** *(str)* -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.

Note: The combination of user_name and password determine how the task runs. For example, if a username is passed without a password the task will only run when the user is logged in. If a password is passed as well the task will run whether the user is logged on or not. If you pass 'System' as the username the task will run as the system account (the password parameter is ignored).
• `description (str)` -- A string representing the text that will be displayed in the description field in the task scheduler.
• `enabled (bool)` -- A boolean value representing whether or not the task is enabled.
• `hidden (bool)` -- A boolean value representing whether or not the task is hidden.
• `run_if_idle (bool)` -- Boolean value that indicates that the Task Scheduler will run the task only if the computer is in an idle state.
• `idle_duration (str)` -- A value that indicates the amount of time that the computer must be in an idle state before the task is run. Valid values are:
  - 1 minute
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour
• `idle_wait_timeout (str)` -- A value that indicates the amount of time that the Task Scheduler will wait for an idle condition to occur. Valid values are:
  - Do not wait
  - 1 minute
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour
  - 2 hours
• `idle_stop_on_end (bool)` -- Boolean value that indicates that the Task Scheduler will terminate the task if the idle condition ends before the task is completed.
• `idle_restart (bool)` -- Boolean value that indicates whether the task is restarted when the computer cycles into an idle condition more than once.
• `ac_only (bool)` -- Boolean value that indicates that the Task Scheduler will launch the task only while on AC power.
• `stop_if_on_batteries (bool)` -- Boolean value that indicates that the task will be stopped if the computer begins to run on battery power.
• `wake_to_run (bool)` -- Boolean value that indicates that the Task Scheduler will wake the computer when it is time to run the task.
• `run_if_network (bool)` -- Boolean value that indicates that the Task Scheduler will run the task only when a network is available.
• `network_id (guid)` -- GUID value that identifies a network profile.
• `network_name (str)` -- Sets the name of a network profile. The name is used for display purposes.
• `allow_demand_start (bool)` -- Boolean value that indicates that the task can be started by using either the Run command or the Context menu.
• `start_when_available (bool)` -- Boolean value that indicates that the Task Scheduler can start the task at any time after its scheduled time has passed.
• `restart_every (str)` -- A value that specifies the interval between task restart attempts. Valid values are:
  - False (to disable)
  - 1 minute
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour
  - 2 hours
• `restart_count (int)` -- The number of times the Task Scheduler will attempt to
restart the task. Valid values are integers 1 - 999.

- **execution_time_limit** *(bool, str)* -- The amount of time allowed to complete the task. Valid values are:
  - False (to disable)
  - 1 hour
  - 2 hours
  - 4 hours
  - 8 hours
  - 12 hours
  - 1 day
  - 3 days

- **force_stop** *(bool)* -- Boolean value that indicates that the task may be terminated by using TerminateProcess.

- **delete_after** *(bool, str)* -- The amount of time that the Task Scheduler will wait before deleting the task after it expires. Requires a trigger with an expiration date. Valid values are:
  - False (to disable)
  - Immediately
  - 30 days
  - 90 days
  - 180 days
  - 365 days

- **multiple_instances** *(str)* -- Sets the policy that defines how the Task Scheduler deals with multiple instances of the task. Valid values are:
  - Parallel
  - Queue
  - No New Instance
  - Stop Existing

Returns True if successful, otherwise False
Return type bool

CLI Example:

```bash
salt '*' task.edit_task <task_name> description='This task is awesome'
```

**salt.modules.win_task.info**(name, location='\')

Get the details about a task in the task scheduler.

Parameters
- **name** *(str)* -- The name of the task for which to return the status
- **location** *(str)* -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns A dictionary containing the task configuration
Return type dict

CLI Example:

```bash
salt 'minion-id' task.info <task_name>
```

**salt.modules.win_task.list_actions**(name, location='\')

List all actions that pertain to a task in the specified location.

Parameters
- **name** *(str)* -- The name of the task for which list actions.
- **location** *(str)* -- A string value representing the location of the task from which to list actions. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns Returns a list of actions.
Return type list
CLI Example:

```bash
# List all actions for a task in the default location
salt 'minion-id' task.list_actions <task_name>

# List all actions for the XblGameSaveTask in the Microsoft\XblGameSave directory
salt 'minion-id' task.list_actions XblGameSaveTask Microsoft\XblGameSave
```

**salt.modules.win_task.list_folders**(location='\')

List all folders located in a specific location in the task scheduler.

- **Parameters**
  - location (str) -- A string value representing the folder from which you want to list tasks. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).

- **Returns**
  - Returns a list of folders.

- **Return type**
  - list

CLI Example:

```bash
# List all folders in the default location
salt 'minion-id' task.list_folders

# List all folders in the Microsoft directory
salt 'minion-id' task.list_folders Microsoft
```

**salt.modules.win_task.list_tasks**(location='\')

List all tasks located in a specific location in the task scheduler.

- **Parameters**
  - location (str) -- A string value representing the folder from which you want to list tasks. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).

- **Returns**
  - Returns a list of tasks

- **Return type**
  - list

CLI Example:

```bash
# List all tasks in the default location
salt 'minion-id' task.list_tasks

# List all tasks in the Microsoft\XblGameSave directory
salt 'minion-id' task.list_tasks Microsoft\XblGameSave
```

**salt.modules.win_task.list_triggers**(name, location='\')

List all triggers that pertain to a task in the specified location.

- **Parameters**
  - name (str) -- The name of the task for which list triggers.
  - location (str) -- A string value representing the location of the task from which to list triggers. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).

- **Returns**
  - Returns a list of triggers.

- **Return type**
  - list

CLI Example:

```bash
# List all triggers for a task in the default location
salt 'minion-id' task.list_triggers <task_name>

# List all triggers for the XblGameSaveTask in the Microsoft\XblGameSave directory
salt 'minion-id' task.list_triggers XblGameSaveTask Microsoft\XblGameSave
```
salt.modules.win_task.run(name, location='\')
Run a scheduled task manually.
Parameters
  - name (str) -- The name of the task to run.
  - location (str) -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).
Returns
True if successful, otherwise False
Return type bool
CLI Example:

salt 'minion-id' task.run <task_name>

salt.modules.win_task.run_wait(name, location='\')
Run a scheduled task and return when the task finishes
Parameters
  - name (str) -- The name of the task to run.
  - location (str) -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).
Returns
True if successful, otherwise False
Return type bool
CLI Example:

salt 'minion-id' task.run_wait <task_name>

salt.modules.win_task.status(name, location='\')
Determine the status of a task. Is it Running, Queued, Ready, etc.
Parameters
  - name (str) -- The name of the task for which to return the status
  - location (str) -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).
Returns
The current status of the task. Will be one of the following:
  - Unknown
  - Disabled
  - Queued
  - Ready
  - Running
Return type str
CLI Example:

salt 'minion-id' task.list_status <task_name>

salt.modules.win_task.stop(name, location='\')
Stop a scheduled task.
Parameters
  - name (str) -- The name of the task to stop.
  - location (str) -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).
Returns
True if successful, otherwise False
Return type bool
CLI Example:

salt 'minion-id' task.list_stop <task_name>
23.9.512 salt.modules.win_timezone

Module for managing timezone on Windows systems.

class salt.modules.win_timezone.\_TzMapper(\_unix_to_win)

    add(k, v)
    get\_unix(key, default=None)
    get\_win(key, default=None)
    list\_unix()
    list\_win()
    remove(k)

salt.modules.win_timezone.\_get\_hwclock()
    Get current hardware clock setting (UTC or local time)

    Note: The hardware clock is always local time on Windows so this will always return "localtime"

        CLI Example:
        salt '*\_timezone.get\_hwclock

salt.modules.win_timezone.\_get\_offset()
    Get current numeric timezone offset from UTC (i.e. -0700)
        Returns Offset from UTC
        Return type str
        CLI Example:
        salt '*\_timezone.get\_offset

salt.modules.win_timezone.\_get\_zone()
    Get current timezone (i.e. America/Denver)
        Returns Timezone in unix format
        Return type str
        Raises CommandExecutionError -- If timezone could not be gathered
        CLI Example:
        salt '*\_timezone.get\_zone

salt.modules.win_timezone.\_get\_zonecode()
    Get current timezone (i.e. PST, MDT, etc)
        Returns An abbreviated timezone code
        Return type str
        CLI Example:
        salt '*\_timezone.get\_zonecode

salt.modules.win_timezone.\_list(unix\_style=True)
    Return a list of Timezones that this module supports. These can be in either Unix or Windows format.

    New in version 2018.3.3.
    Parameters unix\_style (bool) -- True returns Unix-style timezones. False returns Windows-style timezones. Default is True
Returns A list of supported timezones
Return type list

CLI Example:

```plaintext
# Unix-style timezones
salt '*' timezone.list

# Windows-style timezones
salt '*' timezone.list unix_style=False
```

salt.modules.win_timezone.set_hwclock(clock)
Sets the hardware clock to be either UTC or localtime

Note: The hardware clock is always local time on Windows so this will always return False

CLI Example:

```
salt '*' timezone.set_hwclock UTC
```

salt.modules.win_timezone.set_zone(timezone)
Sets the timezone using the tzutil.

Parameters timezone (str) -- A valid timezone
Returns True if successful, otherwise False
Return type bool
 Raises CommandExecutionError -- If invalid timezone is passed

CLI Example:

```
salt '*' timezone.set_zone 'America/Denver'
```

salt.modules.win_timezone.zone_compare(timezone)
Compares the given timezone with the machine timezone. Mostly useful for running state checks.

Parameters timezone (str) -- The timezone to compare. This can be in Windows or Unix format. Can be any of the values returned by the `timezone.list` function
Returns True if they match, otherwise False
Return type bool

Example:

```
salt '*' timezone.zone_compare 'America/Denver'
```

23.9.513 salt.modules.win_useradd

Module for managing Windows Users.

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to `user.info` is not available), see here.

depends

- pywintypes
- win32api
- win32con
salt.modules.win_useradd.add(name, password=None, fullname=None, description=None, groups=None, home=None, homedrive=None, profile=None, logonscript=None)

Add a user to the minion.

Parameters

- **name** (str) -- User name
- **password** (str, optional) -- User's password in plain text.
- **fullname** (str, optional) -- The user's full name.
- **description** (str, optional) -- A brief description of the user account.
- **groups** (str, optional) -- A list of groups to add the user to. (see chgroups)
- **home** (str, optional) -- The path to the user's home directory.
- **homedrive** (str, optional) -- The drive letter to assign to the home directory. Must be the Drive Letter followed by a colon. i.e: U:
- **profile** (str, optional) -- An explicit path to a profile. Can be a UNC or a folder on the system. If left blank, Windows uses its default profile directory.
- **logonscript** (str, optional) -- Path to a login script to run when the user logs on.

Returns True if successful. False is unsuccessful.

Return type bool

CLI Example:

```
salt '*' user.add name password
```

salt.modules.win_useradd.addgroup(name, group)

Add user to a group

Parameters

- **name** (str) -- The user name to add to the group
- **group** (str) -- The name of the group to which to add the user

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' user.addgroup jsnuffy 'Power Users'
```

salt.modules.win_useradd.chfullname(name, fullname)

Change the full name of the user

Parameters

- **name** (str) -- The user name for which to change the full name
- **fullname** (str) -- The new value for the full name

Returns True if successful, otherwise False

Return type bool

CLI Example:
salt.modules.win_useradd.chgroups(name, groups, append=True)

Change the groups this user belongs to, add append=False to make the user a member of only the specified groups.

Parameters
- name (str) -- The user name for which to change groups
- groups (str, list) -- A single group or a list of groups to assign to the user. For multiple groups this can be a comma delimited string or a list.
- append (bool, optional) -- True adds the passed groups to the user's current groups. False sets the user's groups to the passed groups only. Default is True.

Returns True if successful, otherwise False

Return type bool

CLI Example:
salt '*' user.chgroups jsnuffy Administrators,Users True

salt.modules.win_useradd.chhome(name, home, **kwargs)

Change the home directory of the user, pass True for persist to move files to the new home directory if the old home directory exist.

Parameters
- name (str) -- The name of the user whose home directory you wish to change
- home (str) -- The new location of the home directory

Returns True if successful, otherwise False

Return type bool

CLI Example:
salt '*' user.chhome foo \fileserver\home\foo True

salt.modules.win_useradd.chprofile(name, profile)

Change the profile directory of the user

Parameters
- name (str) -- The name of the user whose profile you wish to change
- profile (str) -- The new location of the profile

Returns True if successful, otherwise False

Return type bool

CLI Example:
salt '*' user.chprofile foo \fileserver\profiles\foo

salt.modules.win_useradd.current(sam=False)

Get the username that salt-minion is running under. If salt-minion is running as a service it should return the Local System account. If salt is running from a command prompt it should return the username that started the command prompt.

New in version 2015.5.6.

Parameters sam (bool, optional) -- False returns just the username without any domain notation. True returns the domain with the username in the SAM format. Ie: domain\username

Returns Returns username

Return type str

CLI Example:
salt '*' user.current
salt.modules.win_useradd.delete(name, purge=False, force=False)

Remove a user from the minion

Parameters

- **name** *(str)* -- The name of the user to delete
- **purge** *(bool, optional)* -- Boolean value indicating that the user profile should also be removed when the user account is deleted. If set to True the profile will be removed. Default is False.
- **force** *(bool, optional)* -- Boolean value indicating that the user account should be deleted even if the user is logged in. True will log the user out and delete user.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' user.delete name
```

salt.modules.win_useradd.getUserSid(username)

Get the Security ID for the user

Parameters **username** *(str)* -- The user name for which to look up the SID

Returns The user SID

Return type str

CLI Example:

```
salt '*' user.getUserSid jsnuffy
```

salt.modules.win_useradd.getent(refresh=False)

Return the list of all info for all users

Parameters **refresh** *(bool, optional)* -- Refresh the cached user information. Useful when used from within a state function. Default is False.

Returns A dictionary containing information about all users on the system

Return type dict

CLI Example:

```
salt '*' user.getent
```

salt.modules.win_useradd.info(name)

Return user information

Parameters **name** *(str)* -- Username for which to display information

Returns A dictionary containing user information

- fullname
- username
- SID
- passwd (will always return None)
- comment (same as description, left here for backwards compatibility)
- description
- active
- logonscript
- profile
- home
- homedrive
- groups
- password_changed
- successful_logon_attempts
- failed_logon_attempts
- last_logon
- account_disabled
- account_locked
- password_neverExpires
- disallow_change_password
- gid

Return type: dict

CLI Example:

```
salt '*' user.info jsnuffy
```

**salt.modules.win_useradd.list_groups(name)**

Return a list of groups the named user belongs to

- **Parameters**
  - name (str) -- The user name for which to list groups
- **Returns**
  - A list of groups to which the user belongs
- **Return type**
  - list

CLI Example:

```
salt '*' user.list_groups foo
```

**salt.modules.win_useradd.list_users()**

Return a list of all users on Windows

- **Returns**
  - A list of all users on the system
- **Return type**
  - list

CLI Example:

```
salt '*' user.list_users
```

**salt.modules.win_useradd.removegroup(name, group)**

Remove user from a group

- **Parameters**
  - name (str) -- The user name to remove from the group
  - group (str) -- The name of the group from which to remove the user
- **Returns**
  - True if successful, otherwise False
- **Return type**
  - bool

CLI Example:

```
salt '*' user.removegroup jsnuffy 'Power Users'
```

**salt.modules.win_useradd.rename(name, new_name)**

Change the username for a named user

- **Parameters**
  - name (str) -- The user name to change
  - new_name (str) -- The new name for the current user
- **Returns**
  - True if successful, otherwise False
- **Return type**
  - bool

CLI Example:

```
salt '*' user.rename jsnuffy jshmoe
```

**salt.modules.win_useradd.setpassword(name, password)**

Set the user's password

- **Parameters**
  - name (str) -- The user name for which to set the password
  - password (str) -- The new password
Returns: True if successful, otherwise False
Return type: bool

CLI Example:
```
salt '*' user.setpassword jsnuffy sup3rs3cr3t
```

```python
salt.modules.win_useradd.update(name, password=None, fullname=None, description=None, home=None, homedrive=None, logonscript=None, profile=None, expiration_date=None, expired=None, account_disabled=None, unlock_account=None, password_neverExpires=None, disallow_change_password=None)
```

Updates settings for the windows user. Name is the only required parameter. Settings will only be changed if the parameter is passed a value.

New in version 2015.8.0.

Parameters:
- **name (str)**: The user name to update.
- **password (str, optional)**: New user password in plain text.
- **fullname (str, optional)**: The user's full name.
- **description (str, optional)**: A brief description of the user account.
- **home (str, optional)**: The path to the user's home directory.
- **homedrive (str, optional)**: The drive letter to assign to the home directory. Must be the Drive Letter followed by a colon. ie: U:
- **logonscript (str, optional)**: The path to the logon script.
- **profile (str, optional)**: The path to the user's profile directory.
- **expiration_date (date, optional)**: The date and time when the account expires. Can be a valid date/time string. To set to never expire pass the string 'Never'.
- **expired (bool, optional)**: Pass True to expire the account. The user will be prompted to change their password at the next logon. Pass False to mark the account as 'not expired'. You can't use this to negate the expiration if the expiration was caused by the account expiring. You'll have to change the expiration_date as well.
- **account_disabled (bool, optional)**: True disables the account. False enables the account.
- **unlock_account (bool, optional)**: True unlocks a locked user account. False is ignored.
- **password_neverExpires (bool, optional)**: True sets the password to never expire. False allows the password to expire.
- **disallow_change_password (bool, optional)**: True blocks the user from changing the password. False allows the user to change the password.

Returns: True if successful. False is unsuccessful.
Return type: bool

CLI Example:
```
salt '*' user.update bob password=secret profile=C:\Users\Bob home=\server\homeshare\bob homedrive=U:
```
23.9.514 salt.modules.win_wua

Module for managing Windows Updates using the Windows Update Agent.

List updates on the system using the following functions:

- `win_wua.available`
- `win_wua.list`

This is an easy way to find additional information about updates available to the system, such as the GUID, KB number, or description.

Once you have the GUID or a KB number for the update you can get information about the update, download, install, or uninstall it using these functions:

- `win_wua.get`
- `win_wua.download`
- `win_wua.install`
- `win_wua.uninstall`

The `win_wua.list` and `win_wua.get` functions are utility functions. In addition to returning information about updates they can also download and install updates by setting `download=True` or `install=True`. So, with `py:func:win_wua.list <salt.modules.win_wua.list>` for example, you could run the function with the filters you want to see what is available. Then just add `install=True` to install everything on that list.

If you want to download, install, or uninstall specific updates, use `win_wua.download`, `win_wua.install`, or `win_wua.uninstall`. To update your system with the latest updates use `win_wua.list` and set `install=True`.

You can also adjust the Windows Update settings using the `win_wua.set_wu_settings` function. This function is only supported on the following operating systems:

- Windows Vista / Server 2008
- Windows 7 / Server 2008R2
- Windows 8 / Server 2012
- Windows 8.1 / Server 2012R2

As of Windows 10 and Windows Server 2016, the ability to modify the Windows Update settings has been restricted. The settings can be modified in the Local Group Policy using the `lgpo` module.

New in version 2015.8.0.

```
depends salt.utils.win_update
```

New in version 2017.7.0.

List updates that match the passed criteria. This allows for more filter options than `list()`. Good for finding a specific GUID or KB.

Parameters

- `software (bool)` -- Include software updates in the results. Default is `True`
- **drivers**(bool) -- Include driver updates in the results. Default is True
- **summary**(bool) --
  - True: Return a summary of updates available for each category.
  - False (default): Return a detailed list of available updates.
- **skip_installed**(bool) -- Skip updates that are already installed. Default is True
- **skip_hidden**(bool) -- Skip updates that have been hidden. Default is True
- **skip_mandatory**(bool) -- Skip mandatory updates. Default is False
- **skip_reboot**(bool) -- Skip updates that require a reboot. Default is False
- **categories**(list) -- Specify the categories to list. Must be passed as a list. All categories returned by default.

Categories include the following:
- Critical Updates
- Definition Updates
- Drivers (make sure you set drivers=True)
- Feature Packs
- Security Updates
- Update Rollups
- Updates
- Windows 7
- Windows 8.1
- Windows 8.1 drivers
- Windows 8.1 and later drivers
- Windows Defender

- **severities**(list) -- Specify the severities to include. Must be passed as a list. All severities returned by default.

Severities include the following:
- Critical
- Important

- **online**(bool) -- Tells the Windows Update Agent go online to update its local update database. True will go online. False will use the local update database as is. Default is True

New in version 3001.

Returns

Returns a dict containing either a summary or a list of updates:

```
Dict of Updates:
{'<GUID>': {
    'Title': <title>,
    'KB': <KB>,
    'GUID': <the globally unique identifier for the update>,
    'Description': <description>,
    'Downloaded': <has the update been downloaded>,
    'Installed': <has the update been installed>,
    'Mandatory': <is the update mandatory>,
    'UserInput': <is user input required>,
    'EULAAccepted': <has the EULA been accepted>,
    'Severity': <update severity>,
    'NeedsReboot': <is the update installed and awaiting reboot>,
    'RebootBehavior': <will the update require a reboot>,
    'Categories': [
        '<category 1>',
    ],

(continues on next page)```
Summary of Updates:
{'Total': <total number of updates returned>,
'Available': <updates that are not downloaded or installed>,
'Downloaded': <updates that are downloaded but not installed>,
'Installed': <updates installed (usually 0 unless installed=True)>,
'Categories': {
  <category 1>: <total for that category>,
  <category 2>: <total for category 2>,
  ...
}}

Return type dict

CLI Examples:

# Normal Usage (list all software updates)
salt '*' win_wua.available

# List all updates with categories of Critical Updates and Drivers
salt '*' win_wua.available categories="["Critical Updates","Drivers"]"

# List all Critical Security Updates
salt '*' win_wua.available categories="["Security Updates"] sevairies="["Critical"]"

# List all updates with a severity of Critical
salt '*' win_wua.available severities="["Critical"]"

# A summary of all available updates
salt '*' win_wua.available summary=True

# A summary of all Feature Packs and Windows 8.1 Updates
salt '*' win_wua.available categories="["Feature Packs","Windows 8.1"] summary=True

salt.modules.win_wua.download(names)
New in version 2017.7.0.

Downloads updates that match the list of passed identifiers. It’s easier to use this function by using list_updates and setting download=True.

Parameters names (str, list) -- A single update or a list of updates to download. This can be any combination of GUIDS, KB numbers, or names. GUIDs or KBs are preferred.

Note: An error will be raised if there are more results than there are items in the names parameter

Returns A dictionary containing the details about the downloaded updates

Return type dict

CLI Example:

# Normal Usage
salt '*' win_wua.download names=['12345678-abcd-1234-abcd-1234567890ab',
  -> 'KB2131233']

salt.modules.win_wua.get(name, download=False, install=False, online=True)
New in version 2017.7.0.

Returns details for the named update

Parameters

- **name (str)** -- The name of the update you're searching for. This can be the GUID, a KB number, or any part of the name of the update. GUIDs and KBs are preferred. Run list to get the GUID for the update you're looking for.
- **download (bool)** -- Download the update returned by this function. Run this function first to see if the update exists, then set download=True to download the update.
- **install (bool)** -- Install the update returned by this function. Run this function first to see if the update exists, then set install=True to install the update.
- **online (bool)** -- Tells the Windows Update Agent go online to update its local update database. True will go online. False will use the local update database as is. Default is True

New in version 3001.

Returns

Returns a dict containing a list of updates that match the name if download and install are both set to False. Should usually be a single update, but can return multiple if a partial name is given.

If download or install is set to true it will return the results of the operation.

```
Dict of Updates:
{ '<GUID>': {
    'Title': <title>,
    'KB': <KB>,
    'GUID': <the globally unique identifier for the update>,
    'Description': <description>,
    'Downloaded': <has the update been downloaded>,
    'Installed': <has the update been installed>,
    'Mandatory': <is the update mandatory>,
    'UserInput': <is user input required>,
    'EULAAccepted': <has the EULA been accepted>,
    'Severity': <update severity>,
    'NeedsReboot': <is the update installed and awaiting reboot>,
    'RebootBehavior': <will the update require a reboot>,
    'Categories': [  
        '<category 1>',
        '<category 2>',
        ...  
    ]
}}
```

Return type  dict

CLI Examples:

```
# Recommended Usage using GUID without braces
# Use this to find the status of a specific update
salt '*' win_wua.get 12345678-abcd-1234-abcd-1234567890ab

# Use the following if you don't know the GUID:

# Using a KB number
# Not all updates have an associated KB
salt '*' win_wua.get KB3030298

# Using part or all of the name of the update
# Could possibly return multiple results
```

(continues on next page)
salt.modules.win_wua.get_needs_reboot()
Determines if the system needs to be rebooted.

Returns True if the system requires a reboot, otherwise False
Return type bool

CLI Examples:
salt '*' win_wua.get_needs_reboot

salt.modules.win_wua.get_wu_settings()
Get current Windows Update settings.

Returns
A dictionary of Windows Update settings:
Featured Updates: Boolean value that indicates whether to display notifications for featured updates.
Group Policy Required (Read-only): Boolean value that indicates whether Group Policy requires the Automatic Updates service.
Microsoft Update: Boolean value that indicates whether to turn on Microsoft Update for other Microsoft Products
Needs Reboot: Boolean value that indicates whether the machine is in a reboot pending state.
Non Admins Elevated: Boolean value that indicates whether non-administrators can perform some update-related actions without administrator approval.
Notification Level:
Number 1 to 4 indicating the update level:
1. Never check for updates
2. Check for updates but let me choose whether to download and install them
3. Download updates but let me choose whether to install them
4. Install updates automatically

Read Only (Read-only): Boolean value that indicates whether the Automatic Update settings are read-only.
Recommended Updates: Boolean value that indicates whether to include optional or recommended updates when a search for updates and installation of updates is performed.
Scheduled Day: Days of the week on which Automatic Updates installs or uninstalls updates.
Scheduled Time: Time at which Automatic Updates installs or uninstalls updates.

Return type dict

CLI Examples:
salt '*' win_wua.get_wu_settings

salt.modules.win_wua.install(names)
New in version 2017.7.0.
Installs updates that match the list of identifiers. It may be easier to use the list_updates function and set install=True.

Parameters names (str, list) -- A single update or a list of updates to install. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.
Note: An error will be raised if there are more results than there are items in the names parameter

Returns: A dictionary containing the details about the installed updates
Return type: dict

CLI Examples:

```sh
# Normal Usage
salt '*' win_wua.install KB12323211
```

```py
salt.modules.win_wua.installed(summary=False, kbs_only=False)
```

New in version 3001.

Get a list of all updates that are currently installed on the system.

Note: This list may not necessarily match the Update History on the machine. This will only show the updates that apply to the current build of Windows. So, for example, the system may have shipped with Windows 10 Build 1607. That machine received updates to the 1607 build. Later the machine was upgraded to a newer feature release, 1803 for example. Then more updates were applied. This will only return the updates applied to the 1803 build and not those applied when the system was at the 1607 build.

Parameters

- **summary (bool)** -- Return a summary instead of a detailed list of updates. True will return a Summary, False will return a detailed list of installed updates. Default is False
- **kbs_only (bool)** -- Only return a list of KBs installed on the system. If this parameter is passed, the summary parameter will be ignored. Default is False

Returns: A dictionary of either a Summary or a detailed list of updates installed on the system when kbs_only=False

- list: Returns a list of KBs installed on the system when kbs_only=True

Return type: dict

CLI Examples:

```sh
# Get a detailed list of all applicable updates installed on the system
salt '*' win_wua.installed
```

```sh
# Get a summary of all applicable updates installed on the system
salt '*' win_wua.installed summary=True
```

```sh
# Get a simple list of KBs installed on the system
salt '*' win_wua.installed kbs_only=True
```

```py
salt.modules.win_wua.list(software=True, drivers=False, summary=False, skip_installed=True, categories=None, severities=None, download=False, install=False, online=True)
```

New in version 2017.7.0.

Returns a detailed list of available updates or a summary. If download or install is True the same list will be downloaded and/or installed.

Parameters

- **software (bool)** -- Include software updates in the results. Default is True
- **drivers (bool)** -- Include driver updates in the results. Default is False
- **summary (bool)** --
- **True**: Return a summary of updates available for each category.
- **False** (default): Return a detailed list of available updates.

- **skip_installed** *(bool)* -- Skip installed updates in the results. Default is **True**
- **download** *(bool)* -- (Overrides reporting functionality) Download the list of updates returned by this function. Run this function first with `download=False` to see what will be downloaded, then set `download=True` to download the updates. Default is **False**
- **install** *(bool)* -- (Overrides reporting functionality) Install the list of updates returned by this function. Run this function first with `install=False` to see what will be installed, then set `install=True` to install the updates. Default is **False**
- **categories** *(list)* -- Specify the categories to list. Must be passed as a list. All categories returned by default.

Categories include the following:
- Critical Updates
- Definition Updates
- Drivers (make sure you set `drivers=True`)
- Feature Packs
- Security Updates
- Update Rollups
- Updates
- Update Rollups
- Windows 7
- Windows 8.1
- Windows 8.1 drivers
- Windows 8.1 and later drivers
- Windows Defender

- **severities** *(list)* -- Specify the severities to include. Must be passed as a list. All severities returned by default.

Severities include the following:
- Critical
- Important

- **online** *(bool)* -- Tells the Windows Update Agent go online to update its local update database. **True** will go online. **False** will use the local update database as is. Default is **True**

**Returns**

Returns a dict containing either a summary or a list of updates:

```python
Dict of Updates:
{'<GUID>': {
    'Title': <title>,
    'KB': <KB>,
    'GUID': <the globally unique identifier for the update>,
    'Description': <description>,
    'Downloaded': <has the update been downloaded>,
    'Installed': <has the update been installed>,
    'Mandatory': <is the update mandatory>,
    'UserInput': <is user input required>,
    'EULAAccepted': <has the EULA been accepted>,
    'Severity': <update severity>,
    'NeedsReboot': <is the update installed and awaiting reboot>,
    'RebootBehavior': <will the update require a reboot>,
    'Categories': [ ...
```
Summary of Updates:
{'Total': <total number of updates returned>,
 'Available': <updates that are not downloaded or installed>,
 'Downloaded': <updates that are downloaded but not installed>,
 'Installed': <updates installed (usually 0 unless installed=True)>,
 'Categories': {
   <category 1>: <total for that category>,
   <category 2>: <total for category 2>,
   ... } }

Return type  dict

CLI Examples:

```
# Normal Usage (list all software updates)
salt '*' win_wua.list

# List all updates with categories of Critical Updates and Drivers
salt '*' win_wua.list categories=['Critical Updates','Drivers']

# List all Critical Security Updates
salt '*' win_wua.list categories=['Security Updates'] severities=['Critical']

# List all updates with a severity of Critical
salt '*' win_wua.list severities=['Critical']

# A summary of all available updates
salt win_wua.list summary=True

# A summary of all Feature Packs and Windows 8.1 Updates
salt '*' win_wua.list categories=['Feature Packs','Windows 8.1'] summary=True
```

salt.modules.win_wua.set_wu_settings(level=None, recommended=None, featured=None, elevated=None, msupdate=None, day=None, time=None)

Change Windows Update settings. If no parameters are passed, the current value will be returned.

Supported:
- Windows Vista / Server 2008
- Windows 7 / Server 2008R2
- Windows 8 / Server 2012
- Windows 8.1 / Server 2012R2

Parameters
- **level** *(int)* -- Number from 1 to 4 indicating the update level:
  1. Never check for updates
  2. Check for updates but let me choose whether to download and install them
  3. Download updates but let me choose whether to install them
  4. Install updates automatically
- **recommended** *(bool)* -- Boolean value that indicates whether to include optional or recommended updates when a search for updates and installation of updates is performed.
- **featured** *(bool)* -- Boolean value that indicates whether to display notifications for featured updates.
- **elevated** (bool) -- Boolean value that indicates whether non-administrators can perform some update-related actions without administrator approval.
- **msupdate** (bool) -- Boolean value that indicates whether to turn on Microsoft Update for other Microsoft products.
- **day** (str) -- Days of the week on which Automatic Updates installs or uninstalls updates. Accepted values:
  - Everyday
  - Monday
  - Tuesday
  - Wednesday
  - Thursday
  - Friday
  - Saturday
- **time** (str) -- Time at which Automatic Updates installs or uninstalls updates. Must be in the ##:## 24hr format, e.g. 3:00 PM would be 15:00. Must be in 1 hour increments.

Returns: Returns a dictionary containing the results.
Return type: dict

CLI Examples:
```
salt '*' win_wua.set_wu_settings level=4 recommended=True featured=False
```

salt.modules.win_wua.uninstall(names)

New in version 2017.7.0.

Uninstall updates.

Parameters: names (str, list) -- A single update or a list of updates to uninstall. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

Returns: A dictionary containing the details about the uninstalled updates.
Return type: dict

CLI Examples:
```
# Normal Usage
salt '*' win_wua.uninstall KB3121212

# As a list
salt '*' win_wua.uninstall guid=['12345678-abcd-1234-abcd-1234567890ab', 'KB1231231']
```

23.9.515 salt.modules.win_wusa

Microsoft Update files management via wusa.exe

maintainer: Thomas Lemarchand
platform: Windows
depends: PowerShell

New in version 2018.3.4.

salt.modules.win_wusa.install(path, restart=False)

Install a KB from a .msu file.

Parameters:
- **path** (str) -- The full path to the msu file to install
• **restart** *(bool)* -- True to force a restart if required by the installation. Adds the /forcerestart switch to the wusa.exe command. False will add the /norestart switch instead. Default is False

Returns True if successful, otherwise False
Return type bool

Raises **CommandExecutionError** -- If the package is already installed or an error is encountered

CLI Example:
```
salt '*' wusa.install C:/temp/KB123456.msu
```

**salt.modules.win_wusa.is_installed**(name)
Check if a specific KB is installed.
Parameters
- **name** *(str)* -- The name of the KB to check

Returns True if installed, otherwise False
Return type bool

CLI Example:
```
salt '*' wusa.is_installed KB123456
```

**salt.modules.win_wusa.list**()
Get a list of updates installed on the machine
Returns A list of installed updates
Return type list

CLI Example:
```
salt '*' wusa.list
```

**salt.modules.win_wusa.uninstall**(path, restart=False)
Uninstall a specific KB.
Parameters
- **path** *(str)* -- The full path to the msu file to uninstall. This can also be just the name of the KB to uninstall
- **restart** *(bool)* -- True to force a restart if required by the installation. Adds the /forcerestart switch to the wusa.exe command. False will add the /norestart switch instead. Default is False

Returns True if successful, otherwise False
Return type bool

Raises **CommandExecutionError** -- If an error is encountered

CLI Example:
```
salt '*' wusa.uninstall KB123456

# or

salt '*' wusa.uninstall C:/temp/KB123456.msu
salt.modules.winrepo

Module to manage Windows software repo on a Standalone Minion

file_client: local must be set in the minion config file.

For documentation on Salt's Windows Repo feature, see here.

salt.modules.winrepo.genrepo()

Generate winrepo_cachefile based on sls files in the winrepo_dir

CLI Example:
	salt-call winrepo.genrepo

salt.modules.winrepo.show_sls(name, saltenv='base')

New in version 2015.8.0.

Display the rendered software definition from a specific sls file in the local winrepo cache. This will parse all
Jinja. Run pkg.refresh_db to pull the latest software definitions from the master.

Note: This function does not ask a master for an sls file to render. Instead it directly processes the file specified
in name

Parameters

- **str (saltenv)** -- The name/path of the package you want to view. This can be the
  path to a file on the minion file system or a file on the
  local (full) --
  cache. (minion) --
  **str** -- The default environment is base

Returns Returns a dictionary containing the rendered data structure

Return type: dict

Note: To use a file from the minion cache start from the local winrepo root (C:\salt\var\cache\salt\minion\files\base\win\repo-ng). If you have .sls files organized in subdirectories you'll have to
denote them with .. For example, if you have a test directory in the winrepo root with a gvim.sls file
inside, would target that file like so: test.gvim. Directories can be targeted as well as long as they contain
an init.sls inside. For example, if you have a node directory with an init.sls inside, target that like
so: node.

CLI Example:
	salt '*' winrepo.show_sls gvim
	salt '*' winrepo.show_sls test.npp
	salt '*' winrepo.show_sls C:\test\gvim.sls

salt.modules.winrepo.update_git_repos(clean=False)

Checkout git repos containing Windows Software Package Definitions.

Important: This function requires Git for Windows to be installed in order to work. When installing, make
sure to select an installation option which permits the git executable to be run from the Command Prompt.

clean [False] Clean repo cachedirs which are not configured under winrepo_remotes.
Note: This option only applies if either `pygit2` or `GitPython` is installed into Salt's bundled Python.

Warning: This argument should not be set to `True` if a mix of git and non-git repo definitions are being used, as it will result in the non-git repo definitions being removed.

New in version 2015.8.0.

CLI Example:

```
salt-call winrepo.update_git_repos
```

23.9.517 salt.modules.wordpress

This module is used to manage Wordpress installations

`depends` wp binary from `http://wp-cli.org/`

`class` `salt.modules.wordpress.Plugin(name, status, update, versino)`

- **name**
  - Alias for field number 0

- **status**
  - Alias for field number 1

- **update**
  - Alias for field number 2

- **versino**
  - Alias for field number 3

`salt.modules.wordpress.activate(name, path, user)`

Activate a wordpress plugin

- **name** Wordpress plugin name
- **path** path to wordpress install location
- **user** user to run the command as

CLI Example:

```
salt '*' wordpress.activate HyperDB /var/www/html apache
```

`salt.modules.wordpress.deactivate(name, path, user)`

Deactivate a wordpress plugin

- **name** Wordpress plugin name
- **path** path to wordpress install location
- **user** user to run the command as

CLI Example:

```
salt '*' wordpress.deactivate HyperDB /var/www/html apache
```

`salt.modules.wordpress.install(path, user, admin_user, admin_password, admin_email, title, url)`

Run the initial setup functions for a wordpress install

- **path** path to wordpress install location
- **user** user to run the command as
admin_user Username for the Administrative user for the wordpress install
admin_password Initial Password for the Administrative user for the wordpress install
admin_email Email for the Administrative user for the wordpress install
title Title of the wordpress website for the wordpress install
url Url for the wordpress install

CLI Example:

```
salt '*' wordpress.install /var/www/html apache dwallace password123
   -> dwallace@example.com "Daniel's Awesome Blog" https://blog.dwallace.com
```

salt.modules.wordpress.is_installed(path, user=None)
Check if wordpress is installed and setup
path path to wordpress install location
user user to run the command as

CLI Example:

```
salt '*' wordpress.is_installed /var/www/html apache
```

salt.modules.wordpress.list_plugins(path, user)
List plugins in an installed wordpress path
path path to wordpress install location
user user to run the command as

CLI Example:

```
salt '*' wordpress.list_plugins /var/www/html apache
```

salt.modules.wordpress.show_plugin(name, path, user)
Show a plugin in a wordpress install and check if it is installed
name Wordpress plugin name
path path to wordpress install location
user user to run the command as

CLI Example:

```
salt '*' wordpress.show_plugin HyperDB /var/www/html apache
```

23.9.518 salt.modules.x509
Manage X509 certificates
New in version 2015.8.0.
depends M2Crypto

salt.modules.x509.create_certificate(path=None, text=False, overwrite=True, ca_server=None, **kwargs)
Create an X509 certificate.
path: Path to write the certificate to.
text: If True, return the PEM text without writing to a file. Default False.
overwrite: If True (default), create_certificate will overwrite the entire PEM file. Set False to preserve existing private keys and dh params that may exist in the PEM file.
ca_server: Any of the properties below can be included as additional keyword arguments.
certificate: Request a remotely signed certificate from ca_server. For this to work, a signing_policy must be specified, and that same policy must be configured on the ca_server. See signing_policy for details. Also, the salt master must permit peers to call the sign_remote_certificate function.

Example:
/etc/salt/master.d/peer.conf

```yaml
peer:
  .*:
    - x509.sign_remote_certificate
```

subject properties: Any of the values below can be included to set subject properties. Any other subject properties supported by OpenSSL should also work.

C: 2 letter Country code
CN: Certificate common name, typically the FQDN.
Email: Email address
GN: Given Name
L: Locality
O: Organization
OU: Organization Unit
SN: SurName
ST: State or Province

signing_private_key: A path or string of the private key in PEM format that will be used to sign this certificate. If neither signing_cert, public_key, or csr are included, it will be assumed that this is a self-signed certificate, and the public key matching signing_private_key will be used to create the certificate.

signing_private_key_passphrase: Passphrase used to decrypt the signing_private_key.

signing_cert: A certificate matching the private key that will be used to sign this certificate. This is used to populate the issuer values in the resulting certificate. Do not include this value for self-signed certificates.

public_key: The public key to be included in this certificate. This can be sourced from a public key, certificate, CSR or private key. If a private key is used, the matching public key from the private key will be generated before any processing is done. This means you can request a certificate from a remote CA using a private key file as your public_key and only the public key will be sent across the network to the CA. If neither public_key or csr are specified, it will be assumed that this is a self-signed certificate, and the public key derived from signing_private_key will be used. Specify either public_key or csr, not both. Because you can input a CSR as a public key or as a CSR, it is important to understand the difference. If you import a CSR as a public key, only the public key will be added to the certificate, subject or extension information in the CSR will be lost.

public_key_passphrase: If the public key is supplied as a private key, this is the passphrase used to decrypt it.

csr: A file or PEM string containing a certificate signing request. This will be used to supply the subject, extensions and public key of a certificate. Any subject or extensions specified explicitly will overwrite any in the CSR.

basicConstraints: X509v3 Basic Constraints extension.

extensions: The following arguments set X509v3 Extension values. If the value starts with critical, the extension will be marked as critical.

Some special extensions are subjectKeyIdentifier and authorityKeyIdentifier.

subjectKeyIdentifier can be an explicit value or it can be the special string hash. hash will set the subjectKeyIdentifier equal to the SHA1 hash of the modulus of the public key in this certificate. Note that this is not the exact same hashing method used by OpenSSL when using the hash value.

authorityKeyIdentifier Use values acceptable to the openssl CLI tools. This will automatically populate authorityKeyIdentifier with the subjectKeyIdentifier of signing_cert. If this is a self-signed cert these values will be the same.

basicConstraints: X509v3 Basic Constraints
keyUsage: X509v3 Key Usage
extendedKeyUsage: X509v3 Extended Key Usage
subjectKeyIdentifier: X509v3 Subject Key Identifier
issuerAltName: X509v3 Issuer Alternative Name
subjectAltName: X509v3 Subject Alternative Name
crlDistributionPoints: X509v3 CRL Distribution Points
issuingDistributionPoint: X509v3 Issuing Distribution Point
certificatePolicies: X509v3 Certificate Policies
policyConstraints: X509v3 Policy Constraints
inhibitAnyPolicy: X509v3 Inhibit Any Policy
nameConstraints: X509v3 Name Constraints
noCheck: X509v3 OCSP No Check
nsComment: Netscape Comment
nsCertType: Netscape Certificate Type
days_valid: The number of days this certificate should be valid. This sets the notAfter property of the certificate. Defaults to 365.
version: The version of the X509 certificate. Defaults to 3. This is automatically converted to the version value, so version=3 sets the certificate version field to 0x2.
serial_number: The serial number to assign to this certificate. If omitted a random serial number of size serial_bits is generated.
serial_bits: The number of bits to use when randomly generating a serial number. Defaults to 64.
algorithm: The hashing algorithm to be used for signing this certificate. Defaults to sha256.
copypath: An additional path to copy the resulting certificate to. Can be used to maintain a copy of all certificates issued for revocation purposes.
prepend_cn: If set to True, the CN and a dash will be prepended to the copypath's filename.
Example: /etc/pki/issued_certs/www.example.com-DE:CA:FB:AD:00:00:00:00.crt
signing_policy: A signing policy that should be used to create this certificate. Signing policies should be defined in the minion configuration, or in a minion pillar. It should be a YAML formatted list of arguments which will override any arguments passed to this function. If the minions key is included in the signing policy, only minions matching that pattern (see match.glob and match.compound) will be permitted to remotely request certificates from that policy. In order to match.compound to work salt master must peers permit peers to call it.
Example:
/etc/salt/master.d/peer.conf

peer:
  .*:
  - match.compound

Example:

x509_signing_policies:
  www:
    - minions: 'www*'
    - signing_private_key: /etc/pki/ca.key
    - signing_cert: /etc/pki/ca.crt
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:false"
    - keyUsage: "critical cRLSign, keyCertSign"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 90
    - copypath: /etc/pki/issued_certs/

The above signing policy can be invoked with signing_policy=www
not_before: Initial validity date for the certificate. This date must be specified in the format '%Y-%m-%d %H:%M:%S'.

   New in version 3001.

not_after: Final validity date for the certificate. This date must be specified in the format '%Y-%m-%d %H:%M:%S'.

   New in version 3001.

CLI Example:
```
salt '*' x509.create_certificate path=/etc/pki/myca.crt signing_private_key=wget://etc/pki/myca.key csr=/etc/pki/myca.csr
```

salt.modules.x509.create_crl(path=None, text=False, signing_private_key=None, signing_private_key_passphrase=None, signing_cert=None, revoked=None, include_expired=False, days_valid=100, digest='')

Create a CRL

   Depends
    • PyOpenSSL Python module

path: Path to write the CRL to.
text: If True, return the PEM text without writing to a file. Default False.
signing_private_key: A path or string of the private key in PEM format that will be used to sign the CRL. This is required.
signing_private_key_passphrase: Passphrase to decrypt the private key.
signing_cert: A certificate matching the private key that will be used to sign the CRL. This is required.
revoked: A list of dicts containing all the certificates to revoke. Each dict represents one certificate. A dict must contain either the key serial_number with the value of the serial number to revoke, or certificate with either the PEM encoded text of the certificate, or a path to the certificate to revoke.

   The dict can optionally contain the revocation_date key. If this key is omitted the revocation date will be set to now. If should be a string in the format "%Y-%m-%d %H:%M:%S".

   The dict can also optionally contain the not_after key. This is redundant if the certificate key is included. If the Certificate key is not included, this can be used for the logic behind the include_expired parameter. If should be a string in the format "%Y-%m-%d %H:%M:%S".

   The dict can also optionally contain the reason key. This is the reason code for the revocation. Available choices are unspecified, keyCompromise, CACompromise, affiliationChanged, superseded, cessationOfOperation and certificateHold.
include_expired: Include expired certificates in the CRL. Default is False.
days_valid: The number of days that the CRL should be valid. This sets the Next Update field in the CRL.
digest: The digest to use for signing the CRL. This has no effect on versions of pyOpenSSL less than 0.14

CLI Example:
```
salt '*' x509.create_crl path=/etc/pki/mykey.key 
   signing_private_key=wget://etc/pki/ca.key 
   signing_cert=wget://etc/pki/ca.crt 
   revoked='{"compromised-web-key": {"certificate": "wget://etc/pki/certs/www1.crt", "revocation_date": "2015-03-01 00:00:00"}}'
```

salt.modules.x509.create_csr(path=None, text=False, **kwargs)

Create a certificate signing request.

path: Path to write the certificate to.
text: If True, return the PEM text without writing to a file. Default False.
algorithm: The hashing algorithm to be used for signing this request. Defaults to sha256.
kwargs: The subject, extension and version arguments from x509.create_certificate can be used.

CLI Example:
```python
salt '*' x509.create_csr path=/etc/pki/myca.csr public_key='/etc/pki/myca.key' CN='My Cert'
```

**salt.modules.x509.create_private_key** *(path=None, text=False, bits=2048, passphrase=None, cipher='aes_128_cbc', verbose=True)*

Creates a private key in PEM format.

- **path:** The path to write the file to, either path or text are required.
- **text:** If True, return the PEM text without writing to a file. Default False.
- **bits:** Length of the private key in bits. Default 2048
- **passphrase:** Passphrase for encrypting the private key
- **cipher:** Cipher for encrypting the private key. Has no effect if passphrase is None.
- **verbose:** Provide visual feedback on stdout. Default True

New in version 2016.11.0.

CLI Example:

```bash
salt '*' x509.create_private_key path=/etc/pki/mykey.key
```

**salt.modules.x509.expired** *(certificate)*

Returns a dict containing limited details of a certificate and whether the certificate has expired.

New in version 2016.11.0.

- **certificate:** The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:

```bash
salt '*' x509.expired '/etc/pki/mycert.crt'
```

**salt.modules.x509.get_pem_entries** *(glob_path)*

Returns a dict containing PEM entries in files matching a glob

- **glob_path:** A path to certificates to be read and returned.

CLI Example:

```bash
salt '*' x509.get_pem_entries '/etc/pki/*.crt'
```

**salt.modules.x509.get_pem_entry** *(text, pem_type=None)*

Returns a properly formatted PEM string from the input text fixing any whitespace or line-break issues

- **text:** Text containing the X509 PEM entry to be returned or path to a file containing the text.
- **pem_type:** If specified, this function will only return a pem of a certain type, for example 'CERTIFICATE' or 'CERTIFICATE REQUEST'.

CLI Example:

```bash
salt '*' x509.get_pem_entry "-----BEGIN CERTIFICATE REQUEST-----MIICyzCC Ar8CAQI....-----END CERTIFICATE REQUEST"
```

**salt.modules.x509.get_private_key_size** *(private_key, passphrase=None)*

Returns the bit length of a private key in PEM format.

- **private_key:** A path or PEM encoded string containing a private key.

CLI Example:

```bash
salt '*' x509.get_private_key_size /etc/pki/mycert.key
```

**salt.modules.x509.get_public_key** *(key, passphrase=None, asObj=False)*

Returns a string containing the public key in PEM format.

- **key:** A path or PEM encoded string containing a CSR, Certificate or Private Key from which a public key can be retrieved.
Salt Documentation, Release 3003.3

CLI Example:
```
salt '*' x509.get_public_key /etc/pki/mycert.cer
```

`salt.modules.x509.get_signing_policy(signing_policy_name)`
Returns the details of a names signing policy, including the text of the public key that will be used to sign it. Does not return the private key.

CLI Example:
```
salt '*' x509.get_signing_policy www
```

`salt.modules.x509.read_certificate(certificate)`
Returns a dict containing details of a certificate. Input can be a PEM string or file path.

- `certificate`: The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:
```
salt '*' x509.read_certificate /etc/pki/mycert.crt
```

`salt.modules.x509.read_certificates(glob_path)`
Returns a dict containing details of all certificates matching a glob

- `glob_path`: A path to certificates to be read and returned.

CLI Example:
```
salt '*' x509.read_certificates "/etc/pki/*/crt"
```

`salt.modules.x509.read_crl(crl)`
Returns a dict containing details of a certificate revocation list. Input can be a PEM string or file path.

**Depends**
- OpenSSL command line tool

- `crl`: A path or PEM encoded string containing the CRL to read.

CLI Example:
```
salt '*' x509.read_crl /etc/pki/mycrl.crl
```

`salt.modules.x509.read_csr(csr)`
Returns a dict containing details of a certificate request.

**Depends**
- OpenSSL command line tool

- `csr`: A path or PEM encoded string containing the CSR to read.

CLI Example:
```
salt '*' x509.read_csr /etc/pki/mycert.csr
```

`salt.modules.x509.sign_remote_certificate(argdic, **kwargs)`
Request a certificate to be remotely signed according to a signing policy.

- `argdic`: A dict containing all the arguments to be passed into the create_certificate function. This will become kwarg when passed to create_certificate.

- `kwargs`: kwarg delivered from publish.publish

CLI Example:
```
salt '*' x509.sign_remote_certificate argdic="{"public_key": "/etc/pki/www.key", "signing_policy": "www"}"
__pub_id='www1'
```
Salt Documentation, Release 3003.3

salt.modules.x509.verify_crl(crl, cert)
Verify a CRL against a certificate. Parses openssl command line output, this is a workaround for M2Crypto's inability to get them from CSR objects.

crl: The CRL to verify
cert: The certificate to verify the CRL against

CLI Example:
```
salt '*' x509.verify_crl crl=/etc/pki/myca.crl cert=/etc/pki/myca.crt
```

salt.modules.x509.verify_private_key(private_key, public_key, passphrase=None)
Verify that 'private_key' matches 'public_key'

private_key: The private key to verify, can be a string or path to a private key in PEM format.
public_key: The public key to verify, can be a string or path to a PEM formatted certificate, CSR, or another private key.
passphrase: Passphrase to decrypt the private key.

CLI Example:
```
salt '*' x509.verify_private_key private_key=/etc/pki/myca.key public_key=/etc/pki/myca.crt
```

salt.modules.x509.verify_signature(certificate, signing_pub_key=None, signing_pub_key_passphrase=None)
Verify that certificate has been signed by signing_pub_key

certificate: The certificate to verify. Can be a path or string containing a PEM formatted certificate.
signing_pub_key: The public key to verify, can be a string or path to a PEM formatted certificate, CSR, or another private key.

signing_pub_key_passphrase: Passphrase to the signing_pub_key if it is an encrypted private key.

CLI Example:
```
salt '*' x509.verify_signature /etc/pki/mycert.pem signing_pub_key=/etc/pki/myca.crt
```

salt.modules.x509.will_expire(certificate, days)
Returns a dict containing details of a certificate and whether the certificate will expire in the specified number of days. Input can be a PEM string or file path.

New in version 2016.11.0.
certificate: The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:
```
salt '*' x509.will_expire "/etc/pki/mycert.crt" days=30
```

salt.modules.x509.write_pem(text, path, overwrite=True, pem_type=None)
Writes out a PEM string fixing any formatting or whitespace issues before writing.
text: PEM string input to be written out.
path: Path of the file to write the PEM out to.
overwrite: If True (default), write_pem will overwrite the entire PEM file. Set False to preserve existing private keys and dh params that may exist in the PEM file.
pem_type: The PEM type to be saved, for example CERTIFICATE or PUBLIC KEY. Adding this will allow the function to take input that may contain multiple PEM types.

CLI Example:
```
salt '*' x509.write_pem "-----BEGIN CERTIFICATE-----MIIGMzCCBBugA..." path=/etc/pki/mycert.crt
```
23.9.519 salt.modules.xapi_virt

This module (mostly) uses the XenAPI to manage Xen virtual machines.

Big fat warning: the XenAPI used in this file is the one bundled with Xen Source, NOT XenServer nor Xen Cloud Platform. As a matter of fact it will fail under those platforms. From what I’ve read, little work is needed to adapt this code to XS/XCP, mostly playing with XenAPI version, but as XCP is not taking precedence on Xen Source on many platforms, please keep compatibility in mind.

Useful documentation:

- http://docs.vmd.citrix.com/XenServer/6.0.0/1.0/en_gb/api/
- https://github.com/xapi-project/xen-api/tree/master/scripts/examples/python
- http://xenbits.xen.org/gitweb/?p=xen.git;a=tree;f=tools/python/xen/xm;hb=HEAD

salt.modules.xapi_virt.freecpu()

Return an int representing the number of unallocated cpus on this hypervisor

CLI Example:

```
salt '*' virt.freecpu
```

salt.modules.xapi_virt.freemem()

Return an int representing the amount of memory that has not been given to virtual machines on this node

CLI Example:

```
salt '*' virt.freemem
```

salt.modules.xapi_virt.full_info()

Return the node_info, vm_info and freemem

CLI Example:

```
salt '*' virt.full_info
```

salt.modules.xapi_virt.get_disks(vm_)

Return the disks of a named vm

CLI Example:

```
salt '*' virt.get_disks <vm name>
```

salt.modules.xapi_virt.get_macs(vm_)

Return a list off MAC addresses from the named vm

CLI Example:

```
salt '*' virt.get_macs <vm name>
```

salt.modules.xapi_virt.get_nics(vm_)

Return info about the network interfaces of a named vm

CLI Example:

```
salt '*' virt.get_nics <vm name>
```

salt.modules.xapi_virt.is_hyper()

Returns a bool whether or not this node is a hypervisor of any kind

CLI Example:
salt '*' virt.is_hyper

salt.modules.xapi_virt.list_domains()
    Return a list of virtual machine names on the minion
    CLI Example:
    salt '*' virt.list_domains

salt.modules.xapi_virt.migrate(vm_, target, live=1, port=0, node=-1, ssl=None, change_home_server=0)
    Migrates the virtual machine to another hypervisor
    CLI Example:
    salt '*' virt.migrate <vm name> <target hypervisor> [live] [port] [node] [ssl]
    → [change_home_server]

    Optional values:
    live Use live migration
    port Use a specified port
    node Use specified NUMA node on target
    ssl use ssl connection for migration
    change_home_server change home server for managed domains

salt.modules.xapi_virt.node_info()
    Return a dict with information about this node
    CLI Example:
    salt '*' virt.node_info

salt.modules.xapi_virt.pause(vm_)
    Pause the named vm
    CLI Example:
    salt '*' virt.pause <vm name>

salt.modules.xapi_virt.reboot(vm_)
    Reboot a domain via ACPI request
    CLI Example:
    salt '*' virt.reboot <vm name>

salt.modules.xapi_virt.reset(vm_)
    Reset a VM by emulating the reset button on a physical machine
    CLI Example:
    salt '*' virt.reset <vm name>

salt.modules.xapi_virt.resume(vm_)
    Resume the named vm
    CLI Example:
Salt Documentation, Release 3003.3

```python
salt 'x' virt.resume <vm name>
```

salt.modules.xapi_virt.setmem(vm_, memory)
Changes the amount of memory allocated to VM.
Memory is to be specified in MB
CLI Example:
```python
salt 'x' virt.setmem myvm 768
```

salt.modules.xapi_virt.setvcpus(vm_, vcpus)
Changes the amount of vcpus allocated to VM.
vcpus is an int representing the number to be assigned
CLI Example:
```python
salt 'x' virt.setvcpus myvm 2
```

salt.modules.xapi_virt.shutdown(vm_)
Send a soft shutdown signal to the named vm
CLI Example:
```python
salt 'x' virt.shutdown <vm name>
```

salt.modules.xapi_virt.start(config_)
Start a defined domain
CLI Example:
```python
salt 'x' virt.start <path to Xen cfg file>
```

salt.modules.xapi_virt.stop(vm_)
Hard power down the virtual machine, this is equivalent to pulling the power
CLI Example:
```python
salt 'x' virt.stop <vm name>
```

salt.modules.xapi_virt.vcpu_pin(vm_, vcpu, cpus)
Set which CPUs a VCPU can use.
CLI Example:
```python
salt 'foo' virt.vcpu_pin domU-id 2 1
salt 'foo' virt.vcpu_pin domU-id 2 2-6
```

salt.modules.xapi_virt.vm_cputime(vm_=None)
Return cputime used by the vms on this hyper in a list of dicts:
```python
[
    {'your-vm': {
        'cputime' <int>
        'cputime_percent' <int>
    },
    ...
]```
If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```bash
salt '*' virt.vm_cputime
```

**salt.modules.xapi_virt.vm_diskstats**(vm_=None)

Return disk usage counters used by the vms on this hyper in a list of dicts:

```
[ ]
  'your-vm': {
    'io_read_kbs'   : 0,
    'io_write_kbs'  : 0
   }
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```bash
salt '*' virt.vm_diskstats
```

**salt.modules.xapi_virt.vm_info**(vm_=None)

Return detailed information about the vms.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```bash
salt '*' virt.vm_info
```

**salt.modules.xapi_virt.vm_netstats**(vm_=None)

Return combined network counters used by the vms on this hyper in a list of dicts:

```
[ ]
  'your-vm': {
    'io_read_kbs'   : 0,
    'io_total_read_kbs' : 0,
    'io_total_write_kbs' : 0,
    'io_write_kbs'   : 0
   }
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```bash
salt '*' virt.vm_netstats
```

**salt.modules.xapi_virt.vm_state**(vm_=None)

Return list of all the vms and their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.
23.9.520 salt.modules.xbpspkg

Package support for XBPS package manager (used by VoidLinux)

New in version 2016.11.0.

salt.modules.xbpspkg.add_repo(repo, conffile='/usr/share/xbps.d/15-saltstack.conf')
Add an XBPS repository to the system.

- **repo** url of repo to add (persistent).
- **conffile** path to xbps conf file to add this repo default: /usr/share/xbps.d/15-saltstack.conf

CLI Examples:

```bash
salt '*' pkg.add_repo <repo url> [conffile='/path/to/xbps/repo.conf']
```

salt.modules.xbpspkg.available_version(*names, **kwargs)
Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.xbpspkg.del_repo(repo, **kwargs)
Remove an XBPS repository from the system.

- **repo** url of repo to remove (persistent).

CLI Examples:

```bash
salt '*' pkg.del_repo <repo url>
```

salt.modules.xbpspkg.get_repo(repo, **kwargs)
Display information about the repo.

CLI Examples:

```bash
salt '*' pkg.get_repo 'repo-url'
```

salt.modules.xbpspkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)
Install the passed package.

- **name** The name of the package to be installed.
- **refresh** Whether or not to refresh the package database before installing.
- **fromrepo** Specify a package repository (url) to install from.

Multiple Package Installation Options:

- **pkgs** A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```bash
salt '*' pkg.install pkgs=["foo","bar"]
```
Salt Documentation, Release 3003.3

sources A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and
the values being the source URI or local path to the package.
CLI Example:
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"},{"bar": "salt://bar.
,→deb"}]'

Return a dict containing the new package names and versions:
{'<package>': {'old': '<old-version>',
'new': '<new-version>'}}

CLI Example:
salt '*' pkg.install <package name>

salt.modules.xbpspkg.latest_version(*names, **kwargs)
Return the latest version of the named package available for upgrade or installation. If more than one package
name is specified, a dict of name/version pairs is returned.
If the latest version of a given package is already installed, an empty string will be returned for that package.
CLI Example:
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...

salt.modules.xbpspkg.list_pkgs(versions_as_list=False, **kwargs)
List the packages currently installed as a dict:
{'<package_name>': '<version>'}

CLI Example:
salt '*' pkg.list_pkgs

salt.modules.xbpspkg.list_repos(**kwargs)
List all repos known by XBPS
CLI Example:
salt '*' pkg.list_repos

salt.modules.xbpspkg.list_upgrades(refresh=True, **kwargs)
Check whether or not an upgrade is available for all packages
CLI Example:
salt '*' pkg.list_upgrades

salt.modules.xbpspkg.refresh_db(**kwargs)
Update list of available packages from installed repos
CLI Example:
salt '*' pkg.refresh_db

salt.modules.xbpspkg.remove(name=None, pkgs=None, recursive=True, **kwargs)
name The name of the package to be deleted.
3102

Chapter 23. Salt Module Reference


recursive  Also remove dependent packages (not required elsewhere). Default mode: enabled.

Multiple Package Options:
pkgs  A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <package name> [recursive=False]
salt '*' pkg.remove <package1>,<package2>,<package3> [recursive=False]
salt '*' pkg.remove pkgs=['"foo", "bar"]' [recursive=False]
```

salt.modules.xbpspkg.upgrade(refresh=True, **kwargs)

Run a full system upgrade

refresh  Whether or not to refresh the package database before installing. Default is True.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

salt.modules.xbpspkg.upgrade_available(name, **kwargs)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.xbpspkg.version(*names, **kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

23.9.521 salt.modules.xfs

Module for managing XFS file systems.

salt.modules.xfs.defragment(device)

Defragment mounted XFS filesystem. In order to mount a filesystem, device should be properly mounted and writable.

CLI Example:

```
salt '*' xfs.defragment /dev/sda1
```

salt.modules.xfs.devices()

Get known XFS formatted devices on the system.

CLI Example:
salt 'x' xfs.devices

salt.modules.xfs.dump(device, destination, level=0, label=None, noerase=None)
Dump filesystem device to the media (file, tape etc).

Required parameters:
- **device**: XFS device, content of which to be dumped.
- **destination**: Specifies a dump destination.

Valid options are:
- **label**: Label of the dump. Otherwise automatically generated label is used.
- **level**: Specifies a dump level of 0 to 9.
- **noerase**: Pre-erase media.

Other options are not used in order to let xfsdump use its default values, as they are most optimal. See the xfsdump(8) manpage for a more complete description of these options.

CLI Example:
```bash
salt 'x' xfs.dump /dev/sda1 /destination/on/the/client
salt 'x' xfs.dump /dev/sda1 /destination/on/the/client label='Company accountancy'
salt 'x' xfs.dump /dev/sda1 /destination/on/the/client noerase=True
```

salt.modules.xfs.estimate(path)
Estimate the space that an XFS filesystem will take. For each directory estimate the space that directory would take if it were copied to an XFS filesystem. Estimation does not cross mount points.

CLI Example:
```bash
salt 'x' xfs.estimate /path/to/file
salt 'x' xfs.estimate /path/to/dir/*
```

salt.modules.xfs.info(device)
Get filesystem geometry information.

CLI Example:
```bash
salt 'x' xfs.info /dev/sda1
```

salt.modules.xfs.inventory()
Display XFS dump inventory without restoration.

CLI Example:
```bash
salt 'x' xfs.inventory
```

salt.modules.xfs.mkfs(device, label=None, ssize=None, noforce=None, bso=None, gmo=None, ino=None, lso=None, rso=None, nmo=None, dso=None)
Create a file system on the specified device. By default wipes out with force.

General options:
- **label**: Specify volume label.
- **ssize**: Specify the fundamental sector size of the filesystem.
- **noforce**: Do not force create filesystem, if disk is already formatted.

Filesystem geometry options:
- **bso**: Block size options.
- **gmo**: Global metadata options.
- **dso**: Data section options. **These options specify the location, size, and other parameters of the data section of the filesystem.**
- **ino**: Inode options to specify the inode size of the filesystem, and other inode allocation parameters.
• **ls**o: Log section options.
• **nno**: Naming options.
• **rso**: Realtime section options.

See the `mkfs.xfs(8)` manpage for a more complete description of corresponding options description.

CLI Example:

```bash
salt '*' xfs.mkfs /dev/sda1
salt '*' xfs.mkfs /dev/sda1 dso="su=32k,sw=6" noforce=True
salt '*' xfs.mkfs /dev/sda1 dso="su=32k,sw=6" lso="logdev=/dev/sda2,size=10000b"
```

```bash
salt.modules.xfs.modify(device, label=None, lazy_counting=None, uuid=None)
Modify parameters of an XFS filesystem.

CLI Example:

```bash
salt '*' xfs.modify /dev/sda1 label='My backup' lazy_counting=False
salt '*' xfs.modify /dev/sda1 uuid=False
salt '*' xfs.modify /dev/sda1 uuid=True
```

```bash
salt.modules.xfs.prune_dump(sessionid)
Prunes the dump session identified by the given session id.

CLI Example:

```bash
salt '*' xfs.prune_dump b74a3586-e52e-4a4a-8775-c3334fa8ea2c
```

### 23.9.522 salt.modules.xml

XML file manager

New in version 3000.

```bash
salt.modules.xml.get_attribute(file, element)
Return the attributes of the matched xpath element.

CLI Example:

```bash
salt '*' xml.get_attribute /tmp/test.xml "//element[@id='3']"
```

```bash
salt.modules.xml.get_value(file, element)
Returns the value of the matched xpath element

CLI Example:

```bash
salt '*' xml.get_value /tmp/test.xml "//element"
```

```bash
salt.modules.xml.set_attribute(file, element, key, value)
Set the requested attribute key and value for matched xpath element.

CLI Example:

```bash
salt '*' xml.set_attribute /tmp/test.xml "//element[@id='3']" editedby "gal"
```

```bash
salt.modules.xml.set_value(file, element, value)
Sets the value of the matched xpath element

CLI Example:
```
23.9.523 salt.modules.xmpp

Module for Sending Messages via XMPP (a.k.a. Jabber)

New in version 2014.1.0.

depends

- sleekxmpp>=1.3.1
- pyasn1
- pyasn1-modules
- dnspython

configuration This module can be used by either passing a jid and password directly to send_message,
or by specifying the name of a configuration profile in the minion config, minion pillar, or master
config.

For example:

```
my-xmpp-login:
    xmpp.jid: myuser@jabber.example.org/resourcename
    xmpp.password: verybadpass
```

The resourcename refers to the resource that is using this account. It is user-definable, and op-
tional. The following configurations are both valid:

```
my-xmpp-login:
    xmpp.jid: myuser@jabber.example.org/salt
    xmpp.password: verybadpass

my-xmpp-login:
    xmpp.jid: myuser@jabber.example.org
    xmpp.password: verybadpass
```

class salt.modules.xmpp.SendMsgBot(jid, password, recipient, msg)

classmethod create_multi(jid, password, msg, recipients=None, rooms=None, nick='SaltStack
Bot')

Alternate constructor that accept multiple recipients and rooms

start(event)

class salt.modules.xmpp.SleekXMPPMUC(name="")

filter(record)

Determine if the specified record is to be logged.

Is the specified record to be logged? Returns 0 for no, nonzero for yes. If deemed appropriate, the record
may be modified in-place.

salt.modules.xmpp.send_msg(recipient, message, jid=None, password=None, profile=None)

Send a message to an XMPP recipient. Designed for use in states.

CLI Examples:
salt.modules.xmpp.send_msg_multi(message, recipients=None, rooms=None, jid=None, password=None, nick='SaltStack Bot', profile=None)

Send a message to an XMPP recipient, support send message to multiple recipients or chat room.

CLI Examples:

```python
xmpp.send_msg recipients=['admins@xmpp.example.com']
   rooms=['secret@conference.xmpp.example.com']
   profile='my-xmpp-account'

xmpp.send_msg recipients=['admins@xmpp.example.com']
   rooms=['secret@conference.xmpp.example.com']
   jid='myuser@xmpp.example.com/salt'
   password='verybadpass'
```

### 23.9.524 salt.modules.yumpkg

Support for YUM/DNF

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to ‘pkg.install’ is not available), see [here](#).

**Note:** DNF is fully supported as of version 2015.5.10 and 2015.8.4 (partial support for DNF was initially added in 2015.8.0), and DNF is used automatically in place of YUM in Fedora 22 and newer.

New in version 3003: Support for tdnf on Photon OS.

**class** salt.modules.yumpkg.AvailablePackages(*args, **kwargs)

**salt.modules.yumpkg.available_version(*names, **kwargs)**

This function is an alias of latest_version.

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

A specific repo can be requested using the fromrepo keyword argument, and the disableexcludes option is also supported.

New in version 2014.7.0: Support for the disableexcludes option

**CLI Example:**

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> fromrepo=epel-testing
salt '*' pkg.latest_version <package name> disableexcludes=main
salt '*' pkg.latest_version <package name> disableexcludes=none
```

**salt.modules.yumpkg.clean_metadata(**kwargs)**

New in version 2014.1.0.
Cleans local yum metadata. Functionally identical to `refresh_db()`.

CLI Example:

```
salt '*' pkg.clean_metadata
```

```
salt.modules.yumpkg.del_repo(repo, basedir=None, **kwargs)
```

Delete a repo from `<basedir>` (default basedir: all dirs in `reposdir` yum option).

If the `.repo` file in which the repo exists does not contain any other repo configuration, the file itself will be deleted.

CLI Examples:

```
salt '*' pkg.del_repo myrepo
salt '*' pkg.del_repo myrepo basedir=/path/to/dir
salt '*' pkg.del_repo myrepo basedir=/path/to/dir,/path/to/another/dir
```

```
salt.modules.yumpkg.diff(*paths, **kwargs)
```

Return a formatted diff between current files and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

**Parameters**

- `path` -- Full path to the installed file

**Returns**

Difference string or raises and exception if examined file is binary.

CLI Example:

```
salt '*' pkg.diff /etc/apache2/httpd.conf /etc/sudoers
```

```
salt.modules.yumpkg.download(*packages, **kwargs)
```

New in version 2015.5.0.

Download packages to the local disk. Requires `yumdownloader` from `yum-utils` package.

**Note:** `yum-utils` will already be installed on the minion if the package was installed from the Fedora / EPEL repositories.

CLI Example:

```
salt '*' pkg.download httpd
salt '*' pkg.download httpd postfix
```

```
salt.modules.yumpkg.file_dict(*packages, **kwargs)
```

New in version 2014.1.0.

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of every file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

```
salt.modules.yumpkg.file_list(*packages, **kwargs)
```

New in version 2014.1.0.

List the files that belong to a package. Not specifying any packages will return a list of every file on the system's rpm database (not generally recommended).

CLI Examples:
```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

**salt.modules.yumpkg.get_locked_packages** (*pattern=*\[\w+]+(?:[-][\^\-]+\)\]*; *,full=True*)

This function is an alias of `list_holds`.

Changed in version 2016.3.0,2015.8.4,2015.5.10: Function renamed from `pkg.get_locked_pkgs` to `pkg.list_holds`.

List information on locked packages

**Note:** Requires the appropriate `versionlock` plugin package to be installed:
- On RHEL 5: `yum-versionlock`
- On RHEL 6 & 7: `yum-plugin-versionlock`
- On Fedora: `python-dnf-plugins-extras-versionlock`

**pattern** `[\w+(?:[-][\^\-]+)*]` Regular expression used to match the package name

**full** [True] Show the full hold definition including version and epoch. Set to `False` to return just the name of the package(s) being held.

CLI Example:

```
salt '*' pkg.list_holds
salt '*' pkg.list_holds full=False
```

**salt.modules.yumpkg.get_repo**(repo, basedir=None, **kwargs)

Display a repo from `<basedir>` (default basedir: all dirs in `reposdir` yum option).

CLI Examples:

```
salt '*' pkg.get_repo myrepo
salt '*' pkg.get_repo myrepo basedir=/path/to/dir
salt '*' pkg.get_repo myrepo basedir=/path/to/dir,/path/to/another/dir
```

**salt.modules.yumpkg.group_diff**(name)

New in version 2014.1.0.

Changed in version 2016.3.0,2015.8.4,2015.5.10: Environment groups are now supported. The key names have been renamed, similar to the changes made in `pkg.group_info`.

Lists which of a group's packages are installed and which are not installed

CLI Example:

```
salt '*' pkg.group_diff 'Perl Support'
```

**salt.modules.yumpkg.group_info**(name, expand=False, ignore_groups=None)

New in version 2014.1.0.

Changed in version 3001,2016.3.0,2015.8.4,2015.5.10: The return data has changed. A new key `type` has been added to distinguish environment groups from package groups. Also, keys for the group name and group ID have been added. The mandatory packages, optional packages, and default packages keys have been renamed to `mandatory`, `optional`, and `default` for accuracy, as environment groups include other groups, and not packages. Finally, this function now properly identifies conditional packages.

Lists packages belonging to a certain group

**name** Name of the group to query
**expand**  [False] If the specified group is an environment group, then the group will be expanded and the return data will include package names instead of group names.

New in version 2016.3.0.

**ignore_groups**  [None] This parameter can be used to pass a list of groups to ignore when expanding subgroups. It is used during recursion in order to prevent expanding the same group multiple times.

New in version 3001.

CLI Example:

```
salt '*' pkg.group_info 'Perl Support'
```

```python
salt.modules.yumpkg.group_install(name, skip=(), include=(), **kwargs)
```

New in version 2014.1.0.

Install the passed package group(s). This is basically a wrapper around `pkg.install`, which performs package group resolution for the user. This function is currently considered experimental, and should be expected to undergo changes.

**name**  Package group to install. To install more than one group, either use a comma-separated list or pass the value as a python list.

CLI Examples:

```
salt '*' pkg.group_install 'Group 1'
salt '*' pkg.group_install 'Group 1,Group 2'
salt '*' pkg.group_install ['"Group 1", "Group 2"]'
```

**skip**  Packages that would normally be installed by the package group ("default" packages), which should not be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```
salt '*' pkg.group_install 'My Group' skip='foo,bar'
salt '*' pkg.group_install 'My Group' skip=['"foo", "bar"]'
```

**include**  Packages which are included in a group, which would not normally be installed by a `yum groupinstall` ("optional" packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```
salt '*' pkg.group_install 'My Group' include='foo,bar'
salt '*' pkg.group_install 'My Group' include=['"foo", "bar"]'
```

**Note:** Because this is essentially a wrapper around `pkg.install`, any argument which can be passed to `pkg.install` may also be included here, and it will be passed along wholesale.

```python
salt.modules.yumpkg.group_list()
```

New in version 2014.1.0.

Lists all groups known by `yum` on this system.

CLI Example:

```
salt '*' pkg.group_list
```

```python
salt.modules.yumpkg.groupinstall(name, skip=(), include=(), **kwargs)
```

This function is an alias of `group_install`.
New in version 2014.1.0.

Install the passed package group(s). This is basically a wrapper around `pkg.install`, which performs package group resolution for the user. This function is currently considered experimental, and should be expected to undergo changes.

**name** Package group to install. To install more than one group, either use a comma-separated list or pass the value as a python list.

CLI Examples:

```bash
salt '*' pkg.group_install 'Group 1'
salt '*' pkg.group_install 'Group 1,Group 2'
salt '*' pkg.group_install ['"Group 1", "Group 2"]
```

**skip** Packages that would normally be installed by the package group (“default” packages), which should not be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```bash
salt '*' pkg.group_install 'My Group' skip='foo,bar'
salt '*' pkg.group_install 'My Group' skip=['"foo", "bar"]'
```

**include** Packages which are included in a group, which would not normally be installed by a `yum groupinstall` (“optional” packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```bash
salt '*' pkg.group_install 'My Group' include='foo,bar'
salt '*' pkg.group_install 'My Group' include=['"foo", "bar"]'
```

**Note:** Because this is essentially a wrapper around `pkg.install`, any argument which can be passed to `pkg.install` may also be included here, and it will be passed along wholesale.

---

`salt.modules.yumpkg.hold(name=None, pkgs=None, sources=None, normalize=True, **kwargs)`

New in version 2014.7.0.

Version-lock packages

**Note:** Requires the appropriate `versionlock` plugin package to be installed:

- On RHEL 5: `yum-versionlock`
- On RHEL 6 & 7: `yum-plugin-versionlock`
- On Fedora: `python-dnf-plugins-extras-versionlock`

**name** The name of the package to be held.

Multiple Package Options:

**pkgs** A list of packages to hold. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```bash
salt '*' pkg.hold <package name>
salt '*' pkg.hold pkgs=['"foo", "bar"]'
```
salt.modules.yumpkg.info_installed(*names, **kwargs)

Return the information of the named package(s), installed on the system.

Parameters

**all_versions** -- Include information for all versions of the packages installed on the minion.

CLI Example:

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> <package2> <package3> all_versions=True
```

salt.modules.yumpkg.install(name=None, refresh=False, skip_verify=False, pkgs=None, sources=None, downloadonly=False, reinstall=False, normalize=True, update_holds=False, saltenv='base', ignore_epoch=False, **kwargs)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Install the passed package(s), add refresh=True to clean the yum database before package is installed.

**name** The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option.

32-bit packages can be installed on 64-bit systems by appending the architecture designation (.i686, .i586, etc.) to the end of the package name.

CLI Example:

```
salt '*' pkg.install <package name>
```

**refresh** Whether or not to update the yum database before executing.

**reinstall** Specifying reinstall=True will use yum reinstall rather than yum install for requested packages that are already installed.

If a version is specified with the requested package, then yum reinstall will only be used if the installed version matches the requested version.

Works with sources when the package header of the source can be matched to the name and version of an installed package.

New in version 2014.7.0.

**skip_verify** Skip the GPG verification check (e.g., --nogpgcheck)

**downloadonly** Only download the packages, do not install.

**version** Install a specific version of the package, e.g. 1.2.3-4.el5. Ignored if "pkgs" or "sources" is passed.

Changed in version 2018.3.0: version can now contain comparison operators (e.g. >1.2.3, <=2.0, etc.)

**update_holds** [False] If True, and this function would update the package version, any packages held using the yum/dnf "versionlock" plugin will be unheld so that they can be updated. Otherwise, if this function attempts to update a held package, the held package(s) will be skipped and an error will be raised.

New in version 2016.11.0.

**setopt** A comma-separated or Python list of key=value options. This list will be expanded and --setopt prepended to each in the yum/dnf command that is run.

CLI Example:
salt '*' pkg.install foo setopt='obsoletes=0,plugins=0'

New in version 2019.2.0.

Repository Options:

fromrepo Specify a package repository (or repositories) from which to install. (e.g., yum --disablerepo='*' --enablerepo='somerepo')

enablerepo (ignored if fromrepo is specified) Specify a disabled package repository (or repositories) to enable. (e.g., yum --enablerepo='somerepo')

disablerepo (ignored if fromrepo is specified) Specify an enabled package repository (or repositories) to disable. (e.g., yum --disablerepo='somerepo')

disableexcludes Disable exclude from main, for a repo or for everything. (e.g., yum --disableexcludes='main')

New in version 2014.7.0.

global_epoch [False] Only used when the version of a package is specified using a comparison operator (e.g. >4.1). If set to True, then the epoch will be ignored when comparing the currently-installed version to the desired version.

New in version 2018.3.0.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version.

CLI Examples:

salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-4.el5"}]'

sources A list of RPM packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

salt '*' pkg.install sources='["foo": "salt://foo.rpm"],{"bar": "salt://bar.rpm"}''

normalize [True] Normalize the package name by removing the architecture. This is useful for poorly created packages which might include the architecture as an actual part of the name such as kernel modules which match a specific kernel version.

salt -G role:nsd pkg.install gpfs.gplbin-2.6.32-279.31.1.el6.x86_64
normalize=False

New in version 2014.7.0.

diff_attr: If a list of package attributes is specified, returned value will contain them, eg:

{ '<package>': {'old': {'version': '<old-version>', 'arch': '<old-arch>'},
'new': {'version': '<new-version>',
'arch': '<new-arch>'}}

Valid attributes are: epoch, version, release, arch, install_date, install_date_time_t.

If all is specified, all valid attributes will be returned.
New in version 2018.3.0.
Returns a dict containing the new package names and versions:

```python
{'<package>': { 'old': '<old-version>',
               'new': '<new-version>'}}
```

If an attribute list in diff_attr is specified, the dict will also contain any specified attribute, eg.:

```python
{'<package>': {
               'old': {
                       'version': '<old-version>',
                       'arch': '<old-arch>'},
               'new': {
                       'version': '<new-version>',
                       'arch': '<new-arch>'}}
```

```python
salt.modules.yumpkg.latest_version('names', **kwargs)
```

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

A specific repo can be requested using the fromrepo keyword argument, and the disableexcludes option is also supported.

New in version 2014.7.0: Support for the disableexcludes option

CLI Example:

```shell
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> fromrepo=epel-testing
salt '*' pkg.latest_version <package name> disableexcludes=main
salt '*' pkg.latest_version <package name> <package2> <package3> ...
```

```python
salt.modules.yumpkg.list_downloaded(**kwargs)
```

New in version 2017.7.0.

List prefetched packages downloaded by Yum in the local disk.

CLI Example:

```shell
salt '*' pkg.list_downloaded
```

```python
salt.modules.yumpkg.list_holds(pattern='[w+]+(?:[-][^-]+)*', full=True)
```

Changed in version 2016.3.0, 2015.8.4, 2015.5.10: Function renamed from pkg.get_locked_pkgs to pkg.list_holds.

List information on locked packages

Note: Requires the appropriate versionlock plugin package to be installed:
- On RHEL 5: yum-versionlock
- On RHEL 6 & 7: yum-plugin-versionlock
- On Fedora: python-dnf-plugins-extras-versionlock

```python
pattern [w+([-][^-]+)*] Regular expression used to match the package name
full [True] Show the full hold definition including version and epoch. Set to False to return just the name of the package(s) being held.
```
CLI Example:

```python
salt '*' pkg.list_holds
salt '*' pkg.list_holds full=False
```

`salt.modules.yumpkg.list_installed_patches(**kwargs)`
New in version 2017.7.0.

List installed advisory patches on the system.

CLI Examples:

```python
salt '*' pkg.list_installed_patches
```

`salt.modules.yumpkg.list_patches(refresh=False, **kwargs)`
New in version 2017.7.0.

List all known advisory patches from available repos.

**refresh** force a refresh if set to True. If set to False (default) it depends on yum if a refresh is executed.

CLI Examples:

```python
salt '*' pkg.list_patches
```

`salt.modules.yumpkg.list_pkgs(versions_as_list=False, **kwargs)`
List the packages currently installed as a dict. By default, the dict contains versions as a comma separated string:

```python
{
'<package_name>': '<version>[,<version>...]'
}
```

**versions_as_list:** If set to true, the versions are provided as a list

```python
{
'<package_name>': ['<version>','<version>']
}
```

**attr:** If a list of package attributes is specified, returned value will contain them in addition to version, eg.:

```python
{
'<package_name>': [{'version': 'version', 'arch': 'arch'}]
}
```

Valid attributes are: epoch, version, release, arch, install_date, install_date_time_t.

If **all** is specified, all valid attributes will be returned.

New in version 2018.3.0.

CLI Example:

```python
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs attr=version,arch
salt '*' pkg.list_pkgs attr=['"version", "arch"]
```

`salt.modules.yumpkg.list_repo_pkgs(*args, **kwargs)`
New in version 2014.1.0.

Changed in version 2014.7.0: All available versions of each package are now returned. This required a slight modification to the structure of the return dict. The return data shown below reflects the updated return dict structure. Note that packages which are version-locked using `pkg.hold` will only show the currently-installed version, as locking a package will make other versions appear unavailable to yum/dnf.

Changed in version 2017.7.0: By default, the versions for each package are no longer organized by repository. To get results organized by repository, use `byrepo=True`.

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names. This is recommended as it speeds up the function considerably.
Warning: Running this function on RHEL/CentOS 6 and earlier will be more resource-intensive, as the version of yum that ships with older RHEL/CentOS has no yum subcommand for listing packages from a repository. Thus, a `yum list installed` and `yum list available` are run, which generates a lot of output, which must then be analyzed to determine which package information to include in the return data.

This function can be helpful in discovering the version or repo to specify in a `pkg.installed` state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If `byrepo` is set to `True`, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```yaml
# With byrepo=False (default)
{
    'bash': ['4.1.2-15.el6_5.2', '4.1.2-15.el6_5.1', '4.1.2-15.el6_4'],
    'kernel': ['2.6.32-431.29.2.el6', '2.6.32-431.23.3.el6', '2.6.32-431.20.5.el6', '2.6.32-431.20.3.el6', '2.6.32-431.17.1.el6', '2.6.32-431.11.2.el6', '2.6.32-431.5.1.el6', '2.6.32-431.3.1.el6', '2.6.32-431.1.2.0.1.el6', '2.6.32-431.el6']
}

# With byrepo=True
{
    'base': {
        'bash': ['4.1.2-15.el6_4'],
        'kernel': ['2.6.32-431.el6']
    },
    'updates': {
        'bash': ['4.1.2-15.el6_5.2', '4.1.2-15.el6_5.1'],
        'kernel': ['2.6.32-431.29.2.el6', '2.6.32-431.23.3.el6', '2.6.32-431.20.5.el6', '2.6.32-431.20.3.el6', '2.6.32-431.17.1.el6', '2.6.32-431.11.2.el6', '2.6.32-431.5.1.el6', '2.6.32-431.3.1.el6', '2.6.32-431.1.2.0.1.el6']
    }
}
```

`fromrepo` [None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

`enablerepo` (ignored if `fromrepo` is specified) Specify a disabled package repository (or repositories) to enable. (e.g., `yum --enablerepo='somerepo'`)

New in version 2017.7.0.

`disablerepo` (ignored if `fromrepo` is specified) Specify an enabled package repository (or repositories) to disable. (e.g., `yum --disablerepo='somerepo'`)

New in version 2017.7.0.

**byrepo** [False] When True, the return data for each package will be organized by repository.

New in version 2017.7.0.

**cacheonly** [False] When True, the repo information will be retrieved from the cached repo metadata. This is equivalent to passing the -C option to yum/dnf.

New in version 2017.7.0.

**setopt** A comma-separated or Python list of key=value options. This list will be expanded and --setopt prepended to each in the yum/dnf command that is run.

New in version 2019.2.0.

CLI Examples:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'samba4*' fromrepo=base,updates
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True
```

```{adoc}
salt.modules.yumpkg.list_repos(basedir=None, **kwargs)
Lists all repos in <basedir> (default: all dirs in reposdir yum option).

CLI Example:

```
salt '*' pkg.listrepos
salt '*' pkg.listrepos basedir=/path/to/dir
salt '*' pkg.listrepos basedir=/path/to/dir,/path/to/another/dir
```
```
salt.modules.yumpkg.list_updates(refresh=True, **kwargs)
This function is an alias of list_upgrades.
Check whether or not an upgrade is available for all packages

The fromrepo, enablerepo, and disablerepo arguments are supported, as used in pkg states, and the disableexcludes option is also supported.

New in version 2014.7.0: Support for the disableexcludes option

CLI Example:

```
salt '*' pkg.list_upgrades
```
```
salt.modules.yumpkg.list_updates(refresh=True, **kwargs)
Check whether or not an upgrade is available for all packages

The fromrepo, enablerepo, and disablerepo arguments are supported, as used in pkg states, and the disableexcludes option is also supported.

New in version 2014.7.0: Support for the disableexcludes option

CLI Example:

```
salt '*' pkg.list_upgrades
```
```
salt.modules.yumpkg.mod_repo(repo, basedir=None, **kwargs)
Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the following values are specified:

repo name by which the yum refers to the repo
name a human-readable name for the repo
baseurl the URL for yum to reference
mirrorlist the URL for yum to reference
```
```
Key/Value pairs may also be removed from a repo's configuration by setting a key to a blank value. Bear in mind that a name cannot be deleted, and a baseurl can only be deleted if a mirrorlist is specified (or vice versa).

CLI Examples:

```
salt '*' pkg.mod_repo reponame enabled=1 gpgcheck=1
salt '*' pkg.mod_repo reponame basedir=/path/to/dir enabled=1
salt '*' pkg.mod_repo reponame baseurl=mirrorlist=http://host.com/
```

`salt.modules.yumpkg.modified('packages', **'flags')`

List the modified files that belong to a package. Not specifying any packages will return a list of _all_ modified files on the system's RPM database.

New in version 2015.5.0.

Filtering by flags (True or False):
- `size` Include only files where size changed.
- `mode` Include only files which file's mode has been changed.
- `checksum` Include only files which MD5 checksum has been changed.
- `device` Include only files which major and minor numbers has been changed.
- `symlink` Include only files which are symbolic link contents.
- `owner` Include only files where owner has been changed.
- `group` Include only files where group has been changed.
- `time` Include only files where modification time of the file has been changed.
- `capabilities` Include only files where capabilities differ or not. Note: supported only on newer RPM versions.

CLI Examples:

```
salt '*' pkg.modified
salt '*' pkg.modified httpd
salt '*' pkg.modified httpd postfix
salt '*' pkg.modified httpd owner=True group=False
```

`salt.modules.yumpkg.normalize_name(name)`

Strips the architecture from the specified package name, if necessary. Circumstances where this would be done include:
- If the arch is 32 bit and the package name ends in a 32-bit arch.
- If the arch matches the OS arch, or is noarch.

CLI Example:

```
salt '*' pkg.normalize_name zsh.x86_64
```

`salt.modules.yumpkg.owner('paths', **'kwargs')`

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version`, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Examples:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

`salt.modules.yumpkg.parse_arch(name)`

Parse name and architecture from the specified package name.
CLI Example:

```
salt '*' pkg.parse_arch zsh.x86_64
```

```
salt.modules.yumpkg.purge(name=None, pkgs=None, **kwargs)
```

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group.

This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a **config option** called systemd.scope, with a value of False (no quotes).

Package purges are not supported by yum, this function is identical to `pkg.remove`.

**name**  The name of the package to be purged

Multiple Package Options:

**pkgs**  A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

```
salt.modules.yumpkg.refresh_db(**kwargs)
```

Check the yum repos for updated packages

Returns:
- **True**: Updates are available
- **False**: An error occurred
- **None**: No updates are available

**repo**  Refresh just the specified repo

**disablerepo**  Do not refresh the specified repo

**enablerepo**  Refresh a disabled repo using this option

**branch**  Add the specified branch when refreshing

**disableexcludes**  Disable the excludes defined in your config files. Takes one of three options: - **all** - disable all excludes - **main** - disable excludes defined in [main] in yum.conf - **repoId** - disable excludes defined for that repo

**setopt**  A comma-separated or Python list of key=value options. This list will be expanded and --setopt prepended to each in the yum/dnf command that is run.

New in version 2019.2.0.

CLI Example:

```
salt '*' pkg.refresh_db
```

```
salt.modules.yumpkg.remove(name=None, pkgs=None, **kwargs)
```

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group.

This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a **config option** called systemd.scope, with a value of False (no quotes).
Remove packages

**name**  The name of the package to be removed

Multiple Package Options:

**pkgs**  A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```shell
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=["foo", "bar"]
```

---

**salt.modules.yumpkg.services_need_restart(**`**kwargs**`)**

New in version 3003.

List services that use files which have been changed by the package manager. It might be needed to restart them.

Requires systemd.

CLI Examples:

```shell
salt '*' pkg.services_need_restart
```

---

**salt.modules.yumpkg.unhold(name=**`**None**`, **pkgs=**`**None**`, **sources=**`**None**`, **kwargs**)`

New in version 2014.7.0.

Remove version locks

**Note:** Requires the appropriate versionlock plugin package to be installed:

- On RHEL 5: yum-versionlock
- On RHEL 6 & 7: yum-plugin-versionlock
- On Fedora: python-dnf-plugins-extras-versionlock

**name**  The name of the package to be unheld

Multiple Package Options:

**pkgs**  A list of packages to unhold. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```shell
salt '*' pkg.unhold <package name>
salt '*' pkg.unhold pkgs=["foo", "bar"]
```

---

**salt.modules.yumpkg.update(name=**`**None**`, **pkgs=**`**None**`, **refresh=**`**True**`, **skip_verify=**`**False**`, **normalize=**`**True**`, **minimal=**`**False**`, **obsoletes=**`**False**`, **kwargs**)`

New in version 2019.2.0.

Calls **pkg.upgrade** with **obsoletes=**`**False**`. Mirrors the CLI behavior of yum update. See **pkg.upgrade** for further documentation.

CLI Example:
salt '⋆' pkg.update

salt.modules.yumpkg.upgrade(name=None, pkgs=None, refresh=True, skip_verify=False, normalize=True, minimal=False, obsoletes=True, **kwargs)

Run a full system upgrade (a yum upgrade or dnf upgrade), or upgrade specified packages. If the packages aren't installed, they will not be installed.

Changed in version 2014.7.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Changed in version 2019.2.0: Added obsoletes and minimal arguments

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example:

```
salt '⋆' pkg.upgrade
salt '⋆' pkg.upgrade name=openssl
```

Repository Options:

- **fromrepo** Specify a package repository (or repositories) from which to install. (e.g., yum --disablerepo='*' --enablerepo='somerepo')
- **enablerepo** (ignored if fromrepo is specified) Specify a disabled package repository (or repositories) to enable. (e.g., yum --enablerepo='somerepo')
- **disablerepo** (ignored if fromrepo is specified) Specify an enabled package repository (or repositories) to disable. (e.g., yum --disablerepo='somerepo')
- **disableexcludes** Disable exclude from main, for a repo or for everything. (e.g., yum --disableexcludes='main')

New in version 2014.7.

- **name** The name of the package to be upgraded. Note that this parameter is ignored if "pkgs" is passed.

   32-bit packages can be upgraded on 64-bit systems by appending the architecture designation (.i686, .i586, etc.) to the end of the package name.

   Warning: if you forget 'name=' and run pkg.upgrade openssl, ALL packages are upgraded. This will be addressed in next releases.

   CLI Example:

   ```
salt '⋆' pkg.upgrade name=openssl
   ```

New in version 2016.3.0.

- **pkgs** A list of packages to upgrade from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. If the package was not already installed on the system, it will not be installed.

   CLI Examples:
salt '('* pkg.upgrade pkgs='["foo", "bar"]'
salt '('* pkg.upgrade pkgs='["foo", {"bar": "1.2.3-4.el5"}]'

New in version 2016.3.0.

**normalize** [True] Normalize the package name by removing the architecture. This is useful for poorly created packages which might include the architecture as an actual part of the name such as kernel modules which match a specific kernel version.

salt -G role:nsd pkg.upgrade gplbin-2.6.32-279.31.1.el6.x86_64
  normalize=False

New in version 2016.3.0.

**minimal** [False] Use upgrade-minimal instead of upgrade (e.g., yum upgrade-minimal) Goes to the 'newest' package match which fixes a problem that affects your system.

salt '('* pkg.upgrade minimal=True

New in version 2019.2.0.

**obsoletes** [True] Controls whether yum/dnf should take obsoletes into account and remove them. If set to False yum will use update instead of upgrade and dnf will be run with --obsoletes=False

salt '('* pkg.upgrade obsoletes=False

New in version 2019.2.0.

**setopt** A comma-separated or Python list of key=value options. This list will be expanded and --setopt prepended to each in the yum/dnf command that is run.

New in version 2019.2.0.

**Note:** To add extra arguments to the yum upgrade command, pass them as key word arguments. For arguments without assignments, pass True

salt '('* pkg.upgrade security=True exclude='kernel*'

salt.modules.yumpkg.upgrade_available(name, **kwargs)
Check whether or not an upgrade is available for a given package

CLI Example:
salt '('* pkg.upgrade_available <package name>

salt.modules.yumpkg.verify(*names, **kwargs)
Runs an rpm -Va on a system, and returns the results in a dict
Pass options to modify rpm verify behavior using the verify_options keyword argument
Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the ignore_types keyword argument

CLI Example:
salt '('* pkg.verify
salt '('* pkg.verify httpd
salt '('* pkg.verify 'httpd postfix'

(continues on next page)
Salt Documentation, Release 3003.3

(continued from previous page)

```bash
salt '*' pkg.verify 'httpd postfix' ignore_types=['config','doc']
salt '*' pkg.verify 'httpd postfix' verify_options=['nodeps','nosize']
```

### salt.modules.yumpkg.version

`salt.modules.yumpkg.version('names', **kwargs)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```bash
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### salt.modules.yumpkg.version_cmp

`salt.modules.yumpkg.version_cmp(pkg1, pkg2, ignore_epoch=False, **kwargs)`

New in version 2015.5.4.

Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

* `ignore_epoch` [False] Set to `True` to ignore the epoch when comparing versions

   New in version 2015.8.10, 2016.3.2.

CLI Example:

```bash
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

### 23.9.525 salt.modules.zabbix

Support for Zabbix

* `optdepends`
  * zabbix server

* `configuration` This module is not usable until the zabbix user and zabbix password are specified either in a pillar or in the minion’s config file. Zabbix url should be also specified.

```
zabbix.user: Admin
zabbix.password: mypassword
zabbix.url: http://127.0.0.1/zabbix/api_jsonrpc.php
```

Connection arguments from the minion config file can be overridden on the CLI by using arguments with `_connection_` prefix.

```
zabbix.apiinfo_version _connection_user=Admin _connection_password=zabbix _connection_url=http://host/zabbix/
```

* `codeauthor` Jiri Kotlin <jiri.kotlin@ultimum.io>

### salt.modules.zabbix.apiinfo_version

`salt.modules.zabbix.apiinfo_version(**connection_args)`

Retrieve the version of the Zabbix API.

New in version 2016.3.0.

* `Parameters`
  * `_connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
  * `_connection_password` -- Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
• `_connection_url` -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns On success string with Zabbix API version, False on failure.

CLI Example:

```
salt '*' zabbix.apiinfo_version
```

```
salt.modules.zabbix.compare_params(defined, existing, return_old_value=False)
```

New in version 2017.7.

Compares Zabbix object definition against existing Zabbix object.

Parameters

- **defined** -- Zabbix object definition taken from sls file.
- **existing** -- Existing Zabbix object taken from result of an API call.
- **return_old_value** -- Default False. If True, returns `dict("old"=old_val, "new"=new_val)` for rollback purpose.

Returns Params that are different from existing object. Result extended by object ID can be passed directly to Zabbix API update method.

```
salt.modules.zabbix.configuration_import(config_file, rules=None, file_format='xml', **connection_args)
```

New in version 2017.7.

Imports Zabbix configuration specified in file to Zabbix server.

Parameters

- **config_file** -- File with Zabbix config (local or remote)
- **rules** -- Optional - Rules that have to be different from default (defaults are the same as in Zabbix web UI)
- **file_format** -- Config file format (default: xml)
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

CLI Example:

```
salt '*' zabbix.configuration_import salt://zabbix/config/zabbix_templates.xml → "{'screens': {'createMissing': True, 'updateExisting': True}}"
```

```
salt.modules.zabbix.get_object_id_by_params(obj, params=None, **connection_args)
```

New in version 2017.7.

Get ID of single Zabbix object specified by its name.

Parameters

- **obj** -- Zabbix object type
- **params** -- Parameters by which object is uniquely identified
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns object ID

```
salt.modules.zabbix.get_zabbix_id_mapper()
```

New in version 2017.7.
Make ZABBIX_ID_MAPPER constant available to state modules.

Returns ZABBIX_ID_MAPPER

```
salt.modules.zabbix.host_create(host, groups, interfaces, **connection_args)
```

New in version 2016.3.0.

Create new host

**Note:** This function accepts all standard host properties: keyword argument names differ depending on your zabbix version, see here.

**Parameters**

- **host** -- technical name of the host
- **groups** -- groupids of host groups to add the host to
- **interfaces** -- interfaces to be created for the host
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
- **visible_name** -- string with visible name of the host, use 'visible_name' instead of 'name' parameter to not mess with value supplied from Salt sls file.

returns: ID of the created host.

**CLI Example:**
```
salt '*' zabbix.host_create technicalname 4
  interfaces='{{type: 1, main: 1, useip: 1, ip: "192.168.3.1", dns: ",", port: 10050}}'
  visible_name='Host Visible Name' inventory_mode=0 inventory='{"alias": "something "}';
```

```
salt.modules.zabbix.host_delete(hostids, **connection_args)
```

Delete hosts.

New in version 2016.3.0.

**Parameters**

- **hostids** -- Hosts (hostids) to delete.
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the deleted hosts.

**CLI Example:**
```
salt '*' zabbix.host_delete 10106
```

```
salt.modules.zabbix.host_exists(host=None, hostid=None, name=None, node=None, nodeids=None, **connection_args)
```

Checks if at least one host that matches the given filter criteria exists.

New in version 2016.3.0.

**Parameters**

- **host** -- technical name of the host
hostids -- Hosts (hostids) to delete.
name -- visible name of the host
node -- name of the node the hosts must belong to (zabbix API < 2.4)
nodeids -- IDs of the node the hosts must belong to (zabbix API < 2.4)
_connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
_connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
_connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns  IDs of the deleted hosts, False on failure.

CLI Example:
salt '*' zabbix.host_exists 'Zabbix server'

salt.modules.zabbix.host_get(host=None, name=None, hostids=None, **connection_args)
New in version 2016.3.0.
Retrieve hosts according to the given parameters

Note: This function accepts all optional host.get parameters: keyword argument names differ depending on your zabbix version, see here.

Parameters
host -- technical name of the host
name -- visible name of the host
hostids -- ids of the hosts
_connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
_connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
_connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns  Array with convenient hosts details, False if no host found or on failure.

CLI Example:
salt '*' zabbix.host_get 'Zabbix server'

salt.modules.zabbix.host_inventory_get(hostids, **connection_args)
Retrieve host inventory according to the given parameters. See: https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host_inventory
New in version 2019.2.0.

Parameters
hostids -- Return only host interfaces used by the given hosts.
_connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
_connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
_connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns  Array with host interfaces details, False if no convenient host interfaces found or on failure.

CLI Example:
salt 'salthost' zabbix.host_inventory_set 101054

salt.modules.zabbix.host_inventory_set(hostid='', **connection_args)
Update host inventory items
NOTE: This function accepts all standard host: keyword argument names for
inventory see: https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host_inventory
New in version 2019.2.0.

Parameters

• hostid -- ID of the host to update
• clear_old -- Set to True in order to remove all existing inventory items before
setting the specified items
• _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see
module's docstring)
• _connection_password -- Optional - zabbix password (can also be set in opts or
pillar, see module's docstring)
• _connection_url -- Optional - url of zabbix frontend (can also be set in opts,
pillar, see module's docstring)

Returns ID of the updated host, False on failure.

CLI Example:
salt 'salthost' zabbix.host_inventory_set 101054 asset_tag=jml3322 type=vm clear_old=True

salt.modules.zabbix.host_list(**connection_args)
Retrieve all hosts.
New in version 2016.3.0.

Parameters

• _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see
module's docstring)
• _connection_password -- Optional - zabbix password (can also be set in opts or
pillar, see module's docstring)
• _connection_url -- Optional - url of zabbix frontend (can also be set in opts,
pillar, see module's docstring)

Returns Array with details about hosts, False on failure.

CLI Example:
salt 'salthost' zabbix.host_list

salt.modules.zabbix.host_update(hostid='', **connection_args)
New in version 2016.3.0.
Update existing hosts

Note: This function accepts all standard host and host.update properties: keyword argument names differ
depending on your zabbix version, see the documentation for host objects and the documentation for updating
hosts.

Parameters

• hostid -- ID of the host to update
• _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see
module's docstring)
• _connection_password -- Optional - zabbix password (can also be set in opts or
pillar, see module's docstring)
• _connection_url -- Optional - url of zabbix frontend (can also be set in opts,
pillar, see module's docstring)
- `visible_name` -- string with visible name of the host, use ‘visible_name’ instead of ‘name’ parameter to not mess with value supplied from Salt sls file.

  Returns ID of the updated host.

  CLI Example:

  ```
salt '*' zabbix.host_update 10084 name='Zabbix server2'
  ```

salt.modules.zabbix.hostgroup_create(name, **connection_args)

Create a host group

Note: This function accepts all standard host group properties: keyword argument names differ depending on your zabbix version, see here.

Parameters
- `name` -- name of the host group
- `_connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- `_connection_password` -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- `_connection_url` -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

  Returns ID of the created host group.

  CLI Example:

  ```
salt '*' zabbix.hostgroup_create MyNewGroup
  ```

salt.modules.zabbix.hostgroup_delete(hostgroupids, **connection_args)

Delete the host group.

New in version 2016.3.0.

Parameters
- `hostgroupids` -- IDs of the host groups to delete
- `_connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- `_connection_password` -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- `_connection_url` -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

  Returns ID of the deleted host groups, False on failure.

  CLI Example:

  ```
salt '*' zabbix.hostgroup_delete 23
  ```

salt.modules.zabbix.hostgroup_exists(name=None, groupid=None, node=None, nodeids=None, **connection_args)

Checks if at least one host group that matches the given filter criteria exists.

New in version 2016.3.0.

Parameters
- `name` -- names of the host groups
- `groupid` -- host group IDs
- `node` -- name of the node the host groups must belong to (zabbix API < 2.4)
• **nodeids** -- IDs of the nodes the host groups must belong to (zabbix API < 2.4)
• **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** True if at least one host group exists, False if not or on failure.

CLI Example:
```
salt '*' zabbix.hostgroup_exists MyNewGroup
```

`salt.modules.zabbix.hostgroup_get(name=None, groupids=None, hostids=None, **connection_args)`

New in version 2016.3.0.

Retrieve host groups according to the given parameters

**Note:** This function accepts all standard hostgroup.get properities: keyword argument names differ depending on your zabbix version, see here.

**Parameters**

- **name** -- names of the host groups
- **groupid** -- host group IDs
- **node** -- name of the node the host groups must belong to
- **nodeids** -- IDs of the nodes the host groups must belong to
- **hostids** -- return only host groups that contain the given hosts
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** Array with host groups details, False if no convenient host group found or on failure.

CLI Example:
```
salt '*' zabbix.hostgroup_get MyNewGroup
```

`salt.modules.zabbix.hostgroup_list(**connection_args)`

Retrieve all host groups.

New in version 2016.3.0.

**Parameters**

- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** Array with details about host groups, False on failure.

CLI Example:
```
salt '*' zabbix.hostgroup_list
```
salt.modules.zabbix.hostgroup_update(groupid, name=None, **connection_args)

New in version 2016.3.0.

Update existing hosts group

Note: This function accepts all standard host group properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **groupid** -- ID of the host group to update
- **name** -- name of the host group
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of updated host groups.

CLI Example:

```
salt '*' zabbix.hostgroup_update 24 name='Renamed Name'
```

salt.modules.zabbix.hostinterface_create(hostid, ip='', dns='', main=1, if_type=1, useip=1, port=None, **connection_args)

New in version 2016.3.0.

Create new host interface

Note: This function accepts all standard host group interface: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **hostid** -- ID of the host the interface belongs to
- **ip** -- IP address used by the interface
- **dns** -- DNS name used by the interface
- **main** -- whether the interface is used as default on the host (0 - not default, 1 - default)
- **port** -- port number used by the interface
- **type** -- Interface type (1 - agent; 2 - SNMP; 3 - IPMI; 4 - JMX)
- **useip** -- Whether the connection should be made via IP (0 - connect using host DNS name; 1 - connect using host IP address for this host interface)
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns ID of the created host interface, False on failure.

CLI Example:

```
salt '*' zabbix.hostinterface_create 10105 192.193.194.197
```

salt.modules.zabbix.hostinterface_delete(interfaceids, **connection_args)

Delete host interface
New in version 2016.3.0.

Parameters

- **interfaceids** -- IDs of the host interfaces to delete
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns ID of deleted host interfaces, False on failure.

CLI Example:

```bash
salt '*' zabbix.hostinterface_delete 50
```

salt.modules.zabbix.hostinterface_get(hostids, **connection_args)

Retrieve host groups according to the given parameters

Note: This function accepts all standard hostinterface.get properities: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **hostids** -- Return only host interfaces used by the given hosts.
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with host interfaces details, False if no convenient host interfaces found or on failure.

CLI Example:

```bash
salt '*' zabbix.hostinterface_get 101054
```

salt.modules.zabbix.hostinterface_update(interfaceid, **connection_args)

Update host interface

Note: This function accepts all standard hostinterface: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **interfaceid** -- ID of the hostinterface to update
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns ID of the updated host interface, False on failure.
CLI Example:

```
salt '*' zabbix.hostinterface_update 6 ip_=0.0.0.2
```

**salt.modules.zabbix.mediatype_create**(name, mediatype, **connection_args)**

Create new mediatype

**Note:** This function accepts all standard mediatype properties: keyword argument names differ depending on your zabbix version, see [here](#).

**Parameters**

- **mediatype** -- media type - 0: email, 1: script, 2: sms, 3: Jabber, 100: Ez Texting
- **exec_path** -- exec path - Required for script and Ez Texting types, see Zabbix API docs
- **gsm_modem** -- exec path - Required for sms type, see Zabbix API docs
- **smtp_email** -- email address from which notifications will be sent, required for email type
- **smtp_helo** -- SMTP HELO, required for email type
- **smtp_server** -- SMTP server, required for email type
- **status** -- whether the media type is enabled - 0: enabled, 1: disabled
- **username** -- authentication user, required for Jabber and Ez Texting types
- **passwd** -- authentication password, required for Jabber and Ez Texting types
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**return:** ID of the created mediatype.

CLI Example:

```
salt '*' zabbix.mediatype_create 'Email' 0 smtp_email='noreply@example.com' smtp_server='mailserver.example.com' smtp_helo='zabbix.example.com'
```

**salt.modules.zabbix.mediatype_delete**(mediatypeids, **connection_args)**

Delete mediatype

**Parameters**

- **interfaceids** -- IDs of the mediatypes to delete
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** ID of deleted mediatype, False on failure.

CLI Example:

```
salt '*' zabbix.mediatype_delete 3
```

**salt.modules.zabbix.mediatype_get**(name=None, mediatypeids=None, **connection_args)**

Retrieve mediatypes according to the given parameters.

**Parameters**

- **name** -- Name or description of the mediatype
• **mediatypeids** -- ids of the mediatypes
• **connection_args** *(optional)* -- _connection_user: zabbix user (can also be set in opts or pillar, see module's docstring) _connection_password: zabbix password (can also be set in opts or pillar, see module's docstring) _connection_url: url of zabbix frontend (can also be set in opts or pillar, see module's docstring)

  all optional mediatype.get parameters: keyword argument names depends on your zabbix version, see:

  https://www.zabbix.com/documentation/2.2/manual/api/reference/mediatype/get

**Returns** Array with mediatype details, False if no mediatype found or on failure.

CLI Example:

```
salt '*' zabbix.mediatype_get name='Email'
salt '*' zabbix.mediatype_get mediatypeids='["1", "2", "3"]'
```

**salt.modules.zabbix.mediatype_update** *(mediatypeid, name=False, mediatype=False, **connection_args)*

Update existing mediatype

**Note:** This function accepts all standard mediatype properties: keyword argument names differ depending on your zabbix version, see [here](https://www.zabbix.com/documentation/2.4/manual/api/reference/mediatype/get).

**Parameters**

• **mediatypeid** -- ID of the mediatype to update
• **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** IDs of the updated mediatypes, False on failure.

CLI Example:

```
salt '*' zabbix.usergroup_update 8 name="Email update"
```

**salt.modules.zabbix.run_query** *(method, params, **connection_args)*

Send Zabbix API call

**Parameters**

• **method** -- actual operation to perform via the API
• **params** -- parameters required for specific method
• **connection_args** *(optional)* -- _connection_user: zabbix user (can also be set in opts or pillar, see module's docstring) _connection_password: zabbix password (can also be set in opts or pillar, see module's docstring) _connection_url: url of zabbix frontend (can also be set in opts or pillar, see module's docstring)

  all optional template.get parameters: keyword argument names depends on your zabbix version, see:

  https://www.zabbix.com/documentation/2.4/manual/api/reference/

**Returns** Response from Zabbix API

CLI Example:

```
salt '*' zabbix.run_query proxy.create '{}"host": "zabbixproxy.domain.com", "status": "5"'}'
```
salt.modules.zabbix.substitute_params(input_object, extend_params=None, filter_key='name', **kwargs)

New in version 2017.7.

Go through Zabbix object params specification and if needed get given object ID from Zabbix API and put it back as a value. Definition of the object is done via dict with keys "query_object" and "query_name".

Parameters

- **input_object** -- Zabbix object type specified in state file
- **extend_params** -- Specify query with params
- **filter_key** -- Custom filtering key (default: name)
- **connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns

Params structure with values converted to string for further comparison purposes

salt.modules.zabbix.template_get(name=None, host=None, templateids=None, **connection_args)

Retrieve templates according to the given parameters.

Parameters

- **host** -- technical name of the template
- **name** -- visible name of the template
- **hostids** -- ids of the templates
- **connection_args** (optional) -- _connection_user: zabbix user (can also be set in opts or pillar, see module's docstring)_connection_password: zabbix password (can also be set in opts or pillar, see module's docstring)_connection_url: url of zabbix frontend (can also be set in opts or pillar, see module's docstring)

all optional template.get parameters: keyword argument names depends on your zabbix version, see:

https://www.zabbix.com/documentation/2.4/manual/api/reference/template/get

Returns

Array with convenient template details, False if no template found or on failure.

CLI Example:

```
salt '*' zabbix.template_get name='Template OS Linux'
salt '*' zabbix.template_get templateids='[10050, 10001]'
```

salt.modules.zabbix.user_addmedia(userids, active, mediatypeid, period, sendto, severity, **connection_args)

Add new media to multiple users.

New in version 2016.3.0.

Parameters

- **userids** -- ID of the user that uses the media
- **active** -- Whether the media is enabled (0 enabled, 1 disabled)
- **mediatypeid** -- ID of the media type used by the media
- **period** -- Time when the notifications can be sent as a time period
- **sendto** -- Address, user name or other identifier of the recipient
- **severity** -- Trigger severities to send notifications about
- **connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
salt.modules.zabbix.user_addmedia

Returns IDs of the created media.

CLI Example:

```bash
salt '*' zabbix.user_addmedia 4 active=0 mediatypeid=1 period='1-7,00:00-24:00'\n\n\nsendto='support2@example.com'\nseverity=63
```

salt.modules.zabbix.user_create

Create new zabbix user

Note: This function accepts all standard user properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **alias** -- user alias
- **passwd** -- user's password
- **usrgrps** -- user groups to add the user to
- **_connection_user** -- zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- url of zabbix frontend (can also be set in opts or pillar, see module's docstring)

Returns On success string with id of the created user.

CLI Example:

```bash
salt '*' zabbix.user_create james password007 \n\n\n[7, 12]' firstname='James Bond'
```

salt.modules.zabbix.user_delete

Delete zabbix users.

Parameters

- **users** -- array of users (userids) to delete
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts or pillar, see module's docstring)

Returns On success array with userids of deleted users.

CLI Example:

```bash
salt '*' zabbix.user_delete 15
```

salt.modules.zabbix.user_deletemedia

Delete media by id.

Parameters

- **mediaids** -- array of mediaids to delete
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns On success array with mediaids of deleted media.

CLI Example:

```bash
salt '*' zabbix.user_deletemedia
```
Parameters

- **mediaids** -- IDs of the media to delete
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns

IDs of the deleted media, False on failure.

CLI Example:

```
salt '*' zabbix.user_deletemedia 27
```

salt.modules.zabbix.user_exists( (*alias, **connection_args*)
Checks if user with given alias exists.

New in version 2016.3.0.

Parameters

- **alias** -- user alias
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns

True if user exists, else False.

CLI Example:

```
salt '*' zabbix.user_exists james
```

salt.modules.zabbix.user_get(*alias=None, userids=None, **connection_args*)
Retrieve users according to the given parameters.

New in version 2016.3.0.

Parameters

- **alias** -- user alias
- **userids** -- return only users with the given IDs
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns

Array with details of convenient users, False on failure of if no user found.

CLI Example:

```
salt '*' zabbix.user_get james
```

salt.modules.zabbix.user_getmedia(*userids=None, **connection_args*)
Retrieve media according to the given parameters

New in version 2016.3.0.

Note: This function accepts all standard usermedia.get properties: keyword argument names differ depending on your zabbix version, see [here](#).
Parameters

- **userids** -- return only media that are used by the given users
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns List of retrieved media, False on failure.

CLI Example:

```
salt '*' zabbix.user_getmedia
```

salt.modules.zabbix.user_list(**connection_args)**

Retrieve all of the configured users.

New in version 2016.3.0.

Parameters

- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with user details.

CLI Example:

```
salt '*' zabbix.user_list
```

salt.modules.zabbix.user_update(userid, **connection_args)**

Update existing users

Note: This function accepts all standard user properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **userid** -- id of the user to update
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Id of the updated user on success.

CLI Example:

```
salt '*' zabbix.user_update 16 visible_name='James Brown'
```

salt.modules.zabbix.usergroup_create(name, **connection_args)**

Create new user group

New in version 2016.3.0.

Create new user group
Note: This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see here.

Parameters
- **name** -- name of the user group
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the created user groups.

CLI Example:
```
salt '*' zabbix.usergroup_create GroupName
```

```
salt.modules.zabbix.usergroup_delete(usergroupids, **connection_args)
```

New in version 2016.3.0.

Parameters
- **usergroupids** -- IDs of the user groups to delete
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbixfrontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the deleted user groups.

CLI Example:
```
salt '*' zabbix.usergroup_delete 28
```

```
salt.modules.zabbix.usergroup_exists(name=None, node=None, nodeids=None, **connection_args)
```

Checks if at least one user group that matches the given filter criteria exists

New in version 2016.3.0.

Parameters
- **name** -- names of the user groups
- **node** -- name of the node the user groups must belong to (This will override the nodeids parameter)
- **nodeids** -- IDs of the nodes the user groups must belong to
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns True if at least one user group that matches the given filter criteria exists, else False.

CLI Example:
```
salt '*' zabbix.usergroup_exists Guests
```

```
salt.modules.zabbix.usergroup_get(name=None, usrgpids=None, userids=None, **connection_args)
```

Chapter 23. Salt Module Reference
New in version 2016.3.0.

Retrieve user groups according to the given parameters

**Note:** This function accepts all usergroup_get properties: keyword argument names differ depending on your zabbix version, see [here](#).

**Parameters**

- **name** -- names of the user groups
- **usrgrpids** -- return only user groups with the given IDs
- **userids** -- return only user groups that contain the given users
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** Array with convenient user groups details, False if no user group found or on failure.

**CLI Example:**

```
salt '*' zabbix.usergroup_get Guests
```

salt.modules.zabbix.usergroup_list(**connection_args**)

Retrieve all enabled user groups.

New in version 2016.3.0.

**Parameters**

- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** Array with enabled user groups details, False on failure.

**CLI Example:**

```
salt '*' zabbix.usergroup_list
```

salt.modules.zabbix.usergroup_update(usrgrp, **connection_args**)

New in version 2016.3.0.

Update existing user group

**Note:** This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see [here](#).

**Parameters**

- **usrgrp** -- ID of the user group to update.
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
Returns  IDs of the updated user group, False on failure.

CLI Example:
```
salt '*' zabbix.usergroup_update 8 name=guestsRenamed
```

```
salt.modules.zabbix.usermacro_create(macro, value, hostid, **connection_args)
  Create new host usermacro.
  Parameters
  •  macro -- name of the host usermacro
  •  value -- value of the host usermacro
  •  hostid -- hostid or templateid
  •  _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
  •  _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
  •  _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

  return: ID of the created host usermacro.

CLI Example:
```
salt '*' zabbix.usermacro_create '{$SNMP_COMMUNITY}' 'public' 1
```

```
salt.modules.zabbix.usermacro_createglobal(macro, value, **connection_args)
  Create new global usermacro.
  Parameters
  •  macro -- name of the global usermacro
  •  value -- value of the global usermacro
  •  _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
  •  _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
  •  _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

  return: ID of the created global usermacro.

CLI Example:
```
salt '*' zabbix.usermacro_createglobal '{$SNMP_COMMUNITY}' 'public'
```

```
salt.modules.zabbix.usermacro_delete(macroids, **connection_args)
  Delete host usermacros.
  Parameters
  •  macroids -- macroids of the host usermacros
  •  _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
  •  _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
  •  _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

  return: IDs of the deleted host usermacro.

CLI Example:
```
salt '*' zabbix.usermacro_delete 21
```
salt.modules.zabbix.usermacro_deleteglobal(macroids, **connection_args)

Delete global usermacros.

Parameters

- **macroids** -- macroids of the global usermacros
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: IDs of the deleted global usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_deleteglobal 21
```

salt.modules.zabbix.usermacro_get(macro=None, hostids=None, templateids=None, hostmacroids=None, globalmacroids=None, globalmacro=False, **connection_args)

Retrieve user macros according to the given parameters.

Parameters

- **macro** -- name of the usermacro
- **hostids** -- Return macros for the given hostids
- **templateids** -- Return macros for the given templateids
- **hostmacroids** -- Return macros with the given hostmacroids
- **globalmacroids** -- Return macros with the given globalmacroids (implies globalmacro=True)
- **globalmacro** -- if True, returns only global macros
- **connection_args**(optional) -- _connection_user: zabbix user (can also be set in opts or pillar, see module's docstring) _connection_password: zabbix password (can also be set in opts or pillar, see module's docstring) _connection_url: url of zabbix frontend (can also be set in opts or pillar, see module's docstring)

Returns Array with usermacro details, False if no usermacro found or on failure.

CLI Example

```
salt '*' zabbix.usermacro_get macro='{$SNMP_COMMUNITY}'
```

salt.modules.zabbix.usermacro_update(hostmacroid, value, **connection_args)

Update existing host usermacro.

Parameters

- **hostmacroid** -- id of the host usermacro
- **value** -- new value of the host usermacro
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: ID of the update host usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_update 1 'public'
```

salt.modules.zabbix.usermacro_updateglobal(globalmacroid, value, **connection_args)

Update existing global usermacro.
Parameters

- **globalmacroid** -- id of the host usermacro
- **value** -- new value of the host usermacro
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: ID of the update global usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_updateglobal 1 'public'
```

### 23.9.526 salt.modules.zcbuildout

Management of zc.buildout

New in version 2014.1.0.

This module is inspired by minitage's buildout maker

---

**Note:** The zc.buildout integration is still in beta; the API is subject to change

---

**General notes**

You have those following methods:

- **upgrade_bootstrap**
- **bootstrap**
- **run_buildout**
- **buildout**

```python
def bootstrap(*a, **kw):
    """Run the buildout bootstrap dance (python bootstrap.py)."
    directory directory to execute in
cfg alternative buildout configuration file to use
runas User used to run buildout as
env environment variables to set when running
buildout_ver force a specific buildout version (1 | 2)
test_release buildout accept test release
offline are we executing buildout in offline mode
distribute Forcing use of distribute
new_st Forcing use of setuptools >= 0.7
python path to a python executable to use in place of default (salt one)
onlyif Only execute cmd if statement on the host return 0
unless Do not execute cmd if statement on the host return 0
use_vt Use the new salt VT to stream output [experimental]
```

CLI Example:
salt '...' buildout.bootstrap /srv/mybuildout

salt.modules.zcbuildout.buildout('a, **kw)
  Run buildout in a directory.
  directory  directory to execute in
  config    buildout config to use
  parts     specific buildout parts to run
  runas     user used to run buildout as
  env       environment variables to set when running
  buildout_ver  force a specific buildout version (1 | 2)
  test_release buildout accept test release
  new_st    Forcing use of setuptools >= 0.7
  distribute use distribute over setuptools if possible
  offline   does buildout run offline
  python    python to use
  debug     run buildout with -D debug flag
  onlyif    Only execute cmd if statement on the host return 0
  unless    Do not execute cmd if statement on the host return 0
  newest    run buildout in newest mode
  verbose   run buildout in verbose mode (-vvvvv)
  use_vt    Use the new salt VT to stream output [experimental]
CLI Example:
  salt '...' buildout.buildout /srv/mybuildout

salt.modules.zcbuildout.run_buildout('a, **kw)
  Run a buildout in a directory.
  directory  directory to execute in
  config    alternative buildout configuration file to use
  offline   are we executing buildout in offline mode
  runas     user used to run buildout as
  env       environment variables to set when running
  onlyif    Only execute cmd if statement on the host return 0
  unless    Do not execute cmd if statement on the host return 0
  newest    run buildout in newest mode
  force     run buildout unconditionally
  verbose   run buildout in verbose mode (-vvvvv)
  use_vt    Use the new salt VT to stream output [experimental]
CLI Example:
  salt '...' buildout.run_buildout /srv/mybuildout

salt.modules.zcbuildout.upgrade_bootstrap('a, **kw)
  Upgrade current bootstrap.py with the last released one.
  Indeed, when we first run a buildout, a common source of problem is to have a locally stale bootstrap, we just
  try to grab a new copy
  directory  directory to execute in
  offline   are we executing buildout in offline mode
  buildout_ver  forcing to use a specific buildout version (1 | 2)
  onlyif    Only execute cmd if statement on the host return 0
  unless    Do not execute cmd if statement on the host return 0
CLI Example:
23.9.527 salt.modules.zenoss

Module for working with the Zenoss API
New in version 2016.3.0.

configuration This module requires a 'zenoss' entry in the master/minion config.

For example:

```
zenoss:
  hostname: https://zenoss.example.com
  username: admin
  password: admin123
  verify_ssl: True
  ca_bundle: /etc/ssl/certs/ca-certificates.crt
```

salt.modules.zenoss.add_device(device=None, device_class=None, collector='localhost', prod_state=1000)

A function to connect to a zenoss server and add a new device entry.

Parameters
- **device** -- (Optional) Will use the grain 'fqdn' by default.
- **device_class** -- (Optional) The device class to use. If none, will determine based on kernel grain.
- **collector** -- (Optional) The collector to use for this device. Defaults to 'localhost'.
- **prod_state** -- (Optional) The prodState to set on the device. If none, defaults to 1000 (production)

CLI Example:

```
salt '*' zenoss.add_device
```

salt.modules.zenoss.device_exists(device=None)

Check to see if a device already exists in Zenoss.

Parameters **device** -- (Optional) Will use the grain 'fqdn' by default

CLI Example:

```
salt '*' zenoss.device_exists
```

salt.modules.zenoss.find_device(device=None)

Find a device in Zenoss. If device not found, returns None.

Parameters **device** -- (Optional) Will use the grain 'fqdn' by default

CLI Example:

```
salt '*' zenoss.find_device
```

salt.modules.zenoss.set_prod_state(prod_state, device=None)

A function to set the prod_state in zenoss.

Parameters
- **prod_state** -- (Required) Integer value of the state
- **device** -- (Optional) Will use the grain 'fqdn' by default.

CLI Example:
23.9.528 salt.modules.zfs

Module for running ZFS command

[codeauthor] Nitin Madhok &lt;nmadhok@clemson.edu&gt;, Jorge Schrauwen &lt;sjorge@blackdot.be&gt;
maintainer Jorge Schrauwen &lt;sjorge@blackdot.be&gt;
maturity new
depends salt.utils.zfs
platform illumos,freebsd,linux

Changed in version 2018.3.1: Big refactor to remove duplicate code, better type conversions and improved consistency in output.

salt.modules.zfs.bookmark(snapshot, bookmark)

Creates a bookmark of the given snapshot

[Note: Bookmarks mark the point in time when the snapshot was created, and can be used as the incremental source for a zfs send command.
This feature must be enabled to be used. See zpool-features(5) for details on ZFS feature flags and the bookmarks feature.]

snapshot [string] name of snapshot to bookmark
bookmark [string] name of bookmark

New in version 2016.3.0.

CLI Example:
salt '*' zfs.bookmark myzpool/mydataset@yesterday myzpool/mydataset#complete

salt.modules.zfs.clone(name_a, name_b, **kwargs)

Creates a clone of the given snapshot.
name_a [string] name of snapshot
name_b [string] name of filesystem or volume
create_parent [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.
properties [dict] additional zfs properties (-o)

[Note: ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called “properties” and specifying the properties with their respective values in the form of a python dictionary:]

properties="{"property1": 'value1', 'property2': 'value2'"

New in version 2016.3.0.

CLI Example:
**zfs.clone**

```
salt '*' zfs.clone myzpool/mydataset@yesterday myzpool/mydataset_yesterday
```

salt.modules.zfs.create(name, **kwargs)

Create a ZFS File System.

- **name** [string] name of dataset or volume
- **volume_size** [string] if specified, a zvol will be created instead of a dataset
- **sparse** [boolean] create sparse volume
- **create_parent** [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.
- **properties** [dict] additional zfs properties (-o)

**Note:** ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties=dict(proper1='value1', property2='value2')
```

New in version 2015.5.0.

CLI Example:

```
salt '*' zfs.create myzpool/mydataset [create_parent=True|False]
salt '*' zfs.create myzpool/mydataset properties=dicemountpoint:'/export/zfs',
shareufs:'on')
salt '*' zfs.create myzpool/volume volume_size=1G [sparse=True|False]
salt '*' zfs.create myzpool/volume volume_size=1G properties=dicemountpoint:
'512') [sparse=True|False]
```

salt.modules.zfs.destroy(name, **kwargs)

Destroy a ZFS File System.

- **name** [string] name of dataset, volume, or snapshot
- **force** [boolean] force an unmount of any file systems using the unmount -f command.
- **recursive** [boolean] recursively destroy all children. (-r)
- **recursive_all** [boolean] recursively destroy all dependents, including cloned file systems outside the target hierarchy. (-R)

**Warning:** watch out when using recursive and recursive_all

New in version 2015.5.0.

CLI Example:

```
salt '*' zfs.destroy myzpool/mydataset [force=True|False]
```

salt.modules.zfs.diff(name_a, name_b=None, **kwargs)

Display the difference between a snapshot of a given filesystem and another snapshot of that filesystem from a later time or the current contents of the filesystem.

- **name_a** [string] name of snapshot
- **name_b** [string] (optional) name of snapshot or filesystem
- **show_changetime** [boolean] display the path's inode change time as the first column of output. (default = True)
- **show_indication** [boolean] display an indication of the type of file. (default = True)
- **parsable** [boolean] if true we don't parse the timestamp to a more readable date (default = True)

New in version 2016.3.0.
CLI Example:

```
salt '*' zfs.diff myzpool/mydataset@yesterday myzpool/mydataset
```

**salt.modules.zfs.exists**(name, **kwargs)
Check if a ZFS filesystem or volume or snapshot exists.

- **name** [string] name of dataset
- **type** [string] also check if dataset is of a certain type, valid choices are: filesystem, snapshot, volume, bookmark, or all.

New in version 2015.5.0.

CLI Example:

```
salt '*' zfs.exists myzpool/mydataset
salt '*' zfs.exists myzpool/myvolume type=volume
```

**salt.modules.zfs.get**(dataset, **kwargs)
Displays properties for the given datasets.

- **dataset** [string] name of snapshot(s), filesystem(s), or volume(s)
- **properties** [string] comma-separated list of properties to list, defaults to all
- **recursive** [boolean] recursively list children
- **depth** [int] recursively list children to depth
- **fields** [string] comma-separated list of fields to include, the name and property field will always be added
- **type** [string] comma-separated list of types to display, where type is one of filesystem, snapshot, volume, bookmark, or all.

Changed in version 3004.

- **type** ignored on Solaris 10 and 11 since not a valid parameter on those platforms
- **source** [string] comma-separated list of sources to display. Must be one of the following: local, default, inherited, temporary, and none. The default value is all sources.
- **parsable** [boolean] display numbers in parsable (exact) values (default = True) .. versionadded:: 2018.3.0

**Note:** If no datasets are specified, then the command displays properties for all datasets on the system.

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.get
salt '*' zfs.get myzpool/mydataset [recursive=True|False]
salt '*' zfs.get myzpool/mydataset properties="sharefs,mountpoint"
  ↭[recursive=True|False]
salt '*' zfs.get myzpool/mydataset myzpool/myotherdataset properties=available
  ↭fields=value depth=1
```

**salt.modules.zfs.hold**(tag, *snapshot, **kwargs)
Adds a single reference, named with the tag argument, to the specified snapshot or snapshots.

**Note:** Each snapshot has its own tag namespace, and tags must be unique within that space.

If a hold exists on a snapshot, attempts to destroy that snapshot by using the zfs destroy command return EBUSY.

- **tag** [string] name of tag
- **snapshot** [string] name of snapshot(s)
**recursive**  [boolean] specifies that a hold with the given tag is applied recursively to the snapshots of all descendent file systems.

New in version 2016.3.0.

Changed in version 2018.3.1.

**Warning:** As of 2018.3.1 the tag parameter no longer accepts a comma-separated value. It's now possible to create a tag that contains a comma, this was impossible before.

CLI Example:

```bash
salt '*' zfs.hold mytag myzpool/mydataset@mysnapshot [recursive=True]
salt '*' zfs.hold mytag myzpool/mydataset@mysnapshot myzpool/
    → mydataset@myothersnapshot
```

### `salt.modules.zfs.holds(snapshot, **kwargs)`

Lists all existing user references for the given snapshot or snapshots.

- **snapshot**  [string] name of snapshot
- **recursive**  [boolean] lists the holds that are set on the named descendent snapshots also.

New in version 2016.3.0.

CLI Example:

```bash
salt '*' zfs.holds myzpool/mydataset@baseline
```

### `salt.modules.zfs.inherit(prop, name, **kwargs)`

Clears the specified property

- **prop**  [string] name of property
- **name**  [string] name of the filesystem, volume, or snapshot
- **recursive**  [boolean] recursively inherit the given property for all children.
- **revert**  [boolean] revert the property to the received value if one exists; otherwise operate as if the -S option was not specified.

New in version 2016.3.0.

CLI Example:

```bash
salt '*' zfs.inherit canmount myzpool/mydataset [recursive=True|False]
```

### `salt.modules.zfs.list_(name=None, **kwargs)`

Return a list of all datasets or a specified dataset on the system and the values of their used, available, referenced, and mountpoint properties.

- **name**  [string] name of dataset, volume, or snapshot
- **recursive**  [boolean] recursively list children
- **depth**  [int] limit recursion to depth
- **properties**  [string] comma-separated list of properties to list, the name property will always be added
- **type**  [string] comma-separated list of types to display, where type is one of filesystem, snapshot, volume, bookmark, or all.
- **sort**  [string] property to sort on (default = name)
- **order**  [string [ascending|descending]] sort order (default = ascending)
- **parsable**  [boolean] display numbers in parsable (exact) values .. versionadded:: 2018.3.0

New in version 2015.5.0.

CLI Example:
salt 'zfs.list
salt 'zfs.list myzpool/mydataset [recursive=True|False]
salt 'zfs.list myzpool/mydataset properties="sharenfs,mountpoint"

salt.modules.zfs.list_mount()
List mounted zfs filesystems
New in version 2018.3.1.
CLI Example:
salt '*' zfs.list_mount

salt.modules.zfs.mount(name=None, **kwargs)
Mounts ZFS file systems
name [string] name of the filesystem, having this set to None will mount all filesystems. (this is the default)
overlay [boolean] perform an overlay mount.
options [string] optional comma-separated list of mount options to use temporarily for the duration of the mount.
New in version 2016.3.0.
Changed in version 2018.3.1.

**Warning:** Passing `-a` as name is deprecated and will be removed in 3001.

CLI Example:
salt '*' zfs.mount
salt '*' zfs.mount myzpool/mydataset
salt '*' zfs.mount myzpool/mydataset options=ro

salt.modules.zfs.promote(name)
Promotes a clone file system to no longer be dependent on its "origin" snapshot.

**Note:** This makes it possible to destroy the file system that the clone was created from. The clone parent-child dependency relationship is reversed, so that the origin file system becomes a clone of the specified file system.

The snapshot that was cloned, and any snapshots previous to this snapshot, are now owned by the promoted clone. The space they use moves from the origin file system to the promoted clone, so enough space must be available to accommodate these snapshots. No new space is consumed by this operation, but the space accounting is adjusted. The promoted clone must not have any conflicting snapshot names of its own. The rename subcommand can be used to rename any conflicting snapshots.

name [string] name of clone-filesystem
New in version 2016.3.0.
CLI Example:
salt '*' zfs.promote myzpool/myclone

salt.modules.zfs.release(tag, 'snapshot', **kwargs)
Removes a single reference, named with the tag argument, from the specified snapshot or snapshots.
Note: The tag must already exist for each snapshot. If a hold exists on a snapshot, attempts to destroy that snapshot by using the zfs destroy command return EBUSY.

**tag**  [string] name of tag  
**snapshot**  [string] name of snapshot(s)  
**recursive**  [boolean] recursively releases a hold with the given tag on the snapshots of all descendent file systems.

New in version 2016.3.0.  
Changed in version 2018.3.1.

**Warning:** As of 2018.3.1 the tag parameter no longer accepts a comma-separated value. It's now possible to create a tag that contains a comma, this was impossible before.

CLI Example:

```bash
salt '*' zfs.release mytag myzpool/mydataset@mysnapshot [recursive=True]
salt '*' zfs.release mytag myzpool/mydataset@mysnapshot myzpool/
                → mydataset@myothersnapshot
```

salt.modules.zfs.rename  
(name, new_name, **kwargs)

Rename or Relocate a ZFS File System.  
**name**  [string] name of dataset, volume, or snapshot  
**new_name**  [string] new name of dataset, volume, or snapshot  
**force**  [boolean] force unmount any filesystems that need to be unmounted in the process.  
**create_parent**  [boolean] creates all the nonexistent parent datasets. Datasets created in this manner are automatically mounted according to the mountpoint property inherited from their parent.  
**recursive**  [boolean] recursively rename the snapshots of all descendent datasets. snapshots are the only dataset that can be renamed recursively.

New in version 2015.5.0.

CLI Example:

```bash
salt '*' zfs.rename myzpool/mydataset myzpool/renameddataset
```

salt.modules.zfs.rollback  
(name, **kwargs)

Roll back the given dataset to a previous snapshot.  
**name**  [string] name of snapshot  
**recursive**  [boolean] destroy any snapshots and bookmarks more recent than the one specified.  
**recursive_all**  [boolean] destroy any more recent snapshots and bookmarks, as well as any clones of those snapshots.  
**force**  [boolean] used with the -R option to force an unmount of any clone file systems that are to be destroyed.

**Warning:** When a dataset is rolled back, all data that has changed since the snapshot is discarded, and the dataset reverts to the state at the time of the snapshot. By default, the command refuses to roll back to a snapshot other than the most recent one.  
In order to do so, all intermediate snapshots and bookmarks must be destroyed by specifying the -r option.

New in version 2016.3.0.

CLI Example:
```
salt '*' zfs.rollback myzpool/mydataset@yesterday
```

```
salt.modules.zfs.set('dataset', **kwargs)

Sets the property or list of properties to the given value(s) for each dataset.
```

**dataset** [string] name of snapshot(s), filesystem(s), or volume(s)

**properties** [string] additional zfs properties pairs

**Note:** properties are passed as key-value pairs. e.g.

```
compression=off
```

**Note:** Only some properties can be edited.

See the Properties section for more information on what properties can be set and acceptable values.

Numeric values can be specified as exact values, or in a human-readable form with a suffix of B, K, M, G, T, P, E (for bytes, kilobytes, megabytes, gigabytes, terabytes, petabytes, or exabytes respectively).

New in version 2016.3.0.

**CLI Example:**

```
salt '*' zfs.set myzpool/mydataset compression=off
salt '*' zfs.set myzpool/mydataset myzpool/myotherdataset compression=lz4
←canmount=off
```

```
salt.modules.zfs.snapshot('snapshot', **kwargs)

Creates snapshots with the given names.
```

**snapshot** [string] name of snapshot(s)

**recursive** [boolean] recursively create snapshots of all descendent datasets.

**properties** [dict] additional zfs properties (-o)

**Note:** ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties={"property1": 'value1', 'property2': 'value2'}
```

New in version 2016.3.0.

**CLI Example:**

```
salt '*' zfs.snapshot myzpool/mydataset@yesterday [recursive=True]
salt '*' zfs.snapshot myzpool/mydataset@yesterday myzpool/myotherdataset@yesterday [recursive=True]
←myotherdataset@yesterday [recursive=True]
```

```
salt.modules.zfs.unmount(name, **kwargs)

Unmounts ZFS file systems
```

**name** [string] name of the filesystem, you can use None to unmount all mounted filesystems.

**force** [boolean] forcefully unmount the file system, even if it is currently in use.

**Warning:** Using -a for the name parameter will probably break your system, unless your rootfs is not on zfs.
New in version 2016.3.0.

Changed in version 2018.3.1.

**Warning:** Passing `-a` as name is deprecated and will be removed in 3001.

CLI Example:

```bash
salt '*' zfs.unmount myzpool/mydataset [force=True|False]
```

## 23.9.529 salt.modules.zk_concurrency

Concurrency controls in zookeeper

**depends** kazoo

**configuration** See `salt.modules.zookeeper` for setup instructions.

This module allows you to acquire and release a slot. This is primarily useful for ensuring that no more than `N` hosts take a specific action at once. This can also be used to coordinate between masters.

### `salt.modules.zk_concurrency.lock`(

```bash
path, zk_hosts=None, identifier=None, max_concurrency=1, timeout=None, ephemeral_lease=False, force=False, profile=None, scheme=None, username=None, password=None, default_acl=None)
```

Get lock (with optional timeout)

- `path` The path in zookeeper where the lock is
- `zk_hosts` zookeeper connect string
- `identifier` Name to identify this minion, if unspecified defaults to the hostname
- `max_concurrency` Maximum number of lock holders
- `timeout` timeout to wait for the lock. A None timeout will block forever
- `ephemeral_lease` Whether the locks in zookeeper should be ephemeral
- `force` Forcibly acquire the lock regardless of available slots

**Example:**

```bash
salt minion zk_concurrency.lock /lock/path host1:1234,host2:1234
```

### `salt.modules.zk_concurrency.lock_holders`(

```bash
path, zk_hosts=None, identifier=None, max_concurrency=1, timeout=None, ephemeral_lease=False, profile=None, scheme=None, username=None, password=None, default_acl=None)
```

Return an un-ordered list of lock holders

- `path` The path in zookeeper where the lock is
- `zk_hosts` zookeeper connect string
- `identifier` Name to identify this minion, if unspecified defaults to hostname
- `max_concurrency` Maximum number of lock holders
- `timeout` timeout to wait for the lock. A None timeout will block forever
- `ephemeral_lease` Whether the locks in zookeeper should be ephemeral

**Example:**

```bash
salt minion zk_concurrency.lock_holders /lock/path host1:1234,host2:1234
```
salt.modules.zk_concurrency.party_members(path, zk_hosts=None, min_nodes=1, blocking=False, profile=None, scheme=None, username=None, password=None, default_acl=None)

Get the List of identifiers in a particular party, optionally waiting for the specified minimum number of nodes (min_nodes) to appear.

- **path**: The path in zookeeper where the lock is.
- **zk_hosts**: zookeeper connect string.
- **min_nodes**: The minimum number of nodes expected to be present in the party.
- **blocking**: The boolean indicating if we need to block until min_nodes are available.

Example:

```
salt minion zk_concurrency.party_members /lock/path host1:1234,host2:1234
salt minion zk_concurrency.party_members /lock/path host1:1234,host2:1234 min_nodes=3 blocking=True
```

salt.modules.zk_concurrency.unlock(path, zk_hosts=None, identifier=None, max_concurrency=1, ephemeral_lease=False, scheme=None, profile=None, username=None, password=None, default_acl=None)

Remove lease from semaphore.

- **path**: The path in zookeeper where the lock is.
- **zk_hosts**: zookeeper connect string.
- **identifier**: Name to identify this minion, if unspecified defaults to hostname.
- **max_concurrency**: Maximum number of lock holders.
- **timeout**: timeout to wait for the lock. A None timeout will block forever.
- **ephemeral_lease**: Whether the locks in zookeper should be ephemeral.

Example:

```
salt minion zk_concurrency.unlock /lock/path host1:1234,host2:1234
```

## 23.9.530 salt.modules.znc

**znc**: An advanced IRC bouncer.

New in version 2014.7.0.

Provides an interface to basic ZNC functionality.

salt.modules.znc.buildmod("modules")

Build module using znc-buildmod.

CLI Example:

```
salt '*' znc.buildmod module.cpp [...]
```

salt.modules.znc.dumpconf()

Write the active configuration state to config file.

CLI Example:

```
salt '*' znc.dumpconf
```

salt.modules.znc.rehashconf()

Rehash the active configuration state from config file.

CLI Example:
salt '*' znc.rehashconf

salt.modules.znc.version()
Return server version from znc --version

CLI Example:
salt '*' znc.version

23.9.531 salt.modules.zoneadm

Module for Solaris 10's zoneadm

maintainer Jorge Schrauwen <sjorge@blackdot.be>
maturity new
platform OmniOS,OpenIndiana,SmartOS,OpenSolaris,Solaris 10

New in version 2017.7.0.

Warning: Oracle Solaris 11's zoneadm is not supported by this module!

salt.modules.zoneadm.attach(zone, force=False, brand_opts=None)
Attach the specified zone.
zone [string] name of the zone
force [boolean] force the zone into the "installed" state with no validation
brand_opts [string] brand specific options to pass

CLI Example:
salt '*' zoneadm.attach lawrence
salt '*' zoneadm.attach lawrence True

salt.modules.zoneadm.boot(zone, single=False, altinit=None, smf_options=None)
Boot (or activate) the specified zone.
zone [string] name or uuid of the zone
single [boolean] boots only to milestone svc:/milestone/single-user:default.
altinit [string] valid path to an alternative executable to be the primordial process.
smf_options [string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.

CLI Example:
salt '*' zoneadm.boot clementine
salt '*' zoneadm.boot maeve single=True
salt '*' zoneadm.boot teddy single=True smf_options=verbose

salt.modules.zoneadm.clone(zone, source, snapshot=None)
Install a zone by copying an existing installed zone.
zone [string] name of the zone
source [string] zone to clone from
snapshot [string] optional name of snapshot to use as source

CLI Example:
salt 'スター' zoneadm.clone clementine dolores

salt.modules.zoneadm.detach(zone)
  Detach the specified zone.
  
  **zone** [string] name or uuid of the zone

  CLI Example:

  salt 'スター' zoneadm.detach kissy

salt.modules.zoneadm.halt(zone)
  Halt the specified zone.
  
  **zone** [string] name or uuid of the zone

  **Note:** To cleanly shutdown the zone use the shutdown function.

  CLI Example:

  salt 'スター' zoneadm.halt hector

salt.modules.zoneadm.install(zone, nodataset=False, brand_opts=None)
  Install the specified zone from the system.
  
  **zone** [string] name of the zone
  **nodataset** [boolean] do not create a ZFS file system
  **brand_opts** [string] brand specific options to pass

  CLI Example:

  salt 'スター' zoneadm.install dolores
  salt 'スター' zoneadm.install teddy True

salt.modules.zoneadm.list_zones(verbosity=True, installed=False, configured=False, hide_global=True)
  List all zones

  **verbosity** [boolean] display additional zone information
  **installed** [boolean] include installed zones in output
  **configured** [boolean] include configured zones in output
  **hide_global** [boolean] do not include global zone

  CLI Example:

  salt 'スター' zoneadm.list

salt.modules.zoneadm.move(zone, zonepath)
  Move zone to new zonepath.
  
  **zone** [string] name or uuid of the zone
  **zonepath** [string] new zonepath

  CLI Example:

  salt 'スター' zoneadm.move meave /sweetwater/meave

salt.modules.zoneadm.ready(zone)
  Prepares a zone for running applications.
  
  **zone** [string] name or uuid of the zone

  CLI Example:

  salt 'スター' zoneadm.ready clementine
salt.modules.zoneadm.reboot(zone, single=False, altinit=None, smf_options=None)

Restart the zone. This is equivalent to a halt boot sequence.

- **zone** [string] name or uuid of the zone
- **single** [boolean] boots only to milestone svc:/milestone/single-user:default.
- **altinit** [string] valid path to an alternative executable to be the primordial process.
- **smf_options** [string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.

CLI Example:
```
salt '*' zoneadm.reboot dolores
salt '*' zoneadm.reboot teddy single=True
```

salt.modules.zoneadm.shutdown(zone, reboot=False, single=False, altinit=None, smf_options=None)

Gracefully shutdown the specified zone.

- **zone** [string] name or uuid of the zone
- **reboot** [boolean] reboot zone after shutdown (equivalent of shutdown -i6 -g0 -y)
- **single** [boolean] boots only to milestone svc:/milestone/single-user:default.
- **altinit** [string] valid path to an alternative executable to be the primordial process.
- **smf_options** [string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.

CLI Example:
```
salt '*' zoneadm.shutdown peter
salt '*' zoneadm.shutdown armistice reboot=True
```

salt.modules.zoneadm.uninstall(zone)

Uninstall the specified zone from the system.

- **zone** [string] name or uuid of the zone

**Warning:** The -F flag is always used to avoid the prompts when uninstalling.

CLI Example:
```
salt '*' zoneadm.uninstall teddy
```

salt.modules.zoneadm.verify(zone)

Check to make sure the configuration of the specified zone can safely be installed on the machine.

- **zone** [string] name of the zone

CLI Example:
```
salt '*' zoneadm.verify dolores
```

23.9.532 salt.modules.zonecfg

Module for Solaris 10’s zonecfg

- **maintainer** Jorge Schrauwen <sjorge@blackdot.be>
- **maturity** new
- **platform** OmniOS, OpenIndiana, SmartOS, OpenSolaris, Solaris 10
- **depend** salt.modules.file

New in version 2017.7.0.
Warning: Oracle Solaris 11's zonecfg is not supported by this module!

```python
salt.modules.zonecfg.add_resource(zone, resource_type, **kwargs)
   Add a resource
   zone [string] name of zone
   resource_type [string] type of resource
   kwargs [string|int|...] resource properties

   CLI Example:
   salt '*' zonecfg.add_resource tallgeese rctl name=zone.max-locked-memory value='
   →'(priv=privileged,limit=33554432,action=deny)'
```

```python
salt.modules.zonecfg.clear_property(zone, key)
   Clear a property
   zone [string] name of zone
   key [string] name of property

   CLI Example:
   salt '*' zonecfg.clear_property deathscythe cpu-shares
```

```python
salt.modules.zonecfg.create(zone, brand, zonepath, force=False)
   Create an in-memory configuration for the specified zone.
   zone [string] name of zone
   brand [string] brand name
   zonepath [string] path of zone
   force [boolean] overwrite configuration

   CLI Example:
   salt '*' zonecfg.create deathscythe ipkg /zones/deathscythe
```

```python
salt.modules.zonecfg.create_from_template(zone, template)
   Create an in-memory configuration from a template for the specified zone.
   zone [string] name of zone
   template [string] name of template

   Warning: existing config will be overwritten!

   CLI Example:
   salt '*' zonecfg.create_from_template leo tallgeese
```

```python
salt.modules.zonecfg.delete(zone)
   Delete the specified configuration from memory and stable storage.
   zone [string] name of zone

   CLI Example:
   salt '*' zonecfg.delete epyon
```

```python
salt.modules.zonecfg.export(zone, path=None)
   Export the configuration from memory to stable storage.
   zone [string] name of zone
   path [string] path of file to export to

   CLI Example:
```

23.9. execution modules
salt '⋆' zonecfg.export epyon
salt '⋆' zonecfg.export epyon /zones/epyon.cfg

salt.modules.zonecfg.import_(zone, path)
   Import the configuration to memory from stable storage.
   zone [string] name of zone
   path [string] path of file to export to
   CLI Example:
   salt '⋆' zonecfg.import epyon /zones/epyon.cfg

salt.modules.zonecfg.info(zone, show_all=False)
   Display the configuration from memory
   zone [string] name of zone
   show_all [boolean] also include calculated values like capped-cpu, cpu-shares, ...
   CLI Example:
   salt '⋆' zonecfg.info tallgeese

salt.modules.zonecfg.remove_resource(zone, resource_type, resource_key, resource_value)
   Remove a resource
   zone [string] name of zone
   resource_type [string] type of resource
   resource_key [string] key for resource selection
   resource_value [string] value for resource selection

   Note: Set resource_selector to None for resource that do not require one.
   CLI Example:
   salt '⋆' zonecfg.remove_resource tallgeese rctl name zone.max-locked-memory

salt.modules.zonecfg.set_property(zone, key, value)
   Set a property
   zone [string] name of zone
   key [string] name of property
   value [string] value of property
   CLI Example:
   salt '⋆' zonecfg.set_property deathscythe cpu-shares 100

salt.modules.zonecfg.update_resource(zone, resource_type, resource_selector, **kwargs)
   Add a resource
   zone [string] name of zone
   resource_type [string] type of resource
   resource_selector [string] unique resource identifier
   kwargs [string|int|...] resource properties

   Note: Set resource_selector to None for resource that do not require one.
   CLI Example:
   salt '⋆' zonecfg.update_resource tallgeese rctl name name=zone.max-locked-memory
   → value='{priv=privileged,limit=33554432,action=deny}'
23.9.533 salt.modules.zookeeper

Zookeeper Module

maintainer  SaltStack
maturity   new
platform   all
depends    kazoo

New in version 2018.3.0.

Configuration

configuration  This module is not usable until the following are specified either in a pillar or in the
minion’s config file:

```
zookeeper:
    hosts:  zool,zoo2,zoo3
    default_acl:
      - username: daniel
        password: test
        read: true
        write: true
        create: true
        delete: true
        admin: true
    username: daniel
    password: test
```

If configuration for multiple zookeeper environments is required, they can be set up as different
configuration profiles. For example:

```
zookeeper:
  prod:
    hosts:  zool,zoo2,zoo3
    default_acl:
      - username: daniel
        password: test
        read: true
        write: true
        create: true
        delete: true
        admin: true
    username: daniel
    password: test

  dev:
    hosts:
      - dev1
      - dev2
      - dev3
    default_acl:
      - username: daniel
        password: test
        read: true
```

(continues on next page)
salt.modules.zookeeper.create\(\text{path}, \text{value}=\text{"}, \text{acls}=	ext{None}, \text{ephemeral}=	ext{False}, \text{sequence}=	ext{False}, \text{makepath}=	ext{False}, \text{profile}=	ext{None}, \text{hosts}=	ext{None}, \text{scheme}=	ext{None}, \text{username}=	ext{None}, \text{password}=	ext{None}, \text{default_acl}=	ext{None}\)

Create Znode

\text{path} \ path \ of \ znode \ to \ create\n\text{value} \ value \ to \ assign \ to \ znode \ (Default: \text{"})\n\text{acls} \ list \ of \ acl \ dictionaries \ to \ be \ assigned \ (Default: \text{None})\n\text{ephemeral} \ indicate \ node \ is \ ephemeral \ (Default: \text{False})\n\text{sequence} \ indicate \ node \ is \ suffixed \ with \ a \ unique \ index \ (Default: \text{False})\n\text{makepath} \ Create \ parent \ paths \ if \ they \ do \ not \ exist \ (Default: \text{False})\n\text{profile} \ Configured \ Zookeeper \ profile \ to \ authenticate \ with \ (Default: \text{None})\n\text{hosts} \ Lists \ of \ Zookeeper \ Hosts \ (Default: \text{\'127.0.0.1:2181\')}\n\text{scheme} \ Scheme \ to \ authenticate \ with \ (Default: \text{\'digest\'})\n\text{username} \ Username \ to \ authenticate \ (Default: \text{None})\n\text{password} \ Password \ to \ authenticate \ (Default: \text{None})\n\text{default_acl} \ Default \ acls \ to \ assign \ if \ a \ node \ is \ created \ in \ this \ connection \ (Default: \text{None})

CLI Example:

`salt minion1 zookeeper.create /test/name daniel profile=prod`

salt.modules.zookeeper.delete\(\text{path}, \text{version}=\text{-1}, \text{recursive}=	ext{False}, \text{profile}=	ext{None}, \text{hosts}=	ext{None}, \text{scheme}=	ext{None}, \text{username}=	ext{None}, \text{password}=	ext{None}, \text{default_acl}=	ext{None}\)

Delete znode

\text{path} \ path \ to \ znode\n\text{version} \ only \ delete \ if \ version \ matches \ (Default: \text{-1} (always matches))\n\text{profile} \ Configured \ Zookeeper \ profile \ to \ authenticate \ with \ (Default: \text{None})\n\text{hosts} \ Lists \ of \ Zookeeper \ Hosts \ (Default: \text{\'127.0.0.1:2181\')}\n\text{scheme} \ Scheme \ to \ authenticate \ with \ (Default: \text{\'digest\'})\n\text{username} \ Username \ to \ authenticate \ (Default: \text{None})\n\text{password} \ Password \ to \ authenticate \ (Default: \text{None})\n\text{default_acl} \ Default \ acls \ to \ assign \ if \ a \ node \ is \ created \ in \ this \ connection \ (Default: \text{None})

CLI Example:

`salt minion1 zookeeper.delete /test/name profile=prod`

salt.modules.zookeeper.ensure_path\(\text{path}, \text{acls}=	ext{None}, \text{profile}=	ext{None}, \text{hosts}=	ext{None}, \text{scheme}=	ext{None}, \text{username}=	ext{None}, \text{password}=	ext{None}, \text{default_acl}=	ext{None}\)

Ensure Znode path exists

\text{path} \ Parent \ path \ to \ create\n\text{acls} \ list \ of \ acl \ dictionaries \ to \ be \ assigned \ (Default: \text{None})\n\text{profile} \ Configured \ Zookeeper \ profile \ to \ authenticate \ with \ (Default: \text{None})\n\text{hosts} \ Lists \ of \ Zookeeper \ Hosts \ (Default: \text{\'127.0.0.1:2181\')}\n\text{scheme} \ Scheme \ to \ authenticate \ with \ (Default: \text{\'digest\'})\n\text{username} \ Username \ to \ authenticate \ (Default: \text{None})\n\text{password} \ Password \ to \ authenticate \ (Default: \text{None})\n\text{default_acl} \ Default \ acls \ to \ assign \ if \ a \ node \ is \ created \ in \ this \ connection \ (Default: \text{None})
CLI Example:

```bash
salt minion1 zookeeper.ensure_path /test/name profile=prod
```

```python
salt.modules.zookeeper.exists(path, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)
```

Check if path exists

- `path` path to check
- `profile` Configured Zookeeper profile to authenticate with (Default: None)
- `hosts` Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')
- `scheme` Scheme to authenticate with (Default: 'digest')
- `username` Username to authenticate (Default: None)
- `password` Password to authenticate (Default: None)
- `default_acl` Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```bash
salt minion1 zookeeper.exists /test/name profile=prod
```

```python
salt.modules.zookeeper.get(path, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)
```

Get value saved in znode

- `path` path to check
- `profile` Configured Zookeeper profile to authenticate with (Default: None)
- `hosts` Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')
- `scheme` Scheme to authenticate with (Default: 'digest')
- `username` Username to authenticate (Default: None)
- `password` Password to authenticate (Default: None)
- `default_acl` Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```bash
salt minion1 zookeeper.get /test/name profile=prod
```

```python
salt.modules.zookeeper.get_acls(path, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)
```

Get acls on a znode

- `path` path to znode
- `profile` Configured Zookeeper profile to authenticate with (Default: None)
- `hosts` Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')
- `scheme` Scheme to authenticate with (Default: 'digest')
- `username` Username to authenticate (Default: None)
- `password` Password to authenticate (Default: None)
- `default_acl` Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```bash
salt minion1 zookeeper.get_acls /test/name profile=prod
```

```python
salt.modules.zookeeper.get_children(path, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)
```

Get children in znode path

- `path` path to check
- `profile` Configured Zookeeper profile to authenticate with (Default: None)
- `hosts` Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')
- `scheme` Scheme to authenticate with (Default: 'digest')
- `username` Username to authenticate (Default: None)
- `password` Password to authenticate (Default: None)
- `default_acl` Default acls to assign if a node is created in this connection (Default: None)
CLI Example:
```bash
classic minion1 zookeeper.get_children /test profile=prod
```

```python
salt.modules.zookeeper.make_digest_acl(username, password, read=False, write=False, create=False, delete=False, admin=False, allperms=False)
```

Generates acl object

**Note:** This is heavily used in the zookeeper state and probably is not useful as a cli module

username: username of acl
password: plain text password of acl
read: read acl
write: write acl
create: create acl
delete: delete acl
admin: admin acl
allperms: set all other acls to True

CLI Example:
```bash
salt minion1 zookeeper.make_digest_acl username=daniel password=mypass allperms=True
```

`salt.modules.zookeeper.set(path, value, version=-1, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)
```

Updates znode with new value

path: znode to update
value: value to set in znode
version: only update znode if version matches (Default: -1 (always matches))
profile: Configured Zookeeper profile to authenticate with (Default: None)
hosts: Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')
scheme: Scheme to authenticate with (Default: 'digest')
username: Username to authenticate (Default: None)
password: Password to authenticate (Default: None)
default_acl: Default acls to assign if a node is created in this connection (Default: None)

CLI Example:
```bash
salt minion1 zookeeper.set /test/name gtmanfred profile=prod
```

`salt.modules.zookeeper.set_acls(path, acls, version=-1, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)
```

Sets acls on a znode

path: path to znode
acls: list of acl dictionaries to set on the znode
version: only set acls if version matches (Default: -1 (always matches))
profile: Configured Zookeeper profile to authenticate with (Default: None)
hosts: Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')
scheme: Scheme to authenticate with (Default: 'digest')
username: Username to authenticate (Default: None)
password: Password to authenticate (Default: None)
default_acl: Default acls to assign if a node is created in this connection (Default: None)

CLI Example:
23.9.534 **salt.modules.zpool**

Module for running ZFS zpool command

```python
codeauthor Nitin Madhok <nmadhok@g.clemson.edu>, Jorge Schrauwen <sjorge@blackdot.be>
maintainer Jorge Schrauwen <sjorge@blackdot.be>
maturity new
depends salt.utils.zfs
platform illumos,freebsd,linux
```

Changed in version 2018.3.1: Big refactor to remove duplicate code, better type conversions and improved consistency in output.

**salt.modules.zpool.add**

Add the specified vdev’s to the given storage pool

```python
devname  [string] Name of storage pool
dev [string] One or more devices
force  [boolean] Forces use of device
``` 

CLI Example:

```bash
salt '*' zpool.add devname /devvdev1 /devvdev2 [...]
```

**salt.modules.zpool.attach**

Attach specified device to zpool

```python
zpool  [string] Name of storage pool
dev  [string] Existing device name too
new_dev  [string] New device name (to be attached to dev)
force  [boolean] Forces use of device
``` 

CLI Example:

```bash
class '*' zpool.add devname /devvdev1 /devvdev2 [...]
```

**salt.modules.zpool.clear**

Clears device errors in a pool.

```python
devname  [string] name of storage pool
dev  [string] (optional) specific device to clear
``` 

New in version 2018.3.1.

CLI Example:

```bash
class '*' zpool.clear devname
class '*' zpool.clear devname /dev
```

**salt.modules.zpool.create**

New in version 2015.5.0.
Create a simple zpool, a mirrored zpool, a zpool having nested VDEVs, a hybrid zpool with cache, spare and log drives or a zpool with RAIDZ-1, RAIDZ-2 or RAIDZ-3.

`zpool [string] Name of storage pool`

`vdevs [string] One or move devices`

`force [boolean] Forces use of vdevs, even if they appear in use or specify a conflicting replication level.`

`mountpoint [string] Sets the mount point for the root dataset`

`altroot [string] Equivalent to "-o cachefile=none,altroot=root"`

`properties [dict] Additional pool properties`

`filesystem_properties [dict] Additional filesystem properties`

`createboot [boolean] create a boot partition`

New in version 2018.3.0.

CLI Examples:

```bash
salt '*' zpool.create myzpool /path/to/vdev1 [...][force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 /path/to/vdev2 [...][force=True|False]
salt '*' zpool.create myzpool raidz1 /path/to/vdev1 /path/to/vdev2 raidz2 /path/to/vdev3 /path/to/vdev4 /path/to/vdev5 [...][force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 [...][force=True|False]
salt '*' zpool.create myhybridzpool mirror /tmp/file1 [...][force=True|False]
```

Note: Zpool properties can be specified at the time of creation of the pool by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{'property1': 'value1', 'property2': 'value2'}"
```

Filesystem properties can be specified at the time of creation of the pool by passing an additional argument called "filesystem_properties" and specifying the properties with their respective values in the form of a python dictionary:

```
filesystem_properties="{'property1': 'value1', 'property2': 'value2'}"
```

Example:

```bash
salt '*' zpool.create myzpool /path/to/vdev1 [...][force=True|False]
```

CLI Example:

```bash
salt '*' zpool.create myzpool /path/to/vdev1 [...][force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 /path/to/vdev2 [...][force=True|False]
salt '*' zpool.create myzpool raidz1 /path/to/vdev1 /path/to/vdev2 raidz2 /path/to/vdev3 /path/to/vdev4 /path/to/vdev5 [...][force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 [...][force=True|False]
salt '*' zpool.create myhybridzpool mirror /tmp/file1 [...][force=True|False]
```

salt.modules.zpool.create_file_vdev(size, *vdevs)

Creates file based virtual devices for a zpool.
CLI Example:

```
salt '*' zpool.create_file_vdev 7G /path/to/vdev1 [/path/to/vdev2] [...] 
```

**Note:** Depending on file size, the above command may take a while to return.

**salt.modules.zpool.destroy(zpool, force=False)**

Destroys a storage pool

- `zpool` [string] Name of storage pool
- `force` [boolean] Force destroy of pool

CLI Example:

```
salt '*' zpool.destroy myzpool 
```

**salt.modules.zpool.detach(zpool, device)**

Detach specified device to zpool

- `zpool` [string] Name of storage pool
- `device` [string] Device to detach

CLI Example:

```
salt '*' zpool.detach myzpool /path/to/vdev1 
```

**salt.modules.zpool.exists(zpool)**

Check if a ZFS storage pool is active

- `zpool` [string] Name of storage pool

CLI Example:

```
salt '*' zpool.exists myzpool 
```

**salt.modules.zpool.export(*pools, **kwargs)**

New in version 2015.5.0.

Export storage pools

- `pools` [string] One or more storage pools to export
- `force` [boolean] Force export of storage pools

CLI Example:

```
salt '*' zpool.export myzpool ... [force=True|False] 
salt '*' zpool.export myzpool2 myzpool2 ... [force=True|False] 
```

**salt.modules.zpool.get(zpool, prop=None, show_source=False, parsable=True)**

New in version 2016.3.0.

Retrieves the given list of properties

- `zpool` [string] Name of storage pool
- `prop` [string] Optional name of property to retrieve
- `show_source` [boolean] Show source of property
- `parsable` [boolean] Display numbers in parsable (exact) values

New in version 2018.3.0.

CLI Example:

```
salt '*' zpool.get myzpool 
```

**salt.modules.zpool.healthy()**

Check if all zpools are healthy
New in version 2016.3.0.

**CLI Example:**

```bash
salt '*' zpool.healthy
```

salt.modules.zpool.history(
    *zpool=None, internal=False, verbose=False*
)

New in version 2016.3.0.

Displays the command history of the specified pools, or all pools if no pool is specified.

- **zpool** [string] Optional storage pool
- **internal** [boolean] Toggle display of internally logged ZFS events
- **verbose** [boolean] Toggle display of the user name, the hostname, and the zone in which the operation was performed

**CLI Example:**

```bash
salt '*' zpool.upgrade myzpool
```

salt.modules.zpool.import_(
    *zpool=None, new_name=None, **kwargs*
)

New in version 2015.5.0.

Import storage pools or list pools available for import.

- **zpool** [string] Optional name of storage pool
- **new_name** [string] Optional new name for the storage pool
- **mntopts** [string] Comma-separated list of mount options to use when mounting datasets within the pool.
- **force** [boolean] Forces import, even if the pool appears to be potentially active.
- **altroot** [string] Equivalent to "-o cachefile=none,altroot=root"
- **dir** [string] Searches for devices or files in dir, multiple dirs can be specified as follows: `dir="dir1,dir2"`
- **no_mount** [boolean] Import the pool without mounting any file systems.
- **only_destroyed** [boolean] Imports destroyed pools only. This also sets `force=True`.
- **recovery** [bool|str] false: do not try to recovery broken pools true: try to recovery the pool by rolling back the latest transactions test: check if a pool can be recovered, but don’t import it nolog: allow import without log device, recent transactions might be lost

**Note:** If feature flags are not support this forced to the default of ‘false’

**Warning:** When recovery is set to ‘test’ the result will be have imported set to True if the pool can be imported. The pool might also be imported if the pool was not broken to begin with.

- **properties** [dict] Additional pool properties

**Note:** Zpool properties can be specified at the time of creation of the pool by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```python
properties="{'property1': 'value1', 'property2': 'value2'}"
```

**CLI Example:**

```bash
salt '*' zpool.import [force=True|False]
salt '*' zpool.import myzpool [mynewzpool] [force=True|False]
salt '*' zpool.import myzpool dir='/'tmp'
```

salt.modules.zpool.iostat(
    *zpool=None, sample_time=5, parsable=True*
)

Display I/O statistics for the given pools
zpool [string] optional name of storage pool
sample_time [int] seconds to capture data before output default a sample of 5 seconds is used
parsable [boolean] display data in pythonc values (True, False, Bytes,...)

New in version 2016.3.0.

Changed in version 2018.3.1: Added `parsable` parameter that defaults to True

CLI Example:
salt '*' zpool.iostat myzpool

salt.modules.zpool.labelclear(device, force=False)

New in version 2018.3.0.

Removes ZFS label information from the specified device
device [string] Device name; must not be part of an active pool configuration.
force [boolean] Treat exported or foreign devices as inactive

CLI Example:
salt '*' zpool.labelclear /path/to/dev

salt.modules.zpool.list_(properties='size,alloc,free,cap,frag,health', zpool=None, parsable=True)

New in version 2015.5.0.

Return information about (all) storage pools
zpool [string] optional name of storage pool
properties [string] comma-separated list of properties to list
parsable [boolean] display numbers in parsable (exact) values

New in version 2018.3.0.

Note: The `name` property will always be included, while the `frag` property will get removed if not available

zpool [string] optional zpool

Note: Multiple storage pool can be provided as a space separated list

CLI Example:
salt '*' zpool.list
salt '*' zpool.list zpool=tank
salt '*' zpool.list 'size,free'
salt '*' zpool.list 'size,free' tank

salt.modules.zpool.offline(zpool, *vdevs, **kwargs)

New in version 2015.5.0.

Ensure that the specified devices are offline

Warning: By default, the OFFLINE state is persistent. The device remains offline when the system is rebooted. To temporarily take a device offline, use `temporary=True`.

zpool [string] name of storage pool
vdevs [string] One or more devices
temporary [boolean] Enable temporarily offline
CLI Example:

```
salt '*' zpool.offline myzpool /path/to/vdev1 [...] [temporary=True|False]
```

**salt.modules.zpool.online(zpool, *vdevs, **kwargs)**

New in version 2015.5.0.

Ensure that the specified devices are online

- **zpool** [string] name of storage pool
- **vdevs** [string] one or more devices
- **expand** [boolean] Expand the device to use all available space.

**Note:** If the device is part of a mirror or raidz then all devices must be expanded before the new space will become available to the pool.

CLI Example:

```
salt '*' zpool.online myzpool /path/to/vdev1 [...] 
```

**salt.modules.zpool.reguid(zpool)**

Generates a new unique identifier for the pool

**Warning:** You must ensure that all devices in this pool are online and healthy before performing this action.

- **zpool** [string] name of storage pool

New in version 2016.3.0.

CLI Example:

```
salt '*' zpool.reguid myzpool
```

**salt.modules.zpool.reopen(zpool)**

Reopen all the vdevs associated with the pool

- **zpool** [string] name of storage pool

New in version 2016.3.0.

CLI Example:

```
salt '*' zpool.reopen myzpool
```

**salt.modules.zpool.replace(zpool, old_device=None, new_device=None, force=False)**

Replaces old_device with new_device

**Note:** This is equivalent to attaching new_device, waiting for it to resilver, and then detaching old_device.

The size of new_device must be greater than or equal to the minimum size of all the devices in a mirror or raidz configuration.

- **zpool** [string] Name of storage pool
- **old_device** [string] Old device to replace
- **new_device** [string] Optional new device
- **force** [boolean] Forces use of new_device, even if its appears to be in use.
CLI Example:
```
salt '*' zpool.replace myzpool /path/to/vdev1 /path/to/vdev2
```

```
salt.modules.zpool.scrub(zpool, stop=False, pause=False)
```
Scrub a storage pool

- **zpool** [string] Name of storage pool
- **stop** [boolean] If True, cancel ongoing scrub
- **pause** [boolean] If True, pause ongoing scrub

New in version 2018.3.0.

Note: Pause is only available on recent versions of ZFS.

If both `pause` and `stop` are True, then `stop` will win.

CLI Example:
```
salt '*' zpool.scrub myzpool
```

```
salt.modules.zpool.set(zpool, prop, value)
```
Sets the given property on the specified pool

- **zpool** [string] Name of storage pool
- **prop** [string] Name of property to set
- **value** [string] Value to set for the specified property

New in version 2016.3.0.

CLI Example:
```
salt '*' zpool.set myzpool readonly yes
```

```
salt.modules.zpool.split(zpool, newzpool, **kwargs)
```
New in version 2018.3.0.

Splits devices off pool creating newpool.

Note: All vdevs in pool must be mirrors. At the time of the split, `newzpool` will be a replica of `zpool`.

After splitting, do not forget to import the new pool!

- **zpool** [string] Name of storage pool
- **newzpool** [string] Name of new storage pool
- **mountpoint** [string] Sets the mount point for the root dataset
- **altroot** [string] Sets altroot for `newzpool`
- **properties** [dict] Additional pool properties for `newzpool`

CLI Examples:
```
salt '*' zpool.split datamirror databackup
salt '*' zpool.split datamirror databackup altroot=/backup
```

Note: Zpool properties can be specified at the time of creation of the pool by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:
```
properties="{"property1": 'value1', 'property2': 'value2'}"
```
Example:

```python
salt '*' zpool.split datamirror databackup properties="{'readonly': 'on'})"
```

CLI Example:

```bash
salt '*' zpool.split datamirror databackup
salt '*' zpool.split datamirror databackup altroot=/backup
```

```python
salt.modules.zpool.status(zpool=None)
```

Return the status of the named zpool

**zpool** [string] optional name of storage pool

New in version 2016.3.0.

CLI Example:

```bash
salt '*' zpool.status myzpool
```

```python
salt.modules.zpool.upgrade(zpool=None, version=None)
```

New in version 2016.3.0.

Enables all supported features on the given pool

**zpool** [string] Optional storage pool, applies to all otherwise

**version** [int] Version to upgrade to, if unspecified upgrade to the highest possible

**Warning:** Once this is done, the pool will no longer be accessible on systems that do not support feature flags. See zpool-features(5) for details on compatibility with systems that support feature flags, but do not support all features enabled on the pool.

CLI Example:

```bash
salt '*' zpool.upgrade myzpool
```

### 23.9.535 salt.modules.zypperpkg

Package support for openSUSE via the zypper package manager

**depends**

- `rpm` Python module. Install with `zypper install rpm-python`

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

```python
class salt.modules.zypperpkgWildcard(zypper)
```

New in version 2017.7.0.

Converts string wildcard to a zypper query. .. rubric:: Example

'1.2.3.4*' is '1.2.3.4.whatever.is.here' and is equal to: '1.2.3.4 >= and < 1.2.3.5'

**Parameters** `ptn` -- Pattern

**Returns** Query range

```
Z_OP = ['<', '<=', '=', '>=', '>']
```
salt.modules.zypperpkg.add_lock(name, root=None, **kwargs)
Deprecated since version 3003: This function is deprecated. Please use hold() instead.

Add a package lock. Specify packages to lock by exact name.
root operate on a different root directory.
CLI Example:
```
salt '*' pkg.add_lock <package name>
salt '*' pkg.add_lock <package1>,<package2>,<package3>
```

salt.modules.zypperpkg.available_version(*names, **kwargs)
This function is an alias of latest_version.
Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.
If the latest version of a given package is already installed, an empty dict will be returned for that package.
refresh force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.
root operate on a different root directory.
CLI Example:
```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.zypperpkg.clean_locks(root=None)
Remove unused locks that do not currently (with regard to repositories used) lock any package.
root Operate on a different root directory.
CLI Example:
```
salt '*' pkg.clean_locks
```

salt.modules.zypperpkg.del_repo(repo, root=None)
Delete a repo.
root operate on a different root directory.
CLI Examples:
```
salt '*' pkg.del_repo alias
```

salt.modules.zypperpkg.diff(*paths, **kwargs)
Return a formatted diff between current files and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.
The root parameter can also be passed via the keyword argument.
Parameters path -- Full path to the installed file
Returns Difference string or raises and exception if examined file is binary.
CLI Example:
```
salt '*' pkg.diff /etc/apache2/httpd.conf /etc/sudoers
```

salt.modules.zypperpkg.download(*packages, **kwargs)
Download packages to the local disk.
refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.
root operate on a different root directory.
CLI Example:
Salt Documentation, Release 3003.3

```text
salt '*' pkg.download httpd
salt '*' pkg.download httpd postfix
```

```
salt.modules.zypperpkg.file_dict(*packages, **kwargs)
List the files that belong to a package, grouped by package. Not specifying any packages will return a list of
every file on the system's rpm database (not generally recommended).

The root parameter can also be passed via the keyword argument.

CLI Examples:
```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

```
salt.modules.zypperpkg.file_list(*packages, **kwargs)
List the files that belong to a package. Not specifying any packages will return a list of every file on the system's
rpm database (not generally recommended).

The root parameter can also be passed via the keyword argument.

CLI Examples:
```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

```
salt.modules.zypperpkg.get_repo(repo, root=None, **kwargs)
Display a repo.
  root operate on a different root directory.

CLI Example:
```
salt '*' pkg.get_repo alias
```

```
salt.modules.zypperpkg.hold(name=None, pkgs=None, **kwargs)
New in version 3003.
Add a package hold. Specify one of name and pkgs.
  name A package name to hold, or a comma-separated list of package names to hold.
  pkgs A list of packages to hold. The name parameter will be ignored if this option is passed.

CLI Example:
```
salt '*' pkg.hold <package name>
salt '*' pkg.hold <package1>,<package2>,<package3>
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

```
salt.modules.zypperpkg.info_available(*names, **kwargs)
Return the information of the named package available for the system.
  refresh force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

  root operate on a different root directory.

CLI Example:
```
salt '*' pkg.info_available <package1>
salt '*' pkg.info_available <package1> <package2> <package3> ...
```

```
salt.modules.zypperpkg.info_installed(*names, **kwargs)
Return the information of the named package(s), installed on the system.
```

3172 Chapter 23. Salt Module Reference
Parameters

- **names** -- Names of the packages to get information about.
- **attr** -- Comma-separated package attributes. If no 'attr' is specified, all available attributes returned.
  Valid attributes are: version, vendor, release, build_date, build_date_time_t, install_date, install_date_time_t, build_host, group, source_rpm, arch, epoch, size, license, signature, packager, url, summary, description.
- **errors** -- Handle RPM field errors. If 'ignore' is chosen, then various mistakes are simply ignored and omitted from the texts or strings. If 'report' is chosen, then a field with a mistake is not returned, instead a 'N/A (broken)' (not available, broken) text is placed.
  Valid attributes are: ignore, report
- **all_versions** -- Include information for all versions of the packages installed on the minion.
- **root** -- Operate on a different root directory.

CLI Example:

```bash
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> <package2> <package3> all_versions=True
salt '*' pkg.info_installed <package1> <package2> <package3> attr=version,vendor all_versions=True
salt '*' pkg.info_installed <package1> <package2> <package3> ... attr=version,
  →vendor
salt '*' pkg.info_installed <package1> <package2> <package3> ... attr=version,
  →vendor errors=ignore
salt '*' pkg.info_installed <package1> <package2> <package3> ... attr=version,
  →vendor errors=report

salt.modules.zypperpkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, 
  sources=None, downloadonly=None, skip_verify=False, version=None, 
  ignore_repo_failure=False, no_recommends=False, root=None, **kwargs)
```

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the salt-minion service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a config option called `systemd.scope`, with a value of False (no quotes).

Install the passed package(s), add refresh=True to force a 'zypper refresh' before package is installed.

**name** The name of the package to be installed. Note that this parameter is ignored if either `pkgs` or `sources` is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the `sources` option.

CLI Example:

```bash
salt '*' pkg.install <package name>
```

**refresh** force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

**fromrepo** Specify a package repository to install from.

**downloadonly** Only download the packages, do not install.

**skip_verify** Skip the GPG verification check (e.g., `--no-gpg-checks`)

**version** Can be either a version number, or the combination of a comparison operator (`, >, <=, >=, =`) and a version number (ex. `>1.2.3-4`). This parameter is ignored if `pkgs` or `sources` is passed.

**resolve_capabilities** If this option is set to True zypper will take capabilities into account. In this case names which are just provided by a package will get installed. Default is False.

Multiple Package Installation Options:
pkgs A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. As with the version parameter above, comparison operators can be used to target a specific version of a package.

CLI Examples:

```bash
salt '*' pkg.install pkgs=['"foo", "bar"]
salt '*' pkg.install pkgs=['"foo", {"bar": "1.2.3-4"}]
salt '*' pkg.install pkgs=['"foo", {"bar": "<1.2.3-4"}]
```

sources A list of RPM packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```bash
salt '*' pkg.install sources=[{"foo": "salt://foo.rpm"},{"bar": "salt://bar.rpm"}]
```

ignore_repo_failure Zypper returns error code 106 if one of the repositories are not available for various reasons. In case to set strict check, this parameter needs to be set to True. Default: False.

no_recommends Do not install recommended packages, only required ones.

root operate on a different root directory.

diff_attr: If a list of package attributes is specified, returned value will contain them, eg.:

```json
{ '<package>': {  'old': {  'version': '<old-version>',  'arch': '<old-arch>'},  'new': {  'version': '<new-version>',  'arch': '<new-arch>'}}>}
```

Valid attributes are: epoch, version, release, arch, install_date, install_date_time_t.

If all is specified, all valid attributes will be returned.

New in version 2018.3.0.

Returns a dict containing the new package names and versions:

```json
{ '<package>': {  'old': '<old-version>',  'new': '<new-version>'}}>}
```

If an attribute list is specified in diff_attr, the dict will also contain any specified attribute, eg.:

```json
{ '<package>': {  'old': {  'version': '<old-version>',  'arch': '<old-arch>'},  'new': {  'version': '<new-version>',  'arch': '<new-arch>'}}>}}
```

salt.modules.zypperpkg.latest_version(*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty dict will be returned for that package.
refresh force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

root operate on a different root directory.

CLI Example:

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.zypperpkg.list_downloaded(root=None, **kwargs)

List prefetched packages downloaded by Zypper in the local disk.

root operate on a different root directory.

CLI Example:

```bash
salt '*' pkg.list_downloaded
```

salt.modules.zypperpkg.list_installed_patches(root=None, **kwargs)

List installed advisory patches on the system.

root operate on a different root directory.

CLI Examples:

```bash
salt '*' pkg.list_installed_patches
```

salt.modules.zypperpkg.list_installed_patterns(root=None)

List installed patterns on the system.

root operate on a different root directory.

CLI Examples:

```bash
salt '*' pkg.list_installed_patterns
```

salt.modules.zypperpkg.list_locks(root=None)

List current package locks.

root operate on a different root directory.

Return a dict containing the locked package with attributes:

```python
{'<package>': {'case_sensitive': '<case_sensitive>',
              'match_type': '<match_type>',
              'type': '<type>'}}
```

CLI Example:

```bash
salt '*' pkg.list_locks
```

salt.modules.zypperpkg.list_patches(refresh=False, root=None, **kwargs)

List all known advisory patches from available repos.

refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

root operate on a different root directory.

CLI Examples:

```bash
salt '*' pkg.list_patches
```

salt.modules.zypperpkg.list_patterns(refresh=False, root=None)

List all known patterns from available repos.
refresh  force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.
root  operate on a different root directory.

CLI Examples:

```
salt '*' pkg.list_patterns
```

**salt.modules.zypperpkg.list_pkgs**

salt.modules.zypperpkg.list_pkgs

List the packages currently installed as a dict. By default, the dict contains versions as a comma separated string:

```
{'<package_name>': '"<version>[,<version>...]"'}
```

- **versions_as_list**: If set to True, the versions are provided as a list
  `{'<package_name>': ['<version>', '<version>']}`
- **root**: operate on a different root directory.
- **includes**: List of types of packages to include (package, patch, pattern, product) By default packages are always included.
- **attr**: If a list of package attributes is specified, returned value will contain them in addition to version, eg.:
  `{'<package_name>': [{'version': 'version', 'arch': 'arch'}]}`

Valid attributes are: epoch, version, release, arch, install_date, install_date_time_t.

If all is specified, all valid attributes will be returned.

New in version 2018.3.0.

removed: not supported

purge_desired: not supported

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs attr=version,arch
salt '*' pkg.list_pkgs attr=['"version", "arch"]'
```

**salt.modules.zypperpkg.list_products**

List all available or installed SUSE products.

- **all**: List all products available or only installed. Default is False.
- **refresh**: force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.
- **root**: operate on a different root directory.

Includes handling for OEM products, which read the OEM product line file and overwrite the release value.

CLI Examples:

```
salt '*' pkg.list_products
salt '*' pkg.list_products all=True
```

**salt.modules.zypperpkg.list_provides**

New in version 2018.3.0.

List package provides of installed packages as a dict. `{'<provided_name>': ['<package_name>', '<package_name>', ...]}`

- **root**: operate on a different root directory.

CLI Examples:

```
salt '*' pkg.list_provides
```
salt.modules.zypperpkg.list_repo_pkgs(*args, **kwargs)
New in version 2017.7.5, 2018.3.1.

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names. This is recommended as it speeds up the function considerably.

This function can be helpful in discovering the version or repo to specify in a pkg.installed state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If byrepo is set to True, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```
# With byrepo=False (default)
{
    'bash': ['4.3-83.3.1',
             '4.3-82.6'],
    'vim': ['7.4.326-12.1']
},

'OSS': {
    'bash': ['4.3-82.6'],
    'vim': ['7.4.326-12.1']
},

'OSS Update': {
    'bash': ['4.3-83.3.1']
}
```

fromrepo [None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

byrepo [False] When True, the return data for each package will be organized by repository.

root operate on a different root directory.

CLI Examples:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True
salt '*' pkg.list_repo_pkgs 'python2-*' fromrepo='OSS Updates'
```

salt.modules.zypperpkg.list_repos(root=None, **kwargs)
List all repos.

root operate on a different root directory.

CLI Example:

```
salt '*' pkg.list_repos
```

salt.modules.zypperpkg.list_updates(refresh=True, root=None, **kwargs)
This function is an alias of list_upgrades.
List all available package upgrades on this system.

refresh force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed.

root operate on a different root directory.

CLI Example:

```
salt '*' pkg.list_updates
```

salt.modules.zypperpkg.list_upgrades(refresh=True, root=None, **kwargs)
List all available package upgrades on this system.
refresh  force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed.
root   operate on a different root directory.
 CLI Example:

```
salt '*' pkg.list_upgrades
```

**salt.modules.zypperpkg.mod_repo(repo, **kwargs)**
Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the following values are specified:
- **repo or alias**  alias by which Zypper refers to the repo
- **url, mirrorlist or baseurl**  the URL for Zypper to reference
- **enabled**  Enable or disable (True or False) repository, but do not remove if disabled.
- **refresh**  Enable or disable (True or False) auto-refresh of the repository.
- **cache**  Enable or disable (True or False) RPM files caching.
- **gpgcheck**  Enable or disable (True or False) GPG check for this repository.
- **gpgautoimport** [False]  If set to True, automatically trust and import public GPG key for the repository.
- **root**  operate on a different root directory.
 Key/Value pairs may also be removed from a repo's configuration by setting a key to a blank value. Bear in mind that a name cannot be deleted, and a URL can only be deleted if a mirrorlist is specified (or vice versa).

 CLI Examples:

```
salt '*' pkg.mod_repo alias alias=new_alias
salt '*' pkg.mod_repo alias url=mirrorlist=http://host.com/
```

**salt.modules.zypperpkg.modified(*packages, **flags)**
List the modified files that belong to a package. Not specifying any packages will return a list of _all_ modified files on the system's RPM database.

New in version 2015.5.0.
 Filtering by flags (True or False):
- **size**  Include only files where size changed.
- **mode**  Include only files which file's mode has been changed.
- **checksum**  Include only files which MD5 checksum has been changed.
- **device**  Include only files which major and minor numbers has been changed.
- **symlink**  Include only files which are symbolic link contents.
- **owner**  Include only files where owner has been changed.
- **group**  Include only files where group has been changed.
- **time**  Include only files where modification time of the file has been changed.
- **capabilities**  Include only files where capabilities differ or not. Note: supported only on newer RPM versions.
- **root**  operate on a different root directory.

 CLI Examples:

```
salt '*' pkg.modified
salt '*' pkg.modified httpd
salt '*' pkg.modified httpd postfix
salt '*' pkg.modified httpd owner=True group=False
```

**salt.modules.zypperpkg.normalize_name(name)**
Strips the architecture from the specified package name, if necessary. Circumstances where this would be done include:
- If the arch is 32 bit and the package name ends in a 32-bit arch.
- If the arch matches the OS arch, or is noarch.

 CLI Example:
salt 'x' pkg.normalize_name zsh.x86_64

salt.modules.zypperpkg.owner('paths', **kwargs)
Return the name of the package that owns the file. Multiple file paths can be passed. If a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

The root parameter can also be passed via the keyword argument.

CLI Examples:

salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf

salt.modules.zypperpkg.parse_arch(name)
Parse name and architecture from the specified package name.

CLI Example:

salt '*' pkg.parse_arch zsh.x86_64

salt.modules.zypperpkg.purge(name=None, pkgs=None, root=None, **kwargs)
Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Recursively remove a package and all dependencies which were installed with it, this will call a zypper -n remove -u

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

root Operate on a different root directory.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'

salt.modules.zypperpkg.refresh_db(force=None, root=None)
Trigger a repository refresh by calling zypper refresh. Refresh will run with --force if the "force=True" flag is passed on the CLI or refreshdb_force is set to true in the pillar. The CLI option overrides the pillar setting.

It will return a dict:

{'<database name>': Bool}

root operate on a different root directory.
CLI Example:

```
salt '*' pkg.refresh_db [force=true|false]
```

Pillar Example:

```
zypper:
  refreshdb_force: false
```

```
salt.modules.zypperpkg.remove(name=None, pkgs=None, root=None, **kwargs)
```

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a config option called `systemd.scope`, with a value of `False` (no quotes).

Remove packages with `zypper -n remove`

```
name The name of the package to be deleted.
```

Multiple Package Options:

```
pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.
root Operate on a different root directory.
```

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

```
salt.modules.zypperpkg.remove_lock(name, root=None, **kwargs)
```

Deprecated since version 3003: This function is deprecated. Please use `unhold()` instead.

Remove specified package lock.

```
name A package name, or a comma-separated list of package names.
root operate on a different root directory.
```

CLI Example:

```
salt '*' pkg.remove_lock <package name>
salt '*' pkg.remove_lock <package1>,<package2>,<package3>
```

```
salt.modules.zypperpkg.resolve_capabilities(pkgs, refresh=False, root=None, **kwargs)
```

New in version 2018.3.0.

Convert name provides in `pkgs` into real package names if `resolve_capabilities` parameter is set to `True`. In case of `resolve_capabilities` is set to `False` the package list is returned unchanged.

```
refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.
root operate on a different root directory.
```

`resolve_capabilities` If this option is set to `True` the input will be checked if a package with this name exists. If not, this function will search for a package which provides this name. If one is found the output is exchanged with the real package name. In case this option is set to `False` (Default) the input will be returned unchanged.

CLI Examples:
salt.modules.zypperpkg.**search** *(criteria, refresh=False, **kwargs)*

List known packages, available to the system.

- **refresh** force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.
- **match** *(str)* One of `exact`, `words`, `substrings`. Search for an `exact` match or for the whole `words` only. Default to `substrings` to patch partial words.
- **provides** *(bool)* Search for packages which provide the search strings.
- **requires** *(bool)* Search for packages which require the search strings.
- **suggests** *(bool)* Search for packages which suggest the search strings.
- **conflicts** *(bool)* Search packages conflicting with search strings.
- **obsoletes** *(bool)* Search for packages which obsolete the search strings.
- **file_list** *(bool)* Search for a match in the file list of packages.
- **search_descriptions** *(bool)* Search also in package summaries and descriptions.
- **case_sensitive** *(bool)* Perform case-sensitive search.
- **installed_only** *(bool)* Show only installed packages.
- **not_installed_only** *(bool)* Show only packages which are not installed.
- **details** *(bool)* Show version and repository
- **root** operate on a different root directory.

**CLI Examples:**

```bash
salt '*' pkg.search <criteria>
```

salt.modules.zypperpkg.**services_need_restart**(root=None, **kwargs)**

New in version 3003.

List services that use files which have been changed by the package manager. It might be needed to restart them.

- **root** operate on a different root directory.

**CLI Examples:**

```bash
salt '*' pkg.services_need_restart
```

salt.modules.zypperpkg.**unhold**(name=None, pkgs=None, **kwargs)**

New in version 3003.

Remove a package hold.

- **name** A package name to unhold, or a comma-separated list of package names to unhold.
- **pkgs** A list of packages to unhold. The `name` parameter will be ignored if this option is passed.

**CLI Example:**

```bash
salt '*' pkg.unhold <package name>
salt '*' pkg.unhold <package1>,<package2>,<package3>
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

salt.modules.zypperpkg.**upgrade**(refresh=True, dryrun=False, dist_upgrade=False, fromrepo=None, novendorchange=False, skip_verify=False, no_recommends=False, root=None, **kwargs)**

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, **systemd-run(1)** is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the salt-minion service is restarted. (see `KillMode` in the **systemd.kill(5)** manpage for more information). If desired, usage of **systemd-run(1)** can be suppressed by setting a config option called **systemd.scope**, with a value of False (no quotes).
Run a full system upgrade, a zypper upgrade

**refresh**  force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed.

**dryrun**  If set to True, it creates a debug solver log file and then perform a dry-run upgrade (no changes are made). Default: False

**dist_upgrade**  Perform a system dist-upgrade. Default: False

**fromrepo**  Specify a list of package repositories to upgrade from. Default: None

**novendorchange**  If set to True, no allow vendor changes. Default: False

**skip_verify**  Skip the GPG verification check (e.g., `--no-gpg-checks`)

**no_recommend**  Do not install recommended packages, only required ones.

**root**  Operate on a different root directory.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

**CLI Example:**

```
salt '*' pkg.upgrade
dsalt '*' pkg.upgrade dist_upgrade=True fromrepo=['"MyRepoName"']
dryrun=True
```

salt.modules.zypperpkg.upgrade_available(name,**kwargs)

Check whether or not an upgrade is available for a given package

**refresh**  force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

**root**  operate on a different root directory.

**CLI Example:**

```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.zypperpkg.verify(names,**kwargs)

Runs an rpm -Va on a system, and returns the results in a dict

Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the ignore_types keyword argument.

The root parameter can also be passed via the keyword argument.

**CLI Example:**

```
salt '*' pkg.verify httpd
salt '*' pkg.verify httpd postfix
salt '*' pkg.verify httpd postfix ignore_types=['config', 'doc']
```

salt.modules.zypperpkg.version(names,**kwargs)

Returns a string representing the package version or an empty dict if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

**root**  operate on a different root directory.

**CLI Example:**

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

salt.modules.zypperpkg.version_cmp(ver1, ver2, ignore_epoch=False,**kwargs)

New in version 2015.5.4.
Do a cmp-style comparison on two packages. Return -1 if ver1 < ver2, 0 if ver1 == ver2, and 1 if ver1 > ver2. Return None if there was a problem making the comparison.

ignore_epoch [False] Set to True to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

### 23.10 netapi modules

<table>
<thead>
<tr>
<th>rest_cherrypy</th>
<th>A script to start the CherryPy WSGI server</th>
</tr>
</thead>
<tbody>
<tr>
<td>rest_tornado</td>
<td></td>
</tr>
</tbody>
</table>

| rest_wsgi     | A minimalist REST API for Salt             |

### 23.10.1 rest_cherrypy

- **A REST API for Salt**
  - Authentication
  - Usage
  - Content negotiation
- **Performance Expectations and Recommended Usage**
  - Long-Running HTTP Connections
  - Timeouts
  - Best Practices
  - Performance Tuning
  - Future Plans
- **Deployment**
  - `salt-api` using the CherryPy server
  - Using a WSGI-compliant web server

A script to start the CherryPy WSGI server

This is run by `salt-api` and started in a multiprocess.
A REST API for Salt

Note: This module is Experimental on Windows platforms and supports limited configurations:

- doesn't support PAM authentication (i.e. external_auth: auto)
- doesn't support SSL (i.e. disable_ssl: True)

depends

- CherryPy Python module.
  
  Note: there is a known SSL traceback for CherryPy versions 3.2.5 through 3.7.x. Please use version 3.2.3 or the latest 10.x version instead.

optdepends

- ws4py Python module for websockets support.

client_libraries

- Java: https://github.com/SUSE/salt-netapi-client
- Python: https://github.com/saltstack/pepper

setup All steps below are performed on the machine running the Salt Master daemon. Configuration goes into the Master configuration file.

1. Install salt-api. (This step varies between OS and Linux distros. Some package systems have a split package, others include salt-api in the main Salt package. Ensure the salt-api --version output matches the salt --version output.)
2. Install CherryPy. (Read the version caveat in the section above.)

   Using a secure HTTPS connection is strongly recommended since Salt eauth authentication credentials will be sent over the wire.

   1. Install the PyOpenSSL package.
   2. Generate a self-signed certificate using the create_self_signed_cert() execution function.

```bash
salt-call --local tls.create_self_signed_cert
```

4. Edit the master config to create at least one external auth user or group following the full external auth instructions.
5. Edit the master config with the following production-ready example to enable the rest_cherrypy module. (Adjust cert paths as needed, or disable SSL (not recommended!).)

```yaml
rest_cherrypy:
  port: 8000
  ssl_crt: /etc/pki/tls/certs/localhost.crt
  ssl_key: /etc/pki/tls/certs/localhost.key
```

6. Restart the salt-master daemon.
7. Start the salt-api daemon.
configuration All available configuration options are detailed below. These settings configure the CherryPy HTTP server and do not apply when using an external server such as Apache or Nginx.

port  Required  The port for the webserver to listen on.

host  [0.0.0.0] The socket interface for the HTTP server to listen on.

debug  [False] Starts the web server in development mode. It will reload itself when the underlying code is changed and will output more debugging info.

log_access_file  Path to a file to write HTTP access logs.

log_error_file  Path to a file to write HTTP error logs.

ssl_crt  The path to a SSL certificate. (See below)

ssl_key  The path to the private key for your SSL certificate. (See below)

ssl_chain  (Optional when using PyOpenSSL) the certificate chain to pass to Context.

load_verify_locations  .

disable_ssl  A flag to disable SSL. Warning: your Salt authentication credentials will be sent in the clear!

webhook_disable_auth  [False] The Webhook URL requires authentication by default but external services cannot always be configured to send authentication. See the Webhook documentation for suggestions on securing this interface.

webhook_url  [/hook] Configure the URL endpoint for the Webhook entry point.

thread_pool  [100] The number of worker threads to start up in the pool.

socket_queue_size  [30] Specify the maximum number of HTTP connections to queue.

expire_responses  [True] Whether to check for and kill HTTP responses that have exceeded the default timeout.

    Deprecated since version 2016.11.9, 2017.7.3, 2018.3.0: The "expire_responses" configuration setting, which corresponds to the timeout_monitor setting in CherryPy, is no longer supported in CherryPy versions \geq 12.0.0.

max_request_body_size  [1048576] Maximum size for the HTTP request body.

collect_stats  [False] Collect and report statistics about the CherryPy server

    Reports are available via the Stats URL.

stats_disable_auth  [False] Do not require authentication to access the /stats endpoint.

    New in version 2018.3.0.

static  A filesystem path to static HTML/JavaScript/CSS/image assets.

static_path  [/static] The URL prefix to use when serving static assets out of the directory specified in the static setting.

enable_sessions  [True] Enable or disable all endpoints that rely on session cookies. This can be useful to enforce only header-based authentication.

    New in version 2017.7.0.
app [index.html] A filesystem path to an HTML file that will be served as a static file. This is useful for bootstrapping a single-page JavaScript app.

Warning! If you set this option to a custom web application, anything that uses cookie-based authentication is vulnerable to XSRF attacks. Send the custom X-Auth-Token header instead and consider disabling the enable_sessions setting.

Changed in version 2017.7.0: Add a proof-of-concept JavaScript single-page app.

app_path [/app] The URL prefix to use for serving the HTML file specified in the app setting. This should be a simple name containing no slashes.

Any path information after the specified path is ignored; this is useful for apps that utilize the HTML5 history API.

root_prefix [/] A URL path to the main entry point for the application. This is useful for serving multiple applications from the same URL.

Authentication

Authentication is performed by passing a session token with each request. Tokens are generated via the Login URL.

The token may be sent in one of two ways: as a custom header or as a session cookie. The latter is far more convenient for clients that support cookies.

- Include a custom header named X-Auth-Token.

For example, using curl:

```
curl -sSk https://localhost:8000/login \
  -H 'Accept: application/x-yaml' \
  -d username=saltdev \ 
  -d password=saltdev \ 
  -d eauth=pam
```

Copy the token value from the output and include it in subsequent requests:

```
curl -sSk https://localhost:8000 \
  -H 'Accept: application/x-yaml' \
  -H 'X-Auth-Token: 697adbdc8fe971d09ae4c2a3add7248859c87079' \
  -d client=local \ 
  -d tgt='*' \ 
  -d fun=test.ping
```

- Sent via a cookie. This option is a convenience for HTTP clients that automatically handle cookie support (such as browsers).

For example, using curl:

```
# Write the cookie file:
curl -sSk https://localhost:8000/login \
  -c ~/cookies.txt \
  -H 'Accept: application/x-yaml' \
  -d username=saltdev \ 
  -d password=saltdev \ 
  -d eauth=auto
```

```
# Read the cookie file:
```

(continues on next page)
curl -sSk https://localhost:8000 \
  -b ~/cookies.txt \
  -H 'Accept: application/x-yaml' \
  -d client=local \
  -d tgt='*' \
  -d fun=test.ping

Another example using the requests library in Python:

```python
>>> import requests
>>> session = requests.Session()
>>> session.post('http://localhost:8000/login', json={
    'username': 'saltdev',
    'password': 'saltdev',
    'eauth': 'auto',
})
<Response [200]>
>>> resp = session.post('http://localhost:8000', json=[{
    'client': 'local',
    'tgt': '*',
    'fun': 'test.arg',
    'arg': ['foo', 'bar'],
    'kwarg': {'baz': 'Baz!'},
}])
>>> resp.json()
{u'return': [{...snip...}]

See also:

You can bypass the session handling via the Run URL.

Usage

This interface directly exposes Salt's Python API. Everything possible at the CLI is possible through the Python API. Commands are executed on the Salt Master.

The root URL (/) is RPC-like in that it accepts instructions in the request body for what Salt functions to execute, and the response contains the result of those function calls.

For example:

```bash
% curl -sSi https://localhost:8000 -H 'Content-type: application/json' \
  -d '[[
      "client": "local",
      "tgt": ",",
      "fun": "test.ping"
    ]]'
HTTP/1.1 200 OK
Content-Type: application/json
[...snip...]
{"return": }[
  {"jerry": true}]
```

The request body must be an array of commands. Use this workflow to build a command:
1. Choose a client interface.
2. Choose a function.
3. Fill out the remaining parameters needed for the chosen client.

The `client` field is a reference to the main Python classes used in Salt's Python API. Read the full `Client APIs` documentation, but in short:

- "local" uses `LocalClient` which sends commands to Minions. Equivalent to the `salt` CLI command.
- "runner" uses `RunnerClient` which invokes runner modules on the Master. Equivalent to the `salt-run` CLI command.
- "wheel" uses `WheelClient` which invokes wheel modules on the Master. Wheel modules do not have a direct CLI equivalent but they typically manage Master-side resources such as state files, pillar files, the Salt config files, and the key wheel module exposes similar functionality as the `salt-key` CLI command.

Most clients have variants like synchronous or asynchronous execution as well as others like batch execution. See the full list of client interfaces.

Each client requires different arguments and sometimes has different syntax. For example, `LocalClient` requires the `tgt` argument because it forwards the command to Minions and the other client interfaces do not. `LocalClient` also takes `arg` (array) and `kwarg` (dictionary) arguments because these values are sent to the Minions and used to execute the requested function there. `RunnerClient` and `WheelClient` are executed directly on the Master and thus do not need or accept those arguments.

Read the method signatures in the client documentation linked above, but hopefully an example will help illustrate the concept. This example causes Salt to execute two functions -- the `test.arg` execution function using `LocalClient` and the `test.arg` runner function using `RunnerClient`; note the different structure for each command. The results for both are combined and returned as one response.

```bash
% curl -b ~/cookies.txt -sS localhost:8000 -H 'Content-type: application/json -d ' 
[ 
  { 
    "client": "local", 
    "tgt": "," ,
    "fun": "test.arg", 
    "arg": ["positional arg one", "positional arg two"], 
    "kwarg": { 
      "keyword arg one": "Hello from a minion", 
      "keyword arg two": "Hello again from a minion" 
    } 
  },
  { 
    "client": "runner", 
    "fun": "test.arg", 
    "keyword arg one": "Hello from a master", 
    "keyword arg two": "Runners do not support positional args" 
  }
]
HTTP/1.1 200 OK
[...snip...]
{ 
  "return": [ 
    { 
      "jerry": { 
        "args": [ 
```

(continues on next page)
One more example, this time with more commonly used functions:

```bash
curl -b /tmp/cookies.txt -sSi localhost:8000 -H 'Content-type: application/json' -d '
[
    {
        "client": "local",
        "tgt": ",",
        "fun": "state.sls",
        "kwarg": {
            "mods": "apache",
            "pillar": {
                "lookup": {
                    "wwwdir": "/srv/httpd/htdocs"
                }
            }
        }
    },
    {
        "client": "runner",
        "fun": "cloud.create",
        "provider": "my-ec2-provider",
        "instances": "my-centos-6",
        "image": "ami-1624987f",
        "delvol_on_destroy", true
    }
]
HTTP/1.1 200 OK
[...snip...]
```

(continues on next page)
Content negotiation

This REST interface is flexible in what data formats it will accept as well as what formats it will return (e.g., JSON, YAML, urlencoded).

- Specify the format of data in the request body by including the `Content-Type` header.
- Specify the desired data format for the response body with the `Accept` header.

We recommend the JSON format for most HTTP requests. urlencoded data is simple and cannot express complex data structures -- and that is often required for some Salt commands, such as starting a state run that uses Pillar data. Salt's CLI tool can reformat strings passed in at the CLI into complex data structures, and that behavior also works via salt-api, but that can be brittle and since salt-api can accept JSON it is best just to send JSON.

Here is an example of sending urlencoded data:

```
curl -sSik https://localhost:8000 \\
    -b ~/cookies.txt \\
    -d client=runner \\
    -d fun='jobs.lookup_jid' \\
    -d jid='20150129182456704682'
```

**urlencoded data caveats**

- Only a single command may be sent per HTTP request.
- Repeating the `arg` parameter multiple times will cause those parameters to be combined into a single list.

  Note, some popular frameworks and languages (notably jQuery, PHP, and Ruby on Rails) will automatically append empty brackets onto repeated query string parameters. E.g., `?foo[]=fooone&foo[]=footwo`. This is not supported; send `?foo=fooone&foo=footwo` instead, or send JSON or YAML.

A note about curl

The `-d` flag to curl does *not* automatically urlencode data which can affect passwords and other data that contains characters that must be encoded. Use the `--data-urlencode` flag instead. E.g.:

```
curl -ksi http://localhost:8000/login \
    -H "Accept: application/json" \
    -d username='myapiuser' \
    --data-urlencode password='1234+' \
    -d eauth='pam'
```
Performance Expectations and Recommended Usage

This module provides a thin wrapper around *Salt's Python API*. Executing a Salt command via rest_cherrypy is directly analogous to executing a Salt command via Salt’s CLI (which also uses the Python API) -- they share the same semantics, performance characteristics, and 98% of the same code. As a rule-of-thumb: if you wouldn’t do it at the CLI don’t do it via this API.

Long-Running HTTP Connections

The CherryPy server is a production-ready, threading HTTP server written in Python. Because it makes use of a thread pool to process HTTP requests it is not ideally suited to maintaining large numbers of concurrent, synchronous connections. On moderate hardware with default settings it should top-out at around 30 to 50 concurrent connections.

That number of long-running, synchronous Salt processes is also not ideal. Like at the CLI, each Salt command run will start a process that instantiates its own `LocalClient`, which instantiates its own listener to the Salt event bus, and sends out its own periodic `saltutil.find_job` queries to determine if a Minion is still running the command. Not exactly a lightweight operation.

Timeouts

In addition to the above resource overhead for long-running connections, there are the usual HTTP timeout semantics for the CherryPy server, any HTTP client being used, as well as any hardware in between such as proxies, gateways, or load balancers. `rest_cherrypy` can be configured not to time-out long responses via the `expire_responses` setting, and both `LocalClient` and `RunnerClient` have their own timeout parameters that may be passed as top-level keywords:

```bash
curl -b /tmp/cookies.txt -ssSi localhost:8000 -H 'Content-type: application/json' -d '
[
  {
    "client": "local",
    "tgt": "+",
    "fun": "test.sleep",
    "kwarg": {"length": 30},
    "timeout": 60
  },
  {
    "client": "runner",
    "fun": "test.sleep",
    "kwarg": {"s_time": 30},
    "timeout": 60
  }
]
'
```
Best Practices

Given the performance overhead and HTTP timeouts for long-running operations described above, the most effective and most scalable way to use both Salt and salt-api is to run commands asynchronously using the `local_async`, `runner_async`, and `wheel_async` clients.

Running asynchronous jobs results in being able to process 3x more commands per second for `LocalClient` and 17x more commands per second for `RunnerClient`, in addition to much less network traffic and memory requirements. Job returns can be fetched from Salt's job cache via the `/jobs/<jid>` endpoint, or they can be collected into a data store using Salt's `Returner` system.

The `/events` endpoint is specifically designed to handle long-running HTTP connections and it exposes Salt's event bus which includes job returns. Watching this endpoint first, then executing asynchronous Salt commands second, is the most lightweight and scalable way to use `rest_cherrypy` while still receiving job returns in real-time. But this requires clients that can properly handle the inherent asynchronicity of that workflow.

Performance Tuning

The `thread_pool` and `socket_queue_size` settings can be used to increase the capacity of `rest_cherrypy` to handle incoming requests. Keep an eye on RAM usage as well as available file handles while testing changes to these settings. As salt-api is a thin wrapper around Salt's Python API, also keep an eye on the performance of Salt when testing.

Future Plans

Now that Salt uses the Tornado concurrency library internally, we plan to improve performance in the API by taking advantage of existing processes and event listeners and to use lightweight coroutines to facilitate more simultaneous HTTP connections and better support for synchronous operations. That effort can be tracked in issue 26505, but until that issue is closed `rest_cherrypy` will remain the officially recommended REST API.

Deployment

The `rest_cherrypy` netapi module is a standard Python WSGI app. It can be deployed one of two ways.

**salt-api using the CherryPy server**

The default configuration is to run this module using `salt-api` to start the Python-based CherryPy server. This server is lightweight, multi-threaded, encrypted with SSL, and should be considered production-ready. See the section above for performance expectations.

**Using a WSGI-compliant web server**

This module may be deployed on any WSGI-compliant server such as Apache with mod_wsgi or Nginx with FastCGI, to name just two (there are many).

Note, external WSGI servers handle URLs, paths, and SSL certs directly. The `rest_cherrypy` configuration options are ignored and the `salt-api` daemon does not need to be running at all. Remember Salt authentication credentials are sent in the clear unless SSL is being enforced!

An example Apache virtual host configuration:
<VirtualHost *:80>
  ServerName example.com
  ServerAlias *.example.com

  ServerAdmin webmaster@example.com

  LogLevel warn
  ErrorLog /var/www/example.com/logs/error.log
  CustomLog /var/www/example.com/logs/access.log combined

  DocumentRoot /var/www/example.com/htdocs

  WSGIScriptAlias / /path/to/salt/netapi/rest_cherrypy/wsgi.py
</VirtualHost>

23.10.2 REST URI Reference

/

**class** salt.netapi.rest_cherrypy.app.LowDataAdapter
The primary entry point to Salt’s REST API

**GET**()
An explanation of the API with links of where to go next

**GET** /
Request Headers
- **Accept** -- the desired response format.

Status Codes
- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

Example request:

```
curl -i localhost:8000
```

Example response:

```
HTTP/1.1 200 OK
Content-Type: application/json
```

**POST**(**"kwargs")
Send one or more Salt commands in the request body

**POST** /
Request Headers
- **X-Auth-Token** -- a session token from **Login**.
- **Accept** -- the desired response format.
- **Content-Type** -- the format of the request body.

Response Headers
Content-Type -- the format of the response body; depends on the Accept request header.

Status Codes

- **200** -- success
- **400** -- bad or malformed request
- **401** -- authentication required
- **406** -- requested Content-Type not available

lowstate data describing Salt commands must be sent in the request body.

Example request:

```bash
curl -sSik https://localhost:8000 \
    -b ~/cookies.txt \
    -H "Accept: application/x-yaml" \
    -H "Content-type: application/json" \
    -d '[["client": "local", "tgt": ":*", "fun": "test.ping"]]'
```

POST / HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
X-Auth-Token: d40d1e1e
Content-Type: application/json

```
["client": "local", "tgt": ":*", "fun": "test.ping"]
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 200
Allow: GET, HEAD, POST
Content-Type: application/x-yaml

return:
- ms-0: true
- ms-1: true
- ms-2: true
- ms-3: true
- ms-4: true
```

/login

class salt.netapi.rest_cherrypy.app.Login(*args, **kwargs)

Log in to receive a session token

Authentication information.

GET()

Present the login interface

GET /login

An explanation of how to log in.

Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

Example request:
**POST(**\*kwargs\*)**

*Authenticate* against Salt's eauth system

**POST /login**

**Request Headers**
- `X-Auth-Token` -- a session token from `Login`.
- `Accept` -- the desired response format.
- `Content-Type` -- the format of the request body.

**Form Parameters**
- `eauth` -- the eauth backend configured for the user
- `username` -- username
- `password` -- password

**Status Codes**
- `200` -- success
- `401` -- authentication required
- `406` -- requested Content-Type not available

Example request:

```bash
curl -si localhost:8000/login
   -c ~/cookies.txt
   -H "Accept: application/json"
   -H "Content-type: application/json"
   -d '{
      "username": "saltuser",
      "password": "saltuser",
      "eauth": "auto"
   }'
```

Example response:

```
HTTP/1.1 200 OK
Content-Type: application/json
Content-Length: 206
X-Auth-Token: 6d1b722e
Set-Cookie: session_id=6d1b722e; expires=Sat, 17 Nov 2012 03:23:52 GMT;
Path=/
```

(continues on next page)
/logout

class salt.netapi.rest_cherrypy.app.Logout
Class to remove or invalidate sessions

POST()
Destroy the currently active session and expire the session cookie

/minions

class salt.netapi.rest_cherrypy.app.Minions
Convenience URLs for working with minions

GET(mid=None)
A convenience URL for getting lists of minions or getting minion details

GET /minions/(mid)
Request Headers
- X-Auth-Token -- a session token from Login.
- Accept -- the desired response format.

Status Codes
- 200 -- success
- 401 -- authentication required
- 406 -- requested Content-Type not available

Example request:

curl -i localhost:8000/minions/ms-3

Example response:

HTTP/1.1 200 OK
Content-Length: 129005
Content-Type: application/x-yaml
return:
- ms-3:
  grains.items:
  ...

**POST**(**kwargs**)
Start an execution command and immediately return the job id

**POST** /minions

Request Headers
- **X-Auth-Token** -- a session token from *Login*.
- **Accept** -- the desired response format.
- **Content-Type** -- the format of the request body.

Response Headers
- **Content-Type** -- the format of the response body; depends on the *Accept* request header.

Status Codes
- **200** -- success
- **400** -- bad or malformed request
- **401** -- authentication required
- **406** -- requested Content-Type not available

Lowstate data describing Salt commands must be sent in the request body. The *client* option will be set to *local_async()*.

Example request:
```
curl -sSi localhost:8000/minions \
  -b ~/cookies.txt \
  -H "Accept: application/x-yaml" \
  -d '[["tgt": "+", "fun": "status.diskusage"]]
```

```
POST /minions HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Type: application/json
tgt=*&fun=status.diskusage
```

Example response:
```
HTTP/1.1 202 Accepted
Content-Length: 86
Content-Type: application/x-yaml

return:
- jid: '20130603122505459265'
  minions: [ms-4, ms-3, ms-2, ms-1, ms-0]
  _links:
    jobs:
      - href: /jobs/20130603122505459265
```
/jobs

class salt.netapi.rest_cherrypy.app.Jobs

GET(\(jid\text{-}None, \text{timeout}\text{-}\text{"}\))
A convenience URL for getting lists of previously run jobs or getting the return from a single job

GET /jobs/ \((jid)\)
List jobs or show a single job from the job cache.

Request Headers

• X-Auth-Token -- a session token from Login.
• Accept -- the desired response format.

Status Codes

• 200 -- success
• 401 -- authentication required
• 406 -- requested Content-Type not available

Example request:

curl -i localhost:8000/jobs

curl -i localhost:8000/jobs HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml

Example response:

HTTP/1.1 200 OK
Content-Length: 165
Content-Type: application/x-yaml

return:
- '20121130104633606931':
  Arguments:
  - '3'
  Function: test.fib
  Target: jerry
  Target-type: glob

Example request:

curl -i localhost:8000/jobs/20121130104633606931

curl -i localhost:8000/jobs/20121130104633606931 HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml

Example response:

HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

info:
- Arguments:
Function: test.fib
Minions:
  - jerry
Target: '*'
Target-type: glob
User: saltdev
jid: '20121130104633606931'
return:
  - jerry:
    - - 0
    - - 1
    - - 1
    - - 2
    - 6.9141387939453125e-06

/run

class salt.netapi.rest_cherrypy.app.Run
Run commands bypassing the normal session handling.
salt-api does not enforce authorization, Salt's eauth system does that. Local/Runner/WheelClient all accept username/password/eauth or token kwargs that are then checked by the eauth system. The session mechanism in rest_cherrypy simply pairs a session with a Salt eauth token and then passes the token kwarg in automatically.
If you already have a Salt eauth token, perhaps generated by the mk_token function in the Auth Runner module, then there is no reason to use sessions.
This endpoint accepts either a username, password, eauth trio, or a token kwarg and does not make use of sessions at all.

POST(**kwargs)
Run commands bypassing the normal session handling. Otherwise, this URL is identical to the root URL (/).

POST /run
An array of lowstate data describing Salt commands must be sent in the request body.

Status Codes
- **200** -- success
- **400** -- bad or malformed request
- **401** -- authentication required
- **406** -- requested Content-Type not available

Example request:
curl -sS localhost:8000/run \
  -H 'Accept: application/x-yaml' \
  -H 'Content-type: application/json' \
  -d ']{
    "client": "local",
    "tgt": "*",
    "fun": "test.ping",
    "username": "saltdev",
    "password": "saltdev";
"eauth": "auto"
]
]

Or using a Salt Eauth token:

curl -sS localhost:8000/run \
  -H 'Accept: application/x-yaml' \
  -H 'Content-type: application/json' \
  -d '[
      "client": "local",
      "tgt": "*",
      "fun": "test.ping",
      "token": "<salt eauth token here>"
    ]'

Example response:

HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

to return:
- ms-0: true
- ms-1: true
- ms-2: true
- ms-3: true
- ms-4: true

The /run endpoint can also be used to issue commands using the salt-ssh subsystem. When using salt-ssh, eauth credentials must also be supplied, and are subject to eauth access-control lists.

All SSH client requests are synchronous.

Example SSH client request:

curl -sS localhost:8000/run \
  -H 'Accept: application/x-yaml' \
  -H 'Content-type: application/json' \
  -d client='ssh' \ 
  -d tgt='*' \ 
  -d username='saltdev' \ 
  -d password='saltdev' \ 
  -d eauth='auto' \ 
  -d fun='test.ping'

POST /run HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml

(continues on next page)
Example SSH response:

```
return:
  - silver:
    _stamp: '2020-09-08T23:04:28.912609'
    fun: test.ping
    fun_args: []
    id: silver
    jid: '20200908230427905565'
    retcode: 0
  return: true
```

/events

class salt.netapi.rest_cherrypy.app.Events
Exposé the Salt event bus

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the
master and also when minions ultimately return their results. This URL provides a real-time window into a
running Salt infrastructure.

See also:

Events & Reactor

GET (token=None, salt_token=None)
An HTTP stream of the Salt master event bus

This stream is formatted per the Server Sent Events (SSE) spec. Each event is formatted as JSON.

GET /events

Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

Query Parameters

- **token** -- **optional** parameter containing the token ordinarily supplied
via the X-Auth-Token header in order to allow cross-domain requests in
browsers that do not include CORS support in the EventSource API. E.g.,
curl -NsS localhost:8000/events?token=308650d
- **salt_token** -- **optional** parameter containing a raw Salt eauth
token (not to be confused with the token returned from the
/login URL). E.g., curl -NsS localhost:8000/events?
salt_token=30742765

Example request:
curl -NsS localhost:8000/events

Example response:
Note, the `tag` field is not part of the spec. SSE compliant clients should ignore unknown fields. This addition allows non-compliant clients to only watch for certain tags without having to deserialize the JSON object each time.

```
HTTP/1.1 200 OK
Connection: keep-alive
Cache-Control: no-cache
Content-Type: text/event-stream;charset=utf-8
retry: 400
tag: salt/job/20130802115730568475/new
data: {'tag': 'salt/job/20130802115730568475/new', 'data': {'minions': ['ms-4', 'ms-3', 'ms-2', 'ms-1', 'ms-0']}}
tag: salt/job/20130802115730568475/ret/jerry
data: {'tag': 'salt/job/20130802115730568475/ret/jerry', 'data': {'jid': '20130802115730568475', 'return': True, 'retcode': 0, 'success': True, 'cmd': '_return', 'fun': 'test.ping', 'id': 'ms-1'}}
```

The event stream can be easily consumed via JavaScript:

```javascript
var source = new EventSource('/events');
source.onopen = function() { console.info('Listening ...') }
source.onerror = function(err) { console.error(err) }
source.onmessage = function(message) {
    var saltEvent = JSON.parse(message.data);
    console.log(saltEvent.tag, saltEvent.data);
};
```

Note, the SSE stream is fast and completely asynchronous and Salt is very fast. If a job is created using a regular POST request, it is possible that the job return will be available on the SSE stream before the response for the POST request arrives. It is important to take that asynchronicity into account when designing an application. Below are some general guidelines.

- Subscribe to the SSE stream _before_ creating any events.
- Process SSE events directly as they arrive and don’t wait for any other process to "complete" first (like an ajax request).
- Keep a buffer of events if the event stream must be used for synchronous lookups.
- Be cautious in writing Salt’s event stream directly to the DOM. It is very busy and can quickly overwhelm the memory allocated to a browser tab.

A full, working proof-of-concept JavaScript application is available adjacent to this file. It can be viewed by pointing a browser at the `/app` endpoint in a running `rest_cherrypy` instance.

Or using CORS:

```javascript
var source = new EventSource('/events?' +
    token=ecd589e4e81912cf3c035afad73426dbb8dba75', {withCredentials: true});
```

It is also possible to consume the stream via the shell.

Records are separated by blank lines; the `data:` and `tag:` prefixes will need to be removed manually before attempting to unserialize the JSON.

`curl`’s `-N` flag turns off input buffering which is required to process the stream incrementally.

Here is a basic example of printing each event as it comes in:
curl -Ns localhost:8000/events |
  while IFS= read -r line ; do
echo $line
done

Here is an example of using awk to filter events based on tag:

curl -Ns localhost:8000/events |
  awk 'BEGIN { RS=""; FS="\n" }
$1 ~ /^tag: salt\//{ print $0 }

{
  "tag": "salt\//[0-9]+/new",
  "data": {
    "tgt_type": "glob",
    "jid": "20140112010149808995",
    "return": true,
    "retcode": 0,
    "success": true,
    "cmd": "test.ping",
    "id": "jerry"
  }
}

/hook

class salt.netapi.rest_cherrypy.app.Webhook

A generic web hook entry point that fires an event on Salt's event bus

External services can POST data to this URL to trigger an event in Salt. For example, Amazon SNS, Jenkins-CI or Travis-CI, or GitHub web hooks.

Note: Be mindful of security

Salt's Reactor can run any code. A Reactor SLS that responds to a hook event is responsible for validating that the event came from a trusted source and contains valid data.

This is a generic interface and securing it is up to you!

This URL requires authentication however not all external services can be configured to authenticate. For this reason authentication can be selectively disabled for this URL. Follow best practices -- always use SSL, pass a secret key, configure the firewall to only allow traffic from a known source, etc.

The event data is taken from the request body. The Content-Type header is respected for the payload.

The event tag is prefixed with salt/netapi/hook and the URL path is appended to the end. For example, a POST request sent to /hook/mycompany/myapp/mydata will produce a Salt event with the tag salt/netapi/hook/mycompany/myapp/mydata.

The following is an example .travis.yml file to send notifications to Salt of successful test runs:

```
language: python
script: python -m unittest tests
after_success:
  - |
    curl -sSk https://saltapi-url.example.com:8000/hook/travis/build/success
    --user "$USER"
    --password "$PASS"
    --data "branch>${TRAVIS_BRANCH}"
    --data "commit">${TRAVIS_COMMIT}
```
See also:

*Events & Reactor, reactor*

**POST** (*args, **kwargs*)

Fire an event in Salt with a custom event tag and data

**POST /hook**

Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available
- **413** -- request body is too large

Example request:

```
curl -sS localhost:8000/hook \
   -H 'Content-type: application/json' \
   -d '{"foo": "Foo!", "bar": "Bar!"}'
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 14
Content-Type: application/json

{"success": true}
```

As a practical example, an internal continuous-integration build server could send an HTTP POST request to the URL `https://localhost:8000/hook/mycompany/build/success` which contains the result of a build and the SHA of the version that was built as JSON. That would then produce the following event in Salt that could be used to kick off a deployment via Salt's Reactor:

```
Event fired at Fri Feb 14 17:40:11 2014

Tag: salt/netapi/hook/mycompany/build/success
Data:
{'_stamp': '2014-02-14_17:40:11.440996',
 'headers': {
   'X-My-Secret-Key': 'F0f4GoQjIT@W',
   'Content-Length': '37',
   'Content-Type': 'application/json',
   'Host': 'localhost:8000',
   'Remote-Addr': '127.0.0.1'},
 'post': {'revision': 'aa22a3c4b2e7', 'result': True}}
```

Salt's Reactor could listen for the event:
reactor:
- 'salt/netapi/hook/mycompany/build/*':
- /srv/reactor/react_ci_builds.sls

And finally deploy the new build:

{% set secret_key = data.get('headers', {}).get('X-My-Secret-Key') %}
{% set build = data.get('post', {}) %}

{% if secret_key == 'F0fAg0QjIT@W' and build.result == True %}
deploy_my_app:
  cmd.state.sls:
    - tgt: 'application*'
    - arg:
      - myapp.deploy
    - kwarg:
      pillar:
        revision: '{{ revision }}'
{% endif %}

/keys

class salt.netapi.rest_cherrypy.app.Keys
Convenience URLs for working with minion keys

New in version 2014.7.0.

These URLs wrap the functionality provided by the *key wheel module* functions.

**GET** *(mid=None)*

Show the list of minion keys or detail on a specific key

New in version 2014.7.0.

**GET** /keys/**(mid)**

List all keys or show a specific key

Request Headers

- **X-Auth-Token** -- a session token from *Login*.
- **Accept** -- the desired response format.

Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

Example request:

curl -i localhost:8000/keys

GET /keys HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml

Example response:

HTTP/1.1 200 OK
Content-Length: 165
Content-Type: application/x-yaml

(continues on next page)
return:
  local:
  - master.pem
  - master.pub
  minions:
  - jerry
  minions_pre: []
  minions_rejected: []

Example request:

```
curl -i localhost:8000/keys/jerry
```

GET /keys/jerry HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml

Example response:

```
HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

return:
  minions:
```

**POST(**`**kwargs**)

Easily generate keys for a minion and auto-accept the new key

Accepts all the same parameters as the `key.gen_accept`

**Note:** A note about `curl` Avoid using the `-i` flag or HTTP headers will be written and produce an invalid tar file.

Example partial kickstart script to bootstrap a new minion:

```
%post
  mkdir -p /etc/salt/pki/minion
  curl -sSk https://localhost:8000/keys \
  -d mid=jerry \ 
  -d username=kickstart \ 
  -d password=kickstart \ 
  -d eauth=pam \ 
  | tar -C /etc/salt/pki/minion -xf -

  mkdir -p /etc/salt/minion.d
  printf 'master: 10.0.0.5\nid: jerry' > /etc/salt/minion.d/id.conf

%end
```

**POST /keys**

Generate a public and private key and return both as a tarball

Authentication credentials must be passed in the request.

**Status Codes**
Example request:

```bash
curl -sSk https://localhost:8000/keys \
  -d mid=jerry \
  -d username=kickstart \
  -d password=kickstart \
  -d eauth=pam \
  -o jerry-salt-keys.tar
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 10240
Content-Disposition: attachment; filename="saltkeys-jerry.tar"
Content-Type: application/x-tar

jerry.pub0000644000000000000000000000000007030000000000000010730 0ustar

```

```python
class salt.netapi.rest_cherrypy.app.WebsocketEndpoint
    Open a WebSocket connection to Salt's event bus

    The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure. Uses websocket as the transport mechanism.

    See also:

    Events & Reactor

    GET (token=None, **kwargs)
        Return a websocket connection of Salt's event stream

        GET /ws/ (token)

        Query format_events The event stream will undergo server-side formatting if the format_events URL parameter is included in the request. This can be useful to avoid formatting on the client-side:

        curl -NsS <...snip...> localhost:8000/ws?format_events

        Reqheader X-Auth-Token an authentication token from Login.
        Status 101 switching to the websockets protocol
        Status 401 authentication required
        Status 406 requested Content-Type not available

    Example request:
```
curl -NsSk \
-H 'X-Auth-Token: ffedf49d' \
-H 'Host: localhost:8000' \
-H 'Connection: Upgrade' \
-H 'Upgrade: websocket' \
-H 'Origin: https://localhost:8000' \
-H 'Sec-WebSocket-Version: 13' \
-H 'Sec-WebSocket-Key: \\
  "$(echo -n $RANDOM | base64)" \
localhost:8000/ws

GET /ws HTTP/1.1
Connection: Upgrade
Upgrade: websocket
Host: localhost:8000
Origin: https://localhost:8000
Sec-WebSocket-Version: 13
Sec-WebSocket-Key: s65VsgHigh7v/Jcf4nXHnA==
X-Auth-Token: ffedf49d

Example response:

HTTP/1.1 101 Switching Protocols
Upgrade: websocket
Connection: Upgrade
Sec-WebSocket-Accept: mWZjBV9FCglzn1rIKJAxrTFlnJE=
Sec-WebSocket-Version: 13

An authentication token may optionally be passed as part of the URL for browsers that cannot be configured to send the authentication header or cookie:

curl -NsS <...snip...> localhost:8000/ws/ffedf49d

The event stream can be easily consumed via JavaScript:

```
// Note, you must be authenticated!
var source = new WebSocket('ws://localhost:8000/ws/d0ce6c1a');
source.onerror = function(e) { console.debug('error!', e); };  
source.onmessage = function(e) { console.debug(e.data); };  

source.send('websocket client ready')
source.close();
```

Or via Python, using the Python module websocket-client for example.

```
# Note, you must be authenticated!

from websocket import create_connection

ws = create_connection('ws://localhost:8000/ws/d0ce6c1a')
ws.send('websocket client ready')

# Look at https://pypi.python.org/pypi/websocket-client/ for more examples.
while listening_to_events:
    print ws.recv()
```

(continues on next page)
Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt's event stream by signaling websocket client ready.

/stats

class salt.netapi.rest_cherrypy.app.Stats
Expose statistics on the running CherryPy server

GET()
Return a dump of statistics collected from the CherryPy server

GET /stats
Request Headers
- X-Auth-Token -- a session token from Login.
- Accept -- the desired response format.
Response Headers
- Content-Type -- the format of the response body; depends on the Accept request header.
Status Codes
- 200 -- success
- 401 -- authentication required
- 406 -- requested Content-Type not available

23.10.3 rest_tornado

A non-blocking REST API for Salt

depends
- tornado Python module

configuration All authentication is done through Salt’s external auth system which requires additional configuration not described here.

In order to run rest_tornado with the salt-master add the following to the Salt master config file.

```
rest_tornado:
# can be any port
port: 8000
# address to bind to (defaults to 0.0.0.0)
address: 0.0.0.0
# socket backlog
backlog: 128
ssl_crt: /etc/pki/api/certs/server.crt
# no need to specify ssl_key if cert and key are in one single file
ssl_key: /etc/pki/api/certs/server.key
# debug: False
disable_ssl: False
webhook_disable_auth: False
cors_origin: null
```
Authentication

Authentication is performed by passing a session token with each request. Tokens are generated via the SaltAuthHandler URL.

The token may be sent in one of two ways:

- Include a custom header named X-Auth-Token.
- Sent via a cookie. This option is a convenience for HTTP clients that automatically handle cookie support (such as browsers).

See also:
You can bypass the session handling via the RunSaltAPIHandler URL.

CORS

rest_tornado supports Cross-site HTTP requests out of the box. It is by default deactivated and controlled by the cors_origin config key.

You can allow all origins by settings cors_origin to *.

You can allow only one origin with this configuration:

```
rest_tornado:
    cors_origin: http://salt.yourcompany.com
```

You can also be more specific and select only a few allowed origins by using a list. For example:

```
rest_tornado:
    cors_origin:
        - http://salt.yourcompany.com
        - http://salt-preprod.yourcompany.com
```

The format for origin are full URL, with both scheme and port if not standard.

In this case, rest_tornado will check if the Origin header is in the allowed list if it's the case allow the origin. Else it will returns nothing, effectively preventing the origin to make request.

For reference, CORS is a mechanism used by browser to allow (or disallow) requests made from browser from a different origin than salt-api. It's complementary to Authentication and mandatory only if you plan to use a salt client developed as a Javascript browser application.

Usage

Commands are sent to a running Salt master via this module by sending HTTP requests to the URLs detailed below.

Content negotiation

This REST interface is flexible in what data formats it will accept as well as what formats it will return (e.g., JSON, YAML, x-www-form-urlencoded).

- Specify the format of data in the request body by including the Content-Type header.
- Specify the desired data format for the response body with the Accept header.
Data sent in POST and PUT requests must be in the format of a list of lowstate dictionaries. This allows multiple commands to be executed in a single HTTP request.

**lowstate** A dictionary containing various keys that instruct Salt which command to run, where that command lives, any parameters for that command, any authentication credentials, what returner to use, etc.

Salt uses the lowstate data format internally in many places to pass command data between functions. Salt also uses lowstate for the `LocalClient()` Python API interface.

The following example (in JSON format) causes Salt to execute two commands:

```json
[{
  "client": "local",
  "tgt": "*",
  "fun": "test.fib",
  "arg": ["10"]
},
{
  "client": "runner",
  "fun": "jobs.lookup_jid",
  "jid": "20130603122505459265"
}]
```

Multiple commands in a Salt API request will be executed in serial and makes no guarantees that all commands will run. Meaning that if `test.fib` (from the example above) had an exception, the API would still execute `jobs.lookup_jid`.

Responses to these lowstates are an in-order list of dicts containing the return data, a yaml response could look like:

```
- ms-1: true
- ms-2: true
- ms-1: foo
- ms-2: bar
```

In the event of an exception while executing a command the return for that lowstate will be a string, for example if no minions matched the first lowstate we would get a return like:

```
- No minions matched the target. No command was sent, no jid was assigned.
- ms-1: true
- ms-2: true
```

**x-www-form-urlencoded**

Sending JSON or YAML in the request body is simple and most flexible, however sending data in urlencoded format is also supported with the caveats below. It is the default format for HTML forms, many JavaScript libraries, and the `curl` command.

For example, the equivalent to running `salt '*' test.ping` is sending `fun=test.ping&arg&client=local&tgt=*& in the HTTP request body.

**Caveats:**

- Only a single command may be sent per HTTP request.

- Repeating the `arg` parameter multiple times will cause those parameters to be combined into a single list.

  Note, some popular frameworks and languages (notably jQuery, PHP, and Ruby on Rails) will automatically append empty brackets onto repeated parameters. E.g., `arg=one, arg=two` will be sent as `arg[]=one, arg[]=two`. This is not supported; send JSON or YAML instead.
A Websockets add-on to saltnado

depends

- tornado Python module

In order to enable saltnado_websockets you must add websockets: True to your saltnado config block.

```
rest_tornado:
  # can be any port
  port: 8000
  ssl_crt: /etc/pki/api/certs/server.crt
  # no need to specify ssl_key if cert and key
  # are in one single file
  ssl_key: /etc/pki/api/certs/server.key
  debug: False
  disable_ssl: False
  websockets: True
```

All Events

Exposes all "real-time" events from Salt's event bus on a websocket connection. It should be noted that "Real-time" here means these events are made available to the server as soon as any salt related action (changes to minions, new jobs etc) happens. Clients are however assumed to be able to tolerate any network transport related latencies. Functionality provided by this endpoint is similar to the /events end point.

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure. Uses websocket as the transport mechanism.

Exposes GET method to return websocket connections. All requests should include an auth token. A way to obtain obtain authentication tokens is shown below.

```
% curl -si localhost:8000/login
  -H "Accept: application/json"
  -d username='salt'
  -d password='salt'
  -d eauth='pam'
```

Which results in the response

```
{
  "return": [
    {"perms": [".*", "@runner", "@wheel"],
     "start": 1400556492.277421,
     "token": "d0ce6c1a37e99d03e074392f272fe19c00990cca7",
     "expire": 1400599692.277422,
     "user": "salt",
     "eauth": "pam"
    ]
  ]
}
```

In this example the token returned is d0ce6c1a37e99d03e074392f272fe19c00990cca7 and can be included in subsequent websocket requests (as part of the URL).

The event stream can be easily consumed via JavaScript:
// Note, you must be authenticated!

// Get the Websocket connection to Salt
var source = new WebSocket('wss://localhost:8000/all_events/
  d0ce6c1a37e99dccc0374392f272fe19c0090cca7');

// Get Salt's "real time" event stream.
source.onopen = function() { source.send('websocket client ready'); }

// Other handlers
source.onerror = function(e) { console.debug('error!', e); }

// e.data represents Salt's "real time" event data as serialized JSON.
source.onmessage = function(e) { console.debug(e.data); }

// Terminates websocket connection and Salt's "real time" event stream on the server.
source.close();

Or via Python, using the Python module websocket-client for example. Or the tornado client.

# Note, you must be authenticated!

from websocket import create_connection

# Get the Websocket connection to Salt
ws = create_connection('wss://localhost:8000/all_events/
  d0ce6c1a37e99dccc0374392f272fe19c0090cca7')

# Get Salt's "real time" event stream.
ws.send('websocket client ready')

# Simple listener to print results of Salt's "real time" event stream.
# Look at https://pypi.python.org/pypi/websocket-client/ for more examples.
while listening_to_events:
  print ws.recv() # Salt's "real time" event data as serialized JSON.

# Terminates websocket connection and Salt's "real time" event stream on the server.
ws.close()

# Please refer to https://github.com/liris.websocket-client/issues/81 when using a self signed cert

Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt's event stream by signaling websocket client ready.

**Formatted Events**

Exposes formatted "real-time" events from Salt's event bus on a websocket connection. It should be noted that "Real-time" here means these events are made available to the server as soon as any salt related action (changes to minions, new jobs etc) happens. Clients are however assumed to be able to tolerate any network transport related latencies. Functionality provided by this endpoint is similar to the /events end point.

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure. Uses websocket as the transport mechanism.
Formatted events parses the raw "real time" event stream and maintains a current view of the following:

- minions
- jobs

A change to the minions (such as addition, removal of keys or connection drops) or jobs is processed and clients are updated. Since we use Salt's presence events to track minions, please enable `presence_events` and set a small value for the `loop_interval` in the Salt master config file.

Exposes GET method to return websocket connections. All requests should include an auth token. A way to obtain authentication tokens is shown below.

```bash
% curl -si localhost:8000/login
   -H "Accept: application/json"
   -d username='salt'
   -d password='salt'
   -d eauth='pam'
```

Which results in the response

```
{
   "return": [{
      "perms": [".*", "@runner", "@wheel"],
      "start": 1400556492.277421,
      "token": "d0ce6c1a37e99dcc0374392f272fe19c0090cca7",
      "expire": 1400599692.277422,
      "user": "salt",
      "eauth": "pam"
   }]
}
```

In this example the token returned is d0ce6c1a37e99dcc0374392f272fe19c0090cca7 and can be included in subsequent websocket requests (as part of the URL).

The event stream can be easily consumed via JavaScript:

```javascript
// Note, you must be authenticated!

// Get the Websocket connection to Salt
var source = new WebSocket('wss://localhost:8000/formatted_events/
   d0ce6c1a37e99dcc0374392f272fe19c0090cca7');

// Get Salt's "real time" event stream.
source.onopen = function() { source.send('websocket client ready'); };

// Other handlers
source.onerror = function(e) { console.debug('error!', e); };

// e.data represents Salt's "real time" event data as serialized JSON.
source.onmessage = function(e) { console.debug(e.data); };

// Terminates websocket connection and Salt's "real time" event stream on the server.
source.close();
```

Or via Python, using the Python module `websocket-client` for example. Or the tornado `client`.

```python
# Note, you must be authenticated!
```

(continues on next page)
from websocket import create_connection

# Get the Websocket connection to Salt
ws = create_connection('wss://localhost:8000/formatted_events/
--d0ce6c1a37e99dce0374392f272fe19c0090cca7')

# Get Salt's "real time" event stream.
ws.send('websocket client ready')

# Simple listener to print results of Salt's "real time" event stream.
# Look at https://pypi.python.org/pypi/websocket-client/ for more examples.
while listening_to_events:
    print ws.recv()  # Salt's "real time" event data as serialized JSON.

# Terminates websocket connection and Salt's "real time" event stream on the server.
ws.close()

# Please refer to https://github.com/liris/websocket-client/issues/81 when using a
→ self signed cert

Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt's
event stream by signaling websocket client ready.

Example responses

Minion information is a dictionary keyed by each connected minion's id (mid), grains information for each
minion is also included.

Minion information is sent in response to the following minion events:

- connection drops
  - requires running manage.present periodically every loop_interval seconds
- minion addition
- minion removal

# Not all grains are shown
data: {
    "minions": {
        "minion1": {
            "id": "minion1",
            "grains": {
                "kernel": "Darwin",
                "domain": "local",
                "zmqversion": "4.0.3",
                "kernelrelease": "13.2.0"
            }
        }
    }
}

Job information is also tracked and delivered.

Job information is also a dictionary in which each job's information is keyed by salt's jid.
data: {
    "jobs": {
        "20140609153646699137": {
            "tgt_type": "glob",
            "jid": "20140609153646699137",
            "tgt": "+",
            "start_time": "2014-06-09T15:36:46.700315",
            "state": "complete",
            "fun": "test.ping",
            "minions": {
                "minion1": {
                    "return": true,
                    "retcode": 0,
                    "success": true
                }
            }
        }
    }
}

Setup

23.10.4 REST URI Reference

```
class salt.netapi.rest_tornado.saltnado.SaltAPIHandler(application, **kwargs)

Main API handler for base "/"

disbatch()
  Disbatch all lowstates to the appropriate clients
get()
  An endpoint to determine salt-api capabilities

GET /

Request Headers
  * Accept -- the desired response format.

Status Codes
  * 200 -- success
  * 401 -- authentication required
```
• **406** -- requested Content-Type not available

Example request:

```
curl -i localhost:8000
```

Example response:

```
GET / HTTP/1.1
Host: localhost:8000
Accept: application/json

HTTP/1.1 200 OK
Content-Type: application/json
Content-Length: 83

{"clients": ["local", "local_async", "runner", "runner_async"], "return":
  →"Welcome"}
```

**post()**

Send one or more Salt commands (lowstates) in the request body

**POST /**

- **Request Headers**
  - **X-Auth-Token** -- a session token from `SaltAuthHandler`
  - **Accept** -- the desired response format.
  - **Content-Type** -- the format of the request body.

- **Response Headers**
  - **Content-Type** -- the format of the response body; depends on the
    `Accept` request header.

- **Status Codes**
  - **200** -- success
  - **401** -- authentication required
  - **406** -- requested Content-Type not available

*lowstate* data describing Salt commands must be sent in the request body.

Example request:

```
curl -si https://localhost:8000
  -H "Accept: application/x-yaml"
  -H "X-Auth-Token: d40d1e1e"
  -d client=local
  -d tgt='*'
  -d fun='test.ping'
  -d arg
```

Example response:

```
POST / HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
X-Auth-Token: d40d1e1e
Content-Length: 36
Content-Type: application/x-www-form-urlencoded

fun=test.ping&arg&client=local&tgt=*```
Responses are an in-order list of the lowstate's return data. In the event of an exception running a command the return will be a string instead of a mapping.

```
HTTP/1.1 200 OK
Content-Length: 200
Allow: GET, HEAD, POST
Content-Type: application/x-yaml

return:
- ms-0: true
- ms-1: true
- ms-2: true
- ms-3: true
- ms-4: true
```

multiple commands

Note that if multiple lowstate structures are sent, the Salt API will execute them in serial, and will not stop execution upon failure of a previous job. If you need to have commands executed in order and stop on failure please use compound-command-execution.

/\login

```python
class salt.netapi.rest_tornado.saltnado.SaltAuthHandler(application, request, **kwargs)

Handler for login requests

get()

All logins are done over post, this is a parked endpoint

GET /login

Status Codes

- 401 -- authentication required
- 406 -- requested Content-Type not available

Example request:

curl -i localhost:8000/login

GET /login HTTP/1.1
Host: localhost:8000
Accept: application/json

Example response:

HTTP/1.1 401 Unauthorized
Content-Type: application/json
Content-Length: 58

{"status": "401 Unauthorized", "return": "Please log in"}
```

post()

Authenticate against Salt's eauth system

```
POST /login

Request Headers
```
- **X-Auth-Token** -- a session token from `SaltAuthHandler`.
- **Accept** -- the desired response format.
- **Content-Type** -- the format of the request body.

**Form Parameters**
- **eauth** -- the eauth backend configured for the user
- **username** -- username
- **password** -- password

**Status Codes**
- **200** -- success
- **400** -- bad request
- **401** -- authentication required
- **406** -- requested Content-Type not available
- **500** -- internal server error

**Example request:**

```
curl -si localhost:8000/login
   -H "Accept: application/json"
   -d username='saltuser'
   -d password='saltpass'
   -d eauth='pam'
```

**Example response:**

```
POST / HTTP/1.1
Host: localhost:8000
Content-Length: 42
Content-Type: application/x-www-form-urlencoded
Accept: application/json
username=saltuser&password=saltpass&eauth=pam

HTTP/1.1 200 OK
Content-Type: application/json
Content-Length: 206
X-Auth-Token: 6d1b722e
Set-Cookie: session_id=6d1b722e; expires=Sat, 17 Nov 2012 03:23:52 GMT;
Path=/

{"return": {
    "token": "6d1b722e",
    "start": 1363805943.776223,
    "expire": 1363849143.776224,
    "user": "saltuser",
    "eauth": "pam",
    "perms": [
      "grains.*",
      "status.*",
      "sys.*",
      "test.*"
    ]
}}
```
/minions

```python
class salt.netapi.rest_tornado.saltnado.MinionSaltAPIHandler(application, request, **kwargs)
```

A convenience endpoint for minion related functions

### get(mid=None)

A convenience URL for getting lists of minions or getting minion details

```bash
GET /minions/ (mid)
```

**Request Headers**

- **X-Auth-Token** -- a session token from `SaltAuthHandler`
- **Accept** -- the desired response format.

**Status Codes**

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

**Example request:**

```bash
curl -i localhost:8000/minions/ms-3
```

**Example response:**

```bash
GET /minions/ms-3 HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml

HTTP/1.1 200 OK
Content-Length: 129005
Content-Type: application/x-yaml

return:
- ms-3:
  grains.items:
    ...
```

### post()

Start an execution command and immediately return the job id

```bash
POST /minions
```

**Request Headers**

- **X-Auth-Token** -- a session token from `SaltAuthHandler`
- **Accept** -- the desired response format
- **Content-Type** -- the format of the request body

**Response Headers**

- **Content-Type** -- the format of the response body; depends on the `Accept` request header

**Status Codes**

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

`lowstate` data describing Salt commands must be sent in the request body. The `client` option will be set to `local_async()`.

**Example request:**
curl -sSi localhost:8000/minions \
   -H "Accept: application/x-yaml" \
   -d tgt='*' \
   -d fun='status.diskusage'

POST /minions HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Length: 26
Content-Type: application/x-www-form-urlencoded
tgt=*&fun=status.diskusage

Example response:
HTTP/1.1 202 Accepted
Content-Length: 86
Content-Type: application/x-yaml

return:
- jid: '20130603122505459265'
  minions: [ms-4, ms-3, ms-2, ms-1, ms-0]

/jobs

class salt.netapi.rest_tornado.saltnado.JobsSaltAPIHandler(application, request, **kwargs)

A convenience endpoint for job cache data

get(jid=None)
A convenience URL for getting lists of previously run jobs or getting the return from a single job

GET /jobs/(jid)
List jobs or show a single job from the job cache.

Status Codes
- 200 -- success
- 401 -- authentication required
- 406 -- requested Content-Type not available

Example request:
curl -i localhost:8000/jobs

GET /jobs HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml

Example response:
HTTP/1.1 200 OK
Content-Length: 165
Content-Type: application/x-yaml

return:
- '20121130104633606931':

(continues on next page)
Arguments:
- '3'
Function: test.fib
Target: jerry
Target-type: glob

Example request:

curl -i localhost:8000/jobs/20121130104633606931

GET /jobs/20121130104633606931 HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml

Example response:

HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

info:
- Arguments:
  - '3'
  Function: test.fib
Minions:
- jerry
Target: '*'
Target-type: glob
User: saltdev
jid: '20121130104633606931'
return:
- jerry:
  - - 0
  - 1
  - 1
  - 2
  - 6.9141387939453125e-06

/run

class salt.netapi.rest_tornado.saltnado.RunSaltAPIHandler(application, request, **kwargs):

    Endpoint to run commands without normal session handling

    post()
    Run commands bypassing the normal session handling

    POST /run
    This entry point is primarily for "one-off" commands. Each request must pass full Salt authentication credentials. Otherwise this URL is identical to the root URL (/).

    lowstate data describing Salt commands must be sent in the request body.

    Status Codes
    • 200 -- success
Example request:

curl -sS localhost:8000/run \
  -H 'Accept: application/x-yaml' \
  -d client='local' \
  -d tgt='*' \
  -d fun='test.ping' \
  -d username='saltdev' \
  -d password='saltdev' \
  -d eauth='pam'

POST /run HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Length: 75
Content-Type: application/x-www-form-urlencoded
client=local&tgt=*&fun=test.ping&username=saltdev&password=saltdev&eauth=pam

Example response:

HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

return:
  - ms-0: true
    ms-1: true
    ms-2: true
    ms-3: true
    ms-4: true

/events

class salt.netapi.rest_tornado.saltnado.EventsSaltAPIHandler(application, request, **kwargs)

Expose the Salt event bus

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure.

See also:

Events & Reactor

get()

An HTTP stream of the Salt master event bus

This stream is formatted per the Server Sent Events (SSE) spec. Each event is formatted as JSON.

GET /events

Status Codes

- 200 -- success
- 401 -- authentication required
- 406 -- requested Content-Type not available
Example request:

```bash
curl -NsS localhost:8000/events
```

GET /events HTTP/1.1
Host: localhost:8000

Example response:

```http
HTTP/1.1 200 OK
Connection: keepalive
Cache-Control: no-cache
Content-Type: text/event-stream;charset=utf-8
retry: 400
data: {'tag': '', 'data': {'minions': ['ms-4', 'ms-3', 'ms-2', 'ms-1', 'ms-0']}}
data: {'tag': '20130802115730568475', 'data': {'jid': '20130802115730568475', 'return': True, 'retcode': 0, 'success': True, 'cmd': '_return', 'fun': 'test.ping', 'id': 'ms-1'}}
```

The event stream can be easily consumed via JavaScript:

```javascript
<!-- Note, you must be authenticated! -->
var source = new EventSource('/events');
source.onopen = function() { console.debug('opening') };
source.onerror = function(e) { console.debug('error!', e) };
source.onmessage = function(e) { console.debug(e.data) };
```

Or using CORS:

```javascript
var source = new EventSource('/events', {withCredentials: true});
```

Some browser clients lack CORS support for the EventSource() API. Such clients may instead pass the X-Auth-Token value as an URL parameter:

```
curl -NsS localhost:8000/events/6d1b722e
```

It is also possible to consume the stream via the shell.

Records are separated by blank lines; the data: and tag: prefixes will need to be removed manually before attempting to unserialize the JSON.

curl’s -N flag turns off input buffering which is required to process the stream incrementally.

Here is a basic example of printing each event as it comes in:

```
curl -NsS localhost:8000/events | \
    while IFS= read -r line ; do 
        echo $line
    done
```

Here is an example of using awk to filter events based on tag:

```
curl -NsS localhost:8000/events | \
    awk 'BEGIN { RS="\n"; FS="\\n" }'
```
$1 ~/^tag: salt/job/\([0-9]+\)/new$/ { print $0 }

```
tag: salt/job/20140112010149808995/new
data: {
   "tag": "salt/job/20140112010149808995/new",
   "data": {
      "tgt_type": "glob",
      "jid": "20140112010149808995",
      "tgt": "jerry",
      "_stamp": "2014-01-12 01:01:49.809617",
      "user": "shouse",
      "arg": [],
      "fun": "test.ping",
      "minions": ["jerry"]
   }
}
tag: 20140112010149808995
data: {
   "tag": "20140112010149808995",
   "data": {
      "fun_args": [],
      "jid": "20140112010149808995",
      "return": true,
      "retcode": 0,
      "success": true,
      "cmd": "_return",
      "_stamp": "2014-01-12 01:01:49.819316",
      "fun": "test.ping",
      "id": "jerry"
   }
}
```

### /hook

**class** salt.netapi.rest_tornado.salt.nado.WebhookSaltAPIHandler(application, request, **kwargs)**

A generic web hook entry point that fires an event on Salt's event bus.

External services can POST data to this URL to trigger an event in Salt. For example, Amazon SNS, Jenkins-CI or Travis-CI, or GitHub web hooks.

---

**Note:** Be mindful of security

Salt's Reactor can run any code. A Reactor SLS that responds to a hook event is responsible for validating that the event came from a trusted source and contains valid data.

This is a generic interface and securing it is up to you!

This URL requires authentication however not all external services can be configured to authenticate. For this reason authentication can be selectively disabled for this URL. Follow best practices -- always use SSL, pass a secret key, configure the firewall to only allow traffic from a known source, etc.

The event data is taken from the request body. The `Content-Type` header is respected for the payload.

The event tag is prefixed with `salt/netapi/hook` and the URL path is appended to the end. For example, a POST request sent to `/hook/mycompany/myapp/mydata` will produce a Salt event with the tag `salt/netapi/hook/mycompany/myapp/mydata`.

The following is an example `.travis.yml` file to send notifications to Salt of successful test runs:

```
language: python
script: python -m unittest tests
after_success:
  - 'curl -sS http://saltapi-url.example.com:8000/hook/travis/build/success -d branch="${TRAVIS_BRANCH}" -d commit="${TRAVIS_COMMIT}"'
```

---

See also:

* Events, Reactor
* `post` (tag_suffix=None)

Fire an event in Salt with a custom event tag and data

**POST /hook**

Status Codes

* 200 -- success

---

23.10. netapi modules
Example request:

curl -sS localhost:8000/hook -d foo='Foo!' -d bar='Bar!'  

POST /hook HTTP/1.1  
Host: localhost:8000  
Content-Length: 16  
Content-Type: application/x-www-form-urlencoded  

foo=Foo&bar=Bar!

Example response:

HTTP/1.1 200 OK  
Content-Length: 14  
Content-Type: application/json  

{"success": true}
