- False = disable User Level Authentication. Allow User Level commands to be executed without being authenticated. If the option to disable User Level Command authentication is accepted, the BMC will accept packets with Authentication Type set to None if they contain user level commands. For outgoing packets, the BMC returns responses with the same Authentication Type that was used for the request.

**access_mode** -- Access Mode for IPMI messaging (PEF Alerting is enabled/disabled separately from IPMI messaging)

- disabled = disabled for IPMI messaging
- pre_boot = pre-boot only channel only available when system is in a powered down state or in BIOS prior to start of boot.
- always = channel always available regardless of system mode. BIOS typically dedicates the serial connection to the BMC.
- shared = same as always available, but BIOS typically leaves the serial port available for software use.

**privilege_update_mode** -- Channel Privilege Level Limit. This value sets the maximum privilege level that can be accepted on the specified channel.

- dont_change = don’t set or change channel Privilege Level Limit
- non_volatile = non-volatile Privilege Level Limit according
- volatile = volatile setting of Privilege Level Limit

**privilege_level** -- Channel Privilege Level Limit

- reserved = unused
- callback
- user
- operator
- administrator
- proprietary = used by OEM

**kwargs**

- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

CLI Examples:
salt-call ipmi.set_channel_access privilege_level='administrator'

salt.modules.ipmi.set_identify(on=True, duration=600, **kwargs)
Request identify light

Request the identify light to turn off, on for a duration, or on indefinitely. Other than error exceptions,

Parameters

- on -- Set to True to force on or False to force off
- duration -- Set if wanting to request turn on for a duration in seconds, None = indefinitely.
- kwargs --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

CLI Examples:

salt-call ipmi.set_identify

salt.modules.ipmi.set_power(state='power_on', wait=True, **kwargs)
Request power state change

Parameters

- name --
  - power_on -- system turn on
  - power_off -- system turn off (without waiting for OS)
  - shutdown -- request OS proper shutdown
  - reset -- reset (without waiting for OS)
  - boot -- If system is off, then 'on', else 'reset'
- ensure -- If (bool True), do not return until system actually completes requested state change for 300 seconds. If a non-zero (int), adjust the wait time to the requested number of seconds
- kwargs --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Returns dict -- A dict describing the response retrieved

CLI Examples:
salt-call ipmi.set_power state=shutdown wait=True

salt.modules.ipmi.set_user_access(uid, channel=14, callback=True, link_auth=True, ipmi_msg=True, privilege_level='administrator', **kwargs)

Set user access

Parameters

• **uid** -- user number [1:16]
• **channel** -- number [1:7]
• **callback** -- User Restricted to Callback
  – False = User Privilege Limit is determined by the User Privilege Limit parameter, below, for both callback and non-callback connections.
  – True = User Privilege Limit is determined by the User Privilege Limit parameter for callback connections, but is restricted to Callback level for non-callback connections. Thus, a user can only initiate a Callback when they ‘call in’ to the BMC, but once the callback connection has been made, the user could potentially establish a session as an Operator.
• **link_auth** -- User Link authentication enable/disable (used to enable whether this user’s name and password information will be used for link authentication, e.g. PPP CHAP) for the given channel. Link authentication itself is a global setting for the channel and is enabled/disabled via the serial/modem configuration parameters.
• **ipmi_msg** -- User IPMI Messaging: (used to enable/disable whether this user’s name and password information will be used for IPMI Messaging. In this case, ‘IPMI Messaging’ refers to the ability to execute generic IPMI commands that are not associated with a particular payload type. For example, if IPMI Messaging is disabled for a user, but that user is enabled for activating the SOL payload type, then IPMI commands associated with SOL and session management, such as Get SOL Configuration Parameters and Close Session are available, but generic IPMI commands such as Get SEL Time are unavailable.)
• **privilege_level** -- User Privilege Limit. (Determines the maximum privilege level that the user is allowed to switch to on the specified channel.)
  – callback
  – user
  – operator
  – administrator
  – proprietary
  – no_access
• **kwargs**
  – api_host=127.0.0.1
  – api_user=admin
  – api_pass=example
  – api_port=623
  – api_kg=None

CLI Examples:
salt-call ipmi.set_user_access uid=2 privilege_level='operator'

salt.modules.ipmi.set_user_name(uid, name, **kwargs)
Set user name

Parameters

- **uid** -- user number [1:16]
- **name** -- username (limit of 16bytes)
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

CLI Examples:
salt-call ipmi.set_user_name uid=2 name='steverweber'

salt.modules.ipmi.set_user_password(uid, mode='set_password', password=None, **kwargs)
Set user password and (modes)

Parameters

- **uid** -- id number of user. see: get_names_uid()['name']
- **mode** --
  - disable = disable user connections
  - enable = enable user connections
  - set_password = set or ensure password
  - test_password = test password is correct
- **password** -- max 16 char string (optional when mode is [disable or enable])
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Returns  True on success when mode = test_password, return False on bad password

CLI Example:
salt-call ipmi.set_user_password api_host=127.0.0.1 api_user=admin api_pass=pass
uid=1 password=newPass
salt-call ipmi.set_user_password uid=1 mode=enable
salt.modules.ipmi.

**user_delete** (*uid*, *channel=14, **kwargs*)

Delete user (helper)

**Parameters**

- **uid** -- user number [1:16]
- **channel** -- number [1:7]
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

**CLI Examples:**

```
salt-call ipmi.user_delete uid=2
```

### 23.9.53 **salt.modules.jboss7**

Module for managing JBoss AS 7 through the CLI interface.

New in version 2015.5.0.

In order to run each function, **jboss_config** dictionary with the following properties must be passed:

- **cli_path**: the path to jboss-cli script, for example: `/opt/jboss/jboss-7.0/bin/jboss-cli.sh`
- **controller**: the IP address and port of controller, for example: 10.11.12.13:9999
- **cli_user**: username to connect to jboss administration console if necessary
- **cli_password**: password to connect to jboss administration console if necessary

**Example:**

```python
jboss_config:
    cli_path: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
    controller: 10.11.12.13:9999
    cli_user: 'jbossadm'
    cli_password: 'jbossadm'
```

salt.modules.jboss7.

**create_datasource** (*jboss_config, name, datasource_properties, profile=None*)

Create datasource in running jboss instance

- **jboss_config**: Configuration dictionary with properties specified above.
- **name**: Datasource name
- **datasource_properties**: A dictionary of datasource properties to be created:
  - **driver-name**: mysql
  - **connection-url**: 'jdbc:mysql://localhost:3306/sampleDatabase'
  - **jndi-name**: 'java:jboss/datasources/sampleDS'
• user-name: sampleuser
• password: secret
• min-pool-size: 3
• use-java-context: True

**profile**  The profile name (JBoss domain mode only)

**CLI Example:**

```bash
```

**salt.modules.jboss7.create_simple_binding**(jboss_config, binding_name, value, profile=None)

Create a simple jndi binding in the running jboss instance

**jboss_config**  Configuration dictionary with properties specified above.

**binding_name**  Binding name to be created

**value**  Binding value

**profile**  The profile name (JBoss domain mode only)

**CLI Example:**

```bash
salt '*' jboss7.create_simple_binding '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"}', my_binding_name my_binding_value
```

**salt.modules.jboss7.deploy**(jboss_config, source_file)

Deploy the application on the jboss instance from the local file system where minion is running.

**jboss_config**  Configuration dictionary with properties specified above.

**source_file**  Source file to deploy from

**CLI Example:**

```bash
```

**salt.modules.jboss7.list_deployments**(jboss_config)

List all deployments on the jboss instance

**jboss_config**  Configuration dictionary with properties specified above.

**CLI Example:**

```bash
```

(continues on next page)
salt.modules.jboss7.read_datasource(jboss_config, name, profile=None)
Read datasource properties in the running jboss instance.

jboss_config Configuration dictionary with properties specified above.
name Datasource name
profile Profile name (JBoss domain mode only)

CLI Example:
```bash
```

salt.modules.jboss7.read_simple_binding(jboss_config, binding_name, profile=None)
Read jndi binding in the running jboss instance

jboss_config Configuration dictionary with properties specified above.
binding_name Binding name to be created
profile The profile name (JBoss domain mode only)

CLI Example:
```bash
```

salt.modules.jboss7.reload_(jboss_config, host=None)
Reload running jboss instance

jboss_config Configuration dictionary with properties specified above.
host The name of the host. JBoss domain mode only - and required if running in domain mode. The host name is the "name" attribute of the "host" element in host.xml

CLI Example:
```bash
```

salt.modules.jboss7.remove_datasource(jboss_config, name, profile=None)
Remove an existing datasource from the running jboss instance.

jboss_config Configuration dictionary with properties specified above.
name Datasource name
profile The profile (JBoss domain mode only)

CLI Example:
```bash
```
salt.modules.jboss7.status(jboss_config, host=None, server_config=None)

Get status of running jboss instance.

**jboss_config**  Configuration dictionary with properties specified above.

**host**  The name of the host. JBoss domain mode only - and required if running in domain mode. The host name is the "name" attribute of the "host" element in host.xml

**server_config**  The name of the Server Configuration. JBoss Domain mode only - and required if running in domain mode.

CLI Example:

```sh
```

salt.modules.jboss7.stop_server(jboss_config, host=None)

Stop running jboss instance

**jboss_config**  Configuration dictionary with properties specified above.

**host**  The name of the host. JBoss domain mode only - and required if running in domain mode. The host name is the "name" attribute of the "host" element in host.xml

CLI Example:

```sh
```

salt.modules.jboss7.undeploy(jboss_config, deployment)

Undeploy the application from jboss instance

**jboss_config**  Configuration dictionary with properties specified above.

**deployment**  Deployment name to undeploy

CLI Example:

```sh
```

salt.modules.jboss7.update_datasource(jboss_config, name, new_properties, profile=None)

Update an existing datasource in running jboss instance. If the property doesn't exist if will be created, if it does, it will be updated with the new value

**jboss_config**  Configuration dictionary with properties specified above.

**name**  Datasource name

**new_properties**

A dictionary of datasource properties to be updated. For example:

- **driver-name**: mysql
- **connection-url**: 'jdbc:mysql://localhost:3306/sampleDatabase'
- **jndi-name**: 'java:jboss/datasources/sampleDS'
- **user-name**: sampleuser
- **password**: secret
- min-pool-size: 3
- use-java-context: True

**profile**  The profile name (JBoss domain mode only)

CLI Example:

```bash
```

**salt.modules.jboss7.update_simple_binding** *(jboss_config, binding_name, value, profile=None)*

Update the simple jndi binding in the running jboss instance

- **jboss_config**  Configuration dictionary with properties specified above.
- **binding_name**  Binding name to be updated
- **value**  New binding value
- **profile**  The profile name (JBoss domain mode only)

CLI Example:

```bash
clicksalt '*' jboss7.update_simple_binding '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"} 'my_binding_name' 'my_binding_value'
```

### 23.9.54 salt.modules.jboss7_cli

Module for low-level interaction with JbossAS7 through CLI.

This module exposes two ways of interaction with the CLI, either through commands or operations.

**Note:** Following JBoss documentation (https://developer.jboss.org/wiki/CommandLineInterface): "Operations are considered a low level but comprehensive way to manage the AS controller, i.e. if it can't be done with operations it can't be done in any other way. Commands, on the other hand, are more user-friendly in syntax, although most of them still translate into operation requests and some of them even into a few composite operation requests, i.e. commands also simplify some management operations from the user's point of view."

The difference between calling a command or operation is in handling the result. Commands return a zero return code if operation is successful or return non-zero return code and print an error to standard output in plain text, in case of an error.

Operations return a json-like structure, that contain more information about the result. In case of a failure, they also return a specific return code. This module parses the output from the operations and returns it as a dictionary so that an execution of an operation can then be verified against specific errors.

In order to run each function, jboss_config dictionary with the following properties must be passed:

- **cli_path**: the path to jboss-cli script, for example: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
- **controller**: the IP address and port of controller, for example: 10.11.12.13:9999
- **cli_user**: username to connect to jboss administration console if necessary
• cli_password: password to connect to jboss administration console if necessary

Example:

```
jboss_config:
  cli_path: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
  controller: 10.11.12.13:9999
  cli_user: 'jbossadm'
  cli_password: 'jbossadm'
```

`salt.modules.jboss7_cli.run_command(jboss_config, command, fail_on_error=True)`

Execute a command against jboss instance through the CLI interface.

- **jboss_config**: Configuration dictionary with properties specified above.
- **command**: Command to execute against jboss instance
- **fail_on_error** (default=True) Is true, raise CommandExecutionError exception if execution fails. If false, 'success' property of the returned dictionary is set to False

CLI Example:

```
salt '*' jboss7_cli.run_command '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"}' my_command
```

`salt.modules.jboss7_cli.run_operation(jboss_config, operation, fail_on_error=True, retries=1)`

Execute an operation against jboss instance through the CLI interface.

- **jboss_config**: Configuration dictionary with properties specified above.
- **operation**: An operation to execute against jboss instance
- **fail_on_error** (default=True) Is true, raise CommandExecutionError exception if execution fails. If false, 'success' property of the returned dictionary is set to False
- **retries**: Number of retries in case of "JBAS012144: Could not connect to remote" error

CLI Example:

```
salt '*' jboss7_cli.run_operation '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"}' my_operation
```

**23.9.55 salt.modules.kernelpkg_linux_apt**

Manage Linux kernel packages on APT-based systems

`salt.modules.kernelpkg_linux_apt.active()`

Return the version of the running kernel.

CLI Example:

```
salt '*' kernelpkg.active
```

`salt.modules.kernelpkg_linux_apt.cleanup(keep_latest=True)`

Remove all unused kernel packages from the system.

- **keep_latest** [True] In the event that the active kernel is not the latest one installed, setting this to True will retain the latest kernel package, in addition to the active one. If False, all kernel packages other than the active one will be removed.
Salt Documentation, Release 3002.5

CLI Example:

```
salt '*' kernelpkg.cleanup
```

salt.modules.kernelpkg_linux_apt.latest_available()
Return the version of the latest kernel from the package repositories.

CLI Example:

```
salt '*' kernelpkg.latest_available
```

salt.modules.kernelpkg_linux_apt.latest_installed()
Return the version of the latest installed kernel.

CLI Example:

```
salt '*' kernelpkg.latest_installed
```

Note: This function may not return the same value as `active()` if a new kernel has been installed and the system has not yet been rebooted. The `needs_reboot()` function exists to detect this condition.

salt.modules.kernelpkg_linux_apt.list_installed()
Return a list of all installed kernels.

CLI Example:

```
salt '*' kernelpkg.list_installed
```

salt.modules.kernelpkg_linux_apt.needs_reboot()
Detect if a new kernel version has been installed but is not running. Returns True if a new kernel is installed, False otherwise.

CLI Example:

```
salt '*' kernelpkg.needs_reboot
```

salt.modules.kernelpkg_linux_apt.remove(release)
Remove a specific version of the kernel.

release The release number of an installed kernel. This must be the entire release number as returned by `list_installed()`, not the package name.

CLI Example:

```
salt '*' kernelpkg.remove 4.4.0-70-generic
```

salt.modules.kernelpkg_linux_apt.upgrade(reboot=False, at_time=None)
Upgrade the kernel and optionally reboot the system.

reboot [False] Request a reboot if a new kernel is available.
at_time [immediate] Schedule the reboot at some point in the future. This argument is ignored if `reboot=False`. See `reboot()` for more details on this argument.

CLI Example:

```
salt '*' kernelpkg.upgrade
salt '*' kernelpkg.upgrade reboot=True at_time=1
```
**Note:** An immediate reboot often shuts down the system before the minion has a chance to return, resulting in errors. A minimal delay (1 minute) is useful to ensure the result is delivered to the master.

salt.modules.kernelpkg_linux_apt.upgrade_available()
Detect if a new kernel version is available in the repositories. Returns True if a new kernel is available, False otherwise.

CLI Example:
```
salt '*' kernelpkg.upgrade_available
```

23.9.56 salt.modules.keystoneng

Keystone module for interacting with OpenStack Keystone

New in version 2018.3.0.

:depends: shade

Example configuration

```
keystone:
  cloud: default
```

salt.modules.keystoneng.compare_changes(obj, **kwargs)
Compare two dicts returning only keys that exist in the first dict and are different in the second one

salt.modules.keystoneng.domain_create(auth=None, **kwargs)
Create a domain

CLI Example:
```
salt '*' keystoneng.domain_create name=domain1
```

salt.modules.keystoneng.domain_delete(auth=None, **kwargs)
Delete a domain

CLI Example:
```
salt '*' keystoneng.domain_delete name=domain1
salt '*' keystoneng.domain_delete name=b62e76fbee4fe8f77073f591cf211e
```

salt.modules.keystoneng.domain_get(auth=None, **kwargs)
Get a single domain

CLI Example:
salt.modules.keystoneng.domain_list(auth=None, **kwargs)
List domains
CLI Example:
salt '*' keystoneng.domain_list

salt.modules.keystoneng.domain_search(auth=None, **kwargs)
Search domains
CLI Example:
salt '*' keystoneng.domain_search
salt '*' keystoneng.domain_search name=domain1

salt.modules.keystoneng.domain_update(auth=None, **kwargs)
Update a domain
CLI Example:
salt '*' keystoneng.domain_update name=domain1 new_name=newdomain
salt '*' keystoneng.domain_update name=domain1 enabled=True description='new'

salt.modules.keystoneng.endpoint_create(auth=None, **kwargs)
Create an endpoint
CLI Example:
salt '*' keystoneng.endpoint_create interface=admin service=glance url=https://example.org:9292
salt '*' keystoneng.endpoint_create interface=public service=glance region=RegionOne url=https://example.org:9292
salt '*' keystoneng.endpoint_create interface=admin service=glance url=https://example.org:9292 enabled=True

salt.modules.keystoneng.endpoint_delete(auth=None, **kwargs)
Delete an endpoint
CLI Example:
salt '*' keystoneng.endpoint_delete id=3bee4bd8c2b040ee966adfda1f0bfca9

salt.modules.keystoneng.endpoint_get(auth=None, **kwargs)
Get a single endpoint
CLI Example:
salt '*' keystoneng.endpoint_get id=02cffa173b2460f98e40eda3748dae5

salt.modules.keystoneng.endpoint_list(auth=None, **kwargs)
List endpoints
CLI Example:
salt 'salt' keystoneeng.endpoint_list

salt.modules.keystoneng.endpoint_search(auth=None, **kwargs)
Search endpoints

CLI Example:

    salt 'salt' keystoneeng.endpoint_search
    salt 'salt' keystoneeng.endpoint_search id=02cffa173b2460f98e40eda3748dae5

salt.modules.keystoneng.endpoint_update(auth=None, **kwargs)
Update an endpoint

CLI Example:

    salt 'salt' keystoneeng.endpoint_update endpoint_id=4f961ad09d2d48948896bbe7c6a79717
    →interface=public enabled=False
    salt 'salt' keystoneeng.endpoint_update endpoint_id=4f961ad09d2d48948896bbe7c6a79717
    →region=newregion
    salt 'salt' keystoneeng.endpoint_update endpoint_id=4f961ad09d2d48948896bbe7c6a79717
    →service_name_or_id=glance url=https://example.org:9292

salt.modules.keystoneng.get_entity(ent_type, **kwargs)
Attempt to query Keystone for more information about an entity

salt.modules.keystoneng.get_openstack_cloud(auth=None)
Return an openstack_cloud

salt.modules.keystoneng.get_operator_cloud(auth=None)
Return an operator_cloud

salt.modules.keystoneng.group_create(auth=None, **kwargs)
Create a group

CLI Example:

    salt 'salt' keystoneeng.group_create name=group1
    salt 'salt' keystoneeng.group_create name=group2 domain=domain1 description='my group2
    →'

salt.modules.keystoneng.group_delete(auth=None, **kwargs)
Delete a group

CLI Example:

    salt 'salt' keystoneeng.group_delete name=group1
    salt 'salt' keystoneeng.group_delete name=group2 domain_
    →id=b62e76fbee4f8f77b735f91cf211e
    salt 'salt' keystoneeng.group_delete name=0e4febc2a5ab4f2c8f374b054162506d

salt.modules.keystoneng.group_get(auth=None, **kwargs)
Get a single group

CLI Example:

    salt 'salt' keystoneeng.group_get name=group1
    salt 'salt' keystoneeng.group_get name=group2 domain_
    →id=b62e76fbee4f8f77b735f91cf211e
    salt 'salt' keystoneeng.group_get name=0e4febc2a5ab4f2c8f374b054162506d
salt.modules.keystoneng.group_list(auth=None, **kwargs)
List groups
CLI Example:

```python
salt '*' keystoneng.group_list
salt '*' keystoneng.group_list domain_id=b62e76fbee48fb77073f591cf211e
```

salt.modules.keystoneng.group_search(auth=None, **kwargs)
Search for groups
CLI Example:

```python
salt '*' keystoneng.group_search name=group1
salt '*' keystoneng.group_search domain_id=b62e76fbee48fb77073f591cf211e
```

salt.modules.keystoneng.group_update(auth=None, **kwargs)
Update a group
CLI Example:

```python
salt '*' keystoneng.group_update name=group1 description='new description'
salt '*' keystoneng.group_create name=group2 domain_
  →id=b62e76fbee48fb77073f591cf211e new_name=newgroupname
salt '*' keystoneng.group_create name=0e4febc2a5af4f2c8f374b054162506d new_
  →name=newgroupname
```

salt.modules.keystoneng.project_create(auth=None, **kwargs)
Create a project
CLI Example:

```python
salt '*' keystoneng.project_create name=project1
salt '*' keystoneng.project_create name=project2 domain_
  →id=b62e76fbee48fb77073f591cf211e
salt '*' keystoneng.project_create name=project3 enabled=False description='my'
  →project3'
```

salt.modules.keystoneng.project_delete(auth=None, **kwargs)
Delete a project
CLI Example:

```python
salt '*' keystoneng.project_delete name=project1
salt '*' keystoneng.project_delete name=project2 domain_
  →id=b62e76fbee48fb77073f591cf211e
salt '*' keystoneng.project_delete name=f315afcf12f24ad88c92b936c38f2d5a
```

salt.modules.keystoneng.project_get(auth=None, **kwargs)
Get a single project
CLI Example:

```python
salt '*' keystoneng.project_get name=project1
salt '*' keystoneng.project_get name=project2 domain_
  →id=b62e76fbee48fb77073f591cf211e
salt '*' keystoneng.project_get name=f315afcf12f24ad88c92b936c38f2d5a
```

salt.modules.keystoneng.project_list(auth=None, **kwargs)
List projects
## 23.9. execution modules

Salt Documentation, Release 3002.5

**CLI Example:**

```
salt '*' keystoneng.project_list
salt '*' keystoneng.project_list domain_id=b62e76fbeeff4e8fb77073f591cf211e
```

Salt modules for the keystoneng Python library:

- `project_list` - Get a list of projects
  - CLI Example:
    ```
salt '*' keystoneng.project_list
salt '*' keystoneng.project_list domain_id=b62e76fbeeff4e8fb77073f591cf211e
```

- `project_search` - Search projects
  - CLI Example:
    ```
salt '*' keystoneng.project_search
salt '*' keystoneng.project_search name=project1
salt '*' keystoneng.project_search domain_id=b62e76fbeeff4e8fb77073f591cf211e
```

- `project_update` - Update a project
  - CLI Example:
    ```
salt '*' keystoneng.project_update name=project1 new_name=newproject
salt '*' keystoneng.project_update name=project2 enabled=False description='new → description'
```

- `role_assignment_list` - List role assignments
  - CLI Example:
    ```
salt '*' keystoneng.role_assignment_list
```

- `role_create` - Create a role
  - CLI Example:
    ```
salt '*' keystoneng.role_create name=role1
salt '*' keystoneng.role_create name=role1 domain_id=b62e76fbeeff4e8fb77073f591cf211e
```

- `role_delete` - Delete a role
  - CLI Example:
    ```
salt '*' keystoneng.role_delete name=role1 domain_id=b62e76fbeeff4e8fb77073f591cf211e
salt '*' keystoneng.role_delete name=1eb6edd5525e4ac39af571adee673559
```

- `role_get` - Get a single role
  - CLI Example:
    ```
salt '*' keystoneng.role_get name=role1
salt '*' keystoneng.role_get name=role1 domain_id=b62e76fbeeff4e8fb77073f591cf211e
salt '*' keystoneng.role_get name=1eb6edd5525e4ac39af571adee673559
```

- `role_grant` - Grant a role in a project/domain to a user/group
  - CLI Example:
salt.modules.keystoneng.role_list(auth=None, **kwargs)
List roles

CLI Example:

salt '*' keystoneng.role_list
salt '*' keystoneng.role_list domain_id=b62e76fbee4e8fb77073f591cf211e

salt.modules.keystoneng.role_revoke(auth=None, **kwargs)
Grant a role in a project/domain to a user/group

CLI Example:

salt '*' keystoneng.role_revoke name=role1 user=user1 project=project1
salt '*' keystoneng.role_revoke name=ddbe3e0ed74e4c7f8027bad4af03339d group=user1
  →project=project1 domain=domain1
salt '*' keystoneng.role_revoke name=ddbe3e0ed74e4c7f8027bad4af03339d
  →group=19573afde2421d08654c2215b9e9704 project=1dcac318a83b4610b7a7f7ba01465548

salt.modules.keystoneng.role_search(auth=None, **kwargs)
Search roles

CLI Example:

salt '*' keystoneng.role_search
salt '*' keystoneng.role_search name=role1
salt '*' keystoneng.role_search domain_id=b62e76fbee4e8fb77073f591cf211e

salt.modules.keystoneng.role_update(auth=None, **kwargs)
Update a role

CLI Example:

salt '*' keystoneng.role_update name=role1 new_name=newrole
salt '*' keystoneng.role_update name=1eb6edd5525e4ac39af571adee673559 new_
  →name=newrole

salt.modules.keystoneng.service_create(auth=None, **kwargs)
Create a service

CLI Example:

salt '*' keystoneng.service_create name=glance type=image
salt '*' keystoneng.service_create name=glance type=image description="Image"

salt.modules.keystoneng.service_delete(auth=None, **kwargs)
Delete a service

CLI Example:

salt '*' keystoneng.service_delete name=glance
salt '*' keystoneng.service_delete name=39cc1327cdf744ab815331554430e8ec
salt.modules.keystoneng.service_get(auth=None, **kwargs)
Get a single service

CLI Example:
```
salt '*' keystoneng.service_get name=glance
salt '*' keystoneng.service_get name=75a5804638944b3ab54f7fbc2305a
```

salt.modules.keystoneng.service_list(auth=None, **kwargs)
List services

CLI Example:
```
salt '*' keystoneng.service_list
```

salt.modules.keystoneng.service_search(auth=None, **kwargs)
Search services

CLI Example:
```
salt '*' keystoneng.service_search
salt '*' keystoneng.service_search name=glance
salt '*' keystoneng.service_search name=135f803f8e5444c9b79e6cfec2305a
```

salt.modules.keystoneng.service_update(auth=None, **kwargs)
Update a service

CLI Example:
```
salt '*' keystoneng.service_update name=cinder type=volumev2
salt '*' keystoneng.service_update name=cinder description='new description'
salt '*' keystoneng.service_update name=ab4d35e269f147b3ae2d849f77f5c88fa enabled=False
```

salt.modules.keystoneng.setup_clouds(auth=None)
Call functions to create Shade cloud objects in __context__ to take advantage of Shade's in-memory caching across several states

salt.modules.keystoneng.user_create(auth=None, **kwargs)
Create a user

CLI Example:
```
salt '*' keystoneng.user_create name=user1
salt '*' keystoneng.user_create name=user2 password=1234 enabled=False
salt '*' keystoneng.user_create name=user3 domain_
  → id=b62e76fb9eff4e8fbb77073f591cf21e
```

salt.modules.keystoneng.user_delete(auth=None, **kwargs)
Delete a user

CLI Example:
```
salt '*' keystoneng.user_delete name=user1
salt '*' keystoneng.user_delete name=user2 domain_
  → id=b62e76fb9eff4e8fbb77073f591cf21e
salt '*' keystoneng.user_delete name=a42cbbfa1e894839fd0f584d22e321f
```

salt.modules.keystoneng.user_get(auth=None, **kwargs)
Get a single user
CLI Example:

```
salt '*' keystoneng.user_get name=user1
salt '*' keystoneng.user_get name=user1 domain_id=b62e76fbeeфф4e8fb77073f591cf211e
salt '*' keystoneng.user_get name=02cffaa173b2460f98e40eda3748daе5
```

```
salt '*' keystoneng.user_list
salt '*' keystoneng.user_list domain_id=b62e76fbeeфф4e8fb77073f591cf211e
```

```
salt '*' keystoneng.user_search(auth=None, **kwargs)
```

List users

```
salt '*' keystoneng.user_list
salt '*' keystoneng.user_list domain_id=b62e76fbeeфф4e8fb77073f591cf211e
```

```
salt '*' keystoneng.user_update(auth=None, **kwargs)
```

Update a user

```
salt '*' keystoneng.user_update name=user1 enabled=False description='new

description'
salt '*' keystoneng.user_update name=user1 new_name=newuser
```

23.9.57 salt.modules.keystore

Module to interact with keystores

```
salt.modules.keystore.add(name, keystore, passphrase, certificate, private_key=None)
```

Adds certificates to an existing keystore or creates a new one if necessary.

Parameters

- **name** -- alias for the certificate
- **keystore** -- The path to the keystore file to query
- **passphrase** -- The passphrase to use to decode the keystore
- **certificate** -- The PEM public certificate to add to keystore. Can be a string for file.
- **private_key** -- (Optional for TrustedCert) The PEM private key to add to the keystore

CLI Example:

```
salt '*' keystore.add aliasname /tmp/test.store changeit /tmp/testcert.crt
salt '*' keystore.add aliasname /tmp/test.store changeit certificate="-----BEGIN

CERTIFICATE=====Sib...BM=====END CERTIFICATE-----"
salt '*' keystore.add keyname /tmp/test.store changeit /tmp/512.cert private_key=/

//--tmp/512.key
```

```
salt.modules.keystore.list(keystore, passphrase, alias=None, return_cert=False)
```

Lists certificates in a keytool managed keystore.
Parameters

- **keystore** -- The path to the keystore file to query
- **passphrase** -- The passphrase to use to decode the keystore
- **alias** -- (Optional) If found, displays details on only this key
- **return_certs** -- (Optional) Also return certificate PEM.

**Warning:** There are security implications for using return_cert to return decrypted certificates.

CLI Example:

```
salt '*' keystore.list /usr/lib/jvm/java-8/jre/lib/security/cacerts changeit
salt '*' keystore.list /usr/lib/jvm/java-8/jre/lib/security/cacerts changeit
salt '*' keystore.remove aliasname /tmp/test.store changeit
```

### salt.modules.keystore.remove(name, keystore, passphrase)

Removes a certificate from an existing keystore. Returns True if remove was successful, otherwise False

**Parameters**

- **name** -- alias for the certificate
- **keystore** -- The path to the keystore file to query
- **passphrase** -- The passphrase to use to decode the keystore

CLI Example:

```
salt '*' keystore.remove aliasname /tmp/test.store changeit
```

### 23.9.58 salt.modules.libcloud_dns

**Apache Libcloud DNS Management**

Connection module for Apache Libcloud DNS management

New in version 2016.11.0.

**configuration**

This module uses a configuration profile for one or multiple DNS providers

```
libcloud_dns:
  profile_test1:
    driver: cloudflare
    key: 12345
    secret: mysecret
  profile_test2:
    driver: godaddy
    key: 12345
    secret: mysecret
    shopper_id: 12345
```

**depends** apache-libcloud

```
salt.modules.libcloud_dns.create_record(name, zone_id, type, data, profile)
```

Create a new record.
Parameters

- **name** (str) -- Record name without the domain name (e.g. www). Note: If you want to create a record for a base domain name, you should specify empty string ("") for this argument.
- **zone_id** (str) -- Zone where the requested record is created.
- **type** (str) -- DNS record type (A, AAAA, ...).
- **data** (str) -- Data for the record (depends on the record type).
- **profile** (str) -- The profile key

CLI Example:
```
salt myminion libcloud_dns.create_record www google.com A 12.32.12.2 profile1
```

salt.modules.libcloud_dns.create_zone(domain, profile, type='master', ttl=None)
Create a new zone.

Parameters

- **domain** (str) -- Zone domain name (e.g. example.com)
- **profile** (str) -- The profile key
- **type** (str) -- Zone type (master / slave).
- **ttl** (int) -- TTL for new records. (optional)

CLI Example:
```
salt myminion libcloud_dns.create_zone google.com profile1
```

salt.modules.libcloud_dns.delete_record(zone_id, record_id, profile)
Delete a record.

Parameters

- **zone_id** (str) -- Zone to delete.
- **record_id** (str) -- Record to delete.
- **profile** (str) -- The profile key

Return type bool

CLI Example:
```
salt myminion libcloud_dns.delete_record google.com www profile1
```

salt.modules.libcloud_dns.delete_zone(zone_id, profile)
Delete a zone.

Parameters

- **zone_id** (str) -- Zone to delete.
- **profile** (str) -- The profile key

Return type bool

CLI Example:
salt myminion libcloud_dns.delete_zone google.com profile1

salt.modules.libcloud_dns.extra(method, profile, **libcloud_kwargs)
    Call an extended method on the driver

    Parameters
    • method (str) -- Driver's method name
    • profile (str) -- The profile key
    • libcloud_kwargs (dict) -- Extra arguments for the driver's delete_container method

    CLI Example:
salt myminion libcloud_dns.extra ex_get_permissions google container_name=my_
    → container object_name=me.jpg --out=yaml

salt.modules.libcloud_dns.get_bind_data(zone_id, profile)
    Export Zone to the BIND compatible format.

    Parameters
    • zone_id (str) -- Zone to export.
    • profile (str) -- The profile key

    Returns  Zone data in BIND compatible format.

    Return type  str

    CLI Example:
salt myminion libcloud_dns.get_bind_data google.com profile1

salt.modules.libcloud_dns.get_record(zone_id, record_id, profile)
    Get record information for the given zone_id on the given profile

    Parameters
    • zone_id (str) -- Zone to export.
    • record_id (str) -- Record to delete.
    • profile (str) -- The profile key

    CLI Example:
salt myminion libcloud_dns.get_record google.com www profile1

salt.modules.libcloud_dns.get_zone(zone_id, profile)
    Get zone information for the given zone_id on the given profile

    Parameters
    • zone_id (str) -- Zone to export.
    • profile (str) -- The profile key

    CLI Example:
salt myminion libcloud_dns.get_zone google.com profile1

salt.modules.libcloud_dns.list_record_types(profile)
    List available record types for the given profile, e.g. A, AAAA
Parameters **profile** *(str)* -- The profile key

CLI Example:
```
salt myminion libcloud_dns.list_record_types profile1
```

salt.modules.libcloud_dns.list_records *(zone_id, profile, type=None)*
List records for the given zone_id on the given profile

Parameters

- **zone_id** *(str)* -- Zone to export.
- **profile** *(str)* -- The profile key
- **type** *(str)* -- The record type, e.g. A, NS

CLI Example:
```
salt myminion libcloud_dns.list_records google.com profile1
```

salt.modules.libcloud_dns.list_zones *(profile)*
List zones for the given profile

Parameters **profile** *(str)* -- The profile key

CLI Example:
```
salt myminion libcloud_dns.list_zones profile1
```

salt.modules.libcloud_dns.update_zone *(zone_id, domain, profile, type='master', ttl=None)*
Update an existing zone.

Parameters

- **zone_id** *(str)* -- Zone ID to update.
- **domain** *(str)* -- Zone domain name (e.g. example.com)
- **profile** *(str)* -- The profile key
- **type** *(str)* -- Zone type (master / slave).
- **ttl** *(int)* -- TTL for new records. (optional)

CLI Example:
```
salt myminion libcloud_dns.update_zone google.com google.com profile1 type=slave
```

### 23.9.59 salt.modules.linux_service

If Salt's OS detection does not identify a different virtual service module, the minion will fall back to using this basic module, which simply wraps sysvinit scripts.

salt.modules.linux_service.available *(name)*
Returns True if the specified service is available, otherwise returns False.

CLI Example:
```
salt '*' service.available ssdh
```
salt.modules.linux_service.get_all()
    Return a list of all available services
    
    CLI Example:
    
    ```
    salt '*' service.get_all
    ```

salt.modules.linux_service.missing(name)
    The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.
    
    CLI Example:
    
    ```
    salt '*' service.missing sshd
    ```

salt.modules.linux_service.reload_(name)
    Refreshes config files by calling service reload. Does not perform a full restart.
    
    CLI Example:
    
    ```
    salt '*' service.reload <service name>
    ```

salt.modules.linux_service.restart(name)
    Restart the specified service
    
    CLI Example:
    
    ```
    salt '*' service.restart <service name>
    ```

salt.modules.linux_service.run(name, action)
    Run the specified service with an action.
    
    
    name   Service name.
    action Action name (like start, stop, reload, restart).
    
    CLI Example:
    
    ```
    salt '*' service.run apache2 reload
    salt '*' service.run postgresql initdb
    ```

salt.modules.linux_service.start(name)
    Start the specified service
    
    CLI Example:
    
    ```
    salt '*' service.start <service name>
    ```

salt.modules.linux_service.status(name, sig=None)
    Return the status for a service. If the name contains globbing, a dict mapping service name to PID or empty string is returned.
    
    Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)
    
    Parameters
    
    - name (str) -- The name of the service to check
    - sig (str) -- Signature to use to find the service via ps
Returns  PID if running, empty otherwise
dict: Maps service name to PID if running, empty string otherwise

Return type  string

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

```python
salt.modules.linux_service.stop(name)
```
Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

### 23.9.60 salt.modules.logmod

**On-demand logging**

New in version 2017.7.0.

The sole purpose of this module is logging messages in the (proxy) minion. It comes very handy when debugging complex Jinja templates, for example:

```jinja
{% for var in range(10) %}
    {% do salt.log.info(var) -%}
{% endfor %}
```

CLI Example:

```
salt '*' log.error "Please don't do that, this module is not for CLI use!"
```

```python
salt.modules.logmod.critical(message)
```
Log message at level CRITICAL.

```python
salt.modules.logmod.debug(message)
```
Log message at level DEBUG.

```python
salt.modules.logmod.error(message)
```
Log message at level ERROR.

```python
salt.modules.logmod.exception(message)
```
Log message at level EXCEPTION.

```python
salt.modules.logmod.info(message)
```
Log message at level INFO.

```python
salt.modules.logmod.warning(message)
```
Log message at level WARNING.
23.9.61 `salt.modules.mod_random`

Provides access to randomness generators.

New in version 2014.7.0.

```python
salt.modules.mod_random.get_str(length=20)
```

New in version 2014.7.0.

Returns a random string of the specified length.

- **length**: [20] Any valid number of bytes.

```bash
salt '*' random.get_str 128
```

```python
salt.modules.mod_random.hash(value, algorithm='sha512')
```

New in version 2014.7.0.

Encodes a value with the specified encoder.

- **value**: The value to be hashed.
- **algorithm**: [sha512] The algorithm to use. May be any valid algorithm supported by hashlib.

```bash
salt '*' random.hash 'I am a string' md5
```

```python
salt.modules.mod_random.rand_int(start=1, end=10, seed=None)
```

Returns a random integer number between the start and end number.

New in version 2015.5.3.

- **start**: [1] Any valid integer number.
- **end**: [10] Any valid integer number.
- **seed**: Optional hashable object

Changed in version 2019.2.0: Added seed argument. Will return the same result when run with the same seed.

```bash
salt '*' random.rand_int 1 10
```

```python
salt.modules.mod_random.seed(range=10, hash=None)
```

Returns a random number within a range. Optional hash argument can be any hashable object. If hash is omitted or None, the id of the minion is used.

New in version 2015.8.0.

- **hash**: None Any hashable object.
- **range**: 10 Any valid integer number.

```bash
salt '*' random.seed 10 hash=None
```

```python
salt.modules.mod_random.shadow_hash(crypt_salt=None, password=None, algorithm='sha512')
```

Generates a salted hash suitable for /etc/shadow.
crypt_salt [None] Salt to be used in the generation of the hash. If one is not provided, a random salt will be generated.

password [None] Value to be salted and hashed. If one is not provided, a random password will be generated.

algorithm [sha512] Hash algorithm to use.

CLI Example:
```
salt '*' random.shadow_hash 'MySalt' 'MyPasswd' md5
```

salt.modules.mod_random.str_encode(value, encoder='base64')
New in version 2014.7.0.

value The value to be encoded.

encoder [base64] The encoder to use on the subsequent string.

CLI Example:
```
salt '*' random.str_encode 'I am a new string' base64
```

23.9.62 salt.modules.modjk

Below is an example of the configuration needed for this module. This configuration data can be placed either in grains or pillar.

If using grains, this can be accomplished statically or via a grain module.

If using pillar, the yaml configuration can be placed directly into a pillar SLS file, making this both the easier and more dynamic method of configuring this module.

```
modjk:
  default:
    url: http://localhost/jkstatus
    user: modjk
    pass: secret
    realm: authentication realm for digest passwords
    timeout: 5
  otherVhost:
    url: http://otherVhost/jkstatus
    user: modjk
    pass: secret2
    realm: authentication realm2 for digest passwords
    timeout: 600
```

salt.modules.modjk.bulk_activate(workers, lbn, profile='default')
Activate all the given workers in the specific load balancer

CLI Examples:
```
salt '*' modjk.bulk_activate node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_activate node1,node2,node3 loadbalancer1 other-profile
salt '*' modjk.bulk_activate ['node1','node2','node3'] loadbalancer1
salt '*' modjk.bulk_activate ['node1','node2','node3'] loadbalancer1 other-profile
```
**salt.modules.modjk.bulk_disable** *(workers, lbn, profile='default')*
Disable all the given workers in the specific load balancer

CLI Examples:
```
salt '*' modjk.bulk_disable node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_disable node1,node2,node3 loadbalancer1 other-profile
salt '*' modjk.bulk_disable ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_disable ["node1","node2","node3"] loadbalancer1 other-profile
```

**salt.modules.modjk.bulk_recover** *(workers, lbn, profile='default')*
Recover all the given workers in the specific load balancer

CLI Examples:
```
salt '*' modjk.bulk_recover node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_recover node1,node2,node3 loadbalancer1 other-profile
salt '*' modjk.bulk_recover ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_recover ["node1","node2","node3"] loadbalancer1 other-profile
```

**salt.modules.modjk.bulk_stop** *(workers, lbn, profile='default')*
Stop all the given workers in the specific load balancer

CLI Examples:
```
salt '*' modjk.bulk_stop node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_stop node1,node2,node3 loadbalancer1 other-profile
salt '*' modjk.bulk_stop ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_stop ["node1","node2","node3"] loadbalancer1 other-profile
```

**salt.modules.modjk.dump_config** *(profile='default')*
Dump the original configuration that was loaded from disk

CLI Examples:
```
salt '*' modjk.dump_config
salt '*' modjk.dump_config other-profile
```

**salt.modules.modjk.get_running** *(profile='default')*
Get the current running config (not from disk)

CLI Examples:
```
salt '*' modjk.get_running
salt '*' modjk.get_running other-profile
```

**salt.modules.modjk.lb_edit** *(lbn, settings, profile='default')*
Edit the loadbalancer settings

CLI Examples:
```
salt '*' modjk.lb_edit loadbalancer1 "{"vlr": 1, "vlt": 60}"
salt '*' modjk.lb_edit loadbalancer1 "{"vlr": 1, "vlt": 60}" other-profile
```
Salt Documentation, Release 3002.5

salt.modules.modjk.list_configured_members(lbn, profile='default')
Return a list of member workers from the configuration files

CLI Examples:
```
salt '*' modjk.list_configured_members loadbalancer1
salt '*' modjk.list_configured_members loadbalancer1 other-profile
```

salt.modules.modjk.recover_all(lbn, profile='default')
Set the all the workers in lbn to recover and activate them if they are not

CLI Examples:
```
salt '*' modjk.recover_all loadbalancer1
salt '*' modjk.recover_all loadbalancer1 other-profile
```

salt.modules.modjk.reset_stats(lbn, profile='default')
Reset all runtime statistics for the load balancer

CLI Examples:
```
salt '*' modjk.reset_stats loadbalancer1
salt '*' modjk.reset_stats loadbalancer1 other-profile
```

salt.modules.modjk.version(profile='default')
Return the modjk version

CLI Examples:
```
salt '*' modjk.version
salt '*' modjk.version other-profile
```

salt.modules.modjk.worker_activate(worker, lbn, profile='default')
Set the worker to activate state in the lbn load balancer

CLI Examples:
```
salt '*' modjk.worker_activate node1 loadbalancer1
salt '*' modjk.worker_activate node1 loadbalancer1 other-profile
```

salt.modules.modjk.worker_disable(worker, lbn, profile='default')
Set the worker to disable state in the lbn load balancer

CLI Examples:
```
salt '*' modjk.worker_disable node1 loadbalancer1
salt '*' modjk.worker_disable node1 loadbalancer1 other-profile
```

salt.modules.modjk.worker_edit(worker, lbn, settings, profile='default')
Edit the worker settings

CLI Examples:
```
salt '*' modjk.worker_edit node1 loadbalancer1 "{"vwf": 500, 'vwd': 60}"
salt '*' modjk.worker_edit node1 loadbalancer1 "{"vwf": 500, 'vwd': 60}" other-profile
```
salt.modules.modjk.worker_recover(\texttt{worker, lbn, profile='default'})

Set the worker to recover this module will fail if it is in OK state

CLI Examples:

\begin{verbatim}
salt '*' modjk.worker_recover node1 loadbalancer1
salt '*' modjk.worker_recover node1 loadbalancer1 other-profile
\end{verbatim}

salt.modules.modjk.worker_status(\texttt{worker, profile='default'})

Return the state of the worker

CLI Examples:

\begin{verbatim}
salt '*' modjk.worker_status node1
salt '*' modjk.worker_status node1 other-profile
\end{verbatim}

salt.modules.modjk.worker_stop(\texttt{worker, lbn, profile='default'})

Set the worker to stopped state in the Lbn load balancer

CLI Examples:

\begin{verbatim}
salt '*' modjk.worker_activate node1 loadbalancer1
salt '*' modjk.worker_activate node1 loadbalancer1 other-profile
\end{verbatim}

salt.modules.modjk.workers(\texttt{profile='default'})

Return a list of member workers and their status

CLI Examples:

\begin{verbatim}
salt '*' modjk.workers
salt '*' modjk.workers other-profile
\end{verbatim}

23.9.63 salt.modules.nagios

Run nagios plugins/checks from salt and get the return as data.

salt.modules.nagios.list_plugins()

List all the nagios plugins

CLI Example:

\begin{verbatim}
salt '*' nagios.list_plugins
\end{verbatim}

salt.modules.nagios.recode(plugin, args='', key_name=None)

Run one nagios plugin and return retcode of the execution

salt.modules.nagios.recode_pillar(pillar_name)

Run one or more nagios plugins from pillar data and get the result of cmd.recode The pillar have to be in this format:

\begin{verbatim}
webserver:
   Ping_google:
      - check_icmp: 8.8.8.8
      - check_icmp: google.com
   Load:
      - check_load: -w 0.8 -c 1
   APT:
\end{verbatim}

(continues on next page)
webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You must to group different checks(one or more) and always it will return the highest value of all the checks

CLI Example:

```
salt '*' nagios.retcode webserver
```

```
salt.modules.nagios.run(plugin, args='')
```

Run nagios plugin and return all the data execution with cmd.run

CLI Example:

```
salt '*' nagios.run check_apt
salt '*' nagios.run check_icmp '8.8.8.8'
```

```
salt.modules.nagios.run_all(plugin, args='')
```

Run nagios plugin and return all the data execution with cmd.run_all

```
salt.modules.nagios.run_all_pillar(pillar_name)
```

Run one or more nagios plugins from pillar data and get the result of cmd.run_all The pillar have to be in this format:

```
webserver:
  Ping_google:
    - check_icmp: 8.8.8.8
    - check_icmp: google.com
  Load:
    - check_load: -w 0.8 -c 1
  APT:
    - check_apt
```

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You have to group different checks in a group

CLI Example:

```
salt '*' nagios.run webserver
```

```
salt.modules.nagios.run_pillar(pillar_name)
```

Run one or more nagios plugins from pillar data and get the result of cmd.run The pillar have to be in this format:

```
webserver:
  Ping_google:
    - check_icmp: 8.8.8.8
    - check_icmp: google.com
  Load:
    - check_load: -w 0.8 -c 1
```

(continues on next page)
webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You have to group different checks in a group

CLI Example:

```bash
salt '*' nagios.run webserver
```

## 23.9.64 salt.modules.namecheap_domains

### Namecheap Domain Management

New in version 2017.7.0.

#### Prerequisites

This module uses the `requests` Python module to communicate to the namecheap API.

#### Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```yaml
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.com/xml.response
```

- **salt.modules.namecheap_domains.check**( `domains_to_check` )
  
  Checks the availability of domains

  - **domains_to_check** array of strings List of domains to check

  Returns a dictionary mapping the each domain name to a boolean denoting whether or not it is available.

  CLI Example:

  ```bash
  salt 'my-minion' namecheap_domains.check domain-to-check
  ```

- **salt.modules.namecheap_domains.create**( `domain_name`, `years`, **kwargs** )

  Try to register the specified domain name

  - **domain_name** The domain name to be registered

  - **years** Number of years to register

  Returns the following information:

  - Whether or not the domain was renewed successfully
- Whether or not WhoisGuard is enabled
- Whether or not registration is instant
- The amount charged for registration
- The domain ID
- The order ID
- The transaction ID

CLI Example:

```bash
salt 'my-minion' namecheap_domains.create my-domain-name 2
```

```python
salt.modules.namecheap_domains.get_info(domain_name)
```

Returns information about the requested domain.

doctor namecheap_domains.get_info

domain_name: string Domain name to get information about

CLI Example:

```bash
salt 'my-minion' namecheap_domains.get_info my-domain-name
```

```python
salt.modules.namecheap_domains.get_list(list_type=None, search_term=None, page=None, page_size=None, sort_by=None)
```

Returns a list of domains for the particular user as a list of objects offset by page length of page_size.

- list_type: [ALL] One of ALL, EXPIRING, EXPIRED
- search_term: Keyword to look for on the domain list
- page: [1] Number of result page to return
- page_size: [20] Number of domains to be listed per page (minimum: 10, maximum: 100)
- sort_by: One of NAME, NAME_DESC, EXPIREDATE, EXPIREDATE_DESC, CREATEDATE, or CREATEDATE_DESC

CLI Example:

```bash
salt 'my-minion' namecheap_domains.get_list
```

```python
salt.modules.namecheap_domains.get_tld_list()
```

Returns a list of TLDs as objects

CLI Example:

```bash
salt 'my-minion' namecheap_domains.get_tld_list
```

```python
salt.modules.namecheap_domains/reactivate(domain_name)
```

Try to reactivate the expired domain name

Returns the following information:

- Whether or not the domain was reactivated successfully
- The amount charged for reactivation
- The order ID
- The transaction ID
**CLI Example:**
```
salt 'my-minion' namecheap_domains.reactivate my-domain-name
```

`salt.modules.namecheap_domains.renew(domain_name, years, promotion_code=None)`
Try to renew the specified expiring domain name for a specified number of years

- **domain_name** The domain name to be renewed
- **years** Number of years to renew

Returns the following information:
- Whether or not the domain was renewed successfully
- The domain ID
- The order ID
- The transaction ID
- The amount charged for renewal

**CLI Example:**
```
salt 'my-minion' namecheap_domains.renew my-domain-name 5
```

---

**23.9.65 salt.modules.namecheap_domains_dns**

Namecheap DNS Management

New in version 2017.7.0.

**Prerequisites**

This module uses the requests Python module to communicate to the namecheap API.

**Configuration**

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
# Real url
namecheap.url: https://api.namecheap.com/xml.response
# Sandbox url
# namecheap.url: https://api.sandbox.namecheap.xml.response
```

`salt.modules.namecheap_domains_dns.get_hosts(sld, tld)`
Retrieves DNS host record settings for the requested domain.

- returns a dictionary of information about the requested domain
- **sld** SLD of the domain name
- **tld** TLD of the domain name

**CLI Example:**
```
salt 'my-minion' namecheap_domains_dns.get_list sld tld

salt.modules.namecheap_domains_dns.get_list(sld, tld)
Gets a list of DNS servers associated with the requested domain.
returns a dictionary of information about requested domain
sld  SLD of the domain name
  tld  TLD of the domain name
  CLI Example:
salt 'my-minion' namecheap_domains_dns.get_list sld tld

salt.modules.namecheap_domains_dns.set_custom(sld, tld, nameservers)
Sets domain to use custom DNS servers.
returns True if the custom nameservers were set successfully
sld  SLD of the domain name
  tld  TLD of the domain name
  nameservers  array of strings List of nameservers to be associated with this domain
  CLI Example:
salt 'my-minion' namecheap_domains_dns.set_custom sld tld nameserver

salt.modules.namecheap_domains_dns.set_default(sld, tld)
Sets domain to use namecheap default DNS servers. Required for free services like Host record management,
   URL forwarding, email forwarding, dynamic DNS and other value added services.
  sld  SLD of the domain name
  tld  TLD of the domain name
  Returns True if the domain was successfully pointed at the default DNS servers.
  CLI Example:
salt 'my-minion' namecheap_domains_dns.set_default sld tld

salt.modules.namecheap_domains_dns.set_hosts(sld, tld, hosts)
Sets DNS host records settings for the requested domain.
returns True if the host records were set successfully
sld  SLD of the domain name
  tld  TLD of the domain name
  hosts  Must be passed as a list of Python dictionaries, with each dictionary containing the following keys:
     • hostname
     • recordtype - One of A, AAAA, CNAME, MX, MXE, TXT, URL, URL301, or FRAME
     • address - URL or IP address
     • ttl - An integer between 60 and 60000 (default: 1800)
  Additionally, the mxpref key can be present, but must be accompanied by an emailtype key.
  CLI Example:
23.9.66 salt.modules.namecheap_domains_ns

Namecheap Nameserver Management
New in version 2017.7.0.

Prerequisites

This module uses the requests Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

```
salt.modules.namecheap_domains_ns.create(sld, tld, nameserver, ip)
    Creates a new nameserver. Returns True if the nameserver was created successfully.
    sld    SLD of the domain name
    tld    TLD of the domain name
    nameserver    Nameserver to create
    ip    Nameserver IP address
    CLI Example:
    salt '*' namecheap_domains_ns.create sld tld nameserver ip
```

```
salt.modules.namecheap_domains_ns.delete(sld, tld, nameserver)
    Deletes a nameserver. Returns True if the nameserver was deleted successfully
    sld    SLD of the domain name
    tld    TLD of the domain name
    nameserver    Nameserver to delete
    CLI Example:
    salt '*' namecheap_domains_ns.delete sld tld nameserver
```

```
salt.modules.namecheap_domains_ns.get_info(sld, tld, nameserver)
    Retrieves information about a registered nameserver. Returns the following information:
    - IP Address set for the nameserver
    - Domain name which was queried
```
• A list of nameservers and their statuses

sld  SLD of the domain name

tld  TLD of the domain name

nameserver  Nameserver to retrieve

CLI Example:

```
salt '*' namecheap_domains_ns.get_info sld tld nameserver
```

salt.modules.namecheap_domains_ns.update(sld, tld, nameserver, old_ip, new_ip)

Deletes a nameserver. Returns True if the nameserver was updated successfully.

- sld  SLD of the domain name
- tld  TLD of the domain name
- nameserver  Nameserver to create
- old_ip  Current ip address
- new_ip  New ip address

CLI Example:

```
salt '*' namecheap_domains_ns.update sld tld nameserver old_ip new_ip
```

### 23.9.67 salt.modules.namecheap_users

Namecheap User Management

New in version 2017.7.0.

**Prerequisites**

This module uses the requests Python module to communicate to the namecheap API.

**Configuration**

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

salt.modules.namecheap_users.check_balances(minimum=100)

Checks if the provided minimum value is present in the user’s account.

- minimum  [100] The value to check

Returns a boolean. Returns False if the user’s account balance is less than the provided minimum or True if greater than the minimum.
CLI Example:

```
salt 'my-minion' namecheap_users.check_balances
salt 'my-minion' namecheap_users.check_balances minimum=150
```

Salt modules.namecheap_users.get_balances()

Gets information about fund in the user’s account. This method returns the following information: Available Balance, Account Balance, Earned Amount, Withdrawable Amount and Funds Required for AutoRenew.

Note: If a domain setup with automatic renewal is expiring within the next 90 days, the FundsRequired-ForAutoRenew attribute shows the amount needed in your Namecheap account to complete auto renewal.

CLI Example:

```
salt 'my-minion' namecheap_users.get_balances
```

23.9.68 salt.modules.netaddress

Module for getting information about network addresses.

New in version 2016.3.0.

depends netaddr

salt.modules.netaddress.cidr_broadcast(cidr)

Get the broadcast address associated with a CIDR address.

CLI Example:

```
salt myminion netaddress.cidr_netmask 192.168.0.0/20
```

salt.modules.netaddress.cidr_netmask(cidr)

Get the netmask address associated with a CIDR address.

CLI Example:

```
salt myminion netaddress.cidr_netmask 192.168.0.0/20
```

salt.modules.netaddress.list_cidr_ips(cidr)

Get a list of IP addresses from a CIDR.

CLI Example:

```
salt myminion netaddress.list_cidr_ips 192.168.0.0/20
```

salt.modules.netaddress.list_cidr_ips_ipv6(cidr)

Get a list of IPv6 addresses from a CIDR.

CLI Example:

```
salt myminion netaddress.list_cidr_ips_ipv6 192.168.0.0/20
```
23.9.69 salt.modules.netbox

NetBox

Module to query NetBox

   codeauthor  Zach Moody <zmoody@do.co>
   maturity    new
   depends     pynetbox

The following config should be in the minion config file. In order to work with secrets you should provide a token and path to your private key file:

```
netbox:
  url: <NETBOX_URL>
  token: <NETBOX_USERNAME_API_TOKEN (OPTIONAL)>
  keyfile: </PATH/TO/NETBOX/KEY (OPTIONAL)>
```

New in version 2018.3.0.

salt.modules.netbox.create_circuit(name, provider_id, circuit_type, description=None)

New in version 2019.2.0.

Create a new Netbox circuit

   name  Name of the circuit
   provider_id  The netbox id of the circuit provider
   circuit_type  The name of the circuit type
   asn  The ASN of the circuit provider
   description  The description of the circuit

CLI Example:

```
salt myminion netbox.create_circuit NEW_CIRCUIT_01 Telia Transit 1299 "New Telia\→circuit"
```

salt.modules.netbox.create_circuit_provider(name, asn=None)

New in version 2019.2.0.

Create a new Netbox circuit provider

   name  The name of the circuit provider
   asn  The ASN of the circuit provider

CLI Example:

```
salt myminion netbox.create_circuit_provider Telia 1299
```

salt.modules.netbox.create_circuit_termination(circuit, interface, device, speed, xconnect_id=None, term_side='A')

New in version 2019.2.0.

Terminate a circuit on an interface

   circuit  The name of the circuit
   interface  The name of the interface to terminate on
device  The name of the device the interface belongs to
speed  The speed of the circuit, in Kbps
xconnect_id  The cross-connect identifier
term_side  The side of the circuit termination

CLI Example:

```
salt myminion netbox.create_circuit_termination NEW_CIRCUIT_01 xe-0/0/1 myminion
--10000 xconnect_id=XCON01
```

salt.modules.netbox.create_circuit_type(name)

New in version 2019.2.0.
Create a new Netbox circuit type.

name  The name of the circuit type

CLI Example:

```
salt myminion netbox.create_circuit_type Transit
```

salt.modules.netbox.create_device(name, role, model, manufacturer, site)

New in version 2019.2.0.
Create a new device with a name, role, model, manufacturer and site. All these components need to be already
in Netbox.

name  The name of the device, e.g., edge_router
role  String of device role, e.g., router
model  String of device model, e.g., MX480
manufacturer  String of device manufacturer, e.g., Juniper
site  String of device site, e.g., BRU

CLI Example:

```
salt myminion netbox.create_device edge_router router MX480 Juniper BRU
```

salt.modules.netbox.create_device_role(role, color)

New in version 2019.2.0.
Create a device role

role  String of device role, e.g., router

CLI Example:

```
salt myminion netbox.create_device_role router
```

salt.modules.netbox.create_device_type(model, manufacturer)

New in version 2019.2.0.
Create a device type. If the manufacturer doesn't exist, create a new manufacturer.

model  String of device model, e.g., MX480
manufacturer  String of device manufacturer, e.g., Juniper

CLI Example:
**salt myminion netbox.create_device_type MX480 Juniper**

```python
salt.modules.netbox.create_interface(device_name, interface_name, mac_address=None, description=None, enabled=None, lag=None, lag_parent=None, form_factor=None)
```

New in version 2019.2.0.

Attach an interface to a device. If not all arguments are provided, they will default to Netbox defaults.

- **device_name** The name of the device, e.g., `edge_router`
- **interface_name** The name of the interface, e.g., `TenGigE0/0/0/0`
- **mac_address** String of mac address, e.g., `50:87:89:73:92:C8`
- **description** String of interface description, e.g., `NTT`
- **enabled** String of boolean interface status, e.g., `True`
- **lag** Boolean of interface lag status, e.g., `True`
- **lag_parent** String of interface lag parent name, e.g., `ae13`
- **form_factor** Integer of form factor id, obtained through _choices API endpoint, e.g., `200`

CLI Example:
```
salt myminion netbox.create_interface edge_router ae13 description="Core uplink"
```

**salt.modules.netbox.create_interface_connection(interface_a, interface_b)**

New in version 2019.2.0.

Create an interface connection between 2 interfaces

- **interface_a** Interface id for Side A
- **interface_b** Interface id for Side B

CLI Example:
```
salt myminion netbox.create_interface_connection 123 456
```

**salt.modules.netbox.create_inventory_item(device_name, item_name, manufacturer_name=None, serial='', part_id='', description='')**

New in version 2019.2.0.

Add an inventory item to an existing device.

- **device_name** The name of the device, e.g., `edge_router`
- **item_name** String of inventory item name, e.g., `Transceiver`
- **manufacturer_name** String of inventory item manufacturer, e.g., `Fiberstore`
- **serial** String of inventory item serial, e.g., `FS1238931`
- **part_id** String of inventory item part id, e.g., `740-01234`
- **description** String of inventory item description, e.g., `SFP+-10G-LR`

CLI Example:
```
salt myminion netbox.create_inventory_item edge_router Transceiver part_id=740-01234
```
salt.modules.netbox.create_ipaddress(ip_address, family, device=None, interface=None)

New in version 2019.2.0.

Add an IP address, and optionally attach it to an interface.

ip_address The IP address and CIDR, e.g., 192.168.1.1/24
family Integer of IP family, e.g., 4
device The name of the device to attach IP to, e.g., edge_router
interface The name of the interface to attach IP to, e.g., ae13

CLI Example:

```bash
salt myminion netbox.create_ipaddress 192.168.1.1/24 4 device=edge_router
←interface=ae13
```

salt.modules.netbox.create_manufacturer(name)

New in version 2019.2.0.

Create a device manufacturer.

name The name of the manufacturer, e.g., Juniper

CLI Example:

```bash
salt myminion netbox.create_manufacturer Juniper
```

salt.modules.netbox.create_platform(platform)

New in version 2019.2.0.

Create a new device platform

platform String of device platform, e.g., junos

CLI Example:

```bash
salt myminion netbox.create_platform junos
```

salt.modules.netbox.create_site(site)

New in version 2019.2.0.

Create a new device site

site String of device site, e.g., BRU

CLI Example:

```bash
salt myminion netbox.create_site BRU
```

salt.modules.netbox.delete_interface(device_name, interface_name)

New in version 2019.2.0.

Delete an interface from a device.

device_name The name of the device, e.g., edge_router.
interface_name The name of the interface, e.g., ae13

CLI Example:

```bash
salt myminion netbox.delete_interface edge_router ae13
```
salt.modules.netbox.delete_inventory_item(item_id)
New in version 2019.2.0.
Remove an item from a devices inventory. Identified by the netbox id
item_id Integer of item to be deleted
CLI Example:
```
salt myminion netbox.delete_inventory_item 1354
```

salt.modules.netbox.delete_ipaddress(ipaddr_id)
New in version 2019.2.0.
Delete an IP address. IP addresses in Netbox are a combination of address and the interface it is assigned to.
id The Netbox id for the IP address.
CLI Example:
```
salt myminion netbox.delete_ipaddress 9002
```

salt.modules.netbox.filter_(app, endpoint, **kwargs)
Get a list of items from NetBox.
app String of netbox app, e.g., dcim, circuits, ipam
endpoint String of app endpoint, e.g., sites, regions, devices
kwargs Optional arguments that can be used to filter. All filter keywords are available in Netbox, which can be found by surfing to the corresponding API endpoint, and clicking Filters. e.g., role=router
Returns a list of dictionaries
```
salt myminion netbox.filter dcim devices status=1 role=router
```

salt.modules.netbox.get_(app, endpoint, id=None, **kwargs)
Get a single item from NetBox.
app String of netbox app, e.g., dcim, circuits, ipam
endpoint String of app endpoint, e.g., sites, regions, devices
Returns a single dictionary
To get an item based on ID.
```
salt myminion netbox.get dcim devices id=123
```
Or using named arguments that correspond with accepted filters on the NetBox endpoint.
```
salt myminion netbox.get dcim devices name=my-router
```

salt.modules.netbox.get_circuit_provider(name, asn=None)
New in version 2019.2.0.
Get a circuit provider with a given name and optional ASN.
name The name of the circuit provider
asn The ASN of the circuit provider
CLI Example:
```
salt myminion netbox.get_circuit_provider Telia 1299
```

```
salt.modules.netbox.get_interfaces
    (device_name=None, **kwargs)

New in version 2019.2.0.

Returns interfaces for a specific device using arbitrary netbox filters

device_name  The name of the device, e.g., edge_router

kwargs  Optional arguments to be used for filtering

CLI Example:
```
salt myminion netbox.get_interfaces edge_router name="et-0/0/5"
```

```
salt.modules.netbox.get_ipaddresses
    (device_name=None, **kwargs)

New in version 2019.2.0.

Filters for an IP address using specified filters

device_name  The name of the device to check for the IP address

kwargs  Optional arguments that can be used to filter, e.g., family=4

CLI Example:
```
salt myminion netbox.get_ipaddresses device_name family=4
```

```
salt.modules.netbox.make_interface_child
    (device_name, interface_name, parent_name)

New in version 2019.2.0.

Set an interface as part of a LAG.

device_name  The name of the device, e.g., edge_router.

interface_name  The name of the interface to be attached to LAG, e.g., xe-1/0/2.

parent_name  The name of the LAG interface, e.g., ae13.

CLI Example:
```
salt myminion netbox.make_interface_child xe-1/0/2 ae13
```

```
salt.modules.netbox.make_interface_lag
    (device_name, interface_name)

New in version 2019.2.0.

Update an interface to be a LAG.

device_name  The name of the device, e.g., edge_router.

interface_name  The name of the interface, e.g., ae13.

CLI Example:
```
salt myminion netbox.make_interface_lag edge_router ae13
```

```
salt.modules.netbox.openconfig_interfaces
    (device_name=None)

New in version 2019.2.0.

Return a dictionary structured as standardised in the openconfig-interfaces YANG model, containing physical and configuration data available in Netbox, e.g., IP addresses, MTU, enabled / disabled, etc.

device_name: None  The name of the device to query the interface data for. If not provided, will use the Minion ID.
```
CLI Example:

```
salt '*' netbox.openconfig_interfaces
salt '!' netbox.openconfig_interfaces device_name=cr1.thn.lon
```

```
salt.modules.netbox.openconfig_lacp(device_name=None)
```

New in version 2019.2.0.

Return a dictionary structured as standardised in the openconfig-lacp YANG model, with configuration data for Link Aggregation Control Protocol (LACP) for aggregate interfaces.

**Note:** The `interval` and `lacp_mode` keys have the values set as SLOW and ACTIVE respectively, as this data is not currently available in Netbox, therefore defaulting to the values defined in the standard. See `interval` and `lacp-mode` for further details.

```
device_name: None  The name of the device to query the LACP information for. If not provided, will use the Minion ID.
```

CLI Example:

```
salt '!' netbox.openconfig_lacp
salt '!' netbox.openconfig_lacp device_name=cr1.thn.lon
```

```
salt.modules.netbox.slugify(value)
```

' Slugify given value. Credit to Djangoproject https://docs.djangoproject.com/en/2.0/_modules/django/utils/text/#slugify

```
salt.modules.netbox.update_device(name, **kwargs)
```

New in version 2019.2.0.

Add attributes to an existing device, identified by name.

```
name The name of the device, e.g., edge_router
```

```
kwargs Arguments to change in device, e.g., serial=JN2932930
```

CLI Example:

```
salt myminion netbox.update_device edge_router serial=JN2932920
```

```
salt.modules.netbox.update_interface(device_name, interface_name, **kwargs)
```

New in version 2019.2.0.

Update an existing interface with new attributes.

```
device_name The name of the device, e.g., edge_router
```

```
interface_name The name of the interface, e.g., ae13
```

```
kwargs Arguments to change in interface, e.g., mac_address=50:87:69:53:32:D0
```

CLI Example:

```
salt myminion netbox.update_interface edge_router ae13 mac_address=50:87:69:53:32:D0
```
23.9.70 salt.modules.netbsdservice

The service module for NetBSD

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see here.

salt.modules.netbsdservice.available(name)
Returns True if the specified service is available, otherwise returns False.

CLI Example:
salt '*' service.available sshd

salt.modules.netbsdservice.disable(name, **kwargs)
Disable the named service to start at boot

CLI Example:
salt '*' service.disable <service name>

salt.modules.netbsdservice.disabled(name)
Return True if the named service is enabled, false otherwise

CLI Example:
salt '*' service.disabled <service name>

salt.modules.netbsdservice.enable(name, **kwargs)
Enable the named service to start at boot

CLI Example:
salt '*' service.enable <service name>

salt.modules.netbsdservice.enabled(name, **kwargs)
Return True if the named service is enabled, false otherwise

CLI Example:
salt '*' service.enabled <service name>

salt.modules.netbsdservice.force_reload(name)
Force-reload the named service

CLI Example:
salt '*' service.force_reload <service name>

salt.modules.netbsdservice.get_all()
Return all available boot services

CLI Example:
salt '*' service.get_all

salt.modules.netbsdservice.get_disabled()
Return a set of services that are installed but disabled
Salt Documentation, Release 3002.5

CLI Example:

```python
salt '*' service.get_disabled
```

**salt.modules.netbsdservice.get_enabled()**

Return a list of service that are enabled on boot

CLI Example:

```python
salt '*' service.get_enabled
```

**salt.modules.netbsdservice.missing(name)**

The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```python
salt '*' service.missing sshd
```

**salt.modules.netbsdservice.reload_(name)**

Reload the named service

CLI Example:

```python
salt '*' service.reload <service name>
```

**salt.modules.netbsdservice.restart(name)**

Restart the named service

CLI Example:

```python
salt '*' service.restart <service name>
```

**salt.modules.netbsdservice.start(name)**

Start the specified service

CLI Example:

```python
salt '*' service.start <service name>
```

**salt.modules.netbsdservice.status(name, sig=None)**

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Parameters

- **name (str)** -- The name of the service to check
- **sig (str)** -- Signature to use to find the service via ps

Returns  True if running, False otherwise dict: Maps service name to True/False otherwise

Return type  bool

CLI Example:

```python
salt '*' service.status <service name> [service signature]
```
**salt.minions.netbsdservice.stop**

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

---

## 23.9.71 salt.minions.neutron

Module for handling OpenStack Neutron calls

**depends**

- neutronclient Python module

**configuration** This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion’s config file. For example:

```python
keystone.user: 'admin'
keystone.password: 'password'
keystone.tenant: 'admin'
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
keystone.region_name: 'RegionOne'
keystone.service_type: 'network'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```python
openstack1:
  keystone.user: 'admin'
  keystone.password: 'password'
  keystone.tenant: 'admin'
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
  keystone.region_name: 'RegionOne'
  keystone.service_type: 'network'

openstack2:
  keystone.user: 'admin'
  keystone.password: 'password'
  keystone.tenant: 'admin'
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
  keystone.region_name: 'RegionOne'
  keystone.service_type: 'network'
```

With this configuration in place, any of the neutron functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' neutron.network_list profile=openstack1
```

To use keystoneauth1 instead of keystoneclient, include the `use_keystoneauth` option in the pillar or minion config.

**Note:** this is required to use keystone v3 as for authentication.
salt.modules.neutron.add_gateway_router (router, ext_network, profile=None)

Adds an external network gateway to the specified router

CLI Example:

```
salt '*' neutron.add_gateway_router router-name ext-network-name
```

Parameters

- **router** -- ID or name of the router
- **ext_network** -- ID or name of the external network the gateway
- **profile** -- Profile to build on (Optional)

Returns

Added Gateway router information

salt.modules.neutron.add_interface_router (router, subnet, profile=None)

Adds an internal network interface to the specified router

CLI Example:

```
salt '*' neutron.add_interface_router router-name subnet-name
```

Parameters

- **router** -- ID or name of the router
- **subnet** -- ID or name of the subnet
- **profile** -- Profile to build on (Optional)

Returns

Added interface information

salt.modules.neutron.create_firewall_rule (protocol, action, profile=None, **kwargs)

Creates a new firewall rule

CLI Example:

```
salt '*' neutron.create_firewall_rule protocol action
  tenant_id=tenant_id name=name description=description ip_version=ip_version
  source_ip_address=source_ip_address destination_ip_address=destination_ip_address
  source_port=source_port
  destination_port=destination_port shared=shared enabled=enabled
```

Note: by default the neutron module will attempt to verify its connection utilizing the system certificates. If you need to verify against another bundle of CA certificates or want to skip verification altogether you will need to specify the verify option. You can specify True or False to verify (or not) against system certificates, a path to a bundle or CA certs to check against, or None to allow keystoneauth to search for the certificates on its own. (defaults to True)
Parameters

- **protocol** -- Protocol for the firewall rule, choose "tcp","udp","icmp" or "None".
- **action** -- Action for the firewall rule, choose "allow" or "deny".
- **tenant_id** -- The owner tenant ID. (Optional)
- **name** -- Name for the firewall rule. (Optional)
- **description** -- Description for the firewall rule. (Optional)
- **ip_version** -- IP protocol version, default: 4. (Optional)
- **source_ip_address** -- Source IP address or subnet. (Optional)
- **destination_ip_address** -- Destination IP address or subnet. (Optional)
- **source_port** -- Source port (integer in [1, 65535] or range in a:b). (Optional)
- **destination_port** -- Destination port (integer in [1, 65535] or range in a:b). (Optional)
- **shared** -- Set shared to True, default: False. (Optional)
- **enabled** -- To enable this rule, default: True. (Optional)

```
salt.modules.neutron.create_floatingip(floating_network, port=None, profile=None)
```

Creates a new floatingIP

CLI Example:

```
salt '*' neutron.create_floatingip network-name port-name
```

Parameters

- **floating_network** -- Network name or ID to allocate floatingIP from
- **port** -- Of the port to be associated with the floatingIP (Optional)
- **profile** -- Profile to build on (Optional)

Returns Created floatingIP information

```
salt.modules.neutron.create_ikepolicy(name, profile=None, **kwargs)
```

Creates a new IKEPolicy

CLI Example:

```
salt '*' neutron.create_ikepolicy ikepolicy-name
    phase1_negotiation_mode=main auth_algorithm=sha1
    encryption_algorithm=aes-128 pfs=group5
```

Parameters

- **name** -- Name of the IKE policy
- **phase1_negotiation_mode** -- IKE Phase1 negotiation mode in lowercase, default: main (Optional)
- **auth_algorithm** -- Authentication algorithm in lowercase, default: sha1 (Optional)
- **encryption_algorithm** -- Encryption algorithm in lowercase. default:aes-128 (Optional)
- **pfs** -- Prefect Forward Security in lowercase, default: group5 (Optional)
- **units** -- IKE lifetime attribute. default: seconds (Optional)
- **value** -- IKE lifetime attribute. default: 3600 (Optional)
- **ike_version** -- IKE version in lowercase, default: v1 (Optional)
- **profile** -- Profile to build on (Optional)
- **kwargs** --

Returns  Created IKE policy information

```
salt.modules.neutron.create_ipsec_site_connection(name, ipsecpolicy, ikepolicy, vpnservice, peer_cidrs, peer_address, peer_id, psk, admin_state_up=True, profile=None, **kwargs)
```

Creates a new IPsecSiteConnection

CLI Example:
```
salt '*' neutron.show_ipsec_site_connection connection-name ipsecpolicy-name ikepolicy-name vpnservice-name 192.168.XXX.XXX/24 192.168.XXX.XXX 192.168.XXX.XXX secret
```

Parameters

- **name** -- Set friendly name for the connection
- **ipsecpolicy** -- IPSec policy ID or name associated with this connection
- **ikepolicy** -- IKE policy ID or name associated with this connection
- **vpnservice** -- VPN service instance ID or name associated with this connection
- **peer_cidrs** -- Remote subnet(s) in CIDR format
- **peer_address** -- Peer gateway public IPv4/IPv6 address or FQDN
- **peer_id** -- Peer router identity for authentication Can be IPv4/IPv6 address, e-mail address, key id, or FQDN
- **psk** -- Pre-shared key string
- **initiator** -- Initiator state in lowercase, default:bi-directional
- **admin_state_up** -- Set admin state up to true or false, default: True (Optional)
- **mtu** -- size for the connection, default:1500 (Optional)
- **dpd_action** -- Dead Peer Detection attribute: hold/clear/disabled/ restart/restart-by-peer (Optional)
- **dpd_interval** -- Dead Peer Detection attribute (Optional)
- **dpd_timeout** -- Dead Peer Detection attribute (Optional)
- **profile** -- Profile to build on (Optional)

Returns  Created IPSec site connection information

```
salt.modules.neutron.create_ipsecpolicy(name, profile=None, **kwargs)
```

Creates a new IPsecPolicy

CLI Example:
salt '*' neutron.create_ipsecpolicy ipsecpolicy-name
  transform_protocol=esp auth_algorithm=sha1
  encapsulation_mode=tunnel encryption_algorithm=aes-128

Parameters

- name -- Name of the IPSec policy
- transform_protocol -- Transform protocol in lowercase, default: esp (Optional)
- auth_algorithm -- Authentication algorithm in lowercase, default: sha1 (Optional)
- encapsulation_mode -- Encapsulation mode in lowercase, default: tunnel (Optional)
- encryption_algorithm -- Encryption algorithm in lowercase, default: aes-128 (Optional)
- pfs -- Prefect Forward Security in lowercase, default: group5 (Optional)
- units -- IPSec lifetime attribute. default: seconds (Optional)
- value -- IPSec lifetime attribute. default: 3600 (Optional)
- profile -- Profile to build on (Optional)

Returns
Created IPSec policy information

```
salt.modules.neutron.create_network(name, router_ext=None, admin_state_up=True, network_type=None, physical_network=None, segmentation_id=None, shared=None, profile=None)
```

Creates a new network

CLI Example:

```
salt '*' neutron.create_network network-name
salt '*' neutron.create_network network-name profile=openstack1
```

Parameters

- name -- Name of network to create
- admin_state_up -- should the state of the network be up? default: True (Optional)
- router_ext -- True then if create the external network (Optional)
- network_type -- the Type of network that the provider is such as GRE, VXLAN, VLAN, FLAT, or LOCAL (Optional)
- physical_network -- the name of the physical network as neutron knows it (Optional)
- segmentation_id -- the vlan id or GRE id (Optional)
- shared -- is the network shared or not (Optional)
- profile -- Profile to build on (Optional)

Returns
Created network information

```
salt.modules.neutron.create_port(name, network, device_id=None, admin_state_up=True, profile=None)
```

Creates a new port

CLI Example:
salt '*' neutron.create_port network-name port-name

Parameters

- **name** -- Name of port to create
- **network** -- Network name or ID
- **device_id** -- ID of device (Optional)
- **admin_state_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)

Returns  Created port information

salt.modules.neutron.create_router(name, ext_network=None, admin_state_up=True, profile=None)

Creates a new router

CLI Example: 

salt '*' neutron.create_router new-router-name

Parameters

- **name** -- Name of router to create (must be first)
- **ext_network** -- ID or name of the external for the gateway (Optional)
- **admin_state_up** -- Set admin state up to true or false, default:true (Optional)
- **profile** -- Profile to build on (Optional)

Returns  Created router information

salt.modules.neutron.create_security_group(name=None, description=None, profile=None)

Creates a new security group

CLI Example: 

salt '*' neutron.create_security_group security-group-name

Parameters

- **name** -- Name of security group (Optional)
- **description** -- Description of security group (Optional)
- **profile** -- Profile to build on (Optional)

Returns  Created security group information

salt.modules.neutron.create_security_group_rule

Creates a new security group rule

salt '*' neutron.create_security_group_rule security-group-rule

Parameters

- **security_group**
- **remote_group_id**
- **direction**
- **protocol**
- **port_range_min**
- **port_range_max**
- **ether-type**
- **profile**

Returns  Created security group information
CLI Example:

```
salt '*' neutron.show_security_group_rule security-group-rule-id
```

Parameters

- `security_group` -- Security group name or ID to add rule
- `remote_group_id` -- Remote security group name or ID to apply rule (Optional)
- `direction` -- Direction of traffic: ingress/egress, default: ingress (Optional)
- `protocol` -- Protocol of packet: null/icmp/tcp/udp, default: null (Optional)
- `port_range_min` -- Starting port range (Optional)
- `port_range_max` -- Ending port range (Optional)
- `ethertype` -- IPv4/IPv6, default: IPv4 (Optional)
- `profile` -- Profile to build on (Optional)

Returns Created security group rule information

```
salt.modules.neutron.create_subnet(network, cidr, name=None, ip_version=4, profile=None)
```

Creates a new subnet

CLI Example:

```
salt '*' neutron.create_subnet network-name 192.168.1.0/24
```

Parameters

- `network` -- Network ID or name this subnet belongs to
- `cidr` -- CIDR of subnet to create (Ex. '192.168.1.0/24')
- `name` -- Name of the subnet to create (Optional)
- `ip_version` -- Version to use, default is 4(IPv4) (Optional)
- `profile` -- Profile to build on (Optional)

Returns Created subnet information

```
salt.modules.neutron.create_vpnservice(subnet, router, name, admin_state_up=True, profile=None)
```

Creates a new VPN service

CLI Example:

```
salt '*' neutron.create_vpnservice router-name name
```

Parameters

- `subnet` -- Subnet unique identifier for the VPN service deployment
- `router` -- Router unique identifier for the VPN service
- `name` -- Set a name for the VPN service
- `admin_state_up` -- Set admin state up to true or false, default:True (Optional)
- `profile` -- Profile to build on (Optional)
Returns Created VPN service information

salt.modules.neutron.delete_firewall_rule(firewall_rule, profile=None)
Deletes the specified firewall_rule

CLI Example:
```bash
salt '*' neutron.delete_firewall_rule firewall-rule
```

Parameters
- firewall_rule -- ID or name of firewall rule to delete
- profile -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.deleteFloatingip(floatingip_id, profile=None)
Deletes the specified floating IP

CLI Example:
```bash
salt '*' neutron.delete_floatingip floatingip-id
```

Parameters
- floatingip_id -- ID of floatingIP to delete
- profile -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.delete_ikepolicy(ikepolicy, profile=None)
Deletes the specified IKEPolicy

CLI Example:
```bash
salt '*' neutron.delete_ikepolicy ikepolicy-name
```

Parameters
- ikepolicy -- ID or name of IKE policy to delete
- profile -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.delete_ipsec_site_connection(ipsec_site_connection, profile=None)
Deletes the specified IPsecSiteConnection

CLI Example:
```bash
salt '*' neutron.delete_ipsec_site_connection connection-name
```

Parameters
- ipsec_site_connection -- ID or name of ipsec site connection to delete
- profile -- Profile to build on (Optional)
Returns  True(Succeed) or False

```
salt.modules.neutron.delete_ipsecpolicy(ipsecpolicy, profile=None)
```
Deletes the specified IPsecPolicy

CLI Example:
```
salt '*' neutron.delete_ipsecpolicy ipsecpolicy-name
```

Parameters
- **ipsecpolicy** -- ID or name of IPsec policy to delete
- **profile** -- Profile to build on (Optional)

Returns  True(Succeed) or False

```
salt.modules.neutron.delete_network(network, profile=None)
```
Deletes the specified network

CLI Example:
```
salt '*' neutron.delete_network network-name
salt '*' neutron.delete_network network-name profile=openstack1
```

Parameters
- **network** -- ID or name of network to delete
- **profile** -- Profile to build on (Optional)

Returns  True(Succeed) or False

```
salt.modules.neutron.delete_port(port, profile=None)
```
Deletes the specified port

CLI Example:
```
salt '*' neutron.delete_network port-name
salt '*' neutron.delete_network port-name profile=openstack1
```

Parameters
- **port** -- port name or ID
- **profile** -- Profile to build on (Optional)

Returns  True(Succeed) or False

```
salt.modules.neutron.delete_quota(tenant_id, profile=None)
```
Delete the specified tenant's quota value

CLI Example:
```
salt '*' neutron.update_quota tenant-id
salt '*' neutron.update_quota tenant-id profile=openstack1
```

Parameters
- **tenant_id** -- ID of tenant to quota delete

23.9. execution modules
• **profile** -- Profile to build on (Optional)

**Returns**  True(Delete succeed) or False(Delete failed)

`salt.modules.neutron.delete_router` *(router, profile=None)*
Delete the specified router

CLI Example:
```
salt '*' neutron.delete_router router-name
```

**Parameters**

• **router** -- ID or name of router to delete
• **profile** -- Profile to build on (Optional)

**Returns**  True(Succeed) or False

`salt.modules.neutron.delete_security_group` *(security_group, profile=None)*
Deletes the specified security group

CLI Example:
```
salt '*' neutron.delete_security_group security-group-name
```

**Parameters**

• **security_group** -- ID or name of security group to delete
• **profile** -- Profile to build on (Optional)

**Returns**  True(Succeed) or False

`salt.modules.neutron.delete_security_group_rule` *(security_group_rule_id, profile=None)*
Deletes the specified security group rule

CLI Example:
```
salt '*' neutron.delete_security_group_rule security-group-rule-id
```

**Parameters**

• **security_group_rule_id** -- ID of security group rule to delete
• **profile** -- Profile to build on (Optional)

**Returns**  True(Succeed) or False

`salt.modules.neutron.delete_subnet` *(subnet, profile=None)*
Deletes the specified subnet

CLI Example:
```
salt '*' neutron.delete_subnet subnet-name
salt '*' neutron.delete_subnet subnet-name profile=openstack1
```

**Parameters**

• **subnet** -- ID or name of subnet to delete
salt.modules.neutron.delete_vpnservice(vpnservice, profile=None)
Deletes the specified VPN service

CLI Example:
```
salt '*' neutron.delete_vpnservice vpnservice-name
```

Parameters

• **vpnservice** -- ID or name of vpn service to delete

• **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.get_quotas_tenant(profile=None)
Fetches tenant info in server's context for following quota operation

CLI Example:
```
salt '*' neutron.get_quotas_tenant
salt '*' neutron.get_quotas_tenant profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)

Returns Quotas information

salt.modules.neutron.list_agents(profile=None)
List agents.

CLI Example:
```
salt '*' neutron.list_agents
```

Parameters **profile** -- Profile to build on (Optional)

Returns agents message.

salt.modules.neutron.list_extensions(profile=None)
Fetches a list of all extensions on server side

CLI Example:
```
salt '*' neutron.list_extensions
salt '*' neutron.list_extensions profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)

Returns List of extensions

salt.modules.neutron.list_firewall_rules(profile=None)
Fetches a list of all firewall rules for a tenant

CLI Example:
salt '*' neutron.list_firewall_rules

Parameters profile -- Profile to build on (Optional)
Returns List of firewall rules

salt.modules.neutron.list_firewalls(profile=None)
Fetched a list of all firewalls for a tenant

CLI Example:
salt '*' neutron.list_firewalls

Parameters profile -- Profile to build on (Optional)
Returns List of firewalls

salt.modules.neutron.list_floatingips(profile=None)
Fetch a list of all floatingIPs for a tenant

CLI Example:
salt '*' neutron.list_floatingips
salt '*' neutron.list_floatingips profile=openstack1

Parameters profile -- Profile to build on (Optional)
Returns List of floatingIP

salt.modules.neutron.list_ikepolicies(profile=None)
Fetche a list of all configured IKEPolicies for a tenant

CLI Example:
salt '*' neutron.list_ikepolicies
salt '*' neutron.list_ikepolicies profile=openstack1

Parameters profile -- Profile to build on (Optional)
Returns List of IKE policy

salt.modules.neutron.list_ipsec_site_connections(profile=None)
Fetches all configured IPsec Site Connections for a tenant

CLI Example:
salt '*' neutron.list_ipsec_site_connections
salt '*' neutron.list_ipsec_site_connections profile=openstack1

Parameters profile -- Profile to build on (Optional)
Returns List of IPSec site connection

salt.modules.neutron.list_ipsecpolicies(profile=None)
Fetche a list of all configured IPsecPolicies for a tenant

CLI Example:
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>salt '*' neutron.list_ipsecpolicies ipsecpolicy-name</code></td>
<td>List IPSec policies</td>
</tr>
<tr>
<td><code>salt '*' neutron.list_ipsecpolicies ipsecpolicy-name profile=openstack1</code></td>
<td>List IPSec policies, filter by profile</td>
</tr>
</tbody>
</table>

**Parameters**

*profile* -- Profile to build on (Optional)

**Returns**

List of IPSec policy

---

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>salt.modules.neutron.list_l3_agent_hosting_routers</code></td>
<td>List L3 agents hosting a router.</td>
</tr>
<tr>
<td><code>salt '*' neutron.list_l3_agent_hosting_routers router</code></td>
<td>Example</td>
</tr>
</tbody>
</table>

:param router: router name or ID to query. 
:param profile: Profile to build on (Optional) 
:return: L3 agents message.

**Parameters**

*profile* -- Profile to build on (Optional)

**Returns**

List of L3 agents

---

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>salt.modules.neutron.list_networks</code></td>
<td>Fetches a list of all networks for a tenant</td>
</tr>
<tr>
<td><code>salt '*' neutron.list_networks</code></td>
<td>Example</td>
</tr>
</tbody>
</table>

:param profile: Profile to build on (Optional) 
:return: List of network

**Parameters**

*profile* -- Profile to build on (Optional)

**Returns**

List of network

---

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>salt.modules.neutron.list_ports</code></td>
<td>Fetches a list of all networks for a tenant</td>
</tr>
<tr>
<td><code>salt '*' neutron.list_ports</code></td>
<td>Example</td>
</tr>
</tbody>
</table>

:param profile: Profile to build on (Optional) 
:return: List of port

**Parameters**

*profile* -- Profile to build on (Optional)

**Returns**

List of port

---

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>salt.modules.neutron.list_quotas</code></td>
<td>Fetches all tenants quotas</td>
</tr>
<tr>
<td><code>salt '*' neutron.list_quotas</code></td>
<td>Example</td>
</tr>
</tbody>
</table>

:param profile: Profile to build on (Optional) 
:return: List of quotas

**Parameters**

*profile* -- Profile to build on (Optional)

**Returns**

List of quotas

---

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>salt.modules.neutron.list_routers</code></td>
<td>Fetches a list of all routers for a tenant</td>
</tr>
<tr>
<td><code>salt '*' neutron.list_routers</code></td>
<td>Example</td>
</tr>
</tbody>
</table>

:param profile: Profile to build on (Optional) 
:return: List of routers

**Parameters**

*profile* -- Profile to build on (Optional)

**Returns**

List of routers

---
salt '*' neutron.list_routers
salt '*' neutron.list_routers profile=openstack1

Parameters profile -- Profile to build on (Optional)
Returns List of router

salt.modules.neutron.list_security_group_rules(profile=None)
Fetches a list of all security group rules for a tenant

CLI Example:

salt '*' neutron.list_security_group_rules
salt '*' neutron.list_security_group_rules profile=openstack1

Parameters profile -- Profile to build on (Optional)
Returns List of security group rule

salt.modules.neutron.list_security_groups(profile=None)
Fetches a list of all security groups for a tenant

CLI Example:

salt '*' neutron.list_security_groups
salt '*' neutron.list_security_groups profile=openstack1

Parameters profile -- Profile to build on (Optional)
Returns List of security group

salt.modules.neutron.list_subnets(profile=None)
Fetches a list of all networks for a tenant

CLI Example:

salt '*' neutron.list_subnets
salt '*' neutron.list_subnets profile=openstack1

Parameters profile -- Profile to build on (Optional)
Returns List of subnet

salt.modules.neutron.list_vpnservices(retrieve_all=True, profile=None, **kwargs)
Fetches a list of all configured VPN services for a tenant

CLI Example:

salt '*' neutron.list_vpnservices

Parameters
  - retrieve_all -- True or False, default: True (Optional)
  - profile -- Profile to build on (Optional)

Returns List of VPN service
salt.modules.neutron.remove_gateway_router(router, profile=None)
Removes an external network gateway from the specified router

CLI Example:
```
salt '*' neutron.remove_gateway_router router-name
```

Parameters
- `router` -- ID or name of router
- `profile` -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.remove_interface_router(router, subnet, profile=None)
Removes an internal network interface from the specified router

CLI Example:
```
salt '*' neutron.remove_interface_router router-name subnet-name
```

Parameters
- `router` -- ID or name of the router
- `subnet` -- ID or name of the subnet
- `profile` -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.show_firewall(firewall, profile=None)
Fetches information of a specific firewall rule

CLI Example:
```
salt '*' neutron.show_firewall firewall
```

Parameters
- `firewall` -- ID or name of firewall to look up
- `profile` -- Profile to build on (Optional)

Returns firewall information

salt.modules.neutron.show_firewall_rule(firewall_rule, profile=None)
Fetches information of a specific firewall rule

CLI Example:
```
salt '*' neutron.show_firewall_rule firewall-rule-name
```

Parameters
- `ipsecpolicy` -- ID or name of firewall rule to look up
- `profile` -- Profile to build on (Optional)

Returns firewall rule information
salt.modules.neutron.show floatingip(floatingip_id, profile=None)
Fetches information of a certain floatingIP

CLI Example:

```
salt '*' neutron.show Floatingip floatingip-id
```

Parameters

- **floatingip_id** -- ID of floatingIP to look up
- **profile** -- Profile to build on (Optional)

Returns Floating IP information

salt.modules.neutron.show ikepolicy(ikepolicy, profile=None)
Fetches information of a specific IKEPolicy

CLI Example:

```
salt '*' neutron.show ikepolicy ikepolicy-name
```

Parameters

- **ikepolicy** -- ID or name of ikepolicy to look up
- **profile** -- Profile to build on (Optional)

Returns IKE policy information

salt.modules.neutron.show ipsec site connection(ipsec_site_connection, profile=None)
Fetches information of a specific IPsecSiteConnection

CLI Example:

```
salt '*' neutron.show Ipsec Site Connection connection-name
```

Parameters

- **ipsec_site_connection** -- ID or name of ipsec site connection to look up
- **profile** -- Profile to build on (Optional)

Returns IPSec site connection information

salt.modules.neutron.show ipsec policy(ipsecpolicy, profile=None)
Fetches information of a specific IPsecPolicy

CLI Example:

```
salt '*' neutron.show Ipsec Policy ipsecpolicy-name
```

Parameters

- **ipsecpolicy** -- ID or name of IPSec policy to look up
- **profile** -- Profile to build on (Optional)

Returns IPSec policy information
salt.modules.neutron.show_network(network, profile=None)
Fetches information of a certain network

CLI Example:

```
salt '*' neutron.show_network network-name
salt '*' neutron.show_network network-name profile=openstack1
```

Parameters

- **network** -- ID or name of network to look up
- **profile** -- Profile to build on (Optional)

Returns  Network information

salt.modules.neutron.show_port(port, profile=None)
Fetches information of a certain port

CLI Example:

```
salt '*' neutron.show_port port-id
salt '*' neutron.show_port port-id profile=openstack1
```

Parameters

- **port** -- ID or name of port to look up
- **profile** -- Profile to build on (Optional)

Returns  Port information

salt.modules.neutron.show_quota(tenant_id, profile=None)
Fetches information of a certain tenant's quotas

CLI Example:

```
salt '*' neutron.show_quota tenant-id
salt '*' neutron.show_quota tenant-id profile=openstack1
```

Parameters

- **tenant_id** -- ID of tenant
- **profile** -- Profile to build on (Optional)

Returns  Quota information

salt.modules.neutron.show_router(router, profile=None)
Fetches information of a certain router

CLI Example:

```
salt '*' neutron.show_router router-name
```

Parameters

- **router** -- ID or name of router to look up
- **profile** -- Profile to build on (Optional)
Returns  Router information

```python
salt.modules.neutron.show_security_group(security_group, profile=None)
```
Fetches information of a certain security group

CLI Example:

```
salt '*' neutron.show_security_group security-group-name
```

Parameters

- **security_group** -- ID or name of security group to look up
- **profile** -- Profile to build on (Optional)

Returns  Security group information

```python
salt.modules.neutron.show_security_group_rule(security_group_rule_id, profile=None)
```
Fetches information of a certain security group rule

CLI Example:

```
salt '*' neutron.show_security_group_rule security-group-rule-id
```

Parameters

- **security_group_rule_id** -- ID of security group rule to look up
- **profile** -- Profile to build on (Optional)

Returns  Security group rule information

```python
salt.modules.neutron.show_subnet(subnet, profile=None)
```
Fetches information of a certain subnet

CLI Example:

```
salt '*' neutron.show_subnet subnet-name
```

Parameters

- **subnet** -- ID or name of subnet to look up
- **profile** -- Profile to build on (Optional)

Returns  Subnet information

```python
salt.modules.neutron.show_vpnservice(vpnservice, profile=None, **kwargs)
```
Fetches information of a specific VPN service

CLI Example:

```
salt '*' neutron.show_vpnservice vpnservice-name
```

Parameters

- **vpnservice** -- ID or name of vpn service to look up
- **profile** -- Profile to build on (Optional)

Returns  VPN service information
salt Documentation, Release 3002.5

salt.modules.neutron.update_firewall_rule(firewall_rule, protocol=None, action=None, name=None, description=None, ip_version=None, source_ip_address=None, destination_ip_address=None, source_port=None, destination_port=None, shared=None, enabled=None, profile=None)

Update a firewall rule

CLI Example:

salt '*' neutron.update_firewall_rule firewall_rule protocol=PROTOCOL action=ACTION
name=NAME description=DESCRIPTION ip_version=IP_VERSION
source_ip_address=SOURCE_IP_ADDRESS destination_ip_address=DESTINATION_IP_ADDRESS
source_port=SOURCE_PORT destination_port=DESTINATION_PORT shared=SHARED enabled=ENABLED

Parameters

- **firewall_rule** -- ID or name of firewall rule to update.
- **protocol** -- Protocol for the firewall rule, choose "tcp", "udp", "icmp" or "None". (Optional)
- **action** -- Action for the firewall rule, choose "allow" or "deny". (Optional)
- **name** -- Name for the firewall rule. (Optional)
- **description** -- Description for the firewall rule. (Optional)
- **ip_version** -- IP protocol version, default: 4. (Optional)
- **source_ip_address** -- Source IP address or subnet. (Optional)
- **destination_ip_address** -- Destination IP address or subnet. (Optional)
- **source_port** -- Source port (integer in [1, 65535] or range in a:b). (Optional)
- **destination_port** -- Destination port (integer in [1, 65535] or range in a:b). (Optional)
- **shared** -- Set shared to True, default: False. (Optional)
- **enabled** -- To enable this rule, default: True. (Optional)
- **profile** -- Profile to build on (Optional)

salt.modules.neutron.update_floatingip(floatingip_id, port=None, profile=None)

Updates a floatingIP

CLI Example:

salt '*' neutron.update_floatingip network-name port-name

Parameters

- **floatingip_id** -- ID of floatingIP
- **port** -- ID or name of port, to associate floatingip to None or do not specify to disassociate the floatingip (Optional)
- **profile** -- Profile to build on (Optional)

Returns Value of updated floating IP information
salt.modules.neutron.update_network(network, name, profile=None)

Updates a network

CLI Example:
```
salt '*' neutron.update_network network-name new-network-name
```

Parameters

- **network** -- ID or name of network to update
- **name** -- Name of this network
- **profile** -- Profile to build on (Optional)

Returns Value of updated network information

salt.modules.neutron.update_port(port, name, admin_state_up=True, profile=None)

Updates a port

CLI Example:
```
salt '*' neutron.update_port port-name network-name new-port-name
```

Parameters

- **port** -- Port name or ID
- **name** -- Name of this port
- **admin_state_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)

Returns Value of updated port information

salt.modules.neutron.update_quota(tenant_id, subnet=None, router=None, network=None, floatingip=None, port=None, security_group=None, security_group_rule=None, profile=None)

Update a tenant's quota

CLI Example:
```
salt '*' neutron.update_quota tenant-id subnet=40 router=50
    network=10 floatingip=30 port=30
```

Parameters

- **tenant_id** -- ID of tenant
- **subnet** -- Value of subnet quota (Optional)
- **router** -- Value of router quota (Optional)
- **network** -- Value of network quota (Optional)
- **floatingip** -- Value of floatingip quota (Optional)
- **port** -- Value of port quota (Optional)
- **security_group** -- Value of security group (Optional)
- **security_group_rule** -- Value of security group rule (Optional)
salt.modules.neutron.update_router(router, name=None, admin_state_up=None, profile=None, **kwargs)

Updates a router

CLI Example:
```
salt '*' neutron.update_router router_id name=new-router-name
  admin_state_up=True
```

Parameters
  - **router** -- ID or name of router to update
  - **name** -- Name of this router
  - **ext_network** -- ID or name of the external for the gateway (Optional)
  - **admin_state_up** -- Set admin state up to true or false, default: true (Optional)
  - **profile** -- Profile to build on (Optional)
  - **kwargs** --

Returns Value of updated router information

salt.modules.neutron.update_security_group(security_group, name=None, description=None, profile=None)

Updates a security group

CLI Example:
```
salt '*' neutron.update_security_group security-group-name new-
  security-group-name
```

Parameters
  - **security_group** -- ID or name of security group to update
  - **name** -- Name of this security group (Optional)
  - **description** -- Description of security group (Optional)
  - **profile** -- Profile to build on (Optional)

Returns Value of updated security group information

salt.modules.neutron.update_subnet(subnet, name, profile=None)

Updates a subnet

CLI Example:
```
salt '*' neutron.update_subnet subnet-name new-subnet-name
```

Parameters
  - **subnet** -- ID or name of subnet to update
  - **name** -- Name of this subnet
- **profile** -- Profile to build on (Optional)

**Returns** Value of updated subnet information

```python
salt.modules.neutron.update_vpnservice(vpn_service, desc, profile=None)
```

Updates a VPN service

**CLI Example:**

```
salt '*' neutron.update_vpnservice vpnservice-name desc='VPN Service1'
```

**Parameters**

- **vpnservice** -- ID or name of vpn service to update
- **desc** -- Set a description for the VPN service
- **profile** -- Profile to build on (Optional)

**Returns** Value of updated VPN service information

### 23.9.72 salt.modules.neutron.ng

Neutron module for interacting with OpenStack Neutron

New in version 2018.3.0.

:depends:shade

Example configuration

```python
neutron:
  cloud: default
```

```python
neutron:
  auth:
    username: admin
    password: password123
    user_domain_name: mydomain
    project_name: myproject
    project_domain_name: myproject
    auth_url: https://example.org:5000/v3
    identity_api_version: 3
```

```python
salt.modules.neutron.ng.compare_changes(obj, **kwargs)
```

Compare two dicts returning only keys that exist in the first dict and are different in the second one

```python
salt.modules.neutron.ng.get_openstack_cloud(auth=None)
```

Return an openstack_cloud

```python
salt.modules.neutron.ng.get_operator_cloud(auth=None)
```

Return an operator_cloud

```python
salt.modules.neutron.ng.list_networks(auth=None, **kwargs)
```

List networks

**filters** A Python dictionary of filter conditions to push down

**CLI Example:**
salt.modules.neutronng.list_networks(auth=None, **kwargs)
List networks

salt.modules.neutronng.list_subnets(auth=None, **kwargs)
List subnets

salt.modules.neutronng.network_create(auth=None, **kwargs)
Create a network

salt.modules.neutronng.network_delete(auth=None, **kwargs)
Delete a network

salt.modules.neutronng.network_get(auth=None, **kwargs)
Get a single network

salt.modules.neutronng.security_group_create(auth=None, **kwargs)
Create a security group.
CLI Example:

```python
salt '*' neutronng.security_group_create name=secgroup1 description="Very secure security group"
```

salt.modules.neutronng.security_group_delete(auth=None, **kwargs)
Delete a security group

   name_or_id  The name or unique ID of the security group

CLI Example:

```python
salt '*' neutronng.security_group_delete name_or_id=secgroup1
```

salt.modules.neutronng.security_group_get(auth=None, **kwargs)
Get a single security group. This will create a default security group if one does not exist yet for a particular project id.

   filters  A Python dictionary of filter conditions to push down

CLI Example:

```python
salt '*' neutronng.security_group_get name=1dcac318a83b4610b7a7f7ba01465548
salt '*' neutronng.security_group_get name=default filters='{"tenant_id":"2e778bb64ca64a199eb526b5958d8710"}'
```

salt.modules.neutronng.security_group_rule_create(auth=None, **kwargs)
Create a rule in a security group

   secgroup_name_or_id  The security group name or ID to associate with this security group rule. If a non-unique group name is given, an exception is raised.

   port_range_min  The minimum port number in the range that is matched by the security group rule. If the protocol is TCP or UDP, this value must be less than or equal to the port_range_max attribute value. If nova is used by the cloud provider for security groups, then a value of None will be transformed to -1.

   port_range_max  The maximum port number in the range that is matched by the security group rule. The port_range_min attribute constrains the port_range_max attribute. If nova is used by the cloud provider for security groups, then a value of None will be transformed to -1.

   protocol  The protocol that is matched by the security group rule. Valid values are None, tcp, udp, and icmp.

   remote_ip_prefix  The remote IP prefix to be associated with this security group rule. This attribute matches the specified IP prefix as the source IP address of the IP packet.

   remote_group_id  The remote group ID to be associated with this security group rule

   direction  Either ingress or egress; the direction in which the security group rule is applied. For a compute instance, an ingress security group rule is applied to incoming (ingress) traffic for that instance. An egress rule is applied to traffic leaving the instance

   ethertype  Must be IPv4 or IPv6, and addresses represented in CIDR must match the ingress or egress rules

   project_id  Specify the project ID this security group will be created on (admin-only)

CLI Example:
salt modules.neutronng.security_group_rule_delete(auth=None, **kwargs)
Delete a security group

name_or_id  The unique ID of the security group rule

CLI Example:

```
salt '*' neutronng.security_group_rule_delete name_or_id
  → id=1dcac318a83b4610b7a7f7ba01465548
```

salt modules.neutronng.security_group_update(secgroup=None, auth=None, **kwargs)
Update a security group

secgroup  Name, ID or Raw Object of the security group to update

name  New name for the security group

description  New description for the security group

CLI Example:

```
salt '*' neutronng.security_group_update secgroup=secgroup1
  → "Very secure security group"
salt '*' neutronng.security_group_update secgroup=secgroup1
  → "Very secure security group"
  → project_id=1dcac318a83b4610b7a7f7ba01465548
```

salt modules.neutronng.setup_clouds(auth=None)
Call functions to create Shade cloud objects in __context__ to take advantage of Shade's in-memory caching across several states

salt modules.neutronng.subnet_create(auth=None, **kwargs)
Create a subnet

network_name_or_id  The unique name or ID of the attached network. If a non-unique name is supplied, an exception is raised.

cidr  The CIDR

ip_version  The IP version, which is 4 or 6.

enable_dhcp  [False] Set to True if DHCP is enabled and False if disabled

subnet_name  The name of the subnet

tenant_id  The ID of the tenant who owns the network. Only administrative users can specify a tenant ID other than their own.

allocation_pools  A list of dictionaries of the start and end addresses for the allocation pools.

gateway_ip  The gateway IP address. When you specify both allocation_pools and gateway_ip, you must ensure that the gateway IP does not overlap with the specified allocation pools.
Salt Documentation, Release 3002.5

disable_gateway_ip [False] Set to True if gateway IP address is disabled and False if enabled. It is not
allowed with gateway_ip.
dns_nameservers A list of DNS name servers for the subnet
host_routes A list of host route dictionaries for the subnet
ipv6_ra_mode IPv6 Router Advertisement
dhcpv6-stateless, or slaac.

mode.

Valid

values

are

dhcpv6-stateful,

ipv6_address_mode IPv6 address mode. Valid values are dhcpv6-stateful, dhcpv6-stateless, or
slaac.
use_default_subnetpool If True, use the default subnetpool for ip_version to obtain a CIDR. It is required
to pass None to the cidr argument when enabling this option.
CLI Example:
salt '*' neutronng.subnet_create network_name_or_id=network1
subnet_name=subnet1
salt '*' neutronng.subnet_create subnet_name=subnet2
network_name_or_
,→id=network2 enable_dhcp=True
allocation_pools='[{"start": "192.168.
,→199.2",
"end": "192.168.199.254"}]'
,→gateway_ip='192.168.199.1' cidr=192.168.199.0/24
salt '*' neutronng.subnet_create network_name_or_id=network1
,→name=subnet1 dns_nameservers='["8.8.8.8", "8.8.8.7"]'

subnet_

salt.modules.neutronng.subnet_delete(auth=None, **kwargs)
Delete a subnet
name Name or ID of the subnet to update
CLI Example:
salt '*' neutronng.subnet_delete name=subnet1
salt '*' neutronng.subnet_delete
name=1dcac318a83b4610b7a7f7ba01465548

salt.modules.neutronng.subnet_get(auth=None, **kwargs)
Get a single subnet
filters A Python dictionary of filter conditions to push down
CLI Example:
salt '*' neutronng.subnet_get name=subnet1

salt.modules.neutronng.subnet_update(auth=None, **kwargs)
Update a subnet
name_or_id Name or ID of the subnet to update
subnet_name The new name of the subnet
enable_dhcp Set to True if DHCP is enabled and False if disabled
gateway_ip The gateway IP address. When you specify both allocation_pools and gateway_ip, you must
ensure that the gateway IP does not overlap with the specified allocation pools.
disable_gateway_ip [False] Set to True if gateway IP address is disabled and False if enabled. It is not allowed
with gateway_ip.
allocation_pools A list of dictionaries of the start and end addresses for the allocation pools.
1232

Chapter 23. Salt Module Reference


**dns_nameservers**  A list of DNS name servers for the subnet

**host_routes**  A list of host route dictionaries for the subnet

```python
salt '*' neutronng.subnet_update name=subnet1 subnet_name=subnet2
salt '*' neutronng.subnet_update name=subnet1 dns_nameservers='["8.8.8.8", "8.8.8.7"]',
```

### 23.9.73 salt.modules.nxos_api

Execution module to manage Cisco Nexus Switches (NX-OS) over the NX-API

New in version 2019.2.0.

Execution module used to interface the interaction with a remote or local Nexus switch whether we're running in a Proxy Minion or regular Minion (or regular Minion running directly on the Nexus switch).

**codeauthor**  Mircea Ulinic <ping@mirceaulinic.net>

**maturity**  new

**platform**  any

Note: To be able to use this module you need to enable to NX-API on your switch, by executing `feature nxapi` in configuration mode.

Configuration example:

```bash
switch# conf t
switch(config)# feature nxapi
```

To check that NX-API is properly enabled, execute `show nxapi`.

Output example:

```bash
switch# show nxapi
nxapi enabled
HTTPS Listen on port 443
```

Note: NX-API requires modern NXOS distributions, typically at least 7.0 depending on the hardware. Due to reliability reasons it is recommended to run the most recent version.

Usage

This module can equally be used via the `nxos_api` Proxy module or directly from an arbitrary (Proxy) Minion that is running on a machine having access to the network device API. Given that there are no external dependencies, this module can very well used when using the regular Salt Minion directly installed on the switch.

When running outside of the `nxos_api` Proxy (i.e., from another Proxy Minion type, or regular Minion), the NX-API connection arguments can be either specified from the CLI when executing the command, or in a configuration block under the `nxos_api` key in the configuration opts (i.e., (Proxy) Minion configuration file), or Pillar. The module supports these simultaneously. These fields are the exact same supported by the `nxos_api` Proxy Module:

- **transport**: `https` Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.
- **host**: `localhost` The IP address or DNS host name of the connection device.
- **username**: `admin` The username to pass to the device to authenticate the NX-API connection.
- **password**: The password to pass to the device to authenticate the NX-API connection.
- **port**: The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).
- **timeout**: 60 Time in seconds to wait for the device to respond. Default: 60 seconds.
- **verify**: `True` Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to `True`.

When there is no certificate configuration on the device and this option is set as `True` (default), the commands will fail with the following error: `SSLError: [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed (_ssl.c:581)`. In this case, you either need to configure a proper certificate on the device (recommended), or bypass the checks setting this argument as `False` with all the security risks considered.

Example (when not running in a `nxos_api` Proxy Minion):

```yaml
nxos_api:
  username: test
  password: test
```

In case the `username` and `password` are the same on any device you are targeting, the block above (besides other parameters specific to your environment you might need) should suffice to be able to execute commands from outside a `nxos_api` Proxy, e.g.:

```bash
salt-call --local nxos_api.show 'show lldp neighbors' raw_text
# The command above is available when running in a regular Minion where Salt is installed

salt '*' nxos_api.show 'show version' raw_text=False
```

**Note**: Remember that the above applies only when not running in a `nxos_api` Proxy Minion. If you want to use the `nxos_api Proxy`, please follow the documentation notes for a proper setup.
salt.modules.nxos_api.config(commands=None, config_file=None, template_engine='jinja', context=None, defaults=None, saltenv='base', **kwargs)

Configures the Nexus switch with the specified commands.

This method is used to send configuration commands to the switch. It will take either a string or a list and prepend the necessary commands to put the session into config mode.

**Warning:** All the commands will be applied directly into the running-config.

**config_file** The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice.

This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

**commands** The commands to send to the switch in config mode. If the commands argument is a string it will be cast to a list. The list of commands will also be prepended with the necessary commands to put the session in config mode.

**Note:** This argument is ignored when `config_file` is specified.

**template_engine:** `jinja` The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file without attempting to render, set this argument to `None`.

**context** Variables to add to the template context.

**defaults** Default values of the context_dict.

**transport:** `https` Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.

**host:** `localhost` The IP address or DNS host name of the connection device.

**username:** `admin` The username to pass to the device to authenticate the NX-API connection.

**password** The password to pass to the device to authenticate the NX-API connection.

**port** The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).

**timeout:** 60 Time in seconds to wait for the device to respond. Default: 60 seconds.

**verify:** `True` Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to `True`.

**CLI Example:**

```bash
salt '*' nxos_api.config commands="['spanning-tree mode mstp']"
salt '*' nxos_api.config config_file=salt://config.txt
salt '*' nxos_api.config config_file=https://bit.ly/2LGLcDy context="{'servers': [1.2.3.4]}"
```
salt.modules.nxos_api.rpc(commands, method='cli', **kwargs)
Execute an arbitrary RPC request via the Nexus API.

- **commands**: The commands to be executed.
- **method**: cli The type of the response, i.e., raw text (cli_ascii) or structured document (cli). Defaults to cli (structured data).
- **transport**: https Specifies the type of connection transport to use. Valid values for the connection are http, and https.
- **host**: localhost The IP address or DNS host name of the connection device.
- **username**: admin The username to pass to the device to authenticate the NX-API connection.
- **password**: The password to pass to the device to authenticate the NX-API connection.
- **port**: The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).
- **timeout**: 60 Time in seconds to wait for the device to respond. Default: 60 seconds.
- **verify**: True Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to True.

CLI Example:

```
salt-call --local nxps_api.rpc 'show version'
```

salt.modules.nxos_api.show(commands, raw_text=True, **kwargs)
Execute one or more show (non-configuration) commands.

- **commands**: The commands to be executed.
- **raw_text**: True Whether to return raw text or structured data.
- **transport**: https Specifies the type of connection transport to use. Valid values for the connection are http, and https.
- **host**: localhost The IP address or DNS host name of the connection device.
- **username**: admin The username to pass to the device to authenticate the NX-API connection.
- **password**: The password to pass to the device to authenticate the NX-API connection.
- **port**: The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).
- **timeout**: 60 Time in seconds to wait for the device to respond. Default: 60 seconds.
- **verify**: True Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to True.

CLI Example:

```
salt-call --local nxos_api.show 'show version'
salt '*' nxos_api.show 'show bgp sessions' 'show processes' raw_text=False
salt 'regular-minion' nxos_api.show 'show interfaces' host=sw01.example.com
  --username=test password=test
```
23.9.74 salt.modules.nxos_upgrade

Execution module to upgrade Cisco NX-OS Switches.
New in version 3001.

This module supports execution using a Proxy Minion or Native Minion:

1) Proxy Minion: Connect over SSH or NX-API HTTP(S). See salt.proxy.nxos for proxy minion setup details.

2) Native Minion: Connect over NX-API Unix Domain Socket (UDS). Install the minion inside the GuestShell running on the NX-OS device.

maturity  new
platform  nxos
codeauthor  Michael G Wiebe

Note: To use this module over remote NX-API the feature must be enabled on the NX-OS device by executing feature nxapi in configuration mode.
This is not required for NX-API over UDS.

Configuration example:

switch# conf t
switch(config)# feature nxapi

To check that NX-API is properly enabled, execute show nxapi.

Output example:

switch# show nxapi
nxapi enabled
HTTPS Listen on port 443

salt.modules.nxos_upgrade.check_upgrade_impact(system_image, kickstart_image=None, issu=True, **kwargs)

Display upgrade impact information without actually upgrading the device.

system_image (Mandatory Option)  Path on bootflash: to system image upgrade file.
kickstart_image Path on bootflash: to kickstart image upgrade file. (Not required if using combined system/kickstart image file) Default: None
issu  In Service Software Upgrade (non-disruptive). When True, the upgrade will abort if issu is not possible. When False: Force (disruptive) Upgrade/Downgrade. Default: True
timeout  Timeout in seconds for long running 'install all' impact command. Default: 900
error_pattern  Use the option to pass in a regular expression to search for in the output of the 'install all impact' command that indicates an error has occurred. This option is only used when proxy minion connection type is ssh and otherwise ignored.

salt 'n9k' nxos.check_upgrade_impact system_image=nxos.9.2.1.bin
salt 'n7k' nxos.check_upgrade_impact system_image=n7000-s2-dk9.8.1.1.bin \ kickstart_image=n7000-s2-kickstart.8.1.1.bin issu=False
salt.modules.nxos_upgrade.upgrade(system_image, kickstart_image=None, issu=True, **kwargs)

Upgrade NX-OS switch.

system_image (Mandatory Option) Path on bootflash: to system image upgrade file.

kickstart_image Path on bootflash: to kickstart image upgrade file. (Not required if using combined system/kickstart image file) Default: None

issu Set this option to True when an In Service Software Upgrade or non-disruptive upgrade is required. The upgrade will abort if issu is not possible. Default: True

timeout Timeout in seconds for long running 'install all' upgrade command. Default: 900

error_pattern Use the option to pass in a regular expression to search for in the output of the 'install all upgrade command that indicates an error has occurred. This option is only used when proxy minion connection type is ssh and otherwise ignored.

```
salt 'n9k' nxos.upgrade system_image=nxos.9.2.1.bin
salt 'n7k' nxos.upgrade system_image=n7000-s2-dk9.8.1.1.bin \ kickstart_image=n7000-s2-kickstart.8.1.1.bin issu=False
```

23.9.75 salt.modules.omapi

This module interacts with an ISC DHCP Server via OMAPI. server_ip and server_port params may be set in the minion config or pillar:

```
omapi.server_ip: 127.0.0.1
omapi.server_port: 7991
```

depends pypureomapi Python module

salt.modules.omapi.add_host(mac, name=None, ip=None, ddns=False, group=None, supersede_host=False)

Add a host object for the given mac.

CLI Example:

```
salt dhcp-server omapi.add_host ab:ab:ab:ab:ab:ab name=host1
```

Add ddns-hostname and a fixed-ip statements:

```
salt dhcp-server omapi.add_host ab:ab:ab:ab:ab:ab name=host1 ip=10.1.1.1 ddns=true
```

salt.modules.omapi.delete_host(mac=None, name=None)

Delete the host with the given mac or name.

CLI Examples:

```
salt dhcp-server omapi.delete_host name=host1
salt dhcp-server omapi.delete_host mac=ab:ab:ab:ab:ab:ab
```
23.9.76 `salt.modules.openscap`

Module for OpenSCAP Management

```python
salt.modules.openscap.xccdf(params)
```

Run `oscap xccdf` commands on minions. It uses `cp.push_dir` to upload the generated files to the salt master in the master's minion files cachedir (defaults to `/var/cache/salt/master/minions/minion-id/files`)

It needs `file_recv` set to `True` in the master configuration file.

CLI Example:

```
salt '*' openscap.xccdf "eval --profile Default /usr/share/openscap/scap-yast2sec-xccdf.xml"
```

23.9.77 `salt.modules.philips_hue`

Philips HUE lamps module for proxy.

New in version 2015.8.3.

23.9.78 `salt.modules.powerpath`

powerpath support.

Assumes RedHat

```python
salt.modules.powerpath.add_license(key)
```

Add a license

```python
salt.modules.powerpath.has_powerpath()
```

```python
salt.modules.powerpath.list_licenses()
```

returns a list of applied powerpath license keys

```python
salt.modules.powerpath.remove_license(key)
```

Remove a license

23.9.79 `salt.modules.purefa`

Management of Pure Storage FlashArray

**Installation Prerequisites**

- You will need the `purestorage` python package in your python installation path that is running salt.

```
pip install purestorage
```

- Configure Pure Storage FlashArray authentication. Use one of the following three methods.
  1. From the minion config
pure_tags:
    fa:
        san_ip: management vip or hostname for the FlashArray
        api_token: A valid api token for the FlashArray being managed

2) From environment (PUREFA_IP and PUREFA_API)
3) From the pillar (PUREFA_IP and PUREFA_API)

maintainer Simon Dodsley (simon@purestorage.com)
maturity new
requires purestorage
platform all

New in version 2018.3.0.

salt.modules.purefa.hg_create(name, host=None, volume=None)
Create a hostgroup on a Pure Storage FlashArray.
Will return False if hostgroup already exists, or if named host or volume do not exist.
New in version 2018.3.0.
name [string] name of hostgroup (truncated to 63 characters)
host [string] name of host to add to hostgroup
volume [string] name of volume to add to hostgroup

CLI Example:
salt '*' purefa.hg_create foo host=bar volume=vol

salt.modules.purefa.hg_delete(name)
Delete a hostgroup on a Pure Storage FlashArray (removes all volumes and hosts).
Will return False if hostgroup is already in a deleted state.
New in version 2018.3.0.
name [string] name of hostgroup

CLI Example:
salt '*' purefa.hg_delete foo

salt.modules.purefa.hg_remove(name, volume=None, host=None)
Remove a host and/or volume from a hostgroup on a Pure Storage FlashArray.
Will return False if hostgroup does not exist, or named host or volume are not in the hostgroup.
New in version 2018.3.0.
name [string] name of hostgroup
volume [string] name of volume to remove from hostgroup
host [string] name of host to remove from hostgroup

CLI Example:
salt '*' purefa.hg_remove foo volume=test host=bar
salt.modules.purefa.hg_update(name, host=None, volume=None)
Adds entries to a hostgroup on a Pure Storage FlashArray.
Will return False if hostgroup doesn't exist, or host or volume do not exist.
New in version 2018.3.0.
name [string] name of hostgroup
host [string] name of host to add to hostgroup
volume [string] name of volume to add to hostgroup
CLI Example:
salt '*' purefa.hg_update foo host=bar volume=vol

salt.modules.purefa.host_create(name, iqn=None, wwn=None)
Add a host on a Pure Storage FlashArray.
Will return False if host already exists, or the iSCSI or Fibre Channel parameters are not in a valid format. See Pure Storage FlashArray documentation.
New in version 2018.3.0.
name [string] name of host (truncated to 63 characters)
iqn [string] iSCSI IQN of host
wwn [string] Fibre Channel WWN of host
CLI Example:
salt '*' purefa.host_create foo iqn='<Valid iSCSI IQN>' wwn='<Valid WWN>'

salt.modules.purefa.host_delete(name)
Delete a host on a Pure Storage FlashArray (detaches all volumes).
Will return False if the host doesn't exist.
New in version 2018.3.0.
name [string] name of host
CLI Example:
salt '*' purefa.host_delete foo

salt.modules.purefa.host_update(name, iqn=None, wwn=None)
Update a host's port definitions on a Pure Storage FlashArray.
Will return False if new port definitions are already in use by another host, or are not in a valid format. See Pure Storage FlashArray documentation.
New in version 2018.3.0.
name [string] name of host
iqn [string] Additional iSCSI IQN of host
wwn [string] Additional Fibre Channel WWN of host
CLI Example:
salt '*' purefa.host_update foo iqn='<Valid iSCSI IQN>' wwn='<Valid WWN>'
salt.modules.purefa.pg_create(name, hostgroup=None, host=None, volume=None, enabled=True)

Create a protection group on a Pure Storage FlashArray.

Will return False is the following cases:
- Protection Group already exists
- Protection Group in a deleted state
- More than one type is specified - protection groups are for only hostgroups, hosts or volumes
- Named type for protection group does not exist

New in version 2018.3.0.

name [string] name of protection group
hostgroup [string] name of hostgroup to add to protection group
host [string] name of host to add to protection group
volume [string] name of volume to add to protection group

CLI Example:
```
salt '*' purefa.pg_create foo [hostgroup=foo | host=bar | volume=vol] &<br>enabled=[true | false]
```

salt.modules.purefa.pg_delete(name, eradicate=False)

Delete a protection group on a Pure Storage FlashArray.

Will return False if protection group is already in a deleted state.

New in version 2018.3.0.

name [string] name of protection group

CLI Example:
```
salt '*' purefa.pg_delete foo
```

salt.modules.purefa.pg_eradicate(name)

Eradicate a deleted protection group on a Pure Storage FlashArray.

Will return False if protection group is not in a deleted state.

New in version 2018.3.0.

name [string] name of protection group

CLI Example:
```
salt '*' purefa.pg_eradicate foo
```

salt.modules.purefa.pg_remove(name, hostgroup=None, host=None, volume=None)

Remove a hostgroup, host or volume from a protection group on a Pure Storage FlashArray.

Will return False in the following cases:
- Protection group does not exist
- Specified type is not currently associated with the protection group

New in version 2018.3.0.

name [string] name of hostgroup
**hostgroup** [string] name of hostgroup to remove from protection group

**host** [string] name of host to remove from hostgroup

**volume** [string] name of volume to remove from hostgroup

CLI Example:

```bash
salt '*' purefa.pg_remove foo [hostgroup=bar | host=test | volume=bar]
```

salt.modules.purefa.

**pg_update** *(name, hostgroup=None, host=None, volume=None)*

Update a protection group on a Pure Storage FlashArray.

**Will return False in the following cases:**

- Protection group does not exist
- Incorrect type selected for current protection group type
- Specified type does not exist

New in version 2018.3.0.

**name** [string] name of protection group

**hostgroup** [string] name of hostgroup to add to protection group

**host** [string] name of host to add to protection group

**volume** [string] name of volume to add to protection group

CLI Example:

```bash
salt '*' purefa.pg_update foo [hostgroup=foo | host=bar | volume=vol]
```

salt.modules.purefa.

**snap_create** *(name, suffix=None)*

Create a volume snapshot on a Pure Storage FlashArray.

**Will return False if volume selected to snap does not exist.**

New in version 2018.3.0.

**name** [string] name of volume to snapshot

**suffix** [string] if specified forces snapshot name suffix. If not specified defaults to timestamp.

CLI Example:

```bash
salt '*' purefa.snap_create foo
salt '*' purefa.snap_create foo suffix=bar
```

salt.modules.purefa.

**snap_delete** *(name, suffix=None, eradicate=False)*

Delete a volume snapshot on a Pure Storage FlashArray.

**Will return False if selected snapshot does not exist.**

New in version 2018.3.0.

**name** [string] name of volume

**suffix** [string] name of snapshot

**eradicate** [boolean] Eradicate snapshot after deletion if True. Default is False

CLI Example:
salt '...' purefa.snap_delete foo suffix=snap eradicate=True

salt.modules.purefa.snap_eradicate(name, suffix=None)
    Eradicate a deleted volume snapshot on a Pure Storage FlashArray.
    Will return False if snapshot is not in a deleted state.
    New in version 2018.3.0.
    name  [string] name of volume
    suffix [string] name of snapshot
    CLI Example:
    salt '...' purefa.snap_eradicate foo suffix=snap

salt.modules.purefa.snap_volume_create(name, target, overwrite=False)
    Create R/W volume from snapshot on a Pure Storage FlashArray.
    Will return False if target volume already exists and overwrite is not specified, or selected snapshot doesn't exist.
    New in version 2018.3.0.
    name  [string] name of volume snapshot
    target [string] name of clone volume
    overwrite [boolean] overwrite clone if already exists (default: False)
    CLI Example:
    salt '...' purefa.snap_volume_create foo.bar clone overwrite=True

salt.modules.purefa.volume_attach(name, host)
    Attach a volume to a host on a Pure Storage FlashArray.
    Host and volume must exist or else will return False.
    New in version 2018.3.0.
    name  [string] name of volume
    host  [string] name of host
    CLI Example:
    salt '...' purefa.volume_attach foo bar

salt.modules.purefa.volume_clone(name, target, overwrite=False)
    Clone an existing volume on a Pure Storage FlashArray.
    Will return False if source volume doesn't exist, or target volume already exists and overwrite not specified.
    New in version 2018.3.0.
    name  [string] name of volume
    target [string] name of clone volume
    overwrite [boolean] overwrite clone if already exists (default: False)
    CLI Example:
salt '_salt Documentation, Release 3002.5'

salt 'purefa.volume_clone foo bar overwrite=True

```
salt.modules.purefa.volume_create(name, size=None)
Create a volume on a Pure Storage FlashArray.
Will return False if volume already exists.
New in version 2018.3.0.
```

name [string] name of volume (truncated to 63 characters)
size [string] if specified capacity of volume. If not specified default to 1G. Refer to Pure Storage documenta-
tion for formatting rules.

CLl Example:
```
salt '*' purefa.volume_create foo
salt '*' purefa.volume_create foo size=10T
```

salt.modules.purefa.volume_delete(name, eradicate=False)
Delete a volume on a Pure Storage FlashArray.
Will return False if volume doesn't exist is already in a deleted state.
New in version 2018.3.0.

name [string] name of volume
eradicate [boolean] Eradicate volume after deletion if True. Default is False

CLl Example:
```
salt '*' purefa.volume_delete foo eradicate=True
```

salt.modules.purefa.volume_detach(name, host)
Detach a volume from a host on a Pure Storage FlashArray.
Will return False if either host or volume do not exist, or if selected volume isn’t already connected to the host.
New in version 2018.3.0.

name [string] name of volume
host [string] name of host

CLl Example:
```
salt '*' purefa.volume_detach foo bar
```

salt.modules.purefa.volume_eradicate(name)
Eradicate a deleted volume on a Pure Storage FlashArray.
Will return False is volume is not in a deleted state.
New in version 2018.3.0.

name [string] name of volume

CLl Example:
```
salt '*' purefa.volume_eradicate foo
```

23.9. execution modules

1245
salt.modules.purefa.volume_extend(name, size)
    Extend an existing volume on a Pure Storage FlashArray.
    Will return False if new size is less than or equal to existing size.
    New in version 2018.3.0.
    name  [string] name of volume
    size  [string] New capacity of volume. Refer to Pure Storage documentation for formatting rules.
    CLI Example:
    salt '*' purefa.volume_extend foo 10T

23.9.80  salt.modules.purefb
Management of Pure Storage FlashBlade

Installation Prerequisites

- You will need the purity_fb python package in your python installation path that is running salt.
  
  pip install purity_fb

- Configure Pure Storage FlashBlade authentication. Use one of the following three methods.
  1) From the minion config
     
     pure_tags:
     fb:
       san_ip: management vip or hostname for the FlashBlade
       api_token: A valid api token for the FlashBlade being managed

   2) From environment (PUREFB_IP and PUREFB_API)
   3) From the pillar (PUREFB_IP and PUREFB_API)

 maintainer  Simon Dodsley (simon@purestorage.com)
maturity  new
requires  purity_fb
platform  all
New in version 2019.2.0.

salt.modules.purefb.fs_create(name, size=None, proto='NFS', nfs_rules='*(rw,no_root_squash)', snapshot=False)
    Create a filesystem on a Pure Storage FlashBlade.
    Will return False if filesystem already exists.
    New in version 2019.2.0.
    name  [string] name of filesystem (truncated to 63 characters)
    proto  [string] (Optional) Sharing protocol (NFS, CIFS or HTTP). If not specified default is NFS
    snapshot: boolean  (Optional) Are snapshots enabled on the filesystem. Default is False
nfs_rules [string] (Optional) export rules for NFS. If not specified default is *(rw,no_root_squash).
Refer to Pure Storage documentation for formatting rules.

size [string] if specified capacity of filesystem. If not specified default to 32G. Refer to Pure Storage documentation for formatting rules.

CLI Example:

```
salt '*' purefb.fs_create foo proto=CIFS
salt '*' purefb.fs_create foo size=10T
```

salt.modules.purefb.fs_delete(name, eradicate=False)
Delete a share on a Pure Storage FlashBlade.
Will return False if filesystem doesn't exist or is already in a deleted state.
New in version 2019.2.0.

name [string] name of filesystem

eradicate [boolean] (Optional) Eradicate filesystem after deletion if True. Default is False

CLI Example:

```
salt '*' purefb.fs_delete foo eradicate=True
```

salt.modules.purefb.fs_eradicate(name)
Eradicate a deleted filesystem on a Pure Storage FlashBlade.
Will return False is filesystem is not in a deleted state.
New in version 2019.2.0.

name [string] name of filesystem

CLI Example:

```
salt '*' purefb.fs_eradicate foo
```

salt.modules.purefb.fs_extend(name, size)
Resize an existing filesystem on a Pure Storage FlashBlade.
Will return False if new size is less than or equal to existing size.
New in version 2019.2.0.

name [string] name of filesystem

size [string] New capacity of filesystem. Refer to Pure Storage documentation for formatting rules.

CLI Example:

```
salt '*' purefb.fs_extend foo 10T
```

salt.modules.purefb.fs_update(name, rules, snapshot=False)
Update filesystem on a Pure Storage FlashBlade.
Allows for change of NFS export rules and enabling/disabled of snapshotting capability.
New in version 2019.2.0.

name [string] name of filesystem

rules [string] NFS export rules for filesystem Refer to Pure Storage documentation for formatting rules.

snapshot: boolean (Optional) Enable/Disable snapshots on the filesystem. Default is False
CLI Example:

```
salt '*' purefb.fs_nfs_update foo rules='10.234.112.23(ro), 10.234.112.24(rw)' snapshot=True
```

salt.modules.purefb.\texttt{snap\_create}(name, suffix=None)

Create a filesystem snapshot on a Pure Storage FlashBlade.

Will return False if filesystem selected to snap does not exist.

New in version 2019.2.0.

\begin{itemize}
\item \texttt{name} [string] name of filesystem to snapshot
\item \texttt{suffix} [string] if specified forces snapshot name suffix. If not specified defaults to timestamp.
\end{itemize}

CLI Example:

```
salt '*' purefb.snap_create foo
salt '*' purefb.snap_create foo suffix=\texttt{bar}
```

salt.modules.purefb.\texttt{snap\_delete}(name, suffix=None, eradicate=False)

Delete a filesystem snapshot on a Pure Storage FlashBlade.

Will return False if selected snapshot does not exist.

New in version 2019.2.0.

\begin{itemize}
\item \texttt{name} [string] name of filesystem
\item \texttt{suffix} [string] name of snapshot
\item \texttt{eradicate} [boolean] Eradicate snapshot after deletion if True. Default is False
\end{itemize}

CLI Example:

```
salt '*' purefb.snap_delete foo suffix=\texttt{snap} eradicate=True
```

salt.modules.purefb.\texttt{snap\_eradicate}(name, suffix=None)

Eradicate a deleted filesystem snapshot on a Pure Storage FlashBlade.

Will return False if snapshot is not in a deleted state.

New in version 2019.2.0.

\begin{itemize}
\item \texttt{name} [string] name of filesystem
\item \texttt{suffix} [string] name of snapshot
\end{itemize}

CLI Example:

```
salt '*' purefb.snap_eradicate foo suffix=\texttt{snap}
```
23.9.81 salt.modules.pushbullet

Module for sending messages to Pushbullet (https://www.pushbullet.com)
New in version 2015.8.0.
Requires an `api_key` in `/etc/salt/minion`:

```
pushbullet:
  api_key: 'ABC123abc123ABC123abc123ABC123abc'
```

For example:

```
pushbullet:
  device: "Chrome"
  title: "Example push message"
  body: "Example push message."
```

salt.modules.pushbullet.push_note(`device=None, title=None, body=None`) Pushing a text note.

Parameters

- `device` -- Pushbullet target device
- `title` -- Note title
- `body` -- Note body

Returns Boolean if message was sent successfully.

CLI Example:

```
salt "+" pushbullet.push_note device="Chrome" title="Example title" body="Example push message."
```

23.9.82 salt.modules.pushover_notify

Module for sending messages to Pushover (https://www.pushover.net)
New in version 2016.3.0.

`configuration` This module can be used by either passing an `api key` and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
pushover:
  token: abAHuZyCLtdH8P4zhmFZmgUHUsv1ei8
```

salt.modules.pushover_notify.post_message(`user=None, device=None, message=None, title=None, priority=None, expire=None, retry=None, sound=None, api_version=1, token=None`) Send a message to a Pushover user or group.

Parameters

- `user` -- The user or group to send to, must be key of user or group not email address.
- `message` -- The message to send to the PushOver user or group.
- **title** -- Specify who the message is from.
- **priority** -- The priority of the message, defaults to 0.
- **expire** -- The message should expire after N number of seconds.
- **retry** -- The number of times the message should be retried.
- **sound** -- The sound to associate with the message.
- **api_version** -- The PushOver API version, if not specified in the configuration.
- **token** -- The PushOver token, if not specified in the configuration.

**Returns** Boolean if message was sent successfully.

CLI Example:

```bash
salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx' title='Message from Salt' message='Build is done'
```

```
salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx' title='Message from Salt' message='Build is done' priority='2' expire='720' retry='5'
```

## 23.9.83 salt.modules.pyenv

Manage python installations with pyenv.

**Note:** Git needs to be installed and available via PATH if pyenv is to be installed automatically by the module.

New in version 2014.4.0.

**salt.modules.pyenv.default** *(python=None, runas=None)*

Returns or sets the currently defined default python.

- **python=None** The version to set as the default. Should match one of the versions listed by pyenv. versions. Leave blank to return the current default.

CLI Example:

```bash
salt '*' pyenv.default
```

```bash
salt '*' pyenv.default 2.0.0-p0
```

**salt.modules.pyenv.do** *(cmdline=None, runas=None)*

Execute a python command with pyenv's shims from the user or the system.

CLI Example:

```bash
salt '*' pyenv.do 'gem list bundler'
```

```bash
salt '*' pyenv.do 'gem list bundler' deploy
```

**salt.modules.pyenv.do_with_python** *(python, cmdline, runas=None)*

Execute a python command with pyenv's shims using a specific python version.

CLI Example:

```bash
salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler'
```

```bash
salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler' deploy
```
salt.modules.pyenv.install(runas=None, path=None)
Install pyenv systemwide

CLI Example:
salt '*' pyenv.install

salt.modules.pyenv.install_python(python, runas=None)
Install a python implementation.

python The version of python to install, should match one of the versions listed by pyenv.list

CLI Example:
salt '*' pyenv.install_python 2.0.0-p0

salt.modules.pyenv.is_installed(runas=None)
Check if pyenv is installed.

CLI Example:
salt '*' pyenv.is_installed

salt.modules.pyenv.list_(runas=None)
List the installable versions of python.

CLI Example:
salt '*' pyenv.list

salt.modules.pyenv.rehash(runas=None)
Run pyenv rehash to update the installed shims.

CLI Example:
salt '*' pyenv.rehash

salt.modules.pyenv.uninstall_python(python, runas=None)
Uninstall a python implementation.

python The version of python to uninstall. Should match one of the versions listed by pyenv.versions

CLI Example:
salt '*' pyenv.uninstall_python 2.0.0-p0

salt.modules.pyenv.update(runas=None, path=None)
Updates the current versions of pyenv and python-Build

CLI Example:
salt '*' pyenv.update

salt.modules.pyenv.versions(runas=None)
List the installed versions of python.

CLI Example:
salt '*' pyenv.versions

23.9. execution modules
23.9.84 salt.modules.rest_sample_utils

Utility functions for the rest_sample

salt.modules.rest_sample_utils.fix_outage()

"Fix" the outage

CLI Example:

```
salt 'rest-sample-proxy' rest_sample.fix_outage
```

salt.modules.rest_sample_utils.get_test_string()

Helper function to test cross-calling to the __proxy__ dunder.

CLI Example:

```
salt 'rest-sample-proxy' rest_sample.get_test_string
```

23.9.85 salt.modules.s3

Connection module for Amazon S3

**configuration** This module accepts explicit s3 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
s3.keyid: GKTADJGHEIQSXMKKRBJ08H
s3.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

**Warning:** This is literally the pillar key s3.keyid or the config option s3.keyid, not:

```
s3:
  keyid: blah
```

A **service_url** may also be specified in the configuration:

```
s3.service_url: s3.amazonaws.com
```

A **role_arn** may also be specified in the configuration:

```
s3.role_arn: arn:aws:iam::111111111111:role/my-role-to-assume
```

If a **service_url** is not specified, the default is s3.amazonaws.com. This may appear in various documentation as an "endpoint". A comprehensive list for Amazon S3 may be found at:

http://docs.aws.amazon.com/general/latest/gr/rande.html#s3_region

The **service_url** will form the basis for the final endpoint that is used to query the service.

Path style can be enabled:

```
s3.path_style: True
```
This can be useful if you need to use Salt with a proxy for a S3 compatible storage.

You can use either HTTPS protocol or HTTP protocol:

```
s3.https_enable: True
```

SSL verification may also be turned off in the configuration:

```
s3.verify_ssl: False
```

This is required if using S3 bucket names that contain a period, as these will not match Amazon's S3 wildcard certificates. Certificate verification is enabled by default.

AWS region may be specified in the configuration:

```
s3.location: eu-central-1
```

Default is `us-east-1`.

This module should be usable to query other S3-like services, such as Eucalyptus.

**depends** requests

```
salt.modules.s3.delete(bucket, path=None, action=None, key=None, keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None, role_arn=None, path_style=None, https_enable=None)
```

Delete a bucket, or delete an object from a bucket.

CLI Example to delete a bucket:

```
salt myminion s3.delete mybucket
```

CLI Example to delete an object from a bucket:

```
salt myminion s3.delete mybucket remoteobject
```

```
salt.modules.s3.get(bucket='', path='', return_bin=False, action=None, local_file=None, key=None, keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None, role_arn=None, path_style=None, https_enable=None)
```

List the contents of a bucket, or return an object from a bucket. Set return_bin to True in order to retrieve an object wholesale. Otherwise, Salt will attempt to parse an XML response.

CLI Example to list buckets:

```
salt myminion s3.get
```

CLI Example to list the contents of a bucket:

```
salt myminion s3.get mybucket
```

CLI Example to return the binary contents of an object:

```
salt myminion s3.get mybucket myfile.png return_bin=True
```

CLI Example to save the binary contents of an object to a local file:

```
salt myminion s3.get mybucket myfile.png local_file=/tmp/myfile.png
```

It is also possible to perform an action on a bucket. Currently, S3 supports the following actions:
To perform an action on a bucket:

```
salt myminion s3.get mybucket myfile.png action=acl
```

```
salt.modules.s3.head(bucket, path='', key=None, keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None, role_arn=None, path_style=None, https_enable=None)
```

Return the metadata for a bucket, or an object in a bucket.

CLI Examples:

```
salt myminion s3.head mybucket
salt myminion s3.head mybucket myfile.png
```

```
salt.modules.s3.put(bucket, path=None, return_bin=False, action=None, local_file=None, key=None, keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None, role_arn=None, path_style=None, https_enable=None)
```

Create a new bucket, or upload an object to a bucket.

CLI Example to create a bucket:

```
salt myminion s3.put mybucket
```

CLI Example to upload an object to a bucket:

```
salt myminion s3.put mybucket remotepath local_file=/path/to/file
```

### 23.9.86 salt.modules.s6

`s6` service module

This module is compatible with the `service` states, so it can be used to maintain services using the `provider` argument:

```
myservice:
  service:
    - running
    - provider: s6
```

Note that the `enabled` argument is not available with this provider.

```
codeauthor Marek Skrobacki <skrobul@skrobul.com>
```

```
salt.modules.s6.available(name)
```

Returns `True` if the specified service is available, otherwise returns `False`.

CLI Example:
<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>CLI Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>salt '*' s6.available foo</code></td>
<td>Calls s6.restart() function</td>
<td><code>salt '*' s6.available foo</code></td>
</tr>
<tr>
<td><code>salt.modules.s6.full_restart(name)</code></td>
<td>Calls s6.restart() function</td>
<td><code>salt '*' s6.full_restart &lt;service name&gt;</code></td>
</tr>
<tr>
<td><code>salt.modules.s6.get_all()</code></td>
<td>Return a list of all available services</td>
<td><code>salt '*' s6.get_all</code></td>
</tr>
<tr>
<td><code>salt.modules.s6.missing(name)</code></td>
<td>The inverse of s6.available. Returns True if the specified service is not available, otherwise returns False.</td>
<td><code>salt '*' s6.missing foo</code></td>
</tr>
<tr>
<td><code>salt.modules.s6.reload_(name)</code></td>
<td>Send a HUP to service via s6</td>
<td><code>salt '*' s6.reload &lt;service name&gt;</code></td>
</tr>
<tr>
<td><code>salt.modules.s6.restart(name)</code></td>
<td>Restart service via s6. This will stop/start service</td>
<td><code>salt '*' s6.restart &lt;service name&gt;</code></td>
</tr>
<tr>
<td><code>salt.modules.s6.start(name)</code></td>
<td>Starts service via s6</td>
<td><code>salt '*' s6.start &lt;service name&gt;</code></td>
</tr>
<tr>
<td><code>salt.modules.s6.status(name, sig=None)</code></td>
<td>Return the status for a service via s6, return pid if running</td>
<td><code>salt '*' s6.status &lt;service name&gt;</code></td>
</tr>
<tr>
<td><code>salt.modules.s6.stop(name)</code></td>
<td>Stops service via s6</td>
<td><code>salt '*' s6.stop &lt;service name&gt;</code></td>
</tr>
</tbody>
</table>
Salt Documentation, Release 3002.5

salt.modules.s6.term(name)
    Send a TERM to service via s6

    CLI Example:
    
    salt '*' s6.term <service name>

23.9.87 salt.modules.salt_version

Access Salt's elemental release code-names.

New in version 3000.

Salt's feature release schedule is based on the Periodic Table, as described in the Version Numbers documentation.

When a feature was added (or removed) in a specific release, it can be difficult to build out future-proof functionality that is dependent on a naming scheme that moves.

For example, a state syntax needs to change to support an option that will be removed in the future, but there are many Minion versions in use across an infrastructure. It would be handy to use some Jinja syntax to check for these instances to perform one state syntax over another.

A simple example might be something like the following:

```#
# a boolean check #
{% set option_deprecated = salt['salt_version.less_than']('3001') %}
{% if option_deprecated %}
    <use old syntax>
{% else %}
    <use new syntax>
{% endif %}
```

salt.modules.salt_version.equal(name)
    Returns a boolean (True) if the minion's current version code name matches the named version.

    name  The release code name to check the version against.

    CLI Example:
    
    salt '*' salt_version.equal 'Oxygen'

salt.modules.salt_version.get_release_number(name)
    Returns the release number of a given release code name in a MAJOR.PATCH format.

    If the release name has not been given an assigned release number, the function returns a string. If the release cannot be found, it returns None.

    name  The release code name for which to find a release number.

    CLI Example:
    
    salt '*' salt_version.get_release_number 'Oxygen'

salt.modules.salt_version.greater_than(name)
    Returns a boolean (True) if the minion's current version code name is greater than the named version.

    name  The release code name to check the version against.

    CLI Example:
salt 'salt_version.greater_than 'Oxygen'

salt.modules.salt_version.

Salt Documentation, Release 3002.5

23.9.88 salt.modules.scp

SCP Module

New in version 2019.2.0.
Module to copy files via SCP
salt.modules.scp_mod.get(remote_path, local_path='', recursive=False, preserve_times=False, **kwargs)

Transfer files and directories from remote host to the localhost of the Minion.

remote_path Path to retrieve from remote host. Since this is evaluated by scp on the remote host, shell
wildcards and environment variables may be used.

recursive: False Transfer files and directories recursively.

preserve_times: False Preserve mtime and atime of transferred files and directories.

hostname The hostname of the remote device.

port: 22 The port of the remote device.

username The username required for SSH authentication on the device.

password Used for password authentication. It is also used for private key decryption if passphrase is not
given.

passphrase Used for decrypting private keys.

pkey An optional private key to use for authentication.

key_filename The filename, or list of filenames, of optional private key(s) and/or certificates to try for authen-
tication.

timeout An optional timeout (in seconds) for the TCP connect.

socket_timeout: 10 The channel socket timeout in seconds.

buff_size: 16384 The size of the SCP send buffer.

allow_agent: True Set to False to disable connecting to the SSH agent.

look_for_keys: True Set to False to disable searching for discoverable private key files in ~/.ssh/
banner_timeout An optional timeout (in seconds) to wait for the SSH banner to be presented.

auth_timeout An optional timeout (in seconds) to wait for an authentication response.

auto_add_policy: False Automatically add the host to the known_hosts.

CLI Example:
salt 'salt '*' scp.get /var/tmp/file /tmp/file hostname=10.10.10.1 auto_add_policy=True

salt.modules.scp_mod.put(files, remote_path=None, recursive=False, preserve_times=False, saltenv='base', **kwargs)
Transfer files and directories to remote host.
files  A single path or a list of paths to be transferred.
remote_path  The path on the remote device where to store the files.
recursive: True  Transfer files and directories recursively.
preserve_times: False  Preserve mtime and atime of transferred files and directories.
hostname  The hostname of the remote device.
port: 22  The port of the remote device.
username  The username required for SSH authentication on the device.
password  Used for password authentication. It is also used for private key decryption if passphrase is not given.
passphrase  Used for decrypting private keys.
pkey  An optional private key to use for authentication.
key_filename  The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.
timeout  An optional timeout (in seconds) for the TCP connect.
socket_timeout: 10  The channel socket timeout in seconds.
buff_size: 16384  The size of the SCP send buffer.
allow_agent: True  Set to False to disable connecting to the SSH agent.
look_for_keys: True  Set to False to disable searching for discoverable private key files in ~/.ssh/
banner_timeout  An optional timeout (in seconds) to wait for the SSH banner to be presented.
auth_timeout  An optional timeout (in seconds) to wait for an authentication response.
auto_add_policy: False  Automatically add the host to the known_hosts.

CLI Example:
salt 'salt '*' scp.put /path/to/file /var/tmp/file hostname=server1 auto_add_policy=True

23.9.89  salt.modules.sensehat

Module for controlling the LED matrix or reading environment data on the SenseHat of a Raspberry Pi.
New in version 2017.7.0.

maintainer  Benedikt Werner <1benediktwerner@gmail.com>, Joachim Werner <joe@suse.com>
maturity  new
depends  sense_hat Python module

The rotation of the Pi can be specified in a pillar. This is useful if the Pi is used upside down or sideways to correct the orientation of the image being shown.

Example:
**sensehat:**
   *rotation*: 90

salt.modules.sensehat.clear(`color=None`)

Sets the LED matrix to a single color or turns all LEDs off.

CLI Example:

```python
salt 'raspberry' sensehat.clear
salt 'raspberry' sensehat.clear ['255, 0, 0']
```

salt.modules.sensehat.get_humidity()

Get the percentage of relative humidity from the humidity sensor.

salt.modules.sensehat.get_pixel(x, y)

Returns the color of a single pixel on the LED matrix.

- x  The x coordinate of the pixel. Ranges from 0 on the left to 7 on the right.
- y  The y coordinate of the pixel. Ranges from 0 at the top to 7 at the bottom.

*Note: Please read the note for get_pixels*

salt.modules.sensehat.get_pixels()

Returns a list of 64 smaller lists of [R, G, B] pixels representing the the currently displayed image on the LED matrix.

*Note: When using set_pixels the pixel values can sometimes change when you read them again using get_pixels. This is because we specify each pixel element as 8 bit numbers (0 to 255) but when they’re passed into the Linux frame buffer for the LED matrix the numbers are bit shifted down to fit into RGB 565. 5 bits for red, 6 bits for green and 5 bits for blue. The loss of binary precision when performing this conversion (3 bits lost for red, 2 for green and 3 for blue) accounts for the discrepancies you see.

The get_pixels method provides an accurate representation of how the pixels end up in frame buffer memory after you have called set_pixels.*

salt.modules.sensehat.get_pressure()

Gets the current pressure in Millibars from the pressure sensor.

salt.modules.sensehat.get_temperature()

Gets the temperature in degrees Celsius from the humidity sensor. Equivalent to calling get_temperature_from_humidity.

If you get strange results try using get_temperature_from_pressure.

salt.modules.sensehat.get_temperature_from_humidity()

Gets the temperature in degrees Celsius from the humidity sensor.

salt.modules.sensehat.get_temperature_from_pressure()

Gets the temperature in degrees Celsius from the pressure sensor.

salt.modules.sensehat.low_light(`low_light=True`)

Sets the LED matrix to low light mode. Useful in a dark environment.

CLI Example:
salt 'raspberry' sensehat.low_light
salt 'raspberry' sensehat.low_light False

salt.modules.sensehat.set_pixel(x, y, color)
Sets a single pixel on the LED matrix to a specified color.

x The x coordinate of the pixel. Ranges from 0 on the left to 7 on the right.
y The y coordinate of the pixel. Ranges from 0 at the top to 7 at the bottom.
color The new color of the pixel as a list of [R, G, B] values.

CLI Example:
salt 'raspberry' sensehat.set_pixel 0 0 '[255, 0, 0]'

salt.modules.sensehat.set_pixels(pixels)
Sets the entire LED matrix based on a list of 64 pixel values.

pixels A list of 64 [R, G, B] color values.

salt.modules.sensehat.show_image(image)
Displays an 8 x 8 image on the LED matrix.

image The path to the image to display. The image must be 8 x 8 pixels in size.

CLI Example:
salt 'raspberry' sensehat.show_image /tmp/my_image.png

salt.modules.sensehat.show_letter(letter, text_color=None, back_color=None)
Displays a single letter on the LED matrix.

letter The letter to display

text_color The color in which the letter is shown. Defaults to '[255, 255, 255]' (white).
back_color The background color of the display. Defaults to '[0, 0, 0]' (black).

CLI Example:
salt 'raspberry' sensehat.show_letter O
salt 'raspberry' sensehat.show_letter X '[255, 0, 0]'
salt 'raspberry' sensehat.show_letter B '[0, 0, 255]' '[255, 255, 0]'

salt.modules.sensehat.show_message(message, msg_type=None, text_color=None, back_color=None, scroll_speed=0.1)
Displays a message on the LED matrix.

message The message to display

msg_type The type of the message. Changes the appearance of the message.

Available types are:

| error | red text |
| warning | orange text |
| success | green text |
| info | blue text |

scroll_speed The speed at which the message moves over the LED matrix. This value represents the time paused for between shifting the text to the left by one column of pixels. Defaults to '0.1'.

1260 Chapter 23. Salt Module Reference
text_color  The color in which the message is shown. Defaults to '255, 255, 255' (white).

back_color  The background color of the display. Defaults to '0, 0, 0' (black).

CLI Example:

```
salt 'raspberry' sensehat.show_message 'Status ok'
salt 'raspberry' sensehat.show_message 'Something went wrong' error
salt 'raspberry' sensehat.show_message 'Red' text_color=[255, 0, 0]
salt 'raspberry' sensehat.show_message 'Hello world' None '[0, 0, 255]' '[255, 0]'
```

### 23.9.90  salt.modules.servicenow

Module for execution of ServiceNow CI (configuration items)

New in version 2016.11.0.

**depends**  servicenow_rest python module

**configuration**  Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'servicenow' key by default, if defined.

For example:

```
servicenow:
  instance_name: ''
  username: ''
  password: ''
```

salt.modules.servicenow.delete_record(table, sys_id)

Delete an existing record

**Parameters**

- **table** (str) -- The table name, e.g. sys_user
- **sys_id** (str) -- The unique ID of the record

CLI Example:

```
salt myminion servicenow.delete_record sys_computer 2134566
```

salt.modules.servicenow.non_structured_query(table, query=None, **kwargs)

Run a non-structured (not a dict) query on a servicenow table. See http://wiki.servicenow.com/index.php?title=Encoded_Query_Strings#gsc.tab=0 for help on constructing a non-structured query string.

**Parameters**

- **table** (str) -- The table name, e.g. sys_user
- **query** (str) -- The query to run (or use keyword arguments to filter data)

CLI Example:

```
salt myminion servicenow.non_structured_query sys_computer 'role=web'
salt myminion servicenow.non_structured_query sys_computer role=web type=computer
```

salt.modules.servicenow.set_change_request_state(change_id, state='approved')

Set the approval state of a change request/record

---

23.9.  execution modules  1261
Parameters

- **change_id** *(str)* -- The ID of the change request, e.g. CHG123545
- **state** *(str)* -- The target state, e.g. approved

CLI Example:

```
salt myminion servicenow.set_change_request_state CHG000123 declined
salt myminion servicenow.set_change_request_state CHG000123 approved
```

```
salt.modules.servicenow.update_record_field (table, sys_id, field, value)
```

Update the value of a record's field in a servicenow table

Parameters

- **table** *(str)* -- The table name, e.g. sys_user
- **sys_id** *(str)* -- The unique ID of the record
- **field** *(str)* -- The new value
- **value** *(str)* -- The new value

CLI Example:

```
salt myminion servicenow.update_record_field sys_user 2348234 first_name jimmy
```

23.9.91 **salt.modules.slackware_service**

The service module for Slackware

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see [here](#).

```
salt.modules.slackware_service.available (name)
```

Returns True if the specified service is available, otherwise returns False.

New in version 3002.

CLI Example:

```
salt '*' service.available sshd
```

```
salt.modules.slackware_service.disable (name, **kwargs)
```

Disable the named service to start at boot

New in version 3002.

CLI Example:

```
salt '*' service.disable <service name>
```

```
salt.modules.slackware_service.disabled (name)
```

Return True if the named service is enabled, false otherwise

New in version 3002.

CLI Example:
salt '*' service.disabled <service name>

salt.modules.slackware_service.enable(name, **kwargs)
    Enable the named service to start at boot
    New in version 3002.
    CLI Example:
        salt '*' service.enable <service name>

salt.modules.slackware_service.enabled(name, **kwargs)
    Return True if the named service is enabled, false otherwise
    New in version 3002.
    CLI Example:
        salt '*' service.enabled <service name>

salt.modules.slackware_service.force_reload(name)
    Force-reload the named service
    New in version 3002.
    CLI Example:
        salt '*' service.force_reload <service name>

salt.modules.slackware_service.get_all()
    Return all available boot services
    New in version 3002.
    CLI Example:
        salt '*' service.get_all

salt.modules.slackware_service.get_disabled()
    Return a set of services that are installed but disabled
    New in version 3002.
    CLI Example:
        salt '*' service.get_disabled

salt.modules.slackware_service.get_enabled()
    Return a list of service that are enabled on boot
    New in version 3002.
    CLI Example:
        salt '*' service.get_enabled

salt.modules.slackware_service.missing(name)
    The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.
    New in version 3002.
CLI Example:

```
salt '*' service.missing sshd
```

**salt.modules.slackware_service.reload(name)**

Reload the named service

- New in version 3002.

CLI Example:

```
salt '*' service.reload <service name>
```

**salt.modules.slackware_service.restart(name)**

Restart the named service

- New in version 3002.

CLI Example:

```
salt '*' service.restart <service name>
```

**salt.modules.slackware_service.start(name)**

Start the specified service

- New in version 3002.

CLI Example:

```
salt '*' service.start <service name>
```

**salt.modules.slackware_service.status(name, sig=None)**

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

- New in version 3002.

**Parameters**

- **name (str)** -- The name of the service to check
- **sig (str)** -- Signature to use to find the service via ps

**Returns**

- True if running, False otherwise
- dict: Maps service name to True if running, False otherwise

**Return type**

**bool**

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

**salt.modules.slackware_service.stop(name)**

Stop the specified service

- New in version 3002.

CLI Example:

```
salt '*' service.stop <service name>
```
23.9.92 salt.modules.smf_service

Service support for Solaris 10 and 11, should work with other systems that use SMF also. (e.g. SmartOS)

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see [here](#).

salt.modules.smf_service.available(name)

Returns **True** if the specified service is available, otherwise returns **False**.

We look up the name with the svcs command to get back the FMRI This allows users to use simpler service names

CLI Example:

```bash
salt '*' service.available net-snmp
```

salt.modules.smf_service.disable(name, **kwargs)

Disable the named service to start at boot

CLI Example:

```bash
salt '*' service.disable <service name>
```

salt.modules.smf_service.disabled(name)

Check to see if the named service is disabled to start on boot

CLI Example:

```bash
salt '*' service.disabled <service name>
```

salt.modules.smf_service.enable(name, **kwargs)

Enable the named service to start at boot

CLI Example:

```bash
salt '*' service.enable <service name>
```

salt.modules.smf_service.enabled(name, **kwargs)

Check to see if the named service is enabled to start on boot

CLI Example:

```bash
salt '*' service.enabled <service name>
```

salt.modules.smf_service.get_all()

Return all installed services

CLI Example:

```bash
salt '*' service.get_all
```

salt.modules.smf_service.get_disabled()

Return the disabled services

CLI Example:

```bash
salt '*' service.get_disabled
```
salt.modules.smf_service.get_enabled()
Return the enabled services

CLI Example:
salt '*' service.get_enabled

salt.modules.smf_service.get_running()
Return the running services

CLI Example:
salt '*' service.get_running

salt.modules.smf_service.get_stopped()
Return the stopped services

CLI Example:
salt '*' service.get_stopped

salt.modules.smf_service.missing(name)
The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.

CLI Example:
salt '*' service.missing net-snmp

salt.modules.smf_service.reload_(name)
Reload the named service

CLI Example:
salt '*' service.reload <service name>

salt.modules.smf_service.restart(name)
Restart the named service

CLI Example:
salt '*' service.restart <service name>

salt.modules.smf_service.start(name)
Start the specified service

CLI Example:
salt '*' service.start <service name>

salt.modules.smf_service.status(name, sig=None)
Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Parameters

- name (str) -- The name of the service to check
- sig (str) -- Not implemented
Returns True if running, False otherwise
dict: Maps service name to True if running, False otherwise

Return type bool

CLI Example:
```
salt '*' service.status <service name>
```

```
salt.modules.smf_service.stop(name)
Stop the specified service

CLI Example:
```
salt '*' service.stop <service name>
```

23.9.93 salt.modules.splunk

Module for interop with the Splunk API

New in version 2016.3.0.

depends

- splunk-sdk python module

configuration Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'splunk' key by default, if defined.

For example:
```
splunk:
  username: alice
  password: abc123
  host: example.splunkcloud.com
  port: 8080
```

```
salt.modules.splunk.create_user(email, profile='splunk', **kwargs)
create a splunk user by name/email

CLI Example:
```
salt myminion splunk.create_user user@example.com roles=['user'] realname="Test User" name=testuser
```

```
salt.modules.splunk.delete_user(email, profile='splunk')
Delete a splunk user by email

CLI Example:
```
salt myminion splunk_user.delete 'user@example.com'
```

```
salt.modules.splunk.get_user(email, profile='splunk', **kwargs)
Get a splunk user by name/email

CLI Example:
```
salt myminion splunk.get_user 'user@example.com' user_details=false
salt myminion splunk.get_user 'user@example.com' user_details=true
```
23.9.4  salt.modules.sqlite3

Support for SQLite3

salt.modules.sqlite3.fetch(db=None, sql=None)
Retrieve data from an sqlite3 db (returns all rows, be careful!)

CLI Example:
```
salt '*' sqlite3.fetch /root/test.db 'SELECT * FROM test;'
```

salt.modules.sqlite3.indexes(db=None)
Show all indices in the database, for people with poor spelling skills

CLI Example:
```
salt '*' sqlite3.indexes /root/test.db
```

salt.modules.sqlite3.indices(db=None)
Show all indices in the database

CLI Example:
```
salt '*' sqlite3.indices /root/test.db
```

salt.modules.sqlite3.modify(db=None, sql=None)
Issue an SQL query to sqlite3 (with no return data), usually used to modify the database in some way (insert, delete, create, etc)

CLI Example:
```
salt '*' sqlite3.modify /root/test.db 'CREATE TABLE test(id INT, testdata TEXT);'
```

salt.modules.sqlite3.sqlite_version()
Return version of sqlite

CLI Example:
```
salt '*' sqlite3.sqlite_version
```

salt.modules.sqlite3.tables(db=None)
Show all tables in the database

CLI Example:
salt '*' sqlite3.tables /root/test.db

salt.modules.sqlite3.version()
Return version of pysqlite
CLI Example:
salt '*' sqlite3.version

23.9.95 salt.modules.statuspage
StatusPage
Handle requests for the StatusPage API.
In the minion configuration file, the following block is required:

```yaml
statuspage:
    api_key: <API_KEY>
    page_id: <PAGE_ID>
```

New in version 2017.7.0.
salt.modules.statuspage.create(endpoint='incidents', api_url=None, page_id=None, api_key=None, api_version=None, **kwargs)
Insert a new entry under a specific endpoint.
endpoint: incidents Insert under this specific endpoint.
page_id Page ID. Can also be specified in the config file.
api_key API key. Can also be specified in the config file.
api_version: 1 API version. Can also be specified in the config file.
api_url Custom API URL in case the user has a StatusPage service running in a custom environment.
CLI Example:
salt 'minion' statuspage.create endpoint='components' name='my component' group_id='993vgplshj12'

Example output:

```
minion:  
    comment:  
    out:  
        created_at:  
            2017-01-05T19:35:27.135Z  
        description:  
            None  
        group_id:  
            993vgplshj12  
        id:  
            mjkmzt5lhdgc  
        name:
```

result: True

**salt.modules.statuspage.delete** *(endpoint='incidents', id=None, api_url=None, page_id=None, api_key=None, api_version=None)*

Remove an entry from an endpoint.

- **endpoint**: incidents  Request a specific endpoint.
- **page_id**: Page ID. Can also be specified in the config file.
- **api_key**: API key. Can also be specified in the config file.
- **api_version**: 1  API version. Can also be specified in the config file.
- **api_url**: Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```
salt 'minion' statuspage.delete endpoint='components' id='ftgks51sfs2d'
```

Example output:

```
minion: ----------
comment: None
out: True
result: True
```

**salt.modules.statuspage.retrieve** *(endpoint='incidents', api_url=None, page_id=None, api_key=None, api_version=None)*

Retrieve a specific endpoint from the Statuspage API.

- **endpoint**: incidents  Request a specific endpoint.
- **page_id**: Page ID. Can also be specified in the config file.
- **api_key**: API key. Can also be specified in the config file.
- **api_version**: 1  API version. Can also be specified in the config file.
- **api_url**: Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```
salt 'minion' statuspage.retrieve components
```

Example output:
minion:

salt.modules.statuspage.update(endpoint='incidents', id=None, api_url=None, page_id=None, api_key=None, api_version=None, **kwargs)

Update attribute(s) of a specific endpoint.

id The unique ID of the endpoint entry.
endpoint: incidents Endpoint name.
page_id Page ID. Can also be specified in the config file.
api_key API key. Can also be specified in the config file.
api_version: 1 API version. Can also be specified in the config file.
api_url Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:
salt 'minion' statuspage.update id=dz959yz2nd4l status=resolved

Example output:

name:
23.9.96 salt.modules.supervisord

Provide the service module for system supervisord or supervisord in a virtualenv

salt.modules.supervisord.add(name, user=None, conf_file=None, bin_env=None)
Activates any updates in config for process/group.

user user to run supervisorctl as
conf_file path to supervisord config file
bin_env path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:
salt '*' supervisord.add <name>

salt.modules.supervisord.custom(command, user=None, conf_file=None, bin_env=None)
Run any custom supervisord command

user user to run supervisorctl as
conf_file path to supervisord config file
bin_env path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:
salt '*' supervisord.custom "mstop '*'gunicorn*'"

salt.modules.supervisord.options(name, conf_file=None)
New in version 2014.1.0.
Read the config file and return the config options for a given process

name Name of the configured process
conf_file path to supervisord config file

CLI Example:
salt '*' supervisord.options foo

salt.modules.supervisord.remove(name, user=None, conf_file=None, bin_env=None)
Removes process/group from active config

user user to run supervisorctl as
conf_file path to supervisord config file

23.9. execution modules
bin_env  path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.remove <name>
```

salt.modules.supervisord.reread(user=None, conf_file=None, bin_env=None)
Reload the daemon's configuration files

user  user to run supervisorctl as
conf_file  path to supervisord config file
bin_env  path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.reread
```

salt.modules.supervisord.restart(name='all', user=None, conf_file=None, bin_env=None)
Restart the named service. Process group names should not include a trailing asterisk.

user  user to run supervisorctl as
conf_file  path to supervisord config file
bin_env  path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.restart <service>
salt '*' supervisord.restart <group>: 
```

salt.modules.supervisord.start(name='all', user=None, conf_file=None, bin_env=None)
Start the named service. Process group names should not include a trailing asterisk.

user  user to run supervisorctl as
conf_file  path to supervisord config file
bin_env  path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.start <service>
salt '*' supervisord.start <group>: 
```

salt.modules.supervisord.status(name=None, user=None, conf_file=None, bin_env=None)
List programs and its state

user  user to run supervisorctl as
conf_file  path to supervisord config file
bin_env  path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.status
```

salt.modules.supervisord.status_bool(name, expected_state=None, user=None, conf_file=None, bin_env=None)
Check for status of a specific supervisord process and return boolean result.

name  name of the process to check
**expected_state**  search for a specific process state. If set to None - any process state will match.

**user**  user to run supervisorctl as

**conf_file**  path to supervisord config file

**bin_env**  path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```bash
salt '*' supervisord.status_bool nginx expected_state='RUNNING'
```

salt.modules.supervisord.status_raw(name=None, user=None, conf_file=None, bin_env=None)

Display the raw output of status

**user**  user to run supervisorctl as

**conf_file**  path to supervisord config file

**bin_env**  path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```bash
salt '*' supervisord.status_raw
```

salt.modules.supervisord.stop(name='all', user=None, conf_file=None, bin_env=None)

Stop the named service. Process group names should not include a trailing asterisk.

**user**  user to run supervisorctl as

**conf_file**  path to supervisord config file

**bin_env**  path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```bash
salt '*' supervisord.stop <service>
salt '*' supervisord.stop <group>:
```

salt.modules.supervisord.update(user=None, conf_file=None, bin_env=None, name=None)

Reload config and add/remove/update as necessary

**user**  user to run supervisorctl as

**conf_file**  path to supervisord config file

**bin_env**  path to supervisorctl bin or path to virtualenv with supervisor installed

**name**  name of the process group to update. if none then update any process group that has changes

CLI Example:

```bash
salt '*' supervisord.update
```
23.9.97 salt.modules.telegram

Module for sending messages via Telegram.

**configuration** In order to send a message via the Telegram, certain configuration is required in /etc/salt/minion on the relevant minions or in the pillar. Some sample configs might look like:

```
telegram.chat_id: '123456789'
telegram.token: '00000000:xxxxxxxxxxxxxxxxxxxxxxxxxx'
```

salt.modules.telegram.post_message(*message, chat_id=None, token=None*)

Send a message to a Telegram chat.

**Parameters**
- message -- The message to send to the Telegram chat.
- chat_id -- (optional) The Telegram chat id.
- token -- (optional) The Telegram API token.

**Returns** Boolean if message was sent successfully.

CLI Example:

```
salt '*' telegram.post_message message="Hello Telegram!"
```

23.9.98 salt.modules.temp

Simple module for creating temporary directories and files

This is a thin wrapper around Pythons tempfile module

New in version 2015.8.0.

salt.modules.temp.dir(*suffix='', prefix='tmp', parent=None*)

Create a temporary directory

CLI Example:

```
salt '*' temp.dir
salt '*' temp.dir prefix='mytemp-' parent='/var/run/
```

salt.modules.temp.file(*suffix='', prefix='tmp', parent=None*)

Create a temporary file

CLI Example:

```
salt '*' temp.file
salt '*' temp.file prefix='mytemp-' parent='/var/run/
```
23.9.99  **salt.modules.test_virtual**

Module for running arbitrary tests with a __virtual__ function

```
salt.modules.test_virtual.ping()
```

23.9.100  **salt.modules.testinframod**

This module exposes the functionality of the TestInfra library for use with SaltStack in order to verify the state of your minions. In order to allow for the addition of new resource types in TestInfra this module dynamically generates wrappers for the various resources by iterating over the values in the __all__ variable exposed by the testinfra.modules namespace.

23.9.101  **salt.modules.twilio_notify**

Module for notifications via Twilio

New in version 2014.7.0.

```
depends

- twilio python module

configuration  Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config (with pillar_opts set to True).

For example:

```
my-twilio-account:
    twilio.account_sid: AC32a3c83990934481add5ce1659f04d2
    twilio.auth_token: mytoken
```

salt.modules.twilio_notify.send_sms(profile, body, to, from_)

Send an sms

CLI Example:

```
twilio.send_sms my-twilio-account 'Test sms' '+18019999999' '+18011111111'
```

23.9.102  **salt.modules.uptime**

Wrapper around uptime API

```
salt.modules.uptime.check_exists(name)

Check if a given URL is in being monitored by uptime

CLI Example:

```
salt '*' uptime.check_exists http://example.org
```

salt.modules.uptime.checks_list()

List URL checked by uptime

CLI Example:

```
salt '*' uptime.checks_list
```

23.9.  **execution modules**
salt.modules.uptime.create(name, **params)

Create a check on a given URL.

Additional parameters can be used and are passed to API (for example interval, maxTime, etc). See the documentation https://github.com/fzaninotto/uptime for a full list of the parameters.

CLI Example:

```
salt '*' uptime.create http://example.org
```

salt.modules.uptime.delete(name)

Delete a check on a given URL

CLI Example:

```
salt '*' uptime.delete http://example.org
```

23.9.103 salt.modules.vault

Functions to interact with Hashicorp Vault.

maintainer SaltStack

maturity new

platform all

note If you see the following error, you’ll need to upgrade requests to at least 2.4.2

```
<timestamp> [salt.pillar][CRITICAL][14337] Pillar render error: Failed to load ext_pillar vault: {'error': "request() got an unexpected keyword argument 'json'"}
```

configuration The salt-master must be configured to allow peer-runner configuration, as well as configuration for the module.

Add this segment to the master configuration file, or /etc/salt/master.d/vault.conf:

```
vault:
    url: https://vault.service.domain:8200
    verify: /etc/ssl/certs/ca-certificates.crt
    role_name: minion_role
    auth:
        method: approle
        role_id: 11111111-2222-3333-4444-1111111111111
        secret_id: 11111111-1111-1111-1111-1111111111111
    policies:
        - saltstack/minions
        - saltstack/minion/{minion}
        .. more policies
    keys:
        - n63/TbrQuL3xaIW7ZzpuXj/tIfnK1/MbVxO4vT3wYD2A
        - S90wCvMRhErEA4NVELYBs6w/M6+urgUr24xGK44Uy3
        - F1j4b7JKq8S0NS6Kboiy5laJ0xY8dWJvB3fcwA+SraYl
        - 1cVtvjKJNDVam9c7HNqJufINk4PyyAXIpjkpN/sIuzPv
        - 3pPK5x6vGtwLhNOFv1u2elahECz3HpRUfNXJFYLw6lid
```

url Url to your Vault installation. Required.

verify For details please see https://requests.readthedocs.io/en/master/user/advanced/

#ssl-cert-verification

1278 Chapter 23. Salt Module Reference
New in version 2018.3.0.

**role_name**  Role name for minion tokens created. If omitted, minion tokens will be created without any role, thus being able to inherit any master token policy (including token creation capabilities). Optional.

For details please see: https://www.vaultproject.io/api/auth/token/index.html#create-token

Example configuration: https://www.nomadproject.io/docs/vault-integration/index.html#vault-token-role-configuration

**auth**  Currently only token and approle auth types are supported. Required.

Approle is the preferred way to authenticate with Vault as it provide some advanced options to control authentication process. Please visit Vault documentation for more info: https://www.vaultproject.io/docs/auth/approle.html

The token must be able to create tokens with the policies that should be assigned to minions. You can still use the token auth via a OS environment variable via this config example:

```yaml
vault:
  url: https://vault.service.domain:8200
  auth:
    method: token
    token: xxxxxx
    osenv:
      driver: env
```

And then export the VAULT_TOKEN variable in your OS:

```bash
export VAULT_TOKEN=11111111-1111-1111-1111-111111111111
```

Configuration keys uses or ttl may also be specified under auth to configure the tokens generated on behalf of minions to be reused for the defined number of uses or length of time in seconds. These settings may also be configured on the minion when allow_minion_override is set to True in the master config.

Defining uses will cause the salt master to generate a token with that number of uses rather than a single use token. This multi-use token will be cached on the minion. The type of minion cache can be specified with token_backend: session or token_backend: disk. The value of session is the default, and will store the vault information in memory only for that session. The value of disk will write to an on disk file, and persist between state runs (most helpful for multi-use tokens).

```yaml
vault:
  auth:
    method: token
    token: xxxxxx
    uses: 10
    ttl: 43200
    allow_minion_override: True
    token_backend: disk
```

**policies**  Policies that are assigned to minions when requesting a token. These can either be static, eg saltstack/minions, or templated with grain values, eg, my-policies/{grains[os]}. {minion} is shorthand for grains[id], saltstack/minion/{minion}.
If a template contains a grain which evaluates to a list, it will be expanded into multiple policies. For example, given the template `saltstack/by-role/{grains[roles]}`, and a minion having these grains:

```
grains:
  roles:
    - web
    - database
```

The minion will have the policies `saltstack/by-role/web` and `saltstack/by-role/database`.

Optional. If policies is not configured, `saltstack/minions` and `saltstack/{minion}` are used as defaults.

**Note:** list members which do not have simple string representations, such as dictionaries or objects, do not work and will throw an exception. Strings and numbers are examples of types which work well.

**keys** List of keys to use to unseal vault server with the vault.unseal runner.

Add this segment to the master configuration file, or `/etc/salt/master.d/peer_run.conf`:

```
peer_run:
  .*:
    - vault.generate_token
```

**salt.modules.vault.clear_token_cache()**

Changed in version 3001.

Delete minion Vault token cache file

CLI Example:

```
salt '*' vault.clear_token_cache
```

**salt.modules.vault.delete_secret(path)**

Delete secret at the path in vault. The vault policy used must allow this.

CLI Example:

```
salt '*' vault.delete_secret "secret/my/secret"
```

**salt.modules.vault.destroy_secret(path, *args)**

New in version 3001.

Destroy specified secret version at the path in vault. The vault policy used must allow this. Only supported on Vault KV version 2

CLI Example:

```
salt '*' vault.destroy_secret "secret/my/secret" 1 2
```

**salt.modules.vault.list_secrets(path, default=<class 'salt.exceptions.CommandExecutionError'>)**

Changed in version 3001: The `default` argument has been added. When the path or path/key combination is not found, an exception will be raised, unless a default is provided.

List secret keys at the path in vault. The vault policy used must allow this. The path should end with a trailing slash.
CLI Example:

```bash
salt '*' vault.list_secrets "secret/my/"
```

**salt.modules.vault.read_secret**(path, key=None, metadata=False, default=\(\text{class} 'salt.exceptions.CommandExecutionError'\))

Changed in version 3001: The `default` argument has been added. When the path or path/key combination is not found, an exception will be raised, unless a default is provided.

Return the value of key at path in vault, or entire secret.

Parameters

- **metadata** -- Optional - If using KV v2 backend, display full results, including metadata

  New in version 3001.

Jinja Example:

```jinja
my-secret: {{ salt['vault'].read_secret('secret/my/secret', 'some-key') }}

{% set supersecret = salt['vault'].read_secret('secret/my/secret') %}
secrets:
  first: {{ supersecret.first }}
  second: {{ supersecret.second }}
```

**salt.modules.vault.write_raw**(path, raw)

Set raw data at the path in vault. The vault policy used must allow this.

CLI Example:

```bash
salt '*' vault.write_raw "secret/my/secret" \{"user":"foo","password": "bar"\}
```

**salt.modules.vault.write_secret**(path, **kwargs)

Set secret at the path in vault. The vault policy used must allow this.

CLI Example:

```bash
salt '*' vault.write_secret "secret/my/secret" user="foo" password="bar"
```

### 23.9.104 salt.modules.vbox_guest

VirtualBox Guest Additions installer

**salt.modules.vbox_guest.additions_install**(**kwargs)

Install VirtualBox Guest Additions. Uses the CD, connected by VirtualBox.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press ‘Host+D’ (Host’ is usually ‘Right Ctrl’).

See [https://www.virtualbox.org/manual/ch04.html#idp52733088](https://www.virtualbox.org/manual/ch04.html#idp52733088) for more details.

CLI Example:

```bash
salt '*' vbox_guest.additions_install
salt '*' vbox_guest.additions_install reboot=True
salt '*' vbox_guest.additions_install upgrade_os=True
```
Parameters

- **reboot** *(bool)* -- reboot computer to complete installation
- **upgrade_os** *(bool)* -- upgrade OS (to ensure the latest version of kernel and developer tools are installed)

Returns version of VirtualBox Guest Additions or string with error

```python
salt.modules.vbox_guest.additions_mount()
```

Mount VirtualBox Guest Additions CD to the temp directory.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press 'Host+D' ('Host' is usually 'Right Ctrl').

CLI Example:

```bash
salt '*' vbox_guest.additions_mount
```

Returns True or OSError exception

```python
salt.modules.vbox_guest.additions_remove(**kwargs)
```

Remove VirtualBox Guest Additions.

Firstly it tries to uninstall itself by executing '/opt/VBoxGuestAdditions-VERSION/uninstall.run uninstall'. It uses the CD, connected by VirtualBox if it failes.

CLI Example:

```bash
salt '*' vbox_guest.additions_remove
salt '*' vbox_guest.additions_remove force=True
```

Parameters **force** *(bool)* -- force VirtualBox Guest Additions removing

Returns True if VirtualBox Guest Additions were removed successfully else False

```python
salt.modules.vbox_guest.additions_umount(mount_point)
```

Unmount VirtualBox Guest Additions CD from the temp directory.

CLI Example:

```bash
salt '*' vbox_guest.additions_umount
```

Parameters **mount_point** -- directory VirtualBox Guest Additions is mounted to

Returns True or an string with error

```python
salt.modules.vbox_guest.additions_version()
```

Check VirtualBox Guest Additions version.

CLI Example:

```bash
salt '*' vbox_guest.additions_version
```

Returns version of VirtualBox Guest Additions or False if they are not installed
salt.modules.vbox_guest.grant_access_to_shared_folders_to(name, users=None)

Grant access to auto-mounted shared folders to the users.

User is specified by its name. To grant access for several users use argument users. Access will be denied to the users not listed in users argument.

See https://www.virtualbox.org/manual/ch04.html#sf_mount_auto for more details.

CLI Example:
```
salt '*' vbox_guest.grant_access_to_shared_folders_to fred
salt '*' vbox_guest.grant_access_to_shared_folders_to users ['fred', 'roman']
```

Parameters

- name (str) -- name of the user to grant access to auto-mounted shared folders to
- users (list of str) -- list of names of users to grant access to auto-mounted shared folders to (if specified, name will not be taken into account)

Returns list of users who have access to auto-mounted shared folders

salt.modules.vbox_guest.list_shared_folders_users()

List users who have access to auto-mounted shared folders.

See https://www.virtualbox.org/manual/ch04.html#sf_mount_auto for more details.

CLI Example:
```
salt '*' vbox_guest.list_shared_folders_users
```

Returns list of users who have access to auto-mounted shared folders

23.9.105 salt.modules.win_timezone

Module for managing timezone on Windows systems.

class salt.modules.win_timezone.TzMapper(unix_to_win)

add(k, v)

get_unix(key, default=None)

gnewin(key, default=None)

list_unix()

list_win()

remove(k)

salt.modules.win_timezone.get_hwclock()

Get current hardware clock setting (UTC or localtime)

Note: The hardware clock is always local time on Windows so this will always return "localtime"

CLI Example:
salt '*' timezone.get_hwclock

**salt.modules.win_timezone.get_offset()**
Get current numeric timezone offset from UTC (i.e. -0700)

Returns Offset from UTC

Return type str

CLI Example:
```
salt '*' timezone.get_offset
```

**salt.modules.win_timezone.get_zone()**
Get current timezone (i.e. America/Denver)

Returns Timezone in unix format

Return type str

Raises `CommandExecutionError` -- If timezone could not be gathered

CLI Example:
```
salt '*' timezone.get_zone
```

**salt.modules.win_timezone.get_zonecode()**
Get current timezone (i.e. PST, MDT, etc)

Returns An abbreviated timezone code

Return type str

CLI Example:
```
salt '*' timezone.get_zonecode
```

**salt.modules.win_timezone.list** *(unix_style=True)*
Return a list of Timezones that this module supports. These can be in either Unix or Windows format.

New in version 2018.3.3.

Parameters

- `unix_style` (bool) -- True returns Unix-style timezones. False returns Windows-style timezones. Default is True

Returns A list of supported timezones

Return type list

CLI Example:
```
# Unix-style timezones
salt '*' timezone.list

# Windows-style timezones
salt '*' timezone.list unix_style=False
```

**salt.modules.win_timezone.set_hwclock**(clock)
Sets the hardware clock to be either UTC or localtime

---

Note: The hardware clock is always local time on Windows so this will always return False
CLI Example:
```
salt '*' timezone.set_hwclock UTC
```

**salt.modules.win_timezone.set_zone(timezone)**
Sets the timezone using the tzutil.

- **Parameters**
  - `timezone` *(str)* - A valid timezone
- **Returns**
  - True if successful, otherwise False
- **Return type**
  - bool
- **Raises**
  - CommandExecutionError -- If invalid timezone is passed

CLI Example:
```
salt '*' timezone.set_zone 'America/Denver'
```

**salt.modules.win_timezone.zone_compare(timezone)**
Compares the given timezone with the machine timezone. Mostly useful for running state checks.

- **Parameters**
  - `timezone` *(str)* - The timezone to compare. This can be in Windows or Unix format. Can be any of the values returned by the `timezone.list` function
- **Returns**
  - True if they match, otherwise False
- **Return type**
  - bool

Example:
```
salt '*' timezone.zone_compare 'America/Denver'
```

### 23.9.106 salt.modules.xml

XML file manager

New in version 3000.

**salt.modules.xml.get_attribute(file, element)**
Return the attributes of the matched xpath element.

CLI Example:
```
salt '*' xml.get_attribute /tmp/test.xml ".//element[@id='3']"
```

**salt.modules.xml.get_value(file, element)**
Returns the value of the matched xpath element

CLI Example:
```
salt '*' xml.get_value /tmp/test.xml ".//element"
```

**salt.modules.xml.set_attribute(file, element, key, value)**
Set the requested attribute key and value for matched xpath element.

CLI Example:
```
salt '*' xml.set_attribute /tmp/test.xml ".//element[@id='3']" editedby "gal"
```
salt.modules.xml.set_value(file, element, value)
Sets the value of the matched xpath element

CLI Example:

```
salt '*' xml.set_value /tmp/test.xml "./element" "new value"
```

23.9.107 salt.modules.xmpp

Module for Sending Messages via XMPP (a.k.a. Jabber)

New in version 2014.1.0.

**depends**

- sleekxmpp>=1.3.1
- pyasn1
- pyasn1-modules
- dnspython

**configuration** This module can be used by either passing a jid and password directly to send_message, or by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```
my-xmpp-login:
 xmpp.jid: myuser@jabber.example.org/resource
 xmpp.password: verybadpass
```

The resourcename refers to the resource that is using this account. It is user-definable, and optional. The following configurations are both valid:

```
my-xmpp-login:
 xmpp.jid: myuser@jabber.example.org/salt
 xmpp.password: verybadpass

my-xmpp-login:
 xmpp.jid: myuser@jabber.example.org
 xmpp.password: verybadpass
```

class salt.modules.xmpp.SendMsgBot(jid, password, recipient, msg)

**classmethod create_multi(jid, password, msg, recipients=None, rooms=None, nick='SaltStack Bot')**

Alternate constructor that accept multiple recipients and rooms

**start(event)**

class salt.modules.xmpp.SleekXMPPMUC(name="")

**filter(record)**

Determine if the specified record is to be logged.

Is the specified record to be logged? Returns 0 for no, nonzero for yes. If deemed appropriate, the record may be modified in-place.
salt.modules.xmpp.send_msg(recipient, message, jid=None, password=None, profile=None)
Send a message to an XMPP recipient. Designed for use in states.

CLI Examples:

```
xmpp.send_msg 'admins@xmpp.example.com' 'This is a salt module test' → profile='my-xmpp-account'
xmpp.send_msg 'admins@xmpp.example.com' 'This is a salt module test' → jid='myuser@xmpp.example.com/salt' password='verybadpass'
```

salt.modules.xmpp.send_msg_multi(message, recipients=None, rooms=None, jid=None, password=None, nick='SaltStack Bot', profile=None)
Send a message to an XMPP recipient, support send message to multiple recipients or chat room.

CLI Examples:

```
xmpp.send_msg recipients=['admins@xmpp.example.com'] rooms=['secret@conference.xmpp.example.com'] 'This is a salt module test' → profile='my-xmpp-account'
xmpp.send_msg recipients=['admins@xmpp.example.com'] rooms=['secret@conference.xmpp.example.com'] 'This is a salt module test' → jid='myuser@xmpp.example.com/salt' password='verybadpass'
```

23.9.108  salt.modules.zk_concurrency

Concurrency controls in zookeeper

depends kazoo

configuration  See salt.modules.zookeeper for setup instructions.

This module allows you to acquire and release a slot. This is primarily useful for ensuring that no more than N
hosts take a specific action at once. This can also be used to coordinate between masters.

salt.modules.zk_concurrency.lock(path, zk_hosts=None, identifier=None, max_concurrency=1, timeout=None, ephemeral_lease=False, force=False, profile=None, scheme=None, username=None, password=None, default_acl=None)

Get lock (with optional timeout)

path  The path in zookeeper where the lock is

zk_hosts  zookeeper connect string

identifier  Name to identify this minion, if unspecified defaults to the hostname

max_concurrency  Maximum number of lock holders

timeout  timeout to wait for the lock. A None timeout will block forever

ephemeral_lease  Whether the locks in zookeeper should be ephemeral

force  Forcibly acquire the lock regardless of available slots

Example:

```
salt minion zk_concurrency.lock /lock/path host1:1234,host2:1234
```
salt.modules.zk_concurrency.lock_holders(path, zk_hosts=None, identifier=None, max_concurrency=1, timeout=None, ephemeral_lease=False, scheme=None, username=None, password=None, default_acl=None)

Return an un-ordered list of lock holders

**path** The path in zookeeper where the lock is

**zk_hosts** zookeeper connect string

**identifier** Name to identify this minion, if unspecified defaults to hostname

**max_concurrency** Maximum number of lock holders

**timeout** timeout to wait for the lock. A None timeout will block forever

**ephemeral_lease** Whether the locks in zookeeper should be ephemeral

Example:

```
salt minion zk_concurrency.lock_holders /lock/path host1:1234,host2:1234
```

salt.modules.zk_concurrency.party_members(path, zk_hosts=None, min_nodes=1, blocking=False, profile=None, scheme=None, username=None, password=None, default_acl=None)

Get the List of identifiers in a particular party, optionally waiting for the specified minimum number of nodes (min_nodes) to appear

**path** The path in zookeeper where the lock is

**zk_hosts** zookeeper connect string

**min_nodes** The minimum number of nodes expected to be present in the party

**blocking** The boolean indicating if we need to block until min_nodes are available

Example:

```
salt minion zk_concurrency.party_members /lock/path host1:1234,host2:1234
salt minion zk_concurrency.party_members /lock/path host1:1234,host2:1234 min_nodes=3 blocking=True
```

salt.modules.zk_concurrency.unlock(path, zk_hosts=None, identifier=None, max_concurrency=1, ephemeral_lease=False, scheme=None, profile=None, username=None, password=None, default_acl=None)

Remove lease from semaphore

**path** The path in zookeeper where the lock is

**zk_hosts** zookeeper connect string

**identifier** Name to identify this minion, if unspecified defaults to hostname

**max_concurrency** Maximum number of lock holders

**timeout** timeout to wait for the lock. A None timeout will block forever

**ephemeral_lease** Whether the locks in zookeeper should be ephemeral

Example:

```
salt minion zk_concurrency.unlock /lock/path host1:1234,host2:1234
```
23.9.109 salt.modules.zookeeper

Zookeeper Module

maintainer SaltStack
maturity new
platform all
depends kazoo

New in version 2018.3.0.

Configuration

configuration This module is not usable until the following are specified either in a pillar or in the
minion’s config file:

```yaml
zookeeper:
  hosts: zoo1,zoo2,zoo3
  default_acl:
    - username: daniel
    password: test
    read: true
    write: true
    create: true
    delete: true
    admin: true
  username: daniel
  password: test
```

If configuration for multiple zookeeper environments is required, they can be set up as different
configuration profiles. For example:

```yaml
zookeeper:
  prod:
    hosts: zoo1,zoo2,zoo3
    default_acl:
      - username: daniel
        password: test
        read: true
        write: true
        create: true
        delete: true
        admin: true
      username: daniel
      password: test
  dev:
    hosts:
      - dev1
      - dev2
      - dev3
    default_acl:
      - username: daniel
        password: test
        read: true
        write: true
        create: true
        delete: true
        admin: true
  username: daniel
  password: test
```

(continues on next page)
write: true
create: true
delete: true
admin: true
username: daniel
password: test

salt.modules.zookeeper.create(path, value='', acls=None, ephemeral=False, sequence=False, makepath=False, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Create Znode

path path of znode to create
value value to assign to znode (Default: '')
acls list of acl dictionaries to be assigned (Default: None)
ephemeral indicate node is ephemeral (Default: False)
sequence indicate node is suffixed with a unique index (Default: False)
makepath Create parent paths if they do not exist (Default: False)
profile Configured Zookeeper profile to authenticate with (Default: None)
hosts Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')
scheme Scheme to authenticate with (Default: 'digest')
username Username to authenticate (Default: None)
password Password to authenticate (Default: None)
default_acl Default acls to assign if a node is created in this connection (Default: None)

CLI Example:
salt minion1 zookeeper.create /test/name daniel profile=prod

salt.modules.zookeeper.delete(path, version=-1, recursive=False, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Delete znode

path path to znode
version only delete if version matches (Default: -1 (always matches))
profile Configured Zookeeper profile to authenticate with (Default: None)
hosts Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')
scheme Scheme to authenticate with (Default: 'digest')
username Username to authenticate (Default: None)
password Password to authenticate (Default: None)
default_acl Default acls to assign if a node is created in this connection (Default: None)

CLI Example:
salt minion1 zookeeper.delete /test/name profile=prod
salt.modules.zookeeper.**ensure_path**(*path*, *acls=None*, *profile=None*, *hosts=None*, *scheme=None*, *username=None*, *password=None*, *default_acl=None*)

Ensure Znode path exists

- **path** Parent path to create
- **acls** list of acls dictionaries to be assigned (Default: None)
- **profile** Configured Zookeeper profile to authenticate with (Default: None)
- **hosts** Lists of Zookeeper Hosts (Default: '127.0.0.1:2181)
- **scheme** Scheme to authenticate with (Default: 'digest')
- **username** Username to authenticate (Default: None)
- **password** Password to authenticate (Default: None)
- **default_acl** Default acls to assign if a node is created in this connection (Default: None)

CLI Example:
```
salt minion1 zookeeper.ensure_path /test/name profile=prod
```

salt.modules.zookeeper.**exists**(*path*, *profile=None*, *hosts=None*, *scheme=None*, *username=None*, *password=None*, *default_acl=None*)

Check if path exists

- **path** path to check
- **profile** Configured Zookeeper profile to authenticate with (Default: None)
- **hosts** Lists of Zookeeper Hosts (Default: '127.0.0.1:2181)
- **scheme** Scheme to authenticate with (Default: 'digest')
- **username** Username to authenticate (Default: None)
- **password** Password to authenticate (Default: None)
- **default_acl** Default acls to assign if a node is created in this connection (Default: None)

CLI Example:
```
salt minion1 zookeeper.exists /test/name profile=prod
```

salt.modules.zookeeper.**get**(*path*, *profile=None*, *hosts=None*, *scheme=None*, *username=None*, *password=None*, *default_acl=None*)

Get value saved in znode

- **path** path to check
- **profile** Configured Zookeeper profile to authenticate with (Default: None)
- **hosts** Lists of Zookeeper Hosts (Default: '127.0.0.1:2181)
- **scheme** Scheme to authenticate with (Default: 'digest')
- **username** Username to authenticate (Default: None)
- **password** Password to authenticate (Default: None)
- **default_acl** Default acls to assign if a node is created in this connection (Default: None)

CLI Example:
```
salt minion1 zookeeper.get /test/name profile=prod
```
salt.modules.zookeeper.get_acls(path, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Get acls on a znode

path  path to znode

profile  Configured Zookeeper profile to authenticate with (Default: None)

hosts  Lists of Zookeeper Hosts (Default: '127.0.0.1:2181)

scheme  Scheme to authenticate with (Default: 'digest')

username  Username to authenticate (Default: None)

password  Password to authenticate (Default: None)

default_acl  Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.get_acls /test/name profile=prod
```

salt.modules.zookeeper.get_children(path, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Get children in znode path

path  path to check

profile  Configured Zookeeper profile to authenticate with (Default: None)

hosts  Lists of Zookeeper Hosts (Default: '127.0.0.1:2181)

scheme  Scheme to authenticate with (Default: 'digest')

username  Username to authenticate (Default: None)

password  Password to authenticate (Default: None)

default_acl  Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.get_children /test profile=prod
```

salt.modules.zookeeper.make_digest_acl(username, password, read=False, write=False, create=False, delete=False, admin=False, allperms=False)

Generate acl object

Note:  This is heavily used in the zookeeper state and probably is not useful as a cli module

username  username of acl

password  plain text password of acl

read  read acl

write  write acl

create  create acl

delete  delete acl

admin  admin acl
Salt Documentation, Release 3002.5

allperms set all other acls to True
CLI Example:
salt minion1 zookeeper.make_digest_acl username=daniel password=mypass
,→allperms=True

salt.modules.zookeeper.set(path, value, version=- 1, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)
Update znode with new value
path znode to update
value value to set in znode
version only update znode if version matches (Default: -1 (always matches))
profile Configured Zookeeper profile to authenticate with (Default: None)
hosts Lists of Zookeeper Hosts (Default: '127.0.0.1:2181)
scheme Scheme to authenticate with (Default: 'digest')
username Username to authenticate (Default: None)
password Password to authenticate (Default: None)
default_acl Default acls to assign if a node is created in this connection (Default: None)
CLI Example:
salt minion1 zookeeper.set /test/name gtmanfred profile=prod

salt.modules.zookeeper.set_acls(path, acls, version=- 1, profile=None, hosts=None, scheme=None,
username=None, password=None, default_acl=None)
Set acls on a znode
path path to znode
acls list of acl dictionaries to set on the znode
version only set acls if version matches (Default: -1 (always matches))
profile Configured Zookeeper profile to authenticate with (Default: None)
hosts Lists of Zookeeper Hosts (Default: '127.0.0.1:2181)
scheme Scheme to authenticate with (Default: 'digest')
username Username to authenticate (Default: None)
password Password to authenticate (Default: None)
default_acl Default acls to assign if a node is created in this connection (Default: None)
CLI Example:
salt minion1 zookeeper.set_acls /test/name acls='[{"username": "gtmanfred",
,→"password": "test", "all": True}]' profile=prod

### 23.13.1 salt.proxy.cimc

Proxy Minion interface module for managing Cisco Integrated Management Controller devices

New in version 2018.3.0.

```plaintext
codeauthor Spencer Ervin <spencer_ervin@hotmail.com>
maturity new
depends none
platform unix
```

This proxy minion enables Cisco Integrated Management Controller devices (hereafter referred to as simply 'cimc' devices to be treated individually like a Salt Minion.

The cimc proxy leverages the XML API functionality on the Cisco Integrated Management Controller. The Salt proxy must have access to the cimc on HTTPS (tcp/443).

More in-depth conceptual reading on Proxy Minions can be found in the *Proxy Minion* section of Salt’s documentation.

### Configuration

To use this integration proxy module, please configure the following:

**Pillar**

Proxy minions get their configuration from Salt’s Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID.

```plaintext
proxy:
  proxytype: cimc
  host: <ip or dns name of cimc host>
  username: <cimc username>
```

(continues on next page)
**proxytype**

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this cimc Proxy Module, set this to `cimc`.

**host**

The location, or ip/dns, of the cimc host. Required.

**username**

The username used to login to the cimc host. Required.

**password**

The password used to login to the cimc host. Required.

```python
password: <cimc password>
verify_ssl: True
```

salt.proxy.cimc.get_config_resolver_class(cid=None, hierarchical=False)

The configResolveClass method returns requested managed object in a given class.

salt.proxy.cimc.grains()

Get the grains from the proxied device

salt.proxy.cimc.grains_refresh()

Refresh the grains from the proxied device

salt.proxy.cimc.init(opts)

This function gets called when the proxy starts up.

salt.proxy.cimc.initialized()

Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our init() function has been called

salt.proxy.cimc.logon()

Logs into the cimc device and returns the session cookie.

salt.proxy.cimc.logout(cookie=None)

Closes the session with the device.

salt.proxy.cimc.ping()

Returns true if the device is reachable, else false.

salt.proxy.cimc.prepare_return(x)

Converts the etree to dict

salt.proxy.cimc.set_config_modify(dn=None, inconfig=None, hierarchical=False)

The configConfMo method configures the specified managed object in a single subtree (for example, DN).

salt.proxy.cimc.shutdown()

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.
23.13.2 salt.proxy.cisonso

Proxy Minion interface module for managing (practically) any network device with Cisco Network Services Orchest-urator (Cisco NSO). Cisco NSO uses a series of remote polling agents, APIs and SSH commands to fetch network configuration and represent it in a data model. PyNSO, the Python module used by this proxy minion does the task of converting native Python dictionaries into NETCONF/YANG syntax that the REST API for Cisco NSO can then use to set the configuration of the target network device.

Supported devices:

- A10 AX Series
- Arista 7150 Series
- Ciena 3000, 5000, ESM
- H3c S5800 Series
- Overture 1400, 2200, 5000, 5100, 6000
- Accedian MetroNID
- Avaya ERS 4000, SR8000, VSP 9000
- Cisco: APIC-DC, ASA, IOS, IOS XE, IOS XR, er, ME-4600, NX OS, Prime Network Registrar, Quantum, StarOS, UCS ManagWSA
- Huawei: NE40E, quidway series, Enterprise Network Simulation Framework
- PaloAlto PA-2000, PA-3000, Virtualized Firewalls
- Adtran 900 Series
- Brocade ADX, MLX, Netiron, Vyatta
- Dell Force 10 Networking S-Series
- Infinera DTN-X Multi-Terabit Packet Optical Network Platform
- Pulsecom SuperG
- Adva 150CC Series
- CableLabs Converged Cable Access Platform
- Ericsson EFN324 Series, SE family
- Juniper: Contrail, EX, M, MX, QFX, SRX, Virtual SRX
- Quagga Routing Software
- Affirmed Networks
- Citrix Netscaler
- F5 BIG-IP
- NEC iPasolink

- Nominum DCS
This proxy minion enables a consistent interface to fetch, control and maintain the configuration of network devices via a NETCONF-compliant control plane. Cisco Network Services Orchestrator.

More in-depth conceptual reading on Proxy Minions can be found in the Proxy Minion section of Salt’s documentation.

**Dependencies**

- pynso Python module

**PyNSO**

PyNSO can be installed via pip:

```
pip install pynso
```

**Configuration**

To use this integration proxy module, please configure the following:

**Pillar**

Proxy minions get their configuration from Salt’s Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID. At a minimum for communication with the NSO host, the pillar should look like this:

```
proxy:
    proxitype: cisconso
    host: <ip or dns name of host>
    port: 8080
    use_ssl: false
    username: <username>
    password: password
```
proxytype

The proxytype key and value pair is critical, as it tells Salt which interface to load from the proxy directory in Salt's install hierarchy, or from /srv/salt/_proxy on the Salt Master (if you have created your own proxy module, for example). To use this Cisco NSO Proxy Module, set this to cisconso.

host

The location, or IP/dns, of the Cisco NSO API host. Required.

username

The username used to login to the Cisco NSO host, such as admin. Required.

passwords

The password for the given user. Required.

use_ssl

Whether to use HTTPS messaging to speak to the API.

port

The port that the Cisco NSO API is running on, 8080 by default

Salt Proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your Salt Master and to the Cisco NSO host in question. SaltStack recommends that the machine running the salt-proxy process also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an /etc/salt/proxy file with at least the following in it:

```
master: <ip or hostname of salt-master>
```

You can then start the salt-proxy process with:

```
salt-proxy --proxyid <id you want to give the host>
```

You may want to add -l debug to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you gave the cisconso host>
```

You can confirm that the pillar data is in place for the proxy:
salt <id> pillar.items

And now you should be able to ping the Cisco NSO host to make sure it is responding:

salt <id> test.ping

```python
salt.proxy.cisconso.apply_rollback(datastore, name)

Apply a system rollback

Parameters

- `datastore` (DatastoreType(str enum)) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- `name` (str) -- an ID of the rollback to restore
```

```python
salt.proxy.cisconso.get_data(datastore, path)

Get the configuration of the device tree at the given path

Parameters

- `datastore` (DatastoreType(str enum)) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- `path` (list of str OR tuple) -- The device path, a list of element names in order, comma separated

Returns The network configuration at that tree

Return type dict
```

```python
salt cisco-nso cisconso.get_data devices
```

```python
salt.proxy.cisconso.get_rollback(name)

Get the backup of stored a configuration rollback

Parameters `name` (str) -- Typically an ID of the backup

Return type str

Returns the contents of the rollback snapshot
```

```python
salt.proxy.cisconso.get_rollbacks()

Get a list of stored configuration rollbacks
```

```python
salt.proxy.cisconso.grains()

Get the grains from the proxy device.
```

```python
salt.proxy.cisconso.init(opts)
```

```python
salt.proxy.cisconso.ping()

Check to see if the host is responding. Returns False if the host didn't respond, True otherwise.

CLI Example:

```
salt cisco-nso test.ping
```

```python
salt.proxy.cisconso.set_data_value(datastore, path, data)

Get a data entry in a datastore

Parameters

- `datastore` (DatastoreType(str enum)) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
```

23.13. proxy modules
- **path** (list of str OR tuple) -- The device path to set the value at, a list of element names in order, comma separated
- **data** (dict) -- The new value at the given path

**Return type** bool

**Returns** True if successful, otherwise error.

`salt.proxy.cisconso.shutdown()`

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

### 23.13.3 salt.proxy.docker

Docker Proxy Minion

New in version 2019.2.0.

- **depends** docker

This proxy minion is just a shim to the docker executor, which will use the `docker.call` for everything except state runs.

To configure the proxy minion:

```yaml
proxy:
  proxytype: docker
  name: festive_leakey
```

It is also possible to just name the proxy minion the same name as the container, and use grains to configure the proxy minion:

```yaml
proxy:
  proxytype: docker
  name: {{grains['id']}}
```

- **name**
  
  Name of the docker container

- **salt.proxy.docker.init**(opts)
  
  Always initialize

- **salt.proxy.docker.initialized()**
  
  This should always be initialized

- **salt.proxy.docker.module_executors()**
  
  List of module executors to use for this Proxy Minion

- **salt.proxy.docker.shutdown**(opts)
  
  Nothing needs to be done to shutdown
23.13.4 salt.proxy.esxvm

Proxy Minion interface module for managing VMWare ESXi virtual machines.

Dependencies

- pyVmomi
- jsonschema

Configuration

To use this integration proxy module, please configure the following:

Pillar

Proxy minions get their configuration from Salt’s Pillar. This can now happen from the proxy’s configuration file.

Example pillars:

```
userpass mechanism:

proxy:
    proxytype: esxvm
    datacenter: <datacenter name>
    vcenter: <ip or dns name of parent vcenter>
    mechanism: userpass
    username: <vCenter username>
    passwords: (required if userpass is used)
        - first_password
        - second_password
        - third_password

sspi mechanism:

proxy:
    proxytype: esxvm
    datacenter: <datacenter name>
    vcenter: <ip or dns name of parent vcenter>
    mechanism: sspi
    domain: <user domain>
    principal: <host kerberos principal>
```

proxytype

To use this Proxy Module, set this to esxvm.
datacenter

Name of the datacenter where the virtual machine should be deployed. Required.

vcenter

The location of the VMware vCenter server (host of ip) where the virtual machine should be managed. Required.

mechanism

The mechanism used to connect to the vCenter server. Supported values are userpass and sspi. Required.

Note: Connections are attempted using all (username, password) combinations on proxy startup.

username

The username used to login to the host, such as root. Required if mechanism is userpass.

passwords

A list of passwords to be used to try and login to the vCenter server. At least one password in this list is required if mechanism is userpass. When the proxy comes up, it will try the passwords listed in order.

domain

User realm domain. Required if mechanism is sspi.

principal

Kerberos principal. Required if mechanism is sspi.

protocol

If the ESXi host is not using the default protocol, set this value to an alternate protocol. Default is https.
port

If the ESXi host is not using the default port, set this value to an alternate port. Default is 443.

Salt Proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your Salt Master and to the vCenter server in the pillar. SaltStack recommends that the machine running the salt-proxy process also run a regular minion, though it is not strictly necessary.

To start a proxy minion one needs to establish its identity <id>:

```bash
salt-proxy --proxyid <proxy_id>
```

On the machine that will run the proxy, make sure there is a configuration file present. By default this is `/etc/salt/proxy`. If in a different location, the `<configuration_folder>` has to be specified when running the proxy: file with at least the following in it:

```bash
salt-proxy --proxyid <proxy_id> -c <configuration_folder>
```

Commands

Once the proxy is running it will connect back to the specified master and individual commands can be runs against it:

```bash
# Master - minion communication
salt <proxy_id> test.ping

# Test vcenter connection
salt <proxy_id> vsphere.test_vcenter_connection
```

States

Associated states are documented in `salt.states.esxvm`. Look there to find an example structure for Pillar as well as an example.sls file for configuring an ESX virtual machine from scratch.

```python
salt.proxy.esxvm.find_credentials()
    Cycle through all the possible credentials and return the first one that works.

salt.proxy.esxvm.get_details()
    Function that returns the cached details

salt.proxy.esxvm.init(opts)
    This function gets called when the proxy starts up. For login the protocol and port are cached.

salt.proxy.esxvm.ping()
    Returns True.
    CLI Example:
    ```bash
    salt esx-vm test.ping
    ```

salt.proxy.esxvm.shutdown()
    Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

23.13. proxy modules
23.13.5 salt.proxy.junos

Interface with a Junos device via proxy-minion. To connect to a junos device via junos proxy, specify the host information in the pillar in '/srv/pillar/details.sls'

```yaml
proxy:
  proxytype: junos
  host: <ip or dns name of host>
  username: <username>
  port: 830
  password: <secret>
```

In '/srv/pillar/top.sls' map the device details with the proxy name.

```yaml
base:
  'vmx':
    - details
```

After storing the device information in the pillar, configure the proxy in '/etc/salt/proxy'

```yaml
master: <ip or hostname of salt-master>
```

Run the salt proxy via the following command:

```bash
salt-proxy --proxyid=vmx
```

```python
class salt.proxy.junos.RebootActive(**kwargs)
    Class to get static variable, to indicate when a reboot/shutdown is being processed and the keep_alive should not probe the connection since it interferes with the shutdown process.
    reboot_shutdown = False

class salt.proxy.junos.Alive(opts)
    Validate and return the connection status with the remote device.
    New in version 2018.3.0.

class salt.proxy.junos.Conn()

class salt.proxy.junos.GetRebootActive()

class salt.proxy.junos.GetSerializedFacts()

class salt.proxy.junos.Init(opts)
    Open the connection to the Junos device, login, and bind to the Resource class

class salt.proxy.junos.Initialized()

class salt.proxy.junos.Ping()
    Ping? Pong!

class salt.proxy.junos.Proxytype()
    Returns the name of this proxy

class salt.proxy.junos.RebootActive()

class salt.proxy.junos.RebootClear()

class salt.proxy.junos.Shutdown(opts)
    This is called when the proxy-minion is exiting to make sure the connection to the device is closed cleanly.
```
23.13.6 salt.proxy.nxos_api

Proxy Minion to manage Cisco Nexus Switches (NX-OS) over the NX-API
New in version 2019.2.0.
Proxy module for managing Cisco Nexus switches via the NX-API.

codeauthor Mircea Ulinic <ping@mirceaulinic.net>
maturity new
platform any

Usage

Note: To be able to use this module you need to enable to NX-API on your switch, by executing feature nxapi in configuration mode.

Configuration example:

```
switch# conf t
switch(config)# feature nxapi
```

To check that NX-API is properly enabled, execute show nxapi.

Output example:

```
switch# show nxapi
nxapi enabled
HTTPS Listen on port 443
```

Note: NX-API requires modern NXOS distributions, typically at least 7.0 depending on the hardware. Due to reliability reasons it is recommended to run the most recent version.

Pillar

The nxos_api proxy configuration requires the following parameters in order to connect to the network switch:

- transport: https Specifies the type of connection transport to use. Valid values for the connection are http, and https.
- host: localhost The IP address or DNS host name of the connection device.
- username: admin The username to pass to the device to authenticate the NX-API connection.
- password The password to pass to the device to authenticate the NX-API connection.
- port The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).
- timeout: 60 Time in seconds to wait for the device to respond. Default: 60 seconds.
verify: **True** Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to True.

When there is no certificate configuration on the device and this option is set as True (default), the commands will fail with the following error: `SSLError: [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed (_ssl.c:581)`. In this case, you either need to configure a proper certificate on the device (recommended), or bypass the checks setting this argument as False with all the security risks considered.

All the arguments may be optional, depending on your setup.

**Proxy Pillar Example**

```yaml
proxy:
  proxitype: nxos_api
  host: switch1.example.com
  username: example
  password: example
```

**salt.proxy.nxos_api.get_conn_args()**

Returns the connection arguments of the Proxy Minion.

**salt.proxy.nxos_api.init(opts)**

Open the connection to the Nexus switch over the NX-API.

As the communication is HTTP based, there is no connection to maintain, however, in order to test the connectivity and make sure we are able to bring up this Minion, we are executing a very simple command (show clock) which doesn’t come with much overhead and it’s sufficient to confirm we are indeed able to connect to the NX-API endpoint as configured.

**salt.proxy.nxos_api.initialized()**

Connection finished initializing?

**salt.proxy.nxos_api.ping()**

Connection open successfully?

**salt.proxy.nxos_api.rpc(commands, method='cli', **kwargs)**

Executes an RPC request over the NX-API.

**salt.proxy.nxos_api.shutdown(opts)**

Closes connection with the device.

23.16.1 salt.runners.asam

Novell ASAM Runner

New in version 2015.8.0.

Runner to interact with Novell ASAM Fan-Out Driver

   codeauthor Nitin Madhok <nmadhok@g.clemson.edu>

To use this runner, set up the Novell Fan-Out Driver URL, username and password in the master configuration at /etc/salt/master or /etc/salt/master.d/asam.conf:

```yaml
asam:
  prov1.domain.com
  username: "testuser"
  password: "verybadpass"
  verify_ssl: true
  prov2.domain.com
  username: "testuser"
  password: "verybadpass"
  verify_ssl: true
```

Note: Optionally, protocol and port can be specified if the Fan-Out Driver server is not using the defaults. Default is protocol: https and port: 3451.

salt.runners.asam.add_platform(name, platform_set, server_url)

To add an ASAM platform using the specified ASAM platform set on the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.add_platform my-test-vm test-platform-set prov1.domain.com
```

salt.runners.asam.list_platform_sets(server_url)

To list all ASAM platform sets present on the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.list_platform_sets prov1.domain.com
```
salt.runners.asam.list_platforms(server_url)
To list all ASAM platforms present on the Novell Fan-Out Driver

   CLI Example:
   
   salt-run asam.list_platforms prov1.domain.com

salt.runners.asam.remove_platform(name, server_url)
To remove specified ASAM platform from the Novell Fan-Out Driver

   CLI Example:
   
   salt-run asam.remove_platform my-test-vm prov1.domain.com

23.16.2 salt.runners.drac

Manage Dell DRAC from the Master

The login credentials need to be configured in the Salt master configuration file.

   drac:
     username: admin
     password: secret

salt.runners.drac.poweroff(hostname, timeout=20, username=None, password=None)
Power server off

   CLI Example:
   
   salt-run drac.poweroff example.com

salt.runners.drac.poweron(hostname, timeout=20, username=None, password=None)
Power server on

   CLI Example:
   
   salt-run drac.poweron example.com

salt.runners.drac.pxe(hostname, timeout=20, username=None, password=None)
Connect to the Dell DRAC and have the boot order set to PXE and power cycle the system to PXE boot

   CLI Example:
   
   salt-run drac.pxe example.com

salt.runners.drac.reboot(hostname, timeout=20, username=None, password=None)
Reboot a server using the Dell DRAC

   CLI Example:
   
   salt-run drac.reboot example.com

salt.runners.drac.version(hostname, timeout=20, username=None, password=None)
Display the version of DRAC

   CLI Example:
   
   salt-run drac.version example.com
23.16.3 salt.runners.f5

Runner to provide F5 Load Balancer functionality

depends
  • pycontrol Python module

configuration In order to connect to a F5 Load Balancer, you must specify in the Salt master configuration the currently available load balancers

```
load_balancers:
  bigip1.example.com:
    username: admin
    password: secret
  bigip2.example.com:
    username: admin
    password: secret
```

class salt.runners.f5.F5Mgmt(lb, username, password)

  add_pool_member(name, port, pool_name)
  Add a node to a pool

  check_member_pool(member, pool_name)
  Check a pool member exists in a specific pool

  check_pool(name)
  Check to see if a pool exists

  check_virtualserver(name)
  Check to see if a virtual server exists

  create_pool(name, method='ROUND_ROBIN')
  Create a pool on the F5 load balancer

  create_vs(name, ip, port, protocol, profile, pool_name)
  Create a virtual server

  lbmethods()
  List all the load balancer methods

salt.runners.f5.add_pool_member(lb, name, port, pool_name)
  Add a node to a pool

CLI Examples:

```
salt-run f5.add_pool_member load_balancer 10.0.0.1 80 my_pool
```

salt.runners.f5.check_member_pool(lb, member, pool_name)
  Check a pool member exists in a specific pool

CLI Examples:

```
salt-run f5.check_member_pool load_balancer 10.0.0.1 my_pool
```

salt.runners.f5.check_pool(lb, name)
  Check to see if a pool exists

CLI Examples:
**salt-run f5.check_pool load_balancer pool_name**

```bash
salt.runners.f5.check_virtualserver(lb, name)
Check to see if a virtual server exists
```

CLI Examples:

```
salt-run f5.check_virtualserver load_balancer virtual_server
```

```bash
salt.runners.f5.create_pool(lb, name, method='ROUND_ROBIN')
Create a pool on the F5 load balancer
```

CLI Examples:

```
salt-run f5.create_pool load_balancer pool_name
salt-run f5.create_pool load_balancer my_pool ROUND_ROBIN
```

```bash
salt.runners.f5.create_vs(lb, name, ip, port, protocol, profile, pool_name)
Create a virtual server
```

CLI Examples:

```
salt-run f5.create_vs lbalancer vs_name 10.0.0.1 80 tcp http poolname
```

### 23.16.4 salt.runners.launchd

Manage launchd plist files

```bash
salt.runners.launchd.write_launchd_plist(program)
Write a launchd plist for managing salt-master or salt-minion
```

CLI Example:

```
salt-run launchd.write_launchd_plist salt-master
```

### 23.16.5 salt.runners.spacewalk

**Spacewalk Runner**

New in version 2016.3.0.

Runner to interact with Spacewalk using Spacewalk API

**codeauthor** Nitin Madhok <nmadhok@g.clemson.edu>, Joachim Werner <joe@suse.com>, Benedikt Werner <1benediktwerner@gmail.com>

**maintainer** Benedikt Werner <1benediktwerner@gmail.com>

To use this runner, set up the Spacewalk URL, username and password in the master configuration at `/etc/salt/master` or `/etc/salt/master.d/spacewalk.conf`:

```
spacewalk:
spacewalk01.domain.com:
  username: 'testuser'
  password: 'verybadpass'
spacewalk02.domain.com:
```

(continues on next page)
username: 'testuser'
password: 'verybadpass'

Note: Optionally, protocol can be specified if the spacewalk server is not using the defaults. Default is protocol: https.

salt.runners.spacewalk.addGroupsToKey(server, activation_key, groups)
Add server groups to a activation key

CLI Example:
salt-run spacewalk.addGroupsToKey spacewalk01.domain.com 1-my-key '[group1,group2]'

salt.runners.spacewalk.api(server, command, *args, **kwargs)
Call the Spacewalk xmlrpc api.

CLI Example:
salt-run spacewalk.api spacewalk01.domain.com systemgroup.create MyGroup
Arguments:
"MyGroup", "Description"

State Example:

create_group:
salt.runner:
  - name: spacewalk.api
  - server: spacewalk01.domain.com
  - command: systemgroup.create
  - arguments:
    - MyGroup
    - Description

salt.runners.spacewalk.deleteAllActivationKeys(server)
Delete all activation keys from Spacewalk

CLI Example:
salt-run spacewalk.deleteAllActivationKeys spacewalk01.domain.com

salt.runners.spacewalk.deleteAllGroups(server)
Delete all server groups from Spacewalk

salt.runners.spacewalk.deleteAllSystems(server)
Delete all systems from Spacewalk

CLI Example:
salt-run spacewalk.deleteAllSystems spacewalk01.domain.com

salt.runners.spacewalk.unregister(name, server_url)
Unregister specified server from Spacewalk

CLI Example:
23.16.6 salt.runners.test

This runner is used only for test purposes and serves no production purpose.

salt.runners.test.arg(*args, **kwargs)
Output the given args and kwargs
Kwargs will be filtered for 'private' keynames.

salt.runners.test.get_opts()
New in version 2018.3.0.
Return the configuration options of the master.

CLI Example:
salt-run test.get_opts

salt.runners.test.metasyntactic(locality='us')
Return common metasyntactic variables for the given locality

salt.runners.test.raw_arg(*args, **kwargs)
Output the given args and kwargs

salt.runners.test.sleep(s_time=10)
Sleep t seconds, then return True

salt.runners.test.stdout_print()
Print 'foo' and return 'bar'

salt.runners.test.stream()
Return True

</tbody>
</table>
23.17.1 salt.sdb.confidant

An SDB module for getting credentials from confidant.

Configuring the Confidant module

The module can be configured via sdb in the minion config:

```
confidant:
  driver: confidant
  url: 'https://confidant-production.example.com'
  auth_context:
    from: example-production-iad
    to: confidant-production-iad
    user_type: service
  auth_key: "alias/authnz"
  token_cache_file: /run/confidant/confidant_token
  token_duration: 60

# key, keyid and region can be defined in the profile, but it's generally
# best to use IAM roles or environment variables for AWS auth.
keyid: 98nh9h9h908h09kjjk
key: jhf908gyeghehe0he0g8h9u0j0n0n09hj09h0
region: us-east-1
```

depends confidant-common, confidant-client

Module Documentation

`salt.sdb.confidant.get(key, profile=None)`

Read pillar data from Confidant via its API.

CLI Example:

```
salt myminion sdb.get 'sdb://confidant/credentials'
```

Valid keys are: credentials, credentials_metadata, result. credentials returns a dict of joined credential_pairs, credentials_metadata returns a dict of metadata relevant to the credentials mapped to the confidant service, and result returns a bool that can be used to determine if the sdb call succeeded or failed to fetch credentials from confidant (or from local cache). If result is false, the data in credentials or credentials_metadata can't be trusted.
23.17.2 salt.sdb.consul

Consul sdb Module

maintainer SaltStack

maturity New

platform all

This module allows access to Consul using an sdb:// URI.

Like all sdb modules, the Consul module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. For example:

```
myconsul:
    driver: consul
    host: 127.0.0.1
    port: 8500
    token: b6376760-a8bb-edd5-fcda-33bc13bfc556
    scheme: http
    consistency: default
    dc: dev
    verify: True
```

The `driver` refers to the Consul module, all other options are optional. For option details see: https://python-consul.readthedocs.io/en/latest/#consul

salt.sdb.consul.get(key, profile=None)
salt.sdb.consul.get_conn(profile)
    Return a client object for accessing consul
salt.sdb.consul.set_(key, value, profile=None)

23.17.3 salt.sdb.env

Environment sdb Module

maintainer SaltStack

maturity New

depends None

platform all

This module allows access to environment variables using an sdb:// URI.

Example configuration for this module:

```
osenv:
    driver: env
```
WARNING:

OS environment variables will be available to read via SDB. Please make sure you don’t have any sensitive data in your environment variables‼

Example usage of sdb env module:

```
set some env var:
  cmd.run:
    - name: echo {{ salt['sdb.set']('sdb://osenv/foo', 'bar') }}
    - order: 1

{% if salt['sdb.get']('sdb://osenv/foo') == 'bar' %}
  always-changes-and-succeeds:
    test.succeed_with_changes:
      - name: foo
{% else %}
  always-changes-and-fails:
    test.fail_with_changes:
      - name: foo
{% endif %}
```

The above example will return success.

The env sdb module can also be used with salt cloud. Assuming you have exported the environment variable named compute (and have osenv defined). The example below will look for the salt cloud config key compute_name in the environment:

```
my-openstack-config:
  compute_name: sdb://osenv/compute
```

```
salt.sdb.env.get(key, profile=None)
  Get a value
	salt.sdb.env.set_(key, value, profile=None)
  Set a key/value pair
```

23.17.4 salt.sdb.etcd_db

etcd Database Module

maintainer SaltStack

maturity New

depends python-etcd

platform all

New in version 2015.5.0.

This module allows access to the etcd database using an sdb:// URI. This package is located at https://pypi.python.org/pypi/python-etcd.

Like all sdb modules, the etcd module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:
**myetcd:**
- **driver:** etcd
- **etcd.host:** 127.0.0.1
- **etcd.port:** 2379

The **driver** refers to the etcd module, **etcd.host** refers to the host that is hosting the etcd database and **etcd.port** refers to the port on that host.

**password:** sdb://myetcd/mypassword

```python
salt.sdb.etcd_db.delete(key, service=None, profile=None)
```
Get a value from the etcd service

```python
salt.sdb.etcd_db.get(key, service=None, profile=None)
```
Get a value from the etcd service

```python
salt.sdb.etcd_db.set_(key, value, service=None, profile=None)
```
Set a key/value pair in the etcd service

## 23.17.5 salt.sdb.keyring_db

Keyring Database Module
- **maintainer** SaltStack
- **maturity** New
- **depends** keyring
- **platform** all

This module allows access to the keyring package using an **sdb://** URI. This package is located at [https://pypi.python.org/pypi/keyring](https://pypi.python.org/pypi/keyring).

Care must be taken when using keyring. Not all keyend backends are supported on all operating systems. Also, many backends require an agent to be running in order to work. For instance, the "Secret Service" backend requires a compatible agent such as `gnome-keyring-daemon` or `kwallet` to be running. The keyczar backend does not seem to enjoy the benefits of an agent, and so using it will require either that the password is typed in manually (which is unreasonable for the salt-minion and salt-master daemons, especially in production) or an agent is written for it.

Like all sdb modules, the keyring module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```yaml
mykeyring:
  driver: keyring
  service: system
```

The **driver** refers to the keyring module, **service** refers to the service that will be used inside of keyring (which may be likened unto a database table) and **mykeyring** refers to the name that will appear in the URI:

**password:** sdb://mykeyring/mypassword

The underlying backend configuration must be configured via keyring itself. For examples and documentation, see keyring:
- [https://pypi.python.org/pypi/keyring](https://pypi.python.org/pypi/keyring)

New in version 2014.1.4.
salt.sdb.keyring_db.get(key, service=None, profile=None)
Get a value from a keyring service

salt.sdb.keyring_db.set_(key, value, service=None, profile=None)
Set a key/value pair in a keyring service

23.17.6 salt.sdb.memcached

Memcached sdb Module

maintainer SaltStack
maturity New
depends python-memcached
platform all

This module allows access to memcached using an sdb:// URI. This package is located at https://pypi.python.org/pypi/python-memcached.

Like all sdb modules, the memcached module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
mymemcache:
  driver: memcached
  memcached.host: localhost
  memcached.port: 11211
```

The driver refers to the memcached module, host and port the memcached server to connect to (defaults to localhost and 11211, and mymemcached refers to the name that will appear in the URI:

```
password: sdb://mymemcached/mykey
```

salt.sdb.memcached.get(key, profile=None)
Get a value from memcached

salt.sdb.memcached.set_(key, value, profile=None)
Set a key/value pair in memcached

23.17.7 salt.sdb.redis_sdb

Redis SDB module

New in version 2019.2.0.

This module allows access to Redis using an sdb:// URI.

Like all SDB modules, the Redis module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. For example:

```
sdb_redis:
  driver: redis
  host: 127.0.0.1
  port: 6379
  password: pass
  db: 1
```
The driver refers to the Redis module, all other options are optional. For option details see: https://redis-py.readthedocs.io/en/latest/.

```python
salt.sdb.redis_sdb.delete(key, profile=None)
    Delete a key from the Redis SDB.

salt.sdb.redis_sdb.get(key, profile=None)
    Get a value from the Redis SDB.

salt.sdb.redis_sdb.set_(key, value, profile=None)
    Set a value into the Redis SDB.
```

### 23.17.8 salt.sdb.vault

Vault SDB Module

- **maintainer**: SaltStack
- **maturity**: New
- **platform**: all

New in version 2016.11.0.

This module allows access to Hashicorp Vault using an `sdb://` URI.

Base configuration instructions are documented in the execution module docs. Below are noted extra configuration required for the sdb module, but the base configuration must also be completed.

Like all sdb modules, the vault module requires a configuration profile to be configured in either the minion configuration file or a pillar. This profile requires only setting the `driver` parameter to `vault`:

```yaml
myvault:
    driver: vault
```

Once configured you can access data using a URL such as:

```text
password: sdb://myvault/secret/passwords/mypassword
```

In this URL, `myvault` refers to the configuration profile, `secret/passwords` is the path where the data resides, and `mypassword` is the key of the data to return.

The above URI is analogous to running the following vault command:

```bash
$ vault read -field=mypassword secret/passwords
```

```python
salt.sdb.vault.get(key, profile=None)
    Get a value from the vault service

salt.sdb.vault.set_(key, value, profile=None)
    Set a key/value pair in the vault service
```
23.18 serializer modules

<table>

<td></td>
</tr>
</tbody>
</table>

23.18.1 salt.serializers.configparser

salt.serializers.configparser

New in version 2016.3.0.
Implements a configparser serializer.

salt.serializers.configparser.deserialize(stream_or_string, **options)

Deserializes any string or stream-like object into a Python data structure.

Parameters

- **stream_or_string** -- stream or string to deserialize.
- **options** -- options given to lower configparser module.

salt.serializers.configparser.serialize(obj, **options)

Serializes Python data to a configparser formatted string or file.

Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to lower configparser module.

23.18.2 salt.serializers.plist

salt.serializers.plist

New in version 3001.
Implements plist serializer.

Wrapper around plistlib.

salt.serializers.plist.deserialize(stream_or_string, **options)

Deserializes any string or stream-like object into a Python data structure.

Parameters

- **stream_or_string** -- stream or string to deserialize.
- **options** -- options given to lower plist module.
Returns Deserialized data structure.

salt.serializers.plist.serialize(value, **options)
Serialize Python data to plist. To create a binary plist pass fmt: FMT_BINARY as an option.

Parameters
- **obj** -- the data structure to serialize
- **options** -- options given to lower plist module.

Returns bytes of serialized plist.

23.18.3 salt.serializers.toml

salt.serializers.toml

Implements TOML serializer.
It’s just a wrapper around the python toml module.

salt.serializers.toml.deserialize(stream_or_string, **options)
Deserialize from TOML into Python data structure.

Parameters
- **stream_or_string** -- toml stream or string to deserialize.
- **options** -- options given to the python toml module.

salt.serializers.toml.serialize(obj, **options)
Serialize Python data to TOML.

Parameters
- **obj** -- the data structure to serialize.
- **options** -- options given to the python toml module.

23.19.1 salt.states.acme

ACME / Let’s Encrypt certificate management state

New in version 2016.3.

See also the module documentation

```python
reload-gitlab:
    cmd.run:
        - name: gitlab-ctl hup

dev.example.com:
    acme.cert:
        - aliases:
        - gitlab.example.com
        - email: acmemaster@example.com
        - webroot: /opt/gitlab/embedded/service/gitlab-rails/public
        - renew: 14
        - fire_event: acme/dev.example.com
        - onchanges_in:
            - cmd: reload-gitlab

salt.states.acme.cert(name, aliases=None, email=None, webroot=None, test_cert=False, renew=None, keysize=None, server=None, owner='root', group='root', mode='0640', certname=None, preferred_challenges=None, tls_sni_01_port=None, tls_sni_01_address=None, http_01_port=None, http_01_address=None, dns_plugin=None, dns_plugin_credentials=None)
```

Obtain/renew a certificate from an ACME CA, probably Let’s Encrypt.

Parameters

- **name** -- Common Name of the certificate (DNS name of certificate)
- **aliases** -- subjectAltNames (Additional DNS names on certificate)
- **email** -- e-mail address for interaction with ACME provider
- **webroot** -- True or a full path to webroot. Otherwise use standalone mode
- **test_cert** -- Request a certificate from the Happy Hacker Fake CA (mutually exclusive with 'server')
- **renew** -- True/‘force’ to force a renewal, or a window of renewal before expiry in days
- **keysize** -- RSA key bits
- **server** -- API endpoint to talk to
- **owner** -- owner of the private key file
- **group** -- group of the private key file
- **mode** -- mode of the private key file
- **certname** -- Name of the certificate to save
- **preferred_challenges** -- A sorted, comma delimited list of the preferred challenge to use during authorization with the most preferred challenge listed first.
- **tls_sni_01_port** -- Port used during tls-sni-01 challenge. This only affects the port Certbot listens on. A conforming ACME server will still attempt to connect on port 443.
- **tls_sni_01_address** -- The address the server listens to during tls-sni-01 challenge.
- **http_01_port** -- Port used in the http-01 challenge. This only affects the port Certbot listens on. A conforming ACME server will still attempt to connect on port 80.
- **https_01_address** -- The address the server listens to during http-01 challenge.
- **dns_plugin** -- Name of a DNS plugin to use (currently only 'cloudflare')
- **dns_plugin_credentials** -- Path to the credentials file if required by the specified DNS plugin

### 23.19.2 salt.states.alias

Configuration of email aliases

The mail aliases file can be managed to contain definitions for specific email aliases:

```yaml
username:
  alias.present:
    - target: user@example.com

thomas:
  alias.present:
    - target: thomas@example.com
```

The default alias file is set to `/etc/aliases`, as defined in Salt's config execution module. To change the alias file from the default location, set the following in your minion config:

```yaml
aliases.file: /my/alias/file
```

**salt.states.alias.absent**(name)

Ensure that the named alias is absent

- **name** The alias to remove

**salt.states.alias.present**(name, target)

Ensures that the named alias is present with the given target or list of targets. If the alias exists but the target differs from the previous entry, the target(s) will be overwritten. If the alias does not exist, the alias will be created.

- **name** The local user/address to assign an alias to
- **target** The forwarding address
23.19.3 salt.states.alternatives

Configuration of the alternatives system

Control the alternatives system

{% set my_hadoop_conf = '/opt/hadoop/conf' %}

{{ my_hadoop_conf }}:
  file.directory

hadoop-0.20-conf:
  alternatives.install:
    - name: hadoop-0.20-conf
    - link: /etc/hadoop-0.20/conf
    - path: {{ my_hadoop_conf }}
    - priority: 30
    - require:
      - file: {{ my_hadoop_conf }}

hadoop-0.20-conf:
  alternatives.remove:
    - name: hadoop-0.20-conf
    - path: {{ my_hadoop_conf }}

salt.states.alternatives.auto(name)
  New in version 0.17.0.
  Instruct alternatives to use the highest priority path for <name>

  name is the master name for this link group (e.g. pager)

salt.states.alternatives.install(name, link, path, priority)
  Install new alternative for defined <name>

  name is the master name for this link group (e.g. pager)

  link is the symlink pointing to /etc/alternatives/<name>. (e.g. /usr/bin/pager)

  path is the location of the new alternative target. NB: This file / directory must already exist. (e.g. /usr/bin/less)

  priority is an integer; options with higher numbers have higher priority in automatic mode.

salt.states.alternatives.remove(name, path)
  Removes installed alternative for defined <name> and <path> or fallback to default alternative, if some defined before.

  name is the master name for this link group (e.g. pager)

  path is the location of one of the alternative target files. (e.g. /usr/bin/less)

salt.states.alternatives.set_(name, path)
  New in version 0.17.0.
  Sets alternative for <name> to <path>, if <path> is defined as an alternative for <name>.

  name is the master name for this link group (e.g. pager)

  path is the location of one of the alternative target files. (e.g. /usr/bin/less)
23.19.4 salt.states.apache_module

Manage Apache Modules
New in version 2014.7.0.
Enable and disable apache modules.

Enable cgi module:
   apache_module.enabled:
      - name: cgi

Disable cgi module:
   apache_module.disabled:
      - name: cgi

salt.states.apache_module.disabled(name)
   Ensure an Apache module is disabled.
   New in version 2016.3.0.
   name Name of the Apache module

salt.states.apache_module.enabled(name)
   Ensure an Apache module is enabled.
   New in version 2016.3.0.
   name Name of the Apache module

23.19.5 salt.states.apache_site

Manage Apache Sites
New in version 2016.3.0.
Enable and disable apache sites.

Enable default site:
   apache_site.enabled:
      - name: default

Disable default site:
   apache_site.disabled:
      - name: default

salt.states.apache_site.disabled(name)
   Ensure an Apache site is disabled.
   name Name of the Apache site

salt.states.apache_site.enabled(name)
   Ensure an Apache site is enabled.
   name Name of the Apache site
23.19.6 salt.states.artifactory

This state downloads artifacts from artifactory.

```
salt.states.artifactory.downloaded(name, artifact, target_dir='tmp', target_file=None, use_literal_group_id=False)
```

Ensures that the artifact from artifactory exists at given location. If it doesn’t exist, then it will be downloaded. If it already exists then the checksum of existing file is checked against checksum in artifactory. If it is different then the step will fail.

**artifact** Details of the artifact to be downloaded from artifactory. Various options are:

- **artifactory_url**: URL of the artifactory instance
- **repository**: Repository in artifactory
- **artifact_id**: Artifact ID
- **group_id**: Group ID
- **packaging**: Packaging
- **classifier**: Classifier .. versionadded:: 2015.8.0
- **version**: Version One of the following: - Version to download - latest - Download the latest release of this artifact - latest_snapshot - Download the latest snapshot for this artifact
- **username**: Artifactory username .. versionadded:: 2015.8.0
- **password**: Artifactory password .. versionadded:: 2015.8.0

**target_dir** Directory where the artifact should be downloaded. By default it is downloaded to /tmp directory.

**target_file** Target file to download artifact to. By default file name is resolved by artifactory.

An example to download an artifact to a specific file:

```
jboss_module_downloaded:
artifactory.downloaded:
  - artifact:
      artifactory_url: http://artifactory.intranet.example.com/artifactory
      repository: 'libs-release-local'
      artifact_id: 'module'
      group_id: 'com.company.module'
      packaging: 'jar'
      classifier: 'sources'
      version: '1.0'
      target_file: /opt/jboss7/modules/com/company/lib/module.jar
```

Download artifact to the folder (automatically resolves file name):

```
jboss_module_downloaded:
artifactory.downloaded:
  - artifact:
      artifactory_url: http://artifactory.intranet.example.com/artifactory
      repository: 'libs-release-local'
      artifact_id: 'module'
      group_id: 'com.company.module'
      packaging: 'jar'
      classifier: 'sources'
      version: '1.0'
      target_dir: /opt/jboss7/modules/com/company/lib
```
23.19.7 salt.states.at

Configuration disposable regularly scheduled tasks for at.

The at state can be add disposable regularly scheduled tasks for your system.

salt.states.at.absent(name, jobid=None, **kwargs)
   Changed in version 2017.7.0.
   Remove a job from queue

   jobid: string|int  Specific jobid to remove
   tag  [string] Job's tag
   runas  [string] Runs user-specified jobs
   kwargs  Addition kwargs can be provided to filter jobs. See output of at.jobcheck for more.

   example1:
      at.absent:

   Warning: this will remove all jobs!

   example2:
      at.absent:
         - year: 13

   example3:
      at.absent:
         - tag: rose

   example4:
      at.absent:
         - tag: rose
         - day: 13
         - hour: 16

   example5:
      at.absent:
         - jobid: 4

salt.states.at.mod_watch(name, **kwargs)
   The at watcher, called to invoke the watch command.

   Note: This state exists to support special handling of the watch requisite. It should not be called directly.
   Parameters for this function should be set by the state being triggered.

   name  The name of the atjob

salt.states.at.present(name, timespec, tag=None, user=None, job=None, unique_tag=False)
   Changed in version 2017.7.0.
   Add a job to queue.
job  [string] Command to run.

timespec  [string] The 'timespec' follows the format documented in the at(1) manpage.
tag  [string] Make a tag for the job.
user  [string] The user to run the at job .. versionadded:: 2014.1.4
unique_tag  [boolean] If set to True job will not be added if a job with the tag exists. .. versionadded:: 2017.7.0

```python
rose:
at.present:
    - job: 'echo "I love saltstack" > love'
    - timespec: '9:09 11/09/13'
    - tag: love
    - user: jam
```

salt.states.at.watch(name, timespec, tag=None, user=None, job=None, unique_tag=False)
New in version 2017.7.0.
Add an at job if trigger by watch

job  [string] Command to run.
timespec  [string] The 'timespec' follows the format documented in the at(1) manpage.
tag  [string] Make a tag for the job.
user  [string] The user to run the at job .. versionadded:: 2014.1.4
unique_tag  [boolean] If set to True job will not be added if a job with the tag exists. .. versionadded:: 2017.7.0

```python
minion_restart:
at.watch:
    - job: 'salt-call --local service.restart salt-minion'
    - timespec: 'now +1 min'
    - tag: minion_restart
    - unique_tag: trye
    - watch:
        - file: /etc/salt/minion
```

23.19.8 salt.states.aws_sqs

Manage SQS Queues

Create and destroy SQS queues. Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses the awscli tool provided by Amazon. This can be downloaded from pip. Also check the documentation for awscli for configuration information.

```python
myqueue:
    aws_sqs.exists:
        - region: eu-west-1
```

salt.states.aws_sqs.absent(name, region, user=None, opts=False)
Remove the named SQS queue if it exists.

name  Name of the SQS queue.
region  Region to remove the queue from
user  Name of the user performing the SQS operations
opts Include additional arguments and options to the aws command line

salt.states.aws_sqs.exists(name, region, user=None, opts=False)
Ensure the SQS queue exists.
name Name of the SQS queue.
region Region to create the queue
user Name of the user performing the SQS operations
opts Include additional arguments and options to the aws command line

23.19.9 salt.states.azurearm_compute

Azure (ARM) Compute State Module
New in version 2019.2.0.
maintainer <devops@decisionlab.io>
maturity new
depends
- azure >= 2.0.0
- azure-common >= 1.1.8
- azure-mgmt >= 1.0.0
- azure-mgmt-compute >= 1.0.0
- azure-mgmt-network >= 1.7.1
- azure-mgmt-resource >= 1.1.0
- azure-mgmt-storage >= 1.0.0
- azure-mgmt-web >= 0.32.0
- azure-storage >= 0.34.3
- msrestazure >= 0.4.21
platform linux

configuration This module requires Azure Resource Manager credentials to be passed as a dictionary of keyword arguments to the connection_auth parameter in order to work properly. Since the authentication parameters are sensitive, it’s recommended to pass them to the states via pillar.

Required provider parameters:
if using username and password:
  • subscription_id
  • username
  • password
if using a service principal:
  • subscription_id
  • tenant
  • client_id
Optional provider parameters:

cloud_environment: Used to point the cloud driver to different API endpoints, such as Azure GovCloud. Possible values:

- AZURE_PUBLIC_CLOUD (default)
- AZURE_CHINA_CLOUD
- AZURE_US_GOV_CLOUD
- AZURE_GERMAN_CLOUD

Example Pillar for Azure Resource Manager authentication:

```yaml
azurearm:
  user_pass_auth:
    subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
    username: fletch
    password: 123pass
  mysubscription:
    subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
    tenant: ABCDEFA-1234-ABCD-1234-ABCDDEFAABCD
    client_id: ABCDEFA-1234-ABCD-1234-ABCDDEFAABCD
    secret: XXXXXXXXXXXXXXXXXXXXXX
    cloud_environment: AZURE_PUBLIC_CLOUD
```

Example states using Azure Resource Manager authentication:

```yaml
{% set profile = salt['pillar.get']( 'azurearm:mysubscription') %}
Ensure availability set exists:
  azurearm_compute.availability_set_present:
    - name: my_avail_set
    - resource_group: my_rg
    - virtual_machines:
        - my_vm1
        - my_vm2
    - tags:
        how_awesome: very
        contact_name: Elmer Fudd Gantry
    - connection_auth: {{ profile }}

Ensure availability set is absent:
  azurearm_compute.availability_set_absent:
    - name: other_avail_set
    - resource_group: my_rg
    - connection_auth: {{ profile }}
```

```
salt.states.azurearm_compute.availability_set_absent(name, resource_group, connection_auth=None)
```

New in version 2019.2.0.

Ensure an availability set does not exist in a resource group.

Parameters

- **name** -- Name of the availability set.
- **resource_group** -- Name of the resource group containing the availability set.
• **connection_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

```python
salt.states.azurearm_compute.availability_set_present(name, resource_group,
          tags=None, platform_update_domain_count=None,
          platform_fault_domain_count=None,
          virtual_machines=None, sku=None,
          connection_auth=None, **kwargs)
```

New in version 2019.2.0.

Ensure an availability set exists.

Parameters

- **name** -- Name of the availability set.
- **resource_group** -- The resource group assigned to the availability set.
- **tags** -- A dictionary of strings can be passed as tag metadata to the availability set object.
- **platform_update_domain_count** -- An optional parameter which indicates groups of virtual machines and underlying physical hardware that can be rebooted at the same time.
- **platform_fault_domain_count** -- An optional parameter which defines the group of virtual machines that share a common power source and network switch.
- **virtual_machines** -- A list of names of existing virtual machines to be included in the availability set.
- **sku** -- The availability set SKU, which specifies whether the availability set is managed or not. Possible values are 'Aligned' or 'Classic'. An 'Aligned' availability set is managed, 'Classic' is not.
- **connection_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```yaml
Ensure availability set exists:
  azurearm_compute.availability_set_present:
    - name: aset1
    - resource_group: group1
    - platform_update_domain_count: 5
    - platform_fault_domain_count: 3
    - sku: aligned
    - tags:
      - contact_name: Elmer Fudd Gantry
    - connection_auth: {{ profile }}
    - require:
      - azurearm_resource: Ensure resource group exists
```
23.19.10 salt.states.azurearm_dns

Azure (ARM) DNS State Module
New in version 3000.

maintainer  <devops@eitr.tech>
maturity  new
depends  
  • azure >= 2.0.0
  • azure-common >= 1.1.8
  • azure-mgmt >= 1.0.0
  • azure-mgmt-compute >= 1.0.0
  • azure-mgmt-dns >= 1.0.1
  • azure-mgmt-network >= 1.7.1
  • azure-mgmt-resource >= 1.1.0
  • azure-mgmt-storage >= 1.0.0
  • azure-mgmt-web >= 0.32.0
  • azure-storage >= 0.34.3
  • msrestazure >= 0.4.21

platform  linux

configuration  This module requires Azure Resource Manager credentials to be passed as a dictionary of keyword arguments to the connection_auth parameter in order to work properly. Since the authentication parameters are sensitive, it’s recommended to pass them to the states via pillar.

Required provider parameters:
  if using username and password:
    • subscription_id
    • username
    • password
  if using a service principal:
    • subscription_id
    • tenant
    • client_id
    • secret

Optional provider parameters:
  cloud_environment: Used to point the cloud driver to different API endpoints, such as Azure GovCloud.
    Possible values:
      Possible values:
        • AZURE_PUBLIC_CLOUD (default)
        • AZURE_CHINA_CLOUD
Example Pillar for Azure Resource Manager authentication:

```python
azurearm:
    user_pass_auth:
        subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
        username: fletch
        password: 123pass
    mysubscription:
        subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
        tenant: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
        client_id: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
        secret: XXXXXXXXXXXXXXXXXXXXXX
        cloud_environment: AZURE_PUBLIC_CLOUD
```

Example states using Azure Resource Manager authentication:

```python
{% set profile = salt['pillar.get']('azurearm:mysubscription') %}
Ensure DNS zone exists:
    azurearm_dns.zone_present:
        - name: contoso.com
        - resource_group: my_rg
        - tags:
            how_awesome: very
            contact_name: Elmer Fudd Gantry
        - connection_auth: {{ profile }}

Ensure DNS record set exists:
    azurearm_dns.record_set_present:
        - name: web
        - zone_name: contoso.com
        - resource_group: my_rg
        - record_type: A
        - ttl: 300
        - arecords:
            - ipv4_address: 10.0.0.1
        - tags:
            how_awesome: very
            contact_name: Elmer Fudd Gantry
        - connection_auth: {{ profile }}

Ensure DNS record set is absent:
    azurearm_dns.record_set_absent:
        - name: web
        - zone_name: contoso.com
        - resource_group: my_rg
        - record_type: A
        - connection_auth: {{ profile }}

Ensure DNS zone is absent:
    azurearm_dns.zone_absent:
        - name: contoso.com
        - resource_group: my_rg
        - connection_auth: {{ profile }}
```

salt.states.azurearm_dns.record_set_absent(name, zone_name, resource_group, connection_auth=None)
New in version 3000.

Ensure a record set does not exist in the DNS zone.

**Parameters**

- **name** -- Name of the record set.
- **zone_name** -- Name of the DNS zone.
- **resource_group** -- The resource group assigned to the DNS zone.
- **connection_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

```python
salt.states.azurearm_dns.record_set_present(name, zone_name, resource_group, record_type, if_match=None, if_none_match=None, etag=None, metadata=None, ttl=None, arecords=None, aaaa_records=None, mx_records=None, ns_records=None, ptr_records=None, srv_records=None, txt_records=None, cname_record=None, soa_record=None, caa_records=None, connection_auth=None, **kwargs)
```

New in version 3000.

Ensure a record set exists in a DNS zone.

**Parameters**

- **name** -- The name of the record set, relative to the name of the zone.
- **zone_name** -- Name of the DNS zone (without a terminating dot).
- **resource_group** -- The resource group assigned to the DNS zone.
- **record_type** -- The type of DNS record in this record set. Record sets of type SOA can be updated but not created (they are created when the DNS zone is created). Possible values include: 'A', 'AAAA', 'CAA', 'CNAME', 'MX', 'NS', 'PTR', 'SOA', 'SRV', 'TXT'
- **if_match** -- The etag of the record set. Omit this value to always overwrite the current record set. Specify the last-seen etag value to prevent accidentally overwriting any concurrent changes.
- **if_none_match** -- Set to '*' to allow a new record set to be created, but to prevent updating an existing record set. Other values will be ignored.
- **etag** -- The etag of the record set. Etags are used to handle concurrent changes to the same resource safely.
- **metadata** -- A dictionary of strings can be passed as tag metadata to the record set object.
- **ttl** -- The TTL (time-to-live) of the records in the record set. Required when specifying record information.
- **arecords** -- The list of A records in the record set. View the Azure SDK documentation to create a list of dictionaries representing the record objects.
- **aaaaa_records** -- The list of AAAA records in the record set. View the Azure SDK documentation to create a list of dictionaries representing the record objects.
- **mx_records** -- The list of MX records in the record set. View the Azure SDK documentation to create a list of dictionaries representing the record objects.
• **ns_records** -- The list of NS records in the record set. View the Azure SDK documentation to create a list of dictionaries representing the record objects.

• **ptr_records** -- The list of PTR records in the record set. View the Azure SDK documentation to create a list of dictionaries representing the record objects.

• **srv_records** -- The list of SRV records in the record set. View the Azure SDK documentation to create a list of dictionaries representing the record objects.

• **txt_records** -- The list of TXT records in the record set. View the Azure SDK documentation to create a list of dictionaries representing the record objects.

• **cname_record** -- The CNAME record in the record set. View the Azure SDK documentation to create a dictionary representing the record object.

• **soa_record** -- The SOA record in the record set. View the Azure SDK documentation to create a dictionary representing the record object.

• **caa_records** -- The list of CAA records in the record set. View the Azure SDK documentation to create a list of dictionaries representing the record objects.

• **connection_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```python
Ensure record set exists:
azurearm_dns.record_set_present:
  - name: web
  - zone_name: contoso.com
  - resource_group: my_rg
  - record_type: A
  - ttl: 300
  - arecords:
  - ipv4_address: 10.0.0.1
  - metadata:
    how_awesome: very
    contact_name: Elmer Fudd Gantry
  - connection_auth: {{ profile }}
```

```python
salt.states.azurearm_dns.zone_absent(name, resource_group, connection_auth=None)
New in version 3000.
Ensure a DNS zone does not exist in the resource group.

Parameters

• **name** -- Name of the DNS zone.

• **resource_group** -- The resource group assigned to the DNS zone.

• **connection_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_dns.zone_present(name, resource_group, etag=None, if_match=None, if_none_match=None, registration_virtual_networks=None, resolution_virtual_networks=None, tags=None, zone_type='Public', connection_auth=None, **kwargs)
New in version 3000.
Ensure a DNS zone exists.
Parameters

- **name** -- Name of the DNS zone (without a terminating dot).

- **resource_group** -- The resource group assigned to the DNS zone.

- **etag** -- The etag of the zone. Etags are used to handle concurrent changes to the same resource safely.

- **if_match** -- The etag of the DNS zone. Omit this value to always overwrite the current zone. Specify the last-seen etag value to prevent accidentally overwriting any concurrent changes.

- **if_none_match** -- Set to '*' to allow a new DNS zone to be created, but to prevent updating an existing zone. Other values will be ignored.

- **registration_virtual_networks** -- A list of references to virtual networks that register hostnames in this DNS zone. This is only when zone_type is Private. (requires azure-mgmt-dns >= 2.0.0rc1)

- **resolution_virtual_networks** -- A list of references to virtual networks that resolve records in this DNS zone. This is only when zone_type is Private. (requires azure-mgmt-dns >= 2.0.0rc1)

- **tags** -- A dictionary of strings can be passed as tag metadata to the DNS zone object.

- **zone_type** --
  The type of this DNS zone (Public or Private). Possible values include: 'Public', 'Private'. Default value: 'Public' (requires azure-mgmt-dns >= 2.0.0rc1)

- **connection_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API

Example usage:

```yaml
Ensure DNS zone exists:
  azurearm_dns.zone_present:
    - name: contoso.com
    - resource_group: my_rg
    - zone_type: Private
    - registration_virtual_networks: /subscriptions/{{ sub }}/resourceGroups/my_rg/providers/Microsoft.
      → Network/virtualNetworks/test_vnet
    - tags:
      how_awesome: very
      contact_name: Elmer Fudd Gantry
    - connection_auth: {{ profile }}
```

23.19.11 salt.states.azurearm_network

Azure (ARM) Network State Module

New in version 2019.2.0.

Maintainer: <devops@decisionlab.io>

Maturity: new

Depends:

- azure >= 2.0.0
platform linux

classification This module requires Azure Resource Manager credentials to be passed as a dictionary of keyword arguments to the `connection_auth` parameter in order to work properly. Since the authentication parameters are sensitive, it’s recommended to pass them to the states via pillar.

Required provider parameters:

if using username and password:

- subscription_id
- username
- password

if using a service principal:

- subscription_id
- tenant
- client_id
- secret

Optional provider parameters:

cloud_environment: Used to point the cloud driver to different API endpoints, such as Azure GovCloud. Possible values:

- AZURE_PUBLIC_CLOUD (default)
- AZURE_CHINA_CLOUD
- AZURE_US_GOV_CLOUD
- AZURE_GERMAN_CLOUD

Example Pillar for Azure Resource Manager authentication:

```
azurearm:
  user_pass_auth:
    subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
    username: fletch
    password: 123pass
  mysubscription:
    subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
    tenant: ABCDEFA1234-ABCD-1234-ABCD-1234ABCD1234
```

(continues on next page)
Example states using Azure Resource Manager authentication:

```
{% set profile = salt['pillar.get']('azurearm:my_subscription') %}
Ensures virtual network exists:
  azurearm_network.virtual_network_present:
    - name: my_vnet
    - resource_group: my_rg
    - address_prefixes:
      - '10.0.0.0/8'
      - '192.168.0.0/16'
    - dns_servers:
      - '8.8.8.8'
    - tags:
      how_awesome: very
      contact_name: Elmer Fudd Gantry
    - connection_auth: {{ profile }}

Ensures virtual network is absent:
  azurearm_network.virtual_network_absent:
    - name: other_vnet
    - resource_group: my_rg
    - connection_auth: {{ profile }}
```

`salt.states.azurearm_network.load_balancer_absent(name, resource_group, connection_auth=None)`

New in version 2019.2.0.

Ensure a load balancer does not exist in the resource group.

Parameters

- **name** -- Name of the load balancer.
- **resource_group** -- The resource group assigned to the load balancer.
- **connection_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

`salt.states.azurearm_network.load_balancer_present(name, resource_group, sku=None, frontend_ip_configurations=None, backend_address_pools=None, load_balancing_rules=None, probes=None, inbound_nat_rules=None, inbound_nat_pools=None, outbound_nat_rules=None, tags=None, connection_auth=None, **kwargs)`

New in version 2019.2.0.

Ensure a load balancer exists.

Parameters

- **name** -- Name of the load balancer.
- **resource_group** -- The resource group assigned to the load balancer.
- **sku** -- The load balancer SKU, which can be ‘Basic’ or ‘Standard’.
- **tags** -- A dictionary of strings can be passed as tag metadata to the load balancer object.
- **frontend_ip_configurations** -- An optional list of dictionaries representing valid FrontendIPConfiguration objects. A frontend IP configuration can be either private (using private IP address and subnet parameters) or public (using a reference to a public IP address object). Valid parameters are:
  - name: The name of the resource that is unique within a resource group.
  - private_ip_address: The private IP address of the IP configuration. Required if ‘private_ip_allocation_method’ is ‘Static’.
  - private_ip_allocation_method: The Private IP allocation method. Possible values are: ‘Static’ and ‘Dynamic’.
  - subnet: Name of an existing subnet inside of which the frontend IP will reside.
  - public_ip_address: Name of an existing public IP address which will be assigned to the frontend IP object.
- **backend_address_pools** -- An optional list of dictionaries representing valid BackendAddressPool objects. Only the ‘name’ parameter is valid for a BackendAddressPool dictionary. All other parameters are read-only references from other objects linking to the backend address pool. Inbound traffic is randomly load balanced across IPs in the backend IPs.
- **probes** -- An optional list of dictionaries representing valid Probe objects. Valid parameters are:
  - name: The name of the resource that is unique within a resource group.
  - protocol: The protocol of the endpoint. Possible values are ‘Http’ or ‘Tcp’. If ‘Tcp’ is specified, a received ACK is required for the probe to be successful. If ‘Http’ is specified, a 200 OK response from the specified URI is required for the probe to be successful.
  - port: The port for communicating the probe. Possible values range from 1 to 65535, inclusive.
  - interval_in_seconds: The interval, in seconds, for how frequently to probe the endpoint for health status. Typically, the interval is slightly less than half the allocated timeout period (in seconds) which allows two full probes before taking the instance out of rotation. The default value is 15, the minimum value is 5.
  - number_of_probes: The number of probes where if no response, will result in stopping further traffic from being delivered to the endpoint. This values allows endpoints to be taken out of rotation faster or slower than the typical times used in Azure.
  - request_path: The URI used for requesting health status from the VM. Path is required if a protocol is set to ‘Http’. Otherwise, it is not allowed. There is no default value.
- **load_balancing_rules** -- An optional list of dictionaries representing valid LoadBalancingRule objects. Valid parameters are:
  - name: The name of the resource that is unique within a resource group.
  - load_distribution: The load distribution policy for this rule. Possible values are ‘Default’, ‘SourceIP’, and ‘SourceIPProtocol’.

1348 Chapter 23. Salt Module Reference
- **frontend_port**: The port for the external endpoint. Port numbers for each rule must be unique within the Load Balancer. Acceptable values are between 0 and 65534. Note that value 0 enables 'Any Port'.

- **backend_port**: The port used for internal connections on the endpoint. Acceptable values are between 0 and 65535. Note that value 0 enables 'Any Port'.

- **idle_timeout_in_minutes**: The timeout for the TCP idle connection. The value can be set between 4 and 30 minutes. The default value is 4 minutes. This element is only used when the protocol is set to TCP.

- **enable_floating_ip**: Configures a virtual machine's endpoint for the floating IP capability required to configure a SQL AlwaysOn Availability Group. This setting is required when using the SQL AlwaysOn Availability Groups in SQL server. This setting can't be changed after you create the endpoint.

- **disable_outbound_snat**: Configures SNAT for the VMs in the backend pool to use the public IP address specified in the frontend of the load balancing rule.

- **frontend_ip_configuration**: Name of the frontend IP configuration object used by the load balancing rule object.

- **backend_address_pool**: Name of the backend address pool object used by the load balancing rule object. Inbound traffic is randomly load balanced across IPs in the backend IPs.

- **probe**: Name of the probe object used by the load balancing rule object.

- **inbound_nat_rules** -- An optional list of dictionaries representing valid InboundNatRule objects. Defining inbound NAT rules on your load balancer is mutually exclusive with defining an inbound NAT pool. Inbound NAT pools are referenced from virtual machine scale sets. NICs that are associated with individual virtual machines cannot reference an Inbound NAT pool. They have to reference individual inbound NAT rules. Valid parameters are:
  - **name**: The name of the resource that is unique within a resource group.
  - **frontend_ip_configuration**: Name of the frontend IP configuration object used by the inbound NAT rule object.
  - **protocol**: Possible values include 'Udp', 'Tcp', or 'All'.
  - **frontend_port**: The port for the external endpoint. Port numbers for each rule must be unique within the Load Balancer. Acceptable values range from 1 to 65534.
  - **backend_port**: The port used for the internal endpoint. Acceptable values range from 1 to 65535.
  - **idle_timeout_in_minutes**: The timeout for the TCP idle connection. The value can be set between 4 and 30 minutes. The default value is 4 minutes. This element is only used when the protocol is set to TCP.
  - **enable_floating_ip**: Configures a virtual machine's endpoint for the floating IP capability required to configure a SQL AlwaysOn Availability Group. This setting is required when using the SQL AlwaysOn Availability Groups in SQL server. This setting can't be changed after you create the endpoint.

- **inbound_nat_pools** -- An optional list of dictionaries representing valid InboundNatPool objects. They define an external port range for inbound NAT to a single backend port on NICs associated with a load balancer. Inbound NAT rules are created automatically for each NIC associated with the Load Balancer using an external port from this range. Defining an Inbound NAT pool on your Load Balancer is mutually exclusive with defining
inbound NAT rules. Inbound NAT pools are referenced from virtual machine scale sets. NICs that are associated with individual virtual machines cannot reference an inbound NAT pool. They have to reference individual inbound NAT rules. Valid parameters are:

- **name**: The name of the resource that is unique within a resource group.
- **frontend_ip_configuration**: Name of the frontend IP configuration object used by the inbound NAT pool object.
- **protocol**: Possible values include 'Udp', 'Tcp', or 'All'.
- **frontend_port_range_start**: The first port number in the range of external ports that will be used to provide Inbound NAT to NICs associated with a load balancer. Acceptable values range between 1 and 65534.
- **frontend_port_range_end**: The last port number in the range of external ports that will be used to provide Inbound NAT to NICs associated with a load balancer. Acceptable values range between 1 and 65535.
- **backend_port**: The port used for internal connections to the endpoint. Acceptable values are between 1 and 65535.

- **outbound_nat_rules** -- An optional list of dictionaries representing valid OutboundNatRule objects. Valid parameters are:
  - **name**: The name of the resource that is unique within a resource group.
  - **frontend_ip_configuration**: Name of the frontend IP configuration object used by the outbound NAT rule object.
  - **backend_address_pool**: Name of the backend address pool object used by the outbound NAT rule object. Outbound traffic is randomly load balanced across IPs in the backend IPs.
  - **allocated_outbound_ports**: The number of outbound ports to be used for NAT.

- **connection_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```python
Ensure load balancer exists:
    azurearm_network.load_balancer_present:
    - name: lb1
    - resource_group: group1
    - location: eastus
    - frontend_ip_configurations:
        - name: lb1_feip1
          public_ip_address: pub_ip1
    - backend_address_pools:
        - name: lb1_bepool1
    - probes:
        - name: lb1_webprobe1
          protocol: tcp
          port: 80
          interval_in_seconds: 5
          number_of_probes: 2
    - load_balancing_rules:
        - name: lb1_webprobe1
          protocol: tcp
          frontend_port: 80
```

(continues on next page)
backend_port: 80
idle_timeout_in_minutes: 4
frontend_ip_configuration: lb1_feip1
backend_address_pool: lb1_bepool1
probe: lb1_webprobe1
- tags:

  - require:
    - azurearm_resource: Ensure resource group exists
    - azurearm_network: Ensure public IP exists

salt.states.azurearm_network.network_interface_absent(name, resource_group, connection_auth=None)

New in version 2019.2.0.

Ensure a network interface does not exist in the resource group.

Parameters

- name -- Name of the network interface.
- resource_group -- The resource group assigned to the network interface.
- connection_auth -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_network.network_interface_present(name, ip_configurations, subnet, virtual_network, resource_group, tags=None, virtual_machine=None, network_security_group=None, dns_settings=None, mac_address=None, primary=None, enable_accelerated_networking=None, enable_ip_forwarding=None, connection_auth=None, **kwargs)

New in version 2019.2.0.

Ensure a network interface exists.

Parameters

- name -- Name of the network interface.
- ip_configurations -- A list of dictionaries representing valid NetworkInterfaceIP-Configuration objects. The 'name' key is required at minimum. At least one IP Configuration must be present.
- subnet -- Name of the existing subnet assigned to the network interface.
- virtual_network -- Name of the existing virtual network containing the subnet.
- resource_group -- The resource group assigned to the virtual network.
- tags -- A dictionary of strings can be passed as tag metadata to the network interface object.
• **network_security_group** -- The name of the existing network security group to assign to the network interface.

• **virtual_machine** -- The name of the existing virtual machine to assign to the network interface.

• **dns_settings** -- An optional dictionary representing a valid NetworkInterfaceDnsSettings object. Valid parameters are:
  
  - **dns_servers**: List of DNS server IP addresses. Use 'AzureProvidedDNS' to switch to Azure provided DNS resolution. 'AzureProvidedDNS' value cannot be combined with other IPs, it must be the only value in dns_servers collection.
  
  - **internal_dns_name_label**: Relative DNS name for this NIC used for internal communications between VMs in the same virtual network.

  - **internal_fqdn**: Fully qualified DNS name supporting internal communications between VMs in the same virtual network.

  - **internal_domain_name_suffix**: Even if internal_dns_name_label is not specified, a DNS entry is created for the primary NIC of the VM. This DNS name can be constructed by concatenating the VM name with the value of internal_domain_name_suffix.

• **mac_address** -- Optional string containing the MAC address of the network interface.

• **primary** -- Optional boolean allowing the interface to be set as the primary network interface on a virtual machine with multiple interfaces attached.

• **enable_accelerated_networking** -- Optional boolean indicating whether accelerated networking should be enabled for the interface.

• **enable_ip_forwarding** -- Optional boolean indicating whether IP forwarding should be enabled for the interface.

• **connection_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```yaml
Ensure network interface exists:
  azurearm_network.network_interface_present:
    - name: iface1
    - subnet: vnet1_sn1
    - virtual_network: vnet1
    - resource_group: group1
    - ip_configurations:
      - name: iface1_ipc1
        public_ip_address: pub_ip2
      - dns_settings:
        - internal_dns_name_label: decisionlab-int-test-label
        - primary: True
        - enable_accelerated_networking: True
        - enable_ip_forwarding: False
        - network_security_group: nsg1
        - connection_auth: {{ profile }}
    - require:
      - azurearm_network: Ensure subnet exists
      - azurearm_network: Ensure network security group exists
      - azurearm_network: Ensure another public IP exists
```
salt.states.azurearm_network.network_security_group_absent(name, resource_group, connection_auth=None)

New in version 2019.2.0.

Ensure a network security group does not exist in the resource group.

Parameters

- **name** -- Name of the network security group.
- **resource_group** -- The resource group assigned to the network security group.
- **connection_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_network.network_security_group_present(name, resource_group, tags=None, security_rules=None, connection_auth=None, **kwargs)

New in version 2019.2.0.

Ensure a network security group exists.

Parameters

- **name** -- Name of the network security group.
- **resource_group** -- The resource group assigned to the network security group.
- **tags** -- A dictionary of strings can be passed as tag metadata to the network security group object.
- **security_rules** -- An optional list of dictionaries representing valid SecurityRule objects. See the documentation for the security_rule_present state or security_rule_create_or_update execution module for more information on required and optional parameters for security rules. The rules are only managed if this parameter is present. When this parameter is absent, implemented rules will not be removed, and will merely become unmanaged.
- **connection_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```python
Ensure network security group exists:
    azurearm_network.network_security_group_present:
        - name: nsg1
        - resource_group: group1
        - security_rules:
            - name: nsg1_rule1
              priority: 100
              protocol: tcp
              access: allow
              direction: outbound
              source_address_prefix: virtualnetwork
              destination_address_prefix: internet
              source_port_range: '*'
              destination_port_range: '*'
```

(continues on next page)
- name: nsg1_rule2
  priority: 101
  protocol: tcp
  access: allow
  direction: inbound
  source_address_prefix: internet
  destination_address_prefix: virtualnetwork

    - azurearm_resource: Ensure resource group exists

salt.states.azurearm_network.public_ip_address_absent(name, resource_group, connection_auth=None)

New in version 2019.2.0.

Ensure a public IP address does not exist in the resource group.

Parameters

- name -- Name of the public IP address.
- resource_group -- The resource group assigned to the public IP address.
- connection_auth -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_network.public_ip_address_present(name, resource_group, tags=None, sku=None, public_ip_allocation_method=None, public_ip_address_version=None, dns_settings=None, idle_timeout_in_minutes=None, connection_auth=None, **kwargs)

New in version 2019.2.0.

Ensure a public IP address exists.

Parameters

- name -- Name of the public IP address.
- resource_group -- The resource group assigned to the public IP address.
- dns_settings -- An optional dictionary representing a valid PublicIPAddressDnsSettings object. Parameters include 'domain_name_label' and 'reverse_fqdn', which accept strings. The 'domain_name_label' parameter is concatenated with the regionalized DNS zone make up the fully qualified domain name associated with the public IP address. If a domain name label is specified, an A DNS record is created for the public IP in the Microsoft Azure DNS system. The 'reverse_fqdn' parameter is a user-visible, fully qualified domain name that resolves to this public IP address. If the reverse FQDN is specified, then a PTR DNS record is created pointing from the IP address in the in-addr.arpa domain to the reverse FQDN.
- **sku** -- The public IP address SKU, which can be 'Basic' or 'Standard'.
- **public_ip_allocation_method** -- The public IP allocation method. Possible values are: 'Static' and 'Dynamic'.
- **public_ip_address_version** -- The public IP address version. Possible values are: 'IPv4' and 'IPv6'.
- **idle_timeout_in_minutes** -- An integer representing the idle timeout of the public IP address.
- **tags** -- A dictionary of strings can be passed as tag metadata to the public IP address object.
- **connection_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```python
Ensure public IP exists:

salt.states.azurearm_network.public_ip_address_present:
  - name: pub_ip1
  - resource_group: group1
  - dns_settings:
    - domain_name_label: decisionlab-ext-test-label
    - sku: basic
    - public_ip_allocation_method: static
    - public_ip_address_version: ipv4
    - idle_timeout_in_minutes: 4
  - tags:
    - contact_name: Elmer Fudd Gantry
  - connection_auth: {{ profile }}
  - require:
    - azurearm_resource: Ensure resource group exists
```

**salt.states.azurearm_network.route_absent**(name, route_table, resource_group, connection_auth=None)

New in version 2019.2.0.

Ensure a route table does not exist in the resource group.

Parameters

- **name** -- Name of the route table.
- **route_table** -- The name of the existing route table containing the route.
- **resource_group** -- The resource group assigned to the route table.
- **connection_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

**salt.states.azurearm_network.route_present**(name, address_prefix, next_hop_type, route_table, resource_group, next_hop_ip_address=None, connection_auth=None, **kwargs)

New in version 2019.2.0.

Ensure a route exists within a route table.

Parameters

- **name** -- Name of the route.
• **address_prefix** -- The destination CIDR to which the route applies.

• **next_hop_type** -- The type of Azure hop the packet should be sent to. Possible values are: 'VirtualNetworkGateway', 'VnetLocal', 'Internet', 'VirtualAppliance', and 'None'.

• **next_hop_ip_address** -- The IP address packets should be forwarded to. Next hop values are only allowed in routes where the next hop type is 'VirtualAppliance'.

• **route_table** -- The name of the existing route table which will contain the route.

• **resource_group** -- The resource group assigned to the route table.

• **connection_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```yaml
Ensure route exists:
azurearm_network.route_present:
  - name: rt1_route2
  - route_table: rt1
  - resource_group: group1
  - address_prefix: '192.168.0.0/16'
  - next_hop_type: vnetlocal
  - connection_auth: {{ profile }}
  - require: azurearm_network: Ensure route table exists
```

salt.states.azurearm_network.route_table_absent(name, resource_group, connection_auth=None)

New in version 2019.2.0.

Ensure a route table does not exist in the resource group.

Parameters

• **name** -- Name of the route table.

• **resource_group** -- The resource group assigned to the route table.

• **connection_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_network.route_table_present(name, resource_group, tags=None, routes=None, disable_bgp_route_propagation=None, connection_auth=None, **kwargs)

New in version 2019.2.0.

Ensure a route table exists.

Parameters

• **name** -- Name of the route table.

• **resource_group** -- The resource group assigned to the route table.

• **routes** -- An optional list of dictionaries representing valid Route objects contained within a route table. See the documentation for the route_present state or route_create_or_update execution module for more information on required and optional parameters for routes. The routes are only managed if this parameter is present. When this parameter is absent, implemented routes will not be removed, and will merely become unmanaged.
• **disable_bgp_route_propagation** -- An optional boolean parameter setting whether to disable the routes learned by BGP on the route table.

• **tags** -- A dictionary of strings can be passed as tag metadata to the route table object.

• **connection_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```python
Ensure route table exists:
   azurearm_network.route_table_present:
   - name: rt1
   - resource_group: group1
   - routes:
     - name: rt1_route1
       address_prefix: '0.0.0.0/0'
       next_hop_type: internet
     - name: rt1_route2
       address_prefix: '192.168.0.0/16'
       next_hop_type: vnetlocal
     - tags:
       - contact_name: Elmer Fudd Gantry
     - connection_auth: {{ profile }}
   - require:
   - azurearm_resource: Ensure resource group exists
```

```python
salt.states.azurearm_network.security_rule_absent(name, security_group, resource_group, connection_auth=None)
```

New in version 2019.2.0.

Ensure a security rule does not exist in the network security group.

Parameters

• **name** -- Name of the security rule.

• **security_group** -- The network security group containing the security rule.

• **resource_group** -- The resource group assigned to the network security group.

• **connection_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

```python
salt.states.azurearm_network.security_rule_present(name, access, direction, priority, protocol, security_group, resource_group, destination_address_prefix=None, destination_port_range=None, source_address_prefix=None, source_port_range=None, description=None, destination_address_prefixes=None, destination_port_ranges=None, source_address_prefixes=None, source_port_ranges=None, connection_auth=None, **kwargs)
```

New in version 2019.2.0.

Ensure a security rule exists.
Parameters

- **name** -- Name of the security rule.
- **access** -- 'allow' or 'deny'
- **direction** -- 'inbound' or 'outbound'
- **priority** -- Integer between 100 and 4096 used for ordering rule application.
- **protocol** -- 'tcp', 'udp', or '*'
- **security_group** -- The name of the existing network security group to contain the security rule.
- **resource_group** -- The resource group assigned to the network security group.
- **description** -- Optional description of the security rule.
- **destination_address_prefix** -- The CIDR or destination IP range. Asterix '*' can also be used to match all destination IPs. Default tags such as 'VirtualNetwork', 'AzureLoadBalancer' and 'Internet' can also be used. If this is an ingress rule, specifies where network traffic originates from.
- **destination_port_range** -- The destination port or range. Integer or range between 0 and 65535. Asterix '*' can also be used to match all ports.
- **source_address_prefix** -- The CIDR or source IP range. Asterix '*' can also be used to match all source IPs. Default tags such as 'VirtualNetwork', 'AzureLoadBalancer' and 'Internet' can also be used. If this is an ingress rule, specifies where network traffic originates from.
- **source_port_range** -- The source port or range. Integer or range between 0 and 65535. Asterix '*' can also be used to match all ports.
- **destination_address_prefixes** -- A list of destination_address_prefix values. This parameter overrides destination_address_prefix and will cause any value entered there to be ignored.
- **destination_port_ranges** -- A list of destination_port_range values. This parameter overrides destination_port_range and will cause any value entered there to be ignored.
- **source_address_prefixes** -- A list of source_address_prefix values. This parameter overrides source_address_prefix and will cause any value entered there to be ignored.
- **source_port_ranges** -- A list of source_port_range values. This parameter overrides source_port_range and will cause any value entered there to be ignored.
- **connection_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

**Example usage:**

```
Ensure security rule exists:
    azurearm_network.security_rule_present:
        - name: nsg1_rule2
        - security_group: nsg1
        - resource_group: group1
        - priority: 101
        - protocol: tcp
        - access: allow
        - direction: inbound
        - source_address_prefix: internet
```
salt.states.azurearm_network.subnet_absent(name, virtual_network, resource_group, connection_auth=None)

New in version 2019.2.0.

Ensure a virtual network does not exist in the virtual network.

Parameters

- name -- Name of the subnet.
- virtual_network -- Name of the existing virtual network containing the subnet.
- resource_group -- The resource group assigned to the virtual network.
- connection_auth -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_network.subnet_present(name, address_prefix, virtual_network, resource_group, security_group=None, route_table=None, connection_auth=None, **kwargs)

New in version 2019.2.0.

Ensure a subnet exists.

Parameters

- name -- Name of the subnet.
- address_prefix -- A CIDR block used by the subnet within the virtual network.
- virtual_network -- Name of the existing virtual network to contain the subnet.
- resource_group -- The resource group assigned to the virtual network.
- security_group -- The name of the existing network security group to assign to the subnet.
- route_table -- The name of the existing route table to assign to the subnet.
- connection_auth -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```python
Ensure subnet exists:
  azurearm_network.subnet_present:
    - name: vnet1_sn1
    - virtual_network: vnet1
    - resource_group: group1
    - address_prefix: '192.168.1.0/24'
    - security_group: nsg1
    - route_table: rt1
```
salt.states.azurearm_network.virtual_network_absent(name, resource_group, connection_auth=None)

New in version 2019.2.0.

Ensure a virtual network does not exist in the resource group.

Parameters

- name -- Name of the virtual network.
- resource_group -- The resource group assigned to the virtual network.
- connection_auth -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

salt.states.azurearm_network.virtual_network_present(name, address_prefixes, resource_group, dns_servers=None, tags=None, connection_auth=None, **kwargs)

New in version 2019.2.0.

Ensure a virtual network exists.

Parameters

- name -- Name of the virtual network.
- resource_group -- The resource group assigned to the virtual network.
- address_prefixes -- A list of CIDR blocks which can be used by subnets within the virtual network.
- dns_servers -- A list of DNS server addresses.
- tags -- A dictionary of strings can be passed as tag metadata to the virtual network object.
- connection_auth -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```yaml
Ensure virtual network exists:
  azurearm_network.virtual_network_present:
    - name: vnet1
    - resource_group: group1
    - address_prefixes:
      - '10.0.0.0/8'
      - '192.168.0.0/16'
    - dns_servers:
      - '8.8.8.8'
    - tags:
      contact_name: Elmer Fudd Gantry
    - connection_auth: {{ profile }}
    - require:
      - azurearm_resource: Ensure resource group exists
```
23.19.12  salt.states.beacon

Management of the Salt beacons

New in version 2015.8.0.

```yaml
ps:
  beacon.present:
    - save: True
    - enable: False
    - services:
      salt-master: running
      apache2: stopped

sh:
  beacon.present: []

load:
  beacon.present:
    - averages:
      1m:
        - 0.0
        - 2.0
      5m:
        - 0.0
        - 1.5
      15m:
        - 0.1
        - 1.0

.. versionadded:: 3000

Beginning in the 3000 release, multiple copies of a beacon can be configured using the `beacon_module` parameter.

inotify_infs:
  beacon.present:
    - save: True
    - enable: True
    - files:
      /etc/infs.conf:
        mask:
          - create
          - delete
          - modify
          recurse: True
          auto_add: True
      - interval: 10
      - beacon_module: inotify
      - disable_during_state_run: True

inotify_ntp:
  beacon.present:
    - save: True
    - enable: True
    - files:
      /etc/ntp.conf:

(continues on next page)
```
    mask:
    - create
    - delete
    - modify
    recurse: True
    auto_add: True
    - interval: 10
    - beacon_module: inotify
    - disable_during_state_run: True
```

salt.states.beacon.absent(name, save=False, **kwargs)

   Ensure beacon is absent.

   - name  The name of the beacon that is ensured absent.
   - save  True/False, if True the beacons.conf file be updated too. Default is False.

   Example:
```
remove_beacon:
    beacon.absent:
        - name: ps
        - save: True
```

salt.states.beacon.disabled(name, **kwargs)

   Disable a beacon.

   - name  The name of the beacon to disable.

   Example:
```
disable_beacon:
    beacon.disabled:
        - name: psp
```

salt.states.beacon.enabled(name, **kwargs)

   Enable a beacon.

   - name  The name of the beacon to enable.

   Example:
```
enable_beacon:
    beacon.enabled:
        - name: ps
```

salt.states.beacon.present(name, save=False, **kwargs)

   Ensure beacon is configured with the included beacon data.

   - name  The name of the beacon to ensure is configured.
   - save  True/False, if True the beacons.conf file be updated too. Default is False.

   Example:
```
ps_beacon:
    beacon.present:
        - name: ps
        - save: True
        - enable: False
```
23.19.13 salt.states.boto3_elasticache

Manage Elasticache with boto3

New in version 2017.7.0.

Create, destroy and update Elasticache clusters. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto3 behind the scenes - as a result it inherits any limitations it boto3's implementation of the AWS API. It is also designed to as directly as possible leverage boto3's parameter naming and semantics. This allows one to use http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html as an excellent source for details too involved to reiterate here.

Note: This module is designed to be transparent ("intentionally ignorant" is the phrase I used to describe it to my boss) to new AWS / boto options - since all AWS API params are passed directly through both the state and executions modules, any new args to existing functions which become available after this documentation is written should work immediately.

Brand new API calls, of course, would still require new functions to be added :)

This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information is available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```yaml
elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsdfkjghWupUjasdfklkdfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfkjghWupUjasdfklkdfklgjsdfjajkghs
  region: us-east-1
```

```yaml
Ensure myelasticache exists:
boto3_elasticache.present:
  - name: myelasticache
    - engine: redis
    - cache_node_type: cache.t1.micro
    - num_cache_nodes: 1
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfkjghWupUjasdfklkdfklgjsdfjajkghs
```

# Using a profile from pillars
Ensure myelasticache exists:

```yaml
(continues on next page)
```
boto3_elasticache.present:
- name: myelasticache
- engine: redis
- cache_node_type: cache.t1.micro
- num_cache_nodes: 1
- region: us-east-1
- profile: myprofile

# Passing in a profile
Ensure myelasticache exists:

boto3_elasticache.present:
- name: myelasticache
- engine: redis
- cache_node_type: cache.t1.micro
- num_cache_nodes: 1
- region: us-east-1
- profile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

salt.states.boto3_elasticache.cache_cluster_absent(name, wait=600, region=None, key=None, keyid=None, profile=None, **args)

Ensure a given cache cluster is deleted.

name Name of the cache cluster.

wait Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

CacheClusterId The node group (shard) identifier. Note: In general this parameter is not needed, as 'name' is used if it's not provided.

FinalSnapshotIdentifier The user-supplied name of a final cache cluster snapshot. This is the unique name that identifies the snapshot. ElastiCache creates the snapshot, and then deletes the cache cluster immediately afterward.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto3_elasticache.cache_cluster_present(name, wait=900, security_groups=None, region=None, key=None, keyid=None, profile=None, **args)

Ensure a given cache cluster exists.

name Name of the cache cluster (cache cluster id).

wait Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the
cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

**security_groups** One or more VPC security groups (names and/or IDs) associated with the cache cluster.

**Note:** This is additive with any sec groups provided via the SecurityGroupIds parameter below. Use this parameter ONLY when you are creating a cluster in a VPC.

**CacheClusterId** The node group (shard) identifier. This parameter is stored as a lowercase string.

**Constraints:**
- A name must contain from 1 to 20 alphanumeric characters or hyphens.
- The first character must be a letter.
- A name cannot end with a hyphen or contain two consecutive hyphens.

**Note:** In general this parameter is not needed, as 'name' is used if it's not provided.

**ReplicationGroupId** The ID of the replication group to which this cache cluster should belong. If this parameter is specified, the cache cluster is added to the specified replication group as a read replica; otherwise, the cache cluster is a standalone primary that is not part of any replication group. If the specified replication group is Multi-AZ enabled and the Availability Zone is not specified, the cache cluster is created in Availability Zones that provide the best spread of read replicas across Availability Zones.

**AZMode** Specifies whether the nodes in this Memcached cluster are created in a single Availability Zone or created across multiple Availability Zones in the cluster's region. If the AZMode and PreferredAvailabilityZones are not specified, ElastiCache assumes single-az mode.

**Note:** This parameter is ONLY supported for Memcached cache clusters.

**PreferredAvailabilityZone** The EC2 Availability Zone in which the cache cluster is created. All nodes belonging to this Memcached cache cluster are placed in the preferred Availability Zone. If you want to create your nodes across multiple Availability Zones, use PreferredAvailabilityZones.

Default: System chosen Availability Zone.

**PreferredAvailabilityZones** A list of the Availability Zones in which cache nodes are created. The order of the zones in the list is not important. The number of Availability Zones listed must equal the value of NumCacheNodes. If you want all the nodes in the same Availability Zone, use PreferredAvailabilityZone instead, or repeat the Availability Zone multiple times in the list.

Default: System chosen Availability Zones.

**Note:** This option is ONLY supported on Memcached.

If you are creating your cache cluster in an Amazon VPC (recommended) you can only locate nodes in Availability Zones that are associated with the subnets in the selected subnet group.

**NumCacheNodes** The initial (integer) number of cache nodes that the cache cluster has.

**Note:** For clusters running Redis, this value must be 1.
For clusters running Memcached, this value must be between 1 and 20.

**CacheNodeType**  The compute and memory capacity of the nodes in the node group (shard). Valid node types (and pricing for them) are exhaustively described at [https://aws.amazon.com/elasticache/pricing/](https://aws.amazon.com/elasticache/pricing/)

**Note:**

- All T2 instances must be created in a VPC
- Redis backup/restore is not supported for Redis (cluster mode disabled) T1 and T2 instances.
- Backup/restore is supported on Redis (cluster mode enabled) T2 instances.
- Redis Append-only files (AOF) functionality is not supported for T1 or T2 instances.

**Engine**  The name of the cache engine to be used for this cache cluster. Valid values for this parameter are: memcached | redis

**EngineVersion**  The version number of the cache engine to be used for this cache cluster. To view the supported cache engine versions, use the DescribeCacheEngineVersions operation.

**Note:**  You can upgrade to a newer engine version but you cannot downgrade to an earlier engine version. If you want to use an earlier engine version, you must delete the existing cache cluster or replication group and create it anew with the earlier engine version.

**CacheParameterGroupName**  The name of the parameter group to associate with this cache cluster. If this argument is omitted, the default parameter group for the specified engine is used. You cannot use any parameter group which has cluster-enabled='yes' when creating a cluster.

**CacheSubnetGroupName**  The name of the Cache Subnet Group to be used for the cache cluster. Use this parameter ONLY when you are creating a cache cluster within a VPC.

**Note:**  If you’re going to launch your cluster in an Amazon VPC, you need to create a subnet group before you start creating a cluster.

**CacheSecurityGroupNames**  A list of Cache Security Group names to associate with this cache cluster. Use this parameter ONLY when you are creating a cache cluster outside of a VPC.

**SecurityGroupIds**  One or more VPC security groups associated with the cache cluster. Use this parameter ONLY when you are creating a cache cluster within a VPC.

**Tags**  A list of tags to be added to this resource. Note that due to shortcomings in the AWS API for ElastiCache, these can only be set during resource creation - later modification is not (currently) supported.

**SnapshotArns**  A single-element string list containing an Amazon Resource Name (ARN) that uniquely identifies a Redis RDB snapshot file stored in Amazon S3. The snapshot file is used to populate the node group (shard). The Amazon S3 object name in the ARN cannot contain any commas.

**Note:**  This parameter is ONLY valid if the Engine parameter is redis.

**SnapshotName**  The name of a Redis snapshot from which to restore data into the new node group (shard). The snapshot status changes to restoring while the new node group (shard) is being created.
**Note:** This parameter is ONLY valid if the Engine parameter is redis.

**PreferredMaintenanceWindow**  Specifies the weekly time range during which maintenance on the cache cluster is permitted. It is specified as a range in the format ddd:hh24:mi-ddd:hh24:mi (24H Clock UTC). The minimum maintenance window is a 60 minute period. Valid values for ddd are: sun, mon, tue, wed, thu, fri, sat

Example: sun:23:00-mon:01:30

**Port**  The port number on which each of the cache nodes accepts connections.

Default: 6379

**NotificationTopicArn**  The Amazon Resource Name (ARN) of the Amazon Simple Notification Service (SNS) topic to which notifications are sent.

**Note:** The Amazon SNS topic owner must be the same as the cache cluster owner.

**AutoMinorVersionUpgrade**  This (boolean) parameter is currently disabled.

**SnapshotRetentionLimit**  The number of days for which ElastiCache retains automatic snapshots before deleting them.

Default: 0 (i.e., automatic backups are disabled for this cache cluster).

**Note:** This parameter is ONLY valid if the Engine parameter is redis.

**SnapshotWindow**  The daily time range (in UTC) during which ElastiCache begins taking a daily snapshot of your node group (shard). If you do not specify this parameter, ElastiCache automatically chooses an appropriate time range.

Example: 05:00-09:00

**Note:** This parameter is ONLY valid if the Engine parameter is redis.

**AuthToken**  The password used to access a password protected server.

Password constraints:
- Must be only printable ASCII characters.
- Must be at least 16 characters and no more than 128 characters in length.
- Cannot contain any of the following characters: '/', '"', or '@'.

**CacheNodeIdsToRemove**  A list of cache node IDs to be removed. A node ID is a numeric identifier (0001, 0002, etc.). This parameter is only valid when NumCacheNodes is less than the existing number of cache nodes. The number of cache node IDs supplied in this parameter must match the difference between the existing number of cache nodes in the cluster or pending cache nodes, whichever is greater, and the value of NumCacheNodes in the request.

**NewAvailabilityZones**  The list of Availability Zones where the new Memcached cache nodes are created. This parameter is only valid when NumCacheNodes in the request is greater than the sum of the number of active cache nodes and the number of cache nodes pending creation (which may be zero). The number of Availability Zones supplied in this list must match the cache nodes being added in this request. Note: This option is only supported on Memcached clusters.
NotificationTopicStatus  The status of the SNS notification topic. Notifications are sent only if the status is active.

Valid values: active | inactive

region  Region to connect to.

key  Secret key to be used.

keyid  Access key to be used.

profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto3_elasticache.cache_subnet_group_absent(name, region=None, key=None, keyid=None, profile=None, **args)

Ensure a given cache subnet group is deleted.

name  Name of the cache subnet group.

CacheSubnetGroupName  A name for the cache subnet group. Note: In general this parameter is not needed, as 'name' is used if it's not provided.

region  Region to connect to.

key  Secret key to be used.

keyid  Access key to be used.

profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto3_elasticache.cache_subnet_group_present(name, subnets=None, region=None, key=None, keyid=None, profile=None, **args)

Ensure cache subnet group exists.

name  A name for the cache subnet group. This value is stored as a lowercase string. Constraints: Must contain no more than 255 alphanumeric characters or hyphens.

subnets  A list of VPC subnets (IDs, Names, or a mix) for the cache subnet group.

CacheSubnetGroupName  A name for the cache subnet group. This value is stored as a lowercase string. Constraints: Must contain no more than 255 alphanumeric characters or hyphens. Note: In general this parameter is not needed, as 'name' is used if it's not provided.

CacheSubnetGroupDescription  A description for the cache subnet group.

SubnetIds  A list of VPC subnet IDs for the cache subnet group. This is ADDITIVE with 'subnets' above.

region  Region to connect to.

key  Secret key to be used.

keyid  Access key to be used.

profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto3_elasticache.replication_group_absent(name, wait=600, region=None, key=None, keyid=None, profile=None, **args)

Ensure a given replication group is deleted.
name  Name of the replication group.

wait  Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

ReplicationGroupId  The replication group identifier. Note: In general this parameter is not needed, as 'name' is used if it's not provided.

RetainPrimaryCluster  If set to true, all of the read replicas are deleted, but the primary node is retained.

FinalSnapshotIdentifier  The name of a final node group (shard) snapshot. ElastiCache creates the snapshot from the primary node in the cluster, rather than one of the replicas; this is to ensure that it captures the freshest data. After the final snapshot is taken, the replication group is immediately deleted.

region  Region to connect to.

dict  Secret key to be used.
keyid  Access key to be used.

profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto3_elasticache.replication_group_present(name, wait=900, security_groups=None, region=None, key=None, keyid=None, profile=None, **args)

Ensure a replication group exists and is in the given state.

name  Name of replication group

wait  Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

security_groups  One or more VPC security groups (names and/or IDs) associated with the cache cluster.

Note:  This is additive with any sec groups provided via the SecurityGroupIds parameter below. Use this parameter ONLY when you are creating a cluster in a VPC.

ReplicationGroupId  The replication group identifier. This parameter is stored as a lowercase string.

Constraints:

- A name must contain from 1 to 20 alphanumeric characters or hyphens.
- The first character must be a letter.
- A name cannot end with a hyphen or contain two consecutive hyphens.

Note:  In general this parameter is not needed, as 'name' is used if it's not provided.

ReplicationGroupDescription  A user-created description for the replication group.

PrimaryClusterId  The identifier of the cache cluster that serves as the primary for this replication group. This cache cluster must already exist and have a status of available. This parameter is not required if NumCacheClusters, NumNodeGroups, or ReplicasPerNodeGroup is specified.
**AutomaticFailoverEnabled** Specifies whether a read-only replica is automatically promoted to read/write primary if the existing primary fails. If true, Multi-AZ is enabled for this replication group. If false, Multi-AZ is disabled for this replication group.

Default: False

**Note:** AutomaticFailoverEnabled must be enabled for Redis (cluster mode enabled) replication groups.

ElastiCache Multi-AZ replication groups is not supported on:

- Redis versions earlier than 2.8.6.
- Redis (cluster mode disabled): T1 and T2 node types.
- Redis (cluster mode enabled): T2 node types.

**NumCacheClusters** The number of clusters this replication group initially has. This parameter is not used if there is more than one node group (shard). You should use ReplicasPerNodeGroup instead. If Multi-AZ is enabled, the value of this parameter must be at least 2. The maximum permitted value for NumCacheClusters is 6 (primary plus 5 replicas).

**PreferredCacheClusterAZs** A list of EC2 Availability Zones in which the replication group's cache clusters are created. The order of the Availability Zones in the list is the order in which clusters are allocated. The primary cluster is created in the first AZ in the list. This parameter is not used if there is more than one node group (shard). You should use NodeGroupConfiguration instead. The number of Availability Zones listed must equal the value of NumCacheClusters.

Default: System chosen Availability Zones.

**Note:** If you are creating your replication group in an Amazon VPC (recommended), you can only locate cache clusters in Availability Zones associated with the subnets in the selected subnet group.

**NumNodeGroups** An optional parameter that specifies the number of node groups (shards) for this Redis (cluster mode enabled) replication group. For Redis (cluster mode disabled) either omit this parameter or set it to 1.

Default: 1

**ReplicasPerNodeGroup** An optional parameter that specifies the number of replica nodes in each node group (shard). Valid values are: 0 to 5

**NodeGroupConfiguration** A list of node group (shard) configuration options. Each node group (shard) configuration has the following: Slots, PrimaryAvailabilityZone, ReplicaAvailabilityZones, ReplicaCount. If you're creating a Redis (cluster mode disabled) or a Redis (cluster mode enabled) replication group, you can use this parameter to configure one node group (shard) or you can omit this parameter. For fidely details of the expected data layout of this param, see http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html?#ElastiCache.Client.create_replication_group

**CacheNodeType** The compute and memory capacity of the nodes in the node group (shard). See https://aws.amazon.com/elasticache/pricing/ for current sizing, prices, and constraints.

**Engine** The name of the cache engine to be used for the cache clusters in this replication group.

**EngineVersion** The version number of the cache engine to be used for the cache clusters in this replication group. To view the supported cache engine versions, use the DescribeCacheEngineVersions operation.

**Note:** You can upgrade to a newer engine version but you cannot downgrade to an earlier engine version. If you want to use an earlier engine version, you must delete the existing cache cluster or replication
group and create it anew with the earlier engine version.

**CacheParameterGroupName** The name of the parameter group to associate with this replication group. If this argument is omitted, the default cache parameter group for the specified engine is used.

**Note:** If you are running Redis version 3.2.4 or later, only one node group (shard), and want to use a default parameter group, we recommend that you specify the parameter group by name.

To create a Redis (cluster mode disabled) replication group, use `CacheParameterGroupName=default.redis3.2`

To create a Redis (cluster mode enabled) replication group, use `CacheParameterGroupName=default.redis3.2.cluster.on`

**CacheSubnetGroupName** The name of the cache subnet group to be used for the replication group.

**Note:** If you're going to launch your cluster in an Amazon VPC, you need to create a subnet group before you start creating a cluster. For more information, see Subnets and Subnet Groups.

**CacheSecurityGroupNames** A list of cache security group names to associate with this replication group.

**SecurityGroupIds** One or more Amazon VPC security groups associated with this replication group. Use this parameter only when you are creating a replication group in an VPC.

**Tags** A list of tags to be added to this resource. Note that due to shortcomings in the AWS API for Elasticache, these can only be set during resource creation - later modification is not (currently) supported.

**SnapshotArns** A list of ARNs that uniquely identify the Redis RDB snapshot files stored in Amazon S3. These snapshot files are used to populate the replication group. The Amazon S3 object name in the ARN cannot contain any commas. The list must match the number of node groups (shards) in the replication group, which means you cannot repartition.

**Note:** This parameter is only valid if the Engine parameter is redis.

**SnapshotName** The name of a snapshot from which to restore data into the new replication group. The snapshot status changes to restoring while the new replication group is being created. Note: This parameter is only valid if the Engine parameter is redis.

**PreferredMaintenanceWindow** Specifies the weekly time range during which maintenance on the cluster is performed. It is specified as a range in the format ddd:hh24:mi-ddd:hh24:mi (24H Clock UTC). The minimum maintenance window is a 60 minute period. Valid values for ddd are: sun, mon, tue, wed, thu, fri, sat

Example: sun:23:00-mon:01:30

**Port** The port number on which each member of the replication group accepts connections.

**NotificationTopicArn** The ARN of an SNS topic to which notifications are sent.

**Note:** The SNS topic owner must be the same as the cache cluster owner.

**AutoMinorVersionUpgrade** This parameter is currently disabled.
SnapshotRetentionLimit The number of days for which ElastiCache will retain automatic snapshots before deleting them.

Default: 0 (that is, automatic backups are disabled for this cache cluster).

Note: This parameter is only valid if the Engine parameter is redis.

SnapshotWindow The daily time range (in UTC) during which ElastiCache begins taking a daily snapshot of your node group (shard). If you do not specify this parameter, ElastiCache automatically chooses an appropriate time range.

Example: 05:00-09:00

Note: This parameter is only valid if the Engine parameter is redis.

AuthToken The password used to access a password protected server. Password constraints:

- Must be only printable ASCII characters.
- Must be at least 16 characters and no more than 128 characters in length.
- Cannot contain any of the following characters: '/', '"', or '@'.

SnapshootingClusterId The cache cluster ID that is used as the daily snapshot source for the replication group.

NotificationTopicStatus The status of the SNS notification topic. Notifications are sent only if the status is active. Valid values: active | inactive

region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

23.19.14 salt.states.boto_asg

Manage Autoscale Groups

New in version 2014.7.0.

Create and destroy autoscale groups. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

| asg.keyid: GKTADJGHEIQSXMKKRBJ08H |
| asg.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs |
It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfkjghWupUjasdfklkdfklglgjsdfjajkghs
  region: us-east-1
```

Ensure myasg exists:
```
boto_asg.present:
  - name: myasg
    launch_config_name: mylc
    availability_zones:
      - us-east-1a
      - us-east-1b
    min_size: 1
    max_size: 1
    desired_capacity: 1
    load_balancers:
      - myelb
    suspended_processes:
      - AddToLoadBalancer
      - AlarmNotification
    scaling_policies:
      - adjustment_type: ChangeInCapacity
        as_name: api-production-iad
        cooldown: 1800
        min_adjustment_step: None
        name: ScaleDown
        scaling_adjustment: -1
      region: us-east-1
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfkjghWupUjasdfklkdfklglgjsdfjajkghs
```  

# Using a profile from pillars.
Ensure myasg exists:
```
boto_asg.present:
  - name: myasg
    launch_config_name: mylc
    availability_zones:
      - us-east-1a
      - us-east-1b
    min_size: 1
    max_size: 1
    desired_capacity: 1
    load_balancers:
      - myelb
    profile: myprofile
```

# Passing in a profile.
Ensure myasg exists:
```
boto_asg.present:
  - name: myasg
    launch_config_name: mylc
    availability_zones:
      - us-east-1a
      - us-east-1b
    min_size: 1
```

(continues on next page)
- **max_size**: 1
- **desired_capacity**: 1
- **load_balancers**: myelb
- **profile**: keyid: GKTADJGHEIQSXMKKRBJ08H
text: askdjghsdfjkgWupUjasdflkdfklgsdjfgs
region: us-east-1

# Deleting an autoscale group with running instances.
**Ensure myasg is deleted:**
```
boto_asg.absent:
  - name: myasg
# If instances exist, we must force the deletion of the asg.
  - force: True
```

It's possible to specify cloudwatch alarms that will be setup along with the ASG. Note the alarm name will be the
name attribute defined, plus the ASG resource name.

**Ensure myasg exists:**
```
boto_asg.present:
  - name: myasg
    - launch_config_name: mylc
    - availability_zones:
      - us-east-1a
      - us-east-1b
    - min_size: 1
    - max_size: 1
    - desired_capacity: 1
    - load_balancers: myelb
    - profile: myprofile
    - alarms:
      - CPU:
        name: 'ASG CPU **MANAGED BY SALT**'
        attributes:
          metric: CPUUtilization
          namespace: AWS/EC2
          statistic: Average
          comparison: '>= '
          threshold: 65.0
          period: 60
          evaluation_periods: 30
          unit: null
          description: 'ASG CPU'
          alarm_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]
          insufficient_data_actions: []
          ok_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]
```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource.
Note that 'boto_asg_alarms' will be used as a default value for all resources, if defined and can be used to ensure
alarms are always set for an ASG resource.

Setting the alarms in a pillar:
```
my_asg_alarm:
  CPU:
```

(continues on next page)
Overriding the alarm values on the resource:

```
name: 'ASG CPU **MANAGED BY SALT**'
attributes:
  metric: CPUUtilization
  namespace: AWS/EC2
  statistic: Average
  comparison: '>='
  threshold: 65.0
  period: 60
  evaluation_periods: 30
  unit: null
description: 'ASG CPU'
insufficient_data_actions: []
ok_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
```

salt.states.boto_asg.absent(name, force=False, region=None, key=None, keyid=None, profile=None, remove_lc=False)

Ensure the named autoscale group is deleted.

- **name** Name of the autoscale group.
- **force** Force deletion of autoscale group.
- **remove_lc** Delete the launch config as well.
- **region** The region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
salt.states.boto_asg.present(name, launch_config_name, availability_zones, min_size, max_size, launch_config=None, desired_capacity=None, load_balancers=None, default_cooldown=None, health_check_type=None, health_check_period=None, placement_group=None, vpc_zone_identifier=None, subnet_names=None, tags=None, termination_policies=None, termination_policies_from_pillar='boto_asg_termination_policies', suspended_processes=None, scaling_policies=None, scaling_policies_from_pillar='boto_asg_scaling_policies', scheduled_actions=None, scheduled_actions_from_pillar='boto_asg_scheduled_actions', alarms=None, alarms_from_pillar='boto_asg_alarms', region=None, key=None, keyid=None, profile=None, notification_arn=None, notification_arn_from_pillar='boto_asg_notification_arn', notification_types=None, notification_types_from_pillar='boto_asg_notification_types')

Ensure the autoscale group exists.

name  Name of the autoscale group.

launch_config_name  Name of the launch config to use for the group. Or, if launch_config is specified, this will be the launch config name's prefix. (see below)

launch_config  A dictionary of launch config attributes. If specified, a launch config will be used or created, matching this set of attributes, and the autoscale group will be set to use that launch config. The launch config name will be the Launch_config_name followed by a hyphen followed by a hash of the launch_config dict contents. Example:

```
my_asg:
  boto_asg.present:
    - launch_config:
      - ebs_optimized: false
      - instance_profile_name: my_iam_profile
      - kernel_id: '
      - ramdisk_id: '
      - key_name: my_ssh_key
      - image_name: aws2015091-hvm
      - instance_type: c3.xlarge
      - instance_monitoring: false
      - security_groups:
        - my_sec_group_01
        - my_sec_group_02
```

availability_zones  List of availability zones for the group.

min_size  Minimum size of the group.

max_size  Maximum size of the group.

desired_capacity  The desired capacity of the group.

load_balancers  List of load balancers for the group. Once set this can not be updated (Amazon restriction).

default_cooldown  Number of seconds after a Scaling Activity completes before any further scaling activities can start.

health_check_type  The service you want the health status from, Amazon EC2 or Elastic Load Balancer (EC2 or ELB).

health_check_period  Length of time in seconds after a new EC2 instance comes into service that Auto Scaling starts checking its health.
**placement_group**  Physical location of your cluster placement group created in Amazon EC2. Once set this can not be updated (Amazon restriction).

**vpc_zone_identifier**  A list of the subnet identifiers of the Virtual Private Cloud.

**subnet_names**  For VPC, a list of subnet names (NOT subnet IDs) to deploy into. Exclusive with vpc_zone_identifier.

**tags**  A list of tags. Example:

```yaml
- key: 'key'
  value: 'value'
  propagate_at_launch: true
```

**termination_policies**  A list of termination policies. Valid values are:

- OldestInstance
- NewestInstance
- OldestLaunchConfiguration
- ClosestToNextInstanceHour
- Default

If no value is specified, the Default value is used.

**termination_policies_from_pillar:**  name of pillar dict that contains termination policy settings. Termination policies defined for this specific state will override those from pillar.

**scaling_policies_from_pillar:**  name of pillar dict that contains scaling policy settings. Scaling policies defined for this specific state will override those from pillar.

**scheduled_actions:**  a dictionary of scheduled actions. Each key is the name of scheduled action and each value is dictionary of options. For example:

```yaml
- scheduled_actions:
  scale_up_at_10:
    desired_capacity: 4
    min_size: 3
    max_size: 5
    recurrence: "0 9 * * 1-5"
  scale_down_at_7:
    desired_capacity: 1
    min_size: 1
    max_size: 1
    recurrence: "0 19 * * 1-5"
```

**scheduled_actions_from_pillar:**  name of pillar dict that contains scheduled_actions settings. Scheduled actions for this specific state will override those from pillar.

**alarms:**  a dictionary of name->boto_cloudwatch_alarm sections to be associated with this ASG. All attributes should be specified except for dimension which will be automatically set to this ASG.

See the `salt.states.boto_cloudwatch_alarm` state for information about these attributes.
If any alarm actions include ":self:" this will be replaced with the asg name. For example, alarm_actions reading ":["scaling_policy:self:ScaleUp"]" will map to the arn for this asg's scaling policy named "ScaleUp". In addition, any alarms that have only scaling_policy as actions will be ignored if min_size is equal to max_size for this ASG.

alarms_from_pillar: name of pillar dict that contains alarm settings. Alarms defined for this specific state will override those from pillar.

region The region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
notification_arn The AWS arn that notifications will be sent to
notification_arn_from_pillar name of the pillar dict that contains notification_arn settings. A notification_arn defined for this specific state will override the one from pillar.
notification_types A list of event names that will trigger a notification. The list of valid notification types is:
  - autoscaling:EC2_INSTANCE_LAUNCH
  - autoscaling:EC2_INSTANCE_LAUNCH_ERROR
  - autoscaling:EC2_INSTANCE_TERMINATE
  - autoscaling:EC2_INSTANCE_TERMINATE_ERROR
  - autoscaling:TEST_NOTIFICATION
notification_types_from_pillar name of the pillar dict that contains notification_types settings. notification_types defined for this specific state will override those from the pillar.

23.19.15 salt.states.boto_cloudfront

Manage CloudFront distributions
New in version 2018.3.0.
Create, update and destroy CloudFront distributions.
This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them, either in a pillar file or in the minion's config file:

```
cloudfront.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudfront.key: askdjghsdfjkgWupUjasdfdlkdfklgjsdfjajkghs
```

It's also possible to specify key, keyid, and region via a profile, either passed in as a dict, or a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgWupUjasdfdlkdfklgjsdfjajkghs
  region: us-east-1
```
aws:
    region: us-east-1:
        profile:
            keyid: GKTADJGHEIQSXMKKRBJ08H
            key: askdjghsdfjkghWupUjasdfklkdfklgjdsfjajkghs
            region: us-east-1

depends boto3

salt.states.boto_cloudfront.present(name, config, tags, region=None, key=None, keyid=None, profile=None)

Ensure the CloudFront distribution is present.

name (string) Name of the CloudFront distribution
config (dict) Configuration for the distribution
tags (dict) Tags to associate with the distribution
region (string) Region to connect to
key (string) Secret key to use
keyid (string) Access key to use
profile (dict or string) A dict with region, key, and keyid, or a pillar key (string) that contains such a dict.

Example:

Manage my_distribution CloudFront distribution:
    boto_cloudfront.present:
        - name: my_distribution
        - config:
            Comment: 'partial config shown, most parameters elided'
            Enabled: True
        - tags:
            testing_key: testing_value

23.19.16 salt.states.boto_cognitoidentity

Manage CognitoIdentity Functions

New in version 2016.11.0.

Create and destroy CognitoIdentity identity pools. Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkdfklgjdsfjajkghs
It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgfhUjasdfklgjdsfjajkg
  region: us-east-1
```

Ensure function exists:

```
boto_cognitoidentity.pool_present:
  - PoolName: my_identity_pool
  - region: us-east-1
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkgfhUjasdfklgjdsfjajkg
```

salt.states.boto_cognitoidentity.pool_absent(name, IdentityPoolName, RemoveAllMatched=False, region=None, key=None, keyid=None, profile=None)

Ensure cognito identity pool with passed properties is absent.

- **name** The name of the state definition.
- **IdentityPoolName** Name of the Cognito Identity Pool. Please note that this may match multiple pools with the same given name, in which case, all will be removed.
- **RemoveAllMatched** If True, all identity pools with the matching IdentityPoolName will be removed. If False and there are more than one identity pool with the matching IdentityPoolName, no action will be taken. If False and there is only one identity pool with the matching IdentityPoolName, the identity pool will be removed.
- **region** Region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_cognitoidentity.pool_present(name, IdentityPoolName, AuthenticatedRole, AllowUnauthenticatedIdentities=False, UnauthenticatedRole=None, SupportedLoginProviders=None, DeveloperProviderName=None, OpenIdConnectProviderARNs=None, region=None, key=None, keyid=None, profile=None)

Ensure Cognito Identity Pool exists.

- **name** The name of the state definition
- **IdentityPoolName** Name of the Cognito Identity Pool
- **AuthenticatedRole** An IAM role name or ARN that will be associated with temporary AWS credentials for an authenticated cognito identity.
- **AllowUnauthenticatedIdentities** Whether to allow anonymous user identities
- **UnauthenticatedRole** An IAM role name or ARN that will be associated with anonymous user identities
- **SupportedLoginProviders** A dictionary or pillar that contains key: value pairs mapping provider names to provider app IDs.
**DeveloperProviderName**  A string which is the domain by which Cognito will refer to your users. This name acts as a placeholder that allows your backend and the Cognito service to communicate about the developer provider. Once you have set a developer provider name, you cannot change it. Please take care in setting this parameter.

**OpenIdConnectProviderARNs**  A list or pillar name that contains a list of OpenID Connect provider ARNs.

- **region**  Region to connect to.
- **key**  Secret key to be used.
- **keyid**  Access key to be used.
- **profile**  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 23.19.17 salt.states.boto_dynamodb

**Manage DynamoDB Tables**

New in version 2015.5.0.

Create and destroy DynamoDB tables. Be aware that this interacts with Amazon's services, and so may incur charges. This module uses boto, which can be installed via package, or pip.

This module accepts explicit DynamoDB credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```yaml
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfdfjkgWupUjasdflkdfklgjsdfajkghs
region: us-east-1
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfdfjkgWupUjasdflkdfklgjsdfajkghs
  region: us-east-1
```

**Ensure DynamoDB table does not exist:**

```yaml
boto_dynamodb.absent:
  - table_name: new_table
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfdfjkgWupUjasdflkdfklgjsdfajkghs
  - region: us-east-1
```

**Ensure DynamoDB table exists:**

```yaml
boto_dynamodb.present:
  - table_name: new_table
  - read_capacity_units: 1
  - write_capacity_units: 2
  - hash_key: primary_id
  - hash_key_data_type: N
```

(continues on next page)
It's possible to specify cloudwatch alarms that will be setup along with the DynamoDB table. Note the alarm name will be defined by the name attribute provided, plus the DynamoDB resource name.

Ensure DynamoDB table exists:

```python
boto_dynamodb.present:
  - name: new_table
  - read_capacity_units: 1
  - write_capacity_units: 2
  - hash_key: primary_id
  - hash_key_data_type: N
  - range_key: start_timestamp
  - range_key_data_type: N
  - alarms:
    ConsumedWriteCapacityUnits:
      name: 'DynamoDB ConsumedWriteCapacityUnits **MANAGED BY SALT**'
      attributes:
        metric: ConsumedWriteCapacityUnits
        namespace: AWS/DynamoDB
        statistic: Sum
        comparison: '>='
        # threshold_percent is used to calculate the actual threshold
        # based on the provisioned capacity for the table.
        threshold_percent: 0.75
        period: 300
        evaluation_periods: 2
        unit: Count
        description: 'DynamoDB ConsumedWriteCapacityUnits'
        alarm_actions: [ arn:aws:sns:us-east-1:1234:my-alarm ]
        insufficient_data_actions: []
        ok_actions: [ arn:aws:sns:us-east-1:1234:my-alarm ]
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  - region: us-east-1
```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource.
Note that 'boto_dynamodb_alarms' will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for a resource.

Setting the alarms in a pillar:

```yaml
boto_dynamodb_alarms:
  ConsumedWriteCapacityUnits:
    name: 'DynamoDB ConsumedWriteCapacityUnits **MANAGED BY SALT**'
    attributes:
      metric: ConsumedWriteCapacityUnits
      namespace: AWS/DynamoDB
      statistic: Sum
      comparison: '>='
      # threshold_percent is used to calculate the actual threshold based on the provisioned capacity for the table.
      threshold_percent: 0.75
      period: 300
      evaluation_periods: 2
      unit: Count
      description: 'DynamoDB ConsumedWriteCapacityUnits'
    alarm_actions: ['arn:aws:sns:us-east-1:1234:my-alarm']
    insufficient_data_actions: []
    ok_actions: ['arn:aws:sns:us-east-1:1234:my-alarm']
```

Ensure DynamoDB table exists:

```yaml
boto_dynamodb.present:
  - name: new_table
  - read_capacity_units: 1
  - write_capacity_units: 2
  - hash_key: primary_id
  - hash_key_data_type: N
  - range_key: start_timestamp
  - range_key_data_type: N
  - alarms:
      ConsumedWriteCapacityUnits:
        attributes:
          threshold_percent: 0.90
          period: 900
```

**exception** `salt.states.boto_dynamodb.GsiNotUpdatableError`

Raised when a global secondary index cannot be updated.

`salt.states.boto_dynamodb.absent(name, region=None, key=None, keyid=None, profile=None)`

Ensure the DynamoDB table does not exist.

- **name** Name of the DynamoDB table.
- **region** Region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
salt.states.boto_dynamodb.present(name=None, table_name=None, region=None, key=None, keyid=None, profile=None, read_capacity_units=None, write_capacity_units=None, alarms=None, alarms_from_pillar='boto_dynamodb_alarms', hash_key=None, hash_key_data_type=None, range_key=None, range_key_data_type=None, local_indexes=None, global_indexes=None, backup_configs_from_pillars='boto_dynamodb_backup_configs')

Ensure the DynamoDB table exists. Table throughput can be updated after table creation.

Global secondary indexes (GSIs) are managed with some exceptions:

- If a GSI deletion is detected, a failure will occur (deletes should be done manually in the AWS console).
- If multiple GSIs are added in a single Salt call, a failure will occur (boto supports one creation at a time).
  Note that this only applies after table creation; multiple GSIs can be created during table creation.
- Updates to existing GSIs are limited to read/write capacity only (DynamoDB limitation).

name Name of the DynamoDB table

table_name Name of the DynamoDB table (deprecated)

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

read_capacity_units The read throughput for this table

write_capacity_units The write throughput for this table

hash_key The name of the attribute that will be used as the hash key for this table

hash_key_data_type The DynamoDB datatype of the hash key

range_key The name of the attribute that will be used as the range key for this table

range_key_data_type The DynamoDB datatype of the range key

local_indexes The local indexes you would like to create

global_indexes The global indexes you would like to create

backup_configs_from_pillars Pillars to use to configure DataPipeline backups

23.19.18 salt.states.boto_elasticache

Manage Elasticache

New in version 2014.7.0.

Create, destroy and update Elasticache clusters. Be aware that this interacts with Amazon's services, and so may incur charges.

Note: This module currently only supports creation and deletion of elasticache resources and will not modify clusters when their configuration changes in your state files.

This module uses boto, which can be installed via package, or pip.
This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```yaml
elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsdfjkghWupUjasdfdkfklgjsdfajkghs
```

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfdkfklgjsdfajkghs
  region: us-east-1
```

```yaml
Ensure myelasticache exists:
boto_elasticache.present:
  - name: myelasticache
  - engine: redis
  - cache_node_type: cache.t1.micro
  - num_cache_nodes: 1
  - region: us-east-1
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkghWupUjasdfdkfklgjsdfajkghs
```

```yaml
# Using a profile from pillars
Ensure myelasticache exists:
boto_elasticache.present:
  - name: myelasticache
  - engine: redis
  - cache_node_type: cache.t1.micro
  - num_cache_nodes: 1
  - region: us-east-1
  - profile: myprofile
```

```yaml
# Passing in a profile
Ensure myelasticache exists:
boto_elasticache.present:
  - name: myelasticache
  - engine: redis
  - cache_node_type: cache.t1.micro
  - num_cache_nodes: 1
  - region: us-east-1
  - profile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdfdkfklgjsdfajkghs
```

```bash
salt.states.boto_elasticache.absent(name, wait=True, region=None, key=None, keyid=None, profile=None)
```

Ensure the named elasticache cluster is deleted.

- **name** Name of the cache cluster.
- **wait** Boolean. Wait for confirmation from boto that the cluster is in the deleting state.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
salt.states.boto_elasticache.cache_cluster_absent("args, **kwargs")
salt.states.boto_elasticache.cache_cluster_present("args, **kwargs")
salt.states.boto_elasticache.creategroup(name, primary_cluster_id, replication_group_description, wait=None, region=None, key=None, keyid=None, profile=None)

Ensure the a replication group is create.
name Name of replication group
wait Waits for the group to be available
primary_cluster_id Name of the master cache node
replication_group_description Description for the group
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
salt.states.boto_elasticache.present(name, engine=None, cache_node_type=None, num_cache_nodes=None, preferred_availability_zone=None, port=None, cache_parameter_group_name=None, cache_security_group_names=None, replication_group_id=None, auto_minor_version_upgrade=True, security_group_ids=None, cache_subnet_group_name=None, engine_version=None, notification_topic_arn=None, preferred_maintenance_window=None, wait=None, region=None, key=None, keyid=None, profile=None)

Ensure the cache cluster exists.
name Name of the cache cluster (cache cluster id).
engine The name of the cache engine to be used for this cache cluster. Valid values are memcached or redis.
cache_node_type The compute and memory capacity of the nodes in the cache cluster. cache.t1.micro, cache.m1.small, etc. See: https://boto.readthedocs.io/en/latest/ref/elasticache.html#boto.elasticache.layer1.ElastiCacheConnection.create_cache_cluster
num_cache_nodes The number of cache nodes that the cache cluster will have.
preferred_availability_zone The EC2 Availability Zone in which the cache cluster will be created. All cache nodes belonging to a cache cluster are placed in the preferred availability zone.
port The port number on which each of the cache nodes will accept connections.
cache_parameter_group_name The name of the cache parameter group to associate with this cache cluster. If this argument is omitted, the default cache parameter group for the specified engine will be used.
**cache_security_group_names**  A list of cache security group names to associate with this cache cluster. Use this parameter only when you are creating a cluster outside of a VPC.

**replication_group_id**  The replication group to which this cache cluster should belong. If this parameter is specified, the cache cluster will be added to the specified replication group as a read replica; otherwise, the cache cluster will be a standalone primary that is not part of any replication group.

**auto_minor_version_upgrade**  Determines whether minor engine upgrades will be applied automatically to the cache cluster during the maintenance window. A value of True allows these upgrades to occur; False disables automatic upgrades.

**security_group_ids**  One or more VPC security groups associated with the cache cluster. Use this parameter only when you are creating a cluster in a VPC.

**cache_subnet_group_name**  The name of the cache subnet group to be used for the cache cluster. Use this parameter only when you are creating a cluster in a VPC.

**engine_version**  The version number of the cache engine to be used for this cluster.

**notification_topic_arn**  The Amazon Resource Name (ARN) of the Amazon Simple Notification Service (SNS) topic to which notifications will be sent. The Amazon SNS topic owner must be the same as the cache cluster owner.

**preferred_maintenance_window**  The weekly time range (in UTC) during which system maintenance can occur. Example: sun:05:00-sun:09:00

**wait**  Boolean. Wait for confirmation from boto that the cluster is in the available state.

**region**  Region to connect to.

**key**  Secret key to be used.

**keyid**  Access key to be used.

**profile**  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```python
salt.states.boto_elasticache.replication_group_absent(name, tags=None, region=None, key=None, keyid=None, profile=None)
salt.states.boto_elasticache.replication_group_present(*args, **kwargs)
salt.states.boto_elasticache.subnet_group_absent(name, tags=None, region=None, key=None, keyid=None, profile=None)
salt.states.boto_elasticache.subnet_group_present(name, subnet_ids=None, subnet_names=None, description=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Ensure ElastiCache subnet group exists.

New in version 2015.8.0.

**name**  The name for the ElastiCache subnet group. This value is stored as a lowercase string.

**subnet_ids**  A list of VPC subnet IDs for the cache subnet group. Exclusive with subnet_names.

**subnet_names**  A list of VPC subnet names for the cache subnet group. Exclusive with subnet_ids.

**description**  Subnet group description.

**tags**  A list of tags.

**region**  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

23.19.19  salt.states.boto_elbv2

Manage AWS Application Load Balancer
New in version 2017.7.0.
Add and remove targets from an ALB target group.
This module uses boto3, which can be installed via package, or pip.
This module accepts explicit alb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.
If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elbv2.keyid: GKTADJGHEIQSXMKKRBJ08H
elbv2.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
elbv2.region: us-west-2
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

salt.states.boto_elbv2.create_target_group(name, protocol, port, vpc_id, region=None, key=None, keyid=None, profile=None, health_check_protocol='HTTP', health_check_port='traffic-port', health_check_path='/', health_check_interval_seconds=30, health_check_timeout_seconds=5, healthy_threshold_count=5, unhealthy_threshold_count=2, **kwargs)

New in version 2017.11.0.
Create target group if not present.
name (string) - The name of the target group.
protocol (string) - The protocol to use for routing traffic to the targets
port (int) - The port on which the targets receive traffic. This port is used unless you specify a port override when registering the traffic.
vpc_id (string) - The identifier of the virtual private cloud (VPC).
health_check_protocol (string) - The protocol the load balancer uses when performing health check on targets. The default is the HTTP protocol.
**health_check_port** (string) - The port the load balancer uses when performing health checks on targets. The default is 'traffic-port', which indicates the port on which each target receives traffic from the load balancer.

**health_check_path** (string) - The ping path that is the destination on the targets for health checks. The default is '/'.

**health_check_interval_seconds** (integer) - The approximate amount of time, in seconds, between health checks of an individual target. The default is 30 seconds.

**health_check_timeout_seconds** (integer) - The amount of time, in seconds, during which no response from a target means a failed health check. The default is 5 seconds.

**healthy_threshold_count** (integer) - The number of consecutive health checks successes required before considering an unhealthy target healthy. The default is 5.

**unhealthy_threshold_count** (integer) - The number of consecutive health check failures required before considering a target unhealthy. The default is 2.

**returns** (bool) - True on success, False on failure.

**CLI Example:**

```yaml
create-target:
  boto_elb2.create_target_group:
    - name: myALB
    - protocol: https
    - port: 443
    - vpc_id: myVPC
```

```
salt.states.boto_elbv2.delete_target_group(name, region=None, key=None, keyid=None, profile=None)
```

Delete target group.

**name** (string) - The Amazon Resource Name (ARN) of the resource.

**returns** (bool) - True on success, False on failure.

**CLI Example:**

```yaml
check-target:
  boto_elb2.delete_target_group:
    - name: myALB
    - protocol: https
    - port: 443
    - vpc_id: myVPC
```

```
salt.states.boto_elbv2.targets_deregistered(name, targets, region=None, key=None, keyid=None, profile=None, **kwargs)
```

Remove targets to an Application Load Balancer target group.

**name** The ARN of the Application Load Balancer Target Group to remove targets from.

**targets** A list of target IDs or a string of a single target registered to the target group to be removed

New in version 2017.7.0.

```yaml
remove-targets:
  boto_elb.targets_deregistered:
    - name: arn:myloadbalancer
    - targets:
```

(continues on next page)
salt.states.boto_elbv2.targets_registered(name, targets, region=None, key=None, keyid=None, profile=None, **kwargs)

New in version 2017.7.0.

Add targets to an Application Load Balancer target group. This state will not remove targets.

name The ARN of the Application Load Balancer Target Group to add targets to.

targets A list of target IDs or a string of a single target that this target group should distribute traffic to.

23.19.20 salt.states.boto_iam_role

Manage IAM roles

New in version 2014.7.0.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit IAM credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```python
iam.keyid: GKTADJGHEIQSXMKKRBJ08H
iam.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```python
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

Creating a role will automatically create an instance profile and associate it with the role. This is the default behavior of the AWS console.

```python
myrole:
    boto_iam_role.present:
        - region: us-east-1
        - key: GKTADJGHEIQSXMKKRBJ08H
        - keyid: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
        - policies_from_pillars:
            - shared_iam_bootstrap_policy
        - policies:
```

(continues on next page)
MySQSPolicy:
Statement:
  - Action:
    - sqs:*  
  Effect: Allow  
  Resource:
    - arn:aws:sqs:*:*:* 
  Sid: MyPolicySQS1  

MyS3Policy:
Statement:
  - Action:
    - s3:GetObject  
  Effect: Allow  
  Resource:
    - arn:aws:s3:*:*:mybucket/*  

# Using a credentials profile from pillars
myrole:
  boto_iam_role.present:
    - profile: myiamprofile

# Passing in a credentials profile
myrole:
  boto_iam_role.present:
    - profile:
      key: GKTADJGHEIQSXMKKRBJ08H  
      keyid: askdjghsdfjkghWupUjasdfsflkjdfklgjsdfajkghs  
      region: us-east-1  

If delete_policies: False is specified, existing policies that are not in the given list of policies will not be deleted. This allows manual modifications on the IAM role to be persistent. This functionality was added in 2015.8.0.

Note: When using the profile parameter and region is set outside of the profile group, region is ignored and a default region will be used.

If region is missing from the profile data set, us-east-1 will be used as the default region.

salt.states.boto_iam_role.absent(name, region=None, key=None, keyid=None, profile=None)
Ensure the IAM role is deleted.
- name Name of the IAM role.
- region Region to connect to.
- key Secret key to be used.
- keyid Access key to be used.
- profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iam_role.present(name, policy_document=None, policy_document_from_pillars=None, path=None, policies=None, policies_from_pillars=None, managed_policies=None, create_instance_profile=True, region=None, key=None, keyid=None, profile=None, delete_policies=True)
Ensure the IAM role exists.
name  Name of the IAM role.
	policy_document  The policy that grants an entity permission to assume the role. (See https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create_role)
	policy_document_from_pillars  A pillar key that contains a role policy document. The statements defined here will be appended with the policy document statements defined in the policy_document argument. New in version 2017.7.0.

path  The path to the role/instance profile. (See https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create_role)

policies  A dict of IAM role policies.
	policies_from_pillars  A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the policies argument. If keys conflict, the keys in the policies argument will override the keys defined in policies_from_pillars.

managed_policies  A list of (AWS or Customer) managed policies to be attached to the role.

create_instance_profile  A boolean of whether or not to create an instance profile and associate it with this role.

region  Region to connect to.

key  Secret key to be used.

keyid  Access key to be used.

profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

delete_policies  Deletes existing policies that are not in the given list of policies. Default value is True. If False is specified, existing policies will not be deleted allowing manual modifications on the IAM role to be persistent. New in version 2015.8.0.

23.19.21  salt.states.boto_kinesis

Manage Kinesis Streams

New in version 2017.7.0.

Create and destroy Kinesis streams. Be aware that this interacts with Amazon's services, and so may incur charges. This module uses boto3, which can be installed via package, or pip.

This module accepts explicit Kinesis credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

| keyid: | GKTADJGHEIQSXMKKRBJ08H |
| key:   | askdjghsdfjkgshWupUjasdfklasdfklgjsdfjajkghs |
| region: | us-east-1 |

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:
Ensure Kinesis stream does not exist:
`boto_kinesis.absent`
- name: new_stream
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkgfs
  - region: us-east-1

Ensure Kinesis stream exists:
`boto_kinesis.present`
- name: new_stream
  - retention_hours: 168
  - enhanced_monitoring: ['ALL']
  - num_shards: 2
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkgfs
  - region: us-east-1

salt.states.boto_kinesis.absent(name, region=None, key=None, keyid=None, profile=None)
Delete the kinesis stream, if it exists.

name (string) Stream name
region (string) Region to connect to.
key (string) Secret key to be used.
keyid (string) Access key to be used.
profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_kinesis.present(name, retention_hours=None, enhanced_monitoring=None, num_shards=None, do_reshard=True, region=None, key=None, keyid=None, profile=None)
Ensure the kinesis stream is properly configured and scaled.

name (string) Stream name
retention_hours (int) Retain data for this many hours. AWS allows minimum 24 hours, maximum 168 hours.
enhanced_monitoring (list of string) Turn on enhanced monitoring for the specified shard-level metrics.
  Pass in ['ALL'] or True for all metrics, [] or False for no metrics. Turn on individual metrics by passing in a list: ['IncomingBytes', 'OutgoingBytes'] Note that if only some metrics are supplied, the remaining metrics will be turned off.
num_shards (int) Reshard stream (if necessary) to this number of shards ‼‼! Resharding is expensive! Each split or merge can take up to 30 seconds, and the reshard method balances the partition space evenly. Resharding from N to N+1 can require 2N operations. Resharding is much faster with powers of 2 (e.g. $2^N$ to $2^{N+1}$) ‼‼!
do_reshard (boolean) If set to False, this script will NEVER reshard the stream, regardless of other input. Useful for testing.
region (string) Region to connect to.
key (string) Secret key to be used.
keyid (string)  Access key to be used.

profile (dict)  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key
and keyid.

23.19.22  salt.states.boto_kms

Manage KMS keys, key policies and grants.

New in version 2015.8.0.

Be aware that this interacts with Amazon’s services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit kms credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

<table>
<thead>
<tr>
<th>elb.keyid</th>
<th>GKTADJGHEIQSXMKKRBJ08H</th>
</tr>
</thead>
<tbody>
<tr>
<td>elb.key</td>
<td>askdjghsdfjkgWupUjasdflkdfklgjfdsfjajkghs</td>
</tr>
</tbody>
</table>

It’s also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgWupUjasdflkdfklgjfdsfjajkghs
  region: us-east-1
```

Ensure mykey key exists:
```
boto_kms.key_present:
  - name: mykey
    - region: us-east-1
```

# Using a profile from pillars

Ensure mykey key exists:
```
boto_kms.key_present:
  - name: mykey
    - region: us-east-1
    - profile: myprofile
```

# Passing in a profile

Ensure mykey key exists:
```
boto_key.key_present:
  - name: mykey
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkgWupUjasdflkdfklgjfdsfjajkghs
```

salt.states.boto_kms.key_present(name, policy, description=None, key_usage=None, grants=None, manage_grants=False, key_rotation=False, enabled=True, region=None, key=None, keyid=None, profile=None)

Ensure the KMS key exists. KMS keys can not be deleted, so this function must be used to ensure the key is enabled or disabled.
name  Name of the key.
policy  Key usage policy.
description  Description of the key.
key_usage  Specifies the intended use of the key. Can only be set on creation, defaults to ENCRYPT_DECRYPT, which is also the only supported option.
grants  A list of grants to apply to the key. Not currently implemented.
manage_grants  Whether or not to manage grants. False by default, which will not manage any grants.
key_rotation  Whether or not key rotation is enabled for the key. False by default.
enabled  Whether or not the key is enabled. True by default.
region  Region to connect to.
key  Secret key to be used.
keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

23.19.23 salt.states.boto_lc

Manage Launch Configurations
New in version 2014.7.0.
Create and destroy Launch Configurations. Be aware that this interacts with Amazon's services, and so may incur charges.

A limitation of this module is that you cannot modify launch configurations once they have been created. If a launch configuration with the specified name exists, this module will always report success, even if the specified configuration doesn't match. This is due to a limitation in Amazon's launch configuration API, as it only allows launch configurations to be created and deleted.

Also note that a launch configuration that's in use by an autoscale group cannot be deleted until the autoscale group is no longer using it. This may affect the way in which you want to order your states.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
[asg]
    asg.keyid: GKTADJGHEIQSXMKKRBJ08H
    asg.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
[myprofile]
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```
Credential information is shared with autoscale groups as launch configurations and autoscale groups are completely dependent on each other.

```yaml
Ensure mylc exists:
  boto_lc.present:
    - name: mylc
    - image_id: ami-0b9c9f62
    - key_name: mykey
    - security_groups:
        - mygroup
    - instance_type: m1.small
    - instance_monitoring: true
    - block_device_mappings:
        - '/dev/sda1':
          size: 20
          volume_type: 'io1'
          iops: 220
          delete_on_termination: true
    cloud_init:
      boothooks:
        'disable-master.sh': |
        #!/bin/bash
        echo "manual" > /etc/init/salt-master.override
      scripts:
        'run_salt.sh': |
        #!/bin/bash
        add-apt-repository -y ppa:saltstack/salt
        apt-get update
        apt-get install -y salt-minion
        salt-call state.highstate
    region: us-east-1
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

# Using a profile from pillars.
Ensure mylc exists:
  boto_lc.present:
    - name: mylc
    - image_id: ami-0b9c9f62
    - profile: myprofile

# Passing in a profile.
Ensure mylc exists:
  boto_lc.present:
    - name: mylc
    - image_id: ami-0b9c9f62
    - profile:
      keyid: GKTADJGHEIQXSXMKRRBJ08H
      key: askdjghsdfjkgHupUjasdflkdfklgjsdfjajkghs
      region: us-east-1
```

`salt.states.boto_lc.absent(name, region=None, key=None, keyid=None, profile=None)`

Ensure the named launch configuration is deleted.

- **name** Name of the launch configuration.
- **region** The region to connect to.
- **key** Secret key to be used.
keyid  Access key to be used.

profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_lc.present(name, image_id, key_name=None, vpc_id=None, vpc_name=None,
  security_groups=None, user_data=None, cloud_init=None, instance_type='m1.small',
  kernel_id=None, ramdisk_id=None, block_device_mappings=None, delete_on_termination=None,
  instance_monitoring=False, spot_price=None, instance_profile_name=None, ebs_optimized=False,
  associate_public_ip_address=None, region=None, key=None, keyid=None, profile=None)
```

Ensure the launch configuration exists.

name  Name of the launch configuration.

image_id  AMI to use for instances. AMI must exist or creation of the launch configuration will fail.

key_name  Name of the EC2 key pair to use for instances. Key must exist or creation of the launch configuration will fail.

vpc_id  The VPC id where the security groups are defined. Only necessary when using named security groups that exist outside of the default VPC. Mutually exclusive with vpc_name.

vpc_name  Name of the VPC where the security groups are defined. Only Necessary when using named security groups that exist outside of the default VPC. Mutually exclusive with vpc_id.

security_groups  List of Names or security group id’s of the security groups with which to associate the EC2 instances or VPC instances, respectively. Security groups must exist, or creation of the launch configuration will fail.

user_data  The user data available to launched EC2 instances.

cloud_init  A dict of cloud_init configuration. Currently supported keys: boothooks, scripts and cloud-config. Mutually exclusive with user_data.

instance_type  The instance type. ex: m1.small.

kernel_id  The kernel id for the instance.

ramdisk_id  The RAM disk ID for the instance.

block_device_mappings  A dict of block device mappings that contains a dict with volume_type, delete_on_termination, iops, size, encrypted, snapshot_id.

  volume_type  Indicates what volume type to use. Valid values are standard, io1, gp2. Default is standard.

  delete_on_termination  Whether the volume should be explicitly marked for deletion when its instance is terminated (True), or left around (False). If not provided, or None is explicitly passed, the default AWS behaviour is used, which is True for ROOT volumes of instances, and False for all others.

  iops  For Provisioned IOPS (SSD) volumes only. The number of I/O operations per second (IOPS) to provision for the volume.

  size  Desired volume size (in GiB).

  encrypted  Indicates whether the volume should be encrypted. Encrypted EBS volumes must be attached to instances that support Amazon EBS encryption. Volumes that are created from encrypted snapshots are automatically encrypted. There is no way to create an encrypted volume from an unencrypted snapshot or an unencrypted volume from an encrypted snapshot.

instance_monitoring  Whether instances in group are launched with detailed monitoring.
spot_price  The spot price you are bidding. Only applies if you are building an autoscaling group with spot instances.

instance_profile_name  The name or the Amazon Resource Name (ARN) of the instance profile associated with the IAM role for the instance. Instance profile must exist or the creation of the launch configuration will fail.

ebs_optimized  Specifies whether the instance is optimized for EBS I/O (true) or not (false).

associate_public_ip_address  Used for Auto Scaling groups that launch instances into an Amazon Virtual Private Cloud. Specifies whether to assign a public IP address to each instance launched in a Amazon VPC.

region  The region to connect to.

key  Secret key to be used.

keyid  Access key to be used.

profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

23.19.24 salt.states.boto_secgroup

Manage Security Groups

New in version 2014.7.0.

Create and destroy Security Groups. Be aware that this interacts with Amazon's services, and so may incur charges. This module uses boto, which can be installed via package, or pip.

This module accepts explicit EC2 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```yaml
secgroup.keyid: GKTADJGHEIQSXMKKRBJ08H
secgroup.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
    keyid: GKTADJGHEIQXSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

Ensure mysecgroup exists:
```
salt_states.boto_secgroup:
    - name: mysecgroup
    - description: My security group
    - vpc_name: myvpc
    - rules:
        - ip_protocol: tcp
          from_port: 80
          to_port: 80
          cidr_ip:
```

(continues on next page)
- 10.0.0.0/8
- 192.168.0.0/16
- **ip_protocol**: tcp
  - **from_port**: 8080
  - **to_port**: 8090
- **cidr_ip**:
  - 10.0.0.0/8
  - 192.168.0.0/16
- **ip_protocol**: icmp
  - **from_port**: -1
  - **to_port**: -1
  - **source_group_name**: mysecgroup
- **ip_protocol**: tcp
  - **from_port**: 8080
  - **to_port**: 8080
  - **source_group_name**: MyOtherSecGroup
  - **source_group_name_vpc**: MyPeeredVPC
- **rules_egress**:
  - **ip_protocol**: all
    - **from_port**: -1
    - **to_port**: -1
    - **cidr_ip**:
      - 10.0.0.0/8
      - 192.168.0.0/16
- **tags**:
  - **SomeTag**: 'My Tag Value'
  - **SomeOtherTag**: 'Other Tag Value'
  - **region**: us-east-1
  - **keyid**: GKTADJGHEIQSXMKKRBJ08H
  - **key**: askdjghsdfjkgjWupUjasdfklkdklgjsdfjajkgjsdfjajkgjhs

# Using a profile from pillars
Ensure mysecgroup exists:
```
boto_secgroup.present:
  - name: mysecgroup
  - description: My security group
  - profile: myprofile
```

# Passing in a profile
Ensure mysecgroup exists:
```
boto_secgroup.present:
  - name: mysecgroup
  - description: My security group
  - profile:
    - keyid: GKTADJGHEIQSXMKKRB08H
    - key: askdjghsdsjkghjWupUjasdfkdkfklkgjsdfjajkgjhs
    - region: us-east-1
```

Note: When using the **profile** parameter and **region** is set outside of the profile group, region is ignored and a default region will be used.

If **region** is missing from the **profile** data set, us-east-1 will be used as the default region.

```
salt.states.boto_secgroup.absent(name, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)
```

Ensure a security group with the specified name does not exist.
name  Name of the security group.

vpc_id  The ID of the VPC to remove the security group from, if any. Exclusive with vpc_name.

vpc_name  The name of the VPC to remove the security group from, if any. Exclusive with vpc_name.
         New in version 2016.3.0.

region  Region to connect to.

key   Secret key to be used.

keyid  Access key to be used.

profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and
         keyid.
         New in version 2016.3.0.

salt.states.boto_secgroup.present(name, description, vpc_id=None, vpc_name=None, rules=None, rules_egress=None, delete_ingress_rules=True, delete_egress_rules=True, region=None, key=None, keyid=None, profile=None, tags=None)

Ensure the security group exists with the specified rules.

name  Name of the security group.

description  A description of this security group.

vpc_id  The ID of the VPC to create the security group in, if any. Exclusive with vpc_name.

vpc_name  The name of the VPC to create the security group in, if any. Exclusive with vpc_id.
         New in version 2016.3.0.
         New in version 2015.8.2.

rules  A list of ingress rule dicts. If not specified, rules=None, the ingress rules will be unmanaged. If set to
        an empty list, [], then all ingress rules will be removed.

rules_egress  A list of egress rule dicts. If not specified, rules_egress=None, the egress rules will be
              unmanaged. If set to an empty list, [], then all egress rules will be removed.

delete_ingress_rules  Some tools (EMR comes to mind) insist on adding rules on-the-fly, which salt will hap-
                       pily remove on the next run. Set this param to False to avoid deleting rules which were added outside of salt.

delete_egress_rules  Some tools (EMR comes to mind) insist on adding rules on-the-fly, which salt will happily
                      remove on the next run. Set this param to False to avoid deleting rules which were added outside of salt.

region  Region to connect to.

key   Secret key to be used.

keyid  Access key to be used.

profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key, and
         keyid.

tags  List of key:value pairs of tags to set on the security group
         New in version 2016.3.0.
23.19.25 salt.states.boto_sns

Manage SNS Topics

Create and destroy SNS topics. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion’s config file:

```
sns.keyid: GKTADJGHEIQSXMKKRBJ08H
sns.key: askdjghsdfjkgWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

```
mytopic:
  boto_sns.present:
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkgWupUjasdflkdfklgjsdfjajkghs

# Using a profile from pillars
mytopic:
  boto_sns.present:
    - region: us-east-1
    - profile: mysnsprofile

# Passing in a profile
mytopic:
  boto_sns.present:
    - region: us-east-1
    - profile:
        keyid: GKTADJGHEIQSXMKKRBJ08H
        key: askdjghsdfjkgWupUjasdflkdfklgjsdfjajkghs
```

salt.states.boto_sns.absent(name, region=None, key=None, keyid=None, profile=None, unsubscribe=False)

Ensure the named sns topic is deleted.

name Name of the SNS topic.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
unsubscribe If True, unsubscribe all subscriptions to the SNS topic before deleting the SNS topic.
New in version 2016.11.0.

`salt.states.boto_sns.present(name, subscriptions=None, region=None, key=None, keyid=None, profile=None)`

Ensure the SNS topic exists.

- **name** Name of the SNS topic.
- **subscriptions** List of SNS subscriptions.

Each subscription is a dictionary with a protocol and endpoint key:

```python
[
    {'protocol': 'https', 'endpoint': 'https://www.example.com/sns-endpoint'},
    {'protocol': 'sqs', 'endpoint': 'arn:aws:sqs:us-west-2:123456789012:MyQueue'}
]
```

- **region** Region to connect to.
- **key** Secret key to be used.
- **keyid** Access key to be used.
- **profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 23.19.26 salt.states.boto_vpc

Manage VPCs

New in version 2015.8.0.

```python
depends
```

- `boto >= 2.8.0`
- `boto3 >= 1.2.6`

Create and destroy VPCs. Be aware that this interacts with Amazon's services, and so may incur charges.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```python
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```python
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1

aws:
    region:
        us-east-1:
```

(continues on next page)
profile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfajkghs
    region: us-east-1

Ensure VPC exists:
    boto_vpc.present:
        - name: myvpc
        - cidr_block: 10.10.11.0/24
        - dns_hostnames: True
        - region: us-east-1
        - keyid: GKTADJGHEIQSXMKKRBJ08H
        - key: askdjghsdfjkghWupUjasdflkdfklgjsdfajkghs

Ensure subnet exists:
    boto_vpc.subnet_present:
        - name: mysubnet
        - vpc_id: vpc-123456
        - cidr_block: 10.0.0.0/16
        - region: us-east-1
        - profile: myprofile

{% set profile = salt['pillar.get']('aws:region:us-east-1:profile') %}

Ensure internet gateway exists:
    boto_vpc.internet_gateway_present:
        - name: myigw
        - vpc_name: myvpc
        - profile: {{ profile }}

Ensure route table exists:
    boto_vpc.route_table_present:
        - name: my_route_table
        - vpc_id: vpc-123456
        - routes:
            - destination_cidr_block: 0.0.0.0/0
              instance_id: i-123456
            - subnet_names:
              - subnet1
              - subnet2
        - region: us-east-1
        - profile:
            keyid: GKTADJGHEIQSXMKKRBJ08H
            key: askdjghsdfjkghWupUjasdflkdfklgjsdfajkghs

New in version 2016.11.0.

Request, accept and delete VPC peering connections. VPC peering connections can be named allowing the name to be used throughout the state file. Following example shows how to request and accept a VPC peering connection.

accept the vpc peering connection:
    boto_vpc.accept_vpc_peering_connection:
        - conn_name: salt_vpc_peering
        - region: us-west-2
        - require:
            - boto_vpc: request a vpc peering connection

(continues on next page)
request a vpc peering connection:
  boto_vpc.request_vpc_peering_connection:
    - requester_vpc_id: vpc-4a3d522e
    - peer_vpc_id: vpc-ae81e9ca
    - region: us-west-2
    - conn_name: salt_vpc_peering

VPC peering connections need not be named. In this case the VPC peering connection ID should be used in the state file.

accept the vpc peering connection:
  boto_vpc.accept_vpc_peering_connection:
    - conn_id: pcx-1873c371
    - region: us-west-2

VPC peering connections can be deleted, as shown below.

delete a named vpc peering connection:
  boto_vpc.delete_vpc_peering_connection:
    - conn_name: salt_vpc_peering

Delete also accepts a VPC peering connection id.

delete a vpc peering connection by id:
  boto_vpc.delete_vpc_peering_connection:
    - conn_id: pcx-1873c371

salt.states.boto_vpc.absent(name, tags=None, region=None, key=None, keyid=None, profile=None)
  Ensure VPC with passed properties is absent.
  name  Name of the VPC.
  tags  A list of tags. All tags must match.
  region  Region to connect to.
  key  Secret key to be used.
  keyid  Access key to be used.
  profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

call.salt.states.boto_vpc.accept_vpc_peering_connection(name=None, conn_id=None, conn_name=None, region=None, key=None, keyid=None, profile=None)
  Accept a VPC pending requested peering connection between two VPCs.
  name  Name of this state
  conn_id  The connection ID to accept. Exclusive with conn_name. String type.
  conn_name  The name of the VPC peering connection to accept. Exclusive with conn_id. String type.
  region  Region to connect to.
  key  Secret key to be used.
  keyid  Access key to be used.
profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
boto_vpc.accept_vpc_peering_connection:
  - conn_name: salt_peering_connection
# usage with vpc peering connection id and region
boto_vpc.accept_vpc_peering_connection:
  - conn_id: pbx-1873d472
  - region: us-west-2
```

salt.states.boto_vpc.delete_vpc_peering_connection(name, conn_id=None, conn_name=None, region=None, key=None, keyid=None, profile=None)

ame  Name of the state

conn_id  ID of the peering connection to delete. Exclusive with conn_name.

conn_name  The name of the peering connection to delete. Exclusive with conn_id.

region  Region to connect to.

key  Secret key to be used.

keyid  Access key to be used.

profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
delete a vpc peering connection:
  boto_vpc.delete_vpc_peering_connection:
    - region: us-west-2
    - conn_id: pcx-4613b12e
```

Connection name can be specified (instead of ID). Specifying both conn_name and conn_id will result in an error.

```
delete a vpc peering connection:
  boto_vpc.delete_vpc_peering_connection:
    - conn_name: salt_vpc_peering
```

salt.states.boto_vpc.dhcp_options_absent(name=None, dhcp_options_id=None, region=None, key=None, keyid=None, profile=None)

Ensure a set of DHCP options with the given settings exist.

name  (string) Name of the DHCP options set.

dhcp_options_id  (string) Id of the DHCP options set.

region  (string) Region to connect to.

key  (string) Secret key to be used.

keyid  (string) Access key to be used.
profile (various) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

salt.states.boto_vpc.dhcp_options_present(name, dhcp_options_id=None, vpc_name=None, vpc_id=None, domain_name=None, domain_name_servers=None, ntp_servers=None, netbios_name_servers=None, netbios_node_type=None, tags=None, region=None, key=None, keyid=None, profile=None)

Ensure a set of DHCP options with the given settings exist. Note that the current implementation only SETS values during option set creation. It is unable to update option sets in place, and thus merely verifies the set exists via the given name and/or dhcp_options_id param.

name (string) Name of the DHCP options.

vpc_name (string) Name of a VPC to which the options should be associated. Either vpc_name or vpc_id must be provided.

vpc_id (string) Id of a VPC to which the options should be associated. Either vpc_name or vpc_id must be provided.

domain_name (string) Domain name to be associated with this option set.

domain_name_servers (list of strings) The IP address(es) of up to four domain name servers.

ntp_servers (list of strings) The IP address(es) of up to four desired NTP servers.

netbios_name_servers (list of strings) The IP address(es) of up to four NetBIOS name servers.

netbios_node_type (string) The NetBIOS node type (1, 2, 4, or 8). For more information about the allowed values, see RFC 2132. The recommended is 2 at this time (broadcast and multicast are currently not supported).

tags (dict of key:value pairs) A set of tags to be added.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (various) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

salt.states.boto_vpc.internet_gateway_absent(name, detach=False, region=None, key=None, keyid=None, profile=None)

Ensure the named internet gateway is absent.

name Name of the internet gateway.

detach First detach the internet gateway from a VPC, if attached.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
salt.states.boto_vpc.internet_gateway_present(name, vpc_name=None, vpc_id=None, 
tags=None, region=None, key=None, 
keyid=None, profile=None)

Ensure an internet gateway exists.

name Name of the internet gateway.

vpc_name Name of the VPC to which the internet gateway should be attached.

vpc_id Id of the VPC to which the internet_gateway should be attached. Only one of vpc_name or vpc_id may be provided.

tags A list of tags.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_vpc.nat_gateway_absent(name=None, subnet_name=None, subnet_id=None, region=None, key=None, keyid=None, profile=None, 
wait_for_delete_retries=0)

Ensure the nat gateway in the named subnet is absent.

This function requires boto3.

New in version 2016.11.0.

name Name of the state.

subnet_name Name of the subnet within which the nat gateway should exist

subnet_id Id of the subnet within which the nat gateway should exist. Either subnet_name or subnet_id must be provided.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

wait_for_delete_retries NAT gateway may take some time to be go into deleted or failed state. During the deletion process, subsequent release of elastic IPs may fail; this state will automatically retry this number of times to ensure the NAT gateway is in deleted or failed state before proceeding. Default is set to 0 for backward compatibility.

salt.states.boto_vpc.nat_gateway_present(name, subnet_name=None, subnet_id=None, region=None, key=None, keyid=None, profile=None, 
allocation_id=None)

Ensure a nat gateway exists within the specified subnet

This function requires boto3.

New in version 2016.11.0.

Example:

```bash
boto_vpc.nat_gateway_present:
  - subnet_name: my-subnet
```
name Name of the state

subnet_name Name of the subnet within which the nat gateway should exist

subnet_id Id of the subnet within which the nat gateway should exist. Either subnet_name or subnet_id must be provided.

allocation_id If specified, the elastic IP address referenced by the ID is associated with the gateway. Otherwise, a new allocation_id is created and used.

region Region to connect to.

dns_hostnames Indicates whether the instances launched in the VPC get DNS hostnames.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_vpc.present(name, cidr_block, instance_tenancy=\None, dns_support=\None, dns_hostnames=\None, tags=\None, region=\None, key=\None, keyid=\None, profile=\None)
```

Ensure VPC exists.

ame Name of the VPC.

cidr_block The range of IPs in CIDR format, for example: 10.0.0.0/24. Block size must be between /16 and /28 netmask.

instance_tenancy Instances launched in this VPC will be single-tenant or dedicated hardware.

dns_support Indicates whether the DNS resolution is supported for the VPC.

dns_hostnames Indicates whether the instances launched in the VPC get DNS hostnames.

tags A list of tags.

region Region to connect to.

dns_hostnames Indicates whether the instances launched in the VPC get DNS hostnames.

```
salt.states.boto_vpc.request_vpc_peering_connection(name, requester_vpc_id=\None, requester_vpc_name=\None, peer_vpc_id=\None, peer_vpc_name=\None, conn_name=\None, peer_owner_id=\None, region=\None, key=\None, keyid=\None, profile=\None)
```

name Name of the state

requester_vpc_id ID of the requesting VPC. Exclusive with requester_vpc_name. String type.

requester_vpc_name Name tag of the requesting VPC. Exclusive with requester_vpc_id. String type.

peer_vpc_id ID of the VPC to create VPC peering connection with. This can be a VPC in another account. Exclusive with peer_vpc_name. String type.

peer_vpc_name Name tag of the VPC to create VPC peering connection with. This can only be a VPC the same account. Exclusive with peer_vpc_id. String type.
**conn_name**  The (optional) name to use for this VPC peering connection. String type.

**peer_owner_id**  ID of the owner of the peer VPC. String type. If this isn't supplied AWS uses your account ID. Required if peering to a different account.

**region**  Region to connect to.

**key**  Secret key to be used.

**keyid**  Access key to be used.

**profile**  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```python
request a vpc peering connection:
boto_vpc.request_vpc_peering_connection:
   - requester_vpc_id: vpc-4b3522e
   - peer_vpc_id: vpc-aee83f9ca
   - conn_name: salt_peering_connection
```

**salt.states.boto_vpc.route_table_absent**(name, region=None, key=None, keyid=None, profile=None)

Ensure the named route table is absent.

**name**  Name of the route table.

**region**  Region to connect to.

**key**  Secret key to be used.

**keyid**  Access key to be used.

**profile**  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto_vpc.route_table_present**(name, vpc_name=None, vpc_id=None, routes=None, subnet_ids=None, subnet_names=None, tags=None, region=None, key=None, keyid=None, profile=None)

Ensure route table with routes exists and is associated to a VPC.

This function requires boto3 to be installed if nat gateways are specified.

Example:

```python
boto_vpc.route_table_present:
   - name: my_route_table
   - vpc_id: vpc-123456
   - routes:
      - destination_cidr_block: 0.0.0.0/8
        internet_gateway_name: InternetGateway
      - destination_cidr_block: 10.0.11.0/24
        instance_id: i-123456
      - destination_cidr_block: 10.0.12.0/24
        interface_id: eni-123456
      - destination_cidr_block: 10.0.13.0/24
        instance_name: mygatewayserver
   - subnet_names:
```

(continues on next page)
name  Name of the route table.

vpc_name  Name of the VPC with which the route table should be associated.

vpc_id  Id of the VPC with which the route table should be associated. Either vpc_name or vpc_id must be provided.

routes  A list of routes. Each route has a cidr and a target.

subnet_ids  A list of subnet ids to associate

subnet_names  A list of subnet names to associate

tags  A list of tags.

region  Region to connect to.

key  Secret key to be used.

keyid  Access key to be used.

profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_vpc.subnet_absent(name=None, subnet_id=None, region=None, key=None, keyid=None, profile=None)
```

Ensure subnet with passed properties is absent.

name  Name of the subnet.

region  Region to connect to.

key  Secret key to be used.

keyid  Access key to be used.

profile  A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_vpc.subnet_present(name=None, cidr_block, vpc_name=None, vpc_id=None, availability_zone=None, tags=None, region=None, key=None, keyid=None, profile=None, route_table_id=None, route_table_name=None, auto_assign_public_ipv4=False)
```

Ensure a subnet exists.

name  Name of the subnet.

cidr_block  The range if IPs for the subnet, in CIDR format. For example: 10.0.0.0/24. Block size must be between /16 and /28 netmask.

vpc_name  Name of the VPC in which the subnet should be placed. Either vpc_name or vpc_id must be provided.

vpc_id  Id of the VPC in which the subnet should be placed. Either vpc_name or vpc_id must be provided.

availability_zone  AZ in which the subnet should be placed.

tags  A list of tags.
route_table_id A route table ID to explicitly associate the subnet with. If both route_table_id and route_table_name are specified, route_table_id will take precedence.

New in version 2016.11.0.

route_table_name A route table name to explicitly associate the subnet with. If both route_table_id and route_table_name are specified, route_table_id will take precedence.

New in version 2016.11.0.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_vpc.vpc_peering_connection_absent(name, conn_id=None, conn_name=None, region=None, key=None, keyid=None, profile=None)

salt.states.boto_vpc.vpc_peering_connection_present(name, requester_vpc_id=None, requester_vpc_name=None, peer_vpc_id=None, peer_vpc_name=None, conn_name=None, peer_owner_id=None, region=None, key=None, keyid=None, profile=None)

name Name of the state

requester_vpc_id ID of the requesting VPC. Exclusive with requester_vpc_name.

requester_vpc_name Name tag of the requesting VPC. Exclusive with requester_vpc_id.

peer_vpc_id ID of the VPC to create VPC peering connection with. This can be a VPC in another account. Exclusive with peer_vpc_name.

peer_vpc_name Name tag of the VPC to create VPC peering connection with. This can only be a VPC in the same account, else resolving it into a vpc ID will fail. Exclusive with peer_vpc_id.

c conn_name The name to use for this VPC peering connection.

peer_owner_id ID of the owner of the peer VPC. Defaults to your account ID, so a value is required if peering with a VPC in a different account.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:
ensure peering twixt local vpc and the other guys:

```python
boto_vpc.vpc_peering_connection_present:
  - requester_vpc_name: my_local_vpc
  - peer_vpc_name: some_other_guys_vpc
  - conn_name: peering_from_here_to_there
  - peer_owner_id: 012345654321
```

### 23.19.27 salt.states.bower

**Installation of Bower Packages**

These states manage the installed packages using Bower. Note that npm, git and bower must be installed for these states to be available, so bower states should include requisites to pkg.installed states for the packages which provide npm and git (simply npm and git in most cases), and npm.installed state for the package which provides bower.

Example:

```python
npm:
  pkg.installed
git:
  pkg.installed
bower:
  npm.installed
  require:
    - pkg: npm
    - pkg: git

underscore:
  bower.installed:
    - dir: /path/to/project
    - require:
      - npm: bower
```

**salt.states.bower.bootstrap(name, user=None)**

Bootsraps a frontend distribution.

*Will execute 'bower install' on the specified directory.*

**user** The user to run Bower with

**salt.states.bower.installed(name, dir, pkgs=None, user=None, env=None)**

Verify that the given package is installed and is at the correct version (if specified).

```python
underscore:
  bower.installed:
    - dir: /path/to/project
    - user: someuser
jquery#2.0:
  bower.installed:
    - dir: /path/to/project
```

**name** The package to install

**dir** The target directory in which to install the package
pkgs  A list of packages to install with a single Bower invocation; specifying this argument will ignore the name argument
user  The user to run Bower with
env  A list of environment variables to be set prior to execution. The format is the same as the cmd.run state function.

```python
salt.states.bower.pruned(name, user=None, env=None)
```
New in version 2017.7.0.
Cleans up local bower_components directory.
Will execute 'bower prune' on the specified directory (param: name)
user  The user to run Bower with

```python
salt.states.bower.removed(name, dir, user=None)
```
Verify that the given package is not installed.
dir  The target directory in which to install the package
user  The user to run Bower with

### `salt.states.btrfs`

**maintainer** Alberto Planas <aplanas@suse.com>

**maturity** new

**depends** None

**platform** Linux

```python
salt.states.btrfs.properties(name, device, use_default=False, __dest=None, **properties)
```
Makes sure that a list of properties are set in a subvolume, file or device.
name  Name of the object to change
device  Device where the object lives, if None, the device will be in name
use_default  If True, this subvolume will be resolved to the default subvolume assigned during the create operation
properties  Dictionary of properties
Valid properties are 'ro', 'label' or 'compression'. Check the documentation to see where those properties are valid for each object.

```python
salt.states.btrfs.subvolume_created(name, device, qgroupids=None, set_default=False, copy_on_write=True, force_set_default=True, __dest=None)
```
Makes sure that a btrfs subvolume is present.
name  Name of the subvolume to add
device  Device where to create the subvolume
qgroupids  Add the newly created subvolume to a qgroup. This parameter is a list
set_default  If True, this new subvolume will be set as default when mounted, unless subvol option in mount is used
copy_on_write  If false, set the subvolume with chattr +C
force_set_default  If false and the subvolume is already present, it will not force it as default if set_default is True

salt.states.btrfs.subvolume_deleted(name, device, commit=False, __dest=None)
Makes sure that a btrfs subvolume is removed.

name  Name of the subvolume to remove
device  Device where to remove the subvolume
commit  Wait until the transaction is over

23.19.29 salt.states.chef

Execute Chef client runs

Run chef-client or chef-solo

```
my-chef-run:
  chef.client:
    - override-runlist: 'demo1,demo2'
    - server: 'https://chef.domain.com'

default-chef-run:
  chef.client: []

my-solo-run:
  chef.solo:
    - environment: dev
```

salt.states.chef.client(name, **kwargs)

name  Unique identifier for the state. Does not affect the Chef run.
server  The chef server URL
client_key  Set the client key file location
config  The configuration file to use
config-file-jail  Directory under which config files are allowed to be loaded (no client.rb or knife.rb outside this path will be loaded).
environment  Set the Chef Environment on the node
group  Group to set privilege to
json-attributes  Load attributes from a JSON file or URL
localmode  Point chef-client at local repository if True
log_level  Set the log level (debug, info, warn, error, fatal)
logfile  Set the log file location
node-name  The node name for this client
override-runlist  Replace current run list with specified items for a single run
pid  Set the PID file location, defaults to /tmp/chef-client.pid
run-lock-timeout  Set maximum duration to wait for another client run to finish, default is indefinitely.
runlist  Permanently replace current run list with specified items
user  User to set privilege to

validation_key  Set the validation key file location, used for registering new clients

salt.states.chef.solo(name, **kwargs)

name  Unique identifier for the state. Does not affect the Chef run.

config  The configuration file to use

environment  Set the Chef Environment on the node

group  Group to set privilege to

json-attributes  Load attributes from a JSON file or URL

log_level  Set the log level (debug, info, warn, error, fatal)

logfile  Set the log file location

node-name  The node name for this client

override-runlist  Replace current run list with specified items for a single run

recipe-url  Pull down a remote gzipped tarball of recipes and untar it to the cookbook cache

run-lock-timeout  Set maximum duration to wait for another client run to finish, default is indefinitely.

user  User to set privilege to

23.19.30  salt.states.chronos_job

Configure Chronos jobs via a salt proxy.

```
my_job:
  chronos_job.config:
    - config:
      schedule: "R//PT2S"
      command: "echo 'hi'"
      owner: "me@example.com"
```

New in version 2015.8.2.

salt.states.chronos_job.absent(name)

Ensure that the chronos job with the given name is not present.

Parameters  name -- The app name

Returns  A standard Salt changes dictionary

salt.states.chronos_job.config(name, config)

Ensure that the chronos job with the given name is present and is configured to match the given config values.

Parameters

- name -- The job name
- config -- The configuration to apply (dict)

Returns  A standard Salt changes dictionary
23.19.31 salt.states.cimc

A state module to manage Cisco UCS chassis devices.

   codeauthor Spencer Ervin <spencer_ervin@hotmail.com>
   maturity new
   depends none
   platform unix

About

This state module was designed to handle connections to a Cisco Unified Computing System (UCS) chassis. This module relies on the CIMC proxy module to interface with the device.

See also:

CIMC Proxy Module

salt.states.cimc.hostname(name, hostname=None)

Ensures that the hostname is set to the specified value.

   New in version 2019.2.0.
   
   name: The name of the module function to execute.
   
   hostname(str): The hostname of the server.

SLS Example:

   set_name:
       cimc.hostname:
           - hostname: foobar

salt.states.cimc.logging_levels(name, remote=None, local=None)

Ensures that the logging levels are set on the device. The logging levels must match the following options: emergency, alert, critical, error, warning, notice, informational, debug.

   New in version 2019.2.0.
   
   name: The name of the module function to execute.
   
   remote(str): The logging level for SYSLOG logs.
   
   local(str): The logging level for the local device.

SLS Example:

   logging_levels:
       cimc.logging_levels:
           - remote: informational
           - local: notice

salt.states.cimc.ntp(name, servers)

Ensures that the NTP servers are configured. Servers are provided as an individual string or list format. Only four NTP servers will be reviewed. Any entries past four will be ignored.

   name: The name of the module function to execute.
   
   servers(str, list): The IP address or FQDN of the NTP servers.

SLS Example:
ntp_configuration_list:
  cimc.ntp:
    - servers:
      - foo.bar.com
      - 10.10.10.10

ntp_configuration_str:
  cimc.ntp:
    - servers: foo.bar.com

salt.states.cimc.power_configuration(name, policy=None, delayType=None, delayValue=None)
Ensures that the power configuration is configured on the system. This is only available on some C-Series servers.

New in version 2019.2.0.

name: The name of the module function to execute.

delayValue(int): If a fixed delay is selected, once chassis power is restored and the Cisco IMC has finished rebooting, the system waits for the specified number of seconds before restarting the server. Enter an integer between 0 and 240.

SLS Example:

reset_power:
  cimc.power_configuration:
    - policy: reset
    - delayType: fixed
    - delayValue: 0

power_off:
  cimc.power_configuration:
    - policy: stay-off

salt.states.cimc.syslog(name, primary=None, secondary=None)
Ensures that the syslog servers are set to the specified values. A value of None will be ignored.

name: The name of the module function to execute.

SLS Example:
**syslog_configuration**:

```bash
cimc.syslog:
  - primary: 10.10.10.10
  - secondary: foo.bar.com
```

**salt.states.cimc.user** *(name, id=", user=", priv=", password=", status='active')*

Ensures that a user is configured on the device. Due to being unable to verify the user password. This is a forced operation.

New in version 2019.2.0.

name: The name of the module function to execute.

id(int): The user ID slot on the device.

user(str): The username of the user.

priv(str): The privilege level of the user.

password(str): The password of the user.

status(str): The status of the user. Can be either active or inactive.

SLS Example:

```yaml
user_configuration:
  cimc.user:
    - id: 11
    - user: foo
    - priv: admin
    - password: mypassword
    - status: active
```

23.19.32 salt.states.composer

Installation of Composer Packages

These states manage the installed packages for composer for PHP. Note that either composer is installed and accessible via a bin directory or you can pass the location of composer in the state.

```bash
get-composer:
cmd.run:
  - name: 'CURL=`which curl`; $CURL -sS https://getcomposer.org/installer | php'
  - unless: test -f /usr/local/bin/composer
  - cwd: /root/

install-composer:
cmd.wait:
  - name: mv /root/composer.phar /usr/local/bin/composer
  - cwd: /root/
  - watch:
    - cmd: get-composer

/path/to/project:
composer.installed:
  - no_dev: true
  - require:
    - cmd: install-composer
```

(continues on next page)
# Without composer installed in your PATH
# Note: composer.phar must be executable for state to work properly

/path/to/project:

  composer.installed:
    - composer: /path/to/composer.phar
    - php: /usr/local/bin/php
    - no_dev: true

salt.states.composer.installed(name, composer=None, php=None, user=None, prefer_source=None, prefer_dist=None, no_scripts=None, no_plugins=None, optimize=None, no_dev=None, quiet=False, composer_home='/root', always_check=True, env=None)

Verify that the correct versions of composer dependencies are present.

name Directory location of the composer.json file.

composer Location of the composer.phar file. If not set composer will just execute composer as if it is installed globally. (i.e. /path/to/composer.phar)

php Location of the php executable to use with composer. (i.e. /usr/bin/php)

user Which system user to run composer as.

    New in version 2014.1.4.

prefer_source --prefer-source option of composer.

prefer_dist --prefer-dist option of composer.

no_scripts --no-scripts option of composer.

no_plugins --no-plugins option of composer.

optimize --optimize-autoloader option of composer. Recommended for production.

no_dev --no-dev option for composer. Recommended for production.

quiet --quiet option for composer. Whether or not to return output from composer.

composer_home $COMPOSER_HOME environment variable

always_check If True, always run composer install in the directory. This is the default behavior. If False, only run composer install if there is no vendor directory present.

env A list of environment variables to be set prior to execution.

salt.states.composer.update(name, composer=None, php=None, user=None, prefer_source=None, prefer_dist=None, no_scripts=None, no_plugins=None, optimize=None, no_dev=None, quiet=False, composer_home='/root', env=None)

Composer update the directory to ensure we have the latest versions of all project dependencies.

name Directory location of the composer.json file.

composer Location of the composer.phar file. If not set composer will just execute composer as if it is installed globally. (i.e. /path/to/composer.phar)

php Location of the php executable to use with composer. (i.e. /usr/bin/php)

user Which system user to run composer as.

    New in version 2014.1.4.

prefer_source --prefer-source option of composer.
prefer_dist --prefer-dist option of composer.

no_scripts --no-scripts option of composer.

no_plugins --no-plugins option of composer.

optimize --optimize-autoloader option of composer. Recommended for production.

no_dev --no-dev option for composer. Recommended for production.

quiet --quiet option for composer. Whether or not to return output from composer.

composer_home $COMPOSER_HOME environment variable

eval A list of environment variables to be set prior to execution.

23.19.33 salt.states.cryptdev

Opening of Encrypted Devices

Ensure that an encrypted device is mapped with the mapped function:

```yaml
mappedname:
  cryptdev.mapped:
    - device: /dev/sdb1
    - keyfile: /etc/keyfile.key
    - opts:
      - size=256

swap:
  crypted.mapped:
    - device: /dev/sdx4
    - keyfile: /dev/urandom
    - opts: swap,cipher=aes-cbc-essiv:sha256,size=256

mappedbyuuid:
  crypted.mapped:
    - device: UUID=066e0200-2867-4ebe-b9e6-f30026ca2314
    - keyfile: /etc/keyfile.key
    - config: /etc/alternate-crypttab
```

New in version 2018.3.0.

salt.states.cryptdev.mapped(name, device, keyfile=None, opts=None, config='/etc/crypttab', persist=True, immediate=False, match_on='name')

Verify that a device is mapped

name The name under which the device is to be mapped

device The device name, typically the device node, such as /dev/sdb1 or UUID=066e0200-2867-4ebe-b9e6-f30026ca2314.

keyfile Either None if the password is to be entered manually on boot, or an absolute path to a keyfile. If the password is to be asked interactively, the mapping cannot be performed with immediate=True.

opts A list object of options or a comma delimited list

config Set an alternative location for the crypttab, if the map is persistent, Default is /etc/crypttab

persist Set if the map should be saved in the crypttab, Default is True
immediate Set if the device mapping should be executed immediately. Requires that the keyfile not be `None`, because the password cannot be asked interactively. Note that options are not passed through on the initial mapping. Default is `False`.

match_on A name or list of crypttab properties on which this state should be applied. Default is `name`, meaning that the line is matched only by the name parameter. If the desired configuration requires two devices mapped to the same name, supply a list of parameters to match on.

```python
salt.states.cryptdev.unmapped(name, config='/etc/crypttab', persist=False, immediate=False)
```
Ensure that a device is unmapped

**name** The name to ensure is not mapped

**config** Set an alternative location for the crypttab, if the map is persistent, Default is `/etc/crypttab`

**persist** Set if the map should be removed from the crypttab. Default is `True`

**immediate** Set if the device should be unmapped immediately. Default is `False`.

### 23.19.34 salt.states.csf

CSF Ip tables management

depends

- csf utility

**configuration** See [http://download.configserver.com/csf/install.txt](http://download.configserver.com/csf/install.txt) for setup instructions.

```
Simply allow/deny rules:
csf.rule_present:
ip: 1.2.3.4
method: allow
```

```python
salt.states.csf.nics_skip(name, nics, ipv6)
```
Alias for `csf.nics_skipped`

```python
salt.states.csf.nics_skipped(name, nics, ipv6=False)
```

**name** Meaningless arg, but required for state.

**nics** A list of nics to skip.

**ipv6** Boolean. Set to true if you want to skip the ipv6 interface. Default false (ipv4).

```python
salt.states.csf.option_present(name, value, reload=False)
```
Ensure the state of a particular option/setting in csf.

**name** The option name in csf.conf

**value** The value it should be set to.

**reload** Boolean. If set to true, csf will be reloaded after.

```python
salt.states.csf.ports_open(name, ports, proto='tcp', direction='in')
```
Ensure ports are open for a protocol, in a direction. e.g. - proto='tcp', direction='in' would set the values for TCP_IN in the csf.conf file.

**ports** A list of ports that should be open.

**proto** The protocol. May be one of 'tcp', 'udp', 'tcp6', or 'udp6'.

---

23.19. state modules 1421
**direction** Choose ‘in’, ‘out’, or both to indicate the port should be opened for inbound traffic, outbound traffic, or both.

```python
salt.states.csf.rule_absent(name, method, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='s', ttl=None, reload=False)
```
Ensure iptable is not present.

- **name** The ip address or CIDR for the rule.
- **method** The type of rule. Either ‘allow’ or ‘deny’.
- **port** Optional port to open or close for the iptables rule.
- **proto** The protocol. Either ‘tcp’, ‘udp’. Only applicable if port is specified.
- **direction** The direction of traffic to apply the rule to. Either ‘in’, or ‘out’. Only applicable if port is specified.
- **port_origin** Specifies either the source or destination port is relevant for this rule. Only applicable if port is specified. Either ‘s’, or ‘d’.
- **ip_origin** Specifies whether the ip in this rule refers to the source or destination ip. Either ‘s’, or ‘d’. Only applicable if port is specified.
- **ttl** How long the rule should exist. If supplied, `csf.tempallow()` or `csf.tempdeny()` are used.
- **reload** Reload the csf service after applying this rule. Default false.

```python
salt.states.csf.rule_present(name, method, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='s', ttl=None, comment='', reload=False)
```
Ensure iptable rule exists.

- **name** The ip address or CIDR for the rule.
- **method** The type of rule. Either ‘allow’ or ‘deny’.
- **port** Optional port to open or close for the iptables rule.
- **proto** The protocol. Either ‘tcp’, or ‘udp’. Only applicable if port is specified.
- **direction** The direction of traffic to apply the rule to. Either ‘in’, or ‘out’. Only applicable if port is specified.
- **port_origin** Specifies either the source or destination port is relevant for this rule. Only applicable if port is specified. Either ‘s’, or ‘d’.
- **ip_origin** Specifies whether the ip in this rule refers to the source or destination ip. Either ‘s’, or ‘d’. Only applicable if port is specified.
- **ttl** How long the rule should exist. If supplied, `csf.tempallow()` or `csf.tempdeny()` are used.
- **comment** An optional comment to appear after the rule as a #comment.
- **reload** Reload the csf service after applying this rule. Default false.

```python
salt.states.csf.testing_off(name, reload=False)
```
Ensure testing mode is enabled in csf.

- **reload** Reload CSF after changing the testing status. Default false.

```python
salt.states.csf.testing_on(name, reload=False)
```
Ensure testing mode is enabled in csf.

- **reload** Reload CSF after changing the testing status. Default false.
23.19.35  salt.states.cyg

Installation of Cygwin packages.
A state module to manage cygwin packages. Packages can be installed or removed.

```python
dos2unix:
cyg.installed

class salt.states.cyg.DictDiffer(
current_dict, past_dict)
Calculate the difference between two dictionaries.

(1) items added
(2) items removed
(3) keys same in both but changed values
(4) keys same in both and unchanged values

added()
Return a set of additions to past_dict.

changed()
Return a set of the keys with changed values.

removed()
Return a set of things removed from past_dict.

same()
True if the two dicts are the same.

unchanged()
Return a set of the keys with unchanged values.

salt.states.cyg.installed(name, cyg_arch='x86_64', mirrors=None)
Make sure that a package is installed.

name The name of the package to install

cyg_arch [x86_64] The cygwin architecture to install the package into. Current options are x86 and x86_64

mirrors [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

rsync:
cyg.installed:
- mirrors:
  - http://mirror/without/public/key: ""

salt.states.cyg.removed(name, cyg_arch='x86_64', mirrors=None)
Make sure that a package is not installed.

name The name of the package to uninstall

cyg_arch [x86_64] The cygwin architecture to remove the package from. Current options are x86 and x86_64

mirrors [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:
rsync:
  cyg.removed:
  - mirrors:
    - http://mirror/without/public/key: ""

salt.states.cyg.updated(name=None, cyg_arch='x86_64', mirrors=None)
Make sure all packages are up to date.

name [None] No affect, salt fails poorly without the arg available
cyg_arch [x86_64] The cygwin architecture to update. Current options are x86 and x86_64
mirrors [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

rsync:
  cyg.updated:
  - mirrors:
    - http://mirror/without/public/key: ""

23.19.36 salt.states.ddns

Dynamic DNS updates

Ensure a DNS record is present or absent utilizing RFC 2136 type dynamic updates.

depends
  • dnspython

Note: The dnspython module is required when managing DDNS using a TSIG key. If you are not using a TSIG key, DDNS is allowed by ACLs based on IP address and the dnspython module is not required.

Example:

webserver:
  ddns.present:
    - zone: example.com
    - ttl: 60
    - data: 111.222.333.444
    - nameserver: 123.234.345.456
    - keyfile: /srv/salt/dnspy_tsig_key.txt

salt.states.ddns.absent(name, zone, data=None, rdtype=None, **kwargs)
Ensures that the named DNS record is absent.

name The host portion of the DNS record, e.g., ‘webserver’. Name and zone are concatenated when the entry is created unless name includes a trailing dot, so make sure that information is not duplicated in these two arguments.
zone The zone to check
data Data for the DNS record. E.g., the IP address for an A record. If omitted, all records matching name (and rdtype, if provided) will be purged.
**rdtype** DNS resource type. If omitted, all types will be purged.

**kwargs** Additional arguments the ddns.update function may need (e.g. nameserver, keyfile, keyname).

Note that the nsupdate key file can’t be reused by this function, the keyfile and other arguments must follow the dnspython spec.

```python
class salt.states.ddns.present:
    def __init__(self, name, zone, ttl, data, rdtype='A', **kwargs):
        self.name = name
        self.zone = zone
        self.ttl = ttl
        self.data = data
        self.rdtype = rdtype

    def __call__(self):
        self.check_present

    def check_present(self):
        # Implementation goes here
```

Ensures that the named DNS record is present with the given ttl.

**name** The host portion of the DNS record, e.g., 'webserver'. Name and zone are concatenated when the entry is created unless name includes a trailing dot, so make sure that information is not duplicated in these two arguments.

**zone** The zone to check/update

**ttl** TTL for the record

**data** Data for the DNS record. E.g., the IP address for an A record.

**rdtype** DNS resource type. Default ‘A’.

**kwargs** Additional arguments the ddns.update function may need (e.g. nameserver, keyfile, keyname).

Note that the nsupdate key file can’t be reused by this function, the keyfile and other arguments must follow the dnspython spec.

### 23.19.37 salt.states.debconfmod

Management of debconf selections

```
depends
```

- debconf-utils package

The debconfmod state module manages the enforcement of debconf selections, this state can set those selections prior to package installation.

**Available Functions**

The debconfmod state has two functions, the `set` and `set_file` functions

**set** Set debconf selections from the state itself

**set_file** Set debconf selections from a file

```
nullmailer-debconf:
    debconf.set:
        - name: nullmailer
        - data:
            'shared/mailname': {'type': 'string', 'value': 'server.domain.tld'}
            'nullmailer/relayhost': {'type': 'string', 'value': 'mail.domain.tld'}

ferm-debconf:
    debconf.set:
        - name: ferm
        - data:
            'ferm/enable': {'type': 'boolean', 'value': True}
```

---

23.19. state modules 1425
Note: Due to how PyYAML imports nested dicts (see [here](#)), the values in the data dict must be indented four spaces instead of two.

If you're setting debconf values that requires `dpkg-reconfigure`, you can use the onchanges requisite to reconfigure your package:

```yaml
set-default-shell:
  debconf.set:
    - name: dash
      data:
        'dash/sh': {'type': 'boolean', 'value': false}

reconfigure-dash:
  cmd.run:
    - name: dpkg-reconfigure -f noninteractive dash
    - onchanges:
      - debconf: set-default-shell
```

Every time the set-default-shell state changes, the reconfigure-dash state will also run.

Note: For boolean types, the value should be true or false, not 'true' or 'false'.

```python
salt.states.debconfmod.set(name, data, **kwargs)
```

Set debconf selections

```python
<state_id>:
  debconf.set:
    - name: <name>
    - data:
      <question>: {'type': <type>, 'value': <value>}
      <question>: {'type': <type>, 'value': <value>}

<state_id>:
  debconf.set:
    - name: <name>
    - data:
      <question>: {'type': <type>, 'value': <value>}
      <question>: {'type': <type>, 'value': <value>}
```

name: The package name to set answers for.

data: A set of questions/answers for debconf. Note that everything under this must be indented twice.

question: The question that is being pre-answered

type: The type of question that is being asked (string, boolean, select, etc.)

value: The answer to the question

```python
salt.states.debconfmod.set_file(name, source, template=None, context=None, defaults=None, **kwargs)
```

Set debconf selections from a file or a template

```python
<state_id>:
  debconf.set_file:
```

(continues on next page)
source: The location of the file containing the package selections

template If this setting is applied then the named templating engine will be used to render the package selections file, currently jinja, mako, and wempy are supported

context Overrides default context variables passed to the template.

defaults Default context passed to the template.

23.19.38 salt.states.dellchassis

Manage chassis via Salt Proxies.

New in version 2015.8.2.

Below is an example state that sets basic parameters:

```
my-dell-chassis:
  dellchassis.chassis:
    - chassis_name: my-dell-chassis
    - datacenter: dc-1-us
    - location: my-location
    - mode: 2
    - idrac_launch: 1
    - slot_names:
      - server-1: my-slot-name
      - server-2: my-other-slot-name
    - blade_power_states:
      - server-1: on
      - server-2: off
      - server-3: powercycle
```

However, it is possible to place the entire set of chassis configuration data in pillar. Here's an example pillar structure:

```
proxy:
  host: 10.27.20.18
  admin_username: root
  fallback_admin_username: root
  passwords:
    - super-secret
    - old-secret
  proxytype: fx2
```
chassis:
  name: fx2-1
  username: root
  password: saltstack1
  datacenter: london
  location: rack-1-shelf-3
  management_mode: 2
  idrac_launch: 0
  slot_names:
    - 'server-1': blade1
    - 'server-2': blade2

servers:
  server-1:
    idrac_password: saltstack1
    ipmi_over_lan: True
    ip: 172.17.17.132
    netmask: 255.255.0.0
    gateway: 172.17.17.1
  server-2:
    idrac_password: saltstack1
    ipmi_over_lan: True
    ip: 172.17.17.2
    netmask: 255.255.0.0
    gateway: 172.17.17.1
  server-3:
    idrac_password: saltstack1
    ipmi_over_lan: True
    ip: 172.17.17.20
    netmask: 255.255.0.0
    gateway: 172.17.17.1
  server-4:
    idrac_password: saltstack1
    ipmi_over_lan: True
    ip: 172.17.17.2
    netmask: 255.255.0.0
    gateway: 172.17.17.1

switches:
  switch-1:
    ip: 192.168.1.2
    netmask: 255.255.255.0
    gateway: 192.168.1.1
    snmp: nonpublic
    password: saltstack1
  switch-2:
    ip: 192.168.1.3
    netmask: 255.255.255.0
    gateway: 192.168.1.1
    snmp: nonpublic
    password: saltstack1

And to go with it, here's an example state that pulls the data from the pillar stated above:

```{%
set details = pillar.get('proxy:chassis', {})
%
standup-step1:
```
```
dellchassis.chassis:
  - name: {{ details['name'] }}
  - location: {{ details['location'] }}
  - mode: {{ details['management_mode'] }}
  - idrac_launch: {{ details['idrac_launch'] }}
  - slot_names:
    {% for entry in details['slot_names'] %}
      - {{ next(iter(entry)) }}: {{ entry[next(iter(entry))] }}
    {% endfor %}

blade_powercycle:
  dellchassis.chassis:
    - blade_power_states:
      - server-1: powercycle
      - server-2: powercycle
      - server-3: powercycle
      - server-4: powercycle

# Set idrac_passwords for blades. racadm needs them to be called 'server-x'
{% for k, v in details['servers'].iteritems() %}
  {{ k }}:
    dellchassis.blade_idrac:
      - idrac_password: {{ v['idrac_password'] }}
{% endfor %}

# Set management ip addresses, passwords, and snmp strings for switches
{% for k, v in details['switches'].iteritems() %}
  {{ k }}-switch-setup:
    dellchassis.switch:
      - name: {{ k }}
      - ip: {{ v['ip'] }}
      - netmask: {{ v['netmask'] }}
      - gateway: {{ v['gateway'] }}
      - password: {{ v['password'] }}
      - snmp: {{ v['snmp'] }}
{% endfor %}
```

**Note:** This state module relies on the dracr.py execution module, which runs racadm commands on the chassis, blades, etc. The racadm command runs very slowly and, depending on your state, the proxy minion return might timeout before the racadm commands have completed. If you are repeatedly seeing minions timeout after state calls, please use the `-t` CLI argument to increase the timeout variable.

For example:

```
salt '*' state.sls my-dell-chasis-state-name -t 60
```

**Note:** The Dell CMC units perform adequately but many iDRACs are excruciatingly slow. Some functions can take minutes to execute.

```
salt.states.dellchassis.blade_idrac(name, idrac_password=None, idrac_ipmi=None, idrac_ip=None, idrac_netmask=None, idrac_gateway=None, idrac_dnsname=None, idrac_dhcp=None)
```

---

23.19. state modules 1429
Set parameters for iDRAC in a blade.

**Parameters**

- **idrac_password** -- Password to use to connect to the iDRACs directly (idrac_ipmi and idrac_dnsname must be set directly on the iDRAC. They can't be set through the CMC. If this password is present, use it instead of the CMC password)
- **idrac_ipmi** -- Enable/Disable IPMI over LAN
- **idrac_ip** -- Set IP address for iDRAC
- **idrac_netmask** -- Set netmask for iDRAC
- **idrac_gateway** -- Set gateway for iDRAC
- **idrac_dhcp** -- Turn on DHCP for iDRAC (True turns on, False does nothing because setting a static IP will disable DHCP).

**Returns**

A standard Salt changes dictionary

**NOTE:** If any of the IP address settings is configured, all of ip, netmask, and gateway must be present.

```python
salt.states.dellchassis.chassis(name, chassis_name=None, password=None, datacenter=None, location=None, mode=None, idrac_launch=None, slot_names=None, blade_power_states=None)
```

Manage a Dell Chassis.

**chassis_name** The name of the chassis.

**datacenter** The datacenter in which the chassis is located

**location** The location of the chassis.

**password** Password for the chassis. Note: If this password is set for the chassis, the current implementation of this state will set this password both on the chassis and the iDrac passwords on any configured blades. If the password for the blades should be distinct, they should be set separately with the blade_idrac function.

**mode** The management mode of the chassis. Viable options are:

- 0: None
- 1: Monitor
- 2: Manage and Monitor

**idrac_launch** The iDRAC launch method of the chassis. Viable options are:

- 0: Disabled (launch iDRAC using IP address)
- 1: Enabled (launch iDRAC using DNS name)

**slot_names** The names of the slots, provided as a list identified by their slot numbers.

**blade_power_states** The power states of a blade server, provided as a list and identified by their server numbers. Viable options are:

- on: Ensure the blade server is powered on.
- off: Ensure the blade server is powered off.
- powercycle: Power cycle the blade server.

**Example:**
my-dell-chassis:
  dellchassis.chassis:
    - chassis_name: my-dell-chassis
    - location: my-location
    - datacenter: london
    - mode: 2
    - idrac_launch: 1
    - slot_names:
      - 1: my-slot-name
      - 2: my-other-slot-name
    - blade_power_states:
      - server-1: on
      - server-2: off
      - server-3: powercycle

salt.states.dellchassis.firmware_update(hosts=None, directory='')

State to update the firmware on host using the racadm command

firmwarefile filename (string) starting with salt://

host string representing the hostname supplied to the racadm command

directory Directory name where firmwarefile will be downloaded

dell-chassis-firmware-update:
  dellchassis.firmware_update:
    hosts:
      cmc:
        salt://firmware_cmc.exe
      server-1:
        salt://firmware.exe
    directory: /opt/firmwares

salt.states.dellchassis.switch(name=None, ip=None, netmask=None, gateway=None, dhcp=None, password=None, snmp=None)

Manage switches in a Dell Chassis.

name The switch designation (e.g. switch-1, switch-2)

ip The Static IP Address of the switch

netmask The netmask for the static IP

gateway The gateway for the static IP

dhcp True: Enable DHCP False: Do not change DHCP setup (disabling DHCP is automatic when a static IP is set)

password The access (root) password for the switch

snmp The SNMP community string for the switch

Example:

my-dell-chassis:
  dellchassis.switch:
    - switch: switch-1
    - ip: 192.168.1.1
    - netmask: 255.255.255.0
    - gateway: 192.168.1.254
23.19.39 salt.states.disk

Disk monitoring state

Monitor the state of disk resources.

The `disk.status` function can be used to report that the used space of a filesystem is within the specified limits.

```yaml
used_space:
  disk.status:
    - name: /dev/xda1
    - maximum: 79%
    - minimum: 11%
```

It can be used with an `onfail` requisite, for example, to take additional action in response to or in preparation for other states.

```yaml
storage_threshold:
  disk.status:
    - name: /dev/xda1
    - maximum: 97%

clear_cache:
  cmd.run:
    - name: rm -r /var/cache/app
    - onfail:
      - disk: storage_threshold
```

To use kilobytes (KB) for `minimum` and `maximum` rather than percents, specify the `absolute` flag:

```yaml
used_space:
  disk.status:
    - name: /dev/xda1
    - minimum: 1024 KB
    - maximum: 1048576 KB
    - absolute: True
```

```python
salt.states.disk.status(name, maximum=None, minimum=None, absolute=False, free=False)
```

Return the current disk usage stats for the named mount point

- `name` Disk mount or directory for which to check used space
- `maximum` The maximum disk utilization
- `minimum` The minimum disk utilization
- `absolute` By default, the utilization is measured in percentage. Set the `absolute` flag to use kilobytes.

- New in version 2016.11.0.
- `free` By default, `minimum` & `maximum` refer to the amount of used space. Set to `True` to evaluate the free space instead.
23.19.40 salt.states.dvs

Manage VMware distributed virtual switches (DVSs) and their distributed virtual portgroups (DVportgroups).

codeauthor Alexandru Bleotu <alexandru.bleotu@morganstaley.com>

Examples

Several settings can be changed for DVSs and DVportgroups. Here are two examples covering all of the settings. Fewer settings can be used.

DVS

```
'name': 'dvs1',
'max_mtu': 1000,
'uplink_names': [
    'dvUplink1',
    'dvUplink2',
    'dvUplink3'
],
'capability': {
    'portgroup_operation_supported': false,
    'operation_supported': true,
    'port_operation_supported': false
},
'lacp_api_version': 'multipleLag',
'contact_email': 'foo@email.com',
'product_info': {
    'version': '6.0.0',
    'vendor': 'VMware, Inc.',
    'name': 'DVS'
},
'network_resource_management_enabled': true,
'contact_name': 'me@email.com',
'infrastructure_traffic_resource_pools': [
    {
        'reservation': 0,
        'limit': 1000,
        'share_level': 'high',
        'key': 'management',
        'num_shares': 100
    },
    {
        'reservation': 0,
        'limit': -1,
        'share_level': 'normal',
        'key': 'faultTolerance',
        'num_shares': 50
    },
    {
        'reservation': 0,
    }
]
```
'limit': 32000,
'share_level': 'normal',
'key': 'vmotion',
'num_shares': 50
},
{
'reservation': 10000,
'limit': -1,
'share_level': 'normal',
'key': 'virtualMachine',
'num_shares': 50
},
{
'reservation': 0,
'limit': -1,
'share_level': 'custom',
'key': 'iSCSI',
'num_shares': 75
},
{
'reservation': 0,
'limit': -1,
'share_level': 'normal',
'key': 'nfs',
'num_shares': 50
},
{
'reservation': 0,
'limit': -1,
'share_level': 'normal',
'key': 'hbr',
'num_shares': 50
},
{
'reservation': 8750,
'limit': 15000,
'share_level': 'high',
'key': 'vsan',
'num_shares': 100
},
{
'reservation': 0,
'limit': -1,
'share_level': 'normal',
'key': 'vdp',
'num_shares': 50
}
],
'link_discovery_protocol': {
'operation':
'listen',
'protocol':
'cdp'
},
'network_resource_control_version': 'version3',
'description': 'Managed by Salt. Random settings.'}
Note: The mandatory attribute is: name.

**Portgroup**

```json
'security_policy': {
    'allow_promiscuous': true,
    'mac_changes': false,
    'forged_transmits': true
},
'name': 'vmotion-v702',
'out_shaping': {
    'enabled': true,
    'average_bandwidth': 1500,
    'burst_size': 4096,
    'peak_bandwidth': 1500
},
'num_ports': 128,
'teaming': {
    'port_order': {
        'active': ['dvUplink2'],
        'standby': ['dvUplink1']
    },
    'notify_switches': false,
    'reverse_policy': true,
    'rolling_order': false,
    'policy': 'failover_explicit',
    'failure_criteria': {
        'check_error_percent': true,
        'full_duplex': false,
        'check_duplex': false,
        'percentage': 50,
        'check_speed': 'minimum',
        'speed': 20,
        'check_beacon': true
    }
},
'type': 'earlyBinding',
'vlan_id': 100,
'description': 'Managed by Salt. Random settings.'
```

Note: The mandatory attributes are: name, type.
Dependencies

- pyVmomi Python Module

**pyVmomi**

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See Issue #29537 for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against.

```python
salt.states.dvs.dvs_configured(name, dvs)
```

Configures a DVS.

- **name** Name of the DVS
- **dvs** DVS dict representations (see module sysdocs)

```python
salt.states.dvs.portgroups_configured(name, dvs, portgroups)
```

Configures portgroups on a DVS.

- **name** Name of the DVS
- **dvs** Name of the DVS
- **portgroups** Portgroup dict representations (see module sysdocs)

```python
salt.states.dvs.uplink_portgroup_configured(name, dvs, uplink_portgroup)
```

Configures the uplink portgroup on a DVS. The state assumes there is only one uplink portgroup.

- **name** Name of the DVS
- **dvs** Name of the DVS
- **uplink_portgroup** Uplink portgroup dict representations (see module sysdocs)

### 23.19.41 salt.states.elasticsearch_index

State module to manage Elasticsearch indices

New in version 2015.8.0.

Deprecated since version 2017.7.0: Use elasticsearch state instead

```python
salt.states.elasticsearch_index.absent(name)
```

Ensure that the named index is absent.

- **name** Name of the index to remove
salt.states.elasticsearch_index.present(name, definition=None)

New in version 2015.8.0.

Changed in version 2017.3.0: Marked definition as optional.

Ensure that the named index is present.

name Name of the index to add

definition Optional dict for creation parameters as per https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-create-index.html

Example:

```
# Default settings
mytestindex:
    elasticsearch_index.present

# Extra settings
mytestindex2:
    elasticsearch_index.present:
        - definition:
            settings:
                index:
                    number_of_shards: 10
```

23.19.42 salt.states.elasticsearch_index_template

State module to manage Elasticsearch index templates

New in version 2015.8.0.

Deprecated since version 2017.7.0: Use elasticsearch state instead

salt.states.elasticsearch_index_template.absent(name)

Ensure that the named index template is absent.

name Name of the index to remove

classpath.elasticsearch_index_template.present(name, definition)

New in version 2015.8.0.

Changed in version 2017.3.0: Marked definition as required.

Ensure that the named index template is present.

name Name of the index to add

definition Required dict for creation parameters as per https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-templates.html

Example:

```
mytestindex2_template:
    elasticsearch_index_template.present:
        - definition:
            template: logstash-*
            order: 1
            settings:
                number_of_shards: 1
```
23.19.43  salt.states.eselect

Management of Gentoo configuration using eselect

A state module to manage Gentoo configuration via eselect

```python
salt.states.eselect.set_(name, target, module_parameter=None, action_parameter=None)
```

- **name** The name of the module
- **target** The target to be set for this module
- **module_parameter** additional params passed to the defined module
- **action_parameter** additional params passed to the defined action

---

23.19.44  salt.states.esxdatacenter

Salt states to create and manage VMware vSphere datacenters (datacenters).

- **codeauthor** Alexandru Bleotu <alexandru.bleotu@morganstaley.com>

**Dependencies**

- pyVmomi Python Module

**States**

**datacenter_configured**

Makes sure a datacenter exists and is correctly configured.

If the state is run by an esxdatacenter minion, the name of the datacenter is retrieved from the proxy details, otherwise the datacenter has the same name as the state.

**Supported proxies**: esxdatacenter

**Example:**

1. Make sure that a datacenter named `target_dc` exists on the vCenter, using a esxdatacenter proxy:

Proxy minion configuration (connects passthrough to the vCenter):

```yaml
proxy:
  proxytype: esxdatacenter
datacenter: target_dc
vcenter: vcenter.fake.com
mechanism: sspi
domain: fake.com
principal: host
```

State configuration:
**datacenter_state:**

```
esxdatacenter.datacenter_configured
```

`salt.states.esxdatacenter.datacenter_configured(name)`  
Makes sure a datacenter exists.  
If the state is run by an `esxdatacenter` minion, the name of the datacenter is retrieved from the proxy details, otherwise the datacenter has the same name as the state.  
Supported proxies: `esxdatacenter`  
`name`: Datacenter name. Ignored if the proxytype is `esxdatacenter`.

**23.19.45 salt.states.etcd_mod**

Manage etcd Keys

New in version 2015.8.0.

```python
depends
  • python-etcd
```
This state module supports setting and removing keys from etcd.

**Configuration**

To work with an etcd server you must configure an etcd profile. The etcd config can be set in either the Salt Minion configuration file or in pillar:

```yaml
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

It is technically possible to configure etcd without using a profile, but this is not considered to be a best practice, especially when multiple etcd servers or clusters are available.

```yaml
etcd.host: 127.0.0.1
etcd.port: 4001
```

**Note:** The etcd configuration can also be set in the Salt Master config file, but in order to use any etcd configurations defined in the Salt Master config, the `pillar_opts` must be set to `True`.

Be aware that setting `pillar_opts` to `True` has security implications as this makes all master configuration settings available in all minion's pillars.

Etcd profile configuration can be overridden using following arguments: `host`, `port`, `username`, `password`, `ca`, `client_key` and `client_cert`.

```yaml
my-value:
  etcd.set:
    - name: /path/to/key
    - value: value
    - host: 127.0.0.1
```

(continues on next page)
Available Functions

- **set**
  This will set a value to a key in etcd. Changes will be returned if the key has been created or the value of the key has been updated. This means you can watch these states for changes.

```
/foo/bar/baz:
  etcd.set:
    - value: foo
    - profile: my_etcd_config
```

- **wait_set**
  Performs the same functionality as `set` but only if a watch requisite is `True`.

```
/some/file.txt:
  file.managed:
    - source: salt://file.txt

/foo/bar/baz:
  etcd.wait_set:
    - value: foo
    - profile: my_etcd_config
    - watch:
      - file: /some/file.txt
```

- **rm**
  This will delete a key from etcd. If the key exists then changes will be returned and thus you can watch for changes on the state, if the key does not exist then no changes will occur.

```
/foo/bar/baz:
  etcd.rm:
    - profile: my_etcd_config
```

- **wait_rm**
  Performs the same functionality as `rm` but only if a watch requisite is `True`.

```
/some/file.txt:
  file.managed:
    - source: salt://file.txt

/foo/bar/baz:
  etcd.wait_rm:
    - profile: my_etcd_config
    - watch:
      - file: /some/file.txt
```

```
salt.states.etcd_mod.directory(name, profile=None, **kwargs)
Create a directory in etcd.
```
**name**  The etcd directory name, for example: `/foo/bar/baz`.

**profile**  Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

```yaml
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

`salt.states.etcd_mod.mod_watch(name, **kwargs)`

The etcd watcher, called to invoke the watch command. When called, execute a etcd function based on a watch call requisite.

**Note:**  This state exists to support special handling of the `watch` requisite. It should not be called directly. Parameters for this function should be set by the state being triggered.

`salt.states.etcd_mod.rm(name, recurse=False, profile=None, **kwargs)`

Deletes a key from etcd

**name**  The etcd key name to remove, for example `/foo/bar/baz`.

**recurse**  Optional, defaults to `False`. If `True` performs a recursive delete.

**profile**  Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

```yaml
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

`salt.states.etcd_mod.set_(name, value, profile=None, **kwargs)`

Set a key in etcd

**name**  The etcd key name, for example: `/foo/bar/baz`.

**value**  The value the key should contain.

**profile**  Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

```yaml
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

`salt.states.etcd_mod.wait_rm(name, recurse=False, profile=None, **kwargs)`

Deletes a key from etcd only if the watch statement calls it. This function is also aliased as `wait_rm`.

**name**  The etcd key name to remove, for example `/foo/bar/baz`.

**recurse**  Optional, defaults to `False`. If `True` performs a recursive delete, see: https://python-etcd.readthedocs.io/en/latest/#delete-a-key.

**profile**  Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

```yaml
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```
salt.states.etcd_mod.wait_set(name, value, profile=None, **kwargs)
    Set a key in etcd only if the watch statement calls it. This function is also aliased as wait_set.
    
    name  The etcd key name, for example: /foo/bar/baz.
    value The value the key should contain.
    profile The etcd profile to use that has been configured on the Salt Master, this is optional and defaults to None.

    my_etd_config:
        etcd.host: 127.0.0.1
        etcd.port: 4001

23.19.46 salt.states.ethtool

Configuration of network device
New in version 2016.11.0.

    codeauthor  Krzysztof Pawlowski <msciciel@msciciel.eu>
    maturity  new
    depends  python-ethtool
    platform  linux

    eth0:
        ethtool.coalesce:
            - name: eth0
            - rx_usecs: 24
            - tx_usecs: 48

    eth0:
        ethtool.ring:
            - name: eth0
            - rx: 1024
            - tx: 1024

    eth0:
        ethtool.offload:
            - name: eth0
            - tcp_segmentation_offload: on

salt.states.ethtool.coalesce(name, **kwargs)
Manage coalescing settings of network device

    name  Interface name to apply coalescing settings

    eth0:
        ethtool.coalesce:
            - name: eth0
            - adaptive_rx: on
            - adaptive_tx: on
            - rx_usecs: 24
            - rx_frame: 0
            - rx_usecs_irq: 0
            - rx_frames_irq: 0

(continues on next page)
salt.states.ethtool.offload(name, **kwargs)
Manage protocol offload and other features of network device

name Interface name to apply coalescing settings

```python
eth0:
  ethtool.offload:
    - name: eth0
    - tcp_segmentation_offload: on
```

salt.states.ethtool.ring(name, **kwargs)
Manage rx/tx ring parameters of network device

Use 'max' word to set with factory maximum

name Interface name to apply ring parameters

```python
eth0:
  ethtool.ring:
    - name: eth0
    - rx: 1024
    - rx_mini: 0
    - rx_jumbo: 0
    - tx: max
```

23.19.47 salt.states.firewall

State to check firewall configurations

New in version 2016.3.0.

salt.states.firewall.check(name, port=None, **kwargs)
Checks if there is an open connection from the minion to the defined host on a specific port.

name host name or ip address to test connection to

port The port to test the connection on

kwarg Additional parameters, parameters allowed are: proto (tcp or udp) family (ipv4 or ipv6) timeout
23.19.48 salt.states.gem

Installation of Ruby modules packaged as gems

A state module to manage rubygems. Gems can be set up to be installed or removed. This module will use RVM or rbenv if they are installed. In that case, you can specify what ruby version and gemset to target.

```
addressable:
gem.installed:
  - user: rvm
  - ruby: jruby@jgemset
```

**salt.states.gem.installed** *(name, ruby=None, gem_bin=None, user=None, version=None, rdoc=False, ri=False, pre_releases=False, proxy=None, source=None)*

Make sure that a gem is installed.

**name** The name of the gem to install

**ruby**: **None** Only for RVM or rbenv installations: the ruby version and gemset to target.

**gem_bin**: **None** Custom gem command to run instead of the default. Use this to install gems to a non-default ruby install. If you are using rvm or rbenv use the ruby argument instead.

**user**: **None** The user under which to run the gem command

New in version 0.17.0.

**version** [None] Specify the version to install for the gem. Doesn't play nice with multiple gems at once

**rdoc** [False] Generate RDoc documentation for the gem(s).

**ri** [False] Generate RI documentation for the gem(s).

**pre_releases** [False] Install pre-release version of gem(s) if available.

**proxy** [None] Use the specified HTTP proxy server for all outgoing traffic. Format: *http://hostname[:][port]*

**source** [None] Use the specified HTTP gem source server to download gem. Format: *http://hostname[:][port]*

**salt.states.gem.removed** *(name, ruby=None, user=None, gem_bin=None)*

Make sure that a gem is not installed.

**name** The name of the gem to uninstall

**gem_bin** [None] Full path to gem binary to use.

**ruby** [None] If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if **gem_bin** is specified.

**user**: **None** The user under which to run the gem command

New in version 0.17.0.

**salt.states.gem.sources_add** *(name, ruby=None, user=None)*

Make sure that a gem source is added.
name  The URL of the gem source to be added
ruby: None  For RVM or rbenv installations: the ruby version and gemset to target.
user: None  The user under which to run the gem command

New in version 0.17.0.
salt.states.gem.sources_remove(name, ruby=None, user=None)
Make sure that a gem source is removed.
name  The URL of the gem source to be removed
ruby: None  For RVM or rbenv installations: the ruby version and gemset to target.
user: None  The user under which to run the gem command

New in version 0.17.0.

23.19.49  salt.states.github

Github User State Module
New in version 2016.3.0.
This state is used to ensure presence of users in the Organization.

```yaml
ensure user test is present in github:
  github.present:
    - name: 'Example TestUser1'
    - email: example@domain.com
    - username: 'gitexample'
```

salt.states.github.absent(name, profile='github', **kwargs)
Ensure a github user is absent

```yaml
ensure user test is absent in github:
  github.absent:
    - name: 'Example TestUser1'
    - email: example@domain.com
    - username: 'gitexample'
```

The following parameters are required:
name  Github handle of the user in organization

salt.states.github.present(name, profile='github', **kwargs)
Ensure a user is present

```yaml
ensure user test is present in github:
  github.present:
    - name: 'gitexample'
```

The following parameters are required:
name  This is the github handle of the user in the organization

salt.states.github.repos_absent(name, profile='github', **kwargs)
Ensure a repo is absent.
Example:
**ensure repo test is absent in github:**

```yaml
github.repo_absent:
  - name: 'test'
```

The following parameters are required:

- **name**  This is the name of the repository in the organization.

New in version 2016.11.0.

```python
salt.states.github.repo_present(name, description=None, homepage=None, private=None, has_issues=None, has_wiki=None, has_downloads=None, auto_init=False, gitignore_template=None, license_template=None, teams=None, profile='github', **kwargs)
```

Ensure a repository is present

- **name**  This is the name of the repository.

- **description**  The description of the repository.

- **homepage**  The URL with more information about the repository.

- **private**  The visibility of the repository. Note that private repositories require a paid GitHub account.

- **has_issues**  Whether to enable issues for this repository.

- **has_wiki**  Whether to enable the wiki for this repository.

- **has_downloads**  Whether to enable downloads for this repository.

- **auto_init**  Whether to create an initial commit with an empty README.

- **gitignore_template**  The desired language or platform for a .gitignore, e.g. "Haskell".

- **license_template**  The desired LICENSE template to apply, e.g. "mit" or "mozilla".

- **teams**  The teams for which this repo should belong to, specified as a dict of team name to permission ('pull', 'push' or 'admin').

New in version 2017.7.0.

Example:

```yaml
Ensure repo my-repo is present in github:
  github.repo_present:
    - name: 'my-repo'
    - description: 'My very important repository'
```

New in version 2016.11.0.

```python
salt.states.github.team_absent(name, profile='github', **kwargs)
```

Ensure a team is absent.

Example:

```yaml
ensure team test is present in github:
  github.team_absent:
    - name: 'test'
```

The following parameters are required:

- **name**  This is the name of the team in the organization.

New in version 2016.11.0.
salt.states.github.team_present(name, description=None, repo_names=None, privacy='secret', permission='pull', members=None, enforce_mfa=False, no_mfa_grace_seconds=0, profile='github', **kwargs)

Ensure a team is present

name This is the name of the team in the organization.
description The description of the team.
repo_names The names of repositories to add the team to.
privacy The level of privacy for the team, can be 'secret' or 'closed'. Defaults to secret.
permission The default permission for new repositories added to the team, can be 'pull', 'push' or 'admin'. Defaults to pull.
members The members belonging to the team, specified as a dict of member name to optional configuration. Options include 'enforce_mfa_from' and 'mfa_exempt'.
enforce_mfa Whether to enforce MFA requirements on members of the team. If True then all members without mfa_exempt: True configured will be removed from the team. Note that no_mfa_grace_seconds may be set to allow members a grace period.

no_mfa_grace_seconds The number of seconds of grace time that a member will have to enable MFA before being removed from the team. The grace period will begin from enforce_mfa_from on the member configuration, which defaults to 1970/01/01.

Example:

Ensure team test is present in github:

```python
github.team_present:
  - name: 'test'
  - members:
    user1: {}
    user2: {}
```

Ensure team test_mfa is present in github:

```python
github.team_present:
  - name: 'test_mfa'
  - members:
    user1:
      enforce_mfa_from: 2016/06/15
    - enforce_mfa: True
```

New in version 2016.11.0.

23.19.50 salt.states.glance

Managing Images in OpenStack Glance

salt.states.glance.image_present(name, visibility='public', protected=None, checksum=None, location=None, disk_format='raw', wait_for=None, timeout=30)

Checks if given image is present with properties set as specified.

An image should go through the stages 'queued', 'saving' before becoming 'active'. The attribute 'checksum' can only be checked once the image is active. If you don't specify 'wait_for' but 'checksum' the function will wait for the image to become active before comparing checksums. If you don't specify checksum either the function will return when the image reached 'saving'. The default timeout for both is 30 seconds.

Supported properties:
• visibility (‘public’ or ‘private’)
• protected (bool)
• checksum (string, md5sum)
• location (URL, to copy from)

23.19.51 salt.states.glance_image

Management of OpenStack Glance Images

New in version 2018.3.0.

depends shade

configuration see salt.modules.glanceng for setup instructions

Example States

create image:
  glance_image.present:
    - name: cirros
    - filename: cirros.raw
    - image_format: raw

delete image:
  glance_image.absent:
    - name: cirros

salt.states.glance_image.absent(name, auth=None)
  Ensure image does not exist
  name Name of the image

salt.states.glance_image.present(name, auth=None, **kwargs)
  Ensure image exists and is up-to-date
  name Name of the image
  enabled Boolean to control if image is enabled
  description An arbitrary description of the image

23.19.52 salt.states.gnomedesktop

Configuration of the GNOME desktop

Control the GNOME settings

localdesktop_wm_prefs:
  gnomedesktop.wm_preferences:
    - user: username
    - audible_bell: false
    - action_double_click_titlebar: 'toggle-maximize'
    - visual_bell: true
    - num_workspaces: 6

(continues on next page)
localdesktop_lockdown:
    gnomedesktop.desktop_lockdown:
        - user: username
        - disable_user_switching: true

localdesktop_interface:
    gnomedesktop.desktop_interface:
        - user: username
        - clock_show_date: true
        - clock_format: 12h

salt.states.gnomedesktop.desktop_interface(name, user=None, automatic_mnemonics=None, buttons_have_icons=None, can_change_accels=None, clock_format=None, clock_show_date=None, clock_show_seconds=None, cursor_blink=None, cursor_blink_time=None, cursor_blink_timeout=None, cursor_size=None, cursor_theme=None, document_font_name=None, enableAnimations=None, font_name=None, gtk_color_palette=None, gtk_color_scheme=None, gtk_im_module=None, gtk_im_preedit_style=None, gtk_im_status_style=None, gtk_key_theme=None, gtk_theme=None, gtk_timeout_initial=None, gtk_timeout_repeat=None, icon_theme=None, menubar_accel=None, menubar_detachable=None, menus_have_icons=None, menus_have_tearoff=None, monospace_font_name=None, show_input_method_menu=None, show_unicode_menu=None, text_scaling_factor=None, toolbar_detachable=None, toolbar_icons_size=None, toolbar_style=None, toolkit_accessibility=None, **kwargs)

desktop_interface: sets values in the org.gnome.desktop.interface schema

salt.states.gnomedesktop.desktop_lockdown(name, user=None, disable_application_handlers=None, disable_command_line=None, disable_lock_screen=None, disable_log_out=None, disable_print_setup=None, disable_printing=None, disable_save_to_disk=None, disable_user_switching=None, user_administration_disabled=None, **kwargs)

desktop_lockdown: sets values in the org.gnome.desktop.desktop.lockdown schema
salt.states.gnomedesktop.wm_preferences(name, user=None, action_double_click_titlebar=None, action_middle_click_titlebar=None, action_right_click_titlebar=None, application_based=None, audible_bell=None, auto_raise=None, auto_raise_delay=None, button_layout=None, disable_workarounds=None, focus_mode=None, focus_new_windows=None, mouse_button_modifier=None, num_workspaces=None, raise_on_click=None, resize_with_right_button=None, theme=None, titlebar_font=None, titlebar_uses_system_font=None, visual_bell=None, visual_bell_type=None, workspace_names=None, **kwargs)

wm_preferences: sets values in the org.gnome.desktop.wm.preferences schema

23.19.53 salt.states.gpg

Management of the GPG keychains

New in version 2016.3.0.

salt.states.gpg.absent(name, keys=None, user=None, gnupghome=None, **kwargs)
Ensure GPG public key is absent in keychain

name The unique name or keyid for the GPG public key.
keys The keyId or keyIds to add to the GPG keychain.
user Remove GPG keys from the specified user’s keychain

gnupghome Override GNUPG Home directory

salt.states.gpg.present(name, keys=None, user=None, keyserver=None, gnupghome=None, trust=None, **kwargs)
Ensure GPG public key is present in keychain

name The unique name or keyid for the GPG public key.
keys The keyId or keyIds to add to the GPG keychain.
user Add GPG keys to the specified user’s keychain
keyserver The keyserver to retrieve the keys from.
gnupghome Override GNUPG Home directory

trust Trust level for the key in the keychain, ignored by default. Valid trust levels: expired, unknown, not_trusted, marginally, fully, ultimately
23.19.54  salt.states.grafana4_datasource

Manage Grafana v4.0 data sources

New in version 2017.7.0.

configuration  This state requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the 'grafana' key by default, if defined.

Example configuration using basic authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_user: admin
  grafana_password: admin
  grafana_timeout: 3
```

Example configuration using token based authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_token: token
  grafana_timeout: 3
```

The behavior of this module is to create data sources if the do not exists, and to update data sources if the already exists.

```
Ensure influxdb data source is present:
grafana4_datasource.present:
  - name: influxdb
  - type: influxdb
  - url: http://localhost:8086
  - access: proxy
  - basic_auth: true
  - basic_auth_user: myuser
  - basic_auth_password: mypass
  - is_default: true
```

**salt.states.grafana4_datasource.absent** *(name, orgname=None, profile='grafana')*

Ensure that a data source is absent.

name  Name of the data source to remove.

orgname  Name of the organization from which the data source should be absent.

profile  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

**salt.states.grafana4_datasource.present** *(name, type, url, access=None, user=None, password=None, database=None, basic_auth=None, basic_auth_user=None, basic_auth_password=None, tls_auth=None, json_data=None, is_default=None, with_credentials=None, type_logo_url=None, orgname=None, profile='grafana')*

Ensure that a data source is present.

name  Name of the data source.

type  Type of the datasource ('graphite', 'influxdb' etc.).

access  Use proxy or direct. Default: proxy

url  The URL to the data source API.
user  Optional - user to authenticate with the data source.
password  Optional - password to authenticate with the data source.
database  Optional - database to use with the data source.
basic_auth  Optional - set to True to use HTTP basic auth to authenticate with the data source.
basic_auth_user  Optional - HTTP basic auth username.
basic_auth_password  Optional - HTTP basic auth password.
json_data  Optional - additional json data to post (eg. "timeInterval").
is_default  Optional - set data source as default.
with_credentials  Optional - Whether credentials such as cookies or auth headers should be sent with cross-site requests.
type_logo_url  Optional - Logo to use for this datasource.
orname  Name of the organization in which the data source should be present.
profile  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

23.19.55  salt.states.grafana4_org

Manage Grafana v4.0 orgs

New in version 2017.7.0.

configuration  This state requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the 'grafana' key by default, if defined.

Example configuration using basic authentication:

```
grafana:  
  grafana_url: http://grafana.localhost  
grafana_user: admin  
grafana_password: admin  
grafana_timeout: 3
```

Example configuration using token based authentication:

```
grafana:  
  grafana_url: http://grafana.localhost  
grafana_token: token  
grafana_timeout: 3
```

Ensure foobar org is present:

```
saltstates.grafana4_org.present:  
  - name: foobar  
  - theme: ""  
  - home_dashboard_id: 0  
  - timezone: "utc"  
  - address1: ""  
  - address2: ""  
  - city: ""  
  - zip_code: ""  
  - state: ""  
  - country: ""
```
salt.states.grafana4_org.absent(name, profile='grafana')
  Ensure that a org is present.
  
  name  Name of the org to remove.
  
  profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

salt.states.grafana4_org.present(name, users=None, theme=None, home_dashboard_id=None, timezone=None, address1=None, address2=None, city=None, zip_code=None, address_state=None, country=None, profile='grafana')

  Ensure that an organization is present.
  
  name  Name of the org.
  
  users  Optional - Dict of user/role associated with the org. Example:

    users:
      foo: Viewer
      bar: Editor

  theme  Optional - Selected theme for the org.
  home_dashboard_id  Optional - Home dashboard for the org.
  timezone  Optional - Timezone for the org (one of: "browser", "utc", or ").
  address1  Optional - address1 of the org.
  address2  Optional - address2 of the org.
  city  Optional - city of the org.
  zip_code  Optional - zip_code of the org.
  address_state  Optional - state of the org.
  country  Optional - country of the org.
  profile  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

23.19.56 salt.states.grafana4_user

Manage Grafana v4.0 users

New in version 2017.7.0.

configuration  This state requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the 'grafana' key by default, if defined.

Example configuration using basic authentication:

    grafana:
      grafana_url: http://grafana.localhost
      grafana_user: admin
      grafana_password: admin
      grafana_timeout: 3

Example configuration using token based authentication:
**grafana:**
- **grafana_url**: http://grafana.localhost
- **grafana_token**: token
- **grafana_timeout**: 3

**Ensure foobar user is present:**

```python
grafana4_user.present:
- name: foobar
- password: mypass
- email: "foobar@localhost"
- fullname: Foo Bar
- is_admin: true
```

**salt.states.grafana4_user.absent(name, profile='grafana')**

Ensure that a user is present.

- **name**: Name of the user to remove.
- **profile**: Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

**salt.states.grafana4_user.present(name, password, email, is_admin=False, fullname=None, theme=None, profile='grafana')**

Ensure that a user is present.

- **name**: Name of the user.
- **password**: Password of the user.
- **email**: Email of the user.
- **is_admin**: Optional - Set user as admin user. Default: False
- **fullname**: Optional - Full name of the user.
- **theme**: Optional - Selected theme of the user.
- **profile**: Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

### 23.19.57 salt.states.grafana_datasource

Manage Grafana v2.0 data sources

New in version 2016.3.0.

**grafana:**
- **grafana_timeout**: 3
- **grafana_token**: qwertyuiop
- **grafana_url**: 'https://url.com'

**Ensure influxdb data source is present:**

```python
grafana_datasource.present:
- name: influxdb
- type: influxdb
- url: http://localhost:8086
- access: proxy
- basic_auth: true
- basic_auth_user: myuser
- basic_auth_password: mypass
- is_default: true
```
salt.states.grafana_datasource.absent(name, profile='grafana')

Ensure that a data source is present.

name  Name of the data source to remove.

salt.states.grafana_datasource.present(name, type, url, access='proxy', user='', password='',
    database='', basic_auth=False, basic_auth_user='',
    basic_auth_password='',
    is_default=False, json_data=None, profile='grafana')

Ensure that a data source is present.

name  Name of the data source.

type  Which type of data source it is ('graphite', 'influxdb' etc.).

url  The URL to the data source API.

user  Optional - user to authenticate with the data source

password  Optional - password to authenticate with the data source

basic_auth  Optional - set to True to use HTTP basic auth to authenticate with the data source.

basic_auth_user  Optional - HTTP basic auth username.

basic_auth_password  Optional - HTTP basic auth password.

is_default  Default: False

23.19.58  salt.states.grains

Manage grains on the minion

This state allows for grains to be set.

Grains set or altered with this module are stored in the 'grains' file on the minions, By default, this file is located at: /etc/salt/grains

Note: This does NOT override any grains set in the minion config file.

salt.states.grains.absent(name, destructive=False, delimiter=':', force=False)

New in version 2014.7.0.

Delete a grain from the grains config file

name  The grain name

destructive  If destructive is True, delete the entire grain. If destructive is False, set the grain's value to None. Defaults to False.

force  If force is True, the existing grain will be overwritten regardless of its existing or provided value type. Defaults to False

New in version 2015.8.2.

delimiter  A delimiter different from the default can be provided.

New in version 2015.8.2.

Changed in version 2015.8.2.

This state now support nested grains and complex values. It is also more conservative: if a grain has a value that is a list or a dict, it will not be removed unless the force parameter is True.

23.19.  state modules
**grain_name**: grains.absent

```
salt.states.grains.append(name, value, convert=False, delimiter=': ')
```

New in version 2014.7.0.

Append a value to a list in the grains config file. The grain that is being appended to (name) must exist before the new value can be added.

- **name**: The grain name
- **value**: The value to append
- **convert**: If convert is True, convert non-list contents into a list. If convert is False and the grain contains non-list contents, an error is given. Defaults to False.
- **delimiter**: A delimiter different from the default can be provided.

```yaml
grain_name:
  grains.append:
    - value: to_be_appended
```

**salt.states.grains.exists(name, delimiter=': ')**

Ensure that a grain is set

- **name**: The grain name
- **delimiter**: A delimiter different from the default can be provided.

Check whether a grain exists. Does not attempt to check or set the value.

```
salt.states.grains.list_absent(name, value, delimiter=': ')
```

Delete a value from a grain formed as a list.

New in version 2014.1.0.

- **name**: The grain name.
- **value**: The value to delete from the grain list.
- **delimiter**: A delimiter different from the default : can be provided.

New in version 2015.8.2.

The grain should be list type

```yaml
roles:
  grains.list_absent:
    - value: db
```

For multiple grains, the syntax looks like:

```yaml
roles:
  grains.list_absent:
    - value:
      - web
      - dev
```

```
salt.states.grains.list_present(name, value, delimiter=': ')
```

New in version 2014.1.0.
Ensure the value is present in the list-type grain. Note: If the grain that is provided in name is not present on
the system, this new grain will be created with the corresponding provided value.

**name**  The grain name.

**value**  The value is present in the list type grain.

**delimiter**  A delimiter different from the default : can be provided.

New in version 2015.8.2.

The grain should be list type

```
grains.list_present:
  - value: web
```

For multiple grains, the syntax looks like:

```
grains.list_present:
  - value:
    - web
    - dev
```

salt.states.grains.make_hashable(list_grain, result=None)

Ensure that a list grain is hashable.

**list_grain**  The list grain that should be hashable

**result**  This function is recursive, so it must be possible to use a sublist as parameter to the function. Should
not be used by a caller outside of the function.

Make it possible to compare two list grains to each other if the list contains complex objects.

salt.states.grains.present(name, value, delimiter=':', force=False)

Ensure that a grain is set

Changed in version 2015.8.2.

**name**  The grain name

**value**  The value to set on the grain

**force**  If force is True, the existing grain will be overwritten regardless of its existing or provided value type.

Defaults to False

New in version 2015.8.2.

**delimiter**  A delimiter different from the default can be provided.

New in version 2015.8.2.

It is now capable to set a grain to a complex value (ie. lists and dicts) and supports nested grains as well.

If the grain does not yet exist, a new grain is set to the given value. For a nested grain, the necessary keys
are created if they don’t exist. If a given key is an existing value, it will be converted, but an existing value
different from the given key will fail the state.

If the grain with the given name exists, its value is updated to the new value unless its existing or provided
value is complex (list or dict). Use force: True to overwrite.
cheese:
  grains.present:
    - value: edam

nested_grain_with_complex_value:
  grains.present:
    - name: icinga:Apache SSL
    - value:
      - command: check_https
      - params: -H localhost -p 443 -S

with,a,custom,delimiter:
  grains.present:
    - value: yay
    - delimiter: ","

23.19.59 salt.states.helm

salt.states.helm.release_absent(name, namespace=None, flags=None, kvflags=None)
Make sure the release name is absent.

    name (string) The release name to uninstall.
    namespace (string) The namespace scope for this request.
    flags (list) Flags in argument of the command without values. ex: ['help', '--help']
    kvflags (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

Example:

    helm.release_is_absent:
    helm.release_absent:
      - name: release_name

    # In dry-run mode.
    helm.release_is_absent_dry-run:
    helm.release_absent:
      - name: release_name
      - flags:
        - dry-run

salt.states.helm.release_present(name, chart, values=None, version=None, namespace=None, set=None, flags=None, kvflags=None)
Make sure the release name is present.

    name (string) The release name to install.
    chart (string) The chart to install.
    values (string) Absolute path to the values.yaml file.
    version (string) The exact chart version to install. If this is not specified, the latest version is installed.
    namespace (string) The namespace scope for this request.
    set (string or list) Set a values on the command line.
    flags (list) Flags in argument of the command without values. ex: ['help', '--help']
    kvflags (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}
Example:

```yaml
helm_release_is_present:
  helm.release_present:
    - name: release_name
    - chart: repo/chart

# In dry-run mode.
helm_release_is_present_dry-run:
  helm.release_present:
    - name: release_name
    - chart: repo/chart
    - flags:
      - dry-run

# With values.yaml file.
helm_release_is_present_values:
  helm.release_present:
    - name: release_name
    - chart: repo/chart
    - kvflags:
      values: /path/to/values.yaml
```

salt.states.helm.`repo_managed`(name, `present=None`, `absent=None`, `prune=False`, `repo_update=False`, `namespace=None`, `flags=None`, `kvflags=None)

Make sure the repository is updated.

name (string) Not used.

present (list) List of repository to be present. It’s a list of dict: [{'name': 'local_name', 'url': 'repository_url'}]

absent (list) List of local name repository to be absent.

prune (boolean - default: False) If True, all repository already present but not in the present list would be removed.

repo_update (boolean - default: False) If True, the Helm repository is updated after a repository add or remove.

namespace (string) The namespace scope for this request.

flags (list) Flags in argument of the command without values. ex: ['help', '--help']

kvflags (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

Example:

```yaml
helm.repository_is_managed:
  helm.repo_managed:
    - present:
        - name: local_name_1
        url: repository_url
      - absent:
        - local_name_2
```

salt.states.helm.`repo_updated`(name, `namespace=None`, `flags=None`, `kvflags=None`)

Make sure the repository is updated. To execute after a repository changes.

name (string) Not used.

namespace (string) The namespace scope for this request.

flags (list) Flags in argument of the command without values. ex: ['help', '--help']
**kvflags** (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

Example:

```
helm_repository_is_updated:
    helm.repo_updated
```

### 23.19.60 salt.states.highstate_doc

To be used with processors in module *highstate_doc*.

**salt.states.highstate_doc.note** *(name, source=None, contents=None, **kwargs)*

Add content to a document generated using *highstate_doc.render*.

This state does not perform any tasks on the host. It only is used in highstate_doc lowstate processors to include extra documents.

```
{{sls}} example note:
    highstate_doc(note):
    - name: example note
    - require_in:
      - pkg: somepackage
    - contents: |
      example `highstate_doc.note`
      ------------------
      This state does not do anything to the system! It is only used by a processor you can use `requisites` and `order` to move your docs around the rendered file.
      .. this message appear above the `pkg: somepackage` state.
    - source: salt://{{tpldir}}/also_include_a_file.md

{{sls}} extra help:
    highstate_doc(note):
    - name: example
    - order: 0
    - source: salt://{{tpldir}}/HELP.md
```

### 23.19.61 salt.states.http

HTTP monitoring states

Perform an HTTP query and statefully return the result

New in version 2015.5.0.

**salt.states.http.query** *(name, match=None, match_type='string', status=None, status_type='string', wait_for=None, **kwargs)*

Perform an HTTP query and statefully return the result.

Passes through all the parameters described in the *utils.http.query* function:

- **name** The name of the query.
- **match** Specifies a pattern to look for in the return text. By default, this will perform a string comparison of looking for the value of match in the return text.
**match_type**  Specifies the type of pattern matching to use on match. Default is `string`, but can also be set to `pcre` to use regular expression matching if a more complex pattern matching is required.

**status**  The status code for a URL for which to be checked. Can be used instead of or in addition to the `match` setting. This can be passed as an individual status code or a list of status codes.

**status_type**  Specifies the type of pattern matching to use for status. Default is `string`, but can also be set to `pcre` to use regular expression matching if a more complex pattern matching is required. Additionally, if a list of strings representing statuses is given, the type `list` can be used.

New in version 3000.

**Note:** Despite the name of `match_type` for this argument, this setting actually uses Python’s `re.search()` function rather than Python’s `re.match()` function.

If both `match` and `status` options are set, both settings will be checked. However, note that if only one option is `True` and the other is `False`, then `False` will be returned. If this case is reached, the comments in the return data will contain troubleshooting information.

For more information about the `http.query` state, refer to the [HTTP Tutorial](#).

```python
query_example:
http.query:
- name: 'http://example.com/
- status: 200

query_example2:
http.query:
- name: 'http://example.com/
- status:
  - 200
  - 201
- status_type: list
```

salt.states.http.wait_for_successful_query(*name, wait_for=300, **kwargs*)

Like query but, repeat and wait until match/match_type or status is fulfilled. State returns result from last query state in case of success or if no successful query was made within `wait_for` timeout.

**name**  The name of the query.

**wait_for**  Total time to wait for requests that succeed.

**request_interval**  Optional interval to delay requests by N seconds to reduce the number of requests sent.

**Note:** All other arguments are passed to the http.query state.
23.19.62  salt.states.idem

Idem Support

This state provides access to idem states

New in version 3002.

```
salt.states.idem.state(name, sls, acct_file=None, acct_key=None, acct_profile=None, cache_dir=None, render=None, runtime=None, source_dir=None, test=False)
```

Execute an idem sls file through a salt state

- **sls** A list of idem sls files or sources
- **acct_file** Path to the acct file used in generating idem ctx parameters. Defaults to the value in the ACCT_FILE environment variable.
- **acct_key** Key used to decrypt the acct file. Defaults to the value in the ACCT_KEY environment variable.
- **acct_profile** Name of the profile to add to idem's ctx.acct parameter. Defaults to the value in the ACCT_PROFILE environment variable.
- **cache_dir** The location to use for the cache directory
- **render** The render pipe to use, this allows for the language to be specified (jinja|yaml)
- **runtime** Select which execution runtime to use (serial|parallel)
- **source_dir** The directory containing sls files

```
cheese:
    idem.state:
      - runtime: parallel
      - sls:
        - idem_state.sls
        - sls_source
```

Maturity  new

Depends  acct, pop, pop-config, idem

Platform  all

23.19.63  salt.states.ifttt

Trigger an event in IFTTT

This state is useful for trigging events in IFTTT.

New in version 2015.8.0.

```
ifttt-event:
  ifttt.trigger_event:
    - event: TestEvent
    - value1: 'This state was executed successfully.'
    - value2: 'Another value we can send.'
    - value3: 'A third value we can send.'
```

The api key can be specified in the master or minion configuration like below:

```
ifttt: secret_key: bzMRb-KKIAaNOwKEEw792J7Eb-B3z7muhdlhYblJn4V6
```
salt.states.ifttt.trigger_event(name, event, value1=None, value2=None, value3=None)

Trigger an event in IFTTT

```py
ifttt_event:
  ifttt.trigger_event:
    - event: TestEvent
    - value1: 'A value that we want to send.'
    - value2: 'A second value that we want to send.'
    - value3: 'A third value that we want to send.'
```

The following parameters are required:

- **name** The unique name for this event.
- **event** The name of the event to trigger in IFTTT.

The following parameters are optional:

- **value1** One of the values that we can send to IFTTT.
- **value2** One of the values that we can send to IFTTT.
- **value3** One of the values that we can send to IFTTT.

### 23.19.64 salt.states.incron

**Management of incron, the inotify cron**

The incron state module allows for user incrontabs to be cleanly managed.

Incron declarations require a number of parameters. The parameters needed to be declared: `path`, `mask`, and `cmd`. The `user` whose incrontab is to be edited also needs to be defined.

When making changes to an existing incron job, the `path` declaration is the unique factor, so if an existing cron that looks like this:

```bash
Watch for modifications in /home/user:
  incron.present:
    - user: root
    - path: /home/user
    - mask: - IN_MODIFY
    - cmd: 'echo "$$ $@"'
```

Is changed to this:

```bash
Watch for modifications and access in /home/user:
  incron.present:
    - user: root
    - path: /home/user
    - mask: - IN_MODIFY
    - cmd: 'echo "$$ $@"'
```

Then the existing cron will be updated, but if the cron command is changed, then a new cron job will be added to the user’s crontab.

New in version 0.17.0.
salt.states.incron.absent(name, path, mask, cmd, user='root')
Verifies that the specified incron job is absent for the specified user; only the name is matched when removing a incron job.

name Unique comment describing the entry
path The path that should be watched
user The name of the user who's crontab needs to be modified, defaults to the root user
mask The mask of events that should be monitored for

salt.states.incron.present(name, path, mask, cmd, user='root')
Verifies that the specified incron job is present for the specified user. For more advanced information about what exactly can be set in the cron timing parameters, check your incron system's documentation. Most Unix-like systems' incron documentation can be found via the incrontab man page: man 5 incrontab.

name Unique comment describing the entry
path The path that should be watched
user The name of the user who's crontab needs to be modified, defaults to the root user
mask The mask of events that should be monitored for

23.19.65 salt.states.influxdb08_database

Management of Influxdb 0.8 databases
(compatible with InfluxDB version 0.5-0.8)
New in version 2014.7.0.

salt.states.influxdb08_database.absent(name, user=None, password=None, host=None, port=None)
Ensure that the named database is absent

name The name of the database to remove
user The user to connect as (must be able to remove the database)
password The password of the user
host The host to connect to
port The port to connect to

salt.states.influxdb08_database.present(name, user=None, password=None, host=None, port=None)
Ensure that the named database is present

name The name of the database to create
user The user to connect as (must be able to remove the database)
password The password of the user
host The host to connect to
port The port to connect to
23.19.66 salt.states.influxdb08_user

Management of InfluxDB 0.8 users

(compatible with InfluxDB version 0.5-0.8)
New in version 2014.7.0.

salt.states.influxdb08_user.absent(name, database=None, user=None, password=None, host=None, port=None)

Ensure that the named cluster admin or database user is absent.

name The name of the user to remove

database The database to remove the user from

user The user to connect as (must be able to remove the user)

password The password of the user

host The host to connect to

port The port to connect to

salt.states.influxdb08_user.present(name, passwd, database=None, user=None, password=None, host=None, port=None)

Ensure that the cluster admin or database user is present.

name The name of the user to manage

passwd The password of the user

database The database to create the user in

user The user to connect as (must be able to create the user)

password The password of the user

host The host to connect to

port The port to connect to

23.19.67 salt.states.influxdb_continuous_query

Management of Influxdb continuous queries

New in version 2017.7.0.

(compatible with InfluxDB version 0.9+)

salt.states.influxdb_continuous_query.absent(name, database, **client_args)

Ensure that given continuous query is absent.

name Name of the continuous query to remove.

database Name of the database that the continuous query was defined on.

salt.states.influxdb_continuous_query.present(name, database, query, resample_time=None, coverage_period=None, **client_args)

Ensure that given continuous query is present.

name Name of the continuous query to create.

database Database to create continuous query on.
query  The query content
resample_time  [None] Duration between continuous query resampling.
coverage_period  [None] Duration specifying time period per sample.

23.19.68  salt.states.influxdb_database

Management of Influxdb databases

(compatible with InfluxDB version 0.9+)

salt.states.influxdb_database.absent(name, **client_args)
   Ensure that given database is absent.
   name  Name of the database to remove.

salt.states.influxdb_database.present(name, **client_args)
   Ensure that given database is present.
   name  Name of the database to create.

23.19.69  salt.states.influxdb_retention_policy

Management of Influxdb retention policies

New in version 2017.7.0.

(compatible with InfluxDB version 0.9+)

salt.states.influxdb_retention_policy.absent(name, database, **client_args)
   Ensure that given retention policy is absent.
   name  Name of the retention policy to remove.
   database  Name of the database that the retention policy was defined on.

salt.states.influxdb_retention_policy.convert_duration(duration)
   Convert the a duration string into XXhYYmZZs format
   duration  Duration to convert

Returns: duration_string  String representation of duration in XXhYYmZZs format

salt.states.influxdb_retention_policy.present(name, database, duration='7d', replication=1, default=False, **client_args)
   Ensure that given retention policy is present.
   name  Name of the retention policy to create.
   database  Database to create retention policy on.
23.19.70  salt.states.influxdb_user

Management of InfluxDB users

(compatible with InfluxDB version 0.9+)

```python
salt.states.influxdb_user.absent(name, **client_args)
   Ensure that given user is absent.
   name The name of the user to manage
```

```python
salt.states.influxdb_user.present(name, passwd, admin=False, grants=None, **client_args)
   Ensure that given user is present.
   name Name of the user to manage
   passwd Password of the user
   admin [False] Whether the user should have cluster administration privileges or not.
   grants Optional - Dict of database:privilege items associated with the user. Example:
      grants: foo_db: read bar_db: all
```

Example:

```python
example user present in influxdb:
influxdb_user.present:
   - name: example
   - passwd: somepassword
   - admin: False
   - grants:
      foo_db: read
      bar_db: all
```

23.19.71  salt.states.infoblox_a

Infoblox A record management.

functions accept api_opts:

api_verifyssl: verify SSL [default to True or pillar value]
api_url: server to connect to [default to pillar value]
api_username: [default to pillar value]
api_password: [default to pillar value]

```python
salt.states.infoblox_a.absent(name=None, ipv4addr=None, **api_opts)
   Ensure infoblox A record is removed.
```

State example:

```python
infoblox_a.absent:
   - name: example-ha-0.domain.com

infoblox_a.absent:
   - name:
   - ipv4addr: 127.0.23.23
```

```python
salt.states.infoblox_a.present(name=None, ipv4addr=None, data=None, ensure_data=True, **api_opts)
   Ensure infoblox A record.
```
When you wish to update a hostname ensure `name` is set to the hostname of the current record. You can give a new name in the `data.name`.

State example:

```yaml
infoblox_a.present:
  - name: example-ha-0.domain.com
  - data:
    name: example-ha-0.domain.com
    ipv4addr: 123.0.31.2
    view: Internal
```

### 23.19.72 salt.states.infoblox_cname

Infoblox CNAME management.

functions accept `api_opts`:

- `api_verifyssl`: verify SSL [default to True or pillar value]
- `api_url`: server to connect to [default to pillar value]
- `api_username`: [default to pillar value]
- `api_password`: [default to pillar value]

`salt.states.infoblox_cname.absent(name=None, canonical=None, **api_opts)`

Ensure the CNAME with the given name or canonical name is removed.

`salt.states.infoblox_cname.present(name=None, data=None, ensure_data=True, **api_opts)`

Ensure the CNAME with the given data is present.

- `name` CNAME of record
- `data` raw CNAME api data see: [https://INFOBLOX/wapidoc](https://INFOBLOX/wapidoc)

State example:

```yaml
infoblox_cname.present:
  - name: example-ha-0.domain.com
  - data:
    name: example-ha-0.domain.com
    canonical: example.domain.com
    zone: example.com
    view: Internal
    comment: Example comment

infoblox_cname.present:
  - name: example-ha-0.domain.com
  - data:
    name: example-ha-0.domain.com
    canonical: example.domain.com
    zone: example.com
    view: Internal
    comment: Example comment
    api_url: https://INFOBLOX/wapi/v1.2.1
    api_username: username
    api_password: passwd
```
23.19.73  salt.states.infoblox_host_record

Infoblox host record management.

functions accept api_opts:

  api_verifyssl: verify SSL [default to True or pillar value]
  api_url: server to connect to [default to pillar value]
  api_username: [default to pillar value]
  api_password: [default to pillar value]

salt.states.infoblox_host_record.absent(name=None, ipv4addr=None, mac=None, **api_opts)

Ensure the host with the given Name ipv4addr or mac is removed.

State example:

```
saltstates_infoblox_host_record.absent:
  - name: hostname.of.record.to.remove
saltstates_infoblox_host_record.absent:
  - name: 
    - ipv4addr: 192.168.0.1
saltstates_infoblox_host_record.absent:
  - name: 
    - mac: 12:02:12:31:23:43
```

salt.states.infoblox_host_record.present(name=None, data=None, ensure_data=True, **api_opts)

This will ensure that a host with the provided name exists. This will try to ensure that the state of the host matches the given data If the host is not found then one will be created.

When trying to update a hostname ensure name is set to the hostname of the current record. You can give a new name in the data.name.

Avoid race conditions, use func:nextavailableip:

- func:nextavailableip:network/ZG54dfgsrDFEFfsfsLzA:10.0.0.0/8/default
- func:nextavailableip:10.0.0.0/8
- func:nextavailableip:10.0.0.0/8,externalconfigure_for_dns
- func:nextavailableip:10.0.3-10.0.0.10

State Example:

```
# this would update 'original_hostname.example.ca' to changed 'data'.

infoblox_host_record.present:
  - name: original_hostname.example.ca
  - data: {'namhostname.example.ca': 'hostname.example.ca',
           'aliases': ['hostname.math.example.ca'],
           'extattrs': [{'Business Contact': {'value': 'EXAMPLE@example.ca'}},
                        {'configure_for_dhcp': True},
                        {'ipv4addr': 'func:nextavailableip:129.97.139.0/24',
                         'ipv4addr': 'func:nextavailableip:129.97.139.0/24',
                         'mac': '00:50:56:84:6e:ae']},
  'ipv6addrs': [],
```
23.19.74 salt.states.infoblox_range

Infoblox host record management.

Functions accept api_opts:

api_verifyssl: verify SSL [default to True or pillar value]
api_url: server to connect to [default to pillar value]
api_username: [default to pillar value]
api_password: [default to pillar value]

salt.states.infoblox_range.absent(name=None, start_addr=None, end_addr=None, data=None, **api_opts)

Ensure the range is removed
Supplying the end of the range is optional.

State example:

```yaml
infoblox_range.absent:
  - name: 'vlan10'

infoblox_range.absent:
  - name: 
  - start_addr: 127.0.1.20

infoblox_range.absent
  ```

salt.states.infoblox_range.present(name=None, start_addr=None, end_addr=None, data=None, **api_opts)

Ensure range record is present.

infoblox_range.present: start_addr: '129.97.150.160', end_addr: '129.97.150.170',

Verbose state example:

```yaml
infoblox_range.present:
  data: {
    'always_update_dns': False,
    'authority': False,
    'comment': 'range of IP addresses used for salt.. was used for ghost images deployment',
    'ddns_generate_hostname': True,
    'deny_all_clients': False,
    'deny_bootp': False,
    'disable': False,
    'email_list': [],
    'enable_ddns': False,
    'enable_dhcp_thresholds': False,
    'enable_email_warnings': False,
    'enable_ifmap_publishing': False,
    'enable_snmp_warnings': False,
    'end_addr': '129.97.150.169',
    'exclude': [],
    'extattrs': {},
    'fingerprint_filter_rules': [],
    'high_water_mark': 95,
    'high_water_mark_reset': 85,
    'ignore_dhcp_option_list_request': False,
    'lease_scavenge_time': -1,
    'logic_filter_rules': [],
    'low_water_mark': 0,
    'low_water_mark_reset': 10,
    'mac_filter_rules': [],
  }
```

(continues on next page)
23.19.75  salt.states.ini_manage

Manage ini files

maintainer  <akilesh1597@gmail.com>
maturity  new
depends  re
platform  all
salt.states.ini_manage.options_absent(name, sections=None, separator='=')

```
/home/saltminion/api-paste.ini:
ini.options_absent:

(continues on next page)```
- separator: '='
- sections:
  test:
    - testkey
    - secondoption
  test1:
    - testkey1

options present in file and not specified in sections dict will be untouched
changes dict will contain the list of changes made

salt.states.ini_manage.options_present(name, sections=None, separator='=', strict=False)

/home/saltminion/api-paste.ini:
in.options_present:
  - separator: '='
  - strict: True
  - sections:
    test:
      testkey: 'testval'
      secondoption: 'secondvalue'
    test1:
      testkey1: 'testval121'

options present in file and not specified in sections dict will be untouched, unless strict: True flag is used
changes dict will contain the list of changes made

salt.states.ini_manage.sections_absent(name, sections=None, separator='=')

/home/saltminion/api-paste.ini:
in.sections_absent:
  - separator: '='
  - sections:
    - test
    - test1

options present in file and not specified in sections will be deleted changes dict will contain the sections that changed

salt.states.ini_manage.sections_present(name, sections=None, separator='=')

/home/saltminion/api-paste.ini:
in.sections_present:
  - separator: '='
  - sections:
    - section_one
    - section_two

This will only create empty sections. To also create options, use options_present state

options present in file and not specified in sections will be deleted changes dict will contain the sections that changed
23.19.76 salt.states.ipmi

Manage IPMI devices over LAN

The following configuration defaults can be defined in the minion, master config or pillar:

```yaml
ipmi.config:
  api_host: 127.0.0.1
  api_user: admin
  api_pass: apassword
  api_port: 623
  api_kg: None
```

Every call can override the config defaults:

```yaml
ensure myipmi system is set to network boot:
  ipmi.boot_device:
    - name: network
    - api_host: myipmi.hostname.com
    - api_user: root
    - api_pass: apassword
    - api_kg: None

ensure myipmi system is powered on:
  ipmi.power:
    - name: boot
    - api_host: myipmi.hostname.com
    - api_user: root
    - api_pass: apassword
```

`salt.states.ipmi.boot_device(name='default', **kwargs)
``
Request power state change

   name = default

   • network -- Request network boot
   • hd -- Boot from hard drive
   • safe -- Boot from hard drive, requesting 'safe mode'
   • optical -- boot from CD/DVD/BD drive
   • setup -- Boot into setup utility
   • default -- remove any IPMI directed boot device request

`kwargs`

   • api_host=localhost
   • api_user=admin
   • api_pass=
   • api_port=623
   • api_kg= None

`salt.states.ipmi.power(name='power_on', wait=300, **kwargs)
``
Request power state change

   name
Ensure power state one of:

- power_on -- system turn on
- power_off -- system turn off (without waiting for OS)
- shutdown -- request OS proper shutdown
- reset -- reset (without waiting for OS)
- boot -- If system is off, then 'on', else 'reset'

wait wait X seconds for the job to complete before forcing. (defaults to 300 seconds)

kwargs

- api_host=localhost
- api_user=admin
- api_pass=
- api_port=623
- api_kg=None

salt.states.ipmi.user_absent(name, channel=14, **kwargs)

Remove user Delete all user (uid) records having the matching name.

name string name of user to delete

channel channel to remove user access from defaults to 14 for auto.

kwargs

- api_host=localhost
- api_user=admin
- api_pass=
- api_port=623
- api_kg=None

salt.states.ipmi.user_present(name, uid, password, channel=14, callback=False, link_auth=True, ipmi_msg=True, privilege_level='administrator', **kwargs)

Ensure IPMI user and user privileges.

name name of user (limit 16 bytes)

uid user id number (1 to 7)

password user password (limit 16 bytes)

channel ipmi channel defaults to 14 for auto

callback User Restricted to Callback

False = User Privilege Limit is determined by the User Privilege Limit parameter privilege_level, for both callback and non-callback connections.

True = User Privilege Limit is determined by the privilege_level parameter for callback connections, but is restricted to Callback level for non-callback connections. Thus, a user can only initiate a Callback when they 'call in' to the BMC, but once the callback connection has been made, the user could potentially establish a session as an Operator.
**link_auth** User Link authentication True/False user name and password information will be used for link authentication, e.g. PPP CHAP) for the given channel. Link authentication itself is a global setting for the channel and is enabled/disabled via the serial/modem configuration parameters.

**ipmi_msg** User IPMI Messaging True/False user name and password information will be used for IPMI Messaging. In this case, 'IPMI Messaging' refers to the ability to execute generic IPMI commands that are not associated with a particular payload type. For example, if IPMI Messaging is disabled for a user, but that user is enabled for activating the SOL payload type, then IPMI commands associated with SOL and session management, such as Get SOL Configuration Parameters and Close Session are available, but generic IPMI commands such as Get SEL Time are unavailable.) ipmi_msg

**privilege_level**
- callback
- user
- operator
- administrator
- proprietary
- no_access

**kwargs**
- api_host=localhost
- api_user=admin
- api_pass=
- api_port=623
- api_kg=None

### 23.19.77 salt.states.ipset

**Management of ipsets**

This is an ipset-specific module designed to manage IPSets for use in IPTables Firewalls.

```
setname:
    ipset.set_present:
        - set_type: bitmap:ip
        - range: 192.168.0.0/16
        - comment: True

setname:
    ipset.set_absent:
        - set_type: bitmap:ip
        - range: 192.168.0.0/16
        - comment: True

setname_entries:
    ipset.present:
        - set_name: setname
        - entry: 192.168.0.3
        - comment: Hello
        - require:
```

(continues on next page)
- **ipset**: baz

```
setname_entries:
ipset.present:
  - **set_name**: setname
  - **entry**:
    - 192.168.0.3
    - 192.168.1.3
  - **comment**: Hello
  - **require**:
    - **ipset**: baz

setname_entries:
ipset.absent:
  - **set_name**: setname
  - **entry**:
    - 192.168.0.3
    - 192.168.1.3
  - **comment**: Hello
  - **require**:
    - **ipset**: baz
```

**salt.states.ipset.absent**(name, entry=None, entries=None, family='ipv4', **kwargs)

New in version 2014.7.0.

Remove a entry or entries from a chain

- **name** A user-defined name to call this entry by in another part of a state or formula. This should not be an actual entry.
- **family** Network family, ipv4 or ipv6.

**salt.states.ipset.flush**(name, family='ipv4', **kwargs)

New in version 2014.7.0.

Flush current ipset set

- **family** Networking family, either ipv4 or ipv6

**salt.states.ipset.present**(name, entry=None, family='ipv4', **kwargs)

New in version 2014.7.0.

Append a entry to a set

- **name** A user-defined name to call this entry by in another part of a state or formula. This should not be an actual entry.
- **entry** A single entry to add to a set or a list of entries to add to a set
- **family** Network family, ipv4 or ipv6.

**salt.states.ipset.set_absent**(name, family='ipv4', **kwargs)

New in version 2014.7.0.

Verify the set is absent.

- **family** Networking family, either ipv4 or ipv6
salt.states.ipset.set_present(name, set_type, family='ipv4', **kwargs)

New in version 2014.7.0.

Verify the set exists.

name A user-defined set name.

set_type The type for the set.

family Networking family, either ipv4 or ipv6

23.19.78 salt.states.jboss7

Manage JBoss 7 Application Server via CLI interface
New in version 2015.5.0.

This state uses the jboss-cli.sh script from a JBoss or Wildfly installation and parses its output to determine the execution result.

In order to run each state, a jboss_config dictionary with the following properties must be passed:

```
jboss:
  cli_path: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
  controller: 10.11.12.13:9999
  cli_user: 'jbossadm'
  cli_password: 'jbossadm'
```

If the controller doesn't require a password, then the cli_user and cli_password parameters are optional.

Since same dictionary with configuration will be used in all the states, it may be more convenient to move JBoss configuration and other properties to the pillar.

Example of application deployment from local filesystem:

```
application_deployed:
  jboss7.deployed:
  - salt_source:
      target_file: '/tmp/webapp.war'
  - jboss_config: {{ pillar['jboss'] }}
```

For the sake of brevity, examples for each state assume that jboss_config is contained in the pillar.

salt.states.jboss7.bindings_exist(name, jboss_config, bindings, profile=None)

Ensures that given JNDI binding are present on the server. If a binding doesn't exist on the server it will be created. If it already exists its value will be changed.

jboss_config: Dict with connection properties (see state description)

bindings: Dict with bindings to set.

profile: The profile name (domain mode only)

Example:

```
jndi_entries_created:
  jboss7.bindings_exist:
  - bindings:
      'java:global/sampleapp/environment': 'DEV'
      'java:global/sampleapp/configurationFile': '/var/opt/sampleapp/config.
    properties'
  - jboss_config: {{ pillar['jboss'] }}
```
salt.states.jboss7.datasource_exists(name, jboss_config, datasource_properties, recreate=False, profile=None)

Ensures that a datasource with given properties exist on the jboss instance. If datasource doesn’t exist, it is created, otherwise only the properties that are different will be updated.

name  Datasource property name
jboss_config  Dict with connection properties (see state description)
datasource_properties  Dict with datasource properties
recreate  [False] If set to True and datasource exists it will be removed and created again. However, if there are deployments that depend on the datasource, it will not me possible to remove it.
profile  [None] The profile name for this datasource (domain mode only)

Example:

```yaml
sampleDS:
  jboss7.datasource_exists:
    - recreate: False
    - datasource_properties:
      driver-name: mysql
      connection-url: 'jdbc:mysql://localhost:3306/sampleDatabase'
      jndi-name: 'java:jboss/datasources/sampleDS'
      user-name: sampleuser
      password: secret
      min-pool-size: 3
      use-java-context: True
    - jboss_config: {{ pillar['jboss'] }}
    - profile: full-ha
```

salt.states.jboss7.deployed(name, jboss_config, salt_source=None)

Ensures that the given application is deployed on server.

jboss_config: Dict with connection properties (see state description)
salt_source:

How to find the artifact to be deployed.

target_file: Where to look in the minion's file system for the artifact to be deployed (e.g. '/tmp/application-web-0.39.war'). When source is specified, also specifies where to save the retrieved file.
source: (optional) File on salt master (e.g. salt://application-web-0.39.war). If absent, no files will be retrieved and the artifact in target_file will be used for the deployment.
undeploy: (optional) Regular expression to match against existing deployments. When present, if there is a deployment that matches the regular expression, it will be undeployed before the new artifact is deployed.
undeploy_force: (optional) If True, the artifact will be undeployed although it has not changed.

Examples:

Deployment of a file from minion's local file system:

```yaml
application_deployed:
  jboss7.deployed:
    - salt_source:
      target_file: '/tmp/webapp.war'
    - jboss_config: {{ pillar['jboss'] }}
```
It is assumed that /tmp/webapp.war was made available by some other means. No applications will be undeployed; if an existing deployment that shares that name exists, then it will be replaced with the updated version.

Deployment of a file from the Salt master's file system:

```
application_deployed:
jboss7.deployed:
  salt_source:
    source: salt://application-web-0.39.war
    target_file: '/tmp/application-web-0.39.war'
    undeploy: 'application-web-.*'
  jboss_config: {{ pillar['jboss'] }}
```

Here, application-web-0.39.war file is downloaded from Salt file system to /tmp/application-web-0.39.war file on minion. Existing deployments are checked if any of them matches 'application-web-.*' regular expression, and if so then it is undeployed before deploying the application. This is useful to automate deployment of new application versions.

If the source parameter of salt_source is specified, it can use any protocol that the file states use. This includes not only downloading from the master but also HTTP, HTTPS, FTP, Amazon S3, and OpenStack Swift.

`salt.states.jboss7.reloaded(name, jboss_config, timeout=60, interval=5)`

Reloads configuration of jboss server.

- **jboss_config**: Dict with connection properties (see state description)
- **timeout**: Time to wait until jboss is back in running state. Default timeout is 60s.
- **interval**: Interval between state checks. Default interval is 5s. Decreasing the interval may slightly decrease waiting time but be aware that every status check is a call to jboss-cli which is a java process. If interval is smaller than process cleanup time it may easily lead to excessive resource consumption.

This step performs the following operations:
- Ensures that server is in running or reload-required state (by reading server-state attribute)
- Reloads configuration
- Waits for server to reload and be in running state

Example:

```
configuration_reloaded:
jboss7.reloaded:
  jboss_config: {{ pillar['jboss'] }}
```

23.19.79  `salt.states.junos`

State modules to interact with Junos devices.

- **maturity**: new
- **dependencies**: junos-eznc, jxmlease

Note: Those who wish to use junos-eznc (PyEZ) version >= 2.1.0, must use the latest salt code from github until the next release.

Refer to `junos` for information on connecting to junos proxy.
salt.states.junos.cli(name, **kwargs)
Executes the CLI commands and returns the text output.

```python
show version:
junos.cli:
  - format: xml

get software version of device:
junos.cli:
  - name: show version
  - format: text
  - dest: /home/user/show_version.log
```

Parameters

- **Required** --
  - name: The command that need to be executed on Junos CLI (default = None)

- **Optional** --
  - kwargs: Keyworded arguments which can be provided like-
    - format: Format in which to get the CLI output. (text or xml, default = 'text')
    - timeout: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
    - dest: The destination file where the CLI output can be stored. (default = None)

salt.states.junos.commit(name, **kwargs)
Commits the changes loaded into the candidate configuration.

```python
commit the changes:
junos.commit:
  - confirm: 10
```

Parameters **Optional** --

- kwargs: Keyworded arguments which can be provided like-
  - timeout: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
  - comment: Provide a comment to the commit. (default = None)
  - confirm: Provide time in minutes for commit confirmation. If this option is specified, the commit will be rollbacked in the given time unless the commit is confirmed.
  - sync: On dual control plane systems, requests that the candidate configuration on one control plane be copied to the other control plane, checked for correct syntax, and committed on both Routing Engines. (default = False)
  - force_sync: On dual control plane systems, force the candidate configuration on one control plane to be copied to the other control plane.
  - full: When set to True requires all the daemons to check and evaluate the new configuration.
  - detail: When true return commit detail.
salt.states.junos.commit_check(name)
Perform a commit check on the configuration.

```python
perform commit check:
    junos.commit_check
```

salt.states.junos.diff(name, d_id=0, **kwargs)
Changed in version 3001.

Gets the difference between the candidate and the current configuration.

```python
get the diff:
    junos.diff:
        - d_id: 10
```

Parameters Optional --
- d_id: The rollback diff id (d_id) value [0-49]. (default = 0)

salt.states.junos.file_copy(name, dest=None, **kwargs)
Copies the file from the local device to the junos device.

```python
/home/m2/info.txt:
    junos.file_copy:
        - dest: info_copy.txt
```

Parameters Required --
- name: The source path where the file is kept.
- dest: The destination path where the file will be copied.

salt.states.junos.get_table(name, table, table_file, **kwargs)
New in version 3001.

Retrieve data from a Junos device using Tables/Views

```python
get route details:
    junos.get_table:
        - table: RouteTable
        - table_file: routes.yml

get interface details:
    junos.get_table:
        - table: EthPortTable
        - table_file: ethport.yml
        - table_args:
            interface_name: ge-0/0/0
```

name (required) task definition
table (required) Name of PyEZ Table
file YAML file that has the table specified in table parameter
path: Path of location of the YAML file. defaults to op directory in jnpr.junos.op
target: if command need to run on FPC, can specify fpc target
key: To overwrite key provided in YAML
key_items: To select only given key items
filters: To select only filter for the dictionary from columns
template_args: key/value pair which should render Jinja template command

**salt.states.junos**.install_config(name, **kwargs)

Loads and commits the configuration provided.

```python
Install the mentioned config:
    junos.install_config:
        - name: salt://configs/interface.set
        - timeout: 100
        - diffs_file: '/var/log/diff'
```

```python
Install the mentioned config:
    junos.install_config:
        - path: salt://configs/interface.set
        - timeout: 100
        - template_vars:
            interface_name: lo0
            description: Creating interface via SaltStack.
```

name Path where the configuration/template file is present. If the file has a *.conf extension, the content is treated as text format. If the file has a *.xml extension, the content is treated as XML format. If the file has a *.set extension, the content is treated as Junos OS set commands

template_vars The dictionary of data for the jinja variables present in the jinja template

timeout [30] Set NETCONF RPC timeout. Can be used for commands which take a while to execute.
overwrite [False] Set to True if you want this file is to completely replace the configuration file. Sets action to override

Note: This option cannot be used if format is "set".

merge [False] If set to True will set the load-config action to merge. the default load-config action is 'replace' for xml/json/text config

confirm Provide a comment to the commit. (default = None)

Note: The file will be stored on the proxy minion. To push the files to the master use cp.push.

**salt.states.junos**.install_os(name, **kwargs)

Installs the given image on the device. After the installation is complete the device is rebooted, if reboot=True is given as a keyworded argument.

```python
salt://images/junos_image.tgz:
    junos.install_os:
```

(continues on next page)
Parameters

- **Required**
  - name: Path where the image file is present on the proxy minion.

- **Optional**
  - kwargs: keyworded arguments to be given such as timeout, reboot etc
    - timeout: Set NETCONF RPC timeout. Can be used to RPCs which take a while to execute. (default = 30 seconds)
    - reboot: Whether to reboot after installation (default = False)
    - no_copy: When True the software package will not be SCP’d to the device. (default = False)

```
salt.states.junos.load(name, **kwargs)
```

Loads the configuration provided onto the junos device.

**Install the mentioned config:**

```
junos.load:
  - name: salt://configs/interface.set
```

**Install the mentioned config:**

```
junos.load:
  - name: salt://configs/interface.set
  - template_vars:
    - interface_name: lo0
    - description: Creating interface via SaltStack.
```

Sample template:

```
set interfaces {{ interface_name }} unit 0
```

**name** Path where the configuration/template file is present. If the file has a *conf extension, the content is treated as text format. If the file has a *xml extension, the content is treated as XML format. If the file has a *set extension, the content is treated as Junos OS set commands.

**overwrite** [False] Set to True if you want this file is to completely replace the configuration file.

**Note:** This option cannot be used if format is "set".

**merge** [False] If set to True will set the load-config action to merge. the default load-config action is 'replace' for xml/json/text config

**update** [False] Compare a complete loaded configuration against the candidate configuration. For each hierarchy level or configuration object that is different in the two configurations, the version in the loaded configuration replaces the version in the candidate configuration. When the configuration is later committed, only system processes that are affected by the changed configuration elements parse the new configuration. This action is supported from PyEZ 2.1 (default = False)
**template_vars** Variables to be passed into the template processing engine in addition to those present in __pillar__, __opts__, __grains__, etc. You may reference these variables in your template like so: {{ template_vars["var_name"] }}

salt.states.junos.lock(name)
Attempts an exclusive lock on the candidate configuration. This is a non-blocking call.

**Note:** Any user who wishes to use lock, must necessarily unlock the configuration too. Ensure `unlock` is called in the same orchestration run in which the lock is called.

```
lock the config:
  junos.lock
```

salt.states.junos.resultdecorator(function)

salt.states.junos.rollback(name, d_id, **kwargs)
Rollbacks the committed changes.

```
rollback the changes:
  junos.rollback:
    - id: 5
```

Parameters **Optional** --

- id:
- d_id: The rollback id value [0-49]. (default = 0) (this variable cannot be named id, it conflicts with the state compiler's internal id)
- kwargs: Keyworded arguments which can be provided like-
  - timeout: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
  - comment: Provide a comment to the commit. (default = None)
  - confirm: Provide time in minutes for commit confirmation. If this option is specified, the commit will be rollbacked in the given time unless the commit is confirmed.
  - diffs_file: Path to the file where any diffs will be written. (default = None)

salt.states.junos.rpc(name, dest=None, format='xml', args=None, **kwargs)
Executes the given rpc. The returned data can be stored in a file by specifying the destination path with dest as an argument

```
get-interface-information:
  junos.rpc:
    - dest: /home/user/rpc.log
    - interface_name: lo0

get interface information with terse:
  junos.rpc:
    - name: get-interface-information
    - terse: True
```

Parameters
• **Required**
  - name: The rpc to be executed. (default = None)

• **Optional**
  - dest: Destination file where the rpc output is stored. (default = None) Note that the file will be stored on the proxy minion. To push the files to the master use the salt's following execution module: \texttt{cp.push}
  - format: The format in which the rpc reply must be stored in file specified in the dest (used only when dest is specified) (default = xml)
  - kwargs: Keyworded arguments taken by rpc call like-
    - timeout: 30 Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default= 30 seconds)
    - filter: Only to be used with 'get-config' rpc to get specific configuration.
    - terse: Amount of information you want.
    - interface_name: Name of the interface whose information you want.

\texttt{salt.states.junos.set_hostname(name, **kwargs)}
Changes the hostname of the device.

```python
device_name:
junos.set_hostname:
  - comment: "Host-name set via saltstack."
```

**Parameters**

• **Required**
  - name: The name to be set. (default = None)

• **Optional**
  - kwargs: Keyworded arguments which can be provided like-
    - timeout: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
    - comment: Provide a comment to the commit. (default = None)
    - confirm: Provide time in minutes for commit confirmation. If this option is specified, the commit will be rollbacked in the given time unless the commit is confirmed.

\texttt{salt.states.junos.shutdown(name, **kwargs)}
Shuts down the device.

```python
shut the device:
  junos.shutdown:
    - in_min: 10
```

**Parameters**

**Optional**

• kwargs:
  - reboot: Whether to reboot instead of shutdown. (default=False)
- **at**: Specify time for reboot. (To be used only if reboot=yes)
- **in_min**: Specify delay in minutes for shutdown

**salt.states.junos.unlock**(*name*)

Unlocks the candidate configuration.

```python
unlock the config:
    junos.unlock
```

**salt.states.junos.zeroize**(*name*)

Resets the device to default factory settings.

```python
reset my device:
    junos.zeroize
```

**name**: can be anything

---

### 23.19.80 salt.states.kernelpkg

Manage kernel packages and active kernel version

Example state to install the latest kernel from package repositories:

```python
install-latest-kernel:
    kernelpkg.latest_installed: []
```

Example state to boot the system if a new kernel has been installed:

```python
boot-latest-kernel:
    kernelpkg.latest_active:
        - at_time: 1
```

Example state chaining the install and reboot operations:

```python
install-latest-kernel:
    kernelpkg.latest_installed: []

boot-latest-kernel:
    kernelpkg.latest_active:
        - at_time: 1
        - onchanges:
            - kernelpkg: install-latest-kernel
```

Chaining can also be achieved using wait/listen requisites:

```python
install-latest-kernel:
    kernelpkg.latest_installed: []

boot-latest-kernel:
    kernelpkg.latest_wait:
        - at_time: 1
        - listen:
            - kernelpkg: install-latest-kernel
```

**salt.states.kernelpkg.latest_active**(*name*, **at_time=None, **kwargs)

Initiate a reboot if the running kernel is not the latest one installed.
Note: This state does not install any patches. It only compares the running kernel version number to other kernel versions also installed in the system. If the running version is not the latest one installed, this state will reboot the system.

See `kernelpkg.upgrade` and `latest_installed()` for ways to install new kernel packages.

This module does not attempt to understand or manage boot loader configurations it is possible to have a new kernel installed, but a boot loader configuration that will never activate it. For this reason, it would not be advisable to schedule this state to run automatically.

Because this state function may cause the system to reboot, it may be preferable to move it to the very end of the state run. See `latest_wait()` for a waitable state that can be called with the `listen` requisite.

**name**  Arbitrary name for the state. Does not affect behavior.

**at_time**  The wait time in minutes before the system will be rebooted.

```python
salt.states.kernelpkg.latest_installed(name, **kwargs)
```

Ensure that the latest version of the kernel available in the repositories is installed.

Note: This state only installs the kernel, but does not activate it. The new kernel should become active at the next reboot. See `kernelpkg.needs_reboot` for details on how to detect this condition, and `latest_active()` to initialize a reboot when needed.

**name**  Arbitrary name for the state. Does not affect behavior.

```python
salt.states.kernelpkg.latest_wait(name, at_time=None, **kwargs)
```

Initiate a reboot if the running kernel is not the latest one installed. This is the waitable version of `latest_active()` and will not take any action unless triggered by a watch or listen requisite.

Note: Because this state function may cause the system to reboot, it may be preferable to move it to the very end of the state run using `listen` or `listen_in` requisites.

```python
system-up-to-date:
  pkg.uptodate:
    - refresh: true

boot-latest-kernel:
  kernelpkg.latest_wait:
    - at_time: 1
    - listen:
      - pkg: system-up-to-date
```

**name**  Arbitrary name for the state. Does not affect behavior.

**at_time**  The wait time in minutes before the system will be rebooted.

```python
salt.states.kernelpkg.mod_watch(name, sfun, **kwargs)
```

Execute a kernelpkg state based on a watch or listen call.
### 23.19.81 salt.states.keyboard

**Management of keyboard layouts**

The keyboard layout can be managed for the system:

```
us:
  keyboard.system
```

Or it can be managed for XOrg:

```
us:
  keyboard.xorg
```

**salt.states.keyboard.system(name)**

Set the keyboard layout for the system

- **name** The keyboard layout to use

**salt.states.keyboard.xorg(name)**

Set the keyboard layout for XOrg

- **layout** The keyboard layout to use

### 23.19.82 salt.states.keystone

**Management of Keystone users**

**depends**

- keystoneclient Python module

**configuration** See `salt.modules.keystone` for setup instructions.

```
Keystone tenants:
  keystone.tenant_present:
    - names:
      - admin
      - demo
      - service

Keystone roles:
  keystone.role_present:
    - names:
      - admin
      - Member

admin:
  keystone.user_present:
    - password: R00T_4CC3SS
    - email: admin@domain.com
    - roles:
      admin: # tenants
      - admin  # roles
      service:
      - admin
      - Member
```

(continues on next page)
- require:
  - keystone: Keystone tenants
  - keystone: Keystone roles

nova:
  keystone.user_present:
    - password: '$up3rn0v4'
    - email: nova@domain.com
    - tenant: service
    - roles:
      - service:
        - admin
    - require:
      - keystone: Keystone tenants
      - keystone: Keystone roles

demo:
  keystone.user_present:
    - password: 'd3m0n$trati0n'
    - email: demo@domain.com
    - tenant: demo
    - roles:
      - demo:
        - Member
    - require:
      - keystone: Keystone tenants
      - keystone: Keystone roles

nova service:
  keystone.service_present:
    - name: nova
    - service_type: compute
    - description: OpenStack Compute Service

salt.states.keystone.endpoint_absent(name, region=None, profile=None, interface=None, **connection_args)

Ensure that the endpoint for a service doesn't exist in Keystone catalog

name The name of the service whose endpoints should not exist
region (optional) The region of the endpoint. Defaults to RegionOne.
interface The interface type, which describes the visibility of the endpoint. (for V3 API)

salt.states.keystone.endpoint_present(name, publicurl=None, internalurl=None, adminurl=None, region=None, profile=None, url=None, interface=None, **connection_args)

Ensure the specified endpoints exists for service

name The Service name
publicurl The public url of service endpoint (for V2 API)
internalurl The internal url of service endpoint (for V2 API)
adminurl The admin url of the service endpoint (for V2 API)
region The region of the endpoint
url The endpoint URL (for V3 API)
interface  The interface type, which describes the visibility of the endpoint. (for V3 API)

salt.states.keystone.project_absent(name, profile=None, **connection_args)
Ensure that the keystone project is absent. Alias for tenant_absent from V2 API to fulfill V3 API naming
convention.
New in version 2016.11.0.

name  The name of the project that should not exist

default_nova:
    keystone.project_absent:
      - name: nova

salt.states.keystone.project_present(name, description=None, enabled=True, profile=None, **connection_args)
Ensures that the keystone project exists Alias for tenant_present from V2 API to fulfill V3 API naming con-
vention.
New in version 2016.11.0.

name  The name of the project to manage

description  The description to use for this project

enabled  Availability state for this project

default:
    keystone.project_present:
      - enabled: True
      - description: 'Nova Compute Service'

salt.states.keystone.role_absent(name, profile=None, **connection_args)
Ensure that the keystone role is absent.

name  The name of the role that should not exist

salt.states.keystone.role_present(name, profile=None, **connection_args)
' Ensures that the keystone role exists

name  The name of the role that should be present

salt.states.keystone.service_absent(name, profile=None, **connection_args)
Ensure that the service doesn't exist in Keystone catalog

name  The name of the service that should not exist

salt.states.keystone.service_present(name, service_type, description=None, profile=None, **connection_args)
Ensure service present in Keystone catalog

name  The name of the service

service_type  The type of Openstack Service

description  (optional)  Description of the service

salt.states.keystone.tenant_absent(name, profile=None, **connection_args)
Ensure that the keystone tenant is absent.

name  The name of the tenant that should not exist

salt.states.keystone.tenant_present(name, description=None, enabled=True, profile=None, **connection_args)
Ensures that the keystone tenant exists
name The name of the tenant to manage

description The description to use for this tenant

enabled Availability state for this tenant

```
salt.states.keystone.user_absent(name, profile=None, **connection_args)
```
Ensure that the keystone user is absent.

name The name of the user that should not exist

```
salt.states.keystone.user_present(name, password, email, tenant=None, enabled=True, roles=None, profile=None, password_reset=True, project=None, **connection_args)
```
Ensure that the keystone user is present with the specified properties.

name The name of the user to manage

password The password to use for this user.

**Note:** If the user already exists and a different password was set for the user than the one specified here, the password for the user will be updated. Please set the `password_reset` option to `False` if this is not the desired behavior.

password_reset Whether or not to reset password after initial set. Defaults to `True`.

email The email address for this user

tenant The tenant (name) for this user

project The project (name) for this user (overrides tenant in api v3)

enabled Availability state for this user

roles The roles the user should have under given tenants. Passed as a dictionary mapping tenant names to a list of roles in this tenant, i.e.:

```
roles:
  admin:    # tenant
    - admin  # role
  service:
    - admin
    - Member
```

23.19.83 salt.states.keystone_domain

Management of OpenStack Keystone Domains

New in version 2018.3.0.

depends shade

configuration see `salt.modules.keystoneng` for setup instructions

Example States

```
create domain:
  keystone_domain.present:
    - name: domain1
```

(continues on next page)
create domain with optional params:
keystone_domain.present:
  - name: domain1
  - enabled: False
  - description: 'my domain'

delete domain:
keystone_domain.absent:
  - name: domain1

salt.states.keystone_domain.absent(name, auth=None)
   Ensure domain does not exist
    name  Name of the domain

salt.states.keystone_domain.present(name, auth=None, **kwargs)
   Ensure domain exists and is up-to-date
    name  Name of the domain
     enabled  Boolean to control if domain is enabled
      description  An arbitrary description of the domain

23.19.84  salt.states.keystone_endpoint

Management of OpenStack Keystone Endpoints

New in version 2018.3.0.

depends  shade

configuration  see salt.modules.keystoneng for setup instructions

Example States

create endpoint:
keystone_endpoint.present:
  - name: public
  - url: https://example.org:9292
  - region: RegionOne
  - service_name: glance

destroy endpoint:
keystone_endpoint.absent:
  - name: public
  - url: https://example.org:9292
  - region: RegionOne
  - service_name: glance

create multiple endpoints:
keystone_endpoint.absent:
  - names:
    - public
    - admin
    - internal
    - url: https://example.org:9292

(continues on next page)
- region: RegionOne
  - service_name: glance

salt.states.keystone_endpoint.absent(name, service_name, auth=None, **kwargs)
Ensure an endpoint does not exists

  name  Interface name
  url  URL of the endpoint
  service_name  Service name or ID
  region  The region name to assign the endpoint

salt.states.keystone_endpoint.present(name, service_name, auth=None, **kwargs)
Ensure an endpoint exists and is up-to-date

  name  Interface name
  url  URL of the endpoint
  service_name  Service name or ID
  region  The region name to assign the endpoint
  enabled  Boolean to control if endpoint is enabled

23.19.85  salt.states.keystone_group

Management of OpenStack Keystone Groups

New in version 2018.3.0.

  depends  shade
  configuration  see salt.modules.keystoneng for setup instructions

Example States

create group:
  keystone_group.present:
    - name: group1

delete group:
  keystone_group.absent:
    - name: group1

create group with optional params:
  keystone_group.present:
    - name: group1
    - domain: domain1
    - description: 'my group'

salt.states.keystone_group.absent(name, auth=None, **kwargs)
Ensure group does not exist

  name  Name of the group
  domain  The name or id of the domain
salt.states.keystone_group.present(name, auth=None, **kwargs)
   Ensure an group exists and is up-to-date
   name  Name of the group
   domain The name or id of the domain
   description An arbitrary description of the group

23.19.86 salt.states.keystone_project

Management of OpenStack Keystone Projects

New in version 2018.3.0.
   depends  shade
   configuration see salt.modules.keystoneng for setup instructions

Example States

```
create project:
   keystone_project.present:
      - name: project1

delete project:
   keystone_project.absent:
      - name: project1

create project with optional params:
   keystone_project.present:
      - name: project1
      - domain: domain1
      - enabled: False
      - description: 'my project'
```

salt.states.keystone_project.absent(name, auth=None, **kwargs)
   Ensure a project does not exists
   name  Name of the project
   domain The name or id of the domain

salt.states.keystone_project.present(name, auth=None, **kwargs)
   Ensure a project exists and is up-to-date
   name  Name of the project
   domain The name or id of the domain
   description An arbitrary description of the project
23.19.87 salt.states.keystone_role

Management of OpenStack Keystone Roles

New in version 2018.3.0.

depends shade

configuration see salt.modules.keystoneng for setup instructions

Example States

```yaml
create role:
  keystone_role.present:
    - name: role1

delete role:
  keystone_role.absent:
    - name: role1

create role with optional params:
  keystone_role.present:
    - name: role1
      description: 'my group'
```

salt.states.keystone_role.absent(name, auth=None, **kwargs)
Ensure role does not exist

  name Name of the role

salt.states.keystone_role.present(name, auth=None, **kwargs)
Ensure an role exists

  name Name of the role
  description An arbitrary description of the role

23.19.88 salt.states.keystone_role_grant

Management of OpenStack Keystone Role Grants

New in version 2018.3.0.

depends shade

configuration see salt.modules.keystoneng for setup instructions

Example States

```yaml
create group:
  keystone_group.present:
    - name: group1

delete group:
  keystone_group.absent:
    - name: group1

create group with optional params:
  keystone_group.present:
```

(continues on next page)
- name: group1
- domain: domain1
- description: 'my group'

salt.states.keystone_role_grant.absent(name, auth=None, ""kwargs)
salt.states.keystone_role_grant.present(name, auth=None, ""kwargs)

23.19.89 salt.states.keystone_service

Management of OpenStack Keystone Services

New in version 2018.3.0.

depends shade

configuration see salt.modules.keystoneng for setup instructions

Example States

create service:
  keystone_service.present:
    - name: glance
    - type: image

delete service:
  keystone_service.absent:
    - name: glance

create service with optional params:
  keystone_service.present:
    - name: glance
    - type: image
    - enabled: False
    - description: 'OpenStack Image'

salt.states.keystone_service.absent(name, auth=None)
   Ensure service does not exist

  name  Name of the service

salt.states.keystone_service.present(name, auth=None, ""kwargs)
   Ensure an service exists and is up-to-date

  name  Name of the service

  type  Service type

  enabled  Boolean to control if service is enabled

  description  An arbitrary description of the service
23.19.90  salt.states.keystone_user

Management of OpenStack Keystone Users

New in version 2018.3.0.

depends  shade

configuration  see salt.modules.keystoneng for setup instructions

Example States

```
create user:
    keystone_user.present:
        - name: user1

delete user:
    keystone_user.absent:
        - name: user1

create user with optional params:
    keystone_user.present:
        - name: user1
        - domain: domain1
        - enabled: False
        - password: password123
        - email: "user1@example.org"
        - description: 'my user'
```

salt.states.keystone_user.absent(name, auth=None, **kwargs)

Ensure user does not exists

name  Name of the user

domain  The name or id of the domain

salt.states.keystone_user.present(name, auth=None, **kwargs)

Ensure domain exists and is up-to-date

name  Name of the domain

domain  The name or id of the domain

enabled  Boolean to control if domain is enabled

description  An arbitrary description of the domain

password  The user password

e-mail  The users email address
23.19.91 salt.states.keystore

State management of a java keystore

```
salt.states.keystore.managed(name, passphrase, entries, force_remove=False)
```

- **name** The path to the keystore file
- **passphrase** The password to the keystore
- **entries** A list containing an alias, certificate, and optional private_key. The certificate and private_key can be a file or a string

```
- entries:
  - alias: hostname2
    certificate: /path/to/cert.crt
    private_key: /path/to/key.key
  - alias: stringhost
    certificate: |
    ------BEGIN CERTIFICATE-----
    MIICejCCAXsCAg36MA0GCSqGSIb3DQEBBQUAMIGbMQswCQYDVQQGEwJKUDEOMAwG...
    2VuKv4SwjFRorK1fILHx0qVviMhslNy2ioFLY7JcPZb+v3ftDGyWUqcBIveda0
    ------END CERTIFICATE------

  force_remove If True will cause the state to remove any entries found in the keystore which are not defined in the state. The default is False.
```

Example

```
define_keystore:
  keystore.managed:
    - name: /path/to/keystore
    - passphrase: changeit
    - force_remove: True
    - entries:
      - alias: hostname1
        certificate: /path/to/cert.crt
      - alias: remotehost
        certificate: /path/to/cert2.crt
        private_key: /path/to/key2.key
      - alias: pillarhost
        certificate: {{ salt.pillar.get('path:to:cert') }}
```

23.19.92 salt.states.kmod

Loading and unloading of kernel modules

The Kernel modules on a system can be managed cleanly with the kmod state module:

```
add_kvm:
  kmod.present:
    - name: kvm_amd
remove_beep:
  kmod.absent:
    - name: pcsprk
```
Multiple modules can be specified for both kmod.present and kmod.absent.

```yaml
add_sound:
  kmod.present:
    - mods:
      - snd_hda_codec_hdmi
      - snd_hda_codec
      - snd_hwdep
      - snd_hda_core
      - snd_pcm
      - snd_timer
      - snd
```

salt.states.kmod.absent(name, persist=False, comment=True, mods=None)
Verify that the named kernel module is not loaded

- **name** The name of the kernel module to verify is not loaded
- **persist** Remove module from /etc/modules
- **comment** Comment out module in /etc/modules rather than remove it
- **mods** A list of modules to verify are unloaded. If this argument is used, the `name` argument, although still required, is not used, and becomes a placeholder

New in version 2016.3.0.

salt.states.kmod.present(name, persist=False, mods=None)
Ensure that the specified kernel module is loaded

- **name** The name of the kernel module to verify is loaded
- **persist** Also add module to /etc/modules
- **mods** A list of modules to verify are loaded. If this argument is used, the `name` argument, although still required, is not used, and becomes a placeholder

New in version 2016.3.0.

23.19.93 salt.states.kubernetes

Manage kubernetes resources as salt states

NOTE: This module requires the proper pillar values set. See salt.modules.kubernetesmod for more information.

**Warning**: Configuration options will change in 2019.2.0.

The kubernetes module is used to manage different kubernetes resources.

```yaml
my-nginx:
  kubernetes.deployment_present:
    - namespace: default
      metadata:
        app: frontend
      spec:
        replicas: 1
        template:
          metadata:
```
labels:
  run: my-nginx
spec:
  containers:
  - name: my-nginx
    image: nginx
    ports:
      - containerPort: 80

my-mariadb:
  kubernetes.deployment_absent:
  - namespace: default

# kubernetes deployment as specified inside of
# a file containing the definition of the the
# deployment using the official kubernetes format
redis-master-deployment:
  kubernetes.deployment_present:
    - name: redis-master
    - source: salt://k8s/redis-master-deployment.yml
  require:
    - pip: kubernetes-python-module

# kubernetes service as specified inside of
# a file containing the definition of the the
# service using the official kubernetes format
redis-master-service:
  kubernetes.service_present:
    - name: redis-master
    - source: salt://k8s/redis-master-service.yml
  require:
    - kubernetes.deployment_present: redis-master

# kubernetes deployment as specified inside of
# a file containing the definition of the the
# deployment using the official kubernetes format
# plus some jinja directives
nginx-source-template:
  kubernetes.deployment_present:
    - source: salt://k8s/nginx.yml.jinja
    - template: jinja
  require:
    - pip: kubernetes-python-module

# Kubernetes secret
k8s-secret:
  kubernetes.secret_present:
    - name: top-secret
    - data:
      key1: value1
      key2: value2
      key3: value3

New in version 2017.7.0.

salt.states.kubernetes.configmap_absent(name, namespace='default', **kwargs)
Ensures that the named configmap is absent from the given namespace.
name  The name of the configmap
namespace  The namespace holding the configmap. The 'default' one is going to be used unless a different one is specified.
salt.states.kubernetes.configmap_present(name, namespace='default', data=None, source=None, template=None, **kwargs)
Ensures that the named configmap is present inside of the specified namespace with the given data. If the configmap exists it will be replaced.

name  The name of the configmap.
namespace  The namespace holding the configmap. The 'default' one is going to be used unless a different one is specified.
data  The dictionary holding the configmaps.
source  A file containing the data of the configmap in plain format.
template  Template engine to be used to render the source file.
salt.states.kubernetes.deployment_absent(name, namespace='default', **kwargs)
Ensures that the named deployment is absent from the given namespace.

name  The name of the deployment
namespace  The name of the namespace
salt.states.kubernetes.deployment_present(name, namespace='default', metadata=None, spec=None, source='', template='', **kwargs)
Ensures that the named deployment is present inside of the specified namespace with the given metadata and spec. If the deployment exists it will be replaced.

name  The name of the deployment.
namespace  The namespace holding the deployment. The 'default' one is going to be used unless a different one is specified.
metadata  The metadata of the deployment object.
spec  The spec of the deployment object.
source  A file containing the definition of the deployment (metadata and spec) in the official Kubernetes format.
template  Template engine to be used to render the source file.
salt.states.kubernetes.namespace_absent(name, **kwargs)
Ensures that the named namespace is absent.

name  The name of the namespace
salt.states.kubernetes.namespace_present(name, **kwargs)
Ensures that the named namespace is present.

name  The name of the namespace.
salt.states.kubernetes.node_label_absent(name, node, **kwargs)
Ensures that the named label is absent from the node.

name  The name of the label
node  The name of the node
salt.states.kubernetes.node_label_folder_absent(name, node, **kwargs)
Ensures the label folder doesn't exist on the specified node.

name  The name of label folder
node The name of the node

`salt.states.kubernetes.node_label_present(name, node, value, **kwargs)`
Ensures that the named label is set on the named node with the given value. If the label exists it will be replaced.

- **name** The name of the label.
- **value** Value of the label.
- **node** Node to change.

`salt.states.kubernetes.pod_absent(name, namespace='default', **kwargs)`
Ensures that the named pod is absent from the given namespace.

- **name** The name of the pod
- **namespace** The name of the namespace

`salt.states.kubernetes.pod_present(name, namespace='default', metadata=None, spec=None, source='', template='', **kwargs)`
Ensures that the named pod is present inside of the specified namespace with the given metadata and spec. If the pod exists it will be replaced.

- **name** The name of the pod.
- **namespace** The namespace holding the pod. The 'default' one is going to be used unless a different one is specified.
- **metadata** The metadata of the pod object.
- **spec** The spec of the pod object.
- **source** A file containing the definition of the pod (metadata and spec) in the official kubernetes format.
- **template** Template engine to be used to render the source file.

`salt.states.kubernetes.secret_absent(name, namespace='default', **kwargs)`
Ensures that the named secret is absent from the given namespace.

- **name** The name of the secret
- **namespace** The name of the namespace

`salt.states.kubernetes.secret_present(name, namespace='default', data=None, source=None, template=None, **kwargs)`
Ensures that the named secret is present inside of the specified namespace with the given data. If the secret exists it will be replaced.

- **name** The name of the secret.
- **namespace** The namespace holding the secret. The 'default' one is going to be used unless a different one is specified.
- **data** The dictionary holding the secrets.
- **source** A file containing the data of the secret in plain format.
- **template** Template engine to be used to render the source file.

`salt.states.kubernetes.service_absent(name, namespace='default', **kwargs)`
Ensures that the named service is absent from the given namespace.

- **name** The name of the service
- **namespace** The name of the namespace
salt.states.kubernetes.service_present(name, namespace='default', metadata=None, spec=None, source='', template='', **kwargs)

Ensures that the named service is present inside of the specified namespace with the given metadata and spec. If the deployment exists it will be replaced.

- **name** The name of the service.
- **namespace** The namespace holding the service. The 'default' one is going to be used unless a different one is specified.
- **metadata** The metadata of the service object.
- **spec** The spec of the service object.
- **source** A file containing the definition of the service (metadata and spec) in the official kubernetes format.
- **template** Template engine to be used to render the source file.

23.19.94 salt.states.layman

Management of Gentoo Overlays using layman

A state module to manage Gentoo package overlays via layman

```yaml
sunrise:
  layman.present
```

salt.states.layman.absent(name)

Verify that the overlay is absent

- **name** The name of the overlay to delete

salt.states.layman.present(name)

Verify that the overlay is present

- **name** The name of the overlay to add

23.19.95 salt.states.ldap

Manage entries in an LDAP database

New in version 2016.3.0.

The states.ldap state module allows you to manage LDAP entries and their attributes.

salt.states.ldap.managed(name, entries, connect_spec=None)

Ensure the existence (or not) of LDAP entries and their attributes

Example:

```yaml
ldap://://:
  ldap.managed:
    - connect_spec:
        bind:
          method: sasl
      - entries:
```

(continues on next page)
# make sure the entry doesn't exist
- cn=foo,ou=users,dc=example,dc=com:
  - delete_others: True

# make sure the entry exists with only the specified
# attribute values
- cn=admin,dc=example,dc=com:
  - delete_others: True
  - replace:
    - cn:
      - admin
description:
      - LDAP administrator
objectClass:
  - simpleSecurityObject
  - organizationalRole
userPassword:
  - {{ pillar.ldap_admin_password }}

# make sure the entry exists, its olcRootDN attribute
# has only the specified value, the olcRootDN attribute
# doesn't exist, and all other attributes are ignored
- olcDatabase={1}hdb,cn=config:
  - replace:
    - olcRootDN:
      - cn=admin,dc=example,dc=com
    - olcRootPW: []

# note the use of 'default'. also note how you don't
# have to use list syntax if there is only one attribute
# value
- cn=foo,ou=users,dc=example,dc=com:
  - delete_others: True
  - default:
    - userPassword: changeme
    - shadowLastChange: 0
    # keep sshPublicKey if present, but don't create
    # the attribute if it is missing
    - sshPublicKey: []
  - replace:
    - cn: foo
    - uid: foo
    - uidNumber: 1000
    - gidNumber: 1000
    - gecos: Foo Bar
    - givenName: Foo
    - sn: Bar
    - homeDirectory: /home/foo
    - loginShell: /bin/bash

    objectClass:
      - inetOrgPerson
      - posixAccount
      - top
      - ldapPublicKey
      - shadowAccount
Parameters

- **name** -- The URL of the LDAP server. This is ignored if `connect_spec` is either a connection object or a dict with a 'url' entry.

- **entries** -- A description of the desired state of zero or more LDAP entries.

  `entries` is an iterable of dicts. Each of these dict's keys are the distinguished names (DNs) of LDAP entries to manage. Each of these dicts is processed in order. A later dict can reference an LDAP entry that was already mentioned in an earlier dict, which makes it possible for later dicts to enhance or alter the desired state of an LDAP entry.

  The DNs are mapped to a description of the LDAP entry's desired state. These LDAP entry descriptions are themselves iterables of dicts. Each dict in the iterable is processed in order. They contain directives controlling the entry's state. The key names the directive type and the value is state information for the directive. The specific structure of the state information depends on the directive type.

  The structure of `entries` looks like this:

  ```
  [{dn1: [{directive1: directive1_state,
              directive2: directive2_state},
          {directive3: directive3_state}],
   dn2: [{directive4: directive4_state,
              directive5: directive5_state}],
   {dn3: [{directive6: directive6_state}]
  }
  ```

  These are the directives:

  - `'delete_others'` Boolean indicating whether to delete attributes not mentioned in this dict or any of the other directive dicts for this DN. Defaults to False.

    If you don't want to delete an attribute if present, but you also don't want to add it if it is missing or modify it if it is present, you can use either the 'default' directive or the 'add' directive with an empty value list.

  - `'default'` A dict mapping an attribute name to an iterable of default values for that attribute. If the attribute already exists, it is left alone. If not, it is created using the given list of values.

    An empty value list is useful when you don't want to create an attribute if it is missing but you do want to preserve it if the 'delete_others' key is True.

  - `'add'` Attribute values to add to the entry. This is a dict mapping an attribute name to an iterable of values to add.

    An empty value list is useful when you don't want to create an attribute if it is missing but you do want to preserve it if the 'delete_others' key is True.

  - `'delete'` Attribute values to remove from the entry. This is a dict mapping an attribute name to an iterable of values to delete from the attribute. If the iterable is empty, all of the attribute's values are deleted.

  - `'replace'` Attributes to replace. This is a dict mapping an attribute name to an iterable of values. Any existing values for the attribute are deleted, then the given values are added. The iterable may be empty.

  In the above directives, the iterables of attribute values may instead be `None`, in which case an empty list is used, or a scalar such as a string or number, in which case a new list containing the scalar is used.
Note that if all attribute values are removed from an entry, the entire entry is deleted.

- **connect_spec** -- See the description of the `connect_spec` parameter of the `ldap3.connect` function in the `ldap3` execution module. If this is a dict and the 'url' entry is not specified, the 'url' entry is set to the value of the `name` parameter.

**Returns**

A dict with the following keys:

- **'name'** This is the same object passed to the `name` parameter.

- **'changes'** This is a dict describing the changes made (or, in test mode, the changes that would have been attempted). If no changes were made (or no changes would have been attempted), then this dict is empty. Only successful changes are included.

  Each key is a DN of an entry that was changed (or would have been changed). Entries that were not changed (or would not have been changed) are not included.

  The value is a dict with two keys:

  - **'old'** The state of the entry before modification. If the entry did not previously exist, this key maps to `None`. Otherwise, the value is a dict mapping each of the old entry’s attributes to a list of its values before any modifications were made. Unchanged attributes are excluded from this dict.

  - **'new'** The state of the entry after modification. If the entry was deleted, this key maps to `None`. Otherwise, the value is a dict mapping each of the entry’s attributes to a list of its values after the modifications were made. Unchanged attributes are excluded from this dict.

Example 'changes' dict where a new entry was created with a single attribute containing two values:

```{"
'dn1': {'old': None,
        'new': {'attr1': ['val1', 'val2']}}}
```

Example 'changes' dict where a new attribute was added to an existing entry:

```{"
'dn1': {'old': {},
        'new': {'attr2': ['val3']}}}
```

- **'result'** One of the following values:

  - **True** if no changes were necessary or if all changes were applied successfully.
  - **False** if at least one change was unable to be applied.
  - **None** if changes would be applied but it is in test mode.

### 23.19.96 salt.states.libcloud_dns

Manage DNS records and zones using libcloud

**codeauthor** Anthony Shaw <anthonyshaw@apache.org>

New in version 2016.11.0.

Create and delete DNS records or zones through Libcloud. Libcloud’s DNS system supports over 20 DNS providers including Amazon, Google, GoDaddy, Softlayer

This module uses `libcloud`, which can be installed via package, or pip.
configuration  This module uses a configuration profile for one or multiple DNS providers

```yaml
libcloud_dns:
  profile1:
    driver: godaddy
    key: 2orgk34kgk34g
  profile2:
    driver: route53
    key: blah
    secret: blah
```

Example:

```yaml
my-zone:
  libcloud_dns.zone_present:
    - name: mywebsite.com
    - profile: profile1
my-website:
  libcloud_dns.record_present:
    - name: www
    - zone: mywebsite.com
    - type: A
    - data: 12.34.32.3
    - profile: profile1
    - require:
      - libcloud_dns: my-zone
```

```bash
depends  apache-libcloud

salt.states.libcloud_dns.record_absent(name, zone, type, data, profile)
Ensures a record is absent.

Parameters

- name (str) -- Record name without the domain name (e.g. www). Note: If you want to create a record for a base domain name, you should specify empty string ('') for this argument.
- zone (str) -- Zone where the requested record is created, the domain name
- type (str) -- DNS record type (A, AAAA, ...).
- data (str) -- Data for the record (depends on the record type).
- profile (str) -- The profile key

salt.states.libcloud_dns.record_present(name, zone, type, data, profile)
Ensures a record is present.

Parameters

- name (str) -- Record name without the domain name (e.g. www). Note: If you want to create a record for a base domain name, you should specify empty string ('') for this argument.
- zone (str) -- Zone where the requested record is created, the domain name
- type (str) -- DNS record type (A, AAAA, ...).
- data (str) -- Data for the record (depends on the record type).
- profile (str) -- The profile key

salt.states.libcloud_dns.state_result(result, message, name, changes=None)
```
salt.states.libcloud_dns.zone_absent(domain, profile)

Ensures a record is absent.

Parameters

- domain (str) -- Zone name, i.e. the domain name
- profile (str) -- The profile key

salt.states.libcloud_dns.zone_present(domain, type, profile)

Ensures a record is present.

Parameters

- domain (str) -- Zone name, i.e. the domain name
- type (str) -- Zone type (master / slave), defaults to master
- profile (str) -- The profile key

23.19.97  salt.states.libcloud_loadbalancer

Apache Libcloud Load Balancer State

Manage load balancers using libcloud

codeauthor Anthony Shaw <anthonyshaw@apache.org>

Apache Libcloud load balancer management for a full list of supported clouds, see http://libcloud.readthedocs.io/en/latest/loadbalancer/supported_providers.html

Clouds include Amazon ELB, ALB, Google, Aliyun, CloudStack, Softlayer

New in version 2018.3.0.

configuration This module uses a configuration profile for one or multiple Cloud providers

```
libcloud_loadbalancer:
  profile_test1:
    driver: gce
    key: G00G0123456789ABCXYZ
    secret: mysecret
  profile_test2:
    driver: alb
    key: 12345
    secret: mysecret
```

Example:

Using States to deploy a load balancer with extended arguments to specify region

```
lb_test:
  - libcloud_loadbalancer.balancer_present:
    - name: example
    - port: 80
    - protocol: http
    - profile: google
    - ex_region: us-east1
```

depends apache-libcloud
**salt.states.libcloud_loadbalancer**. **balancer_absent** *(name, profile, **libcloud_kwargs)*
Ensures a load balancer is absent.

**Parameters**
- **name** *(str)* -- Load Balancer name
- **profile** *(str)* -- The profile key

**salt.states.libcloud_loadbalancer**. **balancer_present** *(name, port, protocol, profile, algorithm=None, members=None, **libcloud_kwargs)*
Ensures a load balancer is present.

**Parameters**
- **name** *(str)* -- Load Balancer name
- **port** *(str)* -- Port the load balancer should listen on, defaults to 80
- **protocol** *(str)* -- Load balancer protocol, defaults to http.
- **profile** *(str)* -- The profile key
- **algorithm** *(str)* -- Load balancing algorithm, defaults to ROUND_ROBIN. See Algorithm type in Libcloud documentation for a full listing.
- **members** *(list of dict (ip, port))* -- An optional list of members to create on deployment

**salt.states.libcloud_loadbalancer**. **member_absent** *(ip, port, balancer_id, profile, **libcloud_kwargs)*
Ensure a load balancer member is absent, based on IP and Port

**Parameters**
- **ip** *(str)* -- IP address for the member
- **port** *(int)* -- Port for the member
- **balancer_id** *(str)* -- id of a load balancer you want to detach the member from
- **profile** *(str)* -- The profile key

**salt.states.libcloud_loadbalancer**. **member_present** *(ip, port, balancer_id, profile, **libcloud_kwargs)*
Ensure a load balancer member is present

**Parameters**
- **ip** *(str)* -- IP address for the new member
- **port** *(int)* -- Port for the new member
- **balancer_id** *(str)* -- id of a load balancer you want to attach the member to
- **profile** *(str)* -- The profile key

**salt.states.libcloud_loadbalancer**. **state_result** *(result, message, name, changes=None)*
23.19.98 salt.states.libcloud_storage

Apache Libcloud Storage State

Manage cloud storage using libcloud

codeauthor Anthony Shaw <anthonyshaw@apache.org>

Apache Libcloud Storage (object/blob) management for a full list of supported clouds, see http://libcloud.readthedocs.io/en/latest/storage/supported_providers.html

Clouds include Amazon S3, Google Storage, Aliyun, Azure Blobs, Ceph, OpenStack swift

New in version 2018.3.0.

configuration This module uses a configuration profile for one or multiple Storage providers

```yaml
libcloud_storage:
  profile_test1:
    driver: google_storage
    key: GOOG0123456789ABCXYZ
    secret: mysecret
  profile_test2:
    driver: s3
    key: 12345
    secret: mysecret
```

Examples

Creating a container and uploading a file

```yaml
web_things:
  libcloud_storage.container_present:
    name: my_container_name
    profile: profile1
  libcloud_storage.object_present:
    name: my_file.jpg
    container: my_container_name
    path: /path/to/local/file.jpg
    profile: profile1
```

Downloading a file

This example will download the file from the remote cloud and keep it locally

```yaml
web_things:
  libcloud_storage.file_present:
    name: my_file.jpg
    container: my_container_name
    path: /path/to/local/file.jpg
    profile: profile1

salt.states.libcloud_storage.container_absent(name, profile)
Ensures a container is absent.
```
Parameters

- **name** *(str)* -- Container name
- **profile** *(str)* -- The profile key

salt.states.libcloud_storage.container_present(name, profile)
Ensures a container is present.

Parameters

- **name** *(str)* -- Container name
- **profile** *(str)* -- The profile key

salt.states.libcloud_storage.file_present(container, name, path, profile, overwrite_existing=False)
Ensures a object is downloaded locally.

Parameters

- **container** *(str)* -- Container name
- **name** *(str)* -- Object name in cloud
- **path** *(str)* -- Local path to file
- **profile** *(str)* -- The profile key
- **overwrite_existing** *(bool)* -- Replace if already exists

salt.states.libcloud_storage.object_absent(container, name, profile)
Ensures a object is absent.

Parameters

- **container** *(str)* -- Container name
- **name** *(str)* -- Object name in cloud
- **profile** *(str)* -- The profile key

salt.states.libcloud_storage.object_present(container, name, path, profile)
Ensures a object is present.

Parameters

- **container** *(str)* -- Container name
- **name** *(str)* -- Object name in cloud
- **path** *(str)* -- Local path to file
- **profile** *(str)* -- The profile key

salt.states.libcloud_storage.state_result(result, message, name, changes)
23.19.99 salt.states.locale

Management of languages/locales

Manage the available locales and the system default:

us_locale:
  locale.present:
    - name: en_US.UTF-8

default_locale:
  locale.system:
    - name: en_US.UTF-8
    - require:
      - locale: us_locale

salt.states.locale.present(name)
  Generate a locale if it is not present
  New in version 2014.7.0.
  name The name of the locale to be present. Some distributions require the charmap to be specified as part of
  the locale at this point.

salt.states.locale.system(name)
  Set the locale for the system
  name The name of the locale to use

23.19.100 salt.states.logrotate

Module for managing logrotate.

New in version 2017.7.0.

salt.states.logrotate.set_(name, key, value, setting=None, conf_file='/etc/logrotate.conf')
  Set a new value for a specific configuration line.
  Parameters
  • key (str) -- The command or block to configure.
  • value (str) -- The command value or command of the block specified by the key parameter.
  • setting (str) -- The command value for the command specified by the value parameter.
  • conf_file (str) -- The logrotate configuration file.

Example of usage with only the required arguments:

logrotate-rotate:
  logrotate.set:
    - key: rotate
    - value: 2

Example of usage specifying all available arguments:
23.19.101 salt.states.loop

Loop state

Allows for looping over execution modules.

New in version 2017.7.0.

In both examples below, the execution module function `boto_elb.get_instance_health` returns a list of dicts. The condition checks the `state-key` of the first dict in the returned list and compares its value to the string `InService`.

```
wait_for_service_to_be_healthy:
  loop.until:
    - name: boto_elb.get_instance_health
    - condition: m_ret[0]['state'] == 'InService'
    - period: 5
    - timeout: 20
    - m_args:
      - {{ elb }}
    - m_kwargs:
      keyid: {{ access_key }}
      key: {{ secret_key }}
      instances: "{{ instance }}"
```

**Warning:** This state allows arbitrary python code to be executed through the condition parameter which is literally evaluated within the state. Please use caution.

Changed in version 3000.

A version that does not use eval is now available. It uses either the python `operator` to compare the result of the function called in `name`, which can be one of the following: lt, le, eq (default), ne, ge, gt. Alternatively, `compare_operator` can be filled with a function from an execution module in `__salt__` or `__utils__` like the example below. The function `data.subdict_match` checks if the `expected` expression matches the data returned by calling the `name` function (with passed `args` and `kwargs`).

```
Wait for service to be healthy:
  loop.until_no_eval:
    - name: boto_elb.get_instance_health
    - expected: '0:state:InService'
    - compare_operator: data.subdict_match
    - period: 5
    - timeout: 20
    - args:
      - {{ elb }}
    - kwargs:
      keyid: {{ access_key }}
```

(continues on next page)
key: {{ secret_key }}
instances: "{{ instance }}"

salt.states.loop.until(name, m_args=None, m_kwargs=None, condition=None, period=1, timeout=60)

Loop over an execution module until a condition is met.

Parameters

- **name (str)** -- The name of the execution module
- **m_args (list)** -- The execution module's positional arguments
- **m_kwargs (dict)** -- The execution module's keyword arguments
- **condition (str)** -- The condition which must be met for the loop to break. This should contain m_ret which is the return from the execution module.
- **period (int or float)** -- The number of seconds to wait between executions
- **timeout (int or float)** -- The timeout in seconds

salt.states.loop.until_no_eval(name, expected, compare_operator='eq', timeout=60, period=1, init_wait=0, args=None, kwargs=None)

Generic waiter state that waits for a specific salt function to produce an expected result. The state fails if the function does not exist or raises an exception, or does not produce the expected result within the allotted retries.

Parameters

- **name (str)** -- Name of the module.function to call
- **expected** -- Expected return value. This can be almost anything.
- **compare_operator (str)** -- Operator to use to compare the result of the module.function call with the expected value. This can be anything present in __salt__ or __utils__. Will be called with 2 args: result, expected.
- **timeout (int or float)** -- Abort after this amount of seconds (excluding init_wait).
- **period (int or float)** -- Time (in seconds) to wait between attempts.
- **init_wait (int or float)** -- Time (in seconds) to wait before trying anything.
- **args (list)** -- args to pass to the salt module.function.
- **kwargs (dict)** -- kwargs to pass to the salt module.function.

New in version 3000.

23.19.102 salt.states.lvs_server

Management of LVS (Linux Virtual Server) Real Server

salt.states.lvs_server.absent(name, protocol=None, service_address=None, server_address=None)

Ensure the LVS Real Server in specified service is absent.

name The name of the LVS server.
protocol The service protocol(only support tcp, udp and fwmark service).
service_address  The LVS service address.
server_address  The LVS real server address.
salt.states.lvs_server.present(name, protocol=None, service_address=None, server_address=None, packet_forward_method='dr', weight=1)
Ensure that the named service is present.
name  The LVS server name
protocol  The service protocol
service_address  The LVS service address
server_address  The real server address.
packet_forward_method  The LVS packet forwarding method (dr for direct routing, tunnel for tunneling, nat for network access translation).
weight  The capacity of a server relative to the others in the pool.

```
lvsrs:
  lvs_server.present:
    - protocol: tcp
    - service_address: 1.1.1.1:80
    - server_address: 192.168.0.11:8080
    - packet_forward_method: dr
    - weight: 10
```

23.19.103  salt.states.lvs_service

Management of LVS (Linux Virtual Server) Service

salt.states.lvs_service.absent(name, protocol=None, service_address=None)
Ensure the LVS service is absent.
name  The name of the LVS service
protocol  The service protocol
service_address  The LVS service address
salt.states.lvs_service.present(name, protocol=None, service_address=None, scheduler='wlc')
Ensure that the named service is present.
name  The LVS service name
protocol  The service protocol
service_address  The LVS service address
scheduler  Algorithm for allocating TCP connections and UDP datagrams to real servers.

```
lvstest:
  lvs_service.present:
    - service_address: 1.1.1.1:80
    - protocol: tcp
    - scheduler: rr
```
23.19.104 salt.states.lxc

Manage Linux Containers

salt.states.lxc.absent(name, stop=False, path=None)
Ensure a container is not present, destroying it if present

name  Name of the container to destroy
stop  stop before destroying default: false

New in version 2015.5.2.

path  path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

web01:
lxc.absent

salt.states.lxc.edited_conf(name, lxc_conf=None, lxc_conf_unset=None)

Warning: This state is unsuitable for setting parameters that appear more than once in an LXC config file, or parameters which must appear in a certain order (such as when configuring more than one network interface).

Issue #35523 was opened to track the addition of a suitable replacement or fix.

Edit LXC configuration options

Deprecated since version 2015.5.0.

path  path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

setconf:
lxc.edited_conf:
- name: ubuntu
- lxc_conf:
  - network.ipv4.ip: 10.0.3.6
- lxc_conf_unset:
  - lxc.utsname

salt.states.lxc.frozen(name, start=True, path=None)
New in version 2015.5.0.

Ensure that a container is frozen

Note: This state does not enforce the existence of the named container, it just freezes the container if it is running. To ensure that the named container exists, use lxc.present.

name  The name of the container
path  path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.
start  [True] Start container first, if necessary. If False, then this state will fail if the container is not running.

```
web01:
  lxc.frozen

web02:
  lxc.frozen:
    - start: False
```

```
salt.states.lxc.present(name, running=None, clone_from=None, snapshot=False, profile=None,
                       network_profile=None, template=None, options=None, image=None,
                       config=None, ftype=None, size=None, backing=None, vname=None, lvname=None,
                       thinpool=None, path=None)
```

Changed in version 2015.8.0: The lxc.created state has been renamed to lxc.present, and the lxc.cloned state has been merged into this state.

Create the named container if it does not exist

name  The name of the container to be created

path  path to the container parent default: /var/lib/lxc (system default)

   New in version 2015.8.0.

running  [False]

   • If True, ensure that the container is running
   • If False, ensure that the container is stopped
   • If None, do nothing with regards to the running state of the container

   New in version 2015.8.0.

clone_from  Create named container as a clone of the specified container

snapshot  [False] Use Copy On Write snapshots (LVM). Only supported with clone_from.

profile  Profile to use in container creation (see the LXC Tutorial for more information). Values in a profile will be overridden by the parameters listed below.

network_profile  Network Profile to use in container creation (see the LXC Tutorial for more information). Values in a profile will be overridden by the parameters listed below.

   New in version 2015.5.2.

Container Creation Arguments

template  The template to use. For example, ubuntu or fedora. For a full list of available templates, check out the lxc.templates function.

   Conflicts with the image argument.

   Note: The download template requires the following three parameters to be defined in options:

   • dist - The name of the distribution
   • release - Release name/version
   • arch - Architecture of the container

   The available images can be listed using the lxc.images function.
New in version 2015.5.0.

Template-specific options to pass to the lxc-create command. These correspond to the long options (ones beginning with two dashes) that the template script accepts. For example:

```
web01:
  lxc.present:
    - template: download
    - options:
      dist: centos
      release: 6
      arch: amd64
```

Remember to double-indent the options, due to how PyYAML works.

For available template options, refer to the lxc template scripts which are usually located under `/usr/share/lxc/templates`, or run `lxc-create -t <template> -h`.

- **image** A tar archive to use as the rootfs for the container. Conflicts with the `template` argument.
- **backing** The type of storage to use. Set to `lvm` to use an LVM group. Defaults to filesystem within `/var/lib/lxc`.
- **fstype** Filesystem type to use on LVM logical volume
- **size** Size of the volume to create. Only applicable if `backing` is set to `lvm`.
- **vgname** [lxc] Name of the LVM volume group in which to create the volume for this container. Only applicable if `backing` is set to `lvm`.
- **lvname** Name of the LVM logical volume in which to create the volume for this container. Only applicable if `backing` is set to `lvm`.
- **thinpool** Name of a pool volume that will be used for thin-provisioning this container. Only applicable if `backing` is set to `lvm`.

salt.states.lxc.running(**name**, **restart**=**False**, **path**=**None**)  
Changed in version 2015.5.0: The `lxc.started` state has been renamed to `lxc.running`  
Ensure that a container is running  

**Note:** This state does not enforce the existence of the named container, it just starts the container if it is not running. To ensure that the named container exists, use `lxc.present`.

- **name** The name of the container
- **path** path to the container parent default: `/var/lib/lxc` (system default)
  
  New in version 2015.8.0.
- **restart** [**False**] Restart container if it is already running

```
web01:
  lxc.running

web02:
  lxc.running:
    - restart: True
```
salt.states.lxc.set_pass(name, **kwargs)

Deprecated since version 2015.5.0.

This state function has been disabled, as it did not conform to design guidelines. Specifically, due to the fact that `lxc.set_password` uses `chpasswd(8)` to set the password, there was no method to make this action idempotent (in other words, the password would be changed every time). This makes this state redundant, since the following state will do the same thing:

```yaml
setpass:
  module.run:
    - name: set_pass
    - m_name: root
    - password: secret
```

salt.states.lxc.stopped(name, kill=False, path=None)

Ensure that a container is stopped

**Note:** This state does not enforce the existence of the named container, it just stops the container if it running or frozen. To ensure that the named container exists, use `lxc.present`, or use the `lxc.absent` state to ensure that the container does not exist.

- **name**  The name of the container
- **path**  path to the container parent default: `/var/lib/lxc` (system default)
- **kill** [False] Do not wait for the container to stop, kill all tasks in the container. Older LXC versions will stop containers like this irrespective of this argument.

**Examples:**
```
web01:
  lxc.stopped
```

### 23.19.105 salt.states.lxd

Manage LXD profiles.

New in version 2019.2.0.

- **maintainer**  René Jochum `<rene@jochums.at>`
- **maturity**  new
- **depends**  python-pylxd
- **platform**  Linux

salt.states.lxd.authenticate(name, remote_addr, password, cert, key, verify_cert=True)

Authenticate with a remote peer.

- **remote_addr**  An URL to a remote Server, you also have to give cert and key if you provide remote_addr!

  **Examples:**
  ```
  https://myserver.lan:8443 /var/lib/mysocket.sock
  ```

- **password**  The PaSsW0rD
- **cert**  PEM Formatted SSL Zertifikate.
Examples: /root/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: /root/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
name: Ignore this. This is just here for salt.
salt.states.lxd.config_managed(name, value, force_password=False)
Manage a LXD Server config setting.
name : The name of the config key.
value : Its value.
force_password [False] Set this to True if you want to set the password on every run.
As we can’t retrieve the password from LXD we can’t check if the current one is the same as the given one.
salt.states.lxd.init(name, storage_backend='dir', trust_password=None, network_address=None, network_port=None, storage_create_device=None, storage_create_loop=None, storage_pool=None, done_file='%SALT_CONFIG_DIR%/lxd_initialized')
Initializes the LXD Daemon, as LXD doesn’t tell if its initialized we touch the done_file and check if it exist.
This can only be called once per host unless you remove the done_file.
name : Ignore this. This is just here for salt.
storage_backend : Storage backend to use (zfs or dir, default: dir)
trust_password : Password required to add new clients
network_address [None] Address to bind LXD to (default: none)
network_port [None] Port to bind LXD to (Default: 8443)
storage_create_device [None] Setup device based storage using this DEVICE
storage_create_loop [None] Setup loop based storage with this SIZE in GB
storage_pool [None] Storage pool to use or create
done_file : Path where we check that this method has been called, as it can run only once and there’s currently no way to ask LXD if init has been called.

23.19.106 salt.states.lxd_container

Manage LXD containers.
New in version 2019.2.0.

maintainer René Jochum <rene@jochums.at>
maturity new
depends python-pylxd
platform Linux

salt.states.lxd_container.absent(name, stop=False, remote_addr=None, cert=None, key=None, verify_cert=True)
Ensure a LXD container is not present, destroying it if present
**name** : The name of the container to destroy

**stop** : stop before destroying default: false

**remote_addr** : An URL to a remote Server, you also have to give cert and key if you provide remote_addr!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Zertifikate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

**verify_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

```
salt.states.lxd_container.frozen(name, start=True, remote_addr=None, cert=None, key=None, verify_cert=True)
```

Ensure a LXD container is frozen, start and freeze it if start is true

**name** : The name of the container to freeze

**start** : start and freeze it

**remote_addr** : An URL to a remote Server, you also have to give cert and key if you provide remote_addr!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Zertifikate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

**verify_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

```
salt.states.lxd_container.migrated(name, remote_addr, cert, key, verify_cert, src_remote_addr, stop_and_start=False, src_cert=None, src_key=None, src_verify_cert=None)
```

Ensure a container is migrated to another host

If the container is running, it either must be shut down first (use stop_and_start=True) or criu must be installed on the source and destination machines.

For this operation both certs need to be authenticated, use lxd.authenticate <salt.states.lxd.authenticate to authenticate your cert(s).

**name** : The container to migrate

**remote_addr** : An URL to the destination remote Server

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Zertifikate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

**verify_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
src_remote_addr: An URL to the source remote Server
   Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

stop_and_start: Stop before migrating and start after

src_cert: PEM Formatted SSL Zertifikate, if None we copy "cert"
   Examples: ~/.config/lxc/client.crt

src_key: PEM Formatted SSL Key, if None we copy "key"
   Examples: ~/.config/lxc/client.key

src_verify_cert: Wherever to verify the cert, if None we copy "verify_cert"

salt.states.lxd_container.present(name, running=None, source=None, profiles=None, config=None, devices=None, architecture='x86_64', ephemeral=False, restart_on_change=False, remote_addr=None, cert=None, key=None, verify_cert=True)

Create the named container if it does not exist

name The name of the container to be created

running [None]
   • If True, ensure that the container is running
   • If False, ensure that the container is stopped
   • If None, do nothing with regards to the running state of the container

source [None] Can be either a string containing an image alias:

"xenial/amd64"

or an dict with type "image" with alias:

{"type": "image",
 "alias": "xenial/amd64"}

or image with "fingerprint":

{"type": "image",
 "fingerprint": "SHA-256"}

or image with "properties":

{"type": "image",
 "properties": {
 "os": "ubuntu",
 "release": "14.04",
 "architecture": "x86_64"
 }}

or none:

{"type": "none"}

or copy:

{"type": "copy",
 "source": "my-old-container"}
profiles  [['default']] List of profiles to apply on this container

config : A config dict or None (None = unset).

Can also be a list:

```
[{'key': 'boot.autostart', 'value': 1},
 {'key': 'security.privileged', 'value': '1'}]
```

devices : A device dict or None (None = unset).

architecture  ['x86_64'] Can be one of the following:

- unknown
- i686
- x86_64
- armv7l
- aarch64
- ppc
- ppc64
- ppc64le
- s390x

ephemeral [False] Destroy this container after stop?

restart_on_change  [False] Restart the container when we detect changes on the config or its devices?

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Zertifikate.

Examples: ~/.config/lxc/client.crt
cert : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

salt.states.lxd_container.running(name, restart=False, remote_addr=None, cert=None,
    key=None, verify_cert=True)

Ensure a LXD container is running and restart it if restart is True

name : The name of the container to start/restart.

restart : restart the container if it is already started.

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Zertifikate.

Examples: ~/.config/lxc/client.crt
cert : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key
**verify_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

```python
salt.states.lxd_container.stopped(name, kill=False, remote_addr=None, cert=None, key=None, verify_cert=True)
```

Ensure a LXD container is stopped, kill it if kill is true else stop it

- **name**: The name of the container to stop
- **kill**: kill if true
- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr!
  - Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
- **cert**: PEM Formatted SSL Zertifikate.
  - Examples: ~/.config/lxc/client.crt
- **key**: PEM Formatted SSL Key.
  - Examples: ~/.config/lxc/client.key
- **verify_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

### 23.19.107 salt.states.lxd_image

Manage LXD images.

New in version 2019.2.0.

- **maintainer** René Jochum <rene@jochums.at>
- **maturity** new
- **depends** python-pylxd
- **platform** Linux

```python
salt.states.lxd_image.absent(name, remote_addr=None, cert=None, key=None, verify_cert=True)
```

- **name**: An alias or fingerprint of the image to check and delete.
- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr!
  - Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
- **cert**: PEM Formatted SSL Zertifikate.
  - Examples: ~/.config/lxc/client.crt
- **key**: PEM Formatted SSL Key.
  - Examples: ~/.config/lxc/client.key
- **verify_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

```python
salt.states.lxd_image.present(name, source, aliases=None, public=None, auto_update=None, remote_addr=None, cert=None, key=None, verify_cert=True)
```

Ensure an image exists, copy it else from source

- **name**: An alias of the image, this is used to check if the image exists and it will be added as alias to the image on copy/create.
source : Source dict.

For an LXD to LXD copy:

```python
source:
  type: lxd
  name: ubuntu/xenial/amd64  # This can also be a fingerprint.
  remote_addr: https://images.linuxcontainers.org:8443
  cert: ~/.config/lxd/client.crt
  key: ~/.config/lxd/client.key
  verify_cert: False
```

From file:

```python
source:
  type: file
  filename: salt://lxd/files/busybox.tar.xz
  saltenv: base
```

From simplestreams:

```python
source:
  type: simplestreams
  server: https://cloud-images.ubuntu.com/releases
  name: xenial/amd64
```

From an URL:

```python
source:
  type: url
  url: https://dl.stgraber.org/lxd
```

class : List of aliases to append, can be empty.

public :

  Make this image public available on this instance? None on source_type LXD means copy source

  None on source_type file means False

auto_update :

  Try to auto-update from the original source? None on source_type LXD means copy source

  source_type file does not have auto-update.

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr!

  Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Zertifikate.

  Examples: ~/.config/lxc/client.crt

deprecated : PEM Formatted SSL Key.

  Examples: ~/.config/lxc/client.key

verify_cert  [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it

  off as LXD normally uses self-signed certificates.
23.19.108 salt.states.lxd_profile

Manage LXD profiles.
New in version 2019.2.0.

maintainer René Jochum <rene@jochums.at>
maturity new
depends python-pylxd
platform Linux

salt.states.lxd_profile.absent(name, remote_addr=None, cert=None, key=None, verify_cert=True)
Ensure a LXD profile is not present, removing it if present.

name : The name of the profile to remove.
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Zertifikate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
See the requests-docs for the SSL stuff.

salt.states.lxd_profile.present(name, description=None, config=None, devices=None, remote_addr=None, cert=None, key=None, verify_cert=True)
Creates or updates LXD profiles

name : The name of the profile to create/update
description : A description string
config : A config dict or None (None = unset).
Can also be a list:
"[['key': 'boot.autostart', 'value': 1], ['key': 'security.privileged', 'value': 1]]"
devices : A device dict or None (None = unset).
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Zertifikate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
See the lxd-docs for the details about the config and devices dicts. See the requests-docs for the SSL stuff.
23.19.109 **salt.states.mac_xattr**

Allows you to manage extended attributes on files or directories

Install, enable and disable assistive access on macOS minions

```
/path/to/file:
 xattr.exists:
   - attributes:
     - com.file.attr=test
     - com.apple.quarantine=0x0000111
```

**salt.states.mac_xattr.delete**(*name, attributes*)

Make sure the given attributes are deleted from the file/directory

- **name** The path to the file/directory
- **attributes** The attributes that should be removed from the file/directory, this is accepted as an array.

**salt.states.mac_xattr.exists**(*name, attributes*)

Make sure the given attributes exist on the file/directory

- **name** The path to the file/directory
- **attributes** The attributes that should exist on the file/directory, this is accepted as an array, with key and value split with an equals sign, if you want to specify a hex value then add 0x to the beginning of the value.

23.19.110 **salt.states.makeconf**

Management of Gentoo make.conf

A state module to manage Gentoo’s `make.conf` file

```
makeopts:
  makeconf.present:
    - value: '-j3'
```

**salt.states.makeconf.absent**(*name*)

Verify that the variable is not in the `make.conf`.

- **name** The variable name. This will automatically be converted to upper case since variables in `make.conf` are in upper case

**salt.states.makeconf.present**(*name, value=None, contains=None, excludes=None*)

Verify that the variable is in the `make.conf` and has the provided settings. If value is set, contains and excludes will be ignored.

- **name** The variable name. This will automatically be converted to upper case since variables in `make.conf` are in upper case
- **value** Enforce that the value of the variable is set to the provided value
- **contains** Enforce that the value of the variable contains the provided value
- **excludes** Enforce that the value of the variable does not contain the provided value.
23.19.111 salt.states.marathon_app

Configure Marathon apps via a salt proxy.

```yaml
my_app:
  marathon_app.config:
    - config:
        cmd: "while [ true ] ; do echo 'Hello Marathon' ; sleep 5 ; done"
        cpus: 0.1
        mem: 10
        instances: 3
```

New in version 2015.8.2.

salt.states.marathon_app.absent(name)

Ensure that the marathon app with the given id is not present.

Parameters

- **name** -- The app name/id

Returns

A standard Salt changes dictionary

salt.states.marathon_app.config(name, config)

Ensure that the marathon app with the given id is present and is configured to match the given config values.

Parameters

- **name** -- The app name/id
- **config** -- The configuration to apply (dict)

Returns

A standard Salt changes dictionary

salt.states.marathon_app.running(name, restart=False, force=True)

Ensure that the marathon app with the given id is present and restart if set.

Parameters

- **name** -- The app name/id
- **restart** -- Restart the app
- **force** -- Override the current deployment

Returns

A standard Salt changes dictionary

23.19.112 salt.states.modjk

State to control Apache modjk

salt.states.modjk.worker_activated(name, workers=None, profile='default')

Activate all the workers in the modjk load balancer

Example:

```yaml
loadbalancer:
  modjk.worker_activated:
    - workers:
      - app1
      - app2
```

salt.states.modjk.worker_disabled(name, workers=None, profile='default')

Disable all the workers in the modjk load balancer
Example:

```yaml
loadbalancer:
    modjk.worker_disabled:
        - workers:
            - app1
            - app2
```

salt.states.modjk.worker_recover(name, workers=None, profile='default')
Recover all the workers in the modjk load balancer

Example:

```yaml
loadbalancer:
    modjk.worker_recover:
        - workers:
            - app1
            - app2
```

salt.states.modjk.worker_stopped(name, workers=None, profile='default')
Stop all the workers in the modjk load balancer

Example:

```yaml
loadbalancer:
    modjk.worker_stopped:
        - workers:
            - app1
            - app2
```

23.19.113 salt.states.modjk_worker

Manage modjk workers

Send commands to a modjk load balancer via the peer system.

This module can be used with the `prereq` requisite to remove/add the worker from the load balancer before deploying/restarting service.

Mandatory Settings:

- The minion needs to have permission to publish the `modjk.*` functions (see here for information on configuring peer publishing permissions)
- The modjk load balancer must be configured as stated in the modjk execution module documentation

salt.states.modjk_worker.activate(name, lbn, target, profile='default', tgt_type='glob')

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Activate the named worker from the lbn load balancers at the targeted minions

Example:

```yaml
disable-before-deploy:
    modjk_worker.activate:
        - name: {{ grains['id'] }}
        - lbn: application
```

(continues on next page)
- **target**: 'roles:balancer'
- **tgt_type**: grain

salt.states.modjk_worker.**disable**(name, lbn, target, profile='default', tgt_type='glob')

Changed in version 2017.7.0: The *expr_form* argument has been renamed to *tgt_type*, earlier releases must use *expr_form*.

Disable the named worker from the lbn load balancers at the targeted minions. The worker will get traffic only for current sessions and won't get new ones.

Example:

```python
disable-before-deploy:
  modjk_worker.disable:
    - name: {{ grains['id'] }}
    - lbn: application
    - target: 'roles:balancer'
    - tgt_type: grain
```

salt.states.modjk_worker.**stop**(name, lbn, target, profile='default', tgt_type='glob')

Changed in version 2017.7.0: The *expr_form* argument has been renamed to *tgt_type*, earlier releases must use *expr_form*.

Stop the named worker from the lbn load balancers at the targeted minions. The worker won't get any traffic from the lbn.

Example:

```python
disable-before-deploy:
  modjk_worker.stop:
    - name: {{ grains['id'] }}
    - lbn: application
    - target: 'roles:balancer'
    - tgt_type: grain
```

23.19.114 salt.states.mongodb_database

**Management of MongoDB Databases**

- **depends**
  - pymongo Python module

Only deletion is supported, creation doesn't make sense and can be done using *mongodb_user.present*.

salt.states.mongodb_database.**absent**(name, user=None, password=None, host=None, port=None, authdb=None)

Ensure that the named database is absent. Note that creation doesn't make sense in MongoDB.

- **name** The name of the database to remove
- **user** The user to connect as (must be able to create the user)
- **password** The password of the user
- **host** The host to connect to
- **port** The port to connect to
23.19.115 salt.states.mongodb_user

Management of MongoDB Users

depends

- pymongo Python module

salt.states.mongodb_user.absent(name, user=None, password=None, host=None, port=None, database='admin', authdb=None)

Ensure that the named user is absent

name The name of the user to remove

user MongoDB user with sufficient privilege to create the user

password Password for the admin user specified by the user parameter

host The hostname/IP address of the MongoDB server

port The port on which MongoDB is listening

database The database from which to remove the user specified by the name parameter

authdb The database in which to authenticate

salt.states.mongodb_user.present(name, passwd, database='admin', user=None, password=None, host='localhost', port=27017, authdb=None, roles=None)

Ensure that the user is present with the specified properties

name The name of the user to manage

passwd The password of the user to manage

user MongoDB user with sufficient privilege to create the user

password Password for the admin user specified with the user parameter

host The hostname/IP address of the MongoDB server

port The port on which MongoDB is listening

database The database in which to create the user

Note: If the database doesn't exist, it will be created.

authdb The database in which to authenticate

roles The roles assigned to user specified with the name parameter

Example:

```
mongouser-myapp:
   mongodb_user.present:
     name: myapp
     passwd: password-of-myapp
     database: admin
# Connect as admin:sekrit
     user: admin
     password: sekrit
```

(continues on next page)
- roles:
  - readWrite
  - userAdmin
  - dbOwner

23.19.116 salt.states.monit

Monit state

Manage monit states

```yaml
monit_enable_service_monitoring:
  monit.monitor:
    - name: service

monit_disable_service_monitoring:
  monit.unmonitor:
    - name: service
```

**Note:** Use of these states require that the `monit` execution module is available.

```plaintext
salt.states.monit.monitor(name)
Get the summary from module monit and try to see if service is being monitored. If not then monitor the service.

salt.states.monit.unmonitor(name)
Get the summary from module monit and try to see if service is being monitored. If it is then stop monitoring the service.
```

23.19.117 salt.states.mount

Mounting of filesystems

Mount any type of mountable filesystem with the mounted function:

```plaintext
/mnt/sdb:
  mount.mounted:
    - device: /dev/sdb1
    - fstype: ext4
    - mkmnt: True
    - opts:
      - defaults

/srv/bigdata:
  mount.mounted:
    - device: UUID=066e8200-2867-4ebe-b9e6-f30026ca2314
    - fstype: xfs
    - opts: nobootwait,noatime,nodiratime,nobarrier,logbufs=8
    - dump: 0
    - pass_num: 2
    - persist: True
```

(continues on next page)
- mkmnt: True

/var/lib/bigdata:
  mount.mounted:
    - device: /srv/bigdata
    - fstype: none
    - opts: bind
data: 
    - dump: 0
    - pass_num: 0
    - persist: True
    - mkmnt: True

salt.states.mount.fstab_absent(name, fs_file, mount_by=None, config='/etc/fstab')
Makes sure that a fstab mount point is absent.

name The name of block device. Can be any valid fs_spec value.

fs_file Mount point (target) for the filesystem.

mount_by Select the final value for fs_spec. Can be [None, device, label, uuid, partlabel, partuuid]. If None, the value for fs_spec will be the parameter name, in other case will search the correct value based on the device name. For example, for uuid, the value for fs_spec will be of type 'UUID=xxx' instead of the device name set in name.

config Place where the fstab file lives

salt.states.mount.fstab_present(name, fs_file, fs_vfstype, fs_mntops='defaults', fs_freq=0, fs_passno=0, mount_by=None, config='/etc/fstab', mount=True, match_on='auto', not_change=False, fs_mount=True)
Makes sure that a fstab mount point is present.

name The name of block device. Can be any valid fs_spec value.

fs_file Mount point (target) for the filesystem.

fs_vfstype The type of the filesystem (e.g. ext4, xfs, btrfs, ...)

fs_mntops The mount options associated with the filesystem. Default is defaults.

fs_freq Field is used by dump to determine which fs need to be dumped. Default is 0

fs_passno Field is used by fsck to determine the order in which filesystem checks are done at boot time. Default is 0

fs_mount Field is used only in AIX systems to determine if the filesystem will be mounted by mount_all

mount_by Select the final value for fs_spec. Can be [None, device, label, uuid, partlabel, partuuid]. If None, the value for fs_spec will be the parameter name, in other case will search the correct value based on the device name. For example, for uuid, the value for fs_spec will be of type 'UUID=xxx' instead of the device name set in name.

config Place where the fstab file lives. Default is /etc/fstab

mount Set if the mount should be mounted immediately. Default is True

match_on A name or list of fstab properties on which this state should be applied. Default is auto, a special value indicating to guess based on fstype. In general, auto matches on name for recognized special devices and device otherwise.

not_change By default, if the entry is found in the fstab file but is different from the expected content (like different options), the entry will be replaced with the correct content. If this parameter is set to True and the line is found, the original content will be preserved.
salt.states.mount.mod_watch(name, user=None, **kwargs)
The mounted watcher, called to invoke the watch command.

Note: This state exists to support special handling of the watch requisite. It should not be called directly.
Parameters for this function should be set by the state being triggered.

name The name of the mount point

class盐 states.mount.mounted(name, device, fstype, mkmnt=False, opts='defaults',
dump=0, pass_num=0, config='/etc/fstab', persist=True,
mount=True, user=None, match_on='auto', device_name_regex=None,
extra_mount_invisible_options=None, extra_mount_invisible_keys=None,
extra_mount_translate_options=None, hidden_opts=None, **kwargs)

Verify that a device is mounted

name The path to the location where the device is to be mounted
device The device name, typically the device node, such as /dev/sdb1 or
UUID=066e0200-2867-4ebe-b9e6-f30026ca2314 or LABEL=DATA
fstype The filesystem type, this will be xfs, ext2/3/4 in the case of classic filesystems, fuse in the case
of fuse mounts, and nfs in the case of nfs mounts
mkmnt If the mount point is not present then the state will fail, set mkmnt: True to create the mount point
if it is otherwise not present
opts A list object of options or a comma delimited list
dump The dump value to be passed into the fstab, Default is 0
pass_num The pass value to be passed into the fstab, Default is 0
config Set an alternative location for the fstab, Default is /etc/fstab
persist Set if the mount should be saved in the fstab, Default is True
mount Set if the mount should be mounted immediately, Default is True
user The account used to execute the mount; this defaults to the user salt is running as on the minion
match_on A name or list of fstab properties on which this state should be applied. Default is auto, a special
value indicating to guess based on fstype. In general, auto matches on name for recognized special
devices and device otherwise.
device_name_regex A list of device exact names or regular expressions which should not force a remount.
For example, glusterfs may be mounted with a comma-separated list of servers in fstab, but the
/proc/self/mountinfo will show only the first available server.

{% set glusterfs_ip_list = ['10.0.0.1', '10.0.0.2', '10.0.0.3'] %}

mount glusterfs volume:
  mount.mounted:
    - name: /mnt/glusterfs_mount_point
    - device: {{ glusterfs_ip_list|join(',') }}:/volume_name
    - fstype: glusterfs
    - opts: _netdev,rw,defaults,direct-io-mode=disable
    - mkmnt: True
    - persist: True

(continues on next page)
- dump: 0
- pass_num: 0
- device_name_regex:
  - {{ glusterfs_ip_list|join('|') }}:/volume_name

New in version 2016.11.0.

**extra_mount_invisible_options** A list of extra options that are not visible through the `/proc/self/mountinfo` interface.

If a option is not visible through this interface it will always remount the device. This option extends the builtin `mount_invisible_options` list.

**extra_mount_invisible_keys** A list of extra key options that are not visible through the `/proc/self/mountinfo` interface.

If a key option is not visible through this interface it will always remount the device. This option extends the builtin `mount_invisible_keys` list.

A good example for a key option is the password option:

```
password=badsecret
```

**extra_mount_ignore_fs_keys** A dict of filesystem options which should not force a remount. This will update the internal dictionary. The dict should look like this:

```
{
    'ramfs': ['size']
}
```

**extra_mount_translate_options** A dict of mount options that gets translated when mounted. To prevent a remount add additional options to the default dictionary. This will update the internal dictionary. The dictionary should look like this:

```
{
    'tcp': 'proto=tcp',
    'udp': 'proto=udp'
}
```

**hidden_opts** A list of mount options that will be ignored when considering a remount as part of the state application

New in version 2015.8.2.

**salt.states.mount.swap** *(name, persist=True, config='/etc/fstab')*

Activates a swap device

```
/root/swapfile:
  mount.swap
```

Note: swap does not currently support LABEL

**salt.states.mount.unmounted** *(name, device=None, config='/etc/fstab', persist=False, user=None, **kwargs)*

New in version 0.17.0.

Verify that a device is not mounted
name  The path to the location where the device is to be unmounted from
device  The device to be unmounted. This is optional because the device could be mounted in multiple places.

New in version 2015.5.0.
config  Set an alternative location for the fstab, Default is /etc/fstab
persist  Set if the mount should be purged from the fstab, Default is False
user  The user to own the mount; this defaults to the user salt is running as on the minion

23.19.118  salt.states.mssql_database

Management of Microsoft SQLServer Databases

The mssql_database module is used to create and manage SQL Server Databases

```python
yolo:
    mssql_database.present
```

salt.states.mssql_database.absent(name, **kwargs)
Ensure that the named database is absent

name  The name of the database to remove

salt.states.mssql_database.present(name, containment='NONE', options=None, **kwargs)
Ensure that the named database is present with the specified options

name  The name of the database to manage

containment  Defaults to NONE

options  Can be a list of strings, a dictionary, or a list of dictionaries

23.19.119  salt.states.mssql_login

Management of Microsoft SQLServer Logins

The mssql_login module is used to create and manage SQL Server Logins

```python
frank:
    mssql_login.present
    - domain: mydomain
```

salt.states.mssql_login.absent(name, **kwargs)
Ensure that the named login is absent

name  The name of the login to remove

salt.states.mssql_login.present(name, password=None, domain=None, server_roles=None, options=None, **kwargs)
Checks existence of the named login. If not present, creates the login with the specified roles and options.

name  The name of the login to manage

password  Creates a SQL Server authentication login Since hashed passwords are varbinary values, if the new_login_password is 'long', it will be considered to be HASHED.

domain  Creates a Windows authentication login. Needs to be NetBIOS domain or hostname
server_roles  Add this login to all the server roles in the list
options  Can be a list of strings, a dictionary, or a list of dictionaries

23.19.120  salt.states.mssql_role

Management of Microsoft SQLServer Databases

The mssql_role module is used to create and manage SQL Server Roles

```python
yolo:
    mssql_role.present
```

```
salt.states.mssql_role.absent(name, **kwargs)
    Ensure that the named database is absent
    name  The name of the database to remove

salt.states.mssql_role.present(name, owner=None, grants=None, **kwargs)
    Ensure that the named database is present with the specified options
    name  The name of the database to manage
    owner  Adds owner using AUTHORIZATION option
    Grants  Can only be a list of strings
```

23.19.121  salt.states.mssql_user

Management of Microsoft SQLServer Users

The mssql_user module is used to create and manage SQL Server Users

```python
frank:
    mssql_user.present:
        - database: yolo
```

```
salt.states.mssql_user.absent(name, **kwargs)
    Ensure that the named user is absent
    name  The username of the user to remove

salt.states.mssql_user.present(name, login=None, domain=None, database=None, roles=None, options=None, **kwargs)
    Checks existence of the named user. If not present, creates the user with the specified roles and options.
    name  The name of the user to manage
    login  If not specified, will be created WITHOUT LOGIN
    domain  Creates a Windows authentication user. Needs to be NetBIOS domain or hostname
    database  The database of the user (not the login)
    roles  Add this user to all the roles in the list
    options  Can be a list of strings, a dictionary, or a list of dictionaries
```
23.19.122 salt.states.msteams

Send a message card to Microsoft Teams

This state is useful for sending messages to Teams during state runs.

New in version 2017.7.0.

```
teams-message:
  msteams.post_card:
    - message: 'This state was executed successfully.'
    - hook_url: https://outlook.office.com/webhook/837
```

The hook_url can be specified in the master or minion configuration like below:

```
msteams:
  hook_url: https://outlook.office.com/webhook/837
```

```
salt.states.msteams.post_card(name, message, hook_url=None, title=None, theme_color=None)
  Send a message to a Microsoft Teams channel
```

```
send-msteams-message:
  msteams.post_card:
    - message: 'This state was executed successfully.'
    - hook_url: https://outlook.office.com/webhook/837
```

The following parameters are required:

- **message** The message that is to be sent to the MS Teams channel.

The following parameters are optional:

- **hook_url** The webhook URL given configured in Teams interface, if not specified in the configuration options of master or minion.
- **title** The title for the card posted to the channel
- **theme_color** A hex code for the desired highlight color

23.19.123 salt.states.mysql_database

Management of MySQL databases (schemas)

```
frank:
  mysql_database.present
```

```
salt.states.mysql_database.absent(name, **connection_args)
  Ensure that the named database is absent
```

name The name of the database to remove
salt.states.mysql_database.present(name, character_set=None, collate=None, **connection_args)

Ensure that the named database is present with the specified properties

name The name of the database to manage

23.19.124 salt.states.mysql_grants

Management of MySQL grants (user permissions)

depends

- MySQLdb Python module

configuration See salt.modules.mysql for setup instructions.

The mysql_grants module is used to grant and revoke MySQL permissions.

The name you pass in purely symbolic and does not have anything to do with the grant itself.

The database parameter needs to specify a 'priv_level' in the same specification as defined in the MySQL documentation:

- *
- **
- db_name.*
- db_name.tbl_name
- etc...

This state is not able to set password for the permission from the specified host. See salt.states.mysql_user for further instructions.

```
frank_exampledb:
  mysql_grants.present:
    - grant: select,insert,update
    - database: exampledb.*
    - user: frank
    - host: localhost

frank_otherdb:
  mysql_grants.present:
    - grant: all privileges
    - database: otherdb.*
    - user: frank

restricted_singletable:
  mysql_grants.present:
    - grant: select
    - database: somedb.sometable
    - user: joe
```

salt.states.mysql_grants.absent(name, grant=None, database=None, user=None, host='localhost',
grant_option=False, escape=True, **connection_args)

Ensure that the grant is absent

name The name (key) of the grant to add

grant The grant priv_type (i.e. select,insert,update OR all privileges)
**database**  The database priv_level (i.e. db.tbl OR db.*)

**user**  The user to apply the grant to

**host**  The network/host that the grant should apply to

**salt.states.mysql_grants.present**(*name*, **grant=**None, **database=**None, **user=**None, **host=**'localhost', **grant_option=**False, **escape=**True, **revoke_first=**False, **ssl_option=**False, **connection_args*)

Ensure that the grant is present with the specified properties

**name**  The name (key) of the grant to add

**grant**  The grant priv_type (i.e. select, insert, update OR all privileges)

**database**  The database priv_level (i.e. db.tbl OR db.*)

**user**  The user to apply the grant to

**host**  The network/host that the grant should apply to

**grant_option**  Adds the WITH GRANT OPTION to the defined grant. Default is False

**escape**  Defines if the database value gets escaped or not. Default is True

**revoke_first**  By default, MySQL will not do anything if you issue a command to grant privileges that are more restrictive than what’s already in place. This effectively means that you cannot downgrade permissions without first revoking permissions applied to a db.table/user pair first.

To have Salt forcibly revoke perms before applying a new grant, enable the 'revoke_first options.

WARNING: This will remove permissions for a database before attempting to apply new permissions. There is no guarantee that new permissions will be applied correctly which can leave your database security in an unknown and potentially dangerous state. Use with caution!

Default is False

**ssl_option**  Adds the specified ssl options for the connecting user as requirements for this grant. Value is a list of single-element dicts corresponding to the list of ssl options to use.

Possible key/value pairings for the dicts in the value:

- SSL: True
- X509: True
- SUBJECT: <subject>
- ISSUER: <issuer>
- CIPHER: <cipher>

The non-boolean ssl options take a string as their values, which should be an appropriate value as specified by the MySQL documentation for these options.

Default is False (no ssl options will be used)
23.19.125 salt.states.neutron_network

Management of OpenStack Neutron Networks

New in version 2018.3.0.

depends shade

classification see salt.modules.neutronng for setup instructions

Example States

```python
create network:
    neutron_network.present:
        - name: network1

delete network:
    neutron_network.absent:
        - name: network1

create network with optional params:
    neutron_network.present:
        - name: network1
        - vlan: 200
        - shared: False
        - external: False
        - project: project1
```

```
salt.states.neutron_network.absent(name, auth=None, **kwargs)
    Ensure a network does not exists

    name  Name of the network

salt.states.neutron_network.present(name, auth=None, **kwargs)
    Ensure a network exists and is up-to-date

    name  Name of the network

    provider  A dict of network provider options.

    shared  Set the network as shared.

    external  Whether this network is externally accessible.

    admin_state_up  Set the network administrative state to up.

    vlan  Vlan ID. Alias for provider

    • physical_network: provider
    • network_type: vlan
    • segmentation_id: (vlan id)
```

23.19. state modules 1541
23.19.126 salt.states.neutron_secgroup

Management of OpenStack Neutron Security Groups

New in version 2018.3.0.

depends shade

configuration see salt.modules.neutronng for setup instructions

Example States

```python
create security group;
neutron_secgroup.present:
  - name: security_group1
  - description: "Very Secure Security Group"

delete security group:
neutron_secgroup.absent:
  - name_or_id: security_group1
  - project_name: Project1

create security group with optional params:
neutron_secgroup.present:
  - name: security_group1
  - description: "Very Secure Security Group"
  - project_id: 1dcac318a83b4610b7a7f7ba01465548

create security group with optional params:
neutron_secgroup.present:
  - name: security_group1
  - description: "Very Secure Security Group"
  - project_name: Project1

salt.states.neutron_secgroup.absent(name, auth=None, **kwargs)
  Ensure a security group does not exist
  name Name of the security group

salt.states.neutron_secgroup.present(name, auth=None, **kwargs)
  Ensure a security group exists.
  You can supply either project_name or project_id.
  Creating a default security group will not show up as a change; it gets created through the lookup process.
  name Name of the security group
  description Description of the security group
  project_name Name of Project
  project_id ID of Project
```
23.19.127  salt.states.neutron_secgroup_rule

Management of OpenStack Neutron Security Group Rules

New in version 2018.3.0.

depends  shade

collection  see salt.modules.neutronng for setup instructions

Example States

```python
create security group rule:
neutron_secgroup_rule.present:
 - name: security_group1
   project_name: Project1
   protocol: icmp

delete security group:
neutron_secgroup_rule.absent:
 - name_or_id: security_group1

create security group with optional params:
neutron_secgroup_rule.present:
 - name: security_group1
   description: "Very Secure Security Group"
   project_id: 1dcac318a83b4610b7a7f7ba01465548
```

salt.states.neutron_secgroup_rule.absent(name, auth=None, **kwargs)
Ensure a security group rule does not exist

- name  name or id of the security group rule to delete
- rule_id  uuid of the rule to delete
- project_id  id of project to delete rule from

salt.states.neutron_secgroup_rule.present(name, auth=None, **kwargs)
Ensure a security group rule exists

- defaults: port_range_min=None, port_range_max=None, protocol=None,
  remote_ip_prefix=None, remote_group_id=None, direction='ingress',
  ethertype='IPv4', project_id=None
- name  Name of the security group to associate with this rule
- project_name  Name of the project associated with the security group
- protocol  The protocol that is matched by the security group rule. Valid values are None, tcp, udp, and icmp.

23.19.128  salt.states.neutron_subnet

Management of OpenStack Neutron Subnets

New in version 2018.3.0.

depends  shade

collection  see salt.modules.neutronng for setup instructions

Example States
**create subnet:**
```yaml
neutron_subnet.present:
  - name: subnet1
  - network_name_or_id: network1
  - cidr: 192.168.199.0/24
```

**delete subnet:**
```yaml
neutron_subnet.absent:
  - name: subnet2
```

**create subnet with optional params:**
```yaml
neutron_subnet.present:
  - name: subnet1
  - network_name_or_id: network1
  - enable_dhcp: True
  - cidr: 192.168.199.0/24
  - allocation_pools:
    - start: 192.168.199.5
    - end: 192.168.199.250
  - host_routes:
    - destination: 192.168..0.0/24
      nexthop: 192.168.0.1
    - gateway_ip: 192.168.199.1
    - dns_nameservers:
      - 8.8.8.8
      - 8.8.8.7
```

**create ipv6 subnet:**
```yaml
neutron_subnet.present:
  - name: v6subnet1
  - network_name_or_id: network1
  - ip_version: 6
```

```
salt.states.neutron_subnet.absent(name, auth=None)
  Ensure a subnet does not exists
  name   Name of the subnet

salt.states.neutron_subnet.present(name, auth=None, **kwargs)
  Ensure a subnet exists and is up-to-date
  name   Name of the subnet
  network_name_or_id   The unique name or ID of the attached network. If a non-unique name is supplied, an exception is raised.
  allocation_pools   A list of dictionaries of the start and end addresses for the allocation pools
  gateway_ip   The gateway IP address.
  dns_nameservers   A list of DNS name servers for the subnet.
  host_routes   A list of host route dictionaries for the subnet.
  ipv6_ra_mode   IPv6 Router Advertisement mode. Valid values are: ‘dhcpv6-stateful’, ‘dhcpv6-stateless’, or ‘slaac’.
  ipv6_address_mode   IPv6 address mode. Valid values are: ‘dhcpv6-stateful’, ‘dhcpv6-stateless’, or ‘slaac’.
```
23.19.129 salt.states.nexus

This state downloads artifacts from Nexus 3.x.
New in version 2018.3.0.

salt.states.nexus.downloaded(name, artifact, target_dir='/tmp', target_file=None)

Ensures that the artifact from nexus exists at given location. If it doesn't exist, then it will be downloaded. If it already exists then the checksum of existing file is checked against checksum in nexus. If it is different then the step will fail.

artifact Details of the artifact to be downloaded from nexus. Various options are:
- nexus_url: URL of the nexus instance
- repository: Repository in nexus
- artifact_id: Artifact ID
- group_id: Group ID
- packaging: Packaging
- classifier: Classifier
- version: Version One of the following: - Version to download - latest - Download the latest release of this artifact - latest_snapshot - Download the latest snapshot for this artifact
- username: nexus username
- password: nexus password

target_dir Directory where the artifact should be downloaded. By default it is downloaded to /tmp directory.
target_file Target file to download artifact to. By default file name is resolved by nexus.

An example to download an artifact to a specific file:

```yaml
jboss_module_downloaded:
  nexus.downloaded:
    - artifact:
      nexus_url: http://nexus.intranet.example.com/repository
      repository: 'libs-release-local'
      artifact_id: 'module'
      group_id: 'com.company.module'
      packaging: 'jar'
      classifier: 'sources'
      version: '1.0'
    - target_file: /opt/jboss7/modules/com/company/lib/module.jar
```

Download artifact to the folder (automatically resolves file name):

```yaml
maven_artifact_downloaded:
  nexus.downloaded:
    - artifact:
      nexus_url: http://nexus.intranet.example.com/repository
      repository: 'maven-releases'
      artifact_id: 'module'
      group_id: 'com.company.module'
      packaging: 'zip'
      classifier: 'dist'
      version: '1.0'
    - target_dir: /opt/maven/modules/com/company/release
```
23.19.130 salt.states.npm

Installation of NPM Packages

These states manage the installed packages for node.js using the Node Package Manager (npm). Note that npm must be installed for these states to be available, so npm states should include a requisite to a pkg.installed state for the package which provides npm (simply npm in most cases). Example:

```

```n

salt.states.npm.bootstrap(name, user=None, silent=True)

Bootstraps a node.js application.

- user The user to run NPM with

  New in version 0.17.0.

salt.states.npm.cache_cleaned(name=None, user=None, force=False)

Ensure that the given package is not cached.

- name The name of the package to remove from the cache, or None for all packages

- user The user to run NPM with

- force Force cleaning of cache. Required for npm@5 and greater

  New in version 2016.11.6.

salt.states.npm.installed(name, pkgs=None, dir=None, user=None, force_reinstall=False, registry=None, env=None)

Verify that the given package is installed and is at the correct version (if specified).

```

```

```n

name The package to install

  Changed in version 2014.7.2: This parameter is no longer lowercased by salt so that case-sensitive NPM package names will work.

pkgs A list of packages to install with a single npm invocation; specifying this argument will ignore the name argument

  New in version 2014.7.0.

dir The target directory in which to install the package, or None for global installation
user  The user to run NPM with
  New in version 0.17.0.

registry  The NPM registry from which to install the package
  New in version 2014.7.0.

e  A list of environment variables to be set prior to execution. The format is the same as the cmd.run.
      state function.
  New in version 2014.7.0.

force reinstall  Install the package even if it is already installed

salt.states.npm.removed(name, dir=None, user=None)
  Verify that the given package is not installed.

dir  The target directory in which to install the package, or None for global installation

user  The user to run NPM with
  New in version 0.17.0.

23.19.131  salt.states.nxos

State module for Cisco NX-OS Switch Proxy and Native minions
New in version 2016.11.0.

For documentation on setting up the nxos proxy minion look in the documentation for salt.proxy.nxos.

salt.states.nxos.config_absent(name)
  Ensure a specific configuration line does not exist in the running config

name  config line to remove

Examples:

add snmp group:
  nxos.config_absent:
    - names:
      - snmp-server community randoSNMPstringHERE group network-operator
      - snmp-server community AnotherRandomSNMPString group network-admin

Note:  For certain cases extra lines could be removed based on dependencies. In this example, included after
the example for config_present, the ACLs would be removed because they depend on the existence of the
group.

salt.states.nxos.config_present(name)
  Ensure a specific configuration line exists in the running config

name  config line to set

Examples:

add snmp group:
  nxos.config_present:
    - names:
      - snmp-server community randoSNMPstringHERE group network-operator

(continues on next page)
add snmp acl:

```
nxos.config_present:
  - names:
    - snmp-server community AnotherRandomSNMPSTring group network-admin
```

```
add snmp acl:

- snmp-server community randoSNMPstringHERE use-acl snmp-acl-ro
- snmp-server community AnotherRandomSNMPSTring use-acl snmp-acl-rw
```

salt.states.nxos.replace(name, repl, full_match=False)

Replace all instances of a string or full line in the running config

**name**  String to replace

**repl**  The replacement text

**full_match**  Whether name will match the full line or only a subset of the line. Defaults to False. When False, ‘* is added around name for matching in the show run config.

Examples:

```
replace snmp string:

nxos.replace:
  - name: randoSNMPstringHERE
  - repl: NEWrandoSNMPstringHERE

replace full snmp string:

nxos.replace:
  - name: ^snmp-server community randoSNMPstringHERE group network-operator$
  - repl: snmp-server community NEWrandoSNMPstringHERE group network-operator
  - full_match: True
```

**Note:** The first example will replace the SNMP string on both the group and the ACL, so you will not lose the ACL setting. Because the second is an exact match of the line, when the group is removed, the ACL is removed, but not readded, because it was not matched.

salt.states.nxos.user_absent(name)

Ensure a user is not present

**name**  username to remove if it exists

Examples:

```
delete:

nxos.user_absent:
  - name: daniel
```

salt.states.nxos.user_present(name, password=None, roles=None, encrypted=False, crypt_salt=None, algorithm='sha256')

Ensure a user is present with the specified groups

**name**  Name of user

**password**  Encrypted or Plain Text password for user

**roles**  List of roles the user should be assigned. Any roles not in this list will be removed

**encrypted**  Whether the password is encrypted already or not. Defaults to False
crypt_salt  Salt to use when encrypting the password. Default is None (salt is randomly generated for unhashed passwords)

algorithm  Algorithm to use for hashing password. Defaults to sha256. Accepts md5, blowfish, sha256, sha512

Examples:

```
crypt_salt
algorithm

create:
  nxos.user_present:
    - name: daniel
    - roles:
      - vdc-admin

set_password:
  nxos.user_present:
    - name: daniel
    - password: admin
    - roles:
      - network-admin

update:
  nxos.user_present:
    - name: daniel
    - password: AiN9jaoP
    - roles:
      - network-admin
      - vdc-admin
```

23.19.132  salt.states.nxos_upgrade

Manage NX-OS System Image Upgrades.

New in version 3001.

maturity new

platform nxos

codeauthor Michael G Wiebe

For documentation on setting up the nxos proxy minion look in the documentation for salt.proxy.nxos.

```
salt.states.nxos_upgrade.image_running(name, system_image, kickstart_image=None, issu=True, **kwargs)
```

Ensure the NX-OS system image is running on the device.

name  Name of the salt state task

system_image  Name of the system image file on bootflash:

kickstart_image  Name of the kickstart image file on bootflash: This is not needed if the system_image is a combined system and kickstart image Default: None

issu  Ensure the correct system is running on the device using an in service software upgrade, or force a disruptive upgrade by setting the option to False. Default: False

timeout  Timeout in seconds for long running 'install all' upgrade command. Default: 900

Examples:
upgrade_software_image_n9k:
  nxos.image_running:
    - name: Ensure nxos.7.0.3.I7.5a.bin is running
    - system_image: nxos.7.0.3.I7.5a.bin
    - issu: True

upgrade_software_image_n7k:
  nxos.image_running:
    - name: Ensure n7000-s2-kickstart.8.0.1.bin is running
    - kickstart_image: n7000-s2-kickstart.8.0.1.bin
    - system_image: n7000-s2-dk9.8.0.1.bin
    - issu: False

23.19.133 salt.states.openstack_config

Manage OpenStack configuration file settings.

maintainer Jeffrey C. Ollie <jeff@ocjtech.us>
maturity new
depends
platform linux

salt.states.openstack_config.absent(name, filename, section, parameter=None)
Ensure a value is not set in an OpenStack configuration file.

filename The full path to the configuration file
section The section in which the parameter will be set
parameter (optional) The parameter to change. If the parameter is not supplied, the name will be used as the parameter.

salt.states.openstack_config.present(name, filename, section, value, parameter=None)
Ensure a value is set in an OpenStack configuration file.

filename The full path to the configuration file
section The section in which the parameter will be set
parameter (optional) The parameter to change. If the parameter is not supplied, the name will be used as the parameter.
value The value to set

23.19.134 salt.states.openvswitch_bridge

Management of Open vSwitch bridges.

salt.states.openvswitch_bridge.absent(name)
Ensures that the named bridge does not exist, eventually deletes it.

Parameters name -- The name of the bridge.

salt.states.openvswitch_bridge.present(name)
Ensures that the named bridge exists, eventually creates it.

Parameters name -- The name of the bridge.
23.19.135 salt.states.openvswitch_port

Management of Open vSwitch ports.

salt.states.openvswitch_port.absent(name, bridge=None)

Ensures that the named port exists on bridge, eventually deletes it. If bridge is not set, port is removed from whatever bridge contains it.

Parameters

- **name** -- The name of the port.
- **bridge** -- The name of the bridge.

salt.states.openvswitch_port.present(name, bridge, tunnel_type=None, id=None, remote=None, dst_port=None, internal=False)

Ensures that the named port exists on bridge, eventually creates it.

Parameters

- **name** -- The name of the port.
- **bridge** -- The name of the bridge.
- **tunnel_type** -- Optional type of interface to create, currently supports: vlan, vxlan and gre.
- **id** -- Optional tunnel's key.
- **remote** -- Remote endpoint's IP address.
- **dst_port** -- Port to use when creating tunnelport in the switch.
- **internal** -- Create an internal port if one does not exist

23.19.136 salt.states.opsgenie

Create/Close an alert in OpsGenie

New in version 2018.3.0.

This state is useful for creating or closing alerts in OpsGenie during state runs.

| used_space: |
| disk.status: |
| - name: / |
| - maximum: 79% |
| - minimum: 20% |

| opsgenie_create_action_sender: |
| opsgenie.create_alert: |
| - api_key: XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX |
| - reason: 'Disk capacity is out of designated range.' |
| - name: disk.status |
| - onfail: |
| - disk: used_space |

| opsgenie_close_action_sender: |
| opsgenie.close_alert: |
| - api_key: XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX |
| - name: disk.status |

(continues on next page)
- **require:**
  - **disk:** used_space

```
salt.states.opsgenie.close_alert(name=None, api_key=None, reason='Conditions are met.', action_type='Close')
```

Close an alert in OpsGenie. It’s a wrapper function for create_alert. Example usage with Salt’s requisites and other global state arguments could be found above.

**Required Parameters:**

- **name** It will be used as alert’s alias. If you want to use the close functionality you must provide name field for both states like in above case.

**Optional Parameters:**

- **api_key** It’s the API Key you’ve copied while adding integration in OpsGenie.
- **reason** It will be used as alert’s default message in OpsGenie.
- **action_type** OpsGenie supports the default values Create/Close for action_type. You can customize this field with OpsGenie’s custom actions for other purposes like adding notes or acknowledging alerts.

```
salt.states.opsgenie.create_alert(name=None, api_key=None, reason=None, action_type='Create')
```

Create an alert in OpsGenie. Example usage with Salt’s requisites and other global state arguments could be found above.

**Required Parameters:**

- **api_key** It’s the API Key you’ve copied while adding integration in OpsGenie.
- **reason** It will be used as alert’s default message in OpsGenie.

**Optional Parameters:**

- **name** It will be used as alert’s alias. If you want to use the close functionality you must provide name field for both states like in above case.
- **action_type** OpsGenie supports the default values Create/Close for action_type. You can customize this field with OpsGenie’s custom actions for other purposes like adding notes or acknowledging alerts.

### 23.19.137 salt.states.pagerduty

Create an Event in PagerDuty

New in version 2014.1.0.

This state is useful for creating events on the PagerDuty service during state runs.

```
salt.states.pagerduty.create_event(name, details, service_key, profile)
```

Create an event on the PagerDuty service

**server-warning-message:**

```
pagerduty.create_event:
  - name: 'This is a server warning message'
  - details: 'This is a much more detailed message'
  - service_key: 9abcd123456789efabcde362783cdbaf
  - profile: my-pagerduty-account
```
The following parameters are required:

- **name**  This is a short description of the event.
- **details**  This can be a more detailed description of the event.
- **service_key**  This key can be found by using pagerduty.list_services.
- **profile**  This refers to the configuration profile to use to connect to the PagerDuty service.

23.19.138  salt.states.pagerduty_escalation_policy

Manage PagerDuty escalation policies.

Schedules and users can be referenced by pagerduty ID, or by name, or by email address.

For example:

```python
ensure test escalation policy:
  pagerduty_escalation_policy.present:
    - name: bruce test escalation policy
    - escalation_rules:
      - type: schedule
        id: 'bruce test schedule level1'
      - type: user
        id: 'Bruce Sherrod'
        escalation_delay_in_minutes: 15
      - type: schedule
        id: 'bruce test schedule level2'
        escalation_delay_in_minutes: 15
      - type: user
        id: 'Bruce TestUser1'
      - type: user
        id: 'Bruce TestUser2'
        escalation_delay_in_minutes: 15
      - type: user
        id: 'Bruce TestUser3'
        escalation_delay_in_minutes: 15
        id: 'bruce+test4@lyft.com'
```

salt.states.pagerduty_escalation_policy.absent( profile='pagerduty',  subdomain=None,  api_key=None, **kwargs)

Ensure that a PagerDuty escalation policy does not exist.  Accepts all the arguments that pagerduty_escalation_policy.present accepts; but ignores all arguments except the name.

Name can be the escalation policy id or the escalation policy name.

salt.states.pagerduty_escalation_policy.present( profile='pagerduty',  subdomain=None,  api_key=None, **kwargs)

Ensure that a pagerduty escalation policy exists.  Will create or update as needed.
This method accepts as args everything defined in https://developer.pagerduty.com/documentation/rest/escalation_policies/create. In addition, user and schedule id's will be translated from name (or email address) into PagerDuty unique ids. For example:

```
pagerduty_escalation_policy.present:
  - name: bruce test escalation policy
  - escalation_rules:
    - targets:
      * type: schedule id: 'bruce test schedule level1'
      * type: user id: 'Bruce Sherrod'
```

In this example, 'Bruce Sherrod' will be looked up and replaced with the PagerDuty id (usually a 7 digit all-caps string, e.g. PX6GQL7)

### 23.19.139 salt.states.pagerduty_schedule

Manage PagerDuty schedules.

Example:

```
ensure test schedule:
  pagerduty_schedule.present:
    - name: 'bruce test schedule level1'
    - schedule:
        name: 'bruce test schedule level1'
        time_zone: 'Pacific Time (US & Canada)'
        schedule_layers:
          - name: 'Schedule Layer 1'
            start: '2015-01-01T00:00:00'
            users:
              - user:
                  'id': 'Bruce TestUser1'
                  member_order: 1
              - user:
                  'id': 'Bruce TestUser2'
                  member_order: 2
              - user:
                  'id': 'bruce@test3@lyft.com'
                  member_order: 3
              - user:
                  'id': 'bruce@test4@lyft.com'
                  member_order: 4
        rotation_virtual_start: '2015-01-01T00:00:00'
        priority: 1
        rotation_turn_length_seconds: 604800
```

`salt.states.pagerduty_schedule.absent(profile='pagerduty', subdomain=None, api_key=None, **kwargs)`

Ensure that a pagerduty schedule does not exist. Name can be pagerduty schedule id or pagerduty schedule name.
salt.states.pagerduty_schedule.present

Ensure that a pagerduty schedule exists. This method accepts as args everything defined in https://developer.pagerduty.com/documentation/rest/schedules/create. This means that most arguments are in a dict called "schedule."

User id's can be pagerduty id, or name, or email address.

23.19.140 salt.states.pagerduty_service

Manage PagerDuty services

Escalation policies can be referenced by pagerduty ID or by namea.

For example:

```python
salt.states.pagerduty_service.present:
- name: 'my service'
- escalation_policy_id: 'my escalation policy'
- type: nagios
```

salt.states.pagerduty_service.absent

Ensure a pagerduty service does not exist. Name can be the service name or pagerduty service id.

salt.states.pagerduty_service.present

Ensure pagerduty service exists. This method accepts as arguments everything defined in https://developer.pagerduty.com/documentation/rest/services/create

Note that many arguments are mutually exclusive, depending on the "type" argument.

Examples:

```python
# create a PagerDuty email service at test-email@DOMAIN.pagerduty.com
ensure generic email service exists:
pagerduty_service.present:
  - name: my email service
  - service:
    description: "email service controlled by salt"
    escalation_policy_id: "my escalation policy"
    type: "generic_email"
    service_key: "test-email"

# create a pagerduty service using cloudwatch integration
ensure my cloudwatch service exists:
pagerduty_service.present:
  - name: my cloudwatch service
  - service:
    escalation_policy_id: "my escalation policy"
    type: aws_cloudwatch
    description: "my cloudwatch service controlled by salt"
```
23.19.141 salt.states.pagerduty_user

Manage PagerDuty users.

Example

```yaml
ensure bruce test user 1:
  pagerduty.user_present:
    - name: 'Bruce TestUser1'
    - email: bruce+test1@lyft.com
    - requester_id: P1GV5NT

salt.states.pagerduty_user.absent(profile='pagerduty', subdomain=None, api_key=None, **kwargs)

Ensure pagerduty user does not exist. Name can be pagerduty id, email address, or user name.

salt.states.pagerduty_user.present(profile='pagerduty', subdomain=None, api_key=None, **kwargs)

```

23.19.142 salt.states.pbm

Manages VMware storage policies (called pbm because the vCenter endpoint is /pbm)

Examples

Storage policy

```json
{
  "name": "salt_storage_policy",
  "description": "Managed by Salt. Random capability values.",
  "resource_type": "STORAGE",
  "subprofiles": [
    {
      "capabilities": [
        {
          "setting": {
            "type": "scalar",
            "value": 2
          },
          "namespace": "VSAN",
          "id": "hostFailuresToTolerate"
        },
        {"setting": {
            "type": "scalar",
            "value": 2
          }
        }
      ]
    }
  ]
}
```

(continues on next page)
"namespace": "VSAN",
"id": "stripeWidth"
},
{
"setting": {
"type": "scalar",
"value": true
},
"namespace": "VSAN",
"id": "forceProvisioning"
},
{
"setting": {
"type": "scalar",
"value": 50
},
"namespace": "VSAN",
"id": "proportionalCapacity"
},
{
"setting": {
"type": "scalar",
"value": 0
},
"namespace": "VSAN",
"id": "cacheReservation"
}],
"name": "Rule-Set 1: VSAN",
"force_provision": null
},
"

Dependencies

- pyVmomi Python Module

**pyVmomi**

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See Issue #29537 <https://github.com/saltstack/salt/issues/29537> for more information.

**salt.states.pbm.default_storage_policy_assigned**(name, policy, datastore)

Assigns a default storage policy to a datastore
policy  Name of storage policy
datastore  Name of datastore

salt.states.pbm.default_vsan_policy_configured(name, policy)
Configures the default VSAN policy on a vCenter. The state assumes there is only one default VSAN policy on a vCenter.
policy  Dict representation of a policy

salt.states.pbm.storage_policies_configured(name, policies)
Configures storage policies on a vCenter.
policies  List of dict representation of the required storage policies

23.19.143  salt.states.pecl

Installation of PHP Extensions Using pecl

These states manage the installed pecl extensions. Note that php-pear must be installed for these states to be available, so pecl states should include a requisite to a pkg.installed state for the package which provides pecl (php-pear in most cases). Example:

```yaml
php-pear:
  pkg.installed

mongo:
  pecl.installed:
    - require:
      - pkg: php-pear
```

salt.states.pecl.installed(name, version=None, defaults=False, force=False, preferred_state='stable')
New in version 0.17.0.

Make sure that a pecl extension is installed.
name  The pecl extension name to install
version  The pecl extension version to install. This option may be ignored to install the latest stable version.
defaults  Use default answers for extensions such as pecl_http which ask questions before installation. Without this option, the pecl.installed state will hang indefinitely when trying to install these extensions.
force  Whether to force the installed version or not
preferred_state  The pecl extension state to install

salt.states.pecl.removed(name)
Make sure that a pecl extension is not installed.
name  The pecl extension name to uninstall
23.19.144 salt.states.pkgbuild

The pkgbuild state is the front of Salt package building backend. It automatically builds DEB and RPM packages from specified sources

New in version 2015.8.0.

```
salt_2015.5.2:
  pkgbuild.built:
  - runas: thatch
  - results:
    - salt-2015.5.2-2.el7.centos.noarch.rpm
    - salt-api-2015.5.2-2.el7.centos.noarch.rpm
    - salt-cloud-2015.5.2-2.el7.centos.noarch.rpm
    - salt-master-2015.5.2-2.el7.centos.noarch.rpm
    - salt-minion-2015.5.2-2.el7.centos.noarch.rpm
    - salt-ssh-2015.5.2-2.el7.centos.noarch.rpm
    - salt-syndic-2015.5.2-2.el7.centos.noarch.rpm
  - dest_dir: /tmp/pkg
  - spec: salt://pkg/salt/spec/salt.spec
  - template: jinja
  - deps:
    - salt://pkg/salt/sources/required_dependency.rpm
  - tgt: epel-7-x86_64
  - sources:
    - salt://pkg/salt/sources/logrotate.salt
    - salt://pkg/salt/sources/README.fedora
    - salt://pkg/salt/sources/salt-2015.5.2.tar.gz
    - salt://pkg/salt/sources/salt-2015.5.2-tests.patch
    - salt://pkg/salt/sources/salt-api
    - salt://pkg/salt/sources/salt-api.service
    - salt://pkg/salt/sources/salt-master
    - salt://pkg/salt/sources/salt-master.service
    - salt://pkg/salt/sources/salt-minion
    - salt://pkg/salt/sources/salt-minion.service
    - salt://pkg/salt/sources/saltpkg.sls
    - salt://pkg/salt/sources/salt-syndic
    - salt://pkg/salt/sources/salt-syndic.service
    - salt://pkg/salt/sources/SaltTesting-2015.5.8.tar.gz

/tmp/pkg:
  pkgbuild.repo
```

salt.states.pkgbuild.built(name, runas, dest_dir, spec, sources, tgt, template=None, deps=None, env=None, results=None, force=False, saltenv='base', log_dir='/var/log/salt/pkgbuild')

Ensure that the named package is built and exists in the named directory

**name** The name to track the build, the name value is otherwise unused

**runas** The user to run the build process as

**dest_dir** The directory on the minion to place the built package(s)

**spec** The location of the spec file (used for rpms)

**sources** The list of package sources

**tgt** The target platform to run the build on

**template** Run the spec file through a templating engine
Changed in version 2015.8.2: This argument is now optional, allowing for no templating engine to be used if none is desired.

**deps** Packages required to ensure that the named package is built can be hosted on either the salt master server or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials.

**env** A dictionary of environment variables to be set prior to execution. Example:

```yaml
- env:
  DEB_BUILD_OPTIONS: 'nocheck'
```

**Warning:** The above illustrates a common PyYAML pitfall, that `yes`, `no`, `on`, `off`, `true`, and `false` are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

**results** The names of the expected rpms that will be built

**force** [False] If `True`, packages will be built even if they already exist in the `dest_dir`. This is useful when building a package for continuous or nightly package builds.

New in version 2015.8.2.

**saltenv** The saltenv to use for files downloaded from the salt fileserver

**log_dir** `[/var/log/salt/rpmbuild]` Root directory for log files created from the build. Logs will be organized by package name, version, OS release, and CPU architecture under this directory.

New in version 2015.8.2.

```python
salt.states.pkgbuild.repo(name, keyid=None, env=None, use_passphrase=False, gnupghome='/etc/salt/gpgkeys', runas='builder', timeout=15.0)
```

Make a package repository and optionally sign it and packages present

The name is directory to turn into a repo. This state is best used with onchanges linked to your package building states.

**name** The directory to find packages that will be in the repository

**keyid** Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with keyid which have been loaded into the minion's Pillar data.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```plaintext
---BEGIN PGP PRIVATE KEY BLOCK-----
Version: GnuPG v1

lQO+BFeiFQCADCAPtHz7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBQx47l6c54bo

inNqW9c=
=sICX
-----END PGP PUBLIC KEY BLOCK-----
gpg_pkg_pub_keyname: gpg_pkg_key.pub

env  Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository. Example:

```
- env:
  OPTIONS: 'ask-passphrase'
```

**Warning:** The above illustrates a common PyYAML pitfall, that yes, no, on, off, true, and false are all loaded as boolean True and False values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Use of OPTIONS on some platforms, for example: ask-passphrase, will require gpg-agent or similar to cache passphrases.

---

**Note:** This parameter is not used for making yum repositories.

use_passphrase  [False] New in version 2016.3.0.

Use a passphrase with the signing key presented in keyid. Passphrase is received from Pillar data which could be passed on the command line with pillar parameter. For example:

```
pillar='{"gpg_passphrase" : "my_passphrase" }'
```

gnupghome  [/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with 'keyid'

runas  [builder] New in version 2016.3.0.

User to create the repository as, and optionally sign packages.

**Note:** Ensure the user has correct permissions to any files and directories which are to be utilized.

timeout  [15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.
23.19.145 salt.states.pkgng

Manage package remote repo using FreeBSD pkgng

Salt can manage the URL pkgng pulls packages from. ATM the state and module are small so use cases are typically rather simple:

```
pkgng_clients:
    pkgng.update_packaging_site:
    - name: "http://192.168.0.2"
```

\texttt{salt.states.pkgng.update\_packaging\_site(name)}

23.19.146 salt.states.portage_config

Management of Portage package configuration on Gentoo

A state module to manage Portage configuration on Gentoo

```
salt:
    portage_config.flags:
    - use:
      - openssl
```

\texttt{salt.states.portage\_config.flags(name, use=None, accept\_keywords=None, env=None, license=None, properties=None, unmask=False, mask=False)}

Enforce the given flags on the given package or DEPEND atom.

**Warning:** In most cases, the affected package(s) need to be rebuilt in order to apply the changes.

- **name**  The name of the package or its DEPEND atom
- **use**  A list of USE flags
- **accept\_keywords**  A list of keywords to accept. \texttt{~ARCH} means current host arch, and will be translated into a line without keywords
- **env**  A list of environment files
- **license**  A list of accepted licenses
- **properties**  A list of additional properties
- **unmask**  A boolean to unmask the package
- **mask**  A boolean to mask the package
23.19.147 salt.states.postgres_cluster

Management of PostgreSQL clusters

The postgres_cluster state module is used to manage PostgreSQL clusters. Clusters can be set as either absent or present

```
create cluster 9.3 main:
  postgres_cluster.present:
    - name: 'main'
    - version: '9.3'
```

```
salt.states.postgres_cluster.absent(version, name)
  Ensure that the named cluster is absent
  version  Version of the postgresql server of the cluster to remove
  name    The name of the cluster to remove
  New in version 2016.3.0.
```

```
salt.states.postgres_cluster.present(version, name, port=None, encoding=None, locale=None, datadir=None, allow_group_access=None, data_checksums=None, wal_segsize=None)
  Ensure that the named cluster is present with the specified properties. For more information about all of these options see man pg_createcluster(1)
  version  Version of the postgresql cluster
  name    The name of the cluster
  port    Cluster port
  encoding  The character encoding scheme to be used in this database
  locale  Locale with which to create cluster
  datadir  Where the cluster is stored
  allow_group_access  Allows users in the same group as the cluster owner to read all cluster files created by initdb
  data_checksums  Use checksums on data pages
  wal_segsize  Set the WAL segment size, in megabytes
  New in version 2016.3.0.
```

23.19.148 salt.states.postgres_database

Management of PostgreSQL databases

The postgres_database module is used to create and manage Postgres databases. Databases can be set as either absent or present

```
frank:
  postgres_database.present
```

23.19. state modules
salt.states.postgres_database.absent(name, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None, db_user=None)

Ensure that the named database is absent

name The name of the database to remove
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default
user System user all operations should be performed on behalf of

New in version 0.17.0.

salt.states.postgres_database.present(name, tablespace=None, encoding=None, lc_collate=None, lc_ctype=None, owner=None, owner_recurse=False, template=None, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None, db_user=None)

Ensure that the named database is present with the specified properties. For more information about all of these options see man createdb(1)

name The name of the database to manage
tablespace Default tablespace for the database
encoding The character encoding scheme to be used in this database
lc_collate The LC_COLLATE setting to be used in this database
lc_ctype The LC_CTYPE setting to be used in this database
owner The username of the database owner
owner_recurse Recurse owner change to all relations in the database
template The template database from which to build this database
user System user all operations should be performed on behalf of
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

New in version 0.17.0.
23.19.149  salt.states.postgres_initdb

Initialization of PostgreSQL data directory

The postgres_initdb module is used to initialize the postgresql data directory.

New in version 2016.3.0.

```yaml
pgsql-data-dir:
  postgres_initdb.present:
    - name: /var/lib/pgsql/data
    - auth: password
    - user: postgres
    - password: strong_password
    - encoding: UTF8
    - locale: C
    - runas: postgres
    - checksums: True
    - waldir: /var/postgresql/wal
```

**salt.states.postgres_initdb.present** *(name, user=None, password=None, auth='password', encoding='UTF8', locale=None, runas=None, waldir=None, checksums=False)*

Initialize the PostgreSQL data directory

**name**  The name of the directory to initialize

**user**  The database superuser name

**password**  The password to set for the postgres user

**auth**  The default authentication method for local connections

**encoding**  The default encoding for new databases

**locale**  The default locale for new databases

**waldir**  The transaction log (WAL) directory (default is to keep WAL inside the data directory)

New in version 2019.2.0.

**checksums**  If True, the cluster will be created with data page checksums.

---

**Note:**  Data page checksums are supported since PostgreSQL 9.3.

New in version 2019.2.0.

**runas**  The system user the operation should be performed on behalf of
23.19.150  salt.states.postgres_language

Management of PostgreSQL languages

The postgres_language module is used to create and manage Postgres languages. Languages can be set as either absent or present

New in version 2016.3.0.

```plaintext
plpgsql:
  postgres_language.present:
    - maintenance_db: testdb

plpgsql:
  postgres_language.absent:
    - maintenance_db: testdb
```

**salt.states.postgres_language.absent** *(name, maintenance_db, user=None, db_password=None, db_host=None, db_port=None, db_user=None)*

Ensure that a named language is absent in the specified database.

- **name** The name of the language to remove
- **maintenance_db** The name of the database in which the language is to be installed
- **user** System user all operations should be performed on behalf of
- **db_user** Database username if different from config or default
- **db_password** User password if any password for a specified user
- **db_host** Database host if different from config or default
- **db_port** Database port if different from config or default

**salt.states.postgres_language.present** *(name, maintenance_db, user=None, db_password=None, db_host=None, db_port=None, db_user=None)*

Ensure that a named language is present in the specified database.

- **name** The name of the language to install
- **maintenance_db** The name of the database in which the language is to be installed
- **user** System user all operations should be performed on behalf of
- **db_user** Database username if different from config or default
- **db_password** User password if any password for a specified user
- **db_host** Database host if different from config or default
- **db_port** Database port if different from config or default
23.19.151 salt.states.postgres_privileges

Management of PostgreSQL Privileges

The postgres_privileges module is used to manage Postgres privileges. Privileges can be set as either absent or present.

Privileges can be set on the following database object types:

- database
- schema
- tablespace
- table
- sequence
- language
- group

Setting the grant option is supported as well.

New in version 2016.3.0.

baruwa:

```yaml
postgres_privileges.present:
  object_name: awl
  object_type: table
  privileges:
    - SELECT
    - INSERT
    - DELETE
  grant_option: False
  prepend: public
  maintenance_db: testdb
```

andrew:

```yaml
postgres_privileges.present:
  object_name: admins
  object_type: group
  grant_option: False
  maintenance_db: testdb
```

baruwa:

```yaml
postgres_privileges.absent:
  object_name: awl
  object_type: table
  privileges:
    - SELECT
    - INSERT
    - DELETE
  prepend: public
  maintenance_db: testdb
```

andrew:

```yaml
postgres_privileges.absent:
  object_name: admins
```

(continues on next page)
salt.states.postgres_privileges.absent(name, object_name, object_type, privileges=None, prepend='public', maintenance_db=None, user=None, db_password=None, db_host=None, db_port=None, db_user=None)

Revoke the requested privilege(s) on the specified object(s)

**name** Name of the role whose privileges should be revoked

**object_name** Name of the object on which the revoke is to be performed

**object_type** The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

View permissions should specify `object_type: table`.

**privileges** Comma separated list of privileges to revoke, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

**note** privileges should not be set when revoking group membership

**prepend** Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema
maintenance_db  The name of the database in which the language is to be installed

user  System user all operations should be performed on behalf of

db_user  database username if different from config or default

db_password  user password if any password for a specified user

db_host  Database host if different from config or default

db_port  Database port if different from config or default

salt.states.postgres_privileges.present(name, object_name, object_type, privileges=None, grant_option=None, prepend='public', maintenance_db=None, user=None, db_password=None, db_host=None, db_port=None, db_user=None)

Grant the requested privilege(s) on the specified object to a role

name  Name of the role to which privileges should be granted

object_name  Name of the object on which the grant is to be performed. 'ALL' may be used for objects of type 'table' or 'sequence'.

object_type  The object type, which can be one of the following:

  - table
  - sequence
  - schema
  - tablespace
  - language
  - database
  - group
  - function

View permissions should specify object_type: table.

privileges  List of privileges to grant, from the list below:

  - INSERT
  - CREATE
  - TRUNCATE
  - CONNECT
  - TRIGGER
  - SELECT
  - USAGE
  - TEMPORARY
  - UPDATE
  - EXECUTE
  - REFERENCES
  - DELETE
  - ALL
note  privileges should not be set when granting group membership

grant_option  If grant_option is set to True, the recipient of the privilege can in turn grant it to others

prepend  Table and Sequence object types live under a schema so this should be provided if the object is not
under the default public schema

maintenance_db  The name of the database in which the language is to be installed

user  System user all operations should be performed on behalf of

db_user  database username if different from config or default

db_password  user password if any password for a specified user

db_host  Database host if different from config or default

db_port  Database port if different from config or default

23.19.152  salt.states.postgres_schema

Management of PostgreSQL schemas

The postgres_schemas module is used to create and manage Postgres schemas.

```
public:
    postgres_schema.present 'dbname' 'name'
```

salt.states.postgres_schema.absent(dbname, name, user=None, db_user=None, 
                    db_password=None, db_host=None, db_port=None)

Ensure that the named schema is absent.

dbname  The database's name will work on
name  The name of the schema to remove
user  system user all operations should be performed on behalf of
db_user  database username if different from config or default
db_password  user password if any password for a specified user
db_host  Database host if different from config or default
db_port  Database port if different from config or default

salt.states.postgres_schema.present(dbname, name, owner=None, user=None, db_user=None, 
                           db_password=None, db_host=None, db_port=None)

Ensure that the named schema is present in the database.

dbname  The database's name will work on
name  The name of the schema to manage
user  system user all operations should be performed on behalf of
db_user  database username if different from config or default
db_password  user password if any password for a specified user
db_host  Database host if different from config or default
db_port  Database port if different from config or default
23.19.153 salt.states.postgres_tablespace

Management of PostgreSQL tablespace

A module used to create and manage PostgreSQL tablespaces.

```yaml
ssd-tablespace:
  postgres_tablespace.present:
    - name: indexes
    - directory: /mnt/ssd-data
```

New in version 2015.8.0.

`salt.states.postgres_tablespace.absent(name, user=None, maintenance_db=None, db_user=None, db_password=None, db_host=None, db_port=None)`

Ensure that the named tablespace is absent.

- **name**: The name of the tablespace to remove
- **user**: System user all operations should be performed on behalf of
- **maintenance_db**: Database to act on
- **db_user**: Database username if different from config or default
- **db_password**: User password if any password for a specified user
- **db_host**: Database host if different from config or default
- **db_port**: Database port if different from config or default

`salt.states.postgres_tablespace.present(name, directory, options=None, owner=None, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None, db_user=None)`

Ensure that the named tablespace is present with the specified properties. For more information about all of these options run `man 7 create_tablespace`.

- **name**: The name of the tablespace to create/manage.
- **directory**: The directory where the tablespace will be located, must already exist
- **options**: A dictionary of options to specify for the tablespace. Currently, the only tablespace options supported are `seq_page_cost` and `random_page_cost`. Default values are shown in the example below:

```yaml
my_space:
  postgres_tablespace.present:
    - directory: /srv/my_tablespace
    - options:
      seq_page_cost: 1.0
      random_page_cost: 4.0
```

- **owner**: The database user that will be the owner of the tablespace. Defaults to the user executing the command (i.e. the `user` option)
- **user**: System user all operations should be performed on behalf of
- **maintenance_db**: Database to act on
- **db_user**: Database username if different from config or default
- **db_password**: User password if any password for a specified user
db_host  Database host if different from config or default
db_port  Database port if different from config or default

### 23.19.154 salt.states.powerpath

Powerpath configuration support

Allows configuration of EMC Powerpath. Currently only addition/deletion of licenses is supported.

```
key:
  powerpath.license_present: []
```

- `salt.states.powerpath.license_absent(name)`
  Ensures that the specified PowerPath license key is absent on the host.
  name  The license key to ensure is absent

- `salt.states.powerpath.license_present(name)`
  Ensures that the specified PowerPath license key is present on the host.
  name  The license key to ensure is present

### 23.19.155 salt.states.process

Process Management

Ensure a process matching a given pattern is absent.

```
httpd-absent:
  process.absent:
    - name: apache2
```

- `salt.states.process.absent(name, user=None, signal=None)`
  Ensures that the named command is not running.
  name  The pattern to match.
  user  The user to which the process belongs
  signal  Signal to send to the process(es).

### 23.19.156 salt.states.pushover

Send a message to PushOver

This state is useful for sending messages to PushOver during state runs.

New in version 2015.5.0.

```
pushover-message:
  pushover.post_message:
    - user: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
    - token: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
    - title: Salt Returner
```

(continues on next page)
The api key can be specified in the master or minion configuration like below:

```yaml
pushover:
  token: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

The following parameters are required:

- **name**: The unique name for this event.
- **user**: The user or group of users to send the message to. Must be ID of user, not name or email address.
- **message**: The message that is to be sent to the PushOver channel.

The following parameters are optional:

- **title**: The title to use for the message.
- **device**: The device for the user to send the message to.
- **priority**: The priority for the message.
- **expire**: The message should expire after specified amount of seconds.
- **retry**: The message should be resent this many times.
- **token**: The token for PushOver to use for authentication, if not specified in the configuration options of master or minion.

### 23.19.157 salt.states.pyenv

**Managing python installations with pyenv**

This module is used to install and manage python installations with pyenv. Different versions of python can be installed, and uninstalled. pyenv will be installed automatically the first time it is needed and can be updated later. This module will not automatically install packages which pyenv will need to compile the versions of python.

If pyenv is run as the root user then it will be installed to `/usr/local/pyenv`, otherwise it will be installed to the users `~/.pyenv` directory. To make pyenv available in the shell you may need to add the pyenv/shims and pyenv/bin directories to the users PATH. If you are installing as root and want other users to be able to access pyenv then you will need to add pyenv_ROOT to their environment.
This is how a state configuration could look like:

```
pyenv-deps:
  pkg.installed:
    - pkgs:
      - make
      - build-essential
      - libssl-dev
      - zlib1g-dev
      - libbz2-dev
      - libreadline-dev
      - libsqlite3-dev
      - wget
      - curl
      - llvm
  python-2.6:
    pyenv.absent:
      - require:
        - pkg: pyenv-deps

python-2.7.6:
  pyenv.installed:
    - default: True
    - require:
      - pkg: pyenv-deps
```

Note: Git needs to be installed and available via PATH if pyenv is to be installed automatically by the module.

```
salt.states.pyenv.absent(name, user=None)
    Verify that the specified python is not installed with pyenv. pyenv is installed if necessary.
    name  The version of python to uninstall
    user: None  The user to run pyenv as.
            New in version 0.17.0.
            New in version 0.16.0.

salt.states.pyenv.install_pyenv(name, user=None)
    Install pyenv if not installed. Allows you to require pyenv be installed prior to installing the plugins. Useful
    if you want to install pyenv plugins via the git or file modules and need them installed before installing any
    rubies.
    Use the pyenv.root configuration option to set the path for pyenv if you want a system wide install that is not
    in a user home dir.
    user: None  The user to run pyenv as.

salt.states.pyenv.installed(name, default=False, user=None)
    Verify that the specified python is installed with pyenv. pyenv is installed if necessary.
    name  The version of python to install
    default  [False] Whether to make this python the default.
    user: None  The user to run pyenv as.
            New in version 0.17.0.
            New in version 0.16.0.
```
23.19.158 salt.states.pyrax_queues

Manage Rackspace Queues

New in version 2015.5.0.

Create and destroy Rackspace queues. Be aware that this interacts with Rackspace's services, and so may incur charges.

This module uses pyrax, which can be installed via package, or pip. This module is greatly inspired by boto_* modules from SaltStack code source.

```yaml
myqueue:
  ppyrax_queues.present:
    - provider: my-pyrax
myqueue:
  ppyrax_queues.absent:
    - provider: my-pyrax
```

salt.states.pyrax_queues.absent(name, provider)
Ensure the named Rackspace queue is deleted.

  name  Name of the Rackspace queue.
  provider  Salt Cloud provider

salt.states.pyrax_queues.present(name, provider)
Ensure the RackSpace queue exists.

  name  Name of the Rackspace queue.
  provider  Salt Cloud Provider

23.19.159 salt.states.quota

Management of POSIX Quotas

The quota can be managed for the system:

```yaml
/:  
  quota.mode:
    mode: off
    quotatype: user
```

salt.states.quota.mode(name, mode, quotatype)
Set the quota for the system

  name  The filesystem to set the quota mode on
  mode  Whether the quota system is on or off
  quotatype  Must be user or group
23.19.160 salt.states.rabbitmq_plugin

Manage RabbitMQ Plugins

New in version 2014.1.0.

Example:

```yaml
some_plugin:
  rabbitmq_plugin.enabled: []
```

`salt.states.rabbitmq_plugin.disabled(name, runas=None)`
Ensure the RabbitMQ plugin is disabled.

- **name**  The name of the plugin
- **runas** The user to run the rabbitmq-plugin command as

`salt.states.rabbitmq_plugin.enabled(name, runas=None)`
Ensure the RabbitMQ plugin is enabled.

- **name**  The name of the plugin
- **runas** The user to run the rabbitmq-plugin command as

23.19.161 salt.states.rbac_solaris

Management of Solaris RBAC

- **maintainer** Jorge Schrauwen <sjorge@blackdot.be>
- **maturity** new
- **depends** rbac_solaris,solaris_user
- **platform** solaris,illumos

New in version 2016.11.0.

```yaml
sjorge:
  rbac.managed:
    - roles:
      - netcfg
    - profiles:
      - System Power
    - authorizations:
      - solaris.audit.*
```

`salt.states.rbac_solaris.managed(name, roles=None, profiles=None, authorizations=None)`
Manage RBAC properties for user

- **name**  [string] username
- **roles**  [list] list of roles for user
- **profiles**  [list] list of profiles for user
- **authorizations**  [list] list of authorizations for user
Warning: All existing roles, profiles and authorizations will be replaced! An empty list will remove everything.
Set the property to None to not manage it.

23.19.162 salt.states.rbenv

Managing Ruby installations with rbenv

This module is used to install and manage ruby installations with rbenv and the ruby-build plugin. Different versions of ruby can be installed, and uninstalled. Rbenv will be installed automatically the first time it is needed and can be updated later. This module will not automatically install packages which rbenv will need to compile the versions of ruby. If your version of ruby fails to install, refer to the ruby-build documentation to verify you are not missing any dependencies: https://github.com/rbenv/ruby-build/wiki

If rbenv is run as the root user then it will be installed to /usr/local/rbenv, otherwise it will be installed to the users ~/.rbenv directory. To make rbenv available in the shell you may need to add the rbenv/shims and rbenv/bin directories to the users PATH. If you are installing as root and want other users to be able to access rbenv then you will need to add RBENV_ROOT to their environment.

The following state configuration demonstrates how to install Ruby 1.9.x and 2.x using rbenv on Ubuntu/Debian:

```yaml
rbenv-deps:
  pkg.installed:
    - names:
      - bash
      - git
      - openssl
      - libssl-dev
      - make
      - curl
      - autoconf
      - bison
      - build-essential
      - libffi-dev
      - libyaml-dev
      - libreadline6-dev
      - zlib1g-dev
      - libncurses5-dev

ruby-1.9.3-p429:
  rbenv.absent:
    - require:
      - pkg: rbenv-deps

ruby-2.0.0-p598:
  rbenv.installed:
    - default: True
    - require:
      - pkg: rbenv-deps

salt.states.rbenv.absent(name, user=None)
Verify that the specified ruby is not installed with rbenv. Rbenv is installed if necessary.

    name  The version of ruby to uninstall
```
user: None  The user to run rbenv as.

New in version 0.17.0.
New in version 0.16.0.

salt.states.rbenv.install_rbenv(name, user=None)
Install rbenv if not installed. Allows you to require rbenv be installed prior to installing the plugins. Useful if you want to install rbenv plugins via the git or file modules and need them installed before installing any rubies.

Use the rbenv.root configuration option to set the path for rbenv if you want a system wide install that is not in a user home dir.

user: None  The user to run rbenv as.

salt.states.rbenv.installed(name, default=False, user=None)
Verify that the specified ruby is installed with rbenv. Rbenv is installed if necessary.

name  The version of ruby to install

default  [False]  Whether to make this ruby the default.

user: None  The user to run rbenv as.

New in version 0.17.0.
New in version 0.16.0.

23.19.163  salt.states.rdp

Manage RDP Service on Windows servers

salt.states.rdp.disabled(name)
Disable the RDP service

salt.states.rdp.enabled(name)
Enable the RDP service and make sure access to the RDP port is allowed in the firewall configuration

23.19.164  salt.states.redismod

Management of Redis server

New in version 2014.7.0.

depends

•  redis Python module

count

configuration  See salt.modules.redis for setup instructions.

| key_in_redis: |
| redis.string: |
| -  value:  string data |

The redis server information specified in the minion config file can be overridden in states using the following arguments: host, port, db, password.
key_in_redis:
redis.string:
  - value: string data
  - host: localhost
  - port: 6379
  - db: 0
  - password: somuchkittycat

salt.states.redismod.absent(name, keys=None, **connection_args)
Ensure key absent from redis

  name  Key to ensure absent from redis
  keys  list of keys to ensure absent, name will be ignored if this is used

salt.states.redismod.slaveof(name, sentinel_host=None, sentinel_port=None, sentinel_password=None, **connection_args)
Set this redis instance as a slave.
New in version 2016.3.0.

  name  Master to make this a slave of
  sentinel_host  Ip of the sentinel to check for the master
  sentinel_port  Port of the sentinel to check for the master

salt.states.redismod.string(name, value, expire=None, expireat=None, **connection_args)
Ensure that the key exists in redis with the value specified

  name  Redis key to manage
  value  Data to persist in key
  expire  Sets time to live for key in seconds
  expireat  Sets expiration time for key via UNIX timestamp, overrides expire

23.19.165 salt.states.reg

Manage the Windows registry

Many python developers think of registry keys as if they were python keys in a dictionary which is not the case. The windows registry is broken down into the following components:

Hives

This is the top level of the registry. They all begin with HKEY.

  - HKEY_CLASSES_ROOT (HKCR)
  - HKEY_CURRENT_USER(HKCU)
  - HKEY_LOCAL_MACHINE (HKLM)
  - HKEY_USER (HKU)
  - HKEY_CURRENT_CONFIG
Keys

Hives contain keys. These are basically the folders beneath the hives. They can contain any number of subkeys.

When passing the hivekey values they must be quoted correctly depending on the backslashes being used (\ vs \\). The way backslashes are handled in the state file is different from the way they are handled when working on the CLI. The following are valid methods of passing the hivekey:

**Using single backslashes:** HKLMSOFTWAREPython ’HKLMSOFTWAREPython’

**Using double backslashes:** "HKLM\SOFTWARE\Python"

Values or Entries

Values or Entries are the name/data pairs beneath the keys and subkeys. All keys have a default name/data pair. The name is (Default) with a displayed value of (value not set). The actual value is Null.

Example

The following example is taken from the windows startup portion of the registry:

```plaintext
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Run]
"RTHDVCPL"=""C:\Program Files\Realtek\HDA\RtkNGUI64.exe" -s"
"NvBackend"=""C:\Program Files (x86)\NVIDIA Corporation\Update Core\NvBackend.exe"
"BTMTrayAgent"="rundll32.exe "C:\Program Files (x86)\Intel\Bluetooth\btmshellex.dll",TrayApp"
```

In this example these are the values for each:

**Hive:** HKEY_LOCAL_MACHINE

**Key and subkeys:** SOFTWARE\Microsoft\Windows\CurrentVersion\Run

**Value:**

- There are 3 value names: RTHDVCPL, NvBackend, and BTMTrayAgent
- Each value name has a corresponding value

```python
salt.states.reg.absent(name, vname=None, use_32bit_registry=False)
```

Ensure a registry value is removed. To remove a key use key_absent.

**Parameters**

- **name (str)** -- A string value representing the full path of the key to include the HIVE, Key, and all Subkeys. For example:
  
  ```python
  HKEY_LOCAL_MACHINE\SOFTWARE\Salt
  ```

  Valid hive values include:

  ```
  - HKEY_CURRENT_USER or HKCU
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_USERS or HKU
  ```

- **vname (str)** -- The name of the value you'd like to create beneath the Key. If this parameter is not passed it will assume you want to set the (Default) value
- **use_32bit_registry** *(bool)* -- Use the 32bit portion of the registry. Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.

**Returns** A dictionary showing the results of the registry operation.

**Return type** `dict`

**CLI Example:**

```
'HKEY_CURRENT_USER\SOFTWARE\Salt':
  reg.absent
    - vname: version
```

In the above example the value named `version` will be removed from the SOFTWARE\Salt key in the HKEY_CURRENT_USER hive. If `vname` was not passed, the (Default) value would be deleted.

**salt.states.reg.key_absent** *(name, use_32bit_registry=False)*

New in version 2015.5.4.

Ensure a registry key is removed. This will remove the key, subkeys, and all value entries.

**Parameters**

- **name** *(str)* -- A string representing the full path to the key to be removed to include the hive and the keypath. The hive can be any of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU

- **use_32bit_registry** *(bool)* -- Use the 32bit portion of the registry. Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.

**Returns** A dictionary showing the results of the registry operation.

**Return type** `dict`

**CLI Example:**

The following example will delete the SOFTWARE\DeleteMe key in the HKEY_LOCAL_MACHINE hive including all its subkeys and value pairs.

```
remove_key_demo:
  reg.key_absent:
    - name: HKEY_CURRENT_USER\SOFTWARE\DeleteMe
```

In the above example the path is interpreted as follows:

- HKEY_CURRENT_USER is the hive
- SOFTWARE\DeleteMe is the key

**salt.states.reg.present** *(name, vname=None, vdata=None, vtype='REG_SZ', use_32bit_registry=False, win_owner=None, win_perms=None, win_deny_perms=None, win_inheritance=True, win_perms_reset=False)*

Ensure a registry key or value is present.

**Parameters**

- **name** *(str)* -- A string value representing the full path of the key to include the HIVE, Key, and all Subkeys. For example:
HKEY_LOCAL_MACHINE\SOFTWARE\Salt

Valid hive values include:
- HKEY_CURRENT_USER or HKCU
- HKEY_LOCAL_MACHINE or HKLM
- HKEY_USERS or HKU

- **vname (str)** -- The name of the value you’d like to create beneath the Key. If this parameter is not passed it will assume you want to set the (Default) value.

- **vdata (str, int, list, bytes)** -- The value you’d like to set. If a value name (vname) is passed, this will be the data for that value name. If not, this will be the (Default) value for the key.

The type of data this parameter expects is determined by the value type specified in vtype. The correspondence is as follows:
- REG_BINARY: Binary data (str in Py2, bytes in Py3)
- REG_DWORD: int
- REG_EXPAND_SZ: str
- REG_MULTI_SZ: list of str
- REG_QWORD: int
- REG_SZ: str

**Note:** When setting REG_BINARY, string data will be converted to binary automatically. To pass binary data, use the built-in yaml tag `!!binary` to denote the actual binary characters. For example, the following lines will both set the same data in the registry:
- vdata: Salty Test
- vdata: `!!binary U2FsdHkgVGVzdA==

For more information about the `!!binary` tag see [here](#).

**Note:** The type for the (Default) value is always REG_SZ and cannot be changed. This parameter is optional. If not passed, the Key will be created with no associated item/value pairs.

- **vtype (str)** -- The value type for the data you wish to store in the registry. Valid values are:
  - REG_BINARY
  - REG_DWORD
  - REG_EXPAND_SZ
  - REG_MULTI_SZ
  - REG_QWORD
  - REG_SZ (Default)
- **use_32bit_registry** *(bool)* — Use the 32bit portion of the registry. Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.

- **win_owner** *(str)* — The owner of the registry key. If this is not passed, the account under which Salt is running will be used.

  **Note:** Owner is set for the key that contains the value/data pair. You cannot set ownership on value/data pairs themselves.

  New in version 2019.2.0.

- **win_perms** *(dict)* — A dictionary containing permissions to grant and their propagation. If not passed the ‘Grant’ permissions will not be modified.

  **Note:** Permissions are set for the key that contains the value/data pair. You cannot set permissions on value/data pairs themselves.

  For each user specify the account name, with a sub dict for the permissions to grant and the ‘Applies to’ setting. For example: 

  ```
  {'Administrators': {'perms': 'full_control', 'applies_to': 'this_key_subkeys'}}
  ```

  perms must be specified.

  Registry permissions are specified using the `perms` key. You can specify a single basic permission or a list of advanced perms. The following are valid perms:

  **Basic (passed as a string):**
  - full_control
  - read
  - write

  **Advanced (passed as a list):**
  - delete
  - query_value
  - set_value
  - create_subkey
  - enum_subkeys
  - notify
  - create_link
  - read_control
  - write_dac
  - write_owner

  The ‘Applies to’ setting is optional. It is specified using the `applies_to` key. If not specified this_key_subkeys is used. Valid options are:

  **Applies to settings:**
  - this_key_only
  - this_key_subkeys
- `subkeys_only`

New in version 2019.2.0.

- **`win_deny_perms (dict)`** -- A dictionary containing permissions to deny and their propagation. If not passed the *Deny* permissions will not be modified.

  **Note:** Permissions are set for the key that contains the value/data pair. You cannot set permissions on value/data pairs themselves.

Valid options are the same as those specified in `win_perms`

  **Note:** 'Deny' permissions always take precedence over 'grant' permissions.

New in version 2019.2.0.

- **`win_inheritance (bool)`** -- *True* to inherit permissions from the parent key. *False* to disable inheritance. Default is *True*.

  **Note:** Inheritance is set for the key that contains the value/data pair. You cannot set inheritance on value/data pairs themselves.

New in version 2019.2.0.

- **`win_perms_reset (bool)`** -- If *True* the existing DACL will be cleared and replaced with the settings defined in this function. If *False*, new entries will be appended to the existing DACL. Default is *False*.

  **Note:** Perms are reset for the key that contains the value/data pair. You cannot set permissions on value/data pairs themselves.

New in version 2019.2.0.

**Returns** A dictionary showing the results of the registry operation.

**Return type** dict

Example:

The following example will set the *(Default)* value for the `SOFTWARE\Salt` key in the `HKEY_CURRENT_USER` hive to 2016.3.1:

```
HKEY_CURRENT_USER\SOFTWARE\Salt:
  reg.present:
    - vdata: 2016.3.1
```

Example:

The following example will set the value for the `version` entry under the `SOFTWARE\Salt` key in the `HKEY_CURRENT_USER` hive to 2016.3.1. The value will be reflected in `Wow6432Node`:
In the above example the path is interpreted as follows:

- **HKEY_CURRENT_USER** is the hive
- **SOFTWARE\Salt** is the key
- **vname** is the value name ('version') that will be created under the key
- **vdata** is the data that will be assigned to 'version'

Example:

Binary data can be set in two ways. The following two examples will set a binary value of **Salty Test**

<table>
<thead>
<tr>
<th>no_conversion:</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>reg.present:</strong></td>
</tr>
<tr>
<td>- name: HKLM\SOFTWARE\SaltTesting</td>
</tr>
<tr>
<td>- vname: test_reg_binary_state</td>
</tr>
<tr>
<td>- vdata: Salty Test</td>
</tr>
<tr>
<td>- vtype: REG_BINARY</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>conversion:</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>reg.present:</strong></td>
</tr>
<tr>
<td>- name: HKLM\SOFTWARE\SaltTesting</td>
</tr>
<tr>
<td>- vname: test_reg_binary_state_with_tag</td>
</tr>
<tr>
<td>- vdata: !!binary U2FsdHkgVGVzdA==\n</td>
</tr>
<tr>
<td>- vtype: REG_BINARY</td>
</tr>
</tbody>
</table>

Example:

To set a **REG_MULTI_SZ** value:

<table>
<thead>
<tr>
<th>reg_multi_sz:</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>reg.present:</strong></td>
</tr>
<tr>
<td>- name: HKLM\SOFTWARE\Salt</td>
</tr>
<tr>
<td>- vname: reg_multi_sz</td>
</tr>
<tr>
<td>- vdata:</td>
</tr>
<tr>
<td>- list item 1</td>
</tr>
<tr>
<td>- list item 2</td>
</tr>
</tbody>
</table>

Example:

To ensure a key is present and has permissions:

<table>
<thead>
<tr>
<th>set_key_permissions:</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>reg.present:</strong></td>
</tr>
<tr>
<td>- name: HKLM\SOFTWARE\Salt</td>
</tr>
<tr>
<td>- vname: version</td>
</tr>
<tr>
<td>- vdata: 2016.3.1</td>
</tr>
<tr>
<td>- win_owner: Administrators</td>
</tr>
<tr>
<td>- win_perms:</td>
</tr>
<tr>
<td>jsnuffy:</td>
</tr>
<tr>
<td>perms: full_control</td>
</tr>
<tr>
<td>sjones:</td>
</tr>
<tr>
<td>perms:</td>
</tr>
<tr>
<td>(continues on next page)</td>
</tr>
</tbody>
</table>
- read_control
- enum_subkeys
- query_value

**applies_to:**
- this_key_only

- **win_deny_perms:**
  - **bsimpson:**
    - **perms:** full_control
    - **applies_to:** this_key_subkeys
  - **win_inheritance:** True
  - **win_perms_reset:** True

---

### 23.19.166 salt.states.rvm

**Managing Ruby installations and gemsets with Ruby Version Manager (RVM)**

This module is used to install and manage ruby installations and gemsets with RVM, the Ruby Version Manager. Different versions of ruby can be installed and gemsets created. RVM itself will be installed automatically if it's not present. This module will not automatically install packages that RVM depends on or ones that are needed to build ruby. If you want to run RVM as an unprivileged user (recommended) you will have to create this user yourself.

This is how a state configuration could look like:

```yaml
rvm:
  group.present: []
  user.present:
    - gid: rvm
    - home: /home/rvm
    - require:
      - group: rvm

rvm-deps:
  pkg.installed:
    - packages:
      - bash
      - coreutils
      - gzip
      - bzip2
      - gawk
      - sed
      - curl
      - git-core
      - subversion

mri-deps:
  pkg.installed:
    - packages:
      - build-essential
      - openssl
      - libreadline6
      - libreadline6-dev
      - curl
      - git-core
      - zlib1g
      - zlib1g-dev
```

(continues on next page)
- libssl-dev
- libyaml-dev
- libsqlite3-0
- libsqlite3-dev
- sqlite3
- libxml2-dev
- libxslt1-dev
- autoconf
- libc6-dev
- libncurses5-dev
- automake
- libtool
- bison
- subversion
- ruby

gemset

```yaml
jruby-deps:
  pkg.installed:
  - pkgs:
    - curl
    - g++
    - openjdk-6-jre-headless

ruby-1.9.2:
  rvm.installed:
  - default: True
  - user: rvm
  - require:
    - pkg: rvm-deps
    - pkg: mri-deps
    - user: rvm

jruby:
  rvm.installed:
  - user: rvm
  - require:
    - pkg: rvm-deps
    - pkg: jruby-deps
    - user: rvm

jgemset:
  rvm.gemset_present:
  - ruby: jruby
  - user: rvm
  - require:
    - rvm: jruby

mygemset:
  rvm.gemset_present:
  - ruby: ruby-1.9.2
  - user: rvm
  - require:
    - rvm: ruby-1.9.2
```

```
salt.states.rvm.gemset_present(name, ruby='default', user=None)

Verify that the gemset is present.

name  The name of the gemset.
```
ruby: default  The ruby version this gemset belongs to.
user: None  The user to run rvm as.

New in version 0.17.0.

salt.states.rvm.installed(name, default=False, user=None, opts=None, env=None)
Verify that the specified ruby is installed with RVM. RVM is installed when necessary.

name  The version of ruby to install
default  [False] Whether to make this ruby the default.
user: None  The user to run rvm as.
env: None  A list of environment variables to set (ie, RUBY_CONFIGURE_OPTS)
opts: None  A list of option flags to pass to RVM (ie -C, --patch)

New in version 0.17.0.

23.19.167  salt.states.salt_proxy
Salt proxy state
New in version 2015.8.2.
State to deploy and run salt-proxy processes on a minion.
Set up pillar data for your proxies per the documentation.
Run the state as below

```
salt-proxy-configure:
  salt_proxy.configure_proxy:
    - proxynames: p8000
    - start: True
```

This state will configure the salt proxy settings within /etc/salt/proxy (if /etc/salt/proxy doesn't exists) and start the salt-proxy process (default true), if it isn't already running.

salt.states.salt_proxy.configure_proxy(name, proxynames='p8000', start=True)
Create the salt proxy file and start the proxy process if required

Parameters

- name -- The name of this state
- proxynames -- Name to be used for this proxy (should match entries in pillar)
- start -- Boolean indicating if the process should be started

Example:

```
salt-proxy-configure:
  salt_proxy.configure_proxy:
    - proxynames: p8000
    - start: True
```
23.19.168 salt.states.saltutil

Saltutil State

This state wraps the saltutil execution modules to make them easier to run from a states. Rather than needing to use module.run this state allows for improved change detection.

New in version 3000.

salt.states.saltutil.sync_all(name, **kwargs)
Performs the same task as saltutil.sync_all module See saltutil module for full list of options

```
sync_everything:
    saltutil.sync_all:
        - refresh: True
```

salt.states.saltutil.sync_beacons(name, **kwargs)
Performs the same task as saltutil.sync_beacons module See saltutil module for full list of options

```
sync_everything:
    saltutil.sync_beacons:
        - refresh: True
```

salt.states.saltutil.sync_clouds(name, **kwargs)
Performs the same task as saltutil.sync_clouds module See saltutil module for full list of options

```
sync_everything:
    saltutil.sync_clouds:
        - refresh: True
```

salt.states.saltutil.sync_engines(name, **kwargs)
Performs the same task as saltutil.sync_engines module See saltutil module for full list of options

```
sync_everything:
    saltutil.sync_engines:
        - refresh: True
```

salt.states.saltutil.sync_executors(name, **kwargs)
Performs the same task as saltutil.sync_executors module See saltutil module for full list of options

```
sync_everything:
    saltutil.sync_executors:
        - refresh: True
```

salt.states.saltutil.sync_grains(name, **kwargs)
Performs the same task as saltutil.sync_grains module See saltutil module for full list of options

```
sync_everything:
    saltutil.sync_grains:
        - refresh: True
```
salt.states.saltutil.sync_log_handlers(name, **kwargs)
    Performs the same task as saltutil.sync_log_handlers module See saltutil module for full list of options
    
    sync_everything:
    saltutil.sync_log_handlers:
    - refresh: True

salt.states.saltutil.sync_matchers(name, **kwargs)
    Performs the same task as saltutil.sync_matchers module See saltutil module for full list of options
    
    sync_everything:
    saltutil.sync_matchers:
    - refresh: True

salt.states.saltutil.sync_modules(name, **kwargs)
    Performs the same task as saltutil.sync_modules module See saltutil module for full list of options
    
    sync_everything:
    saltutil.sync_modules:
    - refresh: True

salt.states.saltutil.sync_output(name, **kwargs)
    Performs the same task as saltutil.sync_output module See saltutil module for full list of options
    
    sync_everything:
    saltutil.sync_output:
    - refresh: True

salt.states.saltutil.sync_outputters(name, **kwargs)
    Performs the same task as saltutil.sync_outputters module See saltutil module for full list of options
    
    sync_everything:
    saltutil.sync_outputters:
    - refresh: True

salt.states.saltutil.sync_pillar(name, **kwargs)
    Performs the same task as saltutil.sync_pillar module See saltutil module for full list of options
    
    sync_everything:
    saltutil.sync_pillar:
    - refresh: True

salt.states.saltutil.sync_proxymodules(name, **kwargs)
    Performs the same task as saltutil.sync_proxymodules module See saltutil module for full list of options
    
    sync_everything:
    saltutil.sync_proxymodules:
    - refresh: True
salt.states.saltutil.sync_renderers(name, **kwargs)
    Performs the same task as saltutil.sync_renderers module See saltutil module for full list of options

    ```
    sync_everything:
    saltutil.sync_renderers:
    - refresh: True
    ```

salt.states.saltutil.sync_returners(name, **kwargs)
    Performs the same task as saltutil.sync_returners module See saltutil module for full list of options

    ```
    sync_everything:
    saltutil.sync_returners:
    - refresh: True
    ```

salt.states.saltutil.sync_sdb(name, **kwargs)
    Performs the same task as saltutil.sync_sdb module See saltutil module for full list of options

    ```
    sync_everything:
    saltutil.sync_sdb:
    - refresh: True
    ```

salt.states.saltutil.sync_serializers(name, **kwargs)
    Performs the same task as saltutil.sync_serializers module See saltutil module for full list of options

    ```
    sync_everything:
    saltutil.sync_serializers:
    - refresh: True
    ```

salt.states.saltutil.sync_states(name, **kwargs)
    Performs the same task as saltutil.sync_states module See saltutil module for full list of options

    ```
    sync_everything:
    saltutil.sync_states:
    - refresh: True
    ```

salt.states.saltutil.sync_thorium(name, **kwargs)
    Performs the same task as saltutil.sync_thorium module See saltutil module for full list of options

    ```
    sync_everything:
    saltutil.sync_thorium:
    - refresh: True
    ```

salt.states.saltutil.sync_utils(name, **kwargs)
    Performs the same task as saltutil.sync_utils module See saltutil module for full list of options

    ```
    sync_everything:
    saltutil.sync_utils:
    - refresh: True
    ```
23.19.169 salt.states.schedule

Management of the Salt scheduler

```
job3:
schedule.present:
  - function: test.ping
  - seconds: 3600
  - splay: 10

This will schedule the command: test.ping every 3600 seconds (every hour) splaying the time between 0 and 10 seconds

job2:
schedule.present:
  - function: test.ping
  - seconds: 15
  - splay:
    start: 10
    end: 20

This will schedule the command: test.ping every 15 seconds splaying the time between 10 and 20 seconds

job1:
schedule.present:
  - function: state.sls
  - job_args:
    - httpd
  - job_kwargs:
    test: True
  - when:
    - Monday 5:00pm
    - Tuesday 3:00pm
    - Wednesday 5:00pm
    - Thursday 3:00pm
    - Friday 5:00pm

This will schedule the command: state.sls httpd test=True at 5pm on Monday, Wednesday and Friday, and 3pm on Tuesday and Thursday. Requires that python-dateutil is installed on the minion.

job1:
schedule.present:
  - function: state.sls
  - job_args:
    - httpd
  - job_kwargs:
    test: True
  - cron: '*/5 * * * *'

Scheduled jobs can also be specified using the format used by cron. This will schedule the command: state.sls httpd test=True to run every 5 minutes. Requires that python-croniter is installed on the minion.
```

(continues on next page)
- function: state.sls
- job_args:
  - httpd
- job_kwargs:
  - test: True
- when:
  - Monday 5:00pm
  - Tuesday 3:00pm
  - Wednesday 5:00pm
  - Thursday 3:00pm
  - Friday 5:00pm
- returner: xmpp
- return_config: xmpp_state_run
- return_kwargs:
  - recipient: user@domain.com

This will schedule the command: state.sls httpd test=True at 5pm on Monday, Wednesday and Friday, and 3pm on Tuesday and Thursday. Using the xmpp returner to return the results of the scheduled job, with the alternative configuration options found in the xmpp_state_run section.

job1:
  schedule.present:
    - function: state.sls
    - job_args:
      - httpd
    - job_kwargs:
      - test: True
    - hours: 1
    - skip_during_range:
      - start: 2pm
      - end: 3pm
    - run_after_skip_range: True

This will schedule the command: state.sls httpd test=True at 5pm on Monday, Wednesday and Friday, and 3pm on Tuesday and Thursday. Requires that python-dateutil is installed on the minion.

salt.states.schedule.absent(name, **kwargs)
Ensure a job is absent from the schedule

  name The unique name that is given to the scheduled job.

  persist Whether the job should persist between minion restarts, defaults to True.

salt.states.schedule.disabled(name, **kwargs)
Ensure a job is disabled in the schedule

  name The unique name that is given to the scheduled job.

  persist Whether the job should persist between minion restarts, defaults to True.

salt.states.schedule.enabled(name, **kwargs)
Ensure a job is enabled in the schedule

  name The unique name that is given to the scheduled job.

  persist Whether the job should persist between minion restarts, defaults to True.
salt.states.schedule.present(name, **kwargs)

Ensure a job is present in the schedule

name The unique name that is given to the scheduled job.
seconds The scheduled job will be executed after the specified number of seconds have passed.
minutes The scheduled job will be executed after the specified number of minutes have passed.
days The scheduled job will be executed after the specified number of days have passed.
when This will schedule the job at the specified time(s). The when parameter must be a single value or a
dictionary with the date string(s) using the dateutil format. Requires python-dateutil.
cron This will schedule the job at the specified time(s) using the crontab format. Requires python-croniter.
run_on_start Whether the job will run when Salt minion starts, or the job will be skipped once and run at
the next scheduled run. Value should be a boolean.
function The function that should be executed by the scheduled job.
job_args The arguments that will be used by the scheduled job.
job_kwargs The keyword arguments that will be used by the scheduled job.
maxrunning Ensure that there are no more than N copies of a particular job running.
jid_include Include the job into the job cache.
splay The amount of time in seconds to splay a scheduled job. Can be specified as a single value in seconds
or as a dictionary range with 'start' and 'end' values.
range This will schedule the command within the range specified. The range parameter must be a dictionary
with the date strings using the dateutil format. Requires python-dateutil.
once This will schedule a job to run once on the specified date.
once_fmt The default date format is ISO 8601 but can be overridden by also specifying the once_fmt option.
enabled Whether the job should be enabled or disabled. Value should be a boolean.
return_job Whether to return information to the Salt master upon job completion.
metadata Using the metadata parameter special values can be associated with a scheduled job. These values
are not used in the execution of the job, but can be used to search for specific jobs later if combined with
the return_job parameter. The metadata parameter must be specified as a dictionary, otherwise it will be
ignored.
returner The returner to use to return the results of the scheduled job.
return_config The alternative configuration to use for returner configuration options.
return_kwargs Any individual returner configuration items to override. Should be passed as a dictionary.
persist Whether the job should persist between minion restarts, defaults to True.
skip_during_range This will ensure that the scheduled command does not run within the range specified.
The range parameter must be a dictionary with the date strings using the dateutil format. Requires
python-dateutil.
run_after_skip_range Whether the job should run immediately after the skip_during_range time period ends.
23.19.170  salt.states.selinux

Management of SELinux rules

If SELinux is available for the running system, the mode can be managed and booleans can be set.

```
<table>
<thead>
<tr>
<th>enforcing:</th>
</tr>
</thead>
<tbody>
<tr>
<td>selinux.mode</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>samba_create_home_dirs:</th>
</tr>
</thead>
<tbody>
<tr>
<td>selinux.boolean:</td>
</tr>
<tr>
<td>- value: True</td>
</tr>
<tr>
<td>- persist: True</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>nginx:</th>
</tr>
</thead>
<tbody>
<tr>
<td>selinux.module:</td>
</tr>
<tr>
<td>- enabled: False</td>
</tr>
</tbody>
</table>
```

Note: Use of these states require that the selinux execution module is available.

salt.states.selinux.boolean(name, value, persist=False)

Set up an SELinux boolean

- name: The name of the boolean to set
- value: The value to set on the boolean
- persist: Defaults to False, set persist to true to make the boolean apply on a reboot

salt.states.selinux.fcontext_policy_absent(name, filetype='a', sel_type=None, sel_user=None, sel_level=None)

New in version 2017.7.0.

Makes sure an SELinux file context policy for a given filespec (name), filetype and SELinux context type is absent.

- name: filespec of the file or directory. Regex syntax is allowed.
- filetype: The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also man semanage-fcontext. Defaults to 'a' (all files).
- sel_type: The SELinux context type. There are many.
- sel_user: The SELinux user.
- sel_level: The SELinux MLS range.

salt.states.selinux.fcontext_policy_applied(name, recursive=False)

New in version 2017.7.0.

Checks and makes sure the SELinux policies for a given filespec are applied.

salt.states.selinux.fcontext_policy_present(name, sel_type, filetype='a', sel_user=None, sel_level=None)

New in version 2017.7.0.

Makes sure a SELinux policy for a given filespec (name), filetype and SELinux context type is present.

- name: filespec of the file or directory. Regex syntax is allowed.
- sel_type: SELinux context type. There are many.
```
filetype  The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also man semanage-fcontext. Defaults to ‘a’ (all files).

sel_user  The SELinux user.

sel_level  The SELinux MLS range.

salt.states.selinux.mode(name)
Verifies the mode SELinux is running in, can be set to enforcing, permissive, or disabled

Note: A change to or from disabled mode requires a system reboot. You will need to perform this yourself.

name  The mode to run SELinux in, permissive, enforcing, or disabled.

salt.states.selinux.module(name, module_state='Enabled', version='any', **opts)
Enable/Disable and optionally force a specific version for an SELinux module

name  The name of the module to control

module_state  Should the module be enabled or disabled?

version  Defaults to no preference, set to a specified value if required. Currently can only alert if the version is incorrect.

install  Setting to True installs module

source  Points to module source file, used only when install is True

remove  Setting to True removes module

New in version 2016.3.0.

salt.states.selinux.module_install(name)
Installs custom SELinux module from given file

name  Path to file with module to install

New in version 2016.11.6.

salt.states.selinux.module_remove(name)
Removes SELinux module

name  The name of the module to remove

New in version 2016.11.6.

salt.states.selinux.port_policy_absent(name, sel_type=None, protocol=None, port=None)
New in version 2019.2.0.

Makes sure an SELinux port policy for a given port, protocol and SELinux context type is absent.

name  The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).

sel_type  The SELinux Type. Optional; can be used in determining if policy is present, ignored by semanage port --delete.

protocol  The protocol for the port, tcp or udp. Required if name is not formatted.

port  The port or port range. Required if name is not formatted.

salt.states.selinux.port_policy_present(name, sel_type, protocol=None, port=None, sel_range=None)
New in version 2019.2.0.

Makes sure an SELinux port policy for a given port, protocol and SELinux context type is present.
```
**name**  The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).

**sel_type**  The SELinux Type.

**protocol**  The protocol for the port, tcp or udp. Required if name is not formatted.

**port**  The port or port range. Required if name is not formatted.

**sel_range**  The SELinux MLS/MCS Security Range.

---

### 23.19.171 salt.states.slack

**Send a message to Slack**

This state is useful for sending messages to Slack during state runs.

New in version 2015.5.0.

```python
slack-message:
  slack.post_message:
    - channel: '#general'
    - from_name: SuperAdmin
    - message: 'This state was executed successfully.'
    - api_key: peWcBiMOS9HRzG15peWcBiMOS9HRzG15
```

The api key can be specified in the master or minion configuration like below:

```python
slack:
  api_key: peWcBiMOS9HRzG15peWcBiMOS9HRzG15
```

```python
class slack.post_message(name, **kwargs):
  Send a message to a Slack channel.
```

```python
slack-message:
  slack.post_message:
    - channel: '#general'
    - from_name: SuperAdmin
    - message: 'This state was executed successfully.'
    - api_key: peWcBiMOS9HRzG15peWcBiMOS9HRzG15
```

The following parameters are required:

- **api_key**  The unique name for this event.
- **channel**  The channel to send the message to. Can either be the ID or the name.
- **from_name**  The name of that is to be shown in the "from" field.
- **message**  The message that is to be sent to the Slack channel.

The following parameters are optional:

- **api_key**  The api key for Slack to use for authentication, if not specified in the configuration options of master or minion.
- **icon**  URL to an image to use as the icon for this message

**webhook parameters:**

- **name**  The unique name for this event.
message  The message that is to be sent to the Slack channel.
color  The color of border of left side
short  An optional flag indicating whether the value is short enough to be displayed side-by-side with other values.
webhook  The identifier of WebHook (URL or token).
channel The channel to use instead of the WebHook default.
username  Username to use instead of WebHook default.
icon_emoji  Icon to use instead of WebHook default.

23.19.172  salt.states.smtp

Sending Messages via SMTP

New in version 2014.7.0.

This state is useful for firing messages during state runs, using the SMTP protocol

```
server-warning-message:
smtpt.send_msg:
   - name: 'This is a server warning message'
   - profile: my-smtp-account
   - recipient: admins@example.com
```

```
salt.states.smtp.send_msg(name, recipient, subject, sender=None, profile=None, use_ssl='True', attachments=None)
```

Send a message via SMTP

```
server-warning-message:
smtpt.send_msg:
   - name: 'This is a server warning message'
   - profile: my-smtp-account
   - subject: 'Message from Salt'
   - recipient: admin@example.com
   - sender: admin@example.com
   - use_ssl: True
   - attachments:
      - /var/log/syslog
      - /var/log/messages
```

name  The message to send via SMTP

23.19.173  salt.states.snapper

Managing implicit state and baselines using snapshots

New in version 2016.11.0.

Salt can manage state against explicitly defined state, for example if your minion state is defined by:
If someone modifies this file, the next application of the highstate will allow the admin to correct this deviation and the file will be corrected.

Now, what happens if somebody creates a file `/etc/new_config_file` and deletes `/etc/important_config_file`? Unless you have a explicit rule, this change will go unnoticed.

The snapper state module allows you to manage state implicitly, in addition to explicit rules, in order to define a baseline and iterate with explicit rules as they show that they work in production.

The workflow is: once you have a working and audited system, you would create your baseline snapshot (eg. with `salt tgt snapper.create_snapshot`) and define in your state this baseline using the identifier of the snapshot (in this case: `20`):

```
/my_baseline:
    snapper.baseline_snapshot:
        - number: 20
        - include_diff: False
        - ignore:
          - /var/log
          - /var/cache
```

Baseline snapshots can be also referenced by tag. Most recent baseline snapshot is used in case of multiple snapshots with the same tag:

```
/my_baseline_external_storage:
    snapper.baseline_snapshot:
        • tag: my_custom_baseline_tag
        • config: external
        • ignore: - /mnt/tmp_files/
```

If you have this state, and you haven’t done changes to the system since the snapshot, and you add a user, the state will show you the changes (including full diffs) to `/etc/passwd`, `/etc/shadow`, etc if you call it with `test=True` and will undo all changes if you call it without.

This allows you to add more explicit state knowing that you are starting from a very well defined state, and that you can audit any change that is not part of your explicit configuration.

So after you made this your state, you decided to introduce a change in your configuration:

```
/my_baseline:
    snapper.baseline_snapshot:
        - number: 20
        - ignore:
          - /var/log
          - /var/cache

/hosts_entry:
    file.blockreplace:
        - name: /etc/hosts
        - content: 'First line of content'
        - append_if_not_found: True
```
The change in /etc/hosts will be done after any other change that deviates from the specified snapshot are reverted. This could be for example, modifications to the /etc/passwd file or changes in the /etc/hosts that could render your the hosts_entry rule void or dangerous.

Once you take a new snapshot and you update the baseline snapshot number to include the change in /etc/hosts the hosts_entry rule will basically do nothing. You are free to leave it there for documentation, to ensure that the change is made in case the snapshot is wrong, but if you remove anything that comes after the snapper.baseline_snapshot as it will have no effect; by the moment the state is evaluated, the baseline state was already applied and include this change.

**Warning:** Make sure you specify the baseline state before other rules, otherwise the baseline state will revert all changes if they are not present in the snapshot.

**Warning:** Do not specify more than one baseline rule as only the last one will affect the result.

- **codeauthor** Duncan Mac-Vicar P. (<dmacvicar@suse.de>)
- **codeauthor** Pablo Suárez Hernández (<psuarezhernandez@suse.de>)
- **maturity** new
- **platform** Linux

```python
salt.states.snapper.baseline_snapshot(name, number=None, tag=None, include_diff=True, config='root', ignore=None)
```

Enforces that no file is modified comparing against a previously defined snapshot identified by number.

- **number** Number of selected baseline snapshot.
- **tag** Tag of the selected baseline snapshot. Most recent baseline baseline snapshot is used in case of multiple snapshots with the same tag. (tag and number cannot be used at the same time)
- **include_diff** Include a diff in the response (Default: True)
- **config** Snapper config name (Default: root)
- **ignore** List of files to ignore. (Default: None)

### 23.19.174 salt.states.splunk

Splunk User State Module

New in version 2016.3.0.

This state is used to ensure presence of users in splunk.

```python
ensure example test user 1:
    splunk.present:
        - name: 'Example TestUser1'
        - email: example@domain.com

salt.states.splunk.absent(email, profile='splunk', **kwargs)
```

Ensure a splunk user is absent
The following parameters are required:

- **email** This is the email of the user in splunk
- **name** This is the splunk username used to identify the user.

```python
salt.states.splunk.present(email, profile='splunk', **kwargs)

Ensure a user is present
```

```python
ensure example test user 1:
    splunk.absent:
        - email: 'example@domain.com'
        - name: 'exampleuser'
```

The following parameters are required:

- **email** This is the email of the user in splunk

```python
salt.states.splunk.present(email, profile='splunk', **kwargs)

Ensure a user is present
```

```python
ensure example test user 1:
    splunk.user_present:
        - realname: 'Example TestUser1'
        - name: 'exampleuser'
        - email: 'example@domain.com'
        - roles: ['user']
```

The following parameters are required:

- **email** This is the email of the user in splunk

---

**23.19.175 salt.states.splunk_search**

Splunk Search State Module

New in version 2015.5.0.

This state is used to ensure presence of splunk searches.

```python
server-warning-message:
    splunk_search.present:
        - name: This is the splunk search name
        - search: index=main sourcetype=
```

```python
salt.states.splunk_search.absent(name, profile='splunk')

Ensure a search is absent
```

**API Error Search:**

```
splunk_search.absent
```

The following parameters are required:

- **name** This is the name of the search in splunk

```python
salt.states.splunk_search.present(name, profile='splunk', **kwargs)

Ensure a search is present
```

**API Error Search:**

```
splunk_search.present:
    search: index=main sourcetype=blah
template: alert_5min
```

The following parameters are required:

- **name** This is the name of the search in splunk

---

23.19. state modules
23.19.176 salt.states.sqlite3

Management of SQLite3 databases

New in version 2016.3.0.

depends

• SQLite3 Python Module

configuration See salt.modules.sqlite3 for setup instructions

The sqlite3 module is used to create and manage sqlite3 databases and execute queries

Here is an example of creating a table using sql statements:

```
users:
  sqlite3.table_present:
    - db: /var/www/data/app.sqlite
    - schema: CREATE TABLE `users` (`username` TEXT COLLATE NOCASE UNIQUE NOT NULL,
    →`password` BLOB NOT NULL, `salt` BLOB NOT NULL, `last_login` INT)
```

Here is an example of creating a table using yaml/jinja instead of sql:

```
users:
  sqlite3.table_present:
    - db: /var/www/app.sqlite
    - schema:
    - email TEXT COLLATE NOCASE UNIQUE NOT NULL
    - firstname TEXT NOT NULL
    - lastname TEXT NOT NULL
    - company TEXT NOT NULL
    - password BLOB NOT NULL
    - salt BLOB NOT NULL
```

Here is an example of making sure a table is absent:

```
badservers:
  sqlite3.table_absent:
    - db: /var/www/data/users.sqlite
```

Sometimes you would to have specific data in tables to be used by other services Here is an example of making sure rows with specific data exist:

```
user_john_doe_xyz:
  sqlite3.row_present:
    - db: /var/www/app.sqlite
    - table: users
    - where_sql: email='john.doe@companyxyz.com'
    - data:
      - email: john.doe@companyxyz.com
      - lastname: doe
      - firstname: john
      - company: companyxyz.com
      - password: abcdef012934125
      - salt: abcdef012934125
    - require:
      - sqlite3: users
```

Here is an example of removing a row from a table:
user_john_doe_abc:
salt3.row_absent:
  - db: /var/www/app.sqlite
  - table: users
  - where_sql: email="john.doe@companyabc.com"
  - require:
    - sqlite3: users

Note that there is no explicit state to perform random queries, however, this can be approximated with sqlite3's module functions and module.run:

zone-delete:
  module.run:
    - name: sqlite3.modify
    - db: {{ db }}
    - sql: "DELETE FROM records WHERE id > {{ count[0] }} AND domain_id = {{ domain_ id }}"
    - watch:
      - sqlite3: zone-insert-12

salt.states.sqlite3.row_absent(name, db, table, where_sql, where_args=None)

Makes sure the specified row is absent in db. If multiple rows match where_sql, then the state will fail.

  name Only used as the unique ID
  db The database file name
  table The table name to check
  where_sql The sql to select the row to check
  where_args The list parameters to substitute in where_sql

salt.states.sqlite3.row_present(name, db, table, data, where_sql, where_args=None, update=False)

Checks to make sure the given row exists. If row exists and update is True then row will be updated with data.
Otherwise it will leave existing row unmodified and check it against data. If the existing data doesn't match
data_check the state will fail. If the row doesn't exist then it will insert data into the table. If more than one
row matches, then the state will fail.

  name Only used as the unique ID
  db The database file name
  table The table name to check the data
  data The dictionary of key/value pairs to check against if row exists, insert into the table if it doesn't
  where_sql The sql to select the row to check
  where_args The list parameters to substitute in where_sql
  update True will replace the existing row with data When False and the row exists and data does not equal
   the row data then the state will fail

salt.states.sqlite3.table_absent(name, db)

Make sure the specified table does not exist

  name The name of the table
  db The name of the database file
salt.states.sqlite3.table_present(name, db, schema, force=False)

- **name** The name of the table
- **db** The name of the database file
- **schema** The dictionary containing the schema information
- **force** If the name of the table exists and force is set to False, the state will fail. If force is set to True, the existing table will be replaced with the new table

### 23.19.177 salt.states.ssh_auth

Control of entries in SSH authorized_key files

The information stored in a user’s SSH authorized key file can be easily controlled via the ssh_auth state. Defaults can be set by the enc, options, and comment keys. These defaults can be overridden by including them in the name.

Since the YAML specification limits the length of simple keys to 1024 characters, and since SSH keys are often longer than that, you may have to use a YAML `explicit key`, as demonstrated in the second example below.

```
AAAAB3NzaC1kc3MAAAACBAL0sQ9fJ5bYTEyY==:
  ssh_auth.present:
    - user: root
    - enc: ssh-dss

thatch:
  ssh_auth.present:
    - user: root
    - source: salt://ssh_keys/thatch.id_rsa.pub
    - config: '%h/.ssh/authorized_keys'

sshkeys:
  ssh_auth.present:
    - user: root
    - enc: ssh-rsa
    - options:
      - option1="value1"
      - option2="value2 flag2"
    - comment: myuser
    - names:
      - AAAAB3NzaC1kc3MAAAACBAL0sQ9fJ5bYTEyY==
      - ssh-dss AAAAB3NzaCL0sQ9fJ5bYTEyY== user@domain
      - option3="value3" ssh-dss AAAAB3NzaC1kcQ9J5bYTEyY== other@testdomain
      - AAAAB3NzaC1kcQ9fJFF435bYTEyY== newcomment

sshkeys:
  ssh_auth.manage:
    - user: root
    - enc: ssh-rsa
    - options:
```

(continues on next page)
salt.states.ssh_auth.absent(name, user, enc='ssh-rsa', comment='', source='', options=None, config='.ssh/authorized_keys', fingerprint_hash_type=None)

Verifies that the specified SSH key is absent

name The SSH key to manage
user The user who owns the SSH authorized keys file to modify
enc Defines what type of key is being used; can be ed25519, ecdsa, ssh-rsa or ssh-dss
comment The comment to be placed with the SSH public key
options The options passed to the key, pass a list object
source The source file for the key(s). Can contain any number of public keys, in standard "authorized_keys" format. If this is set, comment, enc and options will be ignored.

New in version 2015.8.0.

config The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/authorized_keys". Token expansion %u and %h for username and home path supported.

fingerprint_hash_type The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to sha256 if not specified.

New in version 2016.11.7.

salt.states.ssh_auth.manage(name, ssh_keys, user, enc='ssh-rsa', comment='', source='', options=None, config='.ssh/authorized_keys', fingerprint_hash_type=None, **kwargs)

New in version 3000.

Ensures that only the specified ssh_keys are present for the specified user

ssh_keys The SSH key to manage
user The user who owns the SSH authorized keys file to modify
enc Defines what type of key is being used; can be ed25519, ecdsa, ssh-rsa or ssh-dss
comment The comment to be placed with the SSH public key
source The source file for the key(s). Can contain any number of public keys, in standard "authorized_keys" format. If this is set, comment and enc will be ignored.

Note: The source file must contain keys in the format <enc> <key> <comment>. If you have generated a keypair using PuTTYgen, then you will need to do the following to retrieve an OpenSSH-compatible public key.

1. In PuTTYgen, click Load, and select the private key file (not the public key), and click Open.
2. Copy the public key from the box labeled Public key for pasting into OpenSSH authorized_keys file.

23.19. state modules 1605
3. Paste it into a new file.

**options** The options passed to the keys, pass a list object

**config** The location of the authorized keys file relative to the user’s home directory, defaults to ".ssh/authorized_keys". Token expansion %u and %h for username and home path supported.

**fingerprint_hash_type** The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to sha256 if not specified.

```python
salt.states.ssh_auth.present(name, user, enc='ssh-rsa', comment='', source='', options=None, config='.ssh/authorized_keys', fingerprint_hash_type=None, **kwargs)
```

Verifies that the specified SSH key is present for the specified user

- **name** The SSH key to manage
- **user** The user who owns the SSH authorized keys file to modify
- **enc** Defines what type of key is being used; can be ed25519, ecdsa, ssh-rsa or ssh-dss
- **comment** The comment to be placed with the SSH public key
- **source** The source file for the key(s). Can contain any number of public keys, in standard "authorized_keys" format. If this is set, comment and enc will be ignored.

**Note:** The source file must contain keys in the format `<enc> <key> <comment>`. If you have generated a keypair using PuTTYgen, then you will need to do the following to retrieve an OpenSSH-compatible public key.

1. In PuTTYgen, click Load, and select the private key file (not the public key), and click Open.
2. Copy the public key from the box labeled Public key for pasting into OpenSSH authorized_keys file.
3. Paste it into a new file.

**options** The options passed to the key, pass a list object

**config** The location of the authorized keys file relative to the user’s home directory, defaults to ".ssh/authorized_keys". Token expansion %u and %h for username and home path supported.

**fingerprint_hash_type** The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to sha256 if not specified.

### 23.19.178 salt.states.stateconf

**Stateconf System**

The stateconf system is intended for use only with the stateconf renderer. This State module presents the set function. This function does not execute any functionality, but is used to interact with the stateconf renderer.

```python
salt.states.stateconf.context(name, **kwargs)
    No-op state to support state config via the stateconf renderer.
```

```python
salt.states.stateconf.set(name, **kwargs)
    No-op state to support state config via the stateconf renderer.
```
23.19.179  salt.states.status

Minion status monitoring
Maps to the status execution module.

salt.states.status.loadavg(name, maximum=None, minimum=None)

Return the current load average for the specified minion. Available values for name are 1-min, 5-min and 15-min. minimum and maximum values should be passed in as strings.

salt.states.status.process(name)

Return whether the specified signature is found in the process tree. This differs slightly from the services states, in that it may refer to a process that is not managed via the init system.

23.19.180  salt.states.statuspage

StatusPage

Manage the StatusPage configuration.

In the minion configuration file, the following block is required:

```
statuspage:
  api_key: <API_KEY>
  page_id: <PAGE_ID>
```

New in version 2017.7.0.

salt.states.statuspage.create(name, endpoint='incidents', api_url=None, page_id=None, api_key=None, api_version=None, **kwargs)

Insert a new entry under a specific endpoint.

endpoint: incidents  Insert under this specific endpoint.
page_id  Page ID. Can also be specified in the config file.
api_key  API key. Can also be specified in the config file.
api_version: 1  API version. Can also be specified in the config file.
api_url  Custom API URL in case the user has a StatusPage service running in a custom environment.
kwargs  Other params.

SLS Example:

```
create-my-component:
  statuspage.create:
    - endpoint: components
    - name: my component
    - group_id: 993vgplshj12
```

salt.states.statuspage.delete(name, endpoint='incidents', id=None, api_url=None, page_id=None, api_key=None, api_version=None)

Remove an entry from an endpoint.

depthpoint: incidents  Request a specific endpoint.
page_id  Page ID. Can also be specified in the config file.
api_key  API key. Can also be specified in the config file.
api_version: 1  API version. Can also be specified in the config file.

api_url  Custom API URL in case the user has a StatusPage service running in a custom environment.

SLS Example:

```
delete-my-component:
  statuspage.delete:
    - endpoint: components
    - id: ftgks51sfs2d
```

salt.states.statuspage.managed(name, config, api_url=None, page_id=None, api_key=None, api_version=None, pace=1, allow_empty=False)

Manage the StatusPage configuration.

cfg  Dictionary with the expected configuration of the StatusPage. The main level keys of this dictionary represent the endpoint name. If a certain endpoint does not exist in this structure, it will be ignored / not configured.

page_id  Page ID. Can also be specified in the config file.

api_key  API key. Can also be specified in the config file.

api_version: 1  API version. Can also be specified in the config file.

api_url  Custom API URL in case the user has a StatusPage service running in a custom environment.

pace: 1  Max requests per second allowed by the API.

allow_empty: False  Allow empty config.

SLS example:

```
my-statuspage-config:
  statuspage.managed:
    - config:
      components:
        - name: component1
          group_id: uy4g37rf
        - name: component2
          group_id: 3n4uyu4gf
      incidents:
        - name: incident1
          status: resolved
          impact: major
          backfilled: false
        - name: incident2
          status: investigating
          impact: minor
```

salt.states.statuspage.update(name, endpoint='incidents', id=None, api_url=None, page_id=None, api_key=None, api_version=None, **kwargs)

Update attribute(s) of a specific endpoint.

id  The unique ID of the endpoint entry.

endpoint: incidents  Endpoint name.

page_id  Page ID. Can also be specified in the config file.

api_key  API key. Can also be specified in the config file.

api_version: 1  API version. Can also be specified in the config file.
api_url Custom API URL in case the user has a StatusPage service running in a custom environment.

SLS Example:

```yaml
update-my-incident:
  statuspage.update:
    - id: dz959yz2nd4l
    - status: resolved
```

23.19.181 `salt.states.supervisord`

Interaction with the Supervisor daemon

```yaml
wsgi_server:
  supervisord.running:
    - require:
      - pkg: supervisor
    - watch:
      - file: /etc/nginx/sites-enabled/wsgi_server.conf
```

**salt.states.supervisord.dead**(name, user=None, conf_file=None, bin_env=None, **kwargs)

Ensure the named service is dead (not running).

- **name** Service name as defined in the supervisor configuration file
- **user** Name of the user to run the supervisorctl command

New in version 0.17.0.

- **conf_file** path to supervisorctl config file
- **bin_env** path to supervisorctl bin or path to virtualenv with supervisor installed

**salt.states.supervisord.mod_watch**(name, restart=True, update=False, user=None, conf_file=None, bin_env=None, **kwargs)

The supervisord watcher, called to invoke the watch command. Always restart on watch

**Note:** This state exists to support special handling of the *watch* requisite. It should not be called directly.

Parameters for this function should be set by the state being triggered.

**salt.states.supervisord.running**(name, restart=False, update=False, user=None, conf_file=None, bin_env=None, **kwargs)

Ensure the named service is running.

- **name** Service name as defined in the supervisor configuration file
- **restart** Whether to force a restart
- **update** Whether to update the supervisor configuration.
- **user** Name of the user to run the supervisorctl command

New in version 0.17.0.

- **conf_file** path to supervisorctl config file
- **bin_env** path to supervisorctl bin or path to virtualenv with supervisor installed
23.19.182 salt.states.sysctl

Configuration of the kernel using sysctl

Control the kernel sysctl system.

```
vm.swappiness:
  sysctl.present:
    - value: 20
```

salt.states.sysctl.present(name, value, config=None)

Ensure that the named sysctl value is set in memory and persisted to the named configuration file. The default sysctl configuration file is /etc/sysctl.conf

- **name** The name of the sysctl value to edit
- **value** The sysctl value to apply
- **config** The location of the sysctl configuration file. If not specified, the proper location will be detected based on platform.

23.19.183 salt.states.syslog_ng

State module for syslog_ng

- **maintainer** Tibor Benke `<btibi@sch.bme.hu>`
- **maturity** new
- **depends** cmd, ps, syslog_ng
- **platform** all

Users can generate syslog-ng configuration files from YAML format or use plain ones and reload, start, or stop their syslog-ng by using this module.

**Details**

The service module is not available on all systems, so this module includes `syslog_ng.reloaded`, `syslog_ng.stopped`, and `syslog_ng.started` functions. If the service module is available on the computers, users should use that.

Users can generate syslog-ng configuration with `syslog_ng.config` function. For more information see `syslog-ng state usage`.

**Syslog-ng configuration file format**

The syntax of a configuration snippet in syslog-ng.conf:

```
object_type object_id {<options>};
```

These constructions are also called statements. There are options inside of them:

```
option(parameter1, parameter2); option2(parameter1, parameter2);
```

salt.states.syslog_ng.config(name, config, write=True)

Builds syslog-ng configuration.

- **name**: the id of the Salt document
- **config**: the parsed YAML code
- **write**: if True, it writes the config into the configuration file, otherwise just returns it

salt.states.syslog_ng.reloaded(name)

Reloads syslog-ng.

salt.states.syslog_ng.started(name=None, user=None, group=None, chroot=None, caps=None, no_caps=False, pidfile=None, enable_core=False, fd_limit=None, verbose=False, debug=False, trace=False, yydebug=False, persist_file=None, control=None, worker_threads=None, *args, **kwargs)

Ensures that syslog-ng is started via the given parameters.

Users shouldn't use this function, if the service module is available on their system.

salt.states.syslog_ng.stopped(name=None)

Kills syslog-ng.

23.19.184 salt.states.sysrc

State to work with sysrc

salt.states.sysrc.absent(name, **kwargs)

Ensure a sysrc variable is absent.

- **name**: The variable name to set
- **file**: (optional) The rc file to add the variable to.
- **jail**: (option) the name or JID of the jail to set the value in.

salt.states.sysrc.managed(name, value, **kwargs)

Ensure a sysrc variable is set to a specific value.

- **name**: The variable name to set
- **value**: Value to set the variable to
- **file**: (optional) The rc file to add the variable to.
- **jail**: (option) the name or JID of the jail to set the value in.

Example:

```yaml
syslogd:
  sysrc.managed:
    - name: syslogd_flags
    - value: -ss
```

23.19. state modules

1611
23.19.185 salt.states.telemetry_alert

Manage Telemetry alert configurations

New in version 2016.3.0.

Create, Update and destroy Mongo Telemetry alert configurations.

This module uses requests, which can be installed via package, or pip.

This module accepts explicit credential (telemetry api key) or can also read api key credentials from a pillar. Example:

```yaml
ensure telemetry alert X is defined on deployment Y:
  telemetry_alert.present:
    - deployment_id: "rs-XXXXXX"
    - metric_name: "testMetric"
    - alert_config:
      - max: 1
        filter: SERVER_ROLE_MONGOD_PRIMARY
        escalate_to: "example@pagerduty.com"
      - name: "**MANAGED BY ORCA DO NOT EDIT BY HAND** manages alarm on testMetric"
```

salt.states.telemetry_alert.absent(name, deployment_id, metric_name, api_key=None, profile='telemetry')

Ensure the telemetry alert config is deleted

- **name** An optional description of the alarms (not currently supported by telemetry API)
- **deployment_id** Specifies the ID of the root deployment resource (replica set cluster or sharded cluster) to which this alert definition is attached
- **metric_name** Specifies the unique ID of the metric to whose values these thresholds will be applied
- **api_key** Telemetry api key for the user
- **profile** A dict with telemetry config data. If present, will be used instead of api_key.

salt.states.telemetry_alert.present(name, deployment_id, metric_name, alert_config, api_key=None, profile='telemetry')

Ensure the telemetry alert exists.

- **name** An optional description of the alarm (not currently supported by telemetry API)
- **deployment_id** Specifies the ID of the root deployment resource (replica set cluster or sharded cluster) to which this alert definition is attached
- **metric_name** Specifies the unique ID of the metric to whose values these thresholds will be applied
- **alert_config** Is a list of dictionaries where each dict contains the following fields:
  - **filter** By default the alert will apply to the deployment and all its constituent resources. If the alert only applies to a subset of those resources, a filter may be specified to narrow this scope.
  - **min** the smallest "ok" value the metric may take on; if missing or null, no minimum is enforced.
  - **max** the largest "ok" value the metric may take on; if missing or null, no maximum is enforced.
  - **notify_all** Used to indicate if you want to alert both onCallEngineer and apiNotifications
- **api_key** Telemetry api key for the user
- **profile** A dict of telemetry config information. If present, will be used instead of api_key.
Management of timezones

The timezone can be managed for the system:

```yaml
America/Denver:
  timezone.system
```

The system and the hardware clock are not necessarily set to the same time. By default, the hardware clock is set to localtime, meaning it is set to the same time as the system clock. If `utc` is set to True, then the hardware clock will be set to UTC, and the system clock will be an offset of that.

```yaml
America/Denver:
  timezone.system:
    - utc: True
```

The Ubuntu community documentation contains an explanation of this setting, as it applies to systems that dual-boot with Windows. This is explained in greater detail here.

```python
salt.states.timezone.system(name, utc=True)
```

Set the timezone for the system.

- `name` The name of the timezone to use (e.g.: America/Denver)
- `utc` Whether or not to set the hardware clock to UTC (default is True)

---

23.19.188 salt.states.tls

Enforce state for SSL/TLS

```python
salt.states.tls.valid_certificate(name, weeks=0, days=0, hours=0, minutes=0, seconds=0)
```

Verify that a TLS certificate is valid now and (optionally) will be valid for the time specified through weeks, days, hours, minutes, and seconds.

---

23.19.189 salt.states.tomcat

Manage Apache Tomcat web applications

Note: This state requires the Tomcat Manager webapp to be installed and running.

The following grains/pillars must be set for communication with Tomcat Manager to work:

```yaml
tomcat-manager:
  user: 'tomcat-manager'
  passwd: 'Passw0rd'
```
Configuring Tomcat Manager

To manage webapps via the Tomcat Manager, you'll need to configure a valid user in the file `conf/tomcat-users.xml`.

```
<?xml version='1.0' encoding='utf-8'?>
<tomcat-users>
    <role rolename="manager-script"/>
    <user username="tomcat-manager" password="Passw0rd" roles="manager-script"/>
</tomcat-users>
```

### Notes

- Using multiple versions (aka. parallel deployments) on the same context path is not supported.
- If you use only this module for deployments you might want to restrict access to the manager so it's only accessible via localhost. For more info: [http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring_Manager_Application_Access](http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring_Manager_Application_Access)

### Last tested on:

- **Tomcat Version**: Apache Tomcat/7.0.54
- **JVM Vendor**: Oracle Corporation
- **JVM Version**: 1.8.0_101-b13
- **OS Architecture**: amd64
- **OS Name**: Linux
- **OS Version**: 3.10.0-327.22.2.el7.x86_64

salt.states.tomcat.mod_watch(name, url='http://localhost:8080/manager', timeout=180)

The tomcat watcher, called to invoke the watch command. When called, it will reload the webapp in question

**Note:** This state exists to support special handling of the watch requisite. It should not be called directly. Parameters for this function should be set by the state being triggered.

salt.states.tomcat.undeployed(name, url='http://localhost:8080/manager', timeout=180)

Enforce that the WAR will be undeployed from the server

**name** The context path to undeploy.

**url** The URL of the server with the Tomcat Manager webapp.

**timeout** [180] Timeout for HTTP request to the Tomcat Manager.

Example:

```
jenkins:
    tomcat.undeployed:
        - name: /ran
        - require:
            - service: application-service
```
salt.states.tomcat.wait(name, url='http://localhost:8080/manager', timeout=180)

Wait for the Tomcat Manager to load.

Notice that if tomcat is not running we won't wait for it start and the state will fail. This state can be required in the tomcat.war_deployed state to make sure tomcat is running and that the manager is running as well and ready for deployment.

timeout [180] Timeout for HTTP request to the Tomcat Manager.

Example:

```
tomcat-service:
  service.running:
    - name: tomcat
    - enable: True

wait-for-tomcatmanager:
  tomcat.wait:
    - timeout: 300
    - require:
      - service: tomcat-service

jenkins:
  tomcat.war_deployed:
    - name: /ran
    - war: salt://jenkins-1.2.4.war
    - require:
      - tomcat: wait-for-tomcatmanager
```

salt.states.tomcat.war_deployed(name, war, force=False, url='http://localhost:8080/manager',
timeout=180, temp_war_location=None, version=True)

Enforce that the WAR will be deployed and started in the context path, while making use of WAR versions in the filename.

**Note:** For more info about Tomcats file paths and context naming, please see [http://tomcat.apache.org/tomcat-7.0-doc/config/context.html#Naming](http://tomcat.apache.org/tomcat-7.0-doc/config/context.html#Naming)

name The context path to deploy (incl. forward slash) the WAR to.

war Absolute path to WAR file (should be accessible by the user running Tomcat) or a path supported by the `salt.modules.cp.get_url` function.

force [False] Force deployment even if the version strings are the same. Disabled by default.

timeout [180] Timeout for HTTP requests to the Tomcat Manager.

temp_war_location [None] Use another location to temporarily copy the WAR file to. By default the system's temp directory is used.

version [''] Specify the WAR version. If this argument is provided, it overrides the version encoded in the WAR file name, if one is present.

Use False or blank value to prevent guessing the version and keeping it blank.

New in version 2016.11.0.
Example:

```
jenkins:
    tomcat.war_deployed:
        - name: /salt-powered-jenkins
        - war: salt://jenkins-1.2.4.war
        - require:
            - service: application-service
```

Note: Be aware that in the above example the WAR `jenkins-1.2.4.war` will be deployed to the context path `salt-powered-jenkins##1.2.4`. To avoid this either specify a version yourself, or set version to `False`.

### 23.19.190 salt.states.trafficserver

Control Apache Traffic Server

New in version 2015.8.0.

**salt.states.trafficserver.bounce_cluster(name)**

```
bounce_ats_cluster:
    trafficserver.bounce_cluster
```

**salt.states.trafficserver.bounce_local(name, drain=False)**

This option modifies the behavior of `traffic_line -b` and `traffic_line -L` such that `traffic_server` is not shut down until the number of active client connections drops to the number given by the `proxy.config.restart.active_client_threshold` configuration variable.

```
bounce_ats_local:
    trafficserver.bounce_local

bounce_ats_local:
    trafficserver.bounce_local
    - drain: True
```

**salt.states.trafficserver.clear_cluster(name)**
Clears accumulated statistics on all nodes in the cluster.

```
clear_ats_cluster:
    trafficserver.clear_cluster
```

**salt.states.trafficserver.clear_node(name)**
Clears accumulated statistics on the local node.

```
clear_ats_node:
    trafficserver.clear_node
```

**salt.states.trafficserver.config(name, value)**
Set Traffic Server configuration variable values.
proxy.config.proxy_name:
  trafficserver.config:
    - value: cdn.site.domain.tld

OR

traffic_server_setting:
  trafficserver.config:
    - name: proxy.config.proxy_name
    - value: cdn.site.domain.tld

salt.states.trafficserver.offline(name, path)
Mark a cache storage device as offline. The storage is identified by a path which must match exactly a path
specified in storage.config. This removes the storage from the cache and redirects requests that would have
used this storage to other storage. This has exactly the same effect as a disk failure for that storage. This does
not persist across restarts of the traffic_server process.

offline_ats_path:
  trafficserver.offline:
    - path: /path/to/cache

salt.states.trafficserver.refresh(name)
Initiate a Traffic Server configuration file reread. Use this command to update the running configuration after
any configuration file modification.

The timestamp of the last reconfiguration event (in seconds since epoch) is published in the
proxy.node.config.reconfigure_time metric.

refresh_ats:
  trafficserver.refresh

salt.states.trafficserver.restart_cluster(name)
Restart the traffic_manager process and the traffic_server process on all the nodes in a cluster.

restart_ats_cluster:
  trafficserver.restart_cluster

salt.states.trafficserver.restart_local(name, drain=False)
Restart the traffic_manager and traffic_server processes on the local node.

This option modifies the behavior of traffic_line -b and traffic_line -L such that traffic_server is
not shut down until the number of active client connections drops to the number given by the
proxy.config.restart.active_client_threshold configuration variable.

restart_ats_local:
  trafficserver.restart_local
restart_ats_local_drain:
  trafficserver.restart_local
    - drain: True

salt.states.trafficserver.shutdown(name)
Shut down Traffic Server on the local node.

shutdown_ats:
  trafficserver.shutdown
salt.states.trafficserver.startup(name)
Start Traffic Server on the local node.

```
startup_ats:
  trafficserver.startup
```

salt.states.trafficserver.zero_cluster(name)
Reset performance statistics to zero across the cluster.

```
zero_ats_cluster:
  trafficserver.zero_cluster
```

salt.states.trafficserver.zero_node(name)
Reset performance statistics to zero on the local node.

```
zero_ats_node:
  trafficserver.zero_node
```

## 23.19.191 salt.states.tuned

Interface to Red Hat tuned-adm module

```
maintainer  Syed Ali <alicsyed@gmail.com>
maturity   new
depends    cmd.run
platform   Linux
```

salt.states.tuned.off(name=None)
Turns 'tuned' off. Example tuned.sls file for turning tuned off:

```
tuned: tuned.off: []
```
To see a valid list of states call execution module: tuned.list

salt.states.tuned.profile(name)
This state module allows you to modify system tuned parameters

Example tuned.sls file to set profile to virtual-guest
tuned:

```
tuned:
  • profile
  • name: virtual-guest
```

name tuned profile name to set the system to
To see a valid list of states call execution module: tuned.list
23.19.192  **salt.states.uptime**

**Monitor Web Server with Uptime**

**Uptime** is an open source remote monitoring application using Node.js, MongoDB, and Twitter Bootstrap.

**Warning:** This state module is beta. It might be changed later to include more or less automation.

**Note:** This state module requires a pillar to specify the location of your uptime install

```yaml
uptime:
  application_url: "http://uptime-url.example.org"
```

Example:

```yaml
url:
  uptime.monitored
url/sitemap.xml:
  uptime.monitored:
    polling: 600 # every hour
```

**salt.states.uptime.monitored**(*name, **params*)

Makes sure an URL is monitored by uptime. Checks if URL is already monitored, and if not, adds it.

23.19.193  **salt.states.vault**

States for managing Hashicorp Vault. Currently handles policies. Configuration instructions are documented in the execution module docs.

**maintainer**  SaltStack

**maturity**  new

**platform**  all

New in version 2017.7.0.

**salt.states.vault.policy_present**(*name, rules*)

Ensure a Vault policy with the given name and rules is present.

**name**  The name of the policy

**rules**  Rules formatted as in-line HCL

```
don-demo-policy:
  vault.policy_present:
    - name: foo/bar
    - rules: |
      path "secret/top-secret/*/" {
        policy = "deny"
      }
      path "secret/not-very-secret/*/" {
        policy = "write"
      }
```
23.19.194 salt.states.vbox_guest

VirtualBox Guest Additions installer state

salt.states.vbox_guest.additions_installed(name, reboot=False, upgrade_os=False)
Ensure that the VirtualBox Guest Additions are installed. Uses the CD, connected by VirtualBox.

name The name has no functional value and is only used as a tracking reference.
reboot [False] Restart OS to complete installation.
upgrade_os [False] Upgrade OS (to ensure the latests version of kernel and developer tools installed).

salt.states.vbox_guest.additions_removed(name, force=False)
Ensure that the VirtualBox Guest Additions are removed. Uses the CD, connected by VirtualBox.

name The name has no functional value and is only used as a tracking reference.
force Force VirtualBox Guest Additions removing.

salt.states.vbox_guest.grant_access_to_shared_folders_to(name, users=None)
Grant access to auto-mounted shared folders to the users.

name Name of the user to grant access to auto-mounted shared folders to.
users List of names of users to grant access to auto-mounted shared folders to. If specified, name will not be taken into account.

23.19.195 salt.states.victorops

Create an Event in VictorOps

New in version 2015.8.0.
This state is useful for creating events on the VictorOps service during state runs.

webserver-warning-message:
victorops.create_event:
  - message_type: 'CRITICAL'
  - entity_id: 'webserver/diskspace'
  - state_message: 'Webserver diskspace is low.'

salt.states.victorops.create_event(name, message_type, routing_key='everyone', **kwargs)
Create an event on the VictorOps service

webserver-warning-message:
victorops.create_event:
  - message_type: 'CRITICAL'
  - entity_id: 'webserver/diskspace'
  - state_message: 'Webserver diskspace is low.'

database-server-warning-message:
victorops.create_event:
  - message_type: 'WARNING'
  - entity_id: 'db_server/load'

(continues on next page)
- **state_message**: 'Database Server load is high.'
- **entity_is_host**: True
- **entity_display_name**: 'dbdserver.example.com'

The following parameters are required:

**name**  This is a short description of the event.

**message_type**  One of the following values: INFO, WARNING, ACKNOWLEDGEMENT, CRITICAL, RECOVERY.

The following parameters are optional:

- **routing_key**  The key for where messages should be routed. By default, sent to 'everyone' route.
- **entity_id**  The name of alerting entity. If not provided, a random name will be assigned.
- **timestamp**  Timestamp of the alert in seconds since epoch. Defaults to the time the alert is received at VictorOps.
- **timestamp_fmt**  The date format for the timestamp parameter. Defaults to '%Y-%m-%dT%H:%M:%S'.
- **state_start_time**  The time this entity entered its current state (seconds since epoch). Defaults to the time alert is received.
- **state_start_time_fmt**  The date format for the timestamp parameter. Defaults to '%Y-%m-%dT%H:%M:%S'.
- **state_message**  Any additional status information from the alert item.
- **entity_is_host**  Used within VictorOps to select the appropriate display format for the incident.
- **entity_display_name**  Used within VictorOps to display a human-readable name for the entity.
- **ack_message**  A user entered comment for the acknowledgment.
- **ack_author**  The user that acknowledged the incident.

---

23.19.196 **salt.states.win_dacl**

Windows Object Access Control Lists

Ensure an ACL is present

**parameters**: name - the path of the object objectType - Registry/File/Directory user - user account or SID for the ace permission - permission for the ace (see module win_acl for available permissions for each objectType) acetype - Allow/Deny propagation - how the ACL should apply to child objects (see module win_acl for available propagation types)

```
addAcl:
  win_dacl.present:
    - name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
    - objectType: Registry
    - user: FakeUser
    - permission: FullControl
    - acetype: ALLOW
    - propagation: KEY&SUBKEYS
```

Ensure an ACL does not exist

---

23.19. **state modules**
parameters: name - the path of the object objectType - Registry/File/Directory user - user account or SID for the ace permission - permission for the ace (see module win_acl for available permissions for each objectType) acetype - Allow/Deny propagation - how the ACL should apply to child objects (see module win_acl for available propagation types)

```python
removeAcl:
win_dacl.absent:
  - name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
  - objectType: Registry
  - user: FakeUser
  - permission: FullControl
  - acetype: ALLOW
  - propagation: KEY&SUBKEYS

Ensure an object is inheriting permissions
parameters: name - the path of the object objectType - Registry/File/Directory clear_existing_acl - True/False - when inheritance is enabled, should the existing ACL be kept or cleared out

```python
eInherit:
win_dacl.enableinheritance:
  - name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
  - objectType: Registry
  - clear_existing_acl: True

Ensure an object is not inheriting permissions
parameters: name - the path of the object objectType - Registry/File/Directory copy_inherited_acl - True/False - if inheritance is enabled, should the inherited permissions be copied to the ACL when inheritance is disabled

```python
dInherit:
win_dacl.disableinheritance:
  - name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
  - objectType: Registry
  - copy_inherited_acl: False
```

salt.states.win_dacl.absent(name, objectType, user, permission, acetype, propagation)
Ensure an ACL does not exist

salt.states.win_dacl.disinherit(name, objectType, copy_inherited_acl=True)
Ensure an object is not inheriting ACLs from its parent

salt.states.win_dacl.inherit(name, objectType, clear_existing_acl=False)
Ensure an object is inheriting ACLs from its parent

salt.states.win_dacl.present(name, objectType, user, permission, acetype, propagation)
Ensure an ACE is present
23.19.197 salt.states.win_dns_client

Module for configuring DNS Client on Windows systems

salt.states.win_dns_client.dns_dhcp(name, interface='Local Area Connection')
Configure the DNS server list from DHCP Server

salt.states.win_dns_client.dns_exists(name, servers=None, interface='Local Area Connection', replace=False)
Configure the DNS server list in the specified interface

Example:

```yaml
config_dns_servers:
  win_dns_client.dns_exists:
    - replace: True  # remove any servers not in the "servers" list, default is False
    - servers:
      - 8.8.8.8
      - 8.8.8.9
```

salt.states.win_dns_client.primary_suffix(name, suffix=None, updates=False)
New in version 2014.7.0.
Configure the global primary DNS suffix of a DHCP client.

suffix [None] The suffix which is advertised for this client when acquiring a DHCP lease When none is set, the explicitly configured DNS suffix will be removed.

updates [False] Allow syncing the DNS suffix with the AD domain when the client's AD domain membership changes

```yaml
primary_dns_suffix:
  win_dns_client.primary_suffix:
    - suffix: sub.domain.tld
    - updates: True
```

23.19.198 salt.states.win_firewall

State for configuring Windows Firewall

salt.states.win_firewall.add_rule(name, localport, protocol='tcp', action='allow', dir='in', remoteip='any')
Add a new inbound or outbound rule to the firewall policy

Parameters

- **name** *(str)* -- The name of the rule. Must be unique and cannot be "all". Required.
- **localport** *(int)* -- The port the rule applies to. Must be a number between 0 and 65535. Can be a range. Can specify multiple ports separated by commas. Required.
- **protocol** *(Optional[str])* -- The protocol. Can be any of the following:
  - A number between 0 and 255
  - icmpv4
  - icmpv6
  - tcp
- udp
- any

- **action** *(Optional)* -- The action the rule performs. Can be any of the following:
  - allow
  - block
  - bypass

- **dir** *(Optional)* -- The direction. Can be in or out.

- **remoteip** *(Optional)* -- The remote IP. Can be any of the following:
  - any
  - localsubnet
  - dns
  - dhcp
  - wins
  - defaultgateway
  - Any valid IPv4 address (192.168.0.12)
  - Any valid subnet (192.168.1.0/24)
  - Any valid range of IP addresses (192.168.0.1-192.168.0.12)
  - A list of valid IP addresses

Can be combinations of the above separated by commas.

New in version 2016.11.6.

Example:

```python
open_smb_port:
    win_firewall.add_rule:
        - name: SMB (445)
        - localport: 445
        - protocol: tcp
        - action: allow
```

salt.states.win_firewall.disabled(name='allprofiles')

Disable all the firewall profiles (Windows only)

**Parameters**

- **profile** *(Optional)* -- The name of the profile to disable. Default is allprofiles. Valid options are:
  - allprofiles
  - domainprofile
  - privateprofile
  - publicprofile

Example:
salt.states.win_firewall.enabled(name='allprofiles')

Enable all the firewall profiles (Windows only)

Parameters profile (Optional[str]) -- The name of the profile to enable. Default is allprofiles. Valid options are:

- allprofiles
- domainprofile
- privateprofile
- publicprofile

Example:

# To enable the domain profile
enable_domain:
  win_firewall.enabled:
    - name: domainprofile

# To enable all profiles
enable_all:
  win_firewall.enabled:
    - name: allprofiles

23.19.199 salt.states.win_iis

Microsoft IIS site management

This module provides the ability to add/remove websites and application pools from Microsoft IIS.

New in version 2016.3.0.

salt.states.win_iis.container_setting(name, container, settings=None)

Set the value of the setting for an IIS container.

Parameters

- name (str) -- The name of the IIS container.
- container (str) -- The type of IIS container. The container types are: AppPools, Sites, SslBindings
- settings (str) -- A dictionary of the setting names and their values. Example of usage for the AppPools container:

  site0-apppool-setting:
    win_iis.container_setting:
      - name: site0

(continues on next page)
- **container**: AppPools
- **settings**:
  - `managedPipelineMode`: Integrated
  - `processModel.maxProcesses`: 1
  - `processModel.userName`: TestUser
  - `processModel.password`: TestPassword
  - `processModel.identityType`: SpecificUser

Example of usage for the `Sites` container:

```yaml
site0-site-setting:
  win_iis.container_setting:
  - name: site0
  - container: Sites
  - settings:
    logFile.logFormat: W3C
    logFile.period: Daily
    limits.maxUrlSegments: 32
```

`salt.states.win_iis.create_app(name, site, sourcepath, apppool=None)`

Create an IIS application.

Parameters

- **name** *(str)* -- The IIS application.
- **site** *(str)* -- The IIS site name.
- **sourcepath** *(str)* -- The physical path.
- **apppool** *(str)* -- The name of the IIS application pool.

Example of usage with only the required arguments:

```yaml
site0-v1-app:
  win_iis.create_app:
  - name: v1
  - site: site0
  - sourcepath: C:\inetpub\site0\v1
```

Example of usage specifying all available arguments:

```yaml
site0-v1-app:
  win_iis.create_app:
  - name: v1
  - site: site0
  - sourcepath: C:\inetpub\site0\v1
  - apppool: site0
```

`salt.states.win_iis.create_apppool(name)`

Create an IIS application pool.

Parameters **name** *(str)* -- The name of the IIS application pool.

Usage:

```yaml
site0-apppool:
  win_iis.create_apppool:
  - name: site0
```
salt.states.win_iis.create_binding(name, site, hostheader='', ipaddress='*', port=80, protocol='http', sslflags=0)

Create an IIS binding.

Parameters

- **site**(str) -- The IIS site name.
- **hostheader**(str) -- The host header of the binding.
- **ipaddress**(str) -- The IP address of the binding.
- **port**(str) -- The TCP port of the binding.
- **protocol**(str) -- The application protocol of the binding.
- **sslflags**(str) -- The flags representing certificate type and storage of the binding.

Example of usage with only the required arguments:

```
site0-https-binding:
    win_iis.create_binding:
        - site: site0
```

Example of usage specifying all available arguments:

```
site0-https-binding:
    win_iis.create_binding:
        - site: site0
        - hostheader: site0.local
        - ipaddress: '*'
        - port: 443
        - protocol: https
        - sslflags: 0
```

salt.states.win_iis.create_cert_binding(name, site, hostheader='', ipaddress='*', port=443, sslflags=0)

Assign a certificate to an IIS binding.

Parameters

- **name**(str) -- The thumbprint of the certificate.
- **site**(str) -- The IIS site name.
- **hostheader**(str) -- The host header of the binding.
- **ipaddress**(str) -- The IP address of the binding.
- **port**(str) -- The TCP port of the binding.
- **sslflags**(str) -- Flags representing certificate type and certificate storage of the binding.

Example of usage with only the required arguments:

```
site0-cert-binding:
    win_iis.create_cert_binding:
        - name: 9988776655443322111000AAABBBCCCDDDEEEFFF
        - site: site0
```

Example of usage specifying all available arguments:
site0-cert-binding:
  win_iis.create_cert_binding:
    - name: 9988776655443322111000AAABBBCCCDDEEEFFF
    - site: site0
    - hostheader: site0.local
    - ipaddress: 192.168.1.199
    - port: 443
    - sslflags: 1

New in version 2016.11.0.

salt.states.win_iis.create_vdir(name, site, sourcepath, app='/')
Create an IIS virtual directory.

Parameters

- **name** *(str)* -- The virtual directory name.
- **site** *(str)* -- The IIS site name.
- **sourcepath** *(str)* -- The physical path.
- **app** *(str)* -- The IIS application.

Example of usage with only the required arguments:

```
site0-foo-vdir:
  win_iis.create_vdir:
    - name: foo
    - site: site0
    - sourcepath: C:\inetpub\vdirs\foo
```

Example of usage specifying all available arguments:

```
site0-foo-vdir:
  win_iis.create_vdir:
    - name: foo
    - site: site0
    - sourcepath: C:\inetpub\vdirs\foo
    - app: v1
```

salt.states.win_iis.deployed(name, sourcepath, apppool='', hostheader='', ipaddress='', port=80, protocol='http')
Ensure the website has been deployed.

Parameters

- **name** *(str)* -- The IIS site name.
- **sourcepath** *(str)* -- The physical path of the IIS site.
- **apppool** *(str)* -- The name of the IIS application pool.
- **hostheader** *(str)* -- The host header of the binding.
- **ipaddress** *(str)* -- The IP address of the binding.
- **port** *(str)* -- The TCP port of the binding.
- **protocol** *(str)* -- The application protocol of the binding.

Example of usage with only the required arguments. This will default to using the default application pool assigned by IIS:
Example of usage specifying all available arguments:

```
site0-deployed:
  win_iis.deployed:
    - name: site0
    - sourcopath: C:\inetpub\site0
```

salt.states.win_iis.remove_app(name, site)
Remove an IIS application.

Parameters

- **name** *(str)* -- The application name.
- **site** *(str)* -- The IIS site name.

Usage:

```
site0-v1-app-remove:
  win_iis.remove_app:
    - name: v1
    - site: site0
```

salt.states.win_iis.remove_apppool(name)
Remove an IIS application pool.

Parameters **name** *(str)* -- The name of the IIS application pool.

Usage:

```
defaultapppool-remove:
  win_iis.remove_apppool:
    - name: DefaultAppPool
```

salt.states.win_iis.remove_binding(name, site, hostheader='', ipaddress='*', port=80)
Remove an IIS binding.

Parameters

- **site** *(str)* -- The IIS site name.
- **hostheader** *(str)* -- The host header of the binding.
- **ipaddress** *(str)* -- The IP address of the binding.
- **port** *(str)* -- The TCP port of the binding.

Example of usage with only the required arguments:

```
site0-https-binding-remove:
  win_iis.remove_binding:
    - site: site0
```
Example of usage specifying all available arguments:

```yaml
site0-https-binding-remove:
    win_iis.remove_binding:
        - site: site0
        - hostheader: site0.local
        - ipaddress: '*'
        - port: 443
```

```
salt.states.win_iis.remove_cert_binding(name, site, hostheader='', ipaddress='', port=443)
Remove a certificate from an IIS binding.
```

Parameters

- **name** *(str)* -- The thumbprint of the certificate.
- **site** *(str)* -- The IIS site name.
- **hostheader** *(str)* -- The host header of the binding.
- **ipaddress** *(str)* -- The IP address of the binding.
- **port** *(str)* -- The TCP port of the binding.

Example of usage with only the required arguments:

```
site0-cert-binding-remove:
    win_iis.remove_cert_binding:
        - name: 9988776655443322111000AAABBBCCCDDDEEEFFF
        - site: site0
```

Example of usage specifying all available arguments:

```
site0-cert-binding-remove:
    win_iis.remove_cert_binding:
        - name: 9988776655443322111000AAABBBCCCDDDEEEFFF
        - site: site0
        - hostheader: site0.local
        - ipaddress: 192.168.1.199
        - port: 443
```

New in version 2016.11.0.

```
salt.states.win_iis.remove_site(name)
Delete a website from IIS.
```

Parameters **name** *(str)* -- The IIS site name.

Usage:

```
defaultwebsite-remove:
    win_iis.remove_site:
        - name: Default Web Site
```

```
salt.states.win_iis.remove_vdir(name, site, app='')
Remove an IIS virtual directory.
```

Parameters

- **name** *(str)* -- The virtual directory name.
- **site** *(str)* -- The IIS site name.
- **app** *(str)* -- The IIS application.

Example of usage with only the required arguments:

```yaml
site0-foo-vdir-remove:
  win_iis.remove_vdir:
    - name: foo
    - site: site0
```

Example of usage specifying all available arguments:

```yaml
site0-foo-vdir-remove:
  win_iis.remove_vdir:
    - name: foo
    - site: site0
    - app: v1
```

**salt.states.win_iis.set_app(name, site, settings=None)**

New in version 2017.7.0.

Set the value of the setting for an IIS web application.

**Note:** This function only configures existing app. Params are case sensitive.

**Parameters**

- **name** *(str)* -- The IIS application.
- **site** *(str)* -- The IIS site name.
- **settings** *(str)* -- A dictionary of the setting names and their values.

Available settings:

- **physicalPath** - The physical path of the webapp
- **applicationPool** - The application pool for the webapp
- **userName** "connectAs" user
- **password** "connectAs" password for user

**Return type**  *bool*

Example of usage:

```yaml
site0-webapp-setting:
  win_iis.set_app:
    - name: app0
    - site: Default Web Site
    - settings:
      userName: domain\user
      password: pass
      physicalPath: c:\inetpub\wwwroot
      applicationPool: appPool0
```

**salt.states.win_iis.webconfiguration_settings(name, settings=None)**

Set the value of webconfiguration settings.

**Parameters**
- **name (str)** -- The name of the IIS PSPath containing the settings. Possible PSPaths are: MACHINE, MACHINE/WEBROOT, IIS:, IIS:Sitessitename, ...

- **settings (dict)** -- Dictionaries of dictionaries. You can match a specific item in a collection with this syntax inside a key: 'Collection[{name: site0}].logFile.directory'

Example of usage for the MACHINE/WEBROOT PSPath:

```
MACHINE-WEBROOT-level-security:
    win_iis.webconfiguration_settings:
        - name: 'MACHINE/WEBROOT'
        - settings:
            system.web/authentication/forms:
                requireSSL: True
                protection: "All"
            credentials.passwordFormat: "SHA1"
            system.web/httpCookies:
                httpOnlyCookies: True
```

Example of usage for the IIS:\Sites\site0 PSPath:

```
site0-IIS-Sites-level-security:
    win_iis.webconfiguration_settings:
        - name: 'IIS:\Sites\site0'
        - settings:
            system.webServer/httpErrors:
                errorMode: "DetailedLocalOnly"
            system.webServer/security/requestFiltering:
                allowDoubleEscaping: False
                verbs.Collection:
                    - verb: TRACE
                      allowed: False
            fileExtensions.allowUnlisted: False
```

Example of usage for the IIS:\ PSPath with a collection matching:

```
site0-IIS-level-security:
    win_iis.webconfiguration_settings:
        - name: 'IIS:\'
        - settings:
            system.applicationHost/sites:
                'Collection[{name: site0}].logFile.directory': 'C:\logs\iis\site0'
```

### 23.19.200 salt.states.win_path

Manage the Windows System PATH

**salt.states.win_path.absent**(*name*)

Remove the directory from the SYSTEM path

Example:

```
'C:\sysinternals':
    win_path.absent
```

**salt.states.win_path.exists**(*name*, *index=*

Add the directory to the system PATH at index location
index  Position where the directory should be placed in the PATH. This is 0-indexed, so 0 means to prepend at
the very start of the PATH.

Note: If the index is not specified, and the directory needs to be added to the PATH, then the directory
will be appended to the PATH, and this state will not enforce its location within the PATH.

Examples:

<table>
<thead>
<tr>
<th>Path</th>
<th>win_path.exists</th>
<th>index</th>
</tr>
</thead>
<tbody>
<tr>
<td>C:\python27</td>
<td>win_path.exists</td>
<td></td>
</tr>
<tr>
<td>C:\sysinternals</td>
<td>win_path.exists</td>
<td>index: 0</td>
</tr>
<tr>
<td>C:\mystuff</td>
<td>win_path.exists</td>
<td>index: -1</td>
</tr>
</tbody>
</table>

23.19.201 salt.states.win_pki

Microsoft certificate management via the Pki PowerShell module.

platform  Windows

New in version 2016.11.0.

salt.states.win_pki.import_cert(name, cert_format='cer', context='LocalMachine', store='My', exportable=True, password='', saltenv='base')

Import the certificate file into the given certificate store.

Parameters

• **name**(str) -- The path of the certificate file to import.
• **cert_format**(str) -- The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
• **context**(str) -- The name of the certificate store location context.
• **store**(str) -- The name of the certificate store.
• **exportable**(bool) -- Mark the certificate as exportable. Only applicable to pfx format.
• **password**(str) -- The password of the certificate. Only applicable to pfx format.
• **saltenv**(str) -- The environment the file resides in.

Example of usage with only the required arguments:

<table>
<thead>
<tr>
<th>site0-cert-imported</th>
<th>win_pki.import_cert</th>
</tr>
</thead>
<tbody>
<tr>
<td>name: salt://win/webserver/certs/site0.cer</td>
<td></td>
</tr>
</tbody>
</table>

Example of usage specifying all available arguments:
site0-cert-imported:
  win_pki.import_cert:
    - name: salt://win/webserver/certs/site0.pfx
    - cert_format: pfx
    - context: LocalMachine
    - store: My
    - exportable: True
    - password: TestPassword
    - saltenv: base

salt.states.win_pki.remove_cert(name, thumbprint, context='LocalMachine', store='My')
Remove the certificate from the given certificate store.

Parameters

- thumbprint (str) -- The thumbprint value of the target certificate.
- context (str) -- The name of the certificate store location context.
- store (str) -- The name of the certificate store.

Example of usage with only the required arguments:

site0-cert-removed:
  win_pki.remove_cert:
    - thumbprint: 998877665544332211100AAABBBCCCDDDEEEFFF

Example of usage specifying all available arguments:

site0-cert-removed:
  win_pki.remove_cert:
    - thumbprint: 998877665544332211100AAABBBCCCDDDEEEFFF
    - context: LocalMachine
    - store: My

23.19.202 salt.states.win_snmp

Module for managing SNMP service settings on Windows servers.

salt.states.win_snmp.agent_settings(name, contact, location, services=none)
Manage the SNMP sysContact, sysLocation, and sysServices settings.

Parameters

- contact (str) -- The SNMP contact.
- location (str) -- The SNMP location.
- services (str) -- A list of selected services.

Example of usage:

snmp-agent-settings:
  win_snmp.agent_settings:
    - contact: Test Contact
    - location: Test Location
    - services:
      - Physical
      - Internet
salt.states.win_snmp.auth_traps_enabled(name, status=True)

Manage the sending of authentication traps.

Parameters status (bool) -- The enabled status.

Example of usage:

```
snmp-auth-traps:
    win_snmp.auth_traps_enabled:
        - status: True
```

cali Documentation, Release 3002.5

salt.states.win_snmp.community_names(name, communities=None)

Manage the SNMP accepted community names and their permissions.

Parameters communities (str) -- A dictionary of SNMP communities and permissions.

Example of usage:

```
snmp-community-names:
    win_snmp.community_names:
        - communities:
            TestCommunity: Read Only
            OtherCommunity: Read Write
```

23.19.203 salt.states.wordpress

This state module is used to manage Wordpress installations

depends wp binary from http://wp-cli.org/

salt.states.wordpress.activated(name, path, user)

Activate wordpress plugins

name name of plugin to activate
path path to wordpress installation
user user who should own the files in the wordpress installation

```
HyperDB:
    wordpress.activated:
        - path: /var/www/html
        - user: apache
```

salt.states.wordpress.deactivated(name, path, user)

Deactivate wordpress plugins

name name of plugin to deactivate
path path to wordpress installation
user user who should own the files in the wordpress installation

```
HyperDB:
    wordpress.deactivated:
        - path: /var/www/html
        - user: apache
```

salt.states.wordpress.installed(name, user, admin_user, admin_password, admin_email, title, url)

Run the initial setup of wordpress
name path to the wordpress installation
user user that owns the files for the wordpress installation
admin_user username for wordpress website administrator user
admin_password password for wordpress website administrator user
admin_email email for wordpress website administrator user
title title for the wordpress website
url url for the wordpress website

```
/var/www/html:
  wordpress.installed:
    - title: Daniel's Awesome Blog
    - user: apache
    - admin_user: dwallace
    - admin_email: dwallace@example.com
    - admin_password: password123
    - url: https://blog.dwallace.com
```

23.19.204 salt.states.x509

Manage X509 Certificates
New in version 2015.8.0.

depends M2Crypto

This module can enable managing a complete PKI infrastructure including creating private keys, CAs, certificates and CRLs. It includes the ability to generate a private key on a server, and have the corresponding public key sent to a remote CA to create a CA signed certificate. This can be done in a secure manner, where private keys are always generated locally and never moved across the network.

Here is a simple example scenario. In this example ca is the ca server, and www is a web server that needs a certificate signed by ca.

For remote signing, peers must be permitted to remotely call the sign_remote_certificate function.

/etc/salt/master.d/peer.conf

```
peer:
  .*:
    - x509.sign_remote_certificate
```

/srv/salt/top.sls

```
base:
  '*':
    - cert
  'ca':
    - ca
  'www':
    - www
```

This state creates the CA key, certificate and signing policy. It also publishes the certificate to the mine where it can be easily retrieved by other minions.

/srv/salt/ca.sls
The signing policy defines properties that override any property requested or included in a CRL. It also can define a restricted list of minions which are allowed to remotely invoke this signing policy.

/srv/salt/x509.conf

mine_functions:
  x509.get_pem_entries: [/etc/pki/ca.crt]

x509_signing_policies:
  www:
    - minions: 'www'
    - signing_private_key: /etc/pki/ca.key
    - signing_cert: /etc/pki/ca.crt
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:false"
    - keyUsage: "critical keyEncipherment"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 3650
    - days_remaining: 0
    - backup: True
    - require:
      - file: /etc/pki
- `authorityKeyIdentifier`: keyid,issuer:always
- `days_valid`: 90
- `copypath`: /etc/pki/issued_certs/

This state will instruct all minions to trust certificates signed by our new CA. Using Jinja to strip newlines from the text avoids dealing with newlines in the rendered YAML, and the `sign_remote_certificate` state will handle properly formatting the text before writing the output.

/srv/salt/cert.sls

```yaml
/usr/local/share/ca-certificates:
  file.directory

/usr/local/share/ca-certificates/intca.crt:
  x509.pemManaged:
    - text: {{ salt['mine.get']('ca', 'x509.get_pem_entries')['ca']['/etc/pki/ca.crt'] | replace('
', '') }}

This state creates a private key then requests a certificate signed by ca according to the www policy.

/srv/salt/www.sls

/etc/pki/www.crt:
  x509.private_key_managed:
    - name: /etc/pki/www.key
    - bits: 4096
    - backup: True

/etc/pki/www.crt:
  x509.certificate_managed:
    - ca_server: ca
    - signing_policy: www
    - public_key: /etc/pki/www.key
    - CN: www.example.com
    - days_remaining: 30
    - backup: True

This other state creates a private key then requests a certificate signed by ca according to the www policy but adds a strict date range for the certificate to be considered valid.

/srv/salt/www-time-limited.sls

/etc/pki/www-time-limited.crt:
  x509.certificate_managed:
    - ca_server: ca
    - signing_policy: www
    - public_key: /etc/pki/www-time-limited.key
    - CN: www.example.com
    - not_before: 2019-05-05 00:00:00
    - not_after: 2020-05-05 14:30:00
    - backup: True

```
salt.states.x509.certificate_managed(name, days_remaining=90, append_certs=None, managed_private_key=None, **kwargs)

Manage a Certificate

name  Path to the certificate
**days_remaining** [90] Recreate the certificate if the number of days remaining on it are less than this number. The value should be less than **days_valid**, otherwise the certificate will be recreated every time the state is run. A value of 0 disables automatic renewal.

**append_certs**: A list of certificates to be appended to the managed file. They must be valid PEM files, otherwise an error will be thrown.

**managed_private_key**: Has no effect since v2016.11 and will be removed in Salt Aluminium. Use a separate `x509.private_key_managed` call instead.

**kwargs**: Any arguments supported by `x509.create_certificate` or `file.managed` are supported.

**not_before**: Initial validity date for the certificate. This date must be specified in the format '%Y-%m-%d %H:%M:%S'.

New in version 3001.

**not_after**: Final validity date for the certificate. This date must be specified in the format '%Y-%m-%d %H:%M:%S'.

New in version 3001.

Examples:

```
/etc/pki/ca.crt:
 x509.certificate_managed:
   - signing_private_key: /etc/pki/ca.key
   - CN: ca.example.com
   - C: US
   - ST: Utah
   - L: Salt Lake City
   - basicConstraints: "critical CA:true"
   - keyUsage: "critical cRLSign, keyCertSign"
   - subjectKeyIdentifier: hash
   - authorityKeyIdentifier: keyid,issuer:always
   - days_valid: 3650
   - days_remaining: 0
   - backup: True

/etc/ssl/www.crt:
 x509.certificate_managed:
   - ca_server: pki
   - signing_policy: www
   - public_key: /etc/ssl/www.key
   - CN: www.example.com
   - days_valid: 90
   - days_remaining: 30
   - backup: True
```

**salt.states.x509.crl_managed** *(name, signing_private_key, signing_private_key_passphrase=None, signing_cert=None, revoked=None, days_valid=100, digest='', days_remaining=30, include_expired=False, **kwargs)*

Manage a Certificate Revocation List

**name** Path to the certificate

**signing_private_key** The private key that will be used to sign the CRL. This is usually your CA’s private key.

**signing_private_key_passphrase** Passphrase to decrypt the private key.

**signing_cert** The certificate of the authority that will be used to sign the CRL. This is usually your CA’s certificate.
revoked A list of certificates to revoke. Must include either a serial number or a the certificate itself. Can optionally include the revocation date and notAfter date from the certificate. See example below for details.

days_valid [100] The number of days the certificate should be valid for.

digest The digest to use for signing the CRL. This has no effect on versions of pyOpenSSL less than 0.14.

days_remaining [30] The CRL should be automatically recreated if there are less than days_remaining days until the CRL expires. Set to 0 to disable automatic renewal.

include_expired [False] If True, include expired certificates in the CRL.

kwargs Any arguments supported by file.managed are supported.

Example:

```yaml
/etc/pki/ca.crl:
 x509.crl_managed:
   signing_private_key: /etc/pki/myca.key
   signing_cert: /etc/pki/myca.crt
   revoked:
     compromised_Web_key:
       certificate: /etc/pki/certs/badweb.crt
       revocation_date: 2015-03-01 00:00:00
       reason: keyCompromise
     terminated_vpn_user:
       serial_number: D6:D2:DC:D8:4D:5C:C0:F4
       not_after: 2016-01-01 00:00:00
       revocation_date: 2015-02-25 00:00:00
       reason: cessationOfOperation
```

salt.states.x509.csr_managed(name, **kwargs)
Manage a Certificate Signing Request

name: Path to the CSR

properties: The properties to be added to the certificate request, including items like subject, extensions and public key. See above for valid properties.

kwargs: Any arguments supported by file.managed are supported.

Example:

```yaml
/etc/pki/mycert.csr:
 x509.csr_managed:
   private_key: /etc/pki/mycert.key
   CN: www.example.com
   C: US
   ST: Utah
   L: Salt Lake City
   keyUsage: 'critical dataEncipherment'
```

salt.states.x509.pem_managed(name, text, backup=False, **kwargs)
Manage the contents of a PEM file directly with the content in text, ensuring correct formatting.

name: The path to the file to manage

text: The PEM formatted text to write.

kwargs: Any arguments supported by file.managed are supported.
salt.states.x509.private_key_managed(name, bits=2048, passphrase=None, cipher='aes_128_cbc', new=False, overwrite=False, verbose=True, **kwargs)

Manage a private key's existence.

**name**: Path to the private key

**bits**: Key length in bits. Default 2048.

**passphrase**: Passphrase for encrypting the private key.

**cipher**: Cipher for encrypting the private key.

**new**: Always create a new key. Defaults to False. Combining new with prereq can allow key rotation whenever a new certificate is generated.

**overwrite**: Overwrite an existing private key if the provided passphrase cannot decrypt it.

**verbose**: Provide visual feedback on stdout, dots while key is generated. Default is True.

New in version 2016.11.0.

**kwargs**: Any kwargs supported by file.managed are supported.

Example:

The JINJA templating in this example ensures a private key is generated if the file doesn't exist and that a new private key is generated whenever the certificate that uses it is to be renewed.

```
/etc/pki/www.key:
   x509.private_key_managed:
     - bits: 4096
     - new: True
   {% if salt['file.file_exists']('/etc/pki/www.key') -%}
     - prereq:
       - x509: /etc/pki/www.crt
   {%- endif %}
```

23.19.205 salt.states.xml

XML Manager

State management of XML files

salt.states.xml.value_present(name, xpath, value, **kwargs)

New in version 3000.

Manages a given XML file

**name** [string] The location of the XML file to manage, as an absolute path.

**xpath** [string] xpath location to manage

**value** [string] value to ensure present

```
ensure_value_true:
   xml.value_present:
     - name: /tmp/test.xml
     - xpath: ./playwright[@id='1']
     - value: William Shakespeare
```
23.19.206  salt.states.xmpp

Sending Messages over XMPP

New in version 2014.1.0.

This state is useful for firing messages during state runs, using the XMPP protocol.

```yaml
server-warning-message:
  xmpp.send_msg:
    - name: 'This is a server warning message'
    - profile: my-xmpp-account
    - recipient: admins@xmpp.example.com/salt
```

```python
salt.states.xmpp.send_msg(name, recipient, profile)

Send a message to an XMPP user
```

```yaml
server-warning-message:
  xmpp.send_msg:
    - name: 'This is a server warning message'
    - profile: my-xmpp-account
    - recipient: admins@xmpp.example.com/salt
```

```python
name The message to send to the XMPP user
```

```python
salt.states.xmpp.send_msg_multi(name, profile, recipients=None, rooms=None)

Send a message to a list of recipients or rooms
```

```yaml
server-warning-message:
  xmpp.send_msg:
    - name: 'This is a server warning message'
    - profile: my-xmpp-account
    - recipients:
      - admins@xmpp.example.com/salt
    - rooms:
      - qa@conference.xmpp.example.com
```

```python
name The message to send to the XMPP user
```

23.19.207  salt.states.zabbix_action

New in version 2017.7.

Management of Zabbix Action object over Zabbix API.

```python
codeauthor Jakub Sliva <jakub.sliva@ultimum.io>
```

```python
salt.states.zabbix_action.absent(name, **kwargs)

Makes the Zabbix Action to be absent (either does not exist or delete it).

Parameters

- **name** -- Zabbix Action name
- **connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
```
- _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
zabbix-action-absent:
zabbix_action.absent:
  - name: Action name
```

salt.states.zabbix_action.present(name, params, **kwargs)
Creates Zabbix Action object or if differs update it according defined parameters

Parameters
- name -- Zabbix Action name
- params -- Definition of the Zabbix Action
- _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

If there is a need to get a value from current zabbix online (e.g. id of a hostgroup you want to put a discovered system into), put a dictionary with two keys "query_object" and "query_name" instead of the value. In this example we want to get object id of hostgroup named "Virtual machines" and "Databases".

```
zabbix-action-present:
zabbix_action.present:
  - name: VMs
    - params:
      eventsource: 2
      status: 0
      filter:
        evaltype: 2
        conditions:
          - conditiontype: 24
            operator: 2
            value: 'virtual'
          - conditiontype: 24
            operator: 2
            value: 'kvm'
        operations:
          - operationtype: 2
          - operationtype: 4
          - opgroup:
            - groupid:
              query_object: hostgroup
              query_name: Virtual machines
            - groupid:
              query_object: hostgroup
              query_name: Databases
```
23.19.208 salt.states.zabbix_hostgroup

Management of Zabbix host groups.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

salt.states.zabbix_hostgroup.absent(name, **kwargs)

Ensures that the host group does not exist, eventually delete host group.

New in version 2016.3.0.

Parameters

- **name** -- name of the host group
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
def delete_testing_host_group:
debux_hostgroup.absent:
    - name: 'My hostgroup name'
```

salt.states.zabbix_hostgroup.present(name, **kwargs)

Ensures that the host group exists, eventually creates new host group.

New in version 2016.3.0.

Parameters

- **name** -- name of the host group
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
def create_testing_host_group:
debux_hostgroup.present:
    - name: 'My hostgroup name'
```

23.19.209 salt.states.zabbix_mediatype

Management of Zabbix mediatypes.

codeauthor Raymond Kuiper <qix@the-wired.net>

salt.states.zabbix_mediatype.absent(name, **kwargs)

Ensures that the mediatype does not exist, eventually deletes the mediatype.

Parameters

- **name** -- name of the mediatype
• _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
delete_mediatype:
    zabbix_mediatype.absent:
      - name: 'Email'
```

salt.states.zabbix_mediatype.present(name, mediatype, **kwargs)
Creates new mediatype. NOTE: This function accepts all standard mediatype properties: keyword argument names differ depending on your zabbix version, see: https://www.zabbix.com/documentation/3.0/manual/api/reference/host/object#host_inventory

Parameters

• name -- name of the mediatype
• _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
make_new_mediatype:
    zabbix_mediatype.present:
        - name: 'Email'
        - mediatype: 0
        - smtp_server: smtp.example.com
        - smtp_hello: zabbix.example.com
        - smtp_email: zabbix@example.com
```

23.19.210 salt.states.zabbix_template

New in version 2017.7.
Management of Zabbix Template object over Zabbix API.

codeauthor Jakub Sliva <jakub.sliva@ultimum.io>

salt.states.zabbix_template.absent(name, **kwargs)
Makes the Zabbix Template to be absent (either does not exist or delete it).

Parameters

• name -- Zabbix Template name
• _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
zabbix-template-absent:
    zabbix_template.absent:
      - name: Ceph OSD
```

salt.states.zabbix_template.is_present(name, **kwargs)
Check if Zabbix Template already exists.

Parameters

• name -- Zabbix Template name

• _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)

• _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)

• _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
does_zabbix-template-exist:
    zabbix_template.is_present:
      - name: Template OS Linux
```

salt.states.zabbix_template.present(name, params, static_host_list=True, **kwargs)
Creates Zabbix Template object or if differs update it according defined parameters. See Zabbix API documentation.

Zabbix API version: >3.0

Parameters

• name -- Zabbix Template name

• params -- Additional parameters according to Zabbix API documentation

• static_host_list -- If hosts assigned to the template are controlled only by this state or can be also assigned externally

• _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)

• _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)

• _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

---

Note: If there is a need to get a value from current zabbix online (e.g. ids of host groups you want the template to be associated with), put a dictionary with two keys "query_object" and "query_name" instead of the value. In this example we want to create template named "Testing Template", assign it to hostgroup Templates, link it to two ceph nodes and create a macro.

---

Note: IMPORTANT NOTE: Objects (except for template name) are identified by name (or by other key in some exceptional cases) so changing name of object means deleting old one and creating new one with new
Note:

NOT SUPPORTED FEATURES:

- linked templates
- trigger dependencies
- groups and group prototypes for host prototypes

SLS Example:

```
zabbix-template-present:
  zabbix_template.present:
    - name: Testing Template
      # Do not touch existing assigned hosts
      # True will detach all other hosts than defined here
      - static_host_list: False
      - params:
        description: Template for Ceph nodes
        groups:
          # groups must already exist
          # template must be at least in one hostgroup
          - groupid:
            query_object: hostgroup
            query_name: Templates
        macros:
          - macro: "${CEPH_CLUSTER_NAME}"
            value: ceph
        hosts:
          # hosts must already exist
          - hostid:
            query_object: host
            query_name: ceph-osd-01
          - hostid:
            query_object: host
            query_name: ceph-osd-02
        # templates:
        # Linked templates - not supported by state module but can be linked
        # manually (will not be touched)
        applications:
          - name: Ceph OSD
            items:
              - name: Ceph OSD avg fill item
                key_: ceph.osd_avg_fill
                type: 2
                value_type: 0
                delay: 60
                units: '%'
                description: 'Average fill of OSD'
                applications:
                  - applicationid:
                    query_object: application
                    query_name: Ceph OSD
```

(continues on next page)

          query_name: Ceph OSD avg fill graph
23.19.211 salt.states.zabbix_usergroup

Management of Zabbix user groups.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

salt.states.zabbix_usergroup.absent(name, **kwargs)
Ensures that the user group does not exist, eventually delete user group.

New in version 2016.3.0.

Parameters

- **name** -- name of the user group
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
def delete_thai_monks_usrgrp:
    zabbix_usergroup.absent:
        - name: 'Thai monks'
```

salt.states.zabbix_usergroup.present(name, **kwargs)
Creates new user group. NOTE: This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see: https://www.zabbix.com/documentation/2.0/manual/appendix/api/usergroup/definitions#user_group

New in version 2016.3.0.

Parameters

- **name** -- name of the user group
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
def make_new_thai_monks_usergroup:
    zabbix_usergroup.present:
        - name: 'Thai monks'
        - gui_access: 1
        - debug_mode: 0
        - users_status: 0
```
23.19.212 salt.states.zabbix_usermacro

Management of Zabbix usermacros. :codeauthor: Raymond Kuiper <qix@the-wired.net>
salt.states.zabbix_usermacro.absent(name, hostid=None, **kwargs)
Ensures that the mediatype does not exist, eventually deletes the mediatype.

Parameters

- **name** -- name of the usermacro
- **hostid** -- id's of the hosts to apply the usermacro on, if missing a global usermacro is assumed.
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
def delete_usermacro:
    zabbix_usermacro.absent:
        - name: '{SNMP_COMMUNITY}'
```

salt.states.zabbix_usermacro.present(name, value, hostid=None, **kwargs)
Creates a new usermacro.

Parameters

- **name** -- name of the usermacro
- **value** -- value of the usermacro
- **hostid** -- id's of the hosts to apply the usermacro on, if missing a global usermacro is assumed.
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
override host usermacro:
    zabbix_usermacro.present:
        - name: '{SNMP_COMMUNITY}''
        - value: 'public'
        - hostid: 21
```
23.19.213  salt.states.zabbix_valuemap

New in version 2017.7.
Management of Zabbix Valuemap object over Zabbix API.

codeauthor  Jakub Sliva <jakub.sliva@ultimum.io>

salt.states.zabbix_valuemap.absent(name, **kwargs)
Makes the Zabbix Value map to be absent (either does not exist or delete it).

Parameters

• name -- Zabbix Value map name

• _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)

• _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)

• _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

  zabbix-valuemap-absent:
  zabbix_valuemap.absent:
  - name: Value map name

salt.states.zabbix_valuemap.present(name, params, **kwargs)
Creates Zabbix Value map object or if differs update it according defined parameters

Parameters

• name -- Zabbix Value map name

• params -- Definition of the Zabbix Value map

• _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)

• _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)

• _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

  zabbix-valuemap-present:
  zabbix_valuemap.present:
  - name: Number mapping
    - params:
      mappings:
        - value: 1
          newvalue: one
        - value: 2
          newvalue: two
23.19.214 salt.states.zcbuildout

Management of zc.buildout

This module is inspired from minitage's buildout maker (https://github.com/minitage/minitage/blob/master/src/minitage/core/makers/buildout.py)

New in version 2016.3.0.

Note: This state module is beta; the API is subject to change and no promise as to performance or functionality is yet present.

Available Functions

- built

```python
salt.states.zcbuildout.installed(name, config='buildout.cfg', quiet=False, parts=None, user=None, env=(), buildout_ver=None, test_release=False, distribute=None, new_st=None, offline=False, newest=False, python='/builds/saltstack/open/docs/builddocs/venv/bin/python', debug=False, verbose=False, unless=None, onlyif=None, use_vt=False, loglevel='debug', **kwargs)
```

Install buildout in a specific directory

It is a thin wrapper to modules.buildout.buildout

- **name** directory to execute in
- **quiet** do not output console & logs
- **config** buildout config to use (default: buildout.cfg)
- **parts** specific buildout parts to run
- **user** user used to run buildout as

New in version 2014.1.4.

- **env** environment variables to set when running
- **buildout_ver** force a specific buildout version (1 | 2)
test_release  buildout accept test release
new_st Forcing use of setuptools >= 0.7
distribute use distribute over setuptools if possible
offline does buildout run offline
python python to use
debug run buildout with -D debug flag
onlyif Only execute cmd if statement on the host return 0
unless Do not execute cmd if statement on the host return 0
newest run buildout in newest mode
verbose run buildout in verbose mode (-vvvvv)
use_vt Use the new salt VT to stream output [experimental]
loglevel loglevel for buildout commands

23.19.215 salt.states.zenoss
State to manage monitoring in Zenoss.
New in version 2016.3.0.
This state module depends on the 'zenoss' Salt execution module.
Allows for setting a state of minions in Zenoss using the Zenoss API. Currently Zenoss 4.x and 5.x are supported.

enable_monitoring:
  zenoss_monitored:
    - name: web01.example.com
    - device_class: /Servers/Linux
    - collector: localhost
    - prod_state: 1000

salt.states.zenoss.monitored(name, device_class=None, collector='localhost', prod_state=None)
Ensure a device is monitored. The 'name' given will be used for Zenoss device name and should be resolvable.

enable_monitoring:
  zenoss_monitored:
    - name: web01.example.com
    - device_class: /Servers/Linux
    - collector: localhost
    - prod_state: 1000
23.19.216  salt.states.zfs

States for managing zfs datasets

maintainer  Jorge Schrauwen <sjorge@blackdot.be>
maturity  new
depends  salt.utils.zfs, salt.modules.zfs
platform  smartos, illumos, solaris, freebsd, linux

New in version 2016.3.0.
Changed in version 2018.3.1: Big refactor to remove duplicate code, better type conversions and improved consistency in output.

test/shares/yuki:
zfs.filesystem_present:
  - create_parent: true
  - properties:
    quota: 16G

test/iscsi/haruhi:
zfs.volume_present:
  - create_parent: true
  - volume_size: 16M
  - sparse: true
  - properties:
    readonly: on

test/shares/yuki@frozen:
zfs.snapshot_present

moka_origin:
zfs.hold_present:
  - snapshot: test/shares/yuki@frozen

test/shares/moka:
zfs.filesystem_present:
  - cloned_from: test/shares/yuki@frozen

test/shares/moka@tsukune:
zfs.snapshot_absent

salt.states.zfs.bookmark_absent(name, force=False, recursive=False)
ensure bookmark is absent on the system

name  [string] name of snapshot
force  [boolean] try harder to destroy the dataset (zfs destroy -f)
recursive  [boolean] also destroy all the child datasets (zfs destroy -r)

salt.states.zfs.bookmark_present(name, snapshot)
ensure bookmark exists

name  [string] name of bookmark
snapshot  [string] name of snapshot

salt.states.zfs.filesystem_absent(name, force=False, recursive=False)
ensure filesystem is absent on the system
name  [string] name of filesystem
force  [boolean] try harder to destroy the dataset (zfs destroy -f)
recursive  [boolean] also destroy all the child datasets (zfs destroy -r)

Warning: If a volume with name exists, this state will succeed without destroying the volume specified by name. This module is dataset type sensitive.

salt.states.zfs.filesystem_present(name, create_parent=False, properties=None, cloned_from=None)
ensure filesystem exists and has properties set
name  [string] name of filesystem
create_parent  [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.
cloned_from  [string] name of snapshot to clone
properties  [dict] additional zfs properties (-o)

Note: cloned_from is only use if the filesystem does not exist yet, when cloned_from is set after the filesystem exists it will be ignored.

Note: Properties do not get cloned, if you specify the properties in the state file they will be applied on a subsequent run.

salt.states.zfs.hold_absent(name, snapshot, recursive=False)
ensure hold is absent on the system
name  [string] name of hold
snapshot  [string] name of snapshot
recursive  [boolean] recursively releases a hold with the given tag on the snapshots of all descendent file systems.

salt.states.zfs.hold_present(name, snapshot, recursive=False)
ensure hold is present on the system
name  [string] name of holdt
snapshot  [string] name of snapshot
recursive  [boolean] recursively add hold with the given tag on the snapshots of all descendent file systems.

salt.states.zfs.promoted(name)
ensure a dataset is not a clone
name  [string] name of fileset or volume

Warning: only one dataset can be the origin, if you promote a clone the original will now point to the promoted dataset
salt.states.zfs.scheduled_snapshot(name, prefix, recursive=True, schedule=None)

Maintain a set of snapshots based on a schedule.

- **name**: string - name of filesystem or volume
- **prefix**: string - prefix for the snapshots e.g. 'test' will result in snapshots being named 'test-yyyymmdd_hhmm'
- **recursive**: boolean - create snapshots for all children also
- **schedule**: dict - dict holding the schedule, the following keys are available (minute, hour, day, month, and year) by default all are set to 0 the value indicated the number of snapshots of that type to keep around.

**Warning**: snapshots will only be created and pruned every time the state runs. a schedule must be setup to automatically run the state. this means that if you run the state daily the hourly snapshot will only be made once per day!

Changed in version 2018.3.0: switched to localtime from gmtime so times now take into account timezones.

salt.states.zfs.snapshot_absent(name, force=False, recursive=False)

Ensure snapshot is absent on the system.

- **name**: string - name of snapshot
- **force**: boolean - try harder to destroy the dataset (zfs destroy -f)
- **recursive**: boolean - also destroy all the child datasets (zfs destroy -r)

salt.states.zfs.snapshot_present(name, recursive=False, properties=None)

Ensure snapshot exists and has properties set.

- **name**: string - name of snapshot
- **recursive**: boolean - recursively create snapshots of all descendent datasets
- **properties**: dict - additional zfs properties (-o)

salt.states.zfs.volume_absent(name, force=False, recursive=False)

Ensure volume is absent on the system.

- **name**: string - name of volume
- **force**: boolean - try harder to destroy the dataset (zfs destroy -f)
- **recursive**: boolean - also destroy all the child datasets (zfs destroy -r)

**Warning**: If a filesystem with name exists, this state will succeed without destroying the filesystem specified by name. This module is dataset type sensitive.

salt.states.zfs.volume_present(name, volume_size, sparse=False, create_parent=False, properties=None, cloned_from=None)

Ensure volume exists and has properties set.

- **name**: string - name of volume
- **volume_size**: string - size of volume
- **sparse**: boolean - create sparse volume
- **create_parent**: boolean - creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.
- **cloned_from**: string - name of snapshot to clone
properties [dict] additional zfs properties (-o)

Note: cloned_from is only used if the volume does not exist yet, when cloned_from is set after the volume exists it will be ignored.

Note: Properties do not get cloned, if you specify the properties in the state file they will be applied on a subsequent run.

volume_size is considered a property, so the volume's size will be corrected when the properties get updated if it differs from the original volume.

The sparse parameter is ignored when using cloned_from.

23.19.217 salt.states.zk_concurrency

Control concurrency of steps within state execution using zookeeper

depends kazoo

configuration See salt.modules.zookeeper for setup instructions.

This module allows you to "wrap" a state's execution with concurrency control. This is useful to protect against all hosts executing highstate simultaneously if your services don't all HUP restart. The common way of protecting against this is to run in batch mode, but that doesn't protect from another person running the same batch command (and thereby having 2x the number of nodes deploying at once).

This module will block while acquiring a slot, meaning that however the command gets called it will coordinate with zookeeper to ensure that no more than max_concurrency steps are executing with a single path.

```
acquire_lock:
  zk_concurrency.lock:
    - name: /trafficeserver
    - zk_hosts: 'zookeeper:2181'
    - max_concurrency: 4
    - prereq:
      - service: trafficeserver

trafficeserver:
  service.running:
    - watch:
      - file: /etc/trafficserver/records.config

/etc/trafficserver/records.config:
  file.managed:
    - source: salt://records.config

release_lock:
  zk_concurrency.unlock:
    - name: /trafficserver
    - require:
      - service: trafficeserver
```

This example would allow the file state to change, but would limit the concurrency of the trafficeserver service restart to 4.
salt.states.zk_concurrency.lock(name, zk_hosts=None, identifier=None, max_concurrency=1, timeout=None, ephemeral_lease=False, profile=None, scheme=None, username=None, password=None, default_acl=None)

Block state execution until you are able to get the lock (or hit the timeout)

salt.states.zk_concurrency.min_party(name, zk_hosts, min_nodes, blocking=False, profile=None, scheme=None, username=None, password=None, default_acl=None)

Ensure that there are min_nodes in the party at name, optionally blocking if not available.

salt.states.zk_concurrency.unlock(name, zk_hosts=None, identifier=None, max_concurrency=1, ephemeral_lease=False, profile=None, scheme=None, username=None, password=None, default_acl=None)

Remove lease from semaphore.

23.19.218 salt.states.zookeeper

depends kazoo

configuration See salt.modules.zookeeper for setup instructions.

ACLS

For more information about acls, please checkout the kazoo documentation.

http://kazoo.readthedocs.io/en/latest/api/security.html#kazoo.security.make_digest_acl

The following options can be included in the acl dictionary:

  param username Username to use for the ACL.
  param password A plain-text password to hash.
  param write Write permission.
    type write bool
  param create Create permission.
    type create bool
  param delete Delete permission.
    type delete bool
  param admin Admin permission.
    type admin bool
  param all All permissions.
    type all bool

salt.states.zookeeper.absent(name, version=-1, recursive=False, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Make sure znode is absent

  name path to znode
  version Specify the version which should be deleted Default: -1 (always match)
  recursive Boolean to indicate if children should be recursively deleted Default: False
profile Configured Zookeeper profile to authenticate with (Default: None)
hosts Lists of Zookeeper Hosts (Default: '127.0.0.1:2181)
scheme Scheme to authenticate with (Default: 'digest')
username Username to authenticate (Default: None)
password Password to authenticate (Default: None)
default_acl Default acls to assign if a node is created in this connection (Default: None)
delete znode:  
  - name: /test
  - recursive: True

salt.states.zookeeper.acls(name, acls, version=- 1, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Update acls on a znode
name path to znode
acls list of acl dictionaries to set on znode
version Specify the version which should be deleted Default: -1 (always match)
profile Configured Zookeeper profile to authenticate with (Default: None)
hosts Lists of Zookeeper Hosts (Default: '127.0.0.1:2181)
scheme Scheme to authenticate with (Default: 'digest')
username Username to authenticate (Default: None)
password Password to authenticate (Default: None)
default_acl Default acls to assign if a node is created in this connection (Default: None)

update acls:
zookeeper.acls:
  - name: /test/name
  - acls:
    - username: daniel
      password: test
      all: True
    - username: gtmanfred
      password: test
      all: True

salt.states.zookeeper.present(name, value, acls=None, ephemeral=False, sequence=False, makepath=False, version=- 1, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Make sure znode is present in the correct state with the correct acls
name path to znode
value value znode should be set to
acls list of acl dictionaries to set on znode (make sure the ones salt is connected with are included) Default: None
ephemeral Boolean to indicate if ephemeral znode should be created Default: False
sequence Boolean to indicate if znode path is suffixed with a unique index Default: False
makepath Boolean to indicate if the parent paths should be created Default: False
version For updating, specify the version which should be updated Default: -1 (always match)
profile Configured Zookeeper profile to authenticate with (Default: None)
hosts Lists of Zookeeper Hosts (Default: ’127.0.0.1:2181)
scheme Scheme to authenticate with (Default: ’digest’)
username Username to authenticate (Default: None)
password Password to authenticate (Default: None)
default_acl Default acls to assign if a node is created in this connection (Default: None)

```
add znode:
  zookeeper.present:
    - name: /test/name
    - value: gtmanfred
    - makepath: True

update znode:
  zookeeper.present:
    - name: /test/name
    - value: daniel
    - acls:
      - username: daniel
        password: test
        read: true
      - username: gtmanfred
        password: test
        read: true
        write: true
        create: true
        delete: true
        admin: true
    - makepath: True
```

23.19.219 salt.states.zpool

States for managing zpools

maintainer Jorge Schrauwen <sjorge@blackdot.be>
maturity new
depends salt.utils.zfs, salt.modules.zpool
platform smartos, illumos, solaris, freebsd, linux

New in version 2016.3.0.
Changed in version 2018.3.1: Big refactor to remove duplicate code, better type conversions and improved consistency in output.

```
oldpool:
  zpool.absent:
    - export: true
```
newpool:
  zpool.present:
    - config:
      import: false
      force: true
    - properties:
      comment: salty storage pool
    - layout:
      - mirror:
        - /dev/disk0
        - /dev/disk1
      - mirror:
        - /dev/disk2
        - /dev/disk3

partitionpool:
  zpool.present:
    - config:
      import: false
      force: true
    - properties:
      comment: disk partition salty storage pool
      ashift: 12
      feature@lz4_compress: enabled
    - filesystem_properties:
      compression: lz4
      atime: on
      relatime: on
    - layout:
      - /dev/disk/by-uuid/3e43ce94-77af-4f52-a91b-6cdbb0b0f41b

simplepool:
  zpool.present:
    - config:
      import: false
      force: true
    - properties:
      comment: another salty storage pool
    - layout:
      - /dev/disk0
      - /dev/disk1

**Warning:** The layout will never be updated, it will only be used at time of creation. It's a whole lot of work to figure out if a devices needs to be detached, removed, etc. This is best done by the sysadmin on a case per case basis.

Filesystem properties are also not updated, this should be managed by the zfs state module.

**salt.states.zpool.absent**(name, export=False, force=False)

ensure storage pool is absent on the system

  name [string] name of storage pool
  export [boolean] export instead of destroy the zpool if present
force [boolean] force destroy or export

salt.states.zpool.present(name, properties=None, filesystem_properties=None, layout=None, config=None)

ensure storage pool is present on the system

name [string] name of storage pool

properties [dict] optional set of properties to set for the storage pool

filesystem_properties [dict] optional set of filesystem properties to set for the storage pool (creation only)

layout: dict disk layout to use if the pool does not exist (creation only)

config [dict] fine grain control over this state

---

Note:

The following configuration properties can be toggled in the config parameter.

- import (true) - try to import the pool before creating it if absent
- import_dirs (None) - specify additional locations to scan for devices on import (comma-separated)
- device_dir (None, SunOS=/dev/dsk, Linux=/dev) - specify device directory to prepend for none absolute device paths
- force (false) - try to force the import or creation

---

Note: It is no longer needed to give a unique name to each top-level vdev, the old layout format is still supported but no longer recommended.

- mirror:
  - /tmp/vdisk3
  - /tmp/vdisk2

- mirror:
  - /tmp/vdisk0
  - /tmp/vdisk1

The above yaml will always result in the following zpool create:

```
zpool create mypool mirror /tmp/vdisk3 /tmp/vdisk2 mirror /tmp/vdisk0 /tmp/vdisk1
```

---

Warning: The legacy format is also still supported but not recommended, because ID's inside the layout dict must be unique they need to have a suffix.

```
mirror-0:  
  /tmp/vdisk3
  /tmp/vdisk2

mirror-1:  
  /tmp/vdisk0
  /tmp/vdisk1
```

---

Warning: Pay attention to the order of your dict!
The above will result in the following `zpool create`:

```
zpool create mypool mirror /tmp/vdisk0 /tmp/vdisk1 /tmp/vdisk2
```

Creating a 3-way mirror! While you probably expect it to be mirror root vdev with 2 devices + a root vdev of 1 device!

### 23.20 thorium modules

23.22.1 salt.tops.cobbler

Cobbler Tops

Cobbler Tops is a master tops subsystem used to look up mapping information from Cobbler via its API. The same cobbler.* parameters are used for both the Cobbler tops and Cobbler pillar modules.

```
master_tops:
  cobbler: {}
cobbler.url: https://example.com/cobbler_api  # default is http://localhost/cobbler_api
cobbler.user: username  # default is no username
cobbler.password: password  # default is no password
```

Module Documentation

salt.tops.cobbler.top(**kwargs)

Look up top data in Cobbler for a minion.

23.22.2 salt.tops.mongo

Read tops data from a mongodb collection

This module will load tops data from a mongo collection. It uses the node’s id for lookups.

Salt Master Mongo Configuration

The module shares the same base mongo connection variables as salt.returners.mongo_return. These variables go in your master config file.

- **mongo.db** - The mongo database to connect to. Defaults to 'salt'.
- **mongo.host** - The mongo host to connect to. Supports replica sets by specifying all hosts in the set, comma-delimited. Defaults to 'salt'.
- **mongo.port** - The port that the mongo database is running on. Defaults to 27017.
- **mongo.user** - The username for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''.  
- **mongo.password** - The password for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''.  

Configuring the Mongo Tops Subsystem

```
master_tops:
  mongo:
    collection: tops
    id_field: _id
    re_replace: ''
    re_pattern: \.example\.com
    states_field: states
    environment_field: environment
```
Module Documentation

salt.tops.mongo.top(**kwargs)
Connect to a mongo database and read per-node tops data.

Parameters

- **collection** (*) -- The mongodb collection to read data from. Defaults to 'tops'.
- **id_field** (*) -- The field in the collection that represents an individual minion id. Defaults to '_id'.
- **re_pattern** (*) -- If your naming convention in the collection is shorter than the minion id, you can use this to trim the name. re_pattern will be used to match the name, and re_replace will be used to replace it. Backrefs are supported as they are in the Python standard library. If None, no mangling of the name will be performed - the collection will be searched with the entire minion id. Defaults to None.
- **re_replace** (*) -- Use as the replacement value in node ids matched with re_pattern. Defaults to ''. Feel free to use backreferences here.
- **states_field** (*) -- The name of the field providing a list of states.
- **environment_field** (*) -- The name of the field providing the environment. Defaults to environment.

23.22.3 salt.tops.reclass_adapter

Read tops data from a reclass database

This master_tops plugin provides access to the reclass database, such that state information (top data) are retrieved from reclass.

You can find more information about reclass at http://reclass.pantsfullofunix.net.

To use the plugin, add it to the master_tops list in the Salt master config and tell reclass by way of a few options how and where to find the inventory:

```
master_tops:
  reclass:
    storage_type: yaml_fs
    inventory_base_uri: /srv/salt
```

This would cause reclass to read the inventory from YAML files in /srv/salt/nodes and /srv/salt/classes.

If you are also using reclass as ext_pillar plugin, and you want to avoid having to specify the same information for both, use YAML anchors (take note of the differing data types for ext_pillar and master_tops):

```
reclass: &reclass
  storage_type: yaml_fs
  inventory_base_uri: /srv/salt
  reclass_source_path: ~/code/reclass

ext_pillar:
  - reclass: *reclass

master_tops:
  reclass: *reclass
```
If you want to run reclass from source, rather than installing it, you can either let the master know via the `PYTHONPATH` environment variable, or by setting the configuration option, like in the example above.

```
salt.tops.reclass_adapter.top(**kwargs)
    Query reclass for the top data (states of the minions).
```

## 23.22.4 salt.tops.varstack_top

Use Varstack to provide tops data

This `master_tops` plugin provides access to the varstack hierarchical yaml files, so you can use varstack as a full external node classifier and store state information (top data) in it.

### Configuring Varstack

To use varstack as a master top external node classifier, install varstack as documented. Then, add to your master's configuration:

```
master_tops:
  varstack: /path/to/the/config/file/varstack.yaml
```

Varstack will then use `/path/to/the/config/file/varstack.yaml` (usually `/etc/varstack.yaml`) to determine which configuration data to return as adapter information. From there you can take a look at the README of varstack to learn how this file is evaluated. The ENC part will just return the `states` dictionary for the node.

Ie, if my.fqdn.yaml file contains:

```
---
states:
  - sudo
  - openssh
  - apache
  - salt.minion
```

these will be returned as `{base: ['sudo', 'openssh', 'apache', 'salt.minion']}` and managed by salt as if given from a top.sls file.

```
salt.tops.varstack_top.top(**kwargs)
    Query varstack for the top data (states of the minions).
```

## 23.23 wheel modules

```
config
error
file_roots
key
minions
pillar_roots
```
24.1 Python client API

Salt provides several entry points for interfacing with Python applications. These entry points are often referred to as *Client() APIs. Each client accesses different parts of Salt, either from the master or from a minion. Each client is detailed below.

See also:
There are many ways to access Salt programmatically.
Salt can be used from CLI scripts as well as via a REST interface.
See Salt’s outputter system to retrieve structured data from Salt as JSON, or as shell-friendly text, or many other formats.
See the state.event runner to utilize Salt’s event bus from shell scripts.
Salt’s netapi module provides access to Salt externally via a REST interface. Review the netapi module documentation for more information.

24.1.1 Salt’s opts dictionary

Some clients require access to Salt’s opts dictionary. (The dictionary representation of the master or minion config files.)
A common pattern for fetching the opts dictionary is to defer to environment variables if they exist or otherwise fetch the config from the default location.

24.1.2 Salt’s Loader Interface

Modules in the Salt ecosystem are loaded into memory using a custom loader system. This allows modules to have conditional requirements (OS, OS version, installed libraries, etc) and allows Salt to inject special variables (__salt__, __opts__, etc).
Most modules can be manually loaded. This is often useful in third-party Python apps or when writing tests. However some modules require and expect a full, running Salt system underneath. Notably modules that facilitate master-to-minion communication such as the mine, publish, and peer execution modules. The error KeyError: 'master_uri' is a likely indicator for this situation. In those instances use the Caller class to execute those modules instead.
Each module type has a corresponding loader function.
24.3 Salt’s Client Interfaces

LocalStorage
Salt Caller
Salt Proxy Caller
RunnerClient
WheelClient
CloudClient
SSHClient

24.2 netapi modules

24.2.1 Introduction to netapi modules

Netapi modules provide API-centric access to Salt. Usually externally-facing services such as REST or WebSockets, XMPP, XMLRPC, etc.

In general netapi modules bind to a port and start a service. They are purposefully open-ended. A single module can be configured to run as well as multiple modules simultaneously.

Netapi modules are enabled by adding configuration to your Salt Master config file and then starting the salt-api daemon. Check the docs for each module to see external requirements and configuration settings.

Communication with Salt and Salt satellite projects is done using Salt’s own Python API. A list of available client interfaces is below.

salt-api

Prior to Salt’s 2014.7.0 release, netapi modules lived in the separate sister projected salt-api. That project has been merged into the main Salt project.

See also:

The full list of netapi modules

24.2.2 Client interfaces

Salt’s client interfaces expose executing functions by crafting a dictionary of values that are mapped to function arguments. This allows calling functions simply by creating a data structure. (And this is exactly how much of Salt’s own internals work!)
Writing netapi modules

Netapi modules, put simply, bind a port and start a service. They are purposefully open-ended and can be used to present a variety of external interfaces to Salt, and even present multiple interfaces at once.

See also:

The full list of netapi modules

Configuration

All netapi configuration is done in the Salt master config and takes a form similar to the following:

```
rest_cherrypy:
  port: 8000
  debug: True
  ssl_crt: /etc/pki/tls/certs/localhost.crt
  ssl_key: /etc/pki/tls/certs/localhost.key
```

The `__virtual__` function

Like all module types in Salt, netapi modules go through Salt’s loader interface to determine if they should be loaded into memory and then executed.

The `__virtual__` function in the module makes this determination and should return `False` or a string that will serve as the name of the module. If the module raises an `ImportError` or any other errors, it will not be loaded.

The `start` function

The `start()` function will be called for each netapi module that is loaded. This function should contain the server loop that actually starts the service. This is started in a multiprocess.

Multiple instances

New in version 2016.11.0.

Rest_cherrypy and rest_tornado support running multiple instances by copying and renaming entire directory of those. To start the copied multiple netapi modules, add configuration blocks for the copied netapi modules in the Salt Master config. The name of each added configuration block must match with the name of each directory of the copied netapi module.

Inline documentation

As with the rest of Salt, it is a best-practice to include liberal inline documentation in the form of a module docstring and docstrings on any classes, methods, and functions in your netapi module.
Loader “magic” methods

The loader makes the \_\_opts\_\_ data structure available to any function in a netapi module.
If you are used to configuration management tools that require you to plan down to the last detail before you install anything, you are probably wondering why this section doesn’t appear before the installation instructions. With Salt, you can switch to a high availability architecture at any time, and add additional components to scale your deployment as you go.

Since a single Salt master can manage thousands of systems, we usually recommend that you start by deploying a single Salt master, and then modifying your deployment as needed for redundancy, geographical distribution, and scale.

### 25.1 High Availability Features in Salt

Salt supports several features for high availability and fault tolerance. Brief documentation for these features is listed alongside their configuration parameters in *Configuration file examples*.

#### 25.1.1 Multimaster

Salt minions can connect to multiple masters at one time by configuring the `master` configuration parameter as a YAML list of all the available masters. By default, all masters are "hot", meaning that any master can direct commands to the Salt infrastructure.

In a multimaster configuration, each master must have the same cryptographic keys, and minion keys must be accepted on all masters separately. The contents of file_roots and pillar_roots need to be kept in sync with processes external to Salt as well.

A tutorial on setting up multimaster with "hot" masters is here: *Multimaster Tutorial*

#### 25.1.2 Multimaster with Failover

Changing the `master_type` parameter from `str` to `failover` will cause minions to connect to the first responding master in the list of masters. Every `master_alive_interval` seconds the minions will check to make sure the current master is still responding. If the master does not respond, the minion will attempt to connect to the next master in the list. If the minion runs out of masters, the list will be recycled in case dead masters have been restored.

Note that `master_alive_interval` must be present in the minion configuration, or else the recurring job to check master status will not get scheduled.

Failover can be combined with PKI-style encrypted keys, but PKI is NOT REQUIRED to use failover.

Multimaster with PKI and Failover is discussed in *this tutorial*
master_type: failover can be combined with master_shuffle: True to spread minion connections across all masters (one master per minion, not each minion connecting to all masters). Adding Salt Syndics into the mix makes it possible to create a load-balanced Salt infrastructure. If a master fails, minions will notice and select another master from the available list.

### 25.1.3 Syndic

Salt's Syndic feature is a way to create differing infrastructure topologies. It is not strictly an HA feature, but can be treated as such.

With the syndic, a Salt infrastructure can be partitioned in such a way that certain masters control certain segments of the infrastructure, and "Master of Masters" nodes can control multiple segments underneath them.

Syndics are covered in depth in *Salt Syndic*.

### 25.1.4 Syndic with Multimaster

New in version 2015.5.0.

Syndic with Multimaster lets you connect a syndic to multiple masters to provide an additional layer of redundancy in a syndic configuration.

Syndics are covered in depth in *Salt Syndic*.

### 25.2 Salt Syndic

The most basic or typical Salt topology consists of a single Master node controlling a group of Minion nodes. An intermediate node type, called Syndic, when used offers greater structural flexibility and scalability in the construction of Salt topologies than topologies constructed only out of Master and Minion node types.

A Syndic node can be thought of as a special passthrough Minion node. A Syndic node consists of a salt-syndic daemon and a salt-master daemon running on the same system. The salt-master daemon running on the Syndic node controls a group of lower level Minion nodes and the salt-syndic daemon connects higher level Master node, sometimes called a Master of Masters.

The salt-syndic daemon relays publications and events between the Master node and the local salt-master daemon. This gives the Master node control over the Minion nodes attached to the salt-master daemon running on the Syndic node.

#### 25.2.1 Configuring the Syndic

To setup a Salt Syndic you need to tell the Syndic node and its Master node about each other. If your Master node is located at 10.10.0.1, then your configurations would be:

On the Syndic node:

```bash
# /etc/salt/master
syndic_master: 10.10.0.1  # may be either an IP address or a hostname

# /etc/salt/minion
# id is shared by the salt-syndic daemon and a possible salt-minion daemon
```

(continues on next page)
# on the Syndic node
id: my_syndic

On the Master node:

# /etc/salt/master
order_masters: True

The `syndic_master` option tells the Syndic node where to find the Master node in the same way that the `master` option tells a Minion node where to find a Master node.

The `id` option is used by the `salt-syndic` daemon to identify with the Master node and if unset will default to the hostname or IP address of the Syndic just as with a Minion.

The `order_masters` option configures the Master node to send extra information with its publications that is needed by Syndic nodes connected directly to it.

Note: Each Syndic must provide its own `file_roots` directory. Files will not be automatically transferred from the Master node.

## 25.2.2 Configuring the Syndic with Multimaster

New in version 2015.5.0.

Syndic with Multimaster lets you connect a syndic to multiple masters to provide an additional layer of redundancy in a syndic configuration.

Higher level masters should first be configured in a multimaster configuration. See [Multimaster Tutorial](#).

On the syndic, the `syndic_master` option is populated with a list of the higher level masters.

Since each syndic is connected to each master, jobs sent from any master are forwarded to minions that are connected to each syndic. If the `master_id` value is set in the master config on the higher level masters, job results are returned to the master that originated the request in a best effort fashion. Events/jobs without a `master_id` are returned to any available master.

## 25.2.3 Running the Syndic

The `salt-syndic` daemon is a separate process that needs to be started in addition to the `salt-master` daemon running on the Syndic node. Starting the `salt-syndic` daemon is the same as starting the other Salt daemons.

The Master node in many ways sees the Syndic as an ordinary Minion node. In particular, the Master will need to accept the Syndic’s Minion key as it would for any other Minion.

On the Syndic node:

```
# salt-syndic
or
# service salt-syndic start
```

On the Master node:

```
# salt-key -a my_syndic
```
The Master node will now be able to control the Minion nodes connected to the Syndic. Only the Syndic key will be listed in the Master node’s key registry but this also means that key activity between the Syndic’s Minions and the Syndic does not encumber the Master node. In this way, the Syndic’s key on the Master node can be thought of as a placeholder for the keys of all the Minion and Syndic nodes beneath it, giving the Master node a clear, high level structural view on the Salt cluster.

On the Master node:

```
# salt-key -L
Accepted Keys:
  my_syndic
Denied Keys:
Unaccepted Keys:
Rejected Keys:

# salt '*' test.version
minion_1:
  2018.3.4
minion_2:
  2018.3.4
minion_4:
  2018.3.4
minion_3:
  2018.3.4
```

### 25.2.4 Topology

A Master node (a node which is itself not a Syndic to another higher level Master node) must run a `salt-master` daemon and optionally a `salt-minion` daemon.

A Syndic node must run `salt-syndic` and `salt-master` daemons and optionally a `salt-minion` daemon.

A Minion node must run a `salt-minion` daemon.

When a `salt-master` daemon issues a command, it will be received by the Syndic and Minion nodes directly connected to it. A Minion node will process the command in the way it ordinarily would. On a Syndic node, the `salt-syndic` daemon will relay the command to the `salt-master` daemon running on the Syndic node, which then propagates the command to the Minions and Syndics connected to it.

When events and job return data are generated by `salt-minion` daemons, they are aggregated by the `salt-master` daemon they are connected to, which `salt-master` daemon then relays the data back through its `salt-syndic` daemon until the data reaches the Master or Syndic node that issued the command.

### 25.2.5 Syndic wait

`syndic_wait` is a master configuration file setting that specifies the number of seconds the Salt client should wait for additional syndics to check in with their lists of expected minions before giving up. This value defaults to 5 seconds.

The `syndic_wait` setting is necessary because the higher-level master does not have a way of knowing which minions are below the syndics. The higher-level master has its own list of expected minions and the masters below them have their own lists as well, so the Salt client does not how long to wait for all returns. The `syndic_wait` option allows time for all minions to return to the Salt client.
Note: To reduce the amount of time the CLI waits for Minions to respond, install a Minion on the Syndic or tune the value of the `syndic_wait` configuration.

While it is possible to run a Syndic without a Minion installed on the same system, it is recommended, for a faster CLI response time, to do so. Without a Minion installed on the Syndic node, the timeout value of `syndic_wait` increases significantly - about three-fold. With a Minion installed on the Syndic, the CLI timeout resides at the value defined in `syndic_wait`.

Note: If you have a very large infrastructure or many layers of Syndics, you may find that the CLI doesn't wait long enough for the Syndics to return their events. If you think this is the case, you can set the `syndic_wait` value in the Master configs on the Master or Syndic nodes from which commands are executed. The default value is 5, and should work for the majority of deployments.

In order for a Master or Syndic node to return information from Minions that are below their Syndics, the CLI requires a short wait time in order to allow the Syndics to gather responses from their Minions. This value is defined in the `syndic_wait` config option and has a default of five seconds.

### 25.2.6 Syndic config options

These are the options that can be used to configure a Syndic node. Note that other than `id`, Syndic config options are placed in the Master config on the Syndic node.

- **id**: Syndic id (shared by the `salt-syndic` daemon with a potential `salt-minion` daemon on the same system)
- **syndic_master**: Master node IP address or hostname
- **syndic_master_port**: Master node ret_port
- **syndic_log_file**: path to the logfile (absolute or not)
- **syndic_pidfile**: path to the pidfile (absolute or not)
- **syndic_wait**: time in seconds to wait on returns from this syndic

### 25.2.7 Minion Data Cache

Beginning with Salt 2016.11.0, the **Pluggable Minion Data Cache** was introduced. The minion data cache contains the Salt Mine data, minion grains, and minion pillar information cached on the Salt Master. By default, Salt uses the `localfs` cache module, but other external data stores can be used instead.

Using a pluggable minion cache modules allows for the data stored on a Salt Master about Salt Minions to be replicated on other Salt Masters the Minion is connected to. Please see the **Minion Data Cache** documentation for more information and configuration examples.
New in version 2016.11.0.

The Minion data cache contains the Salt Mine data, minion grains and minion pillar information cached on the Salt Master. By default, Salt uses the `localfs` cache module to save the data in a `msgpack` file on the Salt Master.

### 26.1 Pluggable Data Cache

While the default Minion data cache is the `localfs` cache, other external data stores can also be used to store this data such as the `consul` module. To configure a Salt Master to use a different data store, the `cache` setting needs to be established:

```yaml
cache: consul
```

The pluggable data cache streamlines using various Salt topologies such as a Multi-Master or Salt Syndics configuration by allowing the data stored on the Salt Master about a Salt Minion to be available to other Salt Syndics or Salt Masters that a Salt Minion is connected to.

Additional minion data cache modules can be easily created by modeling the custom data store after one of the existing cache modules.

See `cache modules` for a current list.

### 26.2 Configuring the Minion Data Cache

The default `localfs` Minion data cache module doesn't require any configuration. External data cache modules with external data stores such as Consul require a configuration setting in the master config.

Here's an example config for Consul:

```yaml
consul.host: 127.0.0.1
consul.port: 8500
consul.token: None
consul.scheme: http
consul.consistency: default
consul.dc: dc1
consul.verify: True

cache: consul
```
SLOTS

New in version 2018.3.0.
Changed in version 3000.

Note: This functionality is under development and could be changed in the future releases

Many times it is useful to store the results of a command during the course of an execution. Salt Slots are designed to allow you to store this information and use it later during the highstate or other job execution.

Slots extend the state syntax and allows you to do things right before the state function is executed. So you can make a decision in the last moment right before a state is executed.

27.1 Execution functions

Note: Using execution modules return data as a state values is a first step of Slots development. Other functionality is under development.

Slots allow you to use the return from a remote-execution function as an argument value in states.

Slot syntax looks close to the simple python function call.

```
__slot__:salt:<module>.<function>(<args>, ..., <kwargs...>, ...)
```

For the 3000 release, this syntax has been updated to support parsing functions which return dictionaries and for appending text to the slot result.

```
__slot__:salt:<module>.<function>(<args>..., <kwargs...>, ...).dictionary ~ append
```

There are some specifics in the syntax coming from the execution functions nature and a desire to simplify the user experience. First one is that you don’t need to quote the strings passed to the slots functions. The second one is that all arguments handled as strings.

Here is a simple example:

```
copy-some-file:
  file.copy:
    - name: __slot__:salt:test.echo(text=/tmp/some_file)
    - source: __slot__:salt:test.echo(/etc/hosts)
```
This will execute the `test.echo` execution functions right before calling the state. The functions in the example will return `/tmp/some_file` and `/etc/hosts` strings that will be used as a target and source arguments in the state function `file.copy`.

Here is an example of result parsing and appending:

```
file-in-user-home:
    file.copy:
    - name: __slot__:salt:user.info(someuser).home ~ /subdirectory
    - source: salt://somefile
```
This section contains details on the Windows Package Manager, and specific information you need to use Salt on Windows.

28.1 Windows Package Manager

28.1.1 Introduction

The Windows Package Manager provides a software repository and a package manager similar to what is provided by *yum* and *apt* on Linux. This tool enables the installation of software on remote Windows systems.

The repository contains a collection of software definition files. A software definition file is a YAML/JINJA file with an `.sls` file extension. It contains all the information Salt needs to install a software package on a Windows system, including the download location of the installer, required command-line switches for silent install, etc.

Software definition files can be hosted in one or more Git repositories. The default repository is hosted on GitHub by SaltStack. It is maintained by SaltStack and the Salt community and contains software definition files for many common Windows packages. Anyone is welcome to submit a pull request to this repo to add new software definitions. The default github repository is:

- salt-winrepo-ng

The Windows Package Manager is used the same way as other package managers Salt is aware of. For example:

- the `pkg.installed` and similar states work on Windows.
- the `pkg.install` and similar module functions work on Windows.

High level differences to *yum* and *apt* are:

- The repository metadata (SLS files) can be managed through either Salt or git
- Packages can be downloaded from within the Salt repository, a git repository or from HTTP(S) or FTP URLs
- No dependencies are managed. Dependencies between packages need to be managed manually
Requirements

If using the software definition files hosted on a Git repo, the following libraries are required:

- GitPython 0.3 or later
- pygit2 0.20.3 with libgit 0.20.0 or later

28.1.2 Quick Start

You can get up and running with winrepo pretty quickly just using the defaults. Assuming no changes to the default configuration (i.e., `file_roots`) run the following commands on the master:

```bash
salt-run winrepo.update_git_repos
salt * pkg.refresh_db
salt * pkg.install firefox_x64
```

On a masterless minion run the following:

```bash
salt-call --local winrepo.update_git_repos
salt-call --local pkg.refresh_db
salt-call --local pkg.install firefox_x64
```

These commands clone the default winrepo from github, update the winrepo database on the minion, and install the latest version of Firefox.

28.1.3 Configuration

The Github repository (winrepo) is synced to the `file_roots` in a location specified by the `winrepo_dir_ng` setting in the config. The default value of `winrepo_dir_ng` is as follows:

- Linux master: `/srv/salt/win/repo-ng` (`salt://win/repo-ng`)
- Masterless minion: `C:\salt\srv\salt\win\repo-ng` (`salt://win/repo-ng`)

Master Configuration

The following are settings available for configuring the winrepo on the master:

- `winrepo_dir`
- `winrepo_dir_ng`
- `winrepo_remotes`
- `winrepo_remotes_ng`
- `winrepo_branch`
- `winrepo_provider`
- `winrepo_ssl_verify`

See [here](#) for detailed information on all master config options for winrepo.
**winrepo_dir**

*winrepo_dir* (str)
This setting is maintained for backwards compatibility with legacy minions. It points to the location in the *file_roots* where the winrepo files are kept. The default is: `/srv/salt/win/repo`

**winrepo_dir_ng**

*winrepo_dir_ng* (str)
The location in the *file_roots* where the winrepo files are kept. The default is `/srv/salt/win/repo-ng`.

**Warning:** You can change the location of the winrepo directory. However, it must always be set to a path that is inside the *file_roots*. Otherwise the software definition files will be unreachable by the minion.

**Important:** A common mistake is to change the *file_roots* setting and fail to update the *winrepo_dir_ng* and *winrepo_dir* settings so that they are inside the *file_roots*.

**winrepo_remotes**

*winrepo_remotes* (list)
This setting is maintained for backwards compatibility with legacy minions. It points to the legacy git repo. The default is a list containing a single URL:

https://github.com/saltstack/salt-winrepo

The legacy repo can be disabled by setting it to an empty list in the master config.

**winrepo_remotes_ng**

*winrepo_remotes_ng* (list)
This setting tells the *winrepo.upgate_git_repos* command where the next generation winrepo is hosted. This a list of URLs to multiple git repos. The default is a list containing a single URL:

https://github.com/saltstack/salt-winrepo-ng
**winrepo_refspecs**

*winrepo_refspecs* (list)
Specify what references to fetch from remote repositories. The default is `['+refs/heads/*:refs/remotes/origin/*', '+refs/tags/*:refs/tags/*']`

**winrepo_branch**

*winrepo_branch* (str)
The branch of the git repo to checkout. The default is *master*

**winrepo_provider**

*winrepo_provider* (str)
The provider to be used for winrepo. Default is *pygit2*. Falls back to *gitpython* when *pygit2* is not available

**winrepo_ssl_verify**

*winrepo_ssl_verify* (bool)
Ignore SSL certificate errors when contacting remote repository. Default is *False*

**Master Configuration (pygit2)**

The following configuration options only apply when the *winrepo_provider* option is set to *pygit2*.

- *winrepo_insecure_auth*
- *winrepo_passphrase*
- *winrepo_password*
- *winrepo_privkey*
- *winrepo_pubkey*
- *winrepo_user*

**winrepo_insecure_auth**

*winrepo_insecure_auth* (bool)
Used only with *pygit2* provider. Whether or not to allow insecure auth. Default is *False*
**winrepo_passphrase**

*winrepo_passphrase* (str)  
Used only with *pygit2* provider. Used when the SSH key being used to authenticate is protected by a passphrase. Default is ''

**winrepo_privkey**

*winrepo_privkey* (str)  
Used only with *pygit2* provider. Used with *winrepo_pubkey* to authenticate to SSH remotes. Default is ''

**winrepo_pubkey**

*winrepo_pubkey* (str)  
Used only with *pygit2* provider. Used with *winrepo_privkey* to authenticate to SSH remotes. Default is ''

**winrepo_user**

*winrepo_user* (str)  
Used only with *pygit2* provider. Used with *winrepo_password* to authenticate to HTTPS remotes. Default is ''

**winrepo_password**

*winrepo_password* (str)  
Used only with *pygit2* provider. Used with *winrepo_user* to authenticate to HTTPS remotes. Default is ''

**Minion Configuration**

Refreshing the package definitions can take some time, these options were introduced to allow more control of when it occurs. These settings apply to all minions whether in masterless mode or not.

- *winrepo_cache_expire_max*
- *winrepo_cache_expire_min*
- *winrepo_cachefile*
- *winrepo_source_dir*
**winrepo_cache_expire_max**

*winrepo_cache_expire_max* (int)
Sets the maximum age in seconds of the winrepo metadata file to avoid it becoming stale. If the metadata file is older than this setting it will trigger a `pkg.refresh_db` on the next run of any `pkg` module function that requires the metadata file. Default is 604800 (1 week).

Software package definitions are automatically refreshed if stale after `winrepo_cache_expire_max`. Running a highstate normal forces the refresh of the package definition and generation of the metadata, unless the metadata is younger than `winrepo_cache_expire_max`.

**winrepo_cache_expire_min**

*winrepo_cache_expire_min* (int)
Sets the minimum age in seconds of the winrepo metadata file to avoid refreshing too often. If the metadata file is older than this setting the metadata will be refreshed unless you pass `refresh: False` in the state. Default is 1800 (30 min).

**winrepo_cachefile**

*winrepo_cachefile* (str)
The file name of the winrepo cache file. The file is placed at the root of `winrepo_dir_ng`. Default is `winrepo.p`.

**winrepo_source_dir**

*winrepo_source_dir* (str)
The location of the .sls files on the Salt file server. This allows for using different environments. Default is `salt:/win/repo-ng/`.

**Warning:** If the default for `winrepo_dir_ng` is changed, this setting may need to changed on each minion. The default setting for `winrepo_dir_ng` is `/srv/salt/win/repo-ng`. If that were changed to `/srv/salt/new/repo-ng` then the `winrepo_source_dir` would need to be changed to `salt://new/repo-ng`.

**Masterless Minion Configuration**

The following are settings available for configuring the winrepo on a masterless minion:

- `winrepo_dir`
- `winrepo_dir_ng`
- `winrepo_remotes`
- `winrepo_remotes_ng`

See [here](#) for detailed information on all minion config options for winrepo.
**winrepo_dir**

**winrepo_dir** (str)

This setting is maintained for backwards compatibility with legacy minions. It points to the location in the file_roots where the winrepo files are kept. The default is: `C:\salt\srv\salt\win\repo`

**winrepo_dir_ng**

**winrepo_dir_ng** (str)

The location in the file_roots where the winrepo files are kept. The default is `C:\salt\srv\salt\win\repo-ng`.

**Warning:** You can change the location of the winrepo directory. However, it must always be set to a path that is inside the file_roots. Otherwise the software definition files will be unreachable by the minion.

**Important:** A common mistake is to change the file_roots setting and fail to update the winrepo_dir_ng and winrepo_dir settings so that they are inside the file_roots. You might also want to verify winrepo_source_dir on the minion as well.

**winrepo_remotes**

**winrepo_remotes** (list)

This setting is maintained for backwards compatibility with legacy minions. It points to the legacy git repo. The default is a list containing a single URL:

https://github.com/saltstack/salt-winrepo

The legacy repo can be disabled by setting it to an empty list in the minion config.

```
winrepo_remotes: []
```

**winrepo_remotes_ng**

**winrepo_remotes_ng** (list)

This setting tells the winrepo.upgate_git_repos command where the next generation winrepo is hosted. This a list of URLs to multiple git repos. The default is a list containing a single URL:

https://github.com/saltstack/salt-winrepo-ng
28.1.4 Initialization

Populate the Local Repository

The SLS files used to install Windows packages are not distributed by default with Salt. Use the `winrepo.update_git_repos` runner to initialize the repository in the location specified by `winrepo_dir_ng` in the master config. This will pull the software definition files down from the git repository.

```
salt-run winrepo.update_git_repos
```

If running a minion in masterless mode, the same command can be run using `salt-call`. The repository will be initialized in the location specified by `winrepo_dir_ng` in the minion config.

```
salt-call --local winrepo.update_git_repos
```

These commands will also sync down the legacy repo to maintain backwards compatibility with legacy minions. See Legacy Minions.

The legacy repo can be disabled by setting it to an empty list in the master or minion config.

```
winrepo_remotes: []
```

Generate the Metadata File (Legacy)

This step is only required if you are supporting legacy minions. In current usage the metadata file is generated on the minion in the next step, Update the Minion Database. For legacy minions the metadata file is generated on the master using the `winrepo.genrepo` runner.

```
salt-run winrepo.genrepo
```

Update the Minion Database

Run `pkg.refresh_db` on each of your Windows minions to synchronize the package repository to the minion and build the package database.

```
# From the master
salt -G 'os:windows' pkg.refresh_db

# From the minion in masterless mode
salt-call --local pkg.refresh_db
```

The above command returns the following summary denoting the number of packages that succeeded or failed to compile:

```
local:  
        -------
    failed:  
            0
    success:  
            301
    total:   
            301
```
Note: This command can take a few minutes to complete as the software definition files are copied to the minion and the database is generated.

Note: Use pkg.refresh_db when developing new Windows package definitions to check for errors in the definitions against one or more Windows minions.

28.1.5 Usage

After completing the configuration and initialization steps, you are ready to manage software on your Windows minions.

Note: The following example commands can be run from the master using `salt` or on a masterless minion using `salt-call`.

List Installed Packages

You can get a list of packages installed on the system using `pkg.list_pkgs`.

```bash
# From the master
salt -G 'os:windows' pkg.list_pkgs

# From the minion in masterless mode
salt-call --local pkg.list_pkgs
```

This will return all software installed on the system whether it is managed by Salt or not as shown below:

```
local:
--------
Frhed 1.6.0:
   1.6.0
GNU Privacy Guard:
   2.2.16
Gpg4win (3.1.9):
   3.1.9
git:
   2.17.1.2
nsis:
   3.03
python3_x64:
   3.7.4150.0
salt-minion-py3:
   2019.2.3
```

You can tell by how the software name is displayed which software is managed by Salt and which software is not. When Salt finds a match in the winrepo database it displays the short name as defined in the software definition file. It is usually a single-word, lower-case name. All other software names will be displayed with the full name as they are shown in Add/Remove Programs. So, in the return above, you can see that Git (git), Nullsoft Installer (nsis), Python 3.7 (python3_x64) and Salt (salt-minion-py3) all have a corresponding software definition file. The others do not.
List Available Versions

You can query the available version of a package using `pkg.list_available` and passing the name of the software:

```sh
# From the master
salt winminion pkg.list_available firefox_x64

# From the minion in masterless mode
salt-call --local pkg.list_available firefox_x64
```

The above command will return the following:

```
winminion:
  - 69.0
    - 69.0.1
    - 69.0.2
    - 69.0.3
    - 70.0
    - 70.0.1
    - 71.0
    - 72.0
    - 72.0.1
    - 72.0.2
    - 73.0
    - 73.0.1
    - 74.0
```

As you can see, there are many versions of Firefox available for installation. You can refer to a software package by its name or its full_name surrounded by quotes.

**Note:** From a Linux master it is OK to use single-quotes. However, the cmd shell on Windows requires you to use double-quotes when wrapping strings that may contain spaces. Powershell seems to accept either one.

Install a Package

You can install a package using `pkg.install`:

```sh
# From the master
salt winminion pkg.install 'firefox_x64'

# From the minion in masterless mode
salt-call --local pkg.install "firefox_x64"
```

The above will install the latest version of Firefox.

```sh
# From the master
salt winminion pkg.install 'firefox_x64' version=74.0

# From the minion in masterless mode
salt-call --local pkg.install "firefox_x64" version=74.0
```

The above will install version 74.0 of Firefox.

If a different version of the package is already installed it will be replaced with the version in the winrepo (only if the package itself supports live updating).
You can also specify the full name:

```
# From the master
salt winminion pkg.install 'Mozilla Firefox 17.0.1 (x86 en-US)'

# From the minion in masterless mode
salt-call --local pkg.install "Mozilla Firefox 17.0.1 (x86 en-US)"
```

## Remove a Package

You can uninstall a package using `pkg.remove`:

```
# From the master
salt winminion pkg.remove firefox_x64

# From the minion in masterless mode
salt-call --local pkg.remove firefox_x64
```

### 28.1.6 Software Definition Files

A software definition file is a YAML/JINJA2 file that contains all the information needed to install a piece of software using Salt. It defines information about the package to include version, full name, flags required for the installer and uninstaller, whether or not to use the Windows task scheduler to install the package, where to download the installation package, etc.

### Directory Structure and Naming

The files are stored in the location designated by the `winrepo_dir_ng` setting. All files in this directory that have a `.sls` file extension are considered software definition files. The files are evaluated to create the metadata file on the minion.

You can maintain standalone software definition files that point to software on other servers or on the internet. In this case the file name would be the short name of the software with the `.sls` extension, ie `firefox.sls`.

You can also store the binaries for your software together with their software definition files in their own directory. In this scenario, the directory name would be the short name for the software and the software definition file would be inside that directory and named `init.sls`.

Look at the following example directory structure on a Linux master assuming default config settings:

```
srv/
 |---salt/
 |   |---win/
 |   |   |---repo-ng/
 |   |   |   |---custom_defs/
 |   |   |   |   |---ms_office_2013_x64/
 |   |   |   |   |   |---access.en-us/
 |   |   |   |   |   |---excel.en-us/
 |   |   |   |   |   |---outlook.en-us/
 |   |   |   |   |   |---powerpoint.en-us/
 |   |   |   |   |   |---word.en-us/
 |   |   |   |   |   |---init.sls
 |   |   |   |---setup.dll
 |   |   |---setup.exe
```

(continues on next page)
In the above directory structure, the user has created the **custom_defs** directory in which to store their custom software definition files. In that directory you see a folder for MS Office 2013 that contains all the installer files along with a software definition file named **init.sls**. The user has also created two more standalone software definition files: **openssl.sls** and **zoom.sls**.

The **salt-winrepo-ng** directory is created by the **winrepo.update_git_repos** command. This folder contains the clone of the git repo designated by the **winrepo_remotes_ng** config setting.

**Warning:** It is recommended that the user not modify the files in the **salt-winrepo-ng** directory as it will break future runs of **winrepo.update_git_repos**.

**Warning:** It is recommended that the user not place any custom software definition files in the **salt-winrepo-ng** directory. The **winrepo.update_git_repos** command wipes out the contents of the **salt-winrepo-ng** directory each time it is run. Any extra files stored there will be lost.

**Writing Software Definition Files**

A basic software definition file is really easy to write if you already know some basic things about your software:

- The full name as shown in Add/Remove Programs
- The exact version number as shown in Add/Remove Programs
- How to install your software silently from the command line

The software definition file itself is just a data structure written in YAML. The top level item is a short name that Salt will use to reference the software. There can be only one short name in the file and it must be unique across all software definition files in the repo. This is the name that will be used to install/remove the software. It is also the name that will appear when Salt finds a match in the repo when running **pkg.list_pkgs**.

The next indentation level is the version number. There can be many of these, but they must be unique within the file. This is also displayed in **pkg.list_pkgs**.

The last indentation level contains the information Salt needs to actually install the software. Available parameters are:
• **full_name**: The full name as displayed in Add/Remove Programs
• **installer**: The location of the installer binary
• **install_flags**: The flags required to install silently
• **uninstaller**: The location of the uninstaller binary
• **uninstall_flags**: The flags required to uninstall silently
• **msiexec**: Use msiexec to install this package
• **allusers**: If this is an MSI, install to all users
• **cache_dir**: Cache the entire directory in the installer URL (salt://)
• **cache_file**: Cache a single file in the installer URL (salt://)
• **use_scheduler**: Launch the installer using the task scheduler
• **source_hash**: The hash sum for the installer

Usage of these parameters is demonstrated in the following examples and discussed in more detail below. To understand these examples you'll need a basic understanding of Jinja. The following links have some basic tips and best practices for working with Jinja in Salt:

Understanding Jinja

Jinja

**Example: Basic**

Take a look at this basic, pure YAML example for a software definition file for Firefox:

```yaml
firefox_x64:
  '74.0':
    full_name: Mozilla Firefox 74.0 (x64 en-US)
    installer: 'https://download-installer.cdn.mozilla.net/pub/firefox/releases/74.0/win64/en-US/Firefox%20Setup%2074.0.exe'
    install_flags: '/S'
    uninstaller: '%ProgramFiles(x86)%/Mozilla Firefox/uninstall/helper.exe'
    uninstall_flags: '/S'
  '73.0.1':
    full_name: Mozilla Firefox 73.0.1 (x64 en-US)
    installer: 'https://download-installer.cdn.mozilla.net/pub/firefox/releases/73.0.1/win64/en-US/Firefox%20Setup%2073.0.1.exe'
    install_flags: '/S'
    uninstaller: '%ProgramFiles(x86)%/Mozilla Firefox/uninstall/helper.exe'
    uninstall_flags: '/S'
```

You can see the first item is the short name for the software, in this case `firefox_x64`. It is the first line in the definition. The next line is indented two spaces and contains the software version. The lines following the version are indented two more spaces and contain all the information needed to install the Firefox package.

**Important**: The package name must be unique to all other packages in the software repository. The full name combined with the version must also be unique. They must also match exactly what is shown in Add/Remove Programs (`appwiz.cpl`).
Important: The version number must be enclosed in quotes, otherwise the YAML parser will remove trailing zeros. For example, 74.0 will just become 74.

As you can see in the example above, a software definition file can define multiple versions for the same piece of software. These are denoted by putting the next version number at the same indentation level as the first with its software definition information indented below it.

Example: Jinja

When there are tens or hundreds of versions available for a piece of software definition file can become quite large. This is a scenario where Jinja can be helpful. Consider the following software definition file for Firefox using Jinja:

```yaml
{% set lang = salt['config.get']('firefox:pkg:lang', 'en-US') %}

firefox_x64:
  {% for version in ['74.0', '73.0', '72.0', '71.0', '70.0', '69.0'] %}
    '{{ version }}':
      full_name: 'Mozilla Firefox {{ version }} (x64 {{ lang }})'
      installer: 'https://download-installer.cdn.mozilla.net/pub/firefox/releases/{{ version }}/win64/{{ lang }}/Firefox%20Setup%20{{ version }}.exe'
      install_flags: '/S'
      uninstaller: '%ProgramFiles%\Mozilla Firefox\uninstall\helper.exe'
      uninstall_flags: '/S'
  {% endfor %}
```

In this example we are able to generate a software definition file that defines how to install 12 versions of Firefox. We use Jinja to create a list of available versions. That list is in a for loop where each version is placed in the `version` variable. The version is inserted everywhere there is a `{{ version }}` marker inside the for loop.

You’ll notice that there is a single variable (lang) defined at the top of the software definition. Because these files are going through the Salt renderer many Salt modules are exposed via the `salt` keyword. In this case it is calling the `config.get` function to get a language setting that can be placed in the minion config. If it is not there, it defaults to `en-US`.

Example: Latest

There are some software vendors that do not provide access to all versions of their software. Instead they provide a single URL to what is always the latest version. In some cases the software keeps itself up to date. One example of this is the Google Chrome web browser.

Chrome

To handle situations such as these, set the version to `latest`. Here’s an example:

```yaml
chrome:
  latest:
    full_name: 'Google Chrome'
    installer: 'https://dl.google.com/edgedl/chrome/install/GoogleChromeStandaloneEnterprise.msi'
    install_flags: '/qn /norestart'
```
The above example shows us two things. First it demonstrates the usage of `latest` as the version. In this case Salt will install the version of Chrome at the URL and report that version.

The second thing to note is that this is installing software using an MSL. You can see that `msiexec` is set to `True`.

### Example: MSI Patch

When the `msiexec` parameter is set to `True` it uses the `/i` option for installs and the `/x` option for uninstalls. This is problematic when trying to install an MSI patch which requires the `/p` option. You can't combine the `/i` and `/p` options. So how do you apply a patch to installed software in winrepo using an `.msp` file?

One wiley contributor came up with the following solution to this problem by using the `%cd%` environment variable. Consider the following software definition file:

```yaml
MyApp:
  '1.0':
    full_name: MyApp
    installer: 'salt://win/repo-ng/MyApp/MyApp.1.0.msi'
    install_flags: '/qn /norestart'
    uninstaller: '{B5B5868F-23BA-297A-917D-0DF345TF5764}'
    uninstall_flags: '/qn /norestart'
    msiexec: True
  '1.1':
    full_name: MyApp
    installer: 'salt://win/repo-ng/MyApp/MyApp.1.0.msi'
    install_flags: '/qn /norestart /update "%cd%\MyApp.1.1.msp"'
    uninstaller: '{B5B5868F-23BA-297A-917D-0DF345TF5764}'
    uninstall_flags: '/qn /norestart'
    msiexec: True
    cache_file: salt://win/repo/MyApp/MyApp.1.1.msp
```

There are a few things to note about this software definition file. First, is the solution we are trying to solve, that of applying a patch. Version 1.0 just installs the application using the 1.0 MSI defined in the `installer` parameter. There is nothing special in the `install_flags` and nothing is cached.

Version 1.1 uses the same installer, but uses the `cache_file` option to specify a single file to cache. In order for this to work the MSP file needs to be in the same directory as the MSI file on the `file_roots`.

The final step to getting this to work is to add the additional `/update` flag to the `install_flags` parameter. Add the path to the MSP file using the `%cd%` environment variable. `%cd%` resolves to the current working directory which is the location in the minion cache where the installer file is cached.

See issue #32780 for more details.

This same approach could be used for applying MST files for MSIs and answer files for other types of `.exe` based installers.
Parameters

These are the parameters that can be used to generate a software definition file. These parameters are all placed under the `version` in the software definition file:

Example usage can be found on the github repo

**full_name (str)**

This is the full name for the software as shown in "Programs and Features" in the control panel. You can also get this information by installing the package manually and then running `pkg.list_pkgs`. Here's an example of the output from `pkg.list_pkgs`:

```bash
salt 'test-2008' pkg.list_pkgs
```

```
test-2008
--------
7-Zip 9.20 (x64 edition):
  9.20.00.0
Mozilla Firefox 74.0 (x64 en-US)
  74.0
Mozilla Maintenance Service:
  74.0
salt-minion-py3:
  3001
```

Notice the Full Name for Firefox: Mozilla Firefox 74.0 (x64 en-US). That's exactly what should be in the `full_name` parameter in the software definition file.

If any of the software installed on the machine matches the full name defined in one of the software definition files in the repository the package name will be returned. The example below shows the `pkg.list_pkgs` for a machine that has Mozilla Firefox 74.0 installed and a software definition for that version of Firefox.

```bash
test-2008:
--------
7zip:
  9.20.00.0
Mozilla Maintenance Service:
  74.0
firefox_x64:
  74.0
salt-minion-py3:
  3001
```

**Important:** The version number and `full_name` need to match the output from `pkg.list_pkgs` exactly so that the installation status can be verified by the state system.

**Note:** It is still possible to successfully install packages using `pkg.install`, even if the `full_name` or the version number don’t match exactly. The module will complete successfully, but continue to display the full name in `pkg.list_pkgs`. If this is happening, verify that the `full_name` and the `version` match exactly what is displayed in Add/Remove Programs.

**Tip:** To force Salt to display the full name when there's already an existing package definition file on the system, you
can pass a bogus saltenv parameter to the command like so: pkg.list_pkgs saltenv=NotARealEnv

**Tip:** It's important use pkg.refresh_db to check for errors and ensure the latest package definition is on any minion you're testing new definitions on.

**installer (str)**

This is the path to the binary (.exe, .msi) that will install the package. This can be a local path or a URL. If it is a URL or a Salt path (salt://), the package will be cached locally and then executed. If it is a path to a file on disk or a file share, it will be executed directly.

**Note:** When storing software in the same location as the winrepo it is usually best practice to place each installer in its own directory rather than in the root of winrepo.

Best practice is to create a sub folder named after the package. That folder will contain the software definition file named init.sls. The binary installer should be stored in that directory as well if you're hosting those files on the file_roots.

pkg.refresh_db will process all .sls files in all sub directories in the winrepo_dir_ng directory.

**install_flags (str)**

This setting contains any flags that need to be passed to the installer to make it perform a silent install. These can often be found by adding /? or /h when running the installer from the command-line. A great resource for finding these silent install flags is the WPKG project [wiki](#):

**Warning:** Salt will appear to hang if the installer is expecting user input. So it is imperative that the software have the ability to install silently.

**uninstaller (str)**

This is the path to the program used to uninstall this software. This can be the path to the same exe or msi used to install the software. Exe uninstallers are pretty straight forward. MSIs, on the other hand, can be handled a couple different ways. You can use the GUID for the software to uninstall or you can use the same MSI used to install the software.

You can usually find uninstall information in the registry:

- Software\Microsoft\Windows\CurrentVersion\Uninstall
- Software\WOW6432Node\Microsoft\Windows\CurrentVersion\Uninstall

Here's an example using the GUID to uninstall software.

<table>
<thead>
<tr>
<th>7zip:</th>
</tr>
</thead>
<tbody>
<tr>
<td>'9.20.00.0':</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

(continues on next page)
install_flags: '/qn /norestart'
uninstaller: '{23170F69-40C1-2702-0920-000001000000}'
uninstall_flags: '/qn /norestart'
msiexec: True

Here's an example using the same MSI used to install the software:

7zip:
'9.20.00.0':
  full_name: 7-Zip 9.20 (x64 edition)
  installer: salt://win/repo-ng/7zip/7z920-x64.msi
  install_flags: '/qn /norestart'
  uninstaller: salt://win/repo-ng/7zip/7z920-x64.msi
  uninstall_flags: '/qn /norestart'
  msiexec: True

uninstall_flags (str)

This setting contains any flags that need to be passed to the uninstaller to make it perform a silent uninstall. These can often be found by adding /? or /h when running the uninstaller from the command-line. A great resource for finding these silent install flags the WPKG project wiki:

Warning: Salt will appear to hang if the uninstaller is expecting user input. So it is imperative that the software have the ability to uninstall silently.

msiexec (bool, str)

This tells Salt to use msiexec /i to install the package and msiexec /x to uninstall. This is for .msi installations only.

Possible options are:

- True
- False (default)
- the path to msiexec.exe on your system

7zip:
'9.20.00.0':
  full_name: 7-Zip 9.20 (x64 edition)
  installer: salt://win/repo/7zip/7z920-x64.msi
  install_flags: '/qn /norestart'
  uninstaller: salt://win/repo/7zip/7z920-x64.msi
  uninstall_flags: '/qn /norestart'
  msiexec: 'C:\Windows\System32\msiexec.exe'
allusers (bool)

This parameter is specific to .msi installations. It tells msiexec to install the software for all users. The default is True.

cache_dir (bool)

This setting requires the software to be stored on the file_roots and only applies to URLs that begin with salt:///. If True the entire directory where the installer resides will be recursively cached. This is useful for installers that depend on other files in the same directory for installation.

Warning: Be aware that all files and directories in the same location as the installer file will be copied down to the minion. If you place your software definition file in the root of winrepo (/srv/salt/win/repo-ng) and it contains cache_dir: True the entire contents of winrepo will be cached to the minion. Therefore, it is best practice to place your installer files in a subdirectory if they are to be stored in winrepo.

Here’s an example using cache_dir:

```yaml
sqlexpress:
  '12.0.2000.8':
    full_name: Microsoft SQL Server 2014 Setup (English)
    installer: 'salt://win/repo/sqlexpress/setup.exe'
    install_flags: '/ACTION=install /IACCEPTSQLSERVERLICENSETERMS /Q'
    cache_dir: True
```

cache_file (str)

This setting requires the file to be stored on the file_roots and only applies to URLs that begin with salt://. It indicates a single file to copy down for use with the installer. It is copied to the same location as the installer. Use this over cache_dir if there are many files in the directory and you only need a specific file and don’t want to cache additional files that may reside in the installer directory.

use_scheduler (bool)

If set to True, Windows will use the task scheduler to run the installation. A one-time task will be created in the task scheduler and launched. The return to the minion will be that the task was launched successfully, not that the software was installed successfully.

Note: This is used by the software definition for Salt itself. The first thing the Salt installer does is kill the Salt service, which then kills all child processes. If the Salt installer is launched via Salt, then the installer itself is killed leaving Salt on the machine but not running. Use of the task scheduler allows an external process to launch the Salt installation so its processes aren’t killed when the Salt service is stopped.
source_hash (str)

This tells Salt to compare a hash sum of the installer to the provided hash sum before execution. The value can be formatted as `<hash_algorithm>=<hash_sum>`, or it can be a URI to a file containing the hash sum.

For a list of supported algorithms, see the [hashlib documentation](#).

Here's an example using source_hash:

```
messageanalyzer:
  '4.0.7551.0':
    full_name: 'Microsoft Message Analyzer'
    installer: 'salt://win/repo/messageanalyzer/MessageAnalyzer64.msi'
    install_flags: '/quiet /norestart'
    uninstaller: '{1CC02C23-8FCD-487E-860C-311EC0A0C933}'
    uninstall_flags: '/quiet /norestart'
    msiexec: True
    source_hash: 'sha1=62875ff451f13b10a8ff988f2943e76a4735d3d4'
```

### Not Implemented

The following parameters are often seen in the software definition files hosted on the Git repo. However, they are not implemented and have no effect on the installation process.

- **bool reboot**  Not implemented
- **str locale**   Not implemented

### 28.1.7 Managing Windows Software on a Standalone Windows Minion

The Windows Software Repository functions similarly in a standalone environment, with a few differences in the configuration.

To replace the winrepo runner that is used on the Salt master, an execution module exists to provide the same functionality to standalone minions. The functions are named the same as the ones in the runner, and are used in the same way; the only difference is that `salt-call` is used instead of `salt-run`:

```
salt-call winrepo.update_git_repos
salt-call pkg.refresh_db
```

After executing the previous commands the repository on the standalone system is ready for use.

### 28.1.8 Troubleshooting

**My software installs correctly but pkg.installed says it failed**

If you have a package that seems to install properly, but Salt reports a failure then it is likely you have a version or full_name mismatch.

Check the exact full_name and version as shown in Add/Remove Programs (`appwiz.cpl`). Use `pkg.list_pkgs` to check that the full_name and version exactly match what is installed. Make sure the software definition file has the exact value for full_name and that the version matches exactly.

Also, make sure the version is wrapped in single quotes in the software definition file.
Changes to sls files not being picked up

You may have recently updated some of the software definition files on the repo. Ensure you have refreshed the database on the minion.

```
salt winminion pkg.refresh_db
```

How Success and Failure are Reported by pkg.installed

The install state/module function of the Windows package manager works roughly as follows:

1. Execute `pkg.list_pkgs` to get a list of software currently on the machine
2. Compare the requested version with the installed version
3. If versions are the same, report no changes needed
4. Install the software as described in the software definition file
5. Execute `pkg.list_pkgs` to get a new list of software currently on the machine
6. Compare the requested version with the new installed version
7. If versions are the same, report success
8. If versions are different, report failure

Winrepo Upgrade Issues

To minimize potential issues, it is a good idea to remove any winrepo git repositories that were checked out by the legacy (pre-2015.8.0) winrepo code when upgrading the master to 2015.8.0 or later. Run `winrepo.update_git_repos` to clone them anew after the master is started.

28.1.9 pygit2/GitPython Support for Maintaining Git Repos

The `winrepo.update_git_repos` runner now makes use of the same underlying code used by the `Git Fileserver Backend` and `Git External Pillar` to maintain and update its local clones of git repositories. If a compatible version of either `pygit2` (0.20.3 and later) or `GitPython` (0.3.0 or later) is installed, Salt will use it instead of the old method (which invokes the `git.latest` state).

Note: If compatible versions of both `pygit2` and `GitPython` are installed, then Salt will prefer `pygit2`. To override this behavior use the `winrepo_provider` configuration parameter:

```
winrepo_provider: gitpython
```

The `winrepo` execution module (discussed above in the Managing Windows Software on a Standalone Windows Minion section) does not yet officially support the new `pygit2/GitPython` functionality, but if either `pygit2` or `GitPython` is installed into Salt’s bundled Python then it should work. However, it should be considered experimental at this time.
28.1.10 Accessing Authenticated Git Repos (pygit2)

Support for pygit2 added the ability to access authenticated git repositories and to set per-remote config settings. An example of this would be the following:

```
winrepo_remotes:
  - https://github.com/saltstack/salt-winrepo.git
  - git@github.com:myuser/myrepo.git:
    - pubkey: /path/to/key.pub
    - privkey: /path/to/key
    - passphrase: myaw3s0m3pa$$phr4$3
  - https://github.com/myuser/privaterepo.git:
    - user: mygithubuser
    - password: CorrectHorseBatteryStaple
```

Note: Per-remote configuration settings work in the same fashion as they do in gitfs, with global parameters being overridden by their per-remote counterparts. For instance, setting `winrepo_passphrase` would set a global passphrase for winrepo that would apply to all SSH-based remotes, unless overridden by a `passphrase` per-remote parameter.

See here for more a more in-depth explanation of how per-remote configuration works in gitfs. The same principles apply to winrepo.

28.1.11 Maintaining Git Repos

A `clean` argument has been added to the `winrepo.update_git_repos` runner. When `clean` is `True` it will tell the runner to dispose of directories under the `winrepo_dir_ng`/`winrepo_dir_ng` which are not explicitly configured. This prevents the need to manually remove these directories when a repo is removed from the config file. To clean these old directories, just pass `clean=True`:

```
salt-run winrepo.update_git_repos clean=True
```

If a mix of git and non-git Windows Repo definition files are being used, then this should not be used, as it will remove the directories containing non-git definitions.

28.1.12 Name Collisions Between Repos

Collisions between repo names are now detected. The `winrepo.update_git_repos` runner will not proceed if any are detected. Consider the following configuration:

```
winrepo_remotes:
  - https://foo.com/bar/baz.git
  - https://mydomain.tld/baz.git
  - https://github.com/foobar/baz
```

The `winrepo.update_git_repos` runner will refuse to update repos here, as all three of these repos would be checked out to the same directory. To work around this, a per-remote parameter called `name` can be used to resolve these conflicts:

```
winrepo_remotes:
  - https://foo.com/bar/baz.git
  - https://mydomain.tld/baz.git:
```

(continues on next page)
28.1.13 Legacy Minions

The Windows Package Manager was upgraded with breaking changes starting with Salt 2015.8.0. To maintain backwards compatibility Salt continues to support older minions.

The breaking change was to generate the winrepo database on the minion instead of the master. This allowed for the use of Jinja in the software definition files. It enabled the use of pillar, grains, execution modules, etc. during compile time. To support this new functionality, a next-generation (ng) repo was created.

See the Changes in Version 2015.8.0 for details.

On prior versions of Salt, or legacy minions, the winrepo database was generated on the master and pushed down to the minions. Any grains exposed at compile time would have been those of the master and not the minion.

The repository for legacy minions is named `salt-winrepo` and is located at:

- [https://github.com/saltstack/salt-winrepo](https://github.com/saltstack/salt-winrepo)

Legacy Configuration

Winrepo settings were changed with the introduction of the Next Generation (ng) of winrepo.

Legacy Master Config Options

There were three options available for a legacy master to configure winrepo. Unless you're running a legacy master as well, you shouldn't need to configure any of these.

- `win_gitrepos`
- `win_repo`
- `win_repo_mastercachefile`

`win_gitrepos`: (list)

A list of URLs to github repos. Default is a list with a single URL:

- `https://github.com/saltstack/salt-winrepo.git`

`win_repo`: (str)

The location on the master to store the winrepo. The default is `/srv/salt/winrepo`.

`win_repo_mastercachefile`: (str) The location on the master to generate the winrepo database file. The default is `/srv/salt/winrepo/winrep.p`
Legacy Minion Config Options

There is only one option available to configure a legacy minion for winrepo.

- win_repo_cachefile

    win_repo_cachefile: (str)

    The location on the Salt file server to obtain the winrepo database file. The default is salt://win/repo/winrepo.p

    **Note:** If the location of the winrepo.p file is not in the default location on the master, the win_repo_cachefile setting will need to be updated to reflect the proper location on each minion.

Legacy Quick Start

You can get up and running with winrepo pretty quickly just using the defaults. Assuming no changes to the default configuration (ie, file_roots) run the following commands on the master:

```
salt-run winrepo.update_git_repos
salt-run winrepo.genrepo
salt * pkg.refresh_db
salt * pkg.install firefox
```

These commands clone the default winrepo from github, generate the metadata file, push the metadata file down to the legacy minion, and install the latest version of Firefox.

Legacy Initialization

Initializing the winrepo for a legacy minion is similar to that for a newer minion. There is an added step in that the metadata file needs to be generated on the master prior to refreshing the database on the minion.

Populate the Local Repository

The SLS files used to install Windows packages are not distributed by default with Salt. So, the first step is to clone the repo to the master. Use the winrepo.update_git_repos runner initialize the repository in the location specified by winrepo_dir in the master config. This will pull the software definition files down from the git repository.

```
salt-run winrepo.update_git_repos
```

Generate the Metadata File

The next step is to create the metadata file for the repo (winrepo.p). The metadata file is generated on the master using the winrepo.genrepo runner.

```
salt-run winrepo.genrepo
```

**Note:** You only need to do this if you need to support legacy minions.
Update the Minion Database

Run `pkg.refresh_db` on each of your Windows minions to copy the metadata file down to the minion.

```
# From the master
salt -G 'os:windows' pkg.refresh_db
```

Changes in Version 2015.8.0+

Git repository management for the Windows Software Repository changed in version 2015.8.0, and several master/minion config parameters were renamed for consistency.

For a complete list of the new winrepo config options, see `here` for master config options, and `here` for configuration options for masterless Windows minions.

pygit2/GitPython Support

On the master, the `winrepo.update_git_repos` runner was updated to use either `pygit2` or `GitPython` to checkout the git repositories containing repo data. If `pygit2` or `GitPython` is installed, existing winrepo git checkouts should be removed after upgrading to 2015.8.0. Then they should be cloned again by running `winrepo.update_git_repos`.

If neither `GitPython` nor `pygit2` are installed, Salt will fall back to pre-existing behavior for `winrepo.update_git_repos`, and a warning will be logged in the master log.

Note: Standalone Windows minions do not support the new `GitPython/pygit2` functionality, and will instead use the `git.latest` state to keep repositories up-to-date. More information on how to use the Windows Software Repo on a standalone minion can be found `here`.

Config Parameters Renamed

Many of the legacy winrepo configuration parameters changed in version 2015.8.0 to make them more consistent. Below are the parameters which changed for version 2015.8.0:

Master Config

<table>
<thead>
<tr>
<th>Old Name</th>
<th>New Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>win_repo</td>
<td><code>winrepo_dir</code></td>
</tr>
<tr>
<td>win_repo_mastercachefile</td>
<td>No longer used on master</td>
</tr>
<tr>
<td>win_gitrepos</td>
<td><code>winrepo_remotes</code></td>
</tr>
</tbody>
</table>

Note: The `winrepo_dir_ng` and `winrepo_remotes_ng` settings were introduced in 2015.8.0 for working with the next generation repo.

See `here` for detailed information on all master config options for the Windows Repo.

Minion Config
<table>
<thead>
<tr>
<th>Old Name</th>
<th>New Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>win_repo</td>
<td>winrepo_dir</td>
</tr>
<tr>
<td>win_repo_cachefile</td>
<td>winrepo_cachefile</td>
</tr>
<tr>
<td>win_gitrepos</td>
<td>winrepo_remotes</td>
</tr>
</tbody>
</table>

Note: The `winrepo_dir_ng` and `winrepo_remotes_ng` settings were introduced in 2015.8.0 for working with the next generation repo.

See [here](#) for detailed information on all minion config options for the Windows Repo.

## 28.2 Windows-specific Behaviour

Salt is capable of managing Windows systems, however due to various differences between the operating systems, there are some things you need to keep in mind.

This document will contain any quirks that apply across Salt or generally across multiple module functions. Any Windows-specific behavior for particular module functions will be documented in the module function documentation. Therefore this document should be read in conjunction with the module function documentation.

### 28.2.1 Group parameter for files

Salt was originally written for managing Unix-based systems, and therefore the file module functions were designed around that security model. Rather than trying to shoehorn that model on to Windows, Salt ignores these parameters and makes non-applicable module functions unavailable instead.

One of the commonly ignored parameters is the `group` parameter for managing files. Under Windows, while files do have a 'primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Because of this, any file module functions that typically require a group, do not under Windows. Attempts to directly use file module functions that operate on the group (e.g. `file.chgrp`) will return a pseudo-value and cause a log message to appear. No group parameters will be acted on.

If you do want to access and change the 'primary group' property and understand the implications, use the `file.get_pgid` or `file.get_pgroup` functions or the `pgroup` parameter on the `file.chown` module function.

### 28.2.2 Dealing with case-insensitive but case-preserving names

Windows is case-insensitive, but however preserves the case of names and it is this preserved form that is returned from system functions. This causes some issues with Salt because it assumes case-sensitive names. These issues generally occur in the state functions and can cause bizarre looking errors.

To avoid such issues, always pretend Windows is case-sensitive and use the right case for names, e.g. specify `user=Administrator` instead of `user=administrator`.

Follow [issue #11801](#) for any changes to this behavior.
28.2.3 Dealing with various username forms

Salt does not understand the various forms that Windows usernames can come in, e.g. username, mydomain\username, username@mydomain.tld can all refer to the same user. In fact, Salt generally only considers the raw username value, i.e. the username without the domain or host information.

Using these alternative forms will likely confuse Salt and cause odd errors to happen. Use only the raw username value in the correct case to avoid problems.

Follow issue #11801 for any changes to this behavior.

28.2.4 Specifying the None group

Each Windows system has built-in _None_ group. This is the default 'primary group' for files for users not on a domain environment.

Unfortunately, the word _None_ has special meaning in Python - it is a special value indicating 'nothing', similar to null or nil in other languages.

To specify the None group, it must be specified in quotes, e.g. ./salt '*' file.chgrp C:\path\to\ file  "'None'".

28.2.5 Symbolic link loops

Under Windows, if any symbolic link loops are detected or if there are too many levels of symlinks (defaults to 64), an error is always raised.

For some functions, this behavior is different to the behavior on Unix platforms. In general, avoid symlink loops on either platform.
29.1 Overview

In its most typical use, Salt is a software application in which clients, called "minions" can be commanded and controlled from a central command server called a "master".

Commands are normally issued to the minions (via the master) by calling a client script simply called, 'salt'. Salt features a pluggable transport system to issue commands from a master to minions. The default transport is ZeroMQ.

29.2 Salt Client

29.2.1 Overview

The salt client is run on the same machine as the Salt Master and communicates with the salt-master to issue commands and to receive the results and display them to the user.

The primary abstraction for the salt client is called 'LocalClient'.

When LocalClient wants to publish a command to minions, it connects to the master by issuing a request to the master's ReqServer (TCP: 4506)

The LocalClient system listens to responses for its requests by listening to the master event bus publisher (master_event_pub.ipc).

29.3 Salt Master

29.3.1 Overview

The salt-master daemon runs on the designated Salt master and performs functions such as authenticating minions, sending, and receiving requests from connected minions and sending and receiving requests and replies to the 'salt' CLI.
29.3.2 Moving Pieces

When a Salt master starts up, a number of processes are started, all of which are called `salt-master` in a process-list but have various role categories.

Among those categories are:

- Publisher
- EventPublisher
- MWorker

29.3.3 Publisher

The Publisher process is responsible for sending commands over the designated transport to connected minions. The Publisher is bound to the following:

- TCP: port 4505
- IPC: publish_pull.ipc

Each salt minion establishes a connection to the master Publisher.

29.3.4 EventPublisher

The EventPublisher publishes master events out to any event listeners. It is bound to the following:

- IPC: master_event_pull.ipc
- IPC: master_event_pub.ipc

29.3.5 MWorker

Worker processes manage the back-end operations for the Salt Master.

The number of workers is equivalent to the number of `worker_threads` specified in the master configuration and is always at least one.

Workers are bound to the following:

- IPC: workers.ipc

29.3.6 ReqServer

The Salt request server takes requests and distributes them to available MWorker processes for processing. It also receives replies back from minions.

The ReqServer is bound to the following:

- TCP: 4506
- IPC: workers.ipc

Each salt minion establishes a connection to the master ReqServer.
29.3.7 Job Flow

The Salt master works by always publishing commands to all connected minions and the minions decide if the command is meant for them by checking themselves against the command target.

The typical lifecycle of a salt job from the perspective of the master might be as follows:

1) A command is issued on the CLI. For example, 'salt my_minion test.version'.
2) The 'salt' command uses LocalClient to generate a request to the salt master by connecting to the ReqServer on TCP:4506 and issuing the job.
3) The salt-master ReqServer sees the request and passes it to an available MWorker over workers.ipc.
4) A worker picks up the request and handles it. First, it checks to ensure that the requested user has permissions to issue the command. Then, it sends the publish command to all connected minions. For the curious, this happens in ClearFuncs.publish().
5) The worker announces on the master event bus that it is about to publish a job to connected minions. This happens by placing the event on the master event bus (master_event_pull.ipc) where the EventPublisher picks it up and distributes it to all connected event listeners on master_event_pub.ipc.
6) The message to the minions is encrypted and sent to the Publisher via IPC on publish_pull.ipc.
7) Connected minions have a TCP session established with the Publisher on TCP port 4505 where they await commands. When the Publisher receives the job over publish_pull, it sends the jobs across the wire to the minions for processing.
8) After the minions receive the request, they decrypt it and perform any requested work, if they determine that they are targeted to do so.
9) When the minion is ready to respond, it publishes the result of its job back to the master by sending the encrypted result back to the master on TCP 4506 where it is again picked up by the ReqServer and forwarded to an available MWorker for processing. (Again, this happens by passing this message across workers.ipc to an available worker.)
10) When the MWorker receives the job it decrypts it and fires an event onto the master event bus (master_event_pull.ipc). (Again for the curious, this happens in AESFuncs._return().)
11) The EventPublisher sees this event and re-publishes it on the bus to all connected listeners of the master event bus (on master_event_pub.ipc). This is where the LocalClient has been waiting, listening to the event bus for minion replies. It gathers the job and stores the result.
12) When all targeted minions have replied or the timeout has been exceeded, the salt client displays the results of the job to the user on the CLI.

29.4 Salt Minion

29.4.1 Overview

The salt-minion is a single process that sits on machines to be managed by Salt. It can either operate as a stand-alone daemon which accepts commands locally via `salt-call` or it can connect back to a master and receive commands remotely.

When starting up, salt minions connect back to a master defined in the minion config file. They connect to two ports on the master:

- TCP: 4505 This is the connection to the master Publisher. It is on this port that the minion receives jobs from the master.
29.4.2 Event System

Similar to the master, a salt-minion has its own event system that operates over IPC by default. The minion event system operates on a push/pull system with IPC files at minion_event_<unique_id>_pub.ipc and minion_event_<unique_id>_pull.ipc.

The astute reader might ask why have an event bus at all with a single-process daemon. The answer is that the salt-minion may fork other processes as required to do the work without blocking the main salt-minion process and this necessitates a mechanism by which those processes can communicate with each other. Secondarily, this provides a bus by which any user with sufficient permissions can read or write to the bus as a common interface with the salt minion.

29.4.3 Minion Job Flow

When a salt minion starts up, it attempts to connect to the Publisher and the ReqServer on the salt master. It then attempts to authenticate and once the minion has successfully authenticated, it simply listens for jobs.

Jobs normally come either come from the 'salt-call' script run by a local user on the salt minion or they can come directly from a master.

The job flow on a minion, coming from the master via a 'salt' command is as follows:

1) A master publishes a job that is received by a minion as outlined by the master's job flow above. 2) The minion is polling its receive socket that's connected to the master Publisher (TCP 4505 on master). When it detects an incoming message, it picks it up from the socket and decrypts it. 3) A new minion process or thread is created and provided with the contents of the decrypted message. The _thread_return() method is provided with the contents of the received message. 4) The new minion thread is created. The _thread_return() function starts up and actually calls out to the requested function contained in the job. 5) The requested function runs and returns a result. [Still in thread.] 6) The result of the function that's run is encrypted and returned to the master's ReqServer (TCP 4506 on master). [Still in thread.] 7) Thread exits. Because the main thread was only blocked for the time that it took to initialize the worker thread, many other requests could have been received and processed during this time.

29.5 A Note on ClearFuncs vs. AESFuncs

A common source of confusion is determining when messages are passed in the clear and when they are passed using encryption. There are two rules governing this behaviour:

1) ClearFuncs is used for intra-master communication and during the initial authentication handshake between a minion and master during the key exchange. 2) AESFuncs is used everywhere else.
29.6 Changelog

With the addition of SEP 01 the keepachangelog format was introduced into our CHANGELOG.md file. The Salt project is using the towncrier tool to manage the CHANGELOG.md file. The reason this tool was added to manage the changelog was because we were previously managing the file manually and it would cause many merge conflicts. This tool allows us to add changelog entries into separate files and before a release we simply need to run towncrier --version=<version> for it to compile the changelog correctly.

29.6.1 How do I add a changelog entry

To add a changelog entry you will need to add a file in the changelog directory. The file name should follow the syntax <issue #>.<type>.

The types are in alignment with keepachangelog:
- removed: any features that have been removed
- deprecated: any features that will soon be removed
- changed: any changes in current existing features
- fixed: any bug fixes
- added: any new features added

For example if you are fixing a bug for issue number #1234 your filename would look like this: changelog/1234.fixed. The contents of the file should contain a summary of what you are fixing. If there is a legitimate reason to not include an issue number with a given contribution you can add the PR number as the file name (<PR #>.<type>).

If your PR does not align with any of the types, then you do not need to add a changelog entry.

29.6.2 How to generate the changelog

This step is only used when we need to generate the changelog right before releasing. You should NOT run towncrier on your PR, unless you are preparing the final PR to update the changelog before a release.

You can run the towncrier tool directly or you can use nox to help run the command and ensure towncrier is installed in a virtual environment. The instructions below will detail both approaches.

If you want to see what output towncrier will produce before generating the changelog you can run towncrier in draft mode:

towncrier --draft --version=3001

nox -e 'changelog(draft=True)' -- 3000.1

Version will need to be set to whichever version we are about to release. Once you are confident the draft output looks correct you can now generate the changelog by running:

towncrier --version=3001

nox -e 'changelog(draft=False)' -- 3000.1

After this is run towncrier will automatically remove all the files in the changelog directory.
29.7 Contributing

So you want to contribute to the Salt project? Excellent! You can help in a number of ways:

- Using Salt and opening well-written bug reports.
- Joining a working group.
- Answering questions on irc, the community Slack, the salt-users mailing list, Server Fault, or r/saltstack on Reddit.
- Fixing bugs.
- Enhancing the documentation.
- Providing workarounds, patches, or other code without tests.
- Telling other people about problems you solved using Salt.

If you’d like to update docs or fix an issue, you’re going to need the Salt repo. The best way to contribute is using Git.

29.7.1 Environment Setup

To hack on Salt or the docs you’re going to need to set up your development environment. If you already have a workflow that you’re comfortable with, you can use that, but otherwise this is an opinionated guide for setting up your dev environment. Follow these steps and you’ll end out with a functioning dev environment and be able to submit your first PR.

This guide assumes at least a passing familiarity with Git, a common version control tool used across many open source projects, and is necessary for contributing to Salt. For an introduction to Git, watch Salt Docs Clinic - Git For the True Beginner. Because of its widespread use, there are many resources for learning more about Git. One popular resource is the free online book Learn Git in a Month of Lunches.

29.7.2 pyenv, Virtual Environments, and You

We recommend pyenv, since it allows installing multiple different Python versions, which is important for testing Salt across all the versions of Python that we support.

On Linux

Install pyenv:

```
git clone https://github.com/pyenv/pyenv.git ~/.pyenv
echo 'export PATH=$HOME/.pyenv/bin:$PATH' >> ~/.profile
```

```
git clone https://github.com/pyenv/pyenv-virtualenv.git $(pyenv root)/plugins/pyenv-virtualenv
```
Salt Documentation, Release 3002.5

On Mac
Install pyenv using brew:
brew update
brew install pyenv
brew install pyenv-virtualenv

Now add pyenv to your .bashrc:
echo 'export PATH="$HOME/.pyenv/bin:$PATH"' >> ~/.bashrc
pyenv init 2>> ~/.bashrc
pyenv virtualenv-init 2>> ~/.bashrc

For other shells, see the pyenv instructions.
Go ahead and restart your shell. Now you should be able to install a new version of Python:
pyenv install 3.7.0

If that fails, don’t panic! You’re probably just missing some build dependencies. Check out pyenv common build
problems.
Now that you’ve got your version of Python installed, you can create a new virtual environment with this command:
pyenv virtualenv 3.7.0 salt

Then activate it:
pyenv activate salt

Sweet! Now you’re ready to clone Salt so you can start hacking away! If you get stuck at any point, check out the
resources at the beginning of this guide. IRC and Slack are particularly helpful places to go.
Get The Source!
Salt uses the fork and clone workflow for Git contributions. See Using the Fork-and-Branch Git Workflow for how
to implement it. But if you just want to hurry and get started you can go ahead and follow these steps:
Clones are so shallow. Well, this one is anyway:
git clone --depth=1 --origin salt https://github.com/saltstack/salt.git

This creates a shallow clone of Salt, which should be fast. Most of the time that’s all you’ll need, and you can
start building out other commits as you go. If you really want all 108,300+ commits you can just run git fetch
--unshallow. Then go make a sandwich because it’s gonna be a while.
You’re also going to want to head over to GitHub and create your own fork of Salt. Once you’ve got that set up you
can add it as a remote:
git remote add yourname <YOUR SALT REMOTE>

If you use your name to refer to your fork, and salt to refer to the official Salt repo you’ll never get upstream or
origin confused.
Note: Each time you start work on a new issue you should fetch the most recent changes from salt/upstream.

29.7. Contributing

1715


**pre-commit and nox Setup**

Here at Salt we use **pre-commit** and **nox** to make it easier for contributors to get quick feedback, for quality control, and to increase the chance that your merge request will get reviewed and merged. Nox enables us to run multiple different test configurations, as well as other common tasks. You can think of it as Make with superpowers. Pre-commit does what it sounds like: it configures some Git pre-commit hooks to run **black** for formatting, **isort** for keeping our imports sorted, and **pylint** to catch issues like unused imports, among others. You can easily install them in your virtualenv with:

```bash
python -m pip install pre-commit nox
pre-commit install
```

**Warning**: Currently there is an issue with the pip-tools-compile pre-commit hook on Windows. The details around this issue are included here: [https://github.com/saltstack/salt/issues/56642](https://github.com/saltstack/salt/issues/56642). Please ensure you export `SKIP=pip-tools-compile`.

Now before each commit, it will ensure that your code at least *looks* right before you open a pull request. And with that step, it’s time to start hacking on Salt!

### 29.7.3 Salt Issues

**Create Your Own**

Perhaps you’ve come to this guide because you found a problem in Salt, and you’ve diagnosed the cause. Maybe you need some help figuring out the problem. In any case, creating quality bug reports is a great way to contribute to Salt even if you lack the skills, time, or inclination to fix it yourself. If that’s the case, head on over to Salt’s issue tracker on GitHub.

Creating a **good** report can take a little bit of time - but every minute you invest in making it easier for others to reproduce and understand your issue is time well spent. The faster someone can understand your issue, the faster it will be able to get fixed correctly.

The thing that every issue needs goes by many names, but one at least as good as any other is **MCVE** - **M**inimum **C**omplete **V**erifiable **E**xample.

In a nutshell:

- **Minimum**: All of the **extra** information has been removed. Will 2 or 3 lines of master/minion config still exhibit the behavior?
- **Complete**: Minimum also means complete. If your example is missing information, then it’s not complete. Salt, Python, and OS versions are all bits of information that make your example complete. Have you provided the commands that you ran?
- **Verifiable**: Can someone take your report and reproduce it?

Slow is smooth, and smooth is fast - it may feel like you’re taking a long time to create your issue if you’re creating a proper MCVE, but a MCVE eliminates back and forth required to reproduce/verify the issue so someone can actually create a fix.
Pick An Issue

If you don’t already have an issue in mind, you can search for help wanted issues. If you also search for good first issue then you should be able to find some issues that are good for getting started contributing to Salt. Documentation issues are also good starter issues. When you find an issue that catches your eye (or one of your own), it’s a good idea to comment on the issue and mention that you’re working on it. Good communication is key to collaboration - so if you don’t have time to complete work on the issue, just leaving some information about when you expect to pick things up again is a great idea!

29.7.4 Hacking Away

Salt, Tests, Documentation, and You

Before approving code contributions, Salt requires:

- documentation
- meaningful passing tests
- correct code

Documentation fixes just require correct documentation.

What If I Don’t Write Tests or Docs?

If you aren’t into writing documentation or tests, we still welcome your contributions! But your PR will be labeled Needs Testcase and Help Wanted until someone can get to write the tests/documentation. Of course, if you have a desire but just lack the skill we are more than happy to collaborate and help out! There’s the documentation working group and the testing working group. We also regularly stream our test clinic live on Twitch every Tuesday afternoon and Thursday morning, Central Time. If you’d like specific help with tests, bring them to the clinic. If no community members need help, you can also just watch tests written in real time.

Documentation

Salt uses both docstrings, as well as normal reStructuredText files in the salt/doc folder for documentation. Since we use nox, you can build your docs and view them in your browser with this one-liner:

```
python -m nox -e 'docs-html(compress=False, clean=False)'; cd doc/_build/html; python -m webbrowser http://localhost:8000/contents.html; python -m http.server
```

The first time this will take a while because there are a lot of modules. Maybe you should go grab some dessert if you already finished that sandwich. But once Sphinx is done building the docs, python should launch your default browser with the URL http://localhost:8000/contents.html. Now you can navigate to your docs and ensure your changes exist. If you make changes, you can simply run this:

```
cd -; python -m nox -e 'docs-html(compress=False, clean=False)'; cd doc/_build/html; python -m http.server
```

And then refresh your browser to get your updated docs. This one should be quite a bit faster since Sphinx won’t need to rebuild everything.

If your change is a docs-only change, you can go ahead and commit/push your code and open a PR. You can indicate that it’s a docs-only change by adding [Documentation] to the title of your PR. Otherwise you’ll want to write some tests and code.
Running Development Salt

Note: If you run into any issues in this section, check the Troubleshooting section.

If you’re going to hack on the Salt codebase you’re going to want to be able to run Salt locally. The first thing you need to do is install Salt as an editable pip install:

```
python -m pip install -e .
```

This will let you make changes to Salt without having to re-install it.

After all of the dependencies and Salt are installed, it’s time to set up the config for development. Typically Salt runs as root, but you can specify which user to run as. To configure that, just copy the master and minion configs. We have .gitignore setup to ignore the local/ directory, so we can put all of our personal files there.

```
mkdir -p local/etc/salt/
```

Create a master config file as local/etc/salt/master:

```
cat <<EOF >local/etc/salt/master
user: $(whoami)
root_dir: $PWD/local/
publish_port: 55505
ret_port: 55506
EOF
```

And a minion config as local/etc/salt/minion:

```
cat <<EOF >local/etc/salt/minion
user: $(whoami)
root_dir: $PWD/local/
master: localhost
id: saltdev
master_port: 55506
EOF
```

Now you can start your Salt master and minion, specifying the config dir.

```
salt-master --config-dir=local/etc/salt/ --log-level=debug --daemon
salt-minion --config-dir=local/etc/salt/ --log-level=debug --daemon
```

Now you should be able to accept the minion key:

```
salt-key -c local/etc/salt -Ay
```

And check that your master/minion are communicating:

```
salt -c local/etc/salt \* test.version
```

Rather than running test.version from your master, you can run it from the minion instead:

```
salt-call -c local/etc/salt test.version
```

Note that you’re running salt-call instead of salt, and you’re not specifying the minion (\*), but if you’re running the dev version then you still will need to pass in the config dir. Now that you’ve got Salt running, you can hack away on the Salt codebase!

If you need to restart Salt for some reason, if you’ve made changes and they don’t appear to be reflected, this is one option:
If you’d rather not use `kill`, you can have a couple of terminals open with your salt virtualenv activated and omit the `--daemon` argument. Salt will run in the foreground, so you can just use `ctrl+c` to quit.

**Test First? Test Last? Test Meaningfully!**

You can write tests first or tests last, as long as your tests are meaningful and complete! *Typically* the best tests for Salt are going to be unit tests. Testing is a whole topic on its own, But you may also want to write functional or integration tests. You’ll find those in the `salt/tests` directory.

When you’re thinking about tests to write, the most important thing to keep in mind is, “What, exactly, am I testing?” When a test fails, you should know:

- What, specifically, failed?
- Why did it fail?
- As much as possible, what do I need to do to fix this failure?

If you can’t answer those questions then you might need to refactor your tests.

When you’re running tests locally, you should make sure that if you remove your code changes your tests are failing. If your tests aren’t failing when you haven’t yet made changes, then it’s possible that you’re testing the wrong thing. But whether you adhere to TDD/BDD, or you write your code first and your tests last, ensure that your tests are meaningful.

**Running Tests**

As previously mentioned, we use `nox`, and that’s how we run our tests. You should have it installed by this point but if not you can install it with this:

```bash
python -m pip install nox
```

Now you can run your tests:

```bash
python -m nox -e "pytest-3.7(coverage=False)" -- tests/unit/cli/test_batch.py
```

It’s a good idea to install `espeak` or use `say` on Mac if you’re running some long-running tests. You can do something like this:

```bash
python -m nox -e "pytest-3.7(coverage=False)" -- tests/unit/cli/test_batch.py; espeak -"Tests done, woohoo!"
```

That way you don’t have to keep monitoring the actual test run.
Changelog and Commit!

When you write your commit message you should use imperative style. Do this:

Add frobnosticate capability

Don’t do this:

Added frobnosticate capability

But that advice is backwards for the changelog. We follow the keepachangelog approach for our changelog, and use towncrier to generate it for each release. As a contributor, all that means is that you need to add a file to the salt/changelog directory, using the `<issue #>.<type>` format. For instance, if you fixed issue 123, you would do:

```
echo "Made sys.doc inform when no minions return" > changelog/123.fixed
```

And that’s all that would go into your file. When it comes to your commit message, it’s usually a good idea to add other information, such as

- What does a reviewer need to know about the change that you made?
- If someone isn’t an expert in this area, what will they need to know?

This will also help you out, because when you go to create the PR it will automatically insert the body of your commit messages.

29.7.5 PR Time!

Once you’ve done all your dev work and tested locally, you should check out our PR guidelines. After you read that page, it’s time to open a new PR. Fill out the PR template - you should have updated or created any necessary docs, and written tests if you’re providing a code change. When you submit your PR, we have a suite of tests that will run across different platforms to help ensure that no known bugs were introduced.

Now What?

You’ve made your changes, added documentation, opened your PR, and have passing tests... now what? When can you expect your code to be merged?

When you open your PR, a reviewer will get automatically assigned. If your PR is submitted during the week you should be able to expect some kind of communication within that business day. If your tests are passing and we’re not in a code freeze, ideally your code will be merged that day. If you haven’t heard from your assigned reviewer, ping them on GitHub, irc, or Community Slack.

It’s likely that your reviewer will leave some comments that need addressing - it may be a style change, or you forgot a changelog entry, or need to update the docs. Maybe it’s something more fundamental - perhaps you encountered the rare case where your PR has a much larger scope than initially assumed.

Whatever the case, simply make the requested changes (or discuss why the requests are incorrect), and push up your new commits. If your PR is open for a significant period of time it may be worth rebasing your changes on the most recent changes to Salt. If you need help, the previously linked Git resources will be valuable.

But if, for whatever reason, you’re not interested in driving your PR to completion then just note that in your PR. Something like, “I’m not interested in writing docs/tests, I just wanted to provide this fix - someone else will need to complete this PR.” If you do that then we’ll add a “Help Wanted” label and someone will be able to pick up the PR, make the required changes, and it can eventually get merged in.

In any case, now that you have a PR open, congrats! You’re a Salt developer! You rock!
29.7.6 Troubleshooting

zmq.core.error.ZMQError

Once the minion starts, you may see an error like the following:

```python
zmq.core.error.ZMQError: ipc path "/path/to/your/virtualenv/var/run/salt/minion/minion_event_7824dc4f7e79ac755af70b9" is longer than 107 characters (sizeof(sockaddr_un.sun_path)).
```

This means that the path to the socket the minion is using is too long. This is a system limitation, so the only workaround is to reduce the length of this path. This can be done in a couple different ways:

1. Create your virtualenv in a path that is short enough.
2. Edit the :conf_minion:sock_dir minion config variable and reduce its length. Remember that this path is relative to the value you set in :conf_minion:root_dir.

NOTE: The socket path is limited to 107 characters on Solaris and Linux, and 103 characters on BSD-based systems.

No permissions to access ...

If you forget to pass your config path to any of the salt* commands, you might see

```bash
No permissions to access "/var/log/salt/master", are you running as the correct user?
```

Just pass `-c local/etc/salt` (or whatever you named it)

File descriptor limit

You might need to raise your file descriptor limit. You can check it with:

```bash
ulimit -n
```

If the value is less than 3072, you should increase it with:

```bash
ulimit -n 3072
# For c-shell:
limit descriptors 3072
```

Pygit2 or other dependency install fails

You may see some failure messages when installing requirements. You can directly access your nox environment and possibly install pygit (or other dependency) that way. When you run nox, you’ll see a message like this:

```bash
nox > Re-using existing virtual environment at .nox/pytest-parametrized-3-crypto-none-transport-zeromq-coverage-false.
```

For this, you would be able to install with:

```bash
.nox/pytest-parametrized-3-crypto-none-transport-zeromq-coverage-false/bin/python -m pip install pygit2
```

29.7. Contributing
29.8 Deprecating Code

Salt should remain backwards compatible, though sometimes, this backwards compatibility needs to be broken because a specific feature and/or solution is no longer necessary or required. At first one might think, let me change this code, it seems that it’s not used anywhere else so it should be safe to remove. Then, once there’s a new release, users complain about functionality which was removed and they where using it, etc. This should, at all costs, be avoided, and, in these cases, that specific code should be deprecated.

In order to give users enough time to migrate from the old code behavior to the new behavior, the deprecation time frame should be carefully determined based on the significance and complexity of the changes required by the user.

Salt feature releases are based on the Periodic Table. Any new features going into the master branch will be named after the next element in the Periodic Table. For example, Magnesium was the feature release name associated with the v3002 tag. At that point in time, any new features going into the master branch, after v3002 was tagged, were part of the Aluminium feature release.

A deprecation warning should be in place for at least two major releases before the deprecated code and its accompanying deprecation warning are removed. More time should be given for more complex changes. For example, if the current release under development is 3001, the deprecated code and associated warnings should remain in place and warn for at least Aluminium.

To help in this deprecation task, salt provides salt.utils.versions.warn_until. The idea behind this helper function is to show the deprecation warning to the user until salt reaches the provided version. Once that provided version is equaled salt.utils.versions.warn_until will raise a RuntimeError making salt stop its execution. This stoppage is unpleasant and will remind the developer that the deprecation limit has been reached and that the code can then be safely removed.

Consider the following example:

```python
def some_function(bar=False, foo=None):
    if foo is not None:
        salt.utils.versions.warn_until("Aluminium",
            "The 'foo' argument has been deprecated and its "
            "functionality removed, as such, its usage is no longer "
            "required."
        )
```

Development begins on Aluminium, or v3003, after the v3002 tag is applied to the master branch. Once this occurs, all uses of the warn_until function targeting Aluminium, along with the code they are warning about should be removed from the code.

29.9 Python 2 Deprecation FAQ

FAQ

- Python 2 Deprecation FAQ
  - Why are we deprecating Python 2?
  - Was this announced/decided before making the change?
  - Can I contribute Python 2 code?
29.9.1 Why are we deprecating Python 2?

Python 2.7.18 was the final release of Python2, released in April 2020. At this point, Python 2 will no longer receive any unpaid support. The Python core developers are focusing their efforts on improving and enhancing Python 3. Additionally, many libraries that Salt depends on have also dropped Python 2 support.

To take advantage of continued support and improvements, Salt is joining the ranks of projects that are dropping legacy Python support in favor of Python 3.

29.9.2 Was this announced/decided before making the change?

SEP 5 was approved in April, 2019.

29.9.3 Can I contribute Python 2 code?

For several years, Salt has been a Python 2/3 codebase, requiring Python 3 support for all contributions. The only changes contributors can expect to this process is that we will now accept Python 3-only code changes.

While there is a significant subset of Python that is compatible with both Python 3 and legacy Python, changes requiring six or otherwise removing Python 3-only code will not be accepted.

29.9.4 What if my OS does not include Python 3 packages? Or, how do I upgrade from Salt on Python 2 to Salt on Python 3?

There are several options to upgrade to Python 3.
On Modern Platforms

At this point, most modern Linux distributions have Python 3 packages. Ubuntu 20.04 LTS has moved to Python 3.8 as its default system Python.

On Other Platforms

Build Your Own

If your current distribution does not have Python 3 it’s pretty simple to use Salt to build and distribute Python 3 on your own. Installing Python 3 and pip installing Salt gives you the most control over your distribution.

pop-build distributions

Another approach is to use the pop-build distribution of Salt. With the Sodium release we will begin releasing packages for Salt using pop-build, in tandem with our normal build process. The pop-build distribution will contain Salt, Python, and any necessary dependencies, which will make it trivial to have a completely supported version of Salt.

29.9.5 Will you support a Python 3 master with an older Python 2 minion?

Yes! Our policy of keeping newer masters backwards compatible with at least the most recent minion version is not changing. You should be able to run modern Salt Masters on Python 3 with slightly older minions running on legacy Python. Of course, if you want your minions to be able to take advantage of the newest features in Salt, upgrading to Python 3 will be necessary.

29.9.6 Will you support Python 2 master with a new Python 3 minion?

In keeping with our existing policy, we make no guarantees about older masters with newer minions. It may work, but breakages are common and should be expected.

29.9.7 How does this impact Salt-SSH support?

Salt-SSH will need Python 3 on the target minions. We will be upgrading Salt-SSH to provide instructions or recommendations on adding Python3 if it is not detected.

29.9.8 What is your plan for removing Python 2 code?

Legacy Python code will be gradually removed from the Salt codebase.

While we could remove most of it at once, that introduces a high level of risk. Instead, beginning with the Sodium (v3001) release, Salt will simply drop support for Python 2. PRs will no longer be required to support Python 2 before merging.

Over time, as modules are changed, six and other legacy Python syntax will be removed. It may be at some point in the future it becomes necessary to remove the last vestiges of legacy Python from Salt, but currently the plan is to take a more measured approach.
29.9.9 Will Salt continue to package for Python 2?

No. Beginning with Sodium (v3001), Salt will no longer release packages for, or support Python 2.

29.10 Installing Salt for development

Clone the repository using:

```bash
git clone https://github.com/saltstack/salt
```

**Note:** tags

Just cloning the repository is enough to work with Salt and make contributions. However, fetching additional tags from git is required to have Salt report the correct version for itself. To do this, first add the git repository as an upstream source:

```bash
git remote add upstream https://github.com/saltstack/salt
```

Fetching tags is done with the git 'fetch' utility:

```bash
git fetch --tags upstream
```

Create a new virtualenv:

```bash
virtualenv /path/to/your/virtualenv
```

Avoid making your `virtualenv path too long`.

On Arch Linux, where Python 3 is the default installation of Python, use the `virtualenv2` command instead of `virtualenv`.

On Gentoo you must use `--system-site-packages` to enable pkg and portage_config functionality

**Note:** Using system Python modules in the virtualenv

To use already-installed python modules in virtualenv (instead of having pip download and compile new ones), run `virtualenv --system-site-packages` Using this method eliminates the requirement to install the salt dependencies again, although it does assume that the listed modules are all installed in the system PYTHONPATH at the time of virtualenv creation.

**Note:** Python development package

Be sure to install python devel package in order to install required Python modules. In Debian/Ubuntu run `sudo apt-get install -y python-dev`. In RedHat based system install `python-devel`

Activate the virtualenv:

```bash
source /path/to/your/virtualenv/bin/activate
```

Install Salt (and dependencies) into the virtualenv:
pip install pyzmq PyYAML pycrypto msgpack jinja2 psutil futures tornado
pip install -e ./salt  # the path to the salt git clone from above

Note: Installing psutil

Python header files are required to build this module, otherwise the pip install will fail. If your distribution separates binaries and headers into separate packages, make sure that you have the headers installed. In most Linux distributions which split the headers into their own package, this can be done by installing the python-dev or python-devel package. For other platforms, the package will likely be similarly named.

Note: Installing dependencies on macOS.

You can install needed dependencies on macOS using homebrew or macports. See macOS Installation

Warning: Installing on RedHat-based Distros

If installing from pip (or from source using setup.py install), be advised that the yum-utils package is needed for Salt to manage packages on RedHat-based systems.

29.10.1 Running a self-contained development version

During development it is easiest to be able to run the Salt master and minion that are installed in the virtualenv you created above, and also to have all the configuration, log, and cache files contained in the virtualenv as well.

The /path/to/your/virtualenv referenced multiple times below is also available in the variable $VIRTUAL_ENV once the virtual environment is activated.

Copy the master and minion config files into your virtualenv:

```
mkdir -p /path/to/your/virtualenv/etc/salt/pki/{master,minion}
cp ./salt/conf/master ./salt/conf/minion /path/to/your/virtualenv/etc/salt/
```

Edit the master config file:

1. Uncomment and change the user: root value to your own user.
2. Uncomment and change the root_dir: / value to point to /path/to/your/virtualenv.
3. Uncomment and change the pki_dir: /etc/salt/pki/master value to point to /path/to/your/virtualenv/etc/salt/pki/master
4. If you are running version 0.11.1 or older, uncomment, and change the pidfile: /var/run/salt-master.pid value to point to /path/to/your/virtualenv/salt-master.pid.
5. If you are also running a non-development version of Salt you will have to change the publish_port and ret_port values as well.

Edit the minion config file:

1. Repeat the edits you made in the master config for the user and root_dir values as well as any port changes.
2. Uncomment and change the pki_dir: /etc/salt/pki/minion value to point to /path/to/your/virtualenv/etc/salt/pki/minion
3. If you are running version 0.11.1 or older, uncomment, and change the pidfile: `/var/run/salt-minion.pid` value to point to `/path/to/your/virtualenv/salt-minion.pid`.

4. Uncomment and change the `master: salt` value to point at localhost.

5. Uncomment and change the `id:` value to something descriptive like "saltdev". This isn't strictly necessary but it will serve as a reminder of which Salt installation you are working with.

6. If you changed the `ret_port` value in the master config because you are also running a non-development version of Salt, then you will have to change the `master_port` value in the minion config to match.

**Note:** Using `salt-call` with a Standalone Minion

If you plan to run `salt-call` with this self-contained development environment in a masterless setup, you should invoke `salt-call` with `-c /path/to/your/virtualenv/etc/salt` so that salt can find the minion config file. Without the `-c` option, Salt finds its config files in `/etc/salt`.

Start the master and minion, accept the minion’s key, and verify your local Salt installation is working:

```bash
cd /path/to/your/virtualenv
salt-master -c ./etc/salt -d
salt-minion -c ./etc/salt -d
salt-key -c ./etc/salt -L
salt-key -c ./etc/salt -A
salt -c ./etc/salt '*' test.version
```

Running the master and minion in debug mode can be helpful when developing. To do this, add `-l debug` to the calls to `salt-master` and `salt-minion`. If you would like to log to the console instead of to the log file, remove the `-d`.

**Note:** Too long socket path?

Once the minion starts, you may see an error like the following:

```
zmq.core.error.ZMQError: ipc path "/path/to/your/virtualenv/var/run/salt/minion/minion_event_7824dc9b7f89f6755939af70b96249f_pub.ipc" is longer than 107 characters (sizeof(sockaddr_un.sun_path)).
```

This means that the path to the socket the minion is using is too long. This is a system limitation, so the only workaround is to reduce the length of this path. This can be done in a couple different ways:

1. Create your virtualenv in a path that is short enough.

2. Edit the `sock_dir` minion config variable and reduce its length. Remember that this path is relative to the value you set in `root_dir`.

**NOTE:** The socket path is limited to 107 characters on Solaris and Linux, and 103 characters on BSD-based systems.

**Note:** File descriptor limits

Ensure that the system open file limit is raised to at least 2047:

```
# check your current limit
ulimit -n

# raise the limit. persists only until reboot
```

(continues on next page)
# use 'limit descriptors 2047' for c-shell
ulimit -n 2047

To set file descriptors on macOS, refer to the macOS Installation instructions.

## Changing Default Paths

Instead of updating your configuration files to point to the new root directory and having to pass the new configuration directory path to all of Salt's CLI tools, you can explicitly tweak the default system paths that Salt expects:

```bash
GENERATE_SALT_SYSPATHS=1 pip install --global-option='--salt-root-dir=/path/to/your/virtualenv/' -e ./salt # the path to the salt git clone from above
```

You can now call all of Salt's CLI tools without explicitly passing the configuration directory.

## Additional Options

If you want to distribute your virtualenv, you probably don't want to include Salt's clone .git/ directory, and, without it, Salt won't report the accurate version. You can tell setup.py to generate the hardcoded version information which is distributable:

```bash
GENERATE_SALT_SYSPATHS=1 WRITE_SALT_VERSION=1 pip install --global-option='--salt-root-dir=/path/to/your/virtualenv/' -e ./salt # the path to the salt git clone from above
```

Instead of passing those two environmental variables, you can just pass a single one which will trigger the other two:

```bash
MIMIC_SALT_INSTALL=1 pip install --global-option='--salt-root-dir=/path/to/your/virtualenv/' -e ./salt # the path to the salt git clone from above
```

This last one will grant you an editable salt installation with hardcoded system paths and version information.

## 29.10.2 Installing Salt from the Python Package Index

If you are installing using easy_install, you will need to define a USE_SETUPTOOLS environment variable, otherwise dependencies will not be installed:

```bash
USE_SETUPTOOLS=1 easy_install salt
```
29.10.3 Editing and previewing the documentation

You need the `sphinx-build` command to build the docs. In Debian/Ubuntu this is provided in the `python-sphinx` package. Sphinx can also be installed to a virtualenv using `pip`:

```
pip install Sphinx==1.3.1
```

Change to salt documentation directory, then:

```
cd doc; make html
```

- This will build the HTML docs. Run `make` without any arguments to see the available make targets, which include `html`, `man`, and `text`.
- The docs then are built within the `docs/_build/` folder. To update the docs after making changes, run `make` again.
- The help information on each module or state is culled from the python code that runs for that piece. Find them in `salt/modules/` or `salt/states/`.
- To build the docs on Arch Linux, the `python2-sphinx` package is required. Additionally, it is necessary to tell `make` where to find the proper `sphinx-build` binary, like so:

```
make SPHINXBUILD=sphinx-build2 html
```

- To build the docs on RHEL/CentOS 6, the `python-sphinx10` package must be installed from EPEL, and the following make command must be used:

```
make SPHINXBUILD=sphinx-build html
```

Once you've updated the documentation, you can run the following command to launch a simple Python HTTP server to see your changes:

```
cd _build/html; python -m SimpleHTTPServer
```

29.10.4 Running unit and integration tests

Run the test suite with the following command:

```
./setup.py test
```

See [here](#) for more information regarding the test suite.

29.10.5 Issue and Pull Request Labeling System

SaltStack uses several labeling schemes to help facilitate code contributions and bug resolution. See the *Labels and Milestones* documentation for more information.
29.11 GitHub Labels and Milestones

SaltStack uses several label categories, as well as milestones, to triage incoming issues and pull requests in the GitHub issue tracker. Labels are used to sort issues by type, priority, severity, status, functional area, functional group, and targeted release and pull requests by status, functional area, functional group, type of change, and test status. Milestones are used to indicate whether an issue is fully triaged or is scheduled to be fixed by SaltStack in an upcoming sprint.

29.11.1 Milestones

All issues are assigned to a milestone, whereas pull requests are almost never assigned to a milestone as the mean lifetime of pull requests is short enough that there is no need to track them temporally.

SaltStack uses milestones to indicate which issues are blocked on submitter or upstream actions, are approved, or are scheduled to be fixed or implemented in an upcoming sprint. If an issue is not attached to a sprint milestone, you are welcome to work on it at your own desire and convenience. If it is attached to a sprint milestone and you have already begun working on it or have a solution in mind or have other ideas related to the issue, you are encouraged to coordinate with the assignee via the GitHub issue tracker to create the best possible solution or implementation.

- **Approved** - The issue has been validated and has all necessary information.
- **Blocked** - The issue is waiting on actions by parties outside of SaltStack, such as receiving more information from the submitter or resolution of an upstream issue. This milestone is usually applied in conjunction with the labels `Info Needed`, `Question`, `Expected Behavior`, `Won't Fix For Now`, or `Upstream Bug`.

29.11.2 Labels

Labels are used to sort and describe issues and pull requests. Some labels are usually reserved for one or the other, though most labels may be applied to both.

New issues will receive at least one label and a milestone, and new pull requests will receive at least one label. Except for the `functional area` and `functional group` label categories, issues will generally receive only up to one label per category.

**Type**

Issues are categorized into one of several types. Type labels are almost never used for pull requests. GitHub treats pull requests like issues in many ways, so a pull request could be considered an issue with an implicit `Pull Request` type label applied.

- **Feature** - The issue is a request for new functionality including changes, enhancements, refactors, etc.
- **Bug** - The issue documents broken, incorrect, or confusing behavior. This label is always accompanied by a `severity label`.
- **Duplicate** - The issue is a duplicate of another feature request or bug report.
- **Upstream Bug** - The issue is a result of an upstream issue.
- **Question** - The issue is more of a question than a request for new features or a report of broken features, but can sometimes lead to further discussion or changes of confusing or incongruous behavior or documentation.
- **Expected Behavior** - The issue is a bug report of intended functionality.
Priority

An issue’s priority is relative to its functional area. If a bug report, for example, about gitfs indicates that all users of gitfs will encounter this bug, then a P1 label will be applied, even though users who are not using gitfs will not encounter the bug. If a feature is requested by many users, it may be given a high priority.

- **P1** - The issue will be seen by all users.
- **P2** - The issue will be seen by most users.
- **P3** - The issue will be seen by about half of users.
- **P4** - The issue will not be seen by most users. Usually the issue is a very specific use case or corner case.

Severity

Severity labels are almost always only applied to issues labeled Bug.

- **Blocker** - The issue is blocking an impending release.
- **Critical** - The issue causes data loss, crashes or hangs salt processes, makes the system unresponsive, etc.
- **High Severity** - The issue reports incorrect functionality, bad functionality, a confusing user experience, etc.
- **Medium Severity** - The issue reports cosmetic items, formatting, spelling, colors, etc.

Functional Area

Many major components of Salt have corresponding GitHub labels. These labels are applied to all issues and pull requests as is reasonably appropriate. They are useful in organizing issues and pull requests according to the source code relevant to issues or the source code changed by pull requests.

- **Execution Module**
- **File Servers**
- **Grains**
- **Multi-Master**
- **Packaging** - Related to packaging of Salt, not Salt’s support for package management.
- **Pillar**
- **RAET**
- **Returners**
- **Runners**
- **SPM**
- **Salt-API**
- **Salt-Cloud**
- **Salt-SSH**
- **Salt-Syndic**
- **State Module**
- **Tests**
Functional Group

These labels sort issues and pull requests according to the internal SaltStack engineering teams.

- **Core** - The issue or pull request relates to code that is central or existential to Salt itself.

- **Platform** - The issue or pull request relates to support and integration with various platforms like traditional operating systems as well as containers, platform-based utilities like filesystems, command schedulers, etc., and system-based applications like webservers, databases, etc.

- **RIoT** - The issue or pull request relates to support and integration with various abstract systems like cloud providers, hypervisors, API-based services, etc.

- **Console** - The issue or pull request relates to the SaltStack enterprise console.

- **Documentation** - The issue or pull request relates to documentation.

Status

Status labels are used to define and track the state of issues and pull requests. Not all potential statuses correspond to a label, but some statuses are common enough that labels have been created for them. If an issue has not been moved beyond the **Blocked** milestone, it is very likely that it will only have a status label.

- **Cannot Reproduce** - The issue is a bug and has been reviewed by a SaltStack engineer, but it cannot be replicated with the provided information and context. Those involved with the bug will need to work through additional ideas until the bug can be isolated and verified.

- **Confirmed** - The issue is a bug and has been confirmed by a SaltStack engineer, who often documents a minimal working example that reproduces the bug.

- **Fixed Pending Verification** - The issue is a bug and has been fixed by one or more pull requests, which should link to the issue. Closure of the issue is contingent upon confirmation of resolution from the submitter. If the submitter reports a negative confirmation, this label is removed. If no response is given after a few weeks, then the issue will be assumed fixed and closed.

- **Info Needed** - The issue needs more information before it can be verified and resolved. For a feature request this may include a description of the use cases. Almost all bug reports need to include at least the versions of salt and its dependencies, the system type and version, commands used, debug logs, error messages, and relevant configs.

- **Pending Changes** - The pull request needs additional changes before it can be merged.

- **Pending Discussion** - The issue or pull request needs more discussion before it can be closed or merged. The status of the issue or pull request is not clear or apparent enough for definite action to be taken, or additional input from SaltStack, the submitter, or another party has been requested.

  If the issue is not a pull request, once the discussion has arrived at a cogent conclusion, this label will be removed and the issue will be accepted. If it is a pull request, the results of the discussion may require additional changes and thus, a **Pending Changes** label.

- **won't-fix** - The issue is legitimate, but it is not something the Salt core team is currently able or willing to fix or implement. Issues having this label may be revisited in the future, or solved by a Salt community member.
Test Status

These labels relate to the status of the automated tests that run on pull requests.

- **has-failing-test** - The PR currently has one or more failing tests that prevent the PR from being merged.
- **Needs Testcase** - The PR has code changes, but lack any automated tests. These PRs need automated tests written before they may be merged.

Other

These labels indicate miscellaneous issue types or statuses that are common or important enough to be tracked and sorted with labels.

- **Awesome** - The pull request implements an especially well crafted solution, or a very difficult but necessary change.
- **Help Wanted** - The issue appears to have a simple solution. Issues having this label should be a good starting place for new contributors to Salt.
- **Regression** - The issue is a bug that breaks functionality known to work in previous releases.
- **Story** - The issue is used by a SaltStack engineer to track progress on multiple related issues in a single place.
- **Stretch** - The issue is an optional goal for the current sprint but may not be delivered.
- **ZD** - The issue is related to a Zendesk customer support ticket.
- **<Release>** - The issue is scheduled to be implemented by <Release>. See here for a discussion of Salt’s release codenames.

29.12 Logging Internals

TODO

29.13 Package Providers

This page contains guidelines for writing package providers.

29.13.1 Package Functions

One of the most important features of Salt is package management. There is no shortage of package managers, so in the interest of providing a consistent experience in pkg states, there are certain functions that should be present in a package provider. Note that these are subject to change as new features are added or existing features are enhanced.
list_pkgs

This function should declare an empty dict, and then add packages to it by calling pkg_resource.add_pkg, like so:

```python
__salt__['pkg_resource.add_pkg'](ret, name, version)
```

The last thing that should be done before returning is to execute pkg_resource.sort_pkglist. This function does not presently do anything to the return dict, but will be used in future versions of Salt.

```python
__salt__['pkg_resource.sort_pkglist'](ret)
```

list_pkgs returns a dictionary of installed packages, with the keys being the package names and the values being the version installed. Example return data:

```python
{"foo": "1.2.3-4", "bar": "5.6.7-8"}
```

latest_version

Accepts an arbitrary number of arguments. Each argument is a package name. The return value for a package will be an empty string if the package is not found or if the package is up-to-date. The only case in which a non-empty string is returned is if the package is available for new installation (i.e. not already installed) or if there is an upgrade available.

If only one argument was passed, this function return a string, otherwise a dict of name/version pairs is returned.

This function must also accept **kwargs, in order to receive the fromrepo and repo keyword arguments from pkg states. Where supported, these arguments should be used to find the install/upgrade candidate in the specified repository. The fromrepo kwarg takes precedence over repo, so if both of those kwargs are present, the repository specified in fromrepo should be used. However, if repo is used instead of fromrepo, it should still work, to preserve backwards compatibility with older versions of Salt.

version

Like latest_version, accepts an arbitrary number of arguments and returns a string if a single package name was passed, or a dict of name/value pairs if more than one was passed. The only difference is that the return values are the currently-installed versions of whatever packages are passed. If the package is not installed, an empty string is returned for that package.

upgrade_available

Deprecated and destined to be removed. For now, should just do the following:

```python
def myfunc():
    return __salt__['pkg.latest_version'](name) != ""
```
install

The following arguments are required and should default to None:

1. name (for single-package pkg states)
2. pkgs (for multiple-package pkg states)
3. sources (for binary package file installation)

The first thing that this function should do is call \texttt{pkg\_resource.parse\_targets} (see below). This function will convert the SLS input into a more easily parsed data structure. \texttt{pkg\_resource.parse\_targets} may need to be modified to support your new package provider, as it does things like parsing package metadata which cannot be done for every package management system.

\begin{verbatim}
pkg_params, pkg_type = __salt__['pkg\_resource.parse\_targets'](name, pkgs, sources)
\end{verbatim}

Two values will be returned to the \texttt{install} function. The first of them will be a dictionary. The keys of this dictionary will be package names, though the values will differ depending on what kind of installation is being done:

- If \texttt{name} was provided (and \texttt{pkgs} was not), then there will be a single key in the dictionary, and its value will be \texttt{None}. Once the data has been returned, if the \texttt{version} keyword argument was provided, then it should replace the \texttt{None} value in the dictionary.

- If \texttt{pkgs} was provided, then \texttt{name} is ignored, and the dictionary will contain one entry for each package in the \texttt{pkgs} list. The values in the dictionary will be \texttt{None} if a version was not specified for the package, and the desired version if specified. See the \texttt{Multiple Package Installation Options} section of the \texttt{pkg\_installed} state for more info.

- If \texttt{sources} was provided, then \texttt{name} is ignored, and the dictionary values will be the path/URI for the package.

The second return value will be a string with two possible values: \texttt{repository} or \texttt{file}. The \texttt{install} function can use this value (if necessary) to build the proper command to install the targeted package(s).

Both before and after the installing the target(s), you should run \texttt{list\_pkgs} to obtain a list of the installed packages. You should then return the output of \texttt{salt.utils.data.compare\_dicts()}:

\begin{verbatim}
def myfunc():
    return salt.utils.data.compare_dicts(old, new)
\end{verbatim}

remove

Removes the passed package and return a list of the packages removed.

\subsection*{29.13.2 Package Repo Functions}

There are some functions provided by \texttt{pkg} which are specific to package repositories, and not to packages themselves. When writing modules for new package managers, these functions should be made available as stated below, in order to provide compatibility with the \texttt{pkg\_repo} state.

All repo functions should accept a basedir option, which defines which directory repository configuration should be found in. The default for this is dictated by the repo manager that is being used, and rarely needs to be changed.

\begin{verbatim}
basedir = "/etc/yum.repos.d"
__salt__['pkg\_list\_repos'](basedir)
\end{verbatim}
list_repos

Lists the repositories that are currently configured on this system.

```python
__salt__['pkg.list_repos']()
```

Returns a dictionary, in the following format:

```python
{'reponame': 'config_key_1': 'config value 1',
 'config_key_2': 'config value 2',
 'config_key_3': ['list item 1 (when appropriate)',
                  'list item 2 (when appropriate)']}
```

get_repo

Displays all local configuration for a specific repository.

```python
__salt__['pkg.get_repo'](repo="myrepo")
```

The information is formatted in much the same way as list_repos, but is specific to only one repo.

```python
{'config_key_1': 'config value 1',
 'config_key_2': 'config value 2',
 'config_key_3': ['list item 1 (when appropriate)',
                  'list item 2 (when appropriate)']}
```

del_repo

Removes the local configuration for a specific repository. Requires a repo argument, which must match the locally configured name. This function returns a string, which informs the user as to whether or not the operation was a success.

```python
__salt__['pkg.del_repo'](repo="myrepo")
```

mod_repo

Modify the local configuration for one or more option for a configured repo. This is also the way to create new repository configuration on the local system; if a repo is specified which does not yet exist, it will be created.

The options specified for this function are specific to the system; please refer to the documentation for your specific repo manager for specifics.

```python
__salt__['pkg.mod_repo'](repo="myrepo", url="http://myurl.com/repo")
```
29.13.3 Low-Package Functions

In general, the standard package functions as describes above will meet your needs. These functions use the system’s native repo manager (for instance, yum or the apt tools). In most cases, the repo manager is actually separate from the package manager. For instance, yum is usually a front-end for rpm, and apt is usually a front-end for dpkg. When possible, the package functions that use those package managers directly should do so through the low package functions.

It is normal and sane for pkg to make calls to lowpkgs, but lowpkg must never make calls to pkg. This is affects functions which are required by both pkg and lowpkg, but the technique in pkg is more performant than what is available to lowpkg. When this is the case, the lowpkg function that requires that technique must still use the lowpkg version.

list_pkgs

Returns a dict of packages installed, including the package name and version. Can accept a list of packages; if none are specified, then all installed packages will be listed.

```
installed = __salt__['lowpkg.list_pkgs']('foo', 'bar')
```

Example output:

```
{"foo": "1.2.3-4", "bar": "5.6.7-8"}
```

verify

Many (but not all) package management systems provide a way to verify that the files installed by the package manager have or have not changed. This function accepts a list of packages; if none are specified, all packages will be included.

```
installed = __salt__['lowpkg.verify']('httpd')
```

Example output:

```
{
    "/etc/httpd/conf/httpd.conf": {
        "mismatch": ["size", "md5sum", "mtime"],
        "type": "config",
    }
}
```

file_list

Lists all of the files installed by all packages specified. If not packages are specified, then all files for all known packages are returned.

```
installed = __salt__['lowpkg.file_list']('httpd', 'apache')
```

This function does not return which files belong to which packages; all files are returned as one giant list (hence the file_list function name. However, This information is still returned inside of a dict, so that it can provide any errors to the user in a sane manner.
{  
  "errors": ["package apache is not installed"],  
  "files": ["/etc/httpd", "/etc/httpd/conf", "/etc/httpd/conf.d", "...SNIP..."],  
}

file_dict

Lists all of the files installed by all packages specified. If not packages are specified, then all files for all known packages are returned.

```
installed = __salt__['lowpkg.file_dict']("httpd", "apache", "kernel")
```

Unlike file_list, this function will break down which files belong to which packages. It will also return errors in the same manner as file_list.

```
{  
  "errors": ["package apache is not installed"],  
  "packages": {  
    "httpd": ["/etc/httpd", "/etc/httpd/conf", "...SNIP..."],  
    "kernel": [  
      "/boot/.vmlinuz-2.6.32-279.el6.x86_64.hmac",  
      "/boot/System.map-2.6.32-279.el6.x86_64",  
      "...SNIP...",  
    ],  
  },  
}
```

29.14 Pull Requests

Salt is a large software project with many developers working together. We encourage all Salt users to contribute new features, bug fixes and documentation fixes. For those who haven't contributed to a large software project before we encourage you to consider the following questions when preparing a pull request.

This isn't an exhaustive list and these aren't necessarily hard and fast rules, but these are things we consider when reviewing a pull request.

- Does this change work on all platforms? In cases where it does not, is an appropriate and easy-to-understand reason presented to the user? Is it documented as-such? Have we thought about all the possible ways this code might be used and accounted as best we can for them?
- Will this code work on versions of all Python we support? Will it work on future versions?
- Are Python reserved keywords used? Are variables named in a way that will make it easy for the next person to understand what's going on?
- Does this code present a security risk in any way? What is the worst possible thing that an attacker could do with this code? If dangerous cases are possible, is it appropriate to document them? If so, has this been done? Would this change pass muster with a professional security audit? Is it obvious to a person using this code what the risks are?
- Is it readable? Does it conform to our style guide? Is the code documented such that the next person who comes along will be able to read and understand it? Most especially, are edge-cases documented to avoid regressions? Will it be immediately evident to the next person who comes along why this change was made?
- If appropriate, has the person who wrote the code which is being modified been notified and included in the process?

- What are the performance implications of this change? Is there a more efficient way to structure the logic and if so, does making the change balance itself against readability in a sensible way? Do the performance characteristics of the code change based on the way it is being invoked (i.e., through an API or various command-line tools)? Will it be easy to profile this change if it might be a problem?

- Are caveats considered and documented in the change?

- Will the code scale? More critically, will it scale in both directions? Salt runs in data-centers and on Raspberry Pi installations in the Sahara. It needs to work on big servers and tiny devices.

- Is appropriate documentation written both in public-facing docs and in-line? How will the user know how to use this? What will they do if it doesn't work as expected? Is this something a new user will understand? Can a user know all they need to about this functionality by reading the public docs?

- Is this a change in behavior? If so, is it in the appropriate branch? Are deprecation warnings necessary? Have those changes been fully documented? Have we fully thought through what implications a change in behavior might have?

- How has the code been tested? If appropriate are there automated tests which cover this? Is it likely to regress? If so, how has the potential of that regression been mitigated? What is the plan for ensuring that this code works going forward?

- If it’s asynchronous code, what is the potential for a race condition?

- Is this code an original work? If it’s borrowed from another project or found online are the appropriate licensing/attribution considerations handled?

- Is the reason for the change fully explained in the PR? If not for review, this is necessary so that somebody in the future can go back and figure out why it was necessary.

- Is the intended behavior of the change clear? How will that behavior be known to future contributors and to users?

- Does this code handle errors in a reasonable way? Have we gone back through the stack as much as possible to make sure that an error cannot be raised that we do not account for? Are errors tested for as well as proper functionality?

- If the code relies on external libraries, do we properly handle old versions of them? Do we require a specific version and if so is this version check implemented? Is the library available on the same platforms that module in question claims to support? If the code was written and tested against a particular library, have we documented that fact?

- Can this code freeze/hang/crash a running daemon? Can it stall a state run? Are there infinite loops? Are appropriate timeouts implemented?

- Is the function interface well documented? If argument types can not be inferred by introspection, are they documented?

- Are resources such as file-handles cleaned-up after they are used?

- Is it possible that a reference-cycle exists between objects that will leak memory?

- Has the code been linted and does it pass all tests?

- Does the change fully address the problem or is it limited to a small surface area? By this, I mean that it should be clear that the submitter has looked for other cases in the function or module where the given case might also be addressed. If additional changes are necessary are they documented in the code as a FIXME or the PR and in Github as an issue to be tracked?

- Will the code throw errors/warnings/stacktraces to the console during normal operation?
• Has all the debugging been removed?

• Does the code log any sensitive data? Does it show sensitive data in process lists? Does it store sensitive data to disk and if so, does it do so in a secure manner? Are there potential race conditions in between writing the data to disk and setting the appropriate permissions?

• Is it clear from the solution that the problem is well-understood? How can somebody who has never seen the problem feel confident that this proposed change is the best one?

• What’s hard-coded that might not need to be? Are we making sensible decisions for the user and allowing them to tune and change things where appropriate?

• Are utility functions used where appropriate? Does this change re-implement something we already have code for?

• Is the right thing being fixed? There are cases where it’s appropriate to fix a test and cases where it’s appropriate to fix the code that’s under test. Which is best for the user? Is this change a shortcut or a solution that will be solid in the months and years to come?

• How will this code react to changes elsewhere in the code base? What is it coupled to and have we fully thought through how best to present a coherent interface to consumers of a given function or method?

• Does this PR try to fix too many bugs/problems at once?

• Should this be split into multiple PRs to make them easier to test and reason about?

### 29.15 Pull Request Requirements

The following outlines what is required before a pull request can be merged into the salt project. For each of these requirements, an exception can be made that requires 3 approvals before merge. The exceptions are detailed more below.

#### 29.15.1 All PR requirements

• Approval Required: approval review from core team member OR 1 approval review from captain of working group

• Cannot merge your own PR until 1 reviewer approves from defined list above that is not the author.

• All Tests Pass

#### 29.15.2 Bug Fix PR requirements

• Test Coverage: regression test written to cover bug fix. Contributors only need to write test coverage for their specific changes.

• Point to the issue the PR is resolving. If there is not an issue one will need to be created.
29.15.3 Feature PR requirements

- Test Coverage: tests written to cover new feature. Contributors only need to write test coverage for their specific changes.
- Add .. versionadded:: <release> to module's documentation. If you are not certain which release your fix will be included in you can include TBD and the PR reviewer will let you know the correct name of the release you need to update to the versionadded.

29.15.4 Exceptions to all requirements

As previously stated, all of the above requirements can be bypassed with 3 approvals. PR’s that do not require tests include:

- documentation
- cosmetic changes (for example changing from log.debug to log.trace)
- fixing tests
- pylint
- changes outside of the salt directory

29.16 Reporting Bugs

Salt uses GitHub to track open issues and feature requests.

To file a bug, please navigate to the new issue page for the Salt project.

In an issue report, please include the following information:

- The output of salt --versions-report from the relevant machines. This can also be gathered remotely by using salt <my_tgt> test.versions_report.
- A description of the problem including steps taken to cause the issue to occur and the expected behaviour.
- Any steps taken to attempt to remediate the problem.
- Any configuration options set in a configuration file that may be relevant.
- A reproduceable test case. This may be as simple as an SLS file that illustrates a problem or it may be a link to a repository that contains a number of SLS files that can be used together to re-produce a problem. If the problem is transitory, any information that can be used to try and reproduce the problem is helpful.
- [Optional] The output of each salt component (master/minion/CLI) running with the -ldebug flag set.

Note: Please be certain to scrub any logs or SLS files for sensitive data!
29.17 Salt Topology

Salt is based on a powerful, asynchronous, network topology using ZeroMQ. Many ZeroMQ systems are in place to enable communication. The central idea is to have the fastest communication possible.

29.17.1 Servers

The Salt Master runs 2 network services. First is the ZeroMQ PUB system. This service by default runs on port 4505 and can be configured via the publish_port option in the master configuration.

Second is the ZeroMQ REP system. This is a separate interface used for all bi-directional communication with minions. By default this system binds to port 4506 and can be configured via the ret_port option in the master.

29.17.2 PUB/SUB

The commands sent out via the salt client are broadcast out to the minions via ZeroMQ PUB/SUB. This is done by allowing the minions to maintain a connection back to the Salt Master and then all connections are informed to download the command data at once. The command data is kept extremely small (usually less than 1K) so it is not a burden on the network.

29.17.3 Return

The PUB/SUB system is a one way communication, so once a publish is sent out the PUB interface on the master has no further communication with the minion. The minion, after running the command, then sends the command's return data back to the master via the ret_port.

29.18 Developing Salt Tutorial

This tutorial assumes you have:

- a web browser
- a GitHub account (<my_account>)
- a command line (CLI)
- git
- a text editor

29.18.1 Fork

In your browser, navigate to the saltstack/salt GitHub repository. Click on Fork (https://github.com/saltstack/salt/#fork-destination-box).

Note: If you have more than one GitHub presence, for example if you are a member of a team, GitHub will ask you into which area to clone Salt. If you don't know where, then select your personal GitHub account.
29.18.2 Clone

In your CLI, navigate to the directory into which you want clone the Salt codebase and submit the following command:

```
$ git clone https://github.com/<my_account>/salt.git
```

where `<my_account>` is the name of your GitHub account. After the clone has completed, add SaltStack as a second remote and fetch any changes from upstream.

```
$ cd salt
$ git remote add upstream https://github.com/saltstack/salt.git
$ git fetch upstream
```

For this tutorial, we will be working off from the `master` branch, which is the default branch for the SaltStack GitHub project. This branch needs to track `upstream/master` so that we will get all upstream changes when they happen.

```
$ git checkout master
$ git branch --set-upstream-to upstream/master
```

29.18.3 Fetch

Fetch any upstream changes on the `master` branch and sync them to your local copy of the branch with a single command:

```
$ git pull --rebase
```

**Note:** For an explanation on `pull` vs `pull --rebase` and other excellent points, see this article by Mislav Marohnić.

29.18.4 Branch

Now we are ready to get to work. Consult the sprint beginner bug list and select an execution module whose `__virtual__` function needs to be updated. I'll select the `alternatives` module.

Create a new branch off from `master`. Be sure to name it something short and descriptive.

```
$ git checkout -b virt_ret
```

29.18.5 Edit

Edit the file you have selected, and verify that the changes are correct.

```
$ vim salt/modules/alternatives.py
$ git diff
```

```
diff --git a/salt/modules/alternatives.py b/salt/modules/alternatives.py
index 1653e5f..30c0a59 100644
--- a/salt/modules/alternatives.py
+++ b/salt/modules/alternatives.py
```

(continues on next page)
+++ b/salt/modules/alternatives.py
@@ -30,7 +30,7 @@ def __virtual__():
     ...
     if os.path.isdir('/etc/alternatives'):
         return True
-    return False
+    return (False, 'Cannot load alternatives module: /etc/alternatives dir not found')

def _get_cmd():

29.18.6 Commit

Stage and commit the changes. Write a descriptive commit summary, but try to keep it less than 50 characters. Review your commit.

```bash
$ git add salt/modules/alternatives.py
$ git commit -m 'modules.alternatives: __virtual__ return err msg'
$ git show
```

Note: If you need more room to describe the changes in your commit, run `git commit` (without the `-m`, message, option) and you will be presented with an editor. The first line is the commit summary and should still be 50 characters or less. The following paragraphs you create are free form and will be preserved as part of the commit.

29.18.7 Push

Push your branch to your GitHub account. You will likely need to enter your GitHub username and password.

```bash
$ git push origin virt_ret
Username for 'https://github.com': <my_account>
Password for 'https://<my_account>@github.com':
```

Note: If authentication over https does not work, you can alternatively setup ssh keys. Once you have done this, you may need add the keys to your git repository configuration

```bash
$ git config ssh.key ~/.ssh/<key_name>
```

where `<key_name>` is the file name of the private key you created.
29.18.8 Merge

In your browser, navigate to the new pull request page on the saltstack/salt GitHub repository and click on compare across forks. Select <my_account> from the list of head forks and the branch you are wanting to merge into master (virt_ret in this case).

When you have finished reviewing the changes, click Create pull request.

If your pull request contains only a single commit, the title and comment will be taken from that commit’s summary and message, otherwise the branch name is used for the title. Edit these fields as necessary and click Create pull request.

Note: Although these instructions seem to be the official pull request procedure on github’s website, here are two alternative methods that are simpler.

- If you navigate to your clone of salt, https://github.com/<my_account>/salt, depending on how old your branch is or how recently you pushed updates on it, you may be presented with a button to create a pull request with your branch.
- I find it easiest to edit the following URL:
  https://github.com/saltstack/salt/compare/master...<my_account>:virt_ret

29.18.9 Resources

GitHub offers many great tutorials on various aspects of the git- and GitHub-centric development workflow:

https://help.github.com/

There are many topics covered by the Salt Developer documentation:

https://docs.saltstack.com/en/latest/topics/development/index.html

The contributing documentation presents more details on specific contributing topics:

https://docs.saltstack.com/en/latest/topics/development/contributing.html

29.19 Modular Systems

When first working with Salt, it is not always clear where all of the modular components are and what they do. Salt comes loaded with more modular systems than many users are aware of, making Salt very easy to extend in many places.

The most commonly used modular systems are execution modules and states. But the modular systems extend well beyond the more easily exposed components and are often added to Salt to make the complete system more flexible.
29.19.1 Developing New Modules

Interactive Debugging

Sometimes debugging with `print()` and extra logs sprinkled everywhere is not the best strategy.

IPython is a helpful debug tool that has an interactive python environment which can be embedded in python programs.

First the system will require IPython to be installed.

```
# Debian
apt-get install ipython

# Arch Linux
pacman -Syu ipython2

# RHEL/CentOS (via EPEL)
yum install python-ipython
```

Now, in the troubling python module, add the following line at a location where the debugger should be started:

```
test = "test123"
import IPython
IPython.embed_kernel()
```

After running a Salt command that hits that line, the following will show up in the log file:

```
[CRITICAL] To connect another client to this kernel, use:
[IPKernelApp] --existing kernel-31271.json
```

Now on the system that invoked `embed_kernel`, run the following command from a shell:

```
# NOTE: use ipython2 instead of ipython for Arch Linux
ipython console --existing
```

This provides a console that has access to all the vars and functions, and even supports tab-completion.

```
print(test)
test123
```

To exit IPython and continue running Salt, press Ctrl-d to logout.

Special Module Contents

These are things that may be defined by the module to influence various things.
__virtual__

Called before __virtual__()  

__proxyenabled__

grains and proxy modules
__proxyenabled__ as a list containing the names of the proxy types that the module supports.

__load__

__func_alias__

__outputter__

Dunder Dictionaries

Salt provides several special "dunder" dictionaries as a convenience for Salt development. These include __opts__, __context__, __salt__, and others. This document will describe each dictionary and detail where they exist and what information and/or functionality they provide.

The following dunder dictionaries are always defined, but may be empty

- __context__
- __grains__
- __pillar__
- __opts__

__opts__

Defined in: All modules

The __opts__ dictionary contains all of the options passed in the configuration file for the master or minion.

Note: In many places in salt, instead of pulling raw data from the __opts__ dict, configuration data should be pulled from the salt get functions such as config.get, aka __salt__['config.get']('foo:bar') The get functions also allow for dict traversal via the : delimiter. Consider using get functions whenever using __opts__ or __pillar__ and __grains__ (when using grains for configuration data)

The configuration file data made available in the __opts__ dictionary is the configuration data relative to the running daemon. If the modules are loaded and executed by the master, then the master configuration data is
available, if the modules are executed by the minion, then the minion configuration is available. Any additional information passed into the respective configuration files is made available

__salt__

Defined in: Auth, Beacons, Engines, Execution, Executors, Outputters, Pillars, Proxies, Renderers, Returners, Runners, SDB, SSH Wrappers, State, Thorium

__salt__ contains the execution module functions. This allows for all functions to be called as they have been set up by the salt loader.

```python
__salt__['cmd.run']('fdisk -l')
__salt__['network.ip_addrs']()
```

Note: When used in runners or outputters, __salt__ references other runner/outputter modules, and not execution modules.

__grains__

Filled in for: Execution, Pillar, Renderer, Returner, SSH Wrapper, State.

The __grains__ dictionary contains the grains data generated by the minion that is currently being worked with. In execution modules, state modules and returners this is the grains of the minion running the calls, when generating the external pillar the __grains__ is the grains data from the minion that the pillar is being generated for.

While __grains__ is defined for every module, it's only filled in for some.

__pillar__

Filled in for: Execution, Renderer, Returner, SSH Wrapper, State

The __pillar__ dictionary contains the pillar for the respective minion.

While __pillar__ is defined for every module, it's only filled in for some.

__ext_pillar__

Filled in for: Pillar

The __ext_pillar__ dictionary contains the external pillar modules.
During a state run the `__context__` dictionary persists across all states that are run and then is destroyed when the state ends.

When running an execution module `__context__` persists across all module executions until the modules are refreshed; such as when `saltutil.sync_all` or `state.apply` are executed.

A great place to see how to use `__context__` is in the `cp.py` module in `salt/modules/cp.py`. The fileclient authenticates with the master when it is instantiated and then is used to copy files to the minion. Rather than create a new fileclient for each file that is to be copied down, one instance of the fileclient is instantiated in the `__context__` dictionary and is reused for each file. Here is an example from `salt/modules/cp.py`:

```
if not "cp.fileclient" in __context__:
    __context__["cp.fileclient"] = salt.fileclient.get_file_client(__opts__)
```

Note: Because `__context__` may or may not have been destroyed, always be sure to check for the existence of the key in `__context__` and generate the key before using it.

---

## __utils__

Defined in: Cloud, Engine, Execution, File Server, Grain, Pillar, Proxy, Roster, Runner, SDB, State

## __proxy__

Defined in: Beacon, Engine, Execution, Executor, Proxy, Renderer, Returner, State, Util

## __runner__

Defined in: Engine, Roster, Thorium

Note: When used in engines, it should be called `__runners__` (plural)

## __executors__

Defined in: Executor

## __ret__

Defined in: Proxy
29.19.2 Configuration Options

A number of configuration options can affect the load process. This is a quick list of them:

- `autoload_dynamic_modules (Minion)`
- `cython_enable (Minion, Master)`
- `disable_modules (Minion)`
- `disable_returners (Minion)`
- `enable_zip_modules (Minion)`
- `extension_modules (Master)`
- `extmod_whitelist (Minion, Master)`
- `extmod_blacklist (Minion, Master)`
- `whitelist_modules (Minion)`
- `grains_dirs (Minion)`
- `module_dirs (Minion, Master)`
- `outputter_dirs (Minion, Master)`
- `providers (Minion)`
- `render_dirs (Minion)`
- `returner_dirs (Minion)`
- `runner_dirs (Master)`
- `states_dirs (Minion)`
- `utils_dirs (Minion)`
29.19.3 Loading Modules

Modules come primarily from several sources:

- The Salt package itself
- The Salt File Server
- The extmods directory
- Secondary packages installed

Using one source to override another is not supported.

The Salt Package

Salt itself ships with a large number of modules. These are part of the Salt package itself and don’t require the user to do anything to use them. (Although a number of them have additional dependencies and/or configuration.)

The Salt File Server

The user may add modules by simply placing them in special directories in their fileserver. The name of the directory inside of the file server is the directory name prepended by underscore, such as:

- _grains
- _modules
- _states

Modules must be synced before they can be used. This can happen a few ways, discussed below.

Note: Using saltenvs besides base may not work in all contexts.

Sync Via States

The minion configuration contains an option autoload_dynamic_modules which defaults to True. This option makes the state system refresh all dynamic modules when states are run. To disable this behavior set autoload_dynamic_modules to False in the minion config.

When dynamic modules are autoloaded via states, only the modules defined in the same saltenvs as the states currently being run.

Sync Via the saltutil Module

The saltutil module has a number of functions that can be used to sync all or specific dynamic modules. The saltutil.sync_* execution functions and runner functions can be used to sync modules to minions and the master, respectively.
The extmods Directory

Any files places in the directory set by `extension_modules` settings (`minion`, `master`, `default`, `/var/cache/salt/*/extmods`) can also be loaded as modules. Note that these directories are also used by the `saltutil.sync_*` functions (mentioned above) and files may be overwritten.

Secondary Packages

Third-party packages may also add modules to Salt if they are installed in the same system and Python environment as the Salt Minion or Master.

This is done via setuptools entry points:

```python
setup(
    # ...
    entry_points={"salt.loader": ["module_dirs=spirofs.loader:module"],
                 # ...
    }
)
```

Note that these are not synced from the Salt Master to the Minions. They must be installed independently on each Minion.

### 29.19.4 Module Types

The specific names used by each loading method above are as follows. See sections below for a short summary of each of these systems.

<table>
<thead>
<tr>
<th>Module Type</th>

Note: While it is possible to import modules directly with the import statement, it is strongly recommended that the appropriate *dunder dictionary* is used to access them instead. This is because a number of factors affect module names, module selection, and module overloading.

### Auth

The auth module system allows for external authentication routines to be easily added into Salt. The *auth* function needs to be implemented to satisfy the requirements of an auth module. Use the `pam` module as an example.

See *External Authentication System* for more about authentication in Salt.

### Beacon

- **Writing Beacons**

Beacons are polled by the Salt event loop to monitor non-salt processes. See *Beacons* for more information about the beacon system.

### Cache

The minion cache is used by the master to store various information about minions. See *Minion Data Cache* for more information.

\(^1\) These modules cannot be loaded from the Salt File Server.
Cloud

Cloud modules are backend implementations used by Salt Cloud.

Engine

Engines are open-ended services managed by the Salt daemon (both master and minion). They may interact with event loop, call other modules, or a variety of non-salt tasks. See Salt Engines for complete details.

Execution

Execution modules make up the core of the functionality used by Salt to interact with client systems. The execution modules create the core system management library used by all Salt systems, including states, which interact with minion systems.

Execution modules are completely open ended in their execution. They can be used to do anything required on a minion, from installing packages to detecting information about the system. The only restraint in execution modules is that the defined functions always return a JSON serializable object.

Executor

Executors control how execution modules get called. The default is to just call them, but this can be customized.

File Server

The file server module system is used to create file server backends used by the Salt Master. These modules need to implement the functions used in the fileserver subsystem. Use the gitfs module as an example. See File Server Backends for more information.

Grains

- Writing Grains

Grain modules define extra routines to populate grains data. All defined public functions will be executed and MUST return a Python dict object. The dict keys will be added to the grains made available to the minion.

See Grains for more.

Log Handler

Log handlers allows the logs from salt (master or minion) to be sent to log aggregation systems.
Matcher

Matcher modules are used to define the *minion targeting expressions*. For now, it is only possible to override the *existing matchers* (the required CLI plumbing for custom matchers is not implemented yet).

Metaproxy

Metaproxy is an abstraction layer above the existing proxy minion. It enables adding different types of proxy minions that can still load existing proxymodules.

Net API

Net API modules are the actual server implementation used by Salt API.

Output

The output modules supply the outputter system with routines to display data in the terminal. These modules are very simple and only require the *output* function to execute. The default system outputter is the *nested* module.

Pillar

External Pillars

Salt provides a mechanism for generating pillar data by calling external pillar interfaces. This document will describe an outline of an ext_pillar module.

Location

Salt expects to find your ext_pillar module in the same location where it looks for other python modules. If the extension_modules option in your Salt master configuration is set, Salt will look for a pillar directory under there and load all the modules it finds. Otherwise, it will look in your Python site-packages salt/pillar directory.

Configuration

The external pillars that are called when a minion refreshes its pillars is controlled by the ext_pillar option in the Salt master configuration. You can pass a single argument, a list of arguments or a dictionary of arguments to your pillar:

```
ext_pillar:
    - example_a: some argument
    - example_b:
        - argumentA
        - argumentB
    - example_c:
        keyA: valueA
        keyB: valueB
```
The Module

Imports and Logging

Import modules your external pillar module needs. You should first include generic modules that come with stock Python:

```python
import logging
```

And then start logging. This is an idiomatic way of setting up logging in Salt:

```python
log = logging.getLogger(__name__)
```

Finally, load modules that are specific to what you are doing. You should catch import errors and set a flag that the `__virtual__` function can use later.

```python
try:
    import weird_thing
    EXAMPLE_A_LOADED = True
except ImportError:
    EXAMPLE_A_LOADED = False
```

Options

If you define an `__opts__` dictionary, it will be merged into the `__opts__` dictionary handed to the `ext_pillar` function later. This is a good place to put default configuration items. The convention is to name things `modulename.option`.

```python
__opts__ = {
    "example_a.someconfig": 137
}
```

Initialization

If you define an `__init__` function, it will be called with the following signature:

```python
def __init__(__opts__):
    # Do init work here
    ...
```

Note: The `__init__` function is ran every time a particular minion causes the external pillar to be called, so don't put heavy initialization code here. The `__init__` functionality is a side-effect of the Salt loader, so it may not be as useful in pillars as it is in other Salt items.
If you define a __virtual__ function, you can control whether or not this module is visible. If it returns False then Salt ignores this module. If it returns a string, then that string will be how Salt identifies this external pillar in its ext_pillar configuration. If you're not renaming the module, simply return True in the __virtual__ function, which is the same as if this function did not exist, then, the name Salt's ext_pillar will use to identify this module is its conventional name in Python.

This is useful to write modules that can be installed on all Salt masters, but will only be visible if a particular piece of software your module requires is installed.

```python
# This external pillar will be known as `example_a`
def __virtual__():
    if EXAMPLE_A_LOADED:
        return True
    return False

# This external pillar will be known as `something_else`__virtualname__ = "something_else"
def __virtual__():
    if EXAMPLE_A_LOADED:
        return __virtualname__
    return False
```

This is where the real work of an external pillar is done. If this module is active and has a function called ext_pillar, whenever a minion updates its pillar this function is called.

How it is called depends on how it is configured in the Salt master configuration. The first argument is always the current pillar dictionary, this contains pillar items that have already been added, starting with the data from pillar_roots, and then from any already-ran external pillars.

Using our example above:

```python
ext_pillar(id, pillar, "some argument")  # example_a
ext_pillar(id, pillar, "argumentA", "argumentB")  # example_b
ext_pillar(id, pillar, keyA="valueA", keyB="valueB")  # example_c
```

In the example_a case, pillar will contain the items from the pillar_roots, in example_b pillar will contain that plus the items added by example_a, and in example_c pillar will contain that plus the items added by example_b. In all three cases, id will contain the ID of the minion making the pillar request.

This function should return a dictionary, the contents of which are merged in with all of the other pillars and returned to the minion. Note: this function is called once for each minion that fetches its pillar data.

```python
def ext_pillar(minion_id, pillar, *args, **kwargs):
    my_pillar = {"external_pillar": {}}
    my_pillar["external_pillar"] = get_external_pillar_dictionary()
    return my_pillar
```
You can call pillar with the dictionary's top name to retrieve its data. From above example, 'external_pillar' is the top dictionary name. Therefore:

```
salt '*' pillar.get external_pillar
```

You shouldn't just add items to pillar and return that, since that will cause Salt to merge data that already exists. Rather, just return the items you are adding or changing. You could, however, use pillar in your module to make some decision based on pillar data that already exists.

This function has access to some useful globals:

- **__opts__**  A dictionary of mostly Salt configuration options. If you had an __opts__ dictionary defined in your module, those values will be included.
- **__salt__**  A dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist. E.g. __salt__['cmd.run']( 'ls -l' ) Note, runs on the master
- **__grains__**  A dictionary of the grains of the minion making this pillar call.

**Example configuration**

As an example, if you wanted to add external pillar via the cmd_json external pillar, add something like this to your master config:

```
ext_pillar:
  - cmd_json: 'echo "\"arg\"":"\"value\"")
```

**Reminder**

Just as with traditional pillars, external pillars must be refreshed in order for minions to see any fresh data:

```
salt '*' saltutil.refresh_pillar
```

Used to define optional external pillar systems. The pillar generated via the filesystem pillar is passed into external pillars. This is commonly used as a bridge to database data for pillar, but is also the backend to the libvirt state used to generate and sign libvirt certificates on the fly.

**Proxy**

Proxy Minions are a way to manage devices that cannot run a full minion directly.

**Renderers**

Renderers are the system used to render sls files into salt highdata for the state compiler. They can be as simple as the py renderer and as complex as stateconf and pydsl.
**Returners**

Returners are used to send data from minions to external sources, commonly databases. A full returner will implement all routines to be supported as an external job cache. Use the `redis` returner as an example.

**Roster**

The *Roster system* is used by Salt SSH to enumerate devices.

**Runners**

Runners are purely master-side execution sequences.

**SDB**

- *Writing SDB Modules*

SDB is a way to store data that’s not associated with a minion. See *Storing Data in Other Databases*.

**Serializer**

Primarily used with `file.serialize`.

**State**

State modules are used to define the state interfaces used by Salt States. These modules are restrictive in that they must follow a number of rules to function properly.

**Note**: State modules define the available routines in sls files. If calling an execution module directly is desired, take a look at the `module` state.

**SPM pkgdb**

- *SPM Development Guide: Package Database*

pkgdb modules provides storage backends to the package database.

**SPM pkgfiles**

- *SPM Development Guide: Package Database*

pkgfiles modules handle the actual installation.
SSH Wrapper

SSH Wrapper

Salt-SSH Background

Salt-SSH works by creating a tar ball of salt, a bunch of python modules, and a generated short minion config. It then copies this onto the destination host over ssh, then uses that host's local python install to run `salt-client --local` with any requested modules. It does not automatically copy over states or cache files and since it uses a local file_client, modules that rely on `cp.cache*` functionality do not work.

SSH Wrapper modules

To support `cp` modules or other functionality which might not otherwise work in the remote environment, a wrapper module can be created. These modules are run from the salt-master initiating the salt-ssh command and can include logic to support the needed functionality. SSH Wrapper modules are located in `/salt/client/ssh/wrapper/` and are named the same as the execution module being extended. Any functions defined inside of the wrapper module are called from the `salt-ssh module.function` argument command rather than executing on the minion.

State Module example

Running salt states on an salt-ssh minion, obviously requires the state files themselves. To support this, a state module wrapper script exists at `salt/client/ssh/wrapper/state.py`, and includes standard state functions like `apply`, `sls`, and `highstate`. When executing `salt-ssh minion state.highstate`, these wrapper functions are used and include the logic to walk the low_state output for that minion to determine files used, gather needed files, tar them together, transfer the tar file to the minion over ssh, and run a state on the ssh minion. This state then extracts the tar file, applies the needed states and data, and cleans up the transferred files.

Wrapper Handling

From the wrapper script any invocations of `__salt__['some.module']()` do not run on the master which is running the wrapper, but instead magically are invoked on the minion over ssh. Should the function being called exist in the wrapper, the wrapper function will be used instead.

One way of supporting this workflow may be to create a wrapper function which performs the needed file copy operations. Now that files are resident on the ssh minion, the next step is to run the original execution module function. But since that function name was already overridden by the wrapper, a function alias can be created in the original execution module, which can then be called from the wrapper.

Example

The saltcheck module needs sls and tst files on the minion to function. The invocation of `saltcheck.run_state_tests` is run from the wrapper module, and is responsible for performing the needed file copy. The saltcheck execution module includes an alias line of `run_state_tests_ssh = salt.utils.funcutils.alias_function(run_state_tests, 'run_state_tests_ssh')` which creates an alias of `run_state_tests` with the name `run_state_tests_ssh`. At the end of the `run_state_tests` function in the wrapper module, it then calls `__salt__['saltcheck.run_state_tests_ssh']()`(). Since this function does not exist in the wrapper script, the call is made on the remote minion, which then having the needed files, runs as expected.
Replacement execution modules for *Salt SSH*.

**Thorium**

Modules for use in the *Thorium* event reactor.

**Tokens**

Token stores for *External Authentication*. See the `salt.tokens` docstring for details.

*Note:* The runner to load tokens modules is `saltutil.sync_eauth_tokens`.

**Tops**

Tops modules are used to convert external data sources into top file data for the state system.

**Util**

Just utility modules to use with other modules via `__utils__` (see *Dunder Dictionaries*).

**Wheel**

The wheel system is used to manage master side management routines. These routines are primarily intended for the API to enable master configuration.

### 29.20 Salt Extend

`salt-extend` is a templating tool for extending SaltStack. If you're looking to add a module to SaltStack, then the `salt-extend` utility can guide you through the process.

You can use Salt Extend to quickly create templated modules for adding new behaviours to some of the module subsystems within Salt.

Salt Extend takes a template directory and merges it into a SaltStack source code directory.

#### 29.20.1 Command line usage

See `salt-extend`
29.20.2 Choosing a template

The following templates are available:

**module**

Creates a new execution module within `salt/modules/{{module_name}}.py`

**module_unit**

Creates a new execution module unit test suite within `tests/unit/modules/test_{{module_name}}.py`

**state**

Creates a new state module within `salt/states/{{module_name}}.py`

**state_unit**

Creates a new state module unit test suite within `tests/unit/states/test_{{module_name}}.py`

29.20.3 Adding templates

1. Create a directory under `<src>/templates`
2. Create a file `template.yml` containing properties for
   - **description** - a description of the template
   - **questions** - a collection of additional questions to ask the user, the name of the item will be used as the key in the context dictionary within the jinja template.
     - **question** - The question to ask the user, as a string
     - **default** - (optional) the default value, can contain Jinja2 template syntax and has access to the default context properties

**Example template.yml**

```
# template.yml

description: "Execution module"
questions:
  depending_libraries:
    question: "What libraries does this module depend upon?"
  virtual_name:
    question: "What module virtual name to use?"
    default: "{{module_name}}"
```

3. Create the files within `<src>/templates/<your template>` to match the target

**Note:** File names can contain Jinja 2 template syntax, e.g. `('{{module_name}}.py')`
Example file in the template directory

```python
print("Hello {{module_name}}")
__virtual__ = "{{__virtual_name__}}"
```

Default context properties

The default context provides the following properties

- **description** - A description of the template
- **short_description** - A short description of the module as entered by the user
- **version** - The version name of the next release
- **module_name** - The module name as entered by the user
- **release_date** - The current date in the format `YYYY-MM-DD`
- **year** - The current year in the format `YYYY`

As well as any additional properties entered from the questions section of `template.yml`

29.20.4 API

salt.utils.extend module

29.21 Salt's Test Suite

Salt comes with a powerful integration and unit test suite allowing for the fully automated run of integration and/or unit tests from a single interface. It uses the combination of pytest, nox and Kitchen Salt to run these tests. Nox is used to manage all of the test python dependencies. When you run the test runner with nox, you will be installing the same python dependencies that we use to run our test suite on PRs and branch tests. Kitchen Salt is used to spin up our virtual machines based off of golden images. These virtual machines use the `salt-jenkins` sls states to configure any system dependencies.

To learn the basics of how Salt's test suite works, be sure to check out the [Salt's Test Suite: An Introduction](https://docs.saltstack.com/en/latest/topics/testing/intro.html) tutorial.

29.21.1 Nox

Nox is used to manage all of the python dependencies used in the test suite and spins up the different nox sessions. You can look at the `noxfile.py` in the salt repo to view all of the current nox configurations. In that file you will notice various nox sessions. When creating each of these sessions, nox will create a virtualenv with the specified interpreter. Once the virtualenv is created it will also install all of the required python dependencies required for that session and run the tests.

For example if you want to run all of the tests using the zeromq transport on python3 you would need to specify the zeromq transport and python3.

```bash
nox -e 'pytest-zeromq-3(coverage=False)'
```

As a contrast, when using the deprecated `runtests.py` test runner, the command would be:

```bash
nox -e 'runtests-zeromq-3(coverage=False)'
```
To run all the tests but on the tcp transport, you would need to specify the tcp session.

```
nox -e 'pytest-tcp-3(coverage=False)'
```

As a contrast, when using the deprecated `runtests.py` test runner, the command would be:

```
nox -e 'runtests-tcp-3(coverage=False)'
```

You can view all available sessions by running:

```
nox --list-sessions
```

For the most part you will only need nox to run the test suite, as this tool will install the exact same python dependencies we use to run on our test runs. The exception to this is when a system dependency is required, for example `mysql`. These system dependencies are installed with sls states managed in the `salt-jenkins` repo or you can manually install the dependency yourself.

### 29.21.2 System Dependencies

The system dependencies are installed from the `salt-jenkins` repo. The `golden-images-provision` state is what is run to determine what dependencies to install on which platform. We run this state only when we want to update our current VM images with new dependencies.

### 29.21.3 Kitchen Salt

We also use Kitchen Salt to spin up the VM's used for testing. You can view the kitchen-salt getting started for instructions on how to install and set it up. Kitchen Salt uses Test Kitchen to spin up the VM or container in the configured provider. Once the VM is spun up, Kitchen Salt can install salt and run a particular set of states. In the case of our branch and PR tests we create "Golden Images" which run the `salt-jenkins` states and install salt system dependencies beforehand. We only update these "Golden Images" when we need to upgrade or install a system dependency. You can view the kitchen-salt jenkins setup docs for instructions on how to set up Kitchen Salt similar to the jenkins environment we use to run branch and PR tests.

### 29.21.4 Test Directory Structure

Salt's test suite is located in the `tests/` directory in the root of Salt’s codebase.

With the migration to PyTest, Salt has created a separate directory for tests that are written taking advantage of the full potential of PyTest. These are located under `tests/pytests`.

As for the old test suite, it is divided into two main groups:

- **Integration Tests**
- **Unit Tests**

Within each of these groups, the directory structure roughly mirrors the structure of Salt's own codebase. Notice that there are directories for `states`, `modules`, `runners`, `output`, and more in each testing group.

The files that are housed in the `modules` directory of either the unit or the integration testing factions contain respective integration or unit test files for Salt execution modules.

The PyTest only tests under `tests/pytests` should, more or less, follow the same grouping as the old test suite.
Integration Tests

The Integration section of Salt’s test suite start up a number of Salt daemons to test functionality in a live environment. These daemons include two Salt Masters, one Syndic, and two Minions. This allows the Syndic interface to be tested and Master/Minion communication to be verified. All of the integration tests are executed as live Salt commands sent through the started daemons.

Integration tests are particularly good at testing modules, states, and shell commands, among other segments of Salt’s ecosystem. By utilizing the integration test daemons, integration tests are easy to write. They are also SaltStack’s generally preferred method of adding new tests.

The discussion in the Integration vs. Unit section of the testing tutorial is beneficial in learning why you might want to write integration tests vs. unit tests. Both testing arenas add value to Salt’s test suite and you should consider adding both types of tests if possible and appropriate when contributing to Salt.

• Integration Test Documentation

Unit Tests

Unit tests do not spin up any Salt daemons, but instead find their value in testing singular implementations of individual functions. Instead of testing against specific interactions, unit tests should be used to test a function’s logic as well as any return or raises statements. Unit tests also rely heavily on mocking external resources.

The discussion in the Integration vs. Unit section of the testing tutorial is useful in determining when you should consider writing unit tests instead of, or in addition to, integration tests when contributing to Salt.

• Unit Test Documentation

29.21.5 Running The Tests

There is only one requirement to install, to quickly get started running salt’s test suite: nox.

```shell
pip install nox
```

Once this requirement is installed, you can use the nox binary to run all of the tests included in Salt’s test suite:

```shell
nox -e 'pytest-zeromq-3(coverage=False)'
```

For more information about options you can pass the test runner, see the --help option:

```shell
nox -e 'pytest-zeromq-3(coverage=False)' -- --help
```

Running Test Subsections

Instead of running the entire test suite all at once, which can take a long time, there are several ways to run only specific groups of tests or individual tests:

• Run unit tests only: nox -e 'pytest-zeromq-3(coverage=False)' -- tests/unit/, using the deprecated runtests.py the command would be nox -e 'runtests-zeromq-3(coverage=False)' -- --unit-tests

• Run unit and integration tests for states: nox -e 'pytest-zeromq-3(coverage=False)' -- tests/unit/states/ tests/integration/states/, using the deprecated runtests.py the command would be nox -e 'runtests-zeromq-3(coverage=False)' -- --state-tests
• Run integration tests for an individual module: `nox -e 'pytest-zeromq-3(coverage=False)' -- tests/integration/modules/test_virt.py`, using the deprecated runtests.py the command would be `nox -e 'runtests-zeromq-3(coverage=False)' -- -n integration.modules.test_virt

• Run unit tests for an individual module: `nox -e 'pytest-zeromq-3(coverage=False)' -- tests/unit/modules/test_virt.py`, using the deprecated runtests.py the command would be `nox -e 'runtests-zeromq-3(coverage=False)' -- -n unit.modules.test_virt

• Run an individual test by using the class and test name (this example is for the `test_default_kvm_profile` test in the `tests/integration/module/test_virt.py`): `nox -e 'pytest-zeromq-3(coverage=False)' -- tests/integration/modules/test_virt.py::VirtTest::test_default_kvm_profile`, using the deprecated runtests.py the command would be `nox -e 'runtests-zeromq-3(coverage=False)' -- -n integration.modules.test_virt.VirtTest.test_default_kvm_profile

For more specific examples of how to run various test subsections or individual tests, please see the pytest documentation on how to run specific tests or the Running Specific Tests section of the Salt's Test Suite: An Introduction tutorial.

Running Unit Tests Without Integration Test Daemons

Since the unit tests do not require a master or minion to execute, it is often useful to be able to run unit tests individually, or as a whole group, without having to start up the integration testing daemons. Starting up the master, minion, and syndic daemons takes a lot of time before the tests can even start running and is unnecessary to run unit tests. To run unit tests without invoking the integration test daemons, simply add the unit directory as an argument:

```
nox -e 'pytest-zeromq-3(coverage=False)' -- tests/unit/
```

As a contrast, when using the deprecated runtests.py test runner, the command would be:

```
nox -e 'runtests-zeromq-3(coverage=False)' -- --unit-tests
```

All of the other options to run individual tests, entire classes of tests, or entire test modules still apply.

Running Destructive Integration Tests

Salt is used to change the settings and behavior of systems. In order to effectively test Salt's functionality, some integration tests are written to make actual changes to the underlying system. These tests are referred to as “destructive tests”. Some examples of destructive tests are changes may be testing the addition of a user or installing packages. By default, destructive tests are disabled and will be skipped.

Generally, destructive tests should clean up after themselves by attempting to restore the system to its original state. For instance, if a new user is created during a test, the user should be deleted after the related test(s) have completed. However, no guarantees are made that test clean-up will complete successfully. Therefore, running destructive tests should be done with caution.

**Note:** Running destructive tests will change the underlying system. Use caution when running destructive tests.

To run tests marked as destructive, set the `--run-destructive` flag:

```
nox -e 'pytest-zeromq-3(coverage=False)' -- --run-destructive
```

As a contrast, when using the deprecated runtests.py test runner, the command would be:
Running Cloud Provider Tests

Salt's testing suite also includes integration tests to assess the successful creation and deletion of cloud instances using Salt-Cloud for providers supported by Salt-Cloud.

The cloud provider tests are off by default and run on sample configuration files provided in tests/integration/files/conf/cloud.providers.d/. In order to run the cloud provider tests, valid credentials, which differ per provider, must be supplied. Each credential item that must be supplied is indicated by an empty string value and should be edited by the user before running the tests. For example, DigitalOcean requires a client key and an api key to operate. Therefore, the default cloud provider configuration file for DigitalOcean looks like this:

```
.digitalocean-config:
  driver: digitalocean
  client_key: ''
  api_key: ''
  location: New York 1
```

As indicated by the empty string values, the `client_key` and the `api_key` must be provided:

```
.digitalocean-config:
  driver: digitalocean
  client_key: wFGEwgregeqw3435gDger
  api_key: GDE43t43REGTrkilg43934t34qT43t4dgegerGEgg
  location: New York 1
```

Note: When providing credential information in cloud provider configuration files, do not include the single quotes.

Once all of the valid credentials for the cloud provider have been supplied, the cloud provider tests can be run by setting the `--cloud-provider-tests` flag:

```
nox -- 'runtests-zeromq-3(coverage=False)' -- --run-destructive
```

As a contrast, when using the deprecated `runtests.py` test runner, the command would be:

```
nox -- 'runtests-cloud-3(coverage=False)'
```

29.21.6 Automated Test Runs

SaltStack maintains a Jenkins server to allow for the execution of tests across supported platforms. The tests executed from Salt's Jenkins server create fresh virtual machines for each test run, then execute destructive tests on the new, clean virtual machine.

SaltStack's Jenkins server continuously runs the entire test suite, including destructive tests, on an array of various supported operating systems throughout the day. Each actively supported branch of Salt's repository runs the tests located in the respective branch's code. Each set of branch tests also includes a pylint run. These branch tests help ensure the viability of Salt code at any given point in time as pull requests are merged into branches throughout the day.
In addition to branch tests, SaltStack’s Jenkins server also runs tests on pull requests. These pull request tests include a smaller set of virtual machines that run on the branch tests. The pull request tests, like the branch tests, include a pylint test as well.

When a pull request is submitted to Salt’s repository on GitHub, the suite of pull request tests are started by Jenkins. These tests are used to gauge the pull request’s viability to merge into Salt’s codebase. If these initial tests pass, the pull request can then merged into the Salt branch by one of Salt’s core developers, pending their discretion. If the initial tests fail, core developers may request changes to the pull request. If the failure is unrelated to the changes in question, core developers may merge the pull request despite the initial failure.

As soon as the pull request is merged, the changes will be added to the next branch test run on Jenkins.

For a full list of currently running test environments, go to https://jenkinsci.saltstack.com.

Using Salt-Cloud on Jenkins

For testing Salt on Jenkins, SaltStack uses Salt-Cloud to spin up virtual machines. The script using Salt-Cloud to accomplish this is open source and can be found here: https://github.com/saltstack/salt/blob/master/tests/jenkins.py

29.21.7 Writing Tests

The salt testing infrastructure is divided into two classes of tests, integration tests and unit tests. These terms may be defined differently in other contexts, but for Salt they are defined this way:

- Unit Test: Tests which validate isolated code blocks and do not require external interfaces such as salt-call or any of the salt daemons.
- Integration Test: Tests which validate externally accessible features.

Salt testing uses unittest2 from the python standard library and MagicMock.

- Writing integration tests
- Writing unit tests

Naming Conventions

Any function in either integration test files or unit test files that is doing the actual testing, such as functions containing assertions, must start with test_:

```python
def test_user_present(self):
    ...
```

When functions in test files are not prepended with test_, the function acts as a normal, helper function and is not run as a test by the test suite.
Submitting New Tests

Which branch of the Salt codebase should new tests be written against? The location of where new tests should be submitted depends largely on the reason you're writing the tests.

Tests for New Features

If you are adding new functionality to Salt, please write the tests for this new feature in the same pull request as the new feature. New features should always be submitted to the `master` branch.

If you have already submitted the new feature, but did not write tests in the original pull request that has already been merged, please feel free to submit a new pull request containing tests. If the feature was recently added to Salt’s `master` branch, then the tests should be added there as well. However, if the feature was added to `master` some time ago and is already present in one or more release branches, please refer to the Tests for Entire Files or Functions section below for more details about where to submit tests for functions or files that do not already have tests.

Tests to Accompany a Bugfix

If you are writing tests for code that fixes a bug in Salt, tests will be required before merging the PR. A great option for most bugfixes is to adopt a TDD style approach:

- reproduce the issue
- write a test that exhibits the behavior
- write the bugfix

This helps ensure that known issues are not reintroduced into the codebase.

Tests for Entire Files or Functions

Sometimes entire files in Salt are completely untested. If you are writing tests for a file that doesn’t have any tests written for it, write your test against the earliest supported release branch that contains the file or function you're testing.

Once your tests are submitted in a pull request and is merged into the branch in question, the tests you wrote will be merged-forward by SaltStack core engineers and the new tests will propagate to the newer release branches. That way the tests you wrote will apply to all current and relevant release branches, and not just the `master` branch, for example. This methodology will help protect against regressions on older files in Salt’s codebase.

There may be times when the tests you write against an older branch fail in the merge-forward process because functionality has changed in newer release branches. In these cases, a Salt core developer may reach out to you for advice on the tests in question if the path forward is unclear.

Note: If tests are written against a file in an older release branch and then merged forward, there may be new functionality in the file that is present in the new release branch that is untested. It would be wise to see if new functionality could use additional testing once the test file has propagated to newer release branches.
Test Helpers

Several Salt-specific helpers are available. A full list is available by inspecting functions exported in tests.support.helpers.

@expensiveTest -- Designates a test which typically requires a relatively costly external resource, like a cloud virtual machine. This decorator is not normally used by developers outside of the Salt core team.

@destructiveTest -- Marks a test as potentially destructive. It will not be run by the test runner unless the `-run-destructive` test is expressly passed.

@requires_network -- Requires a network connection for the test to operate successfully. If a network connection is not detected, the test will not run.

@requires_salt_modules -- Requires all the modules in a list of modules in order for the test to be executed. Otherwise, the test is skipped.

@requires_system_grains -- Loads and passes the grains on the system as an keyword argument to the test function with the name grains.

@skip_if_binaries_missing(['list', 'of', 'binaries']) -- If called from inside a test, the test will be skipped if the binaries are not all present on the system.

@skip_if_not_root -- If the test is not executed as root, it will be skipped.

@with_system_user -- Creates and optionally destroys a system user within a test case. See implementation details in tests.support.helpers for details.

@with_system_group -- Creates and optionally destroys a system group within a test case. See implementation details in tests.support.helpers for details.

@with_system_user_and_group -- Creates and optionally destroys a system user and group within a test case. See implementation details in tests.support.helpers for details.

29.22 Integration Tests

The Salt integration tests come with a number of classes and methods which allow for components to be easily tested. These classes are generally inherited from and provide specific methods for hooking into the running integration test environment created by the integration tests.

It is noteworthy that since integration tests validate against a running environment that they are generally the preferred means to write tests.

The integration system is all located under tests/integration in the Salt source tree. Each directory within tests/integration corresponds to a directory in Salt's tree structure. For example, the integration tests for the test.py Salt module that is located in salt/modules should also be named test.py and reside in tests/integration/modules.
29.22.1 Preparing to Write Integration Tests

This guide assumes that your Salt development environment is already configured and that you have a basic understanding of contributing to the Salt codebase. If you're unfamiliar with either of these topics, please refer to the Installing Salt for Development and the Contributing pages, respectively.

This documentation also assumes that you have an understanding of how to run Salt's test suite, including running the test subsections, and running a single integration test file, class, or individual test.

29.22.2 Best Practices

Integration tests should be written to the following specifications.

What to Test?

Since integration tests are used to validate against a running Salt environment, integration tests should be written with the Salt components, and their various interactions, in mind.

- Isolate testing functionality. Don't rely on the pass or failure of other, separate tests.
- Individual tests should test against a single behavior.
- Since it occasionally takes some effort to “set up” an individual test, it may be necessary to call several functions within a single test. However, be sure that once the work has been done to set up a test, make sure you are clear about the functionality that is being tested.

Naming Conventions

Test names and docstrings should indicate what functionality is being tested. Test functions are named test_<fcn>_<test-name> where <fcn> is the function being tested and <test-name> describes the behavior being tested.

In order for integration tests to get picked up during a run of the test suite, each individual test must be prepended with the test_ naming syntax, as described above.

If a function does not start with test_, then the function acts as a "normal" function and is not considered a testing function. It will not be included in the test run or testing output.

The setUp and tearDown Functions

There are two special functions that can be utilized in the integration side of Salt's test suite: setUp and tearDown. While these functions are not required in all test files, there are many examples in Salt's integration test suite illustrating the broad usefulness of each function.

The setUp function is used to set up any repetitive or useful tasks that the tests in a test class need before running. For example, any of the mac_* integration tests should only run on macOS machines. The setUp function can be used to test for the presence of the Darwin kernel. If the Darwin kernel is not present, then the test should be skipped.

```python
def setUp(self):
    """
    Sets up test requirements
    """
    os_grain = self.run_function("grains.item", ["kernel"])
```

(continues on next page)
The `setUp` function can be used for many things. The above code snippet is only one example. Another example might be to ensure that a particular setting is present before running tests that would require the setting.

The `tearDown` function is used to clean up after any tests. This function is useful for restoring any settings that might have been changed during the test run.

**Note:** The `setUp` and `tearDown` functions run before and after each test in the test class that the `setUp` and `tearDown` functions are defined.

Be sure to read the *Destructive vs Non-Destructive Tests* section when using any kind of destructive functions that might alter the system running the test suite in either the `setUp` or `tearDown` function definitions.

### Testing Order

The test functions within a test class do not run in the order they were defined, but instead run in lexicographical order.

Note that if any `setUp` or `tearDown` functions are defined in the class, those functions will run before (for `setUp`) or after (for `tearDown`) each test case.

### 29.22.3 Integration Classes

The integration classes are located in `tests/integration/__init__.py` and can be extended therein. There are four classes available to extend:

- `ModuleCase`
- `ShellCase`
- `SSHCase`
- `SyndicCase`

**ModuleCase**

Used to define executions run via the master to minions and to call single modules and states. The available testing functions are:

`run_function`

Run a single salt function and condition the return down to match the behavior of the raw function call. This will run the command and only return the results from a single minion to verify.
run_state

Run the state.single command and return the state return structure.

minion_run

Run a single salt function on the 'minion' target and condition the return down to match the behavior of the raw function call.

ShellCase

Shell out to the scripts which ship with Salt. The testing functions are:

run_cp

Execute salt-cp. Pass in the argument string as it would be passed on the command line.

run_call

Execute salt-call, pass in the argument string as it would be passed on the command line.

run_cloud

Execute the salt-cloud command. Pass in the argument string as it would be passed on the command line.

run_key

Execute the salt-key command. Pass in the argument string as it would be passed on the command line.

run_run

Execute the salt-run command. Pass in the argument string as it would be passed on the command line.

run_run_plus

Execute the runner function the and return the return data and output in a dict
run_salt

Execute the salt command. Pass in the argument string as it would be passed on the command line.

run_script

Execute a salt script with the given argument string.

run_ssh

Execute the salt-ssh. Pass in the argument string as it would be passed on the command line.

SSHCase

Used to execute remote commands via salt-ssh. The available methods are as follows:

run_function

Run a single salt function via salt-ssh and condition the return down to match the behavior of the raw function call. This will run the command and only return the results from a single minion to verify.

SyndicCase

Used to execute remote commands via a syndic and is only used to verify the capabilities of the Salt Syndic. The available methods are as follows:

run_function

Run a single salt function and condition the return down to match the behavior of the raw function call. This will run the command and only return the results from a single minion to verify.

29.22.4 Examples

The following sections define simple integration tests present in Salt’s integration test suite for each type of testing class.

Module Example via ModuleCase Class

Import the integration module, this module is already added to the python path by the test execution. Inherit from the integration.ModuleCase class.

Now the workhorse method run_function can be used to test a module:
import os
from tests.support.case import ModuleCase

class TestModuleTest(ModuleCase):
    """
    Validate the test module
    """

def test_ping(self):
    """
    test.ping
    """
    self.assertTrue(self.run_function("test.ping"))

def test_echo(self):
    """
    test.echo
    """
    self.assertEqual(self.run_function("test.echo", ["text"], ["text"]), "text")

The first example illustrates the testing master issuing a `test.ping` call to a testing minion. The test asserts that the minion returned with a True value to the master from the `test.ping` call.

The second example similarly verifies that the minion executed the `test.echo` command with the `text` argument. The `assertEqual` call maintains that the minion ran the function and returned the data as expected to the master.

Shell Example via ShellCase

Validating the shell commands can be done via shell tests:

```
import sys
import shutil
import tempfile

from tests.support.case import ShellCase

class KeyTest(ShellCase):
    """
    Test salt-key script
    """
    _call_binary_ = "salt-key"

def test_list(self):
    """
    test salt-key -L
    """
    data = self.run_key("-L")
    expect = ['Unaccepted Keys:',
              'Accepted Keys:',
              'minion",
              'sub_minion",
              'Rejected:"
```
This example verifies that the `salt-key` command executes and returns as expected by making use of the `run_key` method.

**SSH Example via SSHCase**

Testing salt-ssh functionality can be done using the SSHCase test class:

```python
from tests.support.case import SSHCase

class SSHGrainsTest(SSHCase):
    
    def test_grains_id(self):
        cmd = self.run_function("grains.get", ["id"])
        self.assertEqual(cmd, "localhost")
```

**Testing Event System via SaltMinionEventAssertsMixin**

The fundamentally asynchronous nature of Salt makes testing the event system a challenge. The `SaltMinionEventAssertsMixin` provides a facility for testing that events were received on a minion event bus.

```python
import salt.utils.event
from tests.support.mixins import SaltEventAssertsMixin

class TestEvent(SaltEventAssertsMixin):
    
    def test_event(self):
        e = salt.utils.event.get_event("minion", sock_dir=self.minion_opts["sock_dir"], opts=self.minion_opts)

        e.fire_event({"a": "b"}, "/test_event")

        self.assertMinionEventReceived({"a": "b"})
```
Syndic Example via SyndicCase

Testing Salt’s Syndic can be done via the SyndicCase test class:

```python
from tests.support.case import SyndicCase

class TestSyndic(SyndicCase):
    """
    Validate the syndic interface by testing the test module
    """

def test_ping(self):
    """
    test.ping
    """
    self.assertTrue(self.run_function("test.ping"))
```

This example verifies that a `test.ping` command is issued from the testing master, is passed through to the testing syndic, down to the minion, and back up again by using the `run_function` located with in the `SyndicCase` test class.

29.22.5 Integration Test Files

Since using Salt largely involves configuring states, editing files, and changing system data, the integration test suite contains a directory named `files` to aid in testing functions that require files. Various Salt integration tests use these example files to test against instead of altering system files and data.

Each directory within `tests/integration/files` contain files that accomplish different tasks, based on the needs of the integration tests using those files. For example, `tests/integration/files/ssh` is used to boot-strap the test runner for salt-ssh testing, while `tests/integration/files/pillar` contains files storing data needed to test various pillar functions.

The `tests/integration/files` directory also includes an integration state tree. The integration state tree can be found at `tests/integration/files/file/base`.

The following example demonstrates how integration files can be used with ModuleCase to test states:

```python
# Import python libs
from __future__ import absolute_import
import os
import shutil

# Import Salt Testing libs
from tests.support.case import ModuleCase
from tests.support.paths import FILES, TMP
from tests.support.mixins import SaltReturnAssertsMixin

# Import salt libs
import salt.utils.files

HFILE = os.path.join(TMP, "hosts")

class HostTest(ModuleCase, SaltReturnAssertsMixin):
    """
    Validate the host state
    """
```
To access the integration files, a variable named FILES points to the tests/integration/files directory. This is where the referenced host.present sls file resides.

In addition to the static files in the integration state tree, the location TMP can also be used to store temporary files that the test system will clean up when the execution finishes.

### 29.22.6 Destructive vs Non-Destructive Tests

Since Salt is used to change the settings and behavior of systems, one testing approach is to run tests that make actual changes to the underlying system. This is where the concept of destructive integration tests comes into play. Tests can be written to alter the system they are running on. This capability is what fills in the gap needed to properly test aspects of system management like package installation.

Any test that changes the underlying system in any way, such as creating or deleting users, installing packages, or changing permissions should include the @destructive decorator to signal system changes and should be written with care. System changes executed within a destructive test should also be restored once the related tests have completed. For example, if a new user is created to test a module, the same user should be removed after the test is completed to maintain system integrity.

To write a destructive test, import, and use the destructiveTest decorator for the test method:

```python
from tests.support.case import ModuleCase
from tests.support.helpers import destructiveTest, skip_if_not_root

class DestructiveExampleModuleTest(ModuleCase):
    ""
    Demonstrate a destructive test
    """
    @destructiveTest
    @skip_if_not_root
```

(continues on next page)
def test_user_not_present(self):
    
    """
    This is a DESTRUCTIVE TEST it creates a new user on the minion.
    And then destroys that user.
    """
    ret = self.run_state("user.present", name="salt_test")
    self.assertSaltTrueReturn(ret)
    ret = self.run_state("user.absent", name="salt_test")
    self.assertSaltTrueReturn(ret)

29.22.7 Cloud Provider Tests

Cloud provider integration tests are used to assess Salt-Cloud's ability to create and destroy cloud instances for various supported cloud providers. Cloud provider tests inherit from the ShellCase Integration Class.

Any new cloud provider test files should be added to the tests/integration/cloud/providers/ directory. Each cloud provider test file also requires a sample cloud profile and cloud provider configuration file in the integration test file directory located at tests/integration/files/conf/cloud.*.d/.

The following is an example of the default profile configuration file for Digital Ocean, located at: tests/integration/files/conf/cloud.profiles.d/digitalocean.conf:

digitalocean-test:
    provider: digitalocean-config
    image: Ubuntu 14.04 x64
    size: 512MB

Each cloud provider requires different configuration credentials. Therefore, sensitive information such as API keys or passwords should be omitted from the cloud provider configuration file and replaced with an empty string. The necessary credentials can be provided by the user by editing the provider configuration file before running the tests.

The following is an example of the default provider configuration file for Digital Ocean, located at: tests/integration/files/conf/cloud.providers.d/digitalocean.conf:

digitalocean-config:
    driver: digitalocean
    client_key: ''
    api_key: ''
    location: New York 1

In addition to providing the necessary cloud profile and provider files in the integration test suite file structure, appropriate checks for if the configuration files exist and contain valid information are also required in the test class's setUp function:

from tests.support.case import ShellCase
from tests.support.paths import FILES

class LinodeTest(ShellCase):
    """
    Integration tests for the Linode cloud provider in Salt-Cloud
    """

    def setUp(self):
        """
        (continues on next page)
Sets up the test requirements

```
super(LinodeTest, self).setUp()
```

# check if appropriate cloud provider and profile files are present
profile_str = "linode-config:"
provider = "linode"
providers = self.run_cloud("--list-providers")
if profile_str not in providers:
    self.skipTest(
        "Configuration file for {0} was not found. Check {0}.conf files "
        "in tests/integration/files/conf/cloud.*.d/ to run these tests."
        .format(provider)
    )

# check if apikey and password are present
path = os.path.join(FILES, "conf", "cloud.providers.d", provider + ".conf")
config = cloud_providers_config(path)
api = config["linode-config"]["linode"]["apikey"]
password = config["linode-config"]["linode"]["password"]
if api == "" or password == "":
    self.skipTest(
        "An api key and password must be provided to run these tests. Check "
        "tests/integration/files/conf/cloud.providers.d/{0}.conf".format(
            provider
        )
    )

Repeatedly creating and destroying instances on cloud providers can be costly. Therefore, cloud provider tests are
off by default and do not run automatically. To run the cloud provider tests, the --cloud-provider-tests flag must be provided:

```
./tests/runtests.py --cloud-provider-tests
```

Since cloud provider tests do not run automatically, all provider tests must be preceded with the @expensiveTest
decorator. The expensive test decorator is necessary because it signals to the test suite that the
--cloud-provider-tests flag is required to run the cloud provider tests.

To write a cloud provider test, import, and use the expensiveTest decorator for the test function:

```
from tests.support.helpers import expensiveTest

@expensiveTest
def test_instance(self):
    
    Test creating an instance on Linode

    name = "linode-testing"

    # create the instance
    instance = self.run_cloud("-p linode-test {0}".format(name))
    str = "
```

(continues on next page)
# check if instance with salt installed returned as expected
try:
    self.assertIn(str, instance)
except AssertionError:
    self.run_cloud("-d {0} --assume-yes".format(name))
raise

# delete the instance
delete = self.run_cloud("-d {0} --assume-yes".format(name))
str = "True"
try:
    self.assertIn(str, delete)
except AssertionError:
    raise

## 29.22.8 Adding New Directories

If the corresponding Salt directory does not exist within `tests/integration`, the new directory must be created along with the appropriate test file to maintain Salt's testing directory structure.

In order for Salt's test suite to recognize tests within the newly created directory, options to run the new integration tests must be added to `tests/runtests.py`. Examples of the necessary options that must be added can be found here: https://github.com/saltstack/salt/blob/master/tests/runtests.py. The functions that need to be edited are `setup_additional_options`, `validate_options`, and `run_integration_tests`.

### 29.23 Writing Unit Tests

#### 29.23.1 Introduction

Like many software projects, Salt has two broad-based testing approaches -- integration testing and unit testing. While integration testing focuses on the interaction between components in a sandboxed environment, unit testing focuses on the singular implementation of individual functions.

Unit tests should be used specifically to test a function's logic. Unit tests rely on mocking external resources.

While unit tests are good for ensuring consistent results, they are most useful when they do not require more than a few mocks. Effort should be made to mock as many external resources as possible. This effort is encouraged, but not required. Sometimes the isolation provided by completely mocking the external dependencies is not worth the effort of mocking those dependencies.

In these cases, requiring an external library to be installed on the system before running the test file is a useful way to strike this balance. For example, the unit tests for the MySQL execution module require the presence of the MySQL python bindings on the system running the test file before proceeding to run the tests.

Overly detailed mocking can also result in decreased test readability and brittleness as the tests are more likely to fail when the code or its dependencies legitimately change. In these cases, it is better to add dependencies to the test runner dependency state.
29.23.2 Preparing to Write a Unit Test

This guide assumes that your Salt development environment is already configured and that you have a basic understanding of contributing to the Salt codebase. If you're unfamiliar with either of these topics, please refer to the Installing Salt for Development and the Contributing pages, respectively.

This documentation also assumes that you have an understanding of how to run Salt's test suite, including running the unit test subsection, running the unit tests without testing daemons to speed up development wait times, and running a unit test file, class, or individual test.

29.23.3 Best Practices

Unit tests should be written to the following specifications.

What to Test?

Since unit testing focuses on the singular implementation of individual functions, unit tests should be used specifically to test a function's logic. The following guidelines should be followed when writing unit tests for Salt's test suite:

- Each raise and return statement needs to be independently tested.
- Isolate testing functionality. Don't rely on the pass or failure of other, separate tests.
- Test functions should contain only one assertion, at most, multiple assertions can be made, but against the same outcome.
- Many Salt execution modules are merely wrappers for distribution-specific functionality. If there isn’t any logic present in a simple execution module, consider writing an integration test instead of heavily mocking a call to an external dependency.

Mocking Test Data

A reasonable effort needs to be made to mock external resources used in the code being tested, such as APIs, function calls, external data either globally available or passed in through function arguments, file data, etc.

- Test functions should contain only one assertion and all necessary mock code and data for that assertion.
- External resources should be mocked in order to "block all of the exits". If a test function fails because something in an external library wasn’t mocked properly (or at all), this test is not addressing all of the "exits" a function may experience. We want the Salt code and logic to be tested, specifically.
- Consider the fragility and longevity of a test. If the test is so tightly coupled to the code being tested, this makes a test unnecessarily fragile.
- Make sure you are not mocking the function to be tested so vigorously that the test return merely tests the mocked output. The test should always be testing a function's logic.
Mocking Loader Modules

Salt loader modules use a series of globally available dunder variables, `__salt__`, `__opts__`, `__pillar__`, etc. To facilitate testing these modules `pytest-salt-factories` has a plugin which will prepare the module globals by patching and mocking the dunder variables prior to running each test, as long as the test module defines a fixture named `configure_loader_modules`. Check out the code for the `pytest-salt-factories` plugin to know how it’s internals work.

The reason for the existence of this plugin is because historically one would add these dunder variables directly on the imported module. This, however, introduces unexpected behavior when running the full test suite since those attributes would not be removed once we were done testing the module and would therefore leak to other modules being tested with unpredictable results. This is the kind of work that should be deferred to mock, and that’s exactly what this plugin provides.

As an example, if one needs to specify some options which should be available to the module being tested one should do:

```python
import pytest
import salt.modules.somemodule as somemodule

@ pytest.fixture
def configure_loader_modules():
    
    This fixture should return a dictionary which is what's going to be used to patch and mock Salt's loader

    return {somemodule: {"__opts__": {"test": True}}}
```

Consider this more extensive example from `tests/pytests/unit/beacons/test_sensehat.py`:

```python
import pytest
import salt.beacons.sensehat as sensehat
from tests.support.mock import MagicMock

@ pytest.fixture
def configure_loader_modules():
    return {
        sensehat: {
            "__salt__": {
                "sensehat.get_humidity": MagicMock(return_value=80),
                "sensehat.get_temperature": MagicMock(return_value=30),
                "sensehat.get_pressure": MagicMock(return_value=1500),
            },
        }
    }

def test_non_list_config():
    config = {}

    ret = sensehat.validate(config)

    assert ret == (False, "Configuration for sensehat beacon must be a list.")

def test_empty_config():
```

(continues on next page)
config = [[]]
ret = sensehat.validate(config)
assert ret == (False, "Configuration for sensehat beacon requires sensors.")

def test_sensehat_humidity_match():
    config = ["sensors": {"humidity": "70%"}]
    ret = sensehat.validate(config)
    assert ret == (True, "Valid beacon configuration")
    ret = sensehat.beacon(config)
    assert ret == ["tag": "sensehat/humidity", "humidity": 80]]

def test_sensehat_temperature_match():
    config = ["sensors": {"temperature": 20}]
    ret = sensehat.validate(config)
    assert ret == (True, "Valid beacon configuration")
    ret = sensehat.beacon(config)
    assert ret == ["tag": "sensehat/temperature", "temperature": 30}]

def test_sensehat_temperature_match_range():
    config = ["sensors": {"temperature": [20, 29]}
    ret = sensehat.validate(config)
    assert ret == (True, "Valid beacon configuration")
    ret = sensehat.beacon(config)
    assert ret == ["tag": "sensehat/temperature", "temperature": 30}]

def test_sensehat_pressure_match():
    config = ["sensors": {"pressure": "1400"}]
    ret = sensehat.validate(config)
    assert ret == (True, "Valid beacon configuration")
    ret = sensehat.beacon(config)
    assert ret == ["tag": "sensehat/pressure", "pressure": 1500}]

def test_sensehat_no_match():
    config = ["sensors": {"pressure": "1600"}]
    ret = sensehat.validate(config)
```python
assert ret == (True, "Valid beacon configuration")
ret = sensehat.beacon(config)
assert ret == []
```

What happens in the above example is we mock several calls of the `sensehat` module to return known expected values to assert against.

### Mocking Filehandles

**Note:** This documentation applies to the 2018.3 release cycle and newer. The extended functionality for `mock_open` described below does not exist in the 2017.7 and older release branches.

Opening files in Salt is done using `salt.utils.files.fopen()`. When testing code that reads from files, the `mock_open` helper can be used to mock filehandles. Note that is not the same `mock_open` as `unittest.mock.mock_open()` from the Python standard library, but rather a separate implementation which has additional functionality.

```python
from tests.support.mock import patch, mock_open
import salt.modules.mymod as mymod

def test_something():
    fopen_mock = mock_open(read_data="foo\nbar\nbaz\n")
    with patch("salt.utils.files.fopen", fopen_mock):
        result = mymod.myfunc()
        assert result is True
```

This will force any filehandle opened to mimic a filehandle which, when read, produces the specified contents.

**Important:** String Types

When configuring your `read_data`, make sure that you are using bytestrings (e.g. b"foo\nbar\nbaz\n") when the code you are testing is opening a file for binary reading, otherwise the tests will fail. The mocked filehandles produced by `mock_open` will raise a `TypeError` if you attempt to read a bytestring when opening for non-binary reading, and similarly will not let you read a string when opening a file for binary reading. They will also not permit bytestrings to be "written" if the mocked filehandle was opened for non-binary writing, and vice-versa when opened for non-binary writing. These enhancements force test writers to write more accurate tests.

### More Complex Scenarios

#### Multiple File Paths

What happens when the code being tested reads from more than one file? For those cases, you can pass `read_data` as a dictionary:

```python
import textwrap
```

(continues on next page)
from tests.support.mock import patch, mock_open

import salt.modules.mymod as mymod

def test_something():
    contents = {
        "/etc/foo.conf": textwrap.dedent("foo
    bar
    baz
    ")
    },
    "/etc/b*.conf": textwrap.dedent("one
two
three
    ")
    ),
    }
    fopen_mock = mock_open(read_data=contents)
    with patch("salt.utils.files.fopen", fopen_mock):
        result = mymod.myfunc()
        assert result is True

This would make salt.utils.files.fopen() produce filehandles with different contents depending on which file was being opened by the code being tested. /etc/foo.conf and any file matching the pattern /etc/b*.conf would work, while opening any other path would result in a FileNotFoundError being raised.

Since file patterns are supported, it is possible to use a pattern of '*' to define a fallback if no other patterns match the filename being opened. The below two mock_open calls would produce identical results:

mock_open(read_data="foo\n")
mock_open(read_data=｛"*": "foo\n"｝)

Note: Take care when specifying the read_data as a dictionary, in cases where the patterns overlap (e.g. when both /etc/b*.conf and /etc/bar.conf are in the read_data). Dictionary iteration order will determine which pattern is attempted first, second, etc., with the exception of * which is used when no other pattern matches. If your test case calls for specifying overlapping patterns, and you are not running Python 3.6 or newer, then an OrderedDict can be used to ensure matching is handled in the desired way:

contents = OrderedDict()
contents["/etc/bar.conf"] = "foo\nbar\nbaz\n"
contents["/etc/b*.conf"] = IOError(errno.EACCES, "Permission denied")
contents["*"] = ʹThis is a fallback for files not beginning with "/etc/b\n"
fopen_mock = mock_open(read_data=contents)
Raising Exceptions

Instead of a string, an exception can also be used as the `read_data`:

```python
import errno
from tests.support.mock import patch, mock_open
import salt.modules.mymod as mymod

def test_something():
    exc = IOError(errno.EACCES, "Permission denied")
    fopen_mock = mock_open(read_data=exc)
    with patch("salt.utils.files.fopen", fopen_mock):
        mymod.myfunc()
```

The above example would raise the specified exception when any file is opened. The expectation would be that `mymod.myfunc()` would gracefully handle the IOError, so a failure to do that would result in it being raised and causing the test to fail.

Multiple File Contents

For cases in which a file is being read more than once, and it is necessary to test a function's behavior based on what the file looks like the second (or third, etc.) time it is read, just specify the contents for that file as a list. Each time the file is opened, `mock_open` will cycle through the list and produce a mocked filehandle with the specified contents. For example:

```python
import errno
import textwrap
from tests.support.mock import patch, mock_open
import salt.modules.mymod as mymod

def test_something():
    contents = {
        "/etc/foo.conf": [
            textwrap.dedent("""
            foo
            bar
            """"
        ],
        "/etc/b*.conf": [
            IOError(errno.ENOENT, "No such file or directory"),
            textwrap.dedent("""
            foo
            bar
            baz
            """"
        ],
    }
```

(continues on next page)
Using this example, the first time `/etc/foo.conf` is opened, it will simulate a file with the first string in the list as its contents, while the second time it is opened, the simulated file's contents will be the second string in the list.

If no more items remain in the list, then attempting to open the file will raise a `RuntimeError`. In the example above, if `/etc/foo.conf` were to be opened a third time, a `RuntimeError` would be raised.

Note that exceptions can also be mixed in with strings when using this technique. In the above example, if `/etc/bar.conf` were to be opened twice, the first time would simulate the file not existing, while the second time would simulate a file with string defined in the second element of the list.

Note: Notice that the second path in the `contents` dictionary above (`/etc/b*.conf`) contains an asterisk. The items in the list are cycled through for each match of a given pattern (not separately for each individual file path), so this means that only two files matching that pattern could be opened before the next one would raise a `RuntimeError`.

### Accessing the Mocked Filehandles in a Test

Accessing the Mocked Filehandles in a Test

Note: The code for the `MockOpen`, `MockCall`, and `MockFH` classes (referenced below) can be found in `tests/support/mock.py`. There are extensive unit tests for them located in `tests/unit/test_mock.py`.

The above examples simply show how to mock `salt.utils.files.fopen()` to simulate files with the contents you desire, but you can also access the mocked filehandles (and more), and use them to craft assertions in your tests. To do so, just add an `as` clause to the end of the `patch` statement:

```python
fopen_mock = mock_open(read_data="foo\nbar\nbaz\n")
with patch("salt.utils.files.fopen", fopen_mock) as m_open:
    # do testing here
    ...
```

When doing this, `m_open` will be a `MockOpen` instance. It will contain several useful attributes:

- **read_data** - A dictionary containing the `read_data` passed when `mock_open` was invoked. In the event that multiple file paths are not used, then this will be a dictionary mapping `*` to the `read_data` passed to `mock_open`.
- **call_count** - An integer representing how many times `salt.utils.files.fopen()` was called to open a file.
• **calls** - A list of `MockCall` objects. A `MockCall` object is a simple class which stores the arguments passed to it, making the positional arguments available via its `args` attribute, and the keyword arguments available via its `kwargs` attribute.

```python
from tests.support.mock import patch, mock_open, MockCall
import salt.modules.mymod as mymod

def test_something():
    with patch("salt.utils.files.fopen", mock_open(read_data=b"foo\n")) as m_open:
        mymod.myfunc()
        # Assert that only two opens attempted
        assert m_open.call_count == 2
        # Assert that only /etc/foo.conf was opened
        assert all(call.args[0] == "/etc/foo.conf" for call in m_open.calls)
        # Assert that the first open was for binary read, and the
        # second was for binary write.
        assert m_open.calls == [
            MockCall("/etc/foo.conf", "rb"),
            MockCall("/etc/foo.conf", "wb"),
        ]
```

Note that `MockCall` is imported from `tests.support.mock` in the above example. Also, the second assert above is redundant since it is covered in the final assert, but both are included simply as an example.

• **filehandles** - A dictionary mapping the unique file paths opened, to lists of `MockFH` objects. Each open creates a unique `MockFH` object. Each `MockFH` object itself has a number of useful attributes:

  - **filename** - The path to the file which was opened using `salt.utils.files.fopen()`
  - **call** - A `MockCall` object representing the arguments passed to `salt.utils.files.fopen()`. Note that this `MockCall` is also available in the parent `MockOpen` instance's `calls` list.
  - The following methods are mocked using `unittest.mock.Mock` objects, and Mock's built-in asserts (as well as the call data) can be used as you would with any other Mock object:
    - `.read()`
    - `.readlines()`
    - `.readline()`
    - `.close`
    - `.write`
    - `.writelines`
    - `.seek()`

      - The read functions (.read(), .readlines(), .readline()) all work as expected, as does iterating through the file line by line (i.e. for line in fh:).
      - The `.tell()` method is also implemented in such a way that it updates after each time the mocked filehandle is read, and will report the correct position. The one caveat here is that `.seek()` doesn't actually work (it's simply mocked), and will not change the position. Additionally, neither `.write()` or `.writelines()` will modify the mocked filehandle's contents.
      - The attributes `.write_calls` and `.writelines_calls` (no parenthesis) are available as shorthands and correspond to lists containing the contents passed for all calls to `.write()` and `.writelines()`, respectively.
Examples

```python
with patch("salt.utils.files.fopen", mock_open(read_data=contents)) as m_open:
    # Run the code you are unit testing
    mymod.myfunc()
    # Check that only the expected file was opened, and that it was opened
    # only once.
    assert m_open.call_count == 1
    assert list(m_open.filehandles) == ["/etc/foo.conf"]
    # "opens" will be a list of all the mocked filehandles opened
    opens = m_open.filehandles["/etc/foo.conf"]
    # Check that we wrote the expected lines ("expected" here is assumed to
    # be a list of strings)
    assert opens[0].write_calls == expected
```

```python
with patch("salt.utils.files.fopen", mock_open(read_data=contents)) as m_open:
    # Run the code you are unit testing
    mymod.myfunc()
    # Check that .readlines() was called (remember, it's a Mock)
    m_open.filehandles["/etc/foo.conf"][0].readlines.assert_called()
```

```python
with patch("salt.utils.files.fopen", mock_open(read_data=contents)) as m_open:
    # Run the code you are unit testing
    mymod.myfunc()
    # Check that we read the file and also wrote to it
    m_open.filehandles["/etc/foo.conf"][0].read.assert_called_once()
    m_open.filehandles["/etc/foo.conf"][1].writelines.assert_called_once()
```

Naming Conventions

Test names and docstrings should indicate what functionality is being tested. Test functions are named `test_<fcn>_<test-name>` where `<fcn>` is the function being tested and `<test-name>` describes the raise or return being tested.

Unit tests for `salt/.../<module>.py` are contained in a file called `tests/pytests/unit/.../test_<module>.py`, e.g. the tests for `salt/modules/alternatives.py` are in `tests/pytests/unit/modules/test_alternatives.py`.

In order for unit tests to get picked up during a run of the unit test suite, each unit test file must be prefixed with `test_` and each individual test must also be prefixed with the `test_` naming syntax, as described above.

If a function does not start with `test_`, then the function acts as a "normal" function and is not considered a testing function. It will not be included in the test run or testing output. The same principle applies to unit test files that do not have the `test_*` naming syntax. This test file naming convention is how the test runner recognizes that a test file contains tests.
Imports

Most commonly, the following imports are necessary to create a unit test:

```python
import pytest
```

If you need mock support to your tests, please also import:

```python
from tests.support.mock import MagicMock, patch, call
```

29.23.4 Evaluating Truth

A longer discussion on the types of assertions one can make can be found by reading PyTest’s documentation on assertions.

29.23.5 Tests Using Mock Objects

In many cases, the purpose of a Salt module is to interact with some external system, whether it be to control a database, manipulate files on a filesystem or something else. In these varied cases, it’s necessary to design a unit test which can test the function whilst replacing functions which might actually call out to external systems. One might think of this as “blocking the exits” for code under tests and redirecting the calls to external systems with our own code which produces known results during the duration of the test.

To achieve this behavior, Salt makes heavy use of the MagicMock package.

To understand how one might integrate Mock into writing a unit test for Salt, let’s imagine a scenario in which we’re testing an execution module that’s designed to operate on a database. Furthermore, let’s imagine two separate methods, here presented in pseudo-code in an imaginary execution module called ‘db.py’.

```python
def create_user(username):
    qry = "CREATE USER {0}".format(username)
    execute_query(qry)

def execute_query(qry):
    # Connect to a database and actually do the query...
...
```

Here, let’s imagine that we want to create a unit test for the create_user function. In doing so, we want to avoid any calls out to an external system and so while we are running our unit tests, we want to replace the actual interaction with a database with a function that can capture the parameters sent to it and return pre-defined values. Therefore, our task is clear -- to write a unit test which tests the functionality of create_user while also replacing 'execute_query' with a mocked function.

To begin, we set up the skeleton of our test much like we did before, but with additional imports for MagicMock:

```python
from salt.modules import db
from tests.support.mock import MagicMock, patch, call

def test_create_user():
    """
    Test creating a user
    """
    # First, we replace 'execute_query' with our own mock function
```

(continues on next page)
with patch.object(db, "execute_query", MagicMock()) as db_exq:

    # Now that the exits are blocked, we can run the function under test.
    db.create_user("testuser")

    # We could now query our mock object to see which calls were made
    # to it.
    ## print db_exq.mock_calls

    # Construct a call object that simulates the way we expected
    # execute_query to have been called.
    expected_call = call("CREATE USER testuser")

    # Compare the expected call with the list of actual calls. The
    # test will succeed or fail depending on the output of this
    # assertion.
    db_exq.assert_has_calls(expected_call)

29.23.6 Modifying __salt__ In Place

At times, it becomes necessary to make modifications to a module’s view of functions in its own __salt__ dictionary. Luckily, this process is quite easy.

Below is an example that uses MagicMock’s patch functionality to insert a function into __salt__ that’s actually a MagicMock instance.

import pytest
import salt.modules.my_module as my_module

def configure_loader_modules():
    """
    This fixture should return a dictionary which is what's going to be used to
    patch and mock Salt’s loader
    """
    return {my_module: {}}

def show_patch(self):
    with patch.dict(my_module.__salt__, {"function.to.replace": MagicMock()}):
        # From this scope, carry on with testing, with a modified __salt__!
        ...

(continued from previous page)
29.23.7 A Simple Example

Let’s assume that we’re testing a very basic function in an imaginary Salt execution module. Given a module called `fib.py` that has a function called `calculate(num_of_results)`, which given a `num_of_results`, produces a list of sequential Fibonacci numbers of that length.

A unit test to test this function might be commonly placed in a file called `tests/pytests/unit/modules/test_fib.py`. The convention is to place unit tests for Salt execution modules in `test/pytests/unit/modules/` and to name the tests module prefixed with `test_*.py`.

Tests are grouped around test cases, which are logically grouped sets of tests against a piece of functionality in the tested software. To return to our example, here’s how we might write the skeleton for testing `fib.py`:

```python
import salt.modules.fib as fib

def test_fib():
    """
    To create a unit test, we should prefix the name with `test_` so that it’s recognized by the test runner.
    """
    fib_five = (0, 1, 1, 2, 3)
    assert fib.calculate(5) == fib_five
```

At this point, the test can now be run, either individually or as a part of a full run of the test runner. To ease development, a single test can be executed:

```bash
nox -e 'pytest-3(coverage=False)' -- -v tests/pytests/unit/modules/test_fib.py
```

This will report the status of the test: success, failure, or error. The -v flag increases output verbosity.

To review the results of a particular run, take a note of the log location given in the output for each test run:

```bash
...etc... --log-file=artifacts/logs/runtests-20210106103414.685791.log ...etc...
```

29.23.8 A More Complete Example

Consider the following function from `salt/modules/linux_sysctl.py`.

```python
def get(name):
    """
    Return a single sysctl parameter for this minion

    CLI Example:
    .. code-block:: bash

        salt '*' sysctl.get net.ipv4.ip_forward
    """
    cmd = "sysctl -n {}".format(name)
    out = __salt__['cmd.run'](cmd, python_shell=False)
    return out
```

This function is very simple, comprising only four source lines of code and having only one return statement, so we know only one test is needed. There are also two inputs to the function, the `name` function argument and the call to `__salt__['cmd.run']()` (both of which need to be appropriately mocked.

---

29.23. Writing Unit Tests

---

1793
Mocking a function parameter is straightforward, whereas mocking a function call will require, in this case, the use of MagicMock. For added isolation, we will also redefine the __salt__ dictionary such that it only contains 'cmd.run'.

```python
import pytest
import salt.modules.linux_sysctl as linux_sysctl
from tests.support.mock import MagicMock, patch

@pytest.fixture
def configure_loader_modules():
    return {linux_sysctl: {}}

def test_get():
    
    Tests the return of get function
    
    mock_cmd = MagicMock(return_value=1)
    with patch.dict(linux_sysctl.__salt__, {'cmd.run': mock_cmd}):
        assert linux_sysctl.get('net.ipv4.ip_forward') == 1
```

Since get() has only one raise or return statement and that statement is a success condition, the test function is simply named test_get(). As described, the single function call parameter, name is mocked with net.ipv4.ip_forward and __salt__['cmd.run'] is replaced by a MagicMock function object. We are only interested in the return value of __salt__['cmd.run'], which MagicMock allows us by specifying via return_value=1. Finally, the test itself tests for equality between the return value of get() and the expected return of 1. This assertion is expected to succeed because get() will determine its return value from __salt__['cmd.run'], which we have mocked to return 1.

### 29.23.9 A Complex Example

Now consider the assign() function from the same salt/modules/linux_sysctl.py source file.

```python
def assign(name, value):
    
    Assign a single sysctl parameter for this minion

    CLI Example:
    .. code-block:: bash

        salt '*' sysctl.assign net.ipv4.ip_forward 1
    
    value = str(value)

    tran_tab = name.translate(':'.maketrans('/', ' '))

    sysctl_file = '/proc/sys/{}'.format(tran_tab)
    if not os.path.exists(sysctl_file):
        raise CommandExecutionError("sysctl {} does not exist".format(name))

    ret = {}
    cmd = 'sysctl -w {}={}'.format(name, value)
    data = __salt__['cmd.run_all'](cmd, python_shell=False)
    out = data['stdout']
```

(continues on next page)
err = data["stderr"]

# Example:
#    # sysctl -w net.ipv4.tcp_rmem="4096 87380 16777216"
#    net.ipv4.tcp_rmem = 4096 87380 16777216
regex = re.compile(r"^{}\s+=\s+{}$".format(re.escape(name), re.escape(value)))

if not regex.match(out) or "Invalid argument" in str(err):
    if data["retcode"] != 0 and err:
        error = err
    else:
        error = out
    raise CommandExecutionError("sysctl -w failed: {}".format(error))
new_name, new_value = out.split(" = ", 1)
ret[new_name] = new_value
return ret

This function contains two raise statements and one return statement, so we know that we will need (at least) three tests. It has two function arguments and many references to non-built-in functions. In the tests below you will see that MagicMock’s `patch()` method may be used as a context manager or as a decorator. When patching the salt dunders however, please use the context manager approach.

There are three test functions, one for each raise and return statement in the source function. Each function is self-contained and contains all and only the mocks and data needed to test the raise or return statement it is concerned with.

```python
import pytest
import salt.modules.linux_sysctl as linux_sysctl
from salt.exceptions import CommandExecutionError
from tests.support.mock import MagicMock, patch

@pytest.fixture
def configure_loader_modules():
    return {linux_sysctl: {}}

def test_assign_proc_sys_failed():
    """
    Tests if /proc/sys/<kernel-subsystem> exists or not
    """
    with patch("os.path.exists", MagicMock(return_value=False)):
        cmd = {
            "pid": 1337,
            "retcode": 0,
            "stderr": "",
            "stdout": "net.ipv4.ip_forward = 1",
        }
        mock_cmd = MagicMock(return_value=cmd)
        with patch.dict(linux_sysctl.__salt__, {"cmd.run_all": mock_cmd}):  # with pytest.raises(CommandExecutionError):
            linux_sysctl.assign("net.ipv4.ip_forward", 1)

def test_assign_cmd_failed():
    """
```

(continues on next page)
Tests if the assignment was successful or not

```python
with patch("os.path.exists", MagicMock(return_value=True)):
    cmd = {
        "pid": 1337,
        "retcode": 0,
        "stderr": 'sysctl: setting key "net.ipv4.ip_forward": Invalid argument',
        "stdout": "net.ipv4.ip_forward = backward",
    }
    mock_cmd = MagicMock(return_value=cmd)
    with patch.dict(linux_sysctl.__salt__, {"cmd.run_all": mock_cmd}):
        with pytest.raises(CommandExecutionError):
            linux_sysctl.assign("net.ipv4.ip_forward", "backward")
```

```python
def test_assign_success():
    
    Tests the return of successful assign function

    with patch("os.path.exists", MagicMock(return_value=True)):
        cmd = {
            "pid": 1337,
            "retcode": 0,
            "stderr": "",
            "stdout": "net.ipv4.ip_forward = 1",
        }
        ret = {"net.ipv4.ip_forward": "1"}
        mock_cmd = MagicMock(return_value=cmd)
        with patch.dict(linux_sysctl.__salt__, {"cmd.run_all": mock_cmd}):
            assert linux_sysctl.assign("net.ipv4.ip_forward", 1) == ret
```

## 29.24 SaltStack Git Policy

The SaltStack team follows a git policy to maintain stability and consistency with the repository.

The git policy has been developed to encourage contributions and make contributing to Salt as easy as possible. Code contributors to SaltStack projects DO NOT NEED TO READ THIS DOCUMENT, because all contributions come into SaltStack via a single gateway to make it as easy as possible for contributors to give us code.

The primary rule of git management in SaltStack is to make life easy on contributors and developers to send in code. Simplicity is always a goal!
29.24.1 New Code Entry

All new SaltStack code should be submitted against master.

29.24.2 Release Branching

SaltStack maintains two types of releases, Feature Releases and Point Releases (also commonly referred to as Bugfix Releases). A feature release is managed by incrementing the first or second release point number, so 2015.5.5 -> 2015.8.0 signifies a feature release and 2015.8.0 -> 2015.8.1 signifies a point release.

Feature Release Branching

Each feature release is maintained in a dedicated git branch derived from the last applicable release commit on develop. All file changes relevant to the feature release will be completed in the master branch prior to the creation of the feature release branch. The feature release branch will be named after the relevant numbers to the feature release, which constitute the first two numbers. This means that the release branch for the 2015.8.0 series is named 2015.8.

A feature release branch is created with the following command:

```
# git checkout -b 2015.8 # From the master branch
# git push origin 2015.8
```

Point Releases

As documented in SEP 14, point releases should be rare.

29.25 Salt Conventions

29.25.1 Writing Salt Documentation

Salt’s documentation is built using the Sphinx documentation system. It can be built in a large variety of output formats including HTML, PDF, ePub, and manpage.

All the documentation is contained in the main Salt repository. Speaking broadly, most of the narrative documentation is contained within the https://github.com/saltstack/salt/blob/master/doc subdirectory and most of the reference and API documentation is written inline with Salt’s Python code and extracted using a Sphinx extension.

Style

The Salt project recommends the IEEE style guide as a general reference for writing guidelines. Those guidelines are not strictly enforced but rather serve as an excellent resource for technical writing questions. The NCBI style guide is another very approachable resource.
Point-of-view

Use third-person perspective and avoid "I", "we", "you" forms of address. Identify the addressee specifically e.g., "users should", "the compiler does", etc.

Active voice

Use active voice and present-tense. Avoid filler words.

Title capitalization

Document titles and section titles within a page should follow normal sentence capitalization rules. Words that are capitalized as part of a regular sentence should be capitalized in a title and otherwise left as lowercase. Punctuation can be omitted unless it aids the intent of the title (e.g., exclamation points or question marks).

For example:

This is a main heading

Paragraph.

This is an exciting sub-heading!

Paragraph.

Serial Commas

According to Wikipedia: In English punctuation, a serial comma or series comma (also called Oxford comma and Harvard comma) is a comma placed immediately before the coordinating conjunction (usually "and", "or", or "nor") in a series of three or more terms. For example, a list of three countries might be punctuated either as "France, Italy, and Spain" (with the serial comma), or as "France, Italy and Spain" (without the serial comma).

When writing a list that includes three or more items, the serial comma should always be used.

Documenting modules

Documentation for Salt's various module types is inline in the code. During the documentation build process it is extracted and formatted into the final HTML, PDF, etc format.

Inline documentation

Python has special multi-line strings called docstrings as the first element in a function or class. These strings allow documentation to live alongside the code and can contain special formatting. For example:

```python
def my_function(value):
    
    Upper-case the given value
```

(continues on next page)
Usage:

```python
val = 'a string'
new_val = myfunction(val)
print(new_val)  # 'A STRING'
```

```
:param value: a string
:return: a copy of ``value`` that has been upper-cased

:return value.upper()
```

Specify a release for additions or changes

New functions or changes to existing functions should include a marker that denotes what Salt release will be affected. For example:

```python
def my_function(value):
    
    Upper-case the given value

    .. versionadded:: 2014.7.0

    <...snip...>

    return value.upper()

```

For changes to a function:

```python
def my_function(value, strip=False):
    
    Upper-case the given value

    .. versionchanged:: 2016.3.0
        Added a flag to also strip whitespace from the string.

    <...snip...>

    if strip:
        return value.upper().strip()

    return value.upper()

```

Adding module documentation to the index

Each module type has an index listing all modules of that type. For example: `execution modules`, `state modules`, `renderer modules`. New modules must be added to the index manually.

1. Edit the file for the module type: `execution modules`, `state modules`, `renderer modules`, etc.
2. Add the new module to the alphabetized list.
3. `Build the documentation` which will generate an `.rst` file for the new module in the same directory as the `index.rst`.

---

29.25. Salt Conventions
4. Commit the changes to `index.rst` and the new `.rst` file and send a pull request.

**Cross-references**

The Sphinx documentation system contains a wide variety of cross-referencing capabilities.

**Glossary entries**

Link to *glossary entries* using the `term` role. A cross-reference should be added the first time a Salt-specific term is used in a document.

```
A common way to encapsulate master-side functionality is by writing a
custom `Runner Function`. Custom Runner Functions are easy to write.
```

**Index entries**

Sphinx automatically generates many kinds of index entries, but it is occasionally useful to manually add items to the index.

One method is to use the `index` directive above the document or section that should appear in the index.

```
.. index:: ! Event, event bus, event system
    see: Reactor; Event
```

Another method is to use the `index` role inline with the text that should appear in the index. The index entry is created and the target text is left otherwise intact.

```
Information about the `Salt Reactor`
-----------------------------------

Paragraph.
```

**Documents and sections**

Each document should contain a unique top-level label of the form:

```
.. _my-page:

My page
=======

Paragraph.
```

Unique labels can be linked using the `ref` role. This allows cross-references to survive document renames or movement.

```
For more information see :ref:`my-page`.
```

Note, the `doc` role should *not* be used to link documents together.
Modules

Cross-references to Salt modules can be added using Sphinx's Python domain roles. For example, to create a link to the test.ping function:

```
A useful execution module to test active communication with a minion is the `test.ping <salt.modules.test.ping>` function.
```

Salt modules can be referenced as well:

```
The `test module <salt.modules.test>` contains many useful functions for inspecting an active Salt connection.
```

The same syntax works for all modules types:

```
One of the workhorse state module functions in Salt is the `file.managed <salt.states.file.managed>` function.
```

Settings

Individual settings in the Salt Master or Salt Minion configuration files are cross-referenced using two custom roles, conf_master, and conf_minion.

```
The `minion ID <id>` setting is a unique identifier for a single minion.
```

29.25.2 Salt Formulas

Formulas are pre-written Salt States. They are as open-ended as Salt States themselves and can be used for tasks such as installing a package, configuring, and starting a service, setting up users or permissions, and many other common tasks.

All official Salt Formulas are found as separate Git repositories in the "saltstack-formulas" organization on GitHub: https://github.com/saltstack-formulas

As a simple example, to install the popular Apache web server (using the normal defaults for the underlying distro) simply include the apache-formula from a top file:

```
base:
  'web*':
    - apache
```

Installation

Each Salt Formula is an individual Git repository designed as a drop-in addition to an existing Salt State tree. Formulas can be installed in the following ways.
Adding a Formula as a GitFS remote

One design goal of Salt's GitFS fileserv backend was to facilitate reusable States. GitFS is a quick and natural way to use Formulas.

1. Install any necessary dependencies and configure GitFS.
2. Add one or more Formula repository URLs as remotes in the `gitfs_remotes` list in the Salt Master configuration file:

```
<table>
<thead>
<tr>
<th>gitfs_remotes:</th>
</tr>
</thead>
<tbody>
<tr>
<td>- <a href="https://github.com/saltstack-formulas/apache-formula">https://github.com/saltstack-formulas/apache-formula</a></td>
</tr>
<tr>
<td>- <a href="https://github.com/saltstack-formulas/memcached-formula">https://github.com/saltstack-formulas/memcached-formula</a></td>
</tr>
</tbody>
</table>
```

We strongly recommend forking a formula repository into your own GitHub account to avoid unexpected changes to your infrastructure.

Many Salt Formulas are highly active repositories so pull new changes with care. Plus any additions you make to your fork can be easily sent back upstream with a quick pull request!

3. Restart the Salt master.

Beginning with the 2018.3.0 release, using formulas with GitFS is now much more convenient for deployments which use many different fileserv environments (i.e. saltenvs). Using the `all_saltenvs` parameter, files from a single git branch/tag will appear in all environments. See here for more information on this feature.

Adding a Formula directory manually

Formulas are simply directories that can be copied onto the local file system by using Git to clone the repository or by downloading and expanding a tarball or zip file of the repository. The directory structure is designed to work with `file_roots` in the Salt master configuration.

1. Clone or download the repository into a directory:

```
mkdir -p /srv/formulas
cd /srv/formulas
git clone https://github.com/saltstack-formulas/apache-formula.git
```

# or

```
mkdir -p /srv/formulas
cd /srv/formulas
wget https://github.com/saltstack-formulas/apache-formula/archive/master.tar.gz
tar xf apache-formula-master.tar.gz
```

2. Add the new directory to `file_roots`:

```
<table>
<thead>
<tr>
<th>file_roots:</th>
</tr>
</thead>
<tbody>
<tr>
<td>base:</td>
</tr>
<tr>
<td>- /srv/salt</td>
</tr>
<tr>
<td>- /srv/formulas/apache-formula</td>
</tr>
</tbody>
</table>
```

3. Restart the Salt Master.
Usage

Each Formula is intended to be immediately usable with sane defaults without any additional configuration. Many formulas are also configurable by including data in Pillar; see the pillar.example file in each Formula repository for available options.

Including a Formula in an existing State tree

Formula may be included in an existing sls file. This is often useful when a state you are writing needs to require or extend a state defined in the formula.

Here is an example of a state that uses the epel-formula in a require declaration which directs Salt to not install the python26 package until after the EPEL repository has also been installed:

```yaml
include:
  - epel

python26:
  pkg.installed:
    - require:
      - pkg: epel
```

Including a Formula from a Top File

Some Formula perform completely standalone installations that are not referenced from other state files. It is usually cleanest to include these Formula directly from a Top File.

For example the easiest way to set up an OpenStack deployment on a single machine is to include the openstack-standalone-formula directly from a top.sls file:

```yaml
base:
  'myopenstackmaster':
    - openstack
```

Quickly deploying OpenStack across several dedicated machines could also be done directly from a Top File and may look something like this:

```yaml
base:
  'controller':
    - openstack.horizon
    - openstack.keystone
  'hyper-*':
    - openstack.nova
    - openstack.glance
  'storage-*':
    - openstack.swift
```
Configuring Formula using Pillar

Salt Formulas are designed to work out of the box with no additional configuration. However, many Formula support additional configuration and customization through *Pillar*. Examples of available options can be found in a file named `pillar.example` in the root directory of each Formula repository.

Using Formula with your own states

Remember that Formula are regular Salt States and can be used with all Salt's normal state mechanisms. Formula can be required from other States with `require` declarations, they can be modified using `extend`, they can made to watch other states with *The _in version of requisites*.

The following example uses the stock `apache-formula` alongside a custom state to create a vhost on a Debian/Ubuntu system and to reload the Apache service whenever the vhost is changed.

```yaml
# Include the stock, upstream apache formula.
include:
  - apache

# Use the watch_in requisite to cause the apache service state to reload
# apache whenever the my-example-com-vhost state changes.
my-example-com-vhost:
  file:
    - managed
    - name: /etc/apache2/sites-available/my-example-com
    - watch_in:
      - service: apache
```

Don't be shy to read through the source for each Formula!

Reporting problems & making additions

Each Formula is a separate repository on GitHub. If you encounter a bug with a Formula please file an issue in the respective repository! Send fixes and additions as a pull request. Add tips and tricks to the repository wiki.

Writing Formulas

Each Formula is a separate repository in the `saltstack-formulas` organization on GitHub.

Get involved creating new Formulas

The best way to create new Formula repositories for now is to create a repository in your own account on GitHub and notify a SaltStack employee when it is ready. We will add you to the Contributors team on the `saltstack-formulas` organization and help you transfer the repository over. Ping a SaltStack employee on IRC (#salt on Freenode), join the #formulas channel on the salt-slack (bridged to #saltstack-formulas on Freenode) or send an email to the salt-users mailing list. Note that the IRC logs are available at https://freenode.logbot.info/salt and https://freenode.logbot.info/saltstack-formulas respectively.

There are a lot of repositories in that organization! Team members can manage which repositories they are subscribed to on GitHub’s watching page: https://github.com/watching.
Members of the Contributors team are welcome to participate in reviewing pull requests across the Organization. Some repositories will have regular contributors and some repositories will not. As you get involved in a repository be sure to communicate with any other contributors there on pull requests that are large or have breaking changes.

In general it is best to have another Contributor review and merge any pull requests that you open. Feel free to at-mention other regular contributors to a repository and request a review. However, there are a lot of formula repositories so if a repository does not yet have regular contributors or if your pull request has stayed open for more than a couple days feel free to "selfie-merge" your own pull request.

**Style**

Maintainability, readability, and reusability are all marks of a good Salt sls file. This section contains several suggestions and examples.

```yaml
# Deploy the stable master branch unless version overridden by passing
# Pillar at the CLI or via the Reactor.

deploy_myapp:
  git.latest:
    - name: git@github.com/myco/myapp.git
    - version: {{ salt.pillar.get('myapp:version', 'master') }}
```

**Use a descriptive State ID**

The ID of a state is used as a unique identifier that may be referenced via other states in `requisites`. It must be unique across the whole state tree (*it is a key in a dictionary*, after all).

In addition a state ID should be descriptive and serve as a high-level hint of what it will do, or manage, or change. For example, `deploy_webapp`, or `apache`, or `reload_firewall`.

**Use `module.function` notation**

So-called "short-declaration" notation is preferred for referencing state modules and state functions. It provides a consistent pattern of `module.function` shared between Salt States, the Reactor, Salt Mine, the Scheduler, as well as with the CLI.

```yaml
# Do
apache:
  pkg.installed:
    - name: httpd

# Don't
apache:
  pkg:
    - installed
    - name: httpd
```

Salt's state compiler will transform "short-decs" into the longer format *when compiling the human-friendly highstate structure into the machine-friendly lowstate structure.*
Specify the `name` parameter

Use a unique and permanent identifier for the state ID and reserve `name` for data with variability.

The `name` declaration is a required parameter for all state functions. The state ID will implicitly be used as `name` if it is not explicitly set in the state.

In many state functions the `name` parameter is used for data that varies such as OS-specific package names, OS-specific file system paths, repository addresses, etc. Any time the ID of a state changes all references to that ID must also be changed. Use a permanent ID when writing a state the first time to future-proof that state and allow for easier refactors down the road.

Comment state files

YAML allows comments at varying indentation levels. It is a good practice to comment state files. Use vertical whitespace to visually separate different concepts or actions.

```yaml
# Start with a high-level description of the current sls file.
# Explain the scope of what it will do or manage.

# Comment individual states as necessary.
update_a_config_file:
  # Provide details on why an unusual choice was made. For example:
  #
  # This template is fetched from a third-party and does not fit our
  # company norm of using Jinja. This must be processed using Mako.
  file.managed:
    - name: /path/to/file.cfg
    - source: salt://path/to/file.cfg.template
    - template: mako

  # Provide a description or explanation that did not fit within the state
  # ID. For example:
  #
  # Update the application's last-deployed timestamp.
  # This is a workaround until Bob configures Jenkins to automate RPM
  # builds of the app.
  cmd.run:
    # FIXME: Joe needs this to run on Windows by next quarter. Switch these
    # from shell commands to Salt's file.managed and file.replace state
    # modules.
    - name: |
      touch /path/to/file_last_updated
      sed -e 's/foo/bar/g' /path/to/file_environment
    - onchanges:
      - file: a_config_file
```

Be careful to use Jinja comments for commenting Jinja code and YAML comments for commenting YAML code.

```yaml
# BAD EXAMPLE
# The Jinja in this YAML comment is still executed!
# {% set apache_is_installed = 'apache' in salt.pkg.list_pkgs() %}

# GOOD EXAMPLE
# The Jinja in this Jinja comment will not be executed.
{% set apache_is_installed = 'apache' in salt.pkg.list_pkgs() %}
```
Easy on the Jinja!

Jinja templating provides vast flexibility and power when building Salt sls files. It can also create an unmaintainable tangle of logic and data. Speaking broadly, Jinja is best used when kept apart from the states (as much as is possible). Below are guidelines and examples of how Jinja can be used effectively.

Know the evaluation and execution order

High-level knowledge of how Salt states are compiled and run is useful when writing states.

The default renderer setting in Salt is Jinja piped to YAML. Each is a separate step. Each step is not aware of the previous or following step. Jinja is not YAML aware, YAML is not Jinja aware; they cannot share variables or interact.

- Whatever the Jinja step produces must be valid YAML.
- Whatever the YAML step produces must be a valid highstate data structure. (This is also true of the final step for any of the alternate renderers in Salt.)
- Highstate can be thought of as a human-friendly data structure; easy to write and easy to read.
- Salt’s state compiler validates the highstate and compiles it to low state.
- Low state can be thought of as a machine-friendly data structure. It is a list of dictionaries that each map directly to a function call.
- Salt’s state system finally starts and executes on each “chunk” in the low state. Remember that requisites are evaluated at runtime.
- The return for each function call is added to the “running” dictionary which is the final output at the end of the state run.

The full evaluation and execution order:

Jinja -> YAML -> Highstate -> low state -> execution

Avoid changing the underlying system with Jinja

Avoid calling commands from Jinja that change the underlying system. Commands run via Jinja do not respect Salt’s dry-run mode (test=True)! This is usually in conflict with the idempotent nature of Salt states unless the command being run is also idempotent.

Inspect the local system

A common use for Jinja in Salt states is to gather information about the underlying system. The grains dictionary available in the Jinja context is a great example of common data points that Salt itself has already gathered. Less common values are often found by running commands. For example:

{% set is_selinux_enabled = salt.cmd.run('sestatus') == '1' %}

This is usually best done with a variable assignment in order to separate the data from the state that will make use of the data.
Gather external data

One of the most common uses for Jinja is to pull external data into the state file. External data can come from anywhere like API calls or database queries, but it most commonly comes from flat files on the file system or Pillar data from the Salt Master. For example:

```jinja
{% set some_data = salt.pillar.get('some_data', {'sane default': True}) %}

[# or #]
{% import_yaml 'path/to/file.yaml' as some_data %}

[# or #]
{% import_json 'path/to/file.json' as some_data %}

[# or #]
{% import_text 'path/to/ssh_key.pub' as ssh_pub_key %}

[# or #]
{% from 'path/to/other_file.jinja' import some_data with context %}
```

This is usually best done with a variable assignment in order to separate the data from the state that will make use of the data.

Light conditionals and looping

Jinja is extremely powerful for programmatically generating Salt states. It is also easy to overuse. As a rule of thumb, if it is hard to read it will be hard to maintain!

Separate Jinja control-flow statements from the states as much as is possible to create readable states. Limit Jinja within states to simple variable lookups.

Below is a simple example of a readable loop:

```jinja
{% for user in salt.pillar.get('list_of_users', []) %}

[# Ensure unique state IDs when looping. #]
{{ user.name }}-{{ loop.index }}:
    - name: {{ user.name }}
    - shell: {{ user.shell }}

{% endfor %}
```

Avoid putting a Jinja conditionals within Salt states where possible. Readability suffers and the correct YAML indentation is difficult to see in the surrounding visual noise. Parametrization (discussed below) and variables are both useful techniques to avoid this. For example:

```jinja
[# ---- Bad example ---- #]

apache:
    pkg.installed:
        {% if grains.os_family == 'RedHat' %}
```
Dictionaries are useful to effectively "namespace" a collection of variables. This is useful with parametrization (dis-
cussed below). Dictionaries are also easily combined and merged. And they can be directly serialized into YAML
which is often easier than trying to create valid YAML through templating. For example:

```
# ---- Bad example ---- #

haproxy_conf:
  file.managed:
    - name: /etc/haproxy/haproxy.cfg
      template: jinja
      source: salt://haproxy/external_haproxy.cfg
      if 'external_loadbalancer' in grains.roles %
      source: salt://haproxy/internal_haproxy.cfg
      else %
      context:
        if 'external_loadbalancer' in grains.roles %
        ssl_termination: True
        else %
        ssl_termination: False
        endif %
      endif %

# ---- Better example ---- #

{% load_yaml as haproxy_defaults %}
common_settings:
  bind_port: 80
```
internal_loadbalancer:
  source: salt://haproxy/internal_haproxy.cfg
  settings:
    bind_port: 8080
    ssl_termination: False

external_loadbalancer:
  source: salt://haproxy/external_haproxy.cfg
  settings:
    ssl_termination: True

{% endload %}

{% if 'external_loadbalancer' in grains.roles %}
{% set haproxy = haproxy_defaults['external_loadbalancer'] %}
{% elif 'internal_loadbalancer' in grains.roles %}
{% set haproxy = haproxy_defaults['internal_loadbalancer'] %}
{% endif %}

{% do haproxy.settings.update(haproxy_defaults.common_settings) %}

haproxy_conf:
  file.managed:
    - name: /etc/haproxy/haproxy.cfg
    - template: jinja
    - source: {{ haproxy.source }}
    - context: {{ haproxy.settings | yaml() }}

There is still room for improvement in the above example. For example, extracting into an external file or replacing
the if-elif conditional with a function call to filter the correct data more succinctly. However, the state itself is simple
and legible, the data is separate and also simple and legible. And those suggested improvements can be made at some
future date without altering the state at all!

Avoid heavy logic and programming

Jinja is not Python. It was made by Python programmers and shares many semantics and some syntax but it does
not allow for arbitrary Python function calls or Python imports. Jinja is a fast and efficient templating language but
the syntax can be verbose and visually noisy.

Once Jinja use within an sls file becomes slightly complicated -- long chains of if-elif-elif-else statements, nested
conditionals, complicated dictionary merges, wanting to use sets -- instead consider using a different Salt renderer,
such as the Python renderer. As a rule of thumb, if it is hard to read it will be hard to maintain -- switch to a format
that is easier to read.

Using alternate renderers is very simple to do using Salt's "she-bang" syntax at the top of the file. The Python
renderer must simply return the correct highstate data structure. The following example is a state tree of two sls files,
one simple and one complicated.

/srv/salt/top.sls:

```
base:
  '*':
    - common_configuration
    - roles_configuration
```

/srv/salt/common_configuration.sls:
Salt Documentation, Release 3002.5

common_users:
  user.present:
    - names:
      - larry
      - curly
      - moe

/srv/salt/roles_configuration:

```python
#!/py
def run():
    list_of_roles = set()

    # This example has the minion id in the form 'web-03-dev'.
    # Easily access the grains dictionary:
    try:
        app, instance_number, environment = __grains__['id'].split('-')
        instance_number = int(instance_number)
    except ValueError:
        app, instance_number, environment = ['Unknown', 0, 'dev']

    list_of_roles.add(app)

    if app == 'web' and environment == 'dev':
        list_of_roles.add('primary')
        list_of_roles.add('secondary')
    elif app == 'web' and environment == 'staging':
        if instance_number == 0:
            list_of_roles.add('primary')
        else:
            list_of_roles.add('secondary')

    # Easily cross-call Salt execution modules:
    if __salt__['myutils.query_valid_ec2_instance']():
        list_of_roles.add('is_ec2_instance')

    return {
        "set_roles_grains": {
            "grains.present": [{"name": "roles"}, {"value": list(list_of_roles)},],
        },
    }
```

Jinja Macros

In Salt sls files Jinja macros are useful for one thing and one thing only: creating mini templates that can be reused and rendered on demand. Do not fall into the trap of thinking of macros as functions; Jinja is not Python (see above).

Macros are useful for creating reusable, parameterized states. For example:

```jinja
{% macro user_state(state_id, user_name, shell='/bin/bash', groups=[]) %}
{{ state_id }}:
  user.present:
    - name: {{ user_name }}
    - shell: {{ shell }}
    - groups: {{ groups | json() }}
{% endmacro %}
```
Macros are also useful for creating one-off "serializers" that can accept a data structure and write that out as a domain-specific configuration file. For example, the following macro could be used to write a php.ini config file:

```
/srv/salt/php.sls:

php_ini:
    file.managed:
        - name: /etc/php.ini
        - source: salt://php.ini.tmpl
        - template: jinja
        - context:
            php_ini_settings: {{ salt.pillar.get('php_ini', {}) | json() }}
```

```
/srv/pillar/php.sls:

php_ini:
    PHP:
        engine: 'On'
        short_open_tag: 'Off'
        error_reporting: 'E_ALL & ~E_DEPRECATED & ~E_STRICT'
```

```
/srv/salt/php.ini.tmpl:

{% macro php_ini_serializer(data) %}
{% for section_name, name_val_pairs in data.items() %}
    [{{ section_name }}]
{% for name, val in name_val_pairs.items() -%}
    {{ name }} = "{{ val }}"
{% endfor %}
{% endfor %}
{% endmacro %}

; File managed by Salt at {{{ source }}}.  
; Your changes will be overwritten.

{{ php_ini_serializer(phi

Abstracting static defaults into a lookup table

Separate data that a state uses from the state itself to increases the flexibility and reusability of a state.

An obvious and common example of this is platform-specific package names and file system paths. Another example is sane defaults for an application, or common settings within a company or organization. Organizing such data as a dictionary (aka hash map, lookup table, associative array) often provides a lightweight namespaceing and allows for quick and easy lookups. In addition, using a dictionary allows for easily merging and overriding static values within a lookup table with dynamic values fetched from Pillar.

A strong convention in Salt Formulas is to place platform-specific data, such as package names and file system paths, into a file named map.jinja that is placed alongside the state files.
The following is an example from the MySQL Formula. The \texttt{grains.filter\_by} function performs a lookup on that table using the \texttt{os\_family} grain (by default).

The result is that the \texttt{mysql} variable is assigned to a \texttt{subset} of the lookup table for the current platform. This allows states to reference, for example, the name of a package without worrying about the underlying OS. The syntax for referencing a value is a normal dictionary lookup in Jinja, such as \texttt{\{\{ mysql["service"] \}\}} or the shorthand \texttt{\{\{ mysql.service \}\}}.

\texttt{map.jinja}:

\begin{verbatim}
{% set mysql = salt['grains.filter_by']({
    'Debian': {
        'server': 'mysql-server',
        'client': 'mysql-client',
        'service': 'mysqld',
        'config': '/etc/mysql/my.cnf',
        'python': 'python-mysqldb',
    },
    'RedHat': {
        'server': 'mysql-server',
        'client': 'mysql',
        'service': 'mysqld',
        'config': '/etc/my.cnf',
        'python': 'MySQL-python',
    },
    'Gentoo': {
        'server': 'dev-db/mysql',
        'client': 'dev-db/mysql',
        'service': 'mysqld',
        'config': '/etc/mysql/my.cnf',
        'python': 'dev-python/mysql-python',
    },
}, merge=salt['pillar.get'](\'mysql:lookup\')) %}
\end{verbatim}

Values defined in the map file can be fetched for the current platform in any state file using the following syntax:

\begin{verbatim}
{% from "mysql/map.jinja" import mysql with context %}

mysql-server:
pkg.installed:
    - name: {{ mysql.server }}
service.running:
    - name: {{ mysql.service }}
\end{verbatim}

Organizing Pillar data

It is considered a best practice to make formulas expect all formula-related parameters to be placed under second-level lookup key, within a main namespace designated for holding data for particular service/software/etc, managed by the formula:

\begin{verbatim}
mysql:
    lookup:
        version: 5.7.11
\end{verbatim}
Collecting common values

Common values can be collected into a base dictionary. This minimizes repetition of identical values in each of the lookup_dict sub-dictionaries. Now only the values that are different from the base must be specified by the alternates:

map.jinja:

```jinja
{% set mysql = salt['grains.filter_by']({
    'default': {
        'server': 'mysql-server',
        'client': 'mysql-client',
        'service': 'mysql',
        'config': '/etc/mysql/my.cnf',
        'python': 'python-mysqldb',
    },
    'Debian': {},
    'RedHat': {
        'client': 'mysql',
        'service': 'mysqldb',
        'config': '/etc/my.cnf',
        'python': 'MySQL-python',
    },
    'Gentoo': {
        'server': 'dev-db/mysql',
        'client': 'dev-db/mysql',
        'python': 'dev-python/mysql-python',
    },
}, merge=salt['pillar.get']('mysql:lookup'), base='default') %}
```

Overriding values in the lookup table

Allow static values within lookup tables to be overridden. This is a simple pattern which once again increases flexibility and reusability for state files.

The merge argument in filter_by specifies the location of a dictionary in Pillar that can be used to override values returned from the lookup table. If the value exists in Pillar it will take precedence.

This is useful when software or configuration files is installed to non-standard locations or on unsupported platforms. For example, the following Pillar would replace the config value from the call above.

```
mysql:
    lookup:
        config: /usr/local/etc/mysql/my.cnf
```

Note: Protecting Expansion of Content with Special Characters

When templating keep in mind that YAML does have special characters for quoting, flows, and other special structure and content. When a Jinja substitution may have special characters that will be incorrectly parsed by YAML care must be taken. It is a good policy to use the yaml_encode or the yaml_dquote Jinja filters:

```jinja
{% set foo = 7.7 %}
{% set bar = 'none' %}
```
{%- set baz = true %}
{%- set zap = 'The word of the day is "salty".' %}
{%- set zip = "The quick brown fox . . ." %}

foo: {{ foo|yaml_encode }}
bar: {{ bar|yaml_encode }}
baz: {{ baz|yaml_encode }}
zap: {{ zap|yaml_encode }}
zip: {{ zip|yaml_dquote }}

The above will be rendered as below:

```
foo: 7.7
bar: null
baz: true
zap: "The word of the day is \"salty\"."
zip: "\"The quick brown fox . . .\""
```

The **filter_by** function performs a simple dictionary lookup but also allows for fetching data from Pillar and overriding data stored in the lookup table. That same workflow can be easily performed without using **filter_by**; other dictionaries besides data from Pillar can also be used.

{%- set lookup_table = (...) %}
{%- do lookup_table.update(salt.pillar.get('my:custom:data')) %}

**When to use lookup tables**

The **map.jinja** file is only a convention within Salt Formulas. This greater pattern is useful for a wide variety of data in a wide variety of workflows. This pattern is not limited to pulling data from a single file or data source. This pattern is useful in States, Pillar and the Reactor, for example.

Working with a data structure instead of, say, a config file allows the data to be cobbled together from multiple sources (local files, remote Pillar, database queries, etc), combined, overridden, and searched.

Below are a few examples of what lookup tables may be useful for and how they may be used and represented.

**Platform-specific information**

An obvious pattern and one used heavily in Salt Formulas is extracting platform-specific information such as package names and file system paths in a file named **map.jinja**. The pattern is explained in detail above.

**Sane defaults**

Application settings can be a good fit for this pattern. Store default settings along with the states themselves and keep overrides and sensitive settings in Pillar. Combine both into a single dictionary and then write the application config or settings file.

The example below stores most of the Apache Tomcat `server.xml` file alongside the Tomcat states and then allows values to be updated or augmented via Pillar. (This example uses the BadgerFish format for transforming JSON to XML.)

```
/srv/salt/tomcat/defaults.yaml
```
Server:

'@port': '8005'
'@shutdown': SHUTDOWN

GlobalNamingResources:

Resource:

'@auth': Container
'@description': User database that can be updated and saved
'@factory': org.apache.catalina.users.MemoryUserDatabaseFactory
'@name': UserDatabase
'@pathname': conf/tomcat-users.xml
'@type': org.apache.catalina.UserDatabase

# <...snip...>

/srv/pillar/tomcat.sls:

appX:
  server_xml_overrides:
    Server:
      Service:
        'name': Catalina
      Connector:
        '@port': '8009'
        '@protocol': AJP/1.3
        '@redirectPort': '8443'

# <...snip...>

/srv/salt/tomcat/server_xml.sls:

{% import_yaml 'tomcat/defaults.yaml' as server_xml_defaults %}
{% set server_xml_final_values = salt.pillar.get(
    'appX:server_xml_overrides',
    default=server_xml_defaults,
    merge=True
)%}

appX_server_xml:
  file.serialize:
    - name: /etc/tomcat/server.xml
      dataset: {{ server_xml_final_values | json() }}
      formatter: xml_badgerfish

The file.serialize state can provide a shorthand for creating some files from data structures. There are also many examples within Salt Formulas of creating one-off "serializers" (often as Jinja macros) that reformat a data structure to a specific config file format. For example, look at the `Nginx vhosts`_ states or the php.ini file template.

Environment specific information

A single state can be reused when it is parameterized as described in the section below, by separating the data the state will use from the state that performs the work. This can be the difference between deploying Application X and Application Y, or the difference between production and development. For example:

/srv/salt/app/deploy.sls:

{% import_yaml 'app/defaults.yaml' as app_defaults %}

{% set app_defaults = salt.pillar.get('app:app_defaults',
    default=app_defaults,
    merge=True
)%}
{% Extract the relevant subset for the app configured on the current machine (configured via a grain in this example). %}

{% app = app_defaults.get(salt.grains.get('role')) %}

{% Allow values from Pillar to (optionally) update values from the lookup table. %}

{% do app_defaults.update(salt.pillar.get('myapp', {})) %}

deploy_application:
  git.latest:
    - name: {{ app.repo_url }}
    - version: {{ app.version }}
    - target: {{ app.deploy_dir }}

myco/myapp/deployed:
  event.send:
    - data:
      - version: {{ app.version }}
      - onchanges:
        - git: deploy_application

/srv/salt/app/defaults.yaml:

appX:
  repo_url: git@github.com/myco/appX.git
  target: /var/www/appX
  version: master

appY:
  repo_url: git@github.com/myco/appY.git
  target: /var/www/appY
  version: v1.2.3.4

Single-purpose SLS files

Each sls file in a Formula should strive to do a single thing. This increases the reusability of this file by keeping unrelated tasks from getting coupled together.

As an example, the base Apache formula should only install the Apache httpd server and start the httpd service. This is the basic, expected behavior when installing Apache. It should not perform additional changes such as set the Apache configuration file or create vhosts.

If a formula is single-purpose as in the example above, other formulas, and also other states can include and use that formula with Requisites and Other Global State Arguments without also including undesirable or unintended side-effects.

The following is a best-practice example for a reusable Apache formula. (This skips platform-specific options for brevity. See the full apache-formula for more.)

# apache/init.sls
apache:
  pkg.installed:
    [...]  
  service.running:
    [...]
To illustrate a bad example, say the above Apache formula installed Apache and also created a default vhost. The mod_wsgi state would not be able to include the Apache formula to create that dependency tree without also installing the unneeded default vhost.

*Formulas should be reusable.* Avoid coupling unrelated actions together.

**Parameterization**

*Parameterization is a key feature of Salt Formulas* and also for Salt States. Parameterization allows a single Formula to be reused across many operating systems; to be reused across production, development, or staging environments; and to be reused by many people all with varying goals.

Writing states, specifying ordering and dependencies is the part that takes the longest to write and to test. Filling those states out with data such as users or package names or file locations is the easy part. How many users, what those users are named, or where the files live are all implementation details that should be parameterized. This separation between a state and the data that populates a state creates a reusable formula.

In the example below the data that populates the state can come from anywhere -- it can be hard-coded at the top of the state, it can come from an external file, it can come from Pillar, it can come from an execution function call, or it can come from a database query. The state itself doesn't change regardless of where the data comes from. Production data will vary from development data will vary from data from one company to another, however the state itself stays the same.

```yaml
{% set user_list = [
    {'name': 'larry', 'shell': 'bash'},
    {'name': 'curly', 'shell': 'bash'},
    {'name': 'moe', 'shell': 'zsh'},
] %}

[# or #]

{% set user_list = salt['pillar.get']('user_list') %}

[# or #]
```
{% load_json "default_users.json" as user_list %}

{% or %}

{% set user_list = salt['acme_utils.get_user_list']() %}

{% for user in list_list %}
{{ user.name }}:
  - name: {{ user.name }}
  - shell: {{ user.shell }}
{% endfor %}

Configuration

Formulas should strive to use the defaults of the underlying platform, followed by defaults from the upstream project, followed by sane defaults for the formula itself.

As an example, a formula to install Apache should not change the default Apache configuration file installed by the OS package. However, the Apache formula should include a state to change or override the default configuration file.

Pillar overrides

Pillar lookups must use the safe `get()` and must provide a default value. Create local variables using the Jinja `set` construct to increase readability and to avoid potentially hundreds or thousands of function calls across a large state tree.

{% from "apache/map.jinja" import apache with context %}
{% set settings = salt['pillar.get']('apache', {}) %}

mod_status:
  - name: {{ apache.conf_dir }}
  - source: {{ settings.get('mod_status_conf', 'salt://apache/mod_status.conf') }}
  - template: {{ settings.get('template_engine', 'jinja') }}

Any default values used in the Formula must also be documented in the `pillar.example` file in the root of the repository. Comments should be used liberally to explain the intent of each configuration value. In addition, users should be able copy-and-paste the contents of this file into their own Pillar to make any desired changes.

Scripting

Remember that both State files and Pillar files can easily call out to Salt `execution modules` and have access to all the system grains as well.

{% if '/storage' in salt['mount.active']() %}
/usr/local/etc/myfile.conf:
  - symlink
  - target: /storage/myfile.conf
{% endif %}
Jinja macros to encapsulate logic or conditionals are discouraged in favor of writing custom execution modules in Python.

**Repository structure**

A basic Formula repository should have the following layout:

```
foo-formula
|-- foo/
   |-- map.jinja
   |-- init.sls
   `-- bar.sls
|-- CHANGELOG.rst
|-- LICENSE
|-- pillar.example
|-- README.rst
|-- VERSION
```

See also:

`template-formula`

The `template-formula` repository has a pre-built layout that serves as the basic structure for a new formula repository. Just copy the files from there and edit them.

**README.rst**

The README should detail each available `.sls` file by explaining what it does, whether it has any dependencies on other formulas, whether it has a target platform, and any other installation or usage instructions or tips.

A sample skeleton for the `README.rst` file:

```
===
foo
===

Install and configure the FOO service.

**NOTE**

See the full `Salt Formulas installation and usage instructions <https://docs.saltstack.com/en/latest/topics/development/conventions/formulas.html>`_.

Available states

```
.. contents::
   :local:

```

```
```
**foo**
```

---

Install the `foo` package and enable the service.

```
```
**foo.bar**
```

```
Install the `bar` package.

**CHANGELOG.rst**

The CHANGELOG.rst file should detail the individual versions, their release date and a set of bullet points for each version highlighting the overall changes in a given version of the formula.

A sample skeleton for the CHANGELOG.rst file:

CHANGELOG.rst:

```
foo formula
==========

0.0.2 (2013-01-01)
- Re-organized formula file layout
- Fixed filename used for upstart logger template
- Allow for pillar message to have default if none specified
```

Versioning

Formulas are versioned according to Semantic Versioning, https://semver.org/.

---

**Note:** Given a version number MAJOR.MINOR.PATCH, increment the:

1. MAJOR version when you make incompatible API changes,
2. MINOR version when you add functionality in a backwards-compatible manner, and
3. PATCH version when you make backwards-compatible bug fixes.

Additional labels for pre-release and build metadata are available as extensions to the MAJOR.MINOR.PATCH format.

Formula versions are tracked using Git tags as well as the VERSION file in the formula repository. The VERSION file should contain the currently released version of the particular formula.

**Testing Formulas**

A smoke-test for invalid Jinja, invalid YAML, or an invalid Salt state structure can be performed by with the `state.show_sls` function:

```
salt '*' state.show_sls apache
```

Salt Formulas can then be tested by running each `.sls` file via `state.apply` and checking the output for the success or failure of each state in the Formula. This should be done for each supported platform.
29.25.3 SaltStack Packaging Guide

Since Salt provides a powerful toolkit for system management and automation, the package can be split into a number of sub-tools. While packaging Salt as a single package containing all components is perfectly acceptable, the split packages should follow this convention.

Patching Salt For Distributions

The occasion may arise where Salt source and default configurations may need to be patched. It is preferable if Salt is only patched to include platform specific additions or to fix release time bugs. It is preferable that configuration settings and operations remain in the default state, as changes here lowers the user experience for users moving across distributions.

In the event where a packager finds a need to change the default configuration it is advised to add the files to the master.d or minion.d directories.

Source Files

Release packages should always be built from the source tarball distributed via pypi. Release packages should NEVER use a git checkout as the source for distribution.

Single Package

Shipping Salt as a single package, where the minion, master, and all tools are together is perfectly acceptable and practiced by distributions such as FreeBSD.

Split Package

Salt Should always be split in a standard way, with standard dependencies, this lowers cross distribution confusion about what components are going to be shipped with specific packages. These packages can be defined from the Salt Source as of Salt 2014.1.0:

Salt Common

The salt-common or salt package should contain the files provided by the salt python package, or all files distributed from the salt/ directory in the source distribution packages. The documentation contained under the doc/ directory can be a part of this package but splitting out a doc package is preferred. Since salt-call is the entry point to utilize the libs and is useful for all salt packages it is included in the salt-common package.

Name

- salt OR salt-common
Files

- salt/*
- man/salt.7
- scripts/salt-call
- tests/*
- man/salt-call.1

Depends

- Python 2.6-2.7
- PyYAML
- jinja2

Salt Master

The *salt-master* package contains the applicable scripts, related man pages and init information for the given platform.

Name

- salt-master

Files

- scripts/salt-master
- scripts/salt
- scripts/salt-run
- scripts/salt-key
- scripts/salt-cp
- pkg/<master init data>
- man/salt.1
- man/salt-master.1
- man/salt-run.1
- man/salt-key.1
- man/salt-cp.1
- conf/master
Depends

- Salt Common
- ZeroMQ >= 3.2
- PyZMQ >= 2.10
- PyCrypto
- M2Crypto
- Python MessagePack (Messagepack C lib, or msgpack-pure)

Salt Syndic

The Salt Syndic package can be rolled completely into the Salt Master package. Platforms which start services as part of the package deployment need to maintain a separate salt-syndic package (primarily Debian based platforms). The Syndic may optionally not depend on the anything more than the Salt Master since the master will bring in all needed dependencies, but fall back to the platform specific packaging guidelines.

Name

- salt-syndic

Files

- scripts/salt-syndic
- pkg/<syndic init data>
- man/salt-syndic.1

Depends

- Salt Common
- Salt Master
- ZeroMQ >= 3.2
- PyZMQ >= 2.10
- PyCrypto
- M2Crypto
- Python MessagePack (Messagepack C lib, or msgpack-pure)
Salt Minion

The Minion is a standalone package and should not be split beyond the salt-minion and salt-common packages.

Name

- salt-minion

Files

- scripts/salt-minion
- pkg/<minion init data>
- man/salt-minion.1
- conf/minion

Depends

- Salt Common
- ZeroMQ >= 3.2
- PyZMQ >= 2.10
- PyCrypto
- M2Crypto
- Python MessagePack (Messagepack C lib, or msgpack-pure)

Salt SSH

Since Salt SSH does not require the same dependencies as the minion and master, it should be split out.

Name

- salt-ssh

Files

- scripts/salt-ssh
- man/salt-ssh.1
- conf/cloud*
depends

- Salt Common
- Python MessagePack (Messagepack C lib, or msgpack-pure)

Salt Cloud

As of Salt 2014.1.0 Salt Cloud is included in the same repo as Salt. This can be split out into a separate package or it can be included in the salt-master package.

Name

- salt-cloud

Files

- scripts/salt-cloud
- man/salt-cloud.1

Depends

- Salt Common
- apache libcloud >= 0.14.0

Salt Doc

The documentation package is very distribution optional. A completely split package will split out the documentation, but some platform conventions do not prefer this. If the documentation is not split out, it should be included with the Salt Common package.

Name

- salt-doc

Files

- doc/*
Optional Depends

- Salt Common
- Python Sphinx
- Make

29.25.4 Salt Release Process

The goal for Salt projects is to cut a new feature release every three to four months. This document outlines the process for these releases, and the subsequent bug fix releases which follow.

Feature Release Process

When a new release is ready to be cut, the person responsible for cutting the release will follow the following steps (written using the 3000 release as an example):

1. Create first public draft of release notes with major features.
2. Remove any deprecations for the upcoming release.
3. Ensure all required features are merged.
4. Create issue to start the process of deprecating for the next feature release.
5. Run through a manual test run based off of the head of the feature branch.
6. Update all name references to version number in the docs. For example all neon references in the docs needs to be moved to v3000
7. Review the release notes with major features.
8. Generate the new man pages for the release.
9. Create internal RC tag for testing from the head of the master branch.
10. Build latest windows, mac, ubuntu, debian and redhat packages.
11. Run manual and package tests against new RC packages.
12. Push the internal tag live to salt’s repo.
13. Publish release archive to pypi based off tag.
15. Announce new RC to salt-users and salt-announce google groups.
17. Fix RC issues once they are categorized as a release blocker.
18. Depending on the issues found during the RC process make a decesion on whether to release based off the RC or go through another RC process
19. If a RC is categorized as stable, build all required packages.
20. Test all release packages.
22. Update installation instructions with new release number at repo.saltstack.com.
23. Review and update all impacted Installation documentation.
24. Update and build docs to include new version (3000) as the latest.
25. Pre-announce on salt-users google group that we are about to update our repo.
26. Publish release (v3000) archive to pypi based off tag.
27. Publish all packages live to repo.
28. Publish the docs.
29. Create release at github
30. Update win-repo-ng with new salt versions.
31. Announce release is live to irc, salt-users, salt-announce and release slack community channel.

### Bugfix Releases

Once a feature release branch has been cut from the master branch, if serious bugs or a CVE is found for the most recent release a bugfix release will need to be cut. A temporary branch will be created based off of the previous release tag. For example, if it is determined that a 3000.1 release needs to occur a 3000.1 branch will be created based off of the v3000 tag. The fixes that need to go into 3000.1 will be added and merged into this branch. Here are the steps for a bugfix release.

1. Ensure all required bug fixes are merged.
2. Create release branch with the version of the release. (ex. 3000.1)
3. Create jenkins jobs that test the new release branch.
4. Run through a manual test run based off of the head of the branch.
5. Generate the new man pages for the release.
6. Create internal tag for testing.(ex v3000.1)
7. Build all release packages.
8. Run manual and package tests against new packages.
10. Update and build docs to include new version. (ex. 3000.1)
11. Pre-announce on salt-users google groups that we are about to update our repo.
12. Push the internal tag live to salt’s repo.
13. Publish release archive to pypi based off tag.
14. Push the packages live.
15. Publish release (v3000) archive to pypi based off tag.
16. Publish all packages live to repo.
17. Publish the docs.
18. Create release at github
20. Announce release is live to irc, salt-users, salt-announce and release slack channel.
Salt Documentation, Release 3002.5

29.25.5 Salt Coding Style

To make it easier to contribute and read Salt code, SaltStack has adopted Black as its code formatter. There are a few places where Black is silent, and this guide should be used in those cases.

Coding style is NEVER grounds to reject code contributions, and is never grounds to talk down to another member of the community (There are no grounds to treat others without respect, especially people working to improve Salt)!

Linting

Most Salt style conventions are codified in Salt’s .pylintrc file. Salt’s pylint file has two dependencies: pylint and saltpylint, however, linting should be done using nox.

```
nox -e lint
```

One can target either salt's source code or the test suite(different pylint rules apply):

```
nox -e lint-salt
nox -e lint-tests
```

Variables

Variables should be a minimum of three characters and should provide an easy-to-understand name of the object being represented.

When keys and values are iterated over, descriptive names should be used to represent the temporary variables.

Multi-word variables should be separated by an underscore.

Variables which are two-letter words should have an underscore appended to them to pad them to three characters.

Formatting Strings

All strings which require formatting should use the .format string method:

Please do NOT use printf formatting, unless it’s a log message.

Good:

```
data = "some text"
more = "{} and then some".format(data)
log.debug("%s and then some", data)
```

Bad:

```
data = "some text"
log.debug("{} and then some".format(data))
```
Docstring Conventions

When adding a new function or state, where possible try to use a `versionadded` directive to denote when the function, state, or parameter was added.

```python
def new_func(msg="
```
   .. versionadded:: 0.16.0
   Prints what was passed to the function.
   msg : None
       The string to be printed.
   
   print(msg)
```
```

If you are uncertain what version should be used, either consult a core developer in IRC or bring this up when opening your pull request and a core developer will let you know what version to add. Typically this will be the next element in the periodic table.

Similar to the above, when an existing function or state is modified (for example, when an argument is added), then under the explanation of that new argument a `versionadded` directive should be used to note the version in which the new argument was added. If an argument's function changes significantly, the `versionchanged` directive can be used to clarify this:

```python
def new_func(msg="", signature="
```
   .. versionadded:: 0.16.0
   Prints what was passed to the function.
   msg : None
       The string to be printed. Will be prepended with 'Greetings! '.
   
   .. versionchanged:: 0.17.1
   signature : None
       An optional signature.
   
   print("Greetings! {0}\n{n[1].format(msg, signature))
```
```
Dictionaries

Dictionaries should be initialized using \{\} instead of dict().
See here for an in-depth discussion of this topic.

Imports

Salt code prefers importing modules and not explicit functions. This is both a style and functional preference. The functional preference originates around the fact that the module import system used by pluggable modules will include callable objects (functions) that exist in the direct module namespace. This is not only messy, but may unintentionally expose code python libs to the Salt interface and pose a security problem.

To say this more directly with an example, this is GOOD:

```python
import os

def minion_path():
    path = os.path.join(self.opts["cachedir"], "minions")
    return path
```

This on the other hand is DISCOURAGED:

```python
from os.path import join

def minion_path():
    path = join(self.opts["cachedir"], "minions")
    return path
```

The time when this is changed is for importing exceptions, generally directly importing exceptions is preferred:

This is a good way to import exceptions:

```python
from salt.exceptions import CommandExecutionError
```

Absolute Imports

Although absolute imports seems like an awesome idea, please do not use it. Extra care would be necessary all over salt’s code in order for absolute imports to work as supposed. Believe it, it has been tried before and, as a tried example, by renaming salt.modules.sysmod to salt.modules.sys, all other salt modules which needed to import sys would have to also import absolute_import, which should be avoided.

Note: An exception to this rule is the absolute_import from __future__ at the top of each file within the Salt project. This import is necessary for Py3 compatibility. This particular import looks like this:

```python
from __future__ import absolute_import
```

This import is required for all new Salt files and is a good idea to add to any custom states or modules. However, the practice of avoiding absolute imports still applies to all other cases as to avoid a name conflict.
Code Churn

Many pull requests have been submitted that only churn code in the name of PEP 8. Code churn is a leading source of bugs and is strongly discouraged. While style fixes are encouraged they should be isolated to a single file per commit, and the changes should be legitimate, if there are any questions about whether a style change is legitimate please reference this document and the official PEP 8 (https://legacy.python.org/dev/peps/pep-0008/) document before changing code. Many claims that a change is PEP 8 have been invalid, please double check before committing fixes.

29.26 Salt code and internals

Reference documentation on Salt's internal code.

29.26.1 Contents

salt.aggregation

salt.utils.aggregation

This library makes it possible to introspect dataset and aggregate nodes when it is instructed.

**Note:** The following examples with be expressed in YAML for convenience's sake:

- `!aggr-scalar` will refer to Scalar python function
- `!aggr-map` will refer to Map python object
- `!aggr-seq` will refer for Sequence python python object

How to instructs merging

This yaml document has duplicate keys:

```yaml
foo: !aggr-scalar first
foo: !aggr-scalar second
bar: !aggr-map {first: foo}
bar: !aggr-map {second: bar}
baz: !aggr-scalar 42
```

but tagged values instruct Salt that overlapping values they can be merged together:

```yaml
foo: !aggr-seq [first, second]
bar: !aggr-map {first: foo, second: bar}
baz: !aggr-seq [42]
```
Default merge strategy is keep untouched

For example, this yaml document still has duplicate keys, but does not instruct aggregation:

```
foo: first
foo: second
bar: {first: foo}
bar: {second: bar}
baz: 42
```

So the late found values prevail:

```
foo: second
bar: {second: bar}
baz: 42
```

Limitations

Aggregation is permitted between tagged objects that share the same type. If not, the default merge strategy prevails. For example, these examples:

```
foo: {first: value}
foo: !aggr-map {second: value}

bar: !aggr-map {first: value}
bar: 42

baz: !aggr-seq [42]
baz: [fail]

qux: 42
qux: !aggr-scalar fail
```

are interpreted like this:

```
foo: !aggr-map{second: value}

bar: 42

baz: [fail]

qux: !aggr-seq [fail]
```

Introspection

TODO: write this part

```
salt.utils.aggregation.aggregate(obj_a, obj_b, level=False, map_class=salt.utils.aggregation.Map, sequence_class=salt.utils.aggregation.Sequence)
```

Merge obj_b into obj_a.

```
>>> aggregate('first', 'second', True) == ['first', 'second']
True
```
class salt.utils.aggregation.Aggregate
    Aggregation base.

class salt.utils.aggregation.Map
    Map aggregation.

salt.utils.aggregation.Scalar(obj)
    Shortcut for Sequence creation

    >>> Scalar('foo') == Sequence(['foo'])
    True

class salt.utils.aggregation.Sequence
    Sequence aggregation.

Exceptions

Salt-specific exceptions should be thrown as often as possible so the various interfaces to Salt (CLI, API, etc) can handle those errors appropriately and display error messages appropriately.

salt.exceptions
    This module is a central location for all salt exceptions

salt.exceptions

This module is a central location for all salt exceptions

exception salt.exceptions.ArgumentValueError
    Used when an invalid argument was passed to a command execution

exception salt.exceptions.AuthenticationError
    If sha256 signature fails during decryption

exception salt.exceptions.AuthorizationError
    Thrown when runner or wheel execution fails due to permissions

exception salt.exceptions.CheckError
    Used when a check fails

exception salt.exceptions.CodePageError
    Raised when an error occurs while getting or setting the windows code page

exception salt.exceptions.CommandExecutionError
    Used when a module runs a command which returns an error and wants to show the user the output gracefully instead of dying

exception salt.exceptions.CommandNotFoundError
    Used in modules or grains when a required binary is not available

exception salt.exceptions.EauthAuthenticationError
    Thrown when eauth authentication fails

exception salt.exceptions.FileLockError
    Used when an error occurs obtaining a file lock

exception salt.exceptions.FileserverConfigError
    Used when invalid fileserver settings are detected
exception salt.exceptions.GitLockError(erno, message, 'args', **'kwargs')
Raised when an uncaught error occurs in the midst of obtaining an update/checkout lock in salt.utils.gitfs.

NOTE: While this uses the errno param similar to an OSError, this exception class is not a subclass of OSError. This is done intentionally, so that this exception class can be caught in a try/except without being caught as an OSError.

exception salt.exceptions.GitRemoteError(message='')
Used by GitFS to denote a problem with the existence of the "origin" remote or part of its configuration

exception salt.exceptions.InvalidConfigError(message='', info=None)
Used when the config is invalid

exception salt.exceptions.InvalidEntityError(message='', info=None)
Used when an entity fails validation

exception salt.exceptions.LoaderError(message='')
Problems loading the right renderer

exception salt.exceptions.LoggingRuntimeError
Raised when we encounter an error while logging

exception salt.exceptions.MasterExit
Rise when the master exits

exception salt.exceptions.MinionError(message='')
Minion problems reading uris such as salt:// or http://

exception salt.exceptions.MissingSmb(message='')
Raised when no smb library is found.

exception salt.exceptions.NotImplemented(message='')
Used when a module runs a command which returns an error and wants to show the user the output gracefully instead of dying

exception salt.exceptions.NxosCliError(message='')
NX-OS Cli Error raised when Cli command rejected by the NX-OS device

exception salt.exceptions.NxosClientError(message='')
NX-OS Client Error raised for problems connecting to the NX-OS device

exception salt.exceptions.NxosError(message='')
NX-OS Base Exception class

exception salt.exceptions.NxosRequestNotSupported(message='')
Raised for unsupported client requests

exception salt.exceptions.PkgParseError(message='')
Used when of the pkg modules cannot correctly parse the output from the CLI tool (pacman, yum, apt, aptitude, etc)

exception salt.exceptions.PublishError(message='')
Problems encountered when trying to publish a command

exception salt.exceptions.SaltCacheError(message='')
Thrown when a problem was encountered trying to read or write from the salt cache

exception salt.exceptions.SaltClientError(message='')
Problem reading the master root key

exception salt.exceptions.SaltClientTimeout(message, jid= None, 'args', **'kwargs')
Thrown when a job sent through one of the Client interfaces times out
Takes the jid as a parameter
exception salt.exceptions.SaltCloudConfigError
Raised when a configuration setting is not found and should exist.

exception salt.exceptions.SaltCloudException
Generic Salt Cloud Exception

exception salt.exceptions.SaltCloudExecutionFailure
Raised when too much failures have occurred while querying/waiting for data.

exception salt.exceptions.SaltCloudExecutionTimeout
Raised when too much time has passed while querying/waiting for data.

exception salt.exceptions.SaltCloudNotFound
Raised when some cloud provider function cannot find what's being searched.

exception salt.exceptions.SaltCloudPasswordError
Raise when virtual terminal password input failed

exception salt.exceptions.SaltCloudSystemExit
This exception is raised when the execution should be stopped.

exception salt.exceptions.SaltConfigurationError
Configuration error

exception salt.exceptions.SaltDaemonNotRunning
Throw when a running master/minion/syndic is not running but is needed to perform the requested operation (e.g., eauth).

exception salt.exceptions.SaltDeserializationError
Thrown when salt cannot deserialize data.

exception salt.exceptions.SaltException
Base exception class; all Salt-specific exceptions should subclass this

_pack()
Pack this exception into a serializable dictionary that is safe for transport via msgpack

exception salt.exceptions.SaltInvocationError
Used when the wrong number of arguments are sent to modules or invalid arguments are specified on the command line

exception salt.exceptions.SaltMasterError
Problem reading the master root key

exception salt.exceptions.SaltMasterUnresolvableError
Problem resolving the name of the Salt master

exception salt.exceptions.SaltNoMinionsFound
An attempt to retrieve a list of minions failed

exception salt.exceptions.SaltRenderError
Used when a renderer needs to raise an explicit error. If a line number and buffer string are passed, get_context will be invoked to get the location of the error.

exception salt.exceptions.SaltReqTimeoutError
Thrown when a salt master request call fails to return within the timeout

exception salt.exceptions.SaltRunnerError
Problem in runner

exception salt.exceptions.SaltSyndicMasterError
Problem while proxying a request in the syndication master
**exception** salt.exceptions.SaltSystemExit *(code=0, msg=None)*

This exception is raised when an unsolvable problem is found. There's nothing else to do, salt should just exit.

**exception** salt.exceptions.SaltWheelError *(message="")*

Problem in wheel

**exception** salt.exceptions.TemplateError *(message="")*

Used when a custom error is triggered in a template

**exception** salt.exceptions.TimedProcTimeoutError *(message="")*

Thrown when a timed subprocess does not terminate within the timeout, or if the specified timeout is not an int or a float

**exception** salt.exceptions.TimeoutError *(message="")*

Thrown when an operation cannot be completed within a given time limit.

**exception** salt.exceptions.TokenAuthenticationError *(message="")*

Thrown when token authentication fails

**exception** salt.exceptions.VMwareApiError *(message="", info=None)*

Used when representing a generic VMware API error

**exception** salt.exceptions.VMwareConnectionError *(message="", info=None)*

Used when the client fails to connect to a either a VMware vCenter server or to a ESXi host

**exception** salt.exceptions.VMwareFileNotFoundError *(message="", info=None)*

Used when representing a generic VMware error if a file not found

**exception** salt.exceptions.VMwareMultipleObjectsError *(message="", info=None)*

Used when multiple objects were retrieved (and one was expected)

**exception** salt.exceptions.VMwareNotFoundError *(message="", info=None)*

Used when a VMware object was not found

**exception** salt.exceptions.VMwareObjectExistsError *(message="", info=None)*

Used when a VMware object already exists

**exception** salt.exceptions.VMwareObjectNotFoundError *(message="", info=None)*

Used when a VMware object was not found

**exception** salt.exceptions.VMwareObjectRetrievalError *(message="", info=None)*

Used when a VMware object cannot be retrieved

**exception** salt.exceptions.VMwarePowerOnError *(message="", info=None)*

Used when error occurred during power on

**exception** salt.exceptions.VMwareRuntimeError *(message="", info=None)*

Used when a runtime error is encountered when communicating with the vCenter

**exception** salt.exceptions.VMwareSaltError *(message="", info=None)*

Used when a VMware object cannot be retrieved

**exception** salt.exceptions.VMwareSystemError *(message="", info=None)*

Used when representing a generic VMware system error

**exception** salt.exceptions.VMwareVmCreationError *(message="", info=None)*

Used when a configuration parameter is incorrect

**exception** salt.exceptions.VMwareVmRegisterError *(message="", info=None)*

Used when a configuration parameter is incorrect

**salt.exceptions.get_error_message(error)**

Get human readable message from Python Exception
The Salt Fileserver and Client

Introduction

Salt has a modular fileserver, and multiple client classes which are used to interact with it. This page serves as a developer's reference, to help explain how the fileserver and clients both work.

Fileserver

The fileserver is not a daemon, so the fileserver and client are not a true server and client in the traditional sense. Instead, the fileserver is simply a class (salt.fileserver.Fileserver), located in salt/fileserver/__init__.py. This class has access to the configured fileserver backends via a loader instance, referenced as self.servers. When a request comes in from the fileclient, it will ultimately result in a Fileserver class function being run.

The functions in this class will run corresponding functions in the configured fileserver backends to perform the requested action. So, in summary:

1. A fileclient class makes a request...
2. which triggers the fileserver to run a function...
3. which runs a named function in each of the configured backends.

Not all of the functions will always execute on every configured backend. For instance, the find_file function in the fileserver will stop when it finds a match, so if it finds a match for the desired path in the first configured backend, it won't proceed and try to find the file in the next backend in the list.

Additionally, not all backends implement all functions in the salt.fileserver.Fileserver class. For instance, there is a function called update, which exists to update remote file servers such as the git, hg, and svn backends. This action has no use however in the roots backend, so it is simply not implemented there, and thus the roots backend will be skipped if the update function is run on the fileserver.

Backends for the fileserver are located in salt/fileserver/ (the files not named __init__.py).

Fileclient

There are three fileclient classes:

salt.fileclient.RemoteClient

This client is used when file_client is set to remote. This is how minions request files from the master.

Functions in this client will craft a payload and send it to the master via the transport channel. This is the same way that the minion asks the minion to do other things, such as updating and requesting data from the mine. The payload will be a dictionary with a key called cmd, and other values as needed.

Payloads sent via the transport channel are processed my an MWorker instance on the master, and the MWorker's _handle_aes() function will execute the command. The command will be a function attribute of the salt.master.AESFuncs class. The AESFuncs class' __setup_fileserver() function instantiates a salt.fileserver.Fileserver instance and maps its member functions to AESFuncs attributes. This is what makes the fileserver functions available remotely. The result of the function is returned back through the transport channel to the minion.

Transporting files is done in chunks, the size of which is decided by the file_buffer_size config option. If you look at the serve_file() function in any of the fileserver backends, you can see how the loc value in the payload
determines the offset so that an intermediate chunk of the file can be served. The RemoteClient's `get_file()` function will loop until the end of the file is reached, retrieving one chunk at a time.

**salt.fileclient.FSClient**

This client is used when `file_client` is set to `local`. This is how masterless minions request files.

This class inherits from the RemoteClient, but instead of using a transport channel (`zmq`, `tcp`, etc.), it uses a "fake" transport channel (`salt.fileserver.FSChan`), which implements its own `send()` function. Thus, when a function that the FSClient inherits from the RemoteClient runs `self.channel.send()`, it's actually calling `salt.fileserver.FSChan.send()`, which calls corresponding functions in the `salt.fileserver.Fileserver()` class. The result is that local file requests use the same code as remote file requests, they just bypass sending them through an actual transport channel and instead call them on the FSChan's Fileserver instance.

**salt.fileclient.LocalClient**

This client is now used exclusively by Pillar. This used to be used when `file_client` was set to `local`, but the FSChan class was written to allow minions with `file_client: local` to access the full set of backends. This class will probably be renamed at some point as it is often confused with `salt.client.LocalClient`.

**The cp Module**

Most of the user-facing interaction with the fileclient happens via the `cp` module. The functions in this module instantiate a fileclient instance (if one is not already saved to the `__context__` dunder) and run fileclient functions.

**Updating the Fileserver**

The master daemon spawns a process dedicated to routine maintenance tasks upon startup. This process runs an instance of `salt.master.Maintenance`, which loops forever, running a series of functions and then sleeping for a length of time determined by the `loop_interval` config option. One of the maintenance tasks is to update the fileserver, and it essentially runs `salt.fileserver.Fileserver.update()`, which as we know from above will run all configured backends' `update()` functions, if present. This is now remote fileserver like `git`, `hg`, and `svn` stay up-to-date.

For the local file_client (FSClient), since it does not interact with the master, upon spawning of its FSChan it will update the fileserver.

**Salt opts dictionary**

It is very common in the Salt codebase to see `opts` referred to in a number of contexts.

For example, it can be seen as `__opts__` in certain cases, or simply as `opts` as an argument to a function in others.

Simply put, this data structure is a dictionary of Salt's runtime configuration information that's passed around in order for functions to know how Salt is configured.

When writing Python code to use specific parts of Salt, it may become necessary to initialize a copy of `opts` from scratch in order to have it available for a given function.

To do so, use the utility functions available in `salt.config`.

As an example, here is how one might generate and print an options dictionary for a minion instance:
import salt.config

opts = salt.config.minion_config("/etc/salt/minion")
print(opts)

To generate and display `opts` for a master, the process is similar:

```python
import salt.config

opts = salt.config.master_config("/etc/salt/master")
print(opts)
```

### Unicode in Salt

Though Unicode handling in large projects can often be complex, Salt adheres to several basic rules to help developers handle Unicode correctly.

(For a basic introduction to this problem, see Ned Batchelder's excellent introduction to the topic [here](http://nedbatchelder.com/text/unipain/unipain.html).

Salt's basic workflow for Unicode handling is as follows:

1. **Salt should** convert whatever data is passed on CLI/API to Unicode. Internally, everything that Salt does should be Unicode unless it is printing to the screen or writing to storage.

2. **Modules and various Salt pluggable systems** use incoming data assuming Unicode.
   1. **For Salt modules that query an API**, the module should convert the data received from the API into Unicode.
   2. **For Salt modules that shell out to get output**, the module should convert data received into Unicode. (This does not apply if using the `cmd` execution module, which should handle this for you.)
   3. **For Salt modules which print directly to the console (not via an outputter)** or which write directly to disk, a string should be encoded when appropriate. To handle this conversion, the global variable `__salt_system_encoding__` is available, which declares the locale of the system that Salt is running on.

3. **When a function in a Salt module returns a string**, it should return a `unicode` type in Python 2.

4. **When Salt delivers the data to an outputter or a returner**, it is the job of the outputter or returner to encode the Unicode before displaying it on the console or writing it to storage.

### 29.27 Salt Community Projects

This page contains links to Salt-related projects created by community members. If you come across a useful project please add it to the list!
29.27.1 Hubblestack

Hubble is a modular, open-source security compliance framework built on top of SaltStack. The project provides on-demand profile-based auditing, real-time security event notifications, automated remediation, alerting and reporting.

https://hubblestack.io/

29.27.2 alkali

alkali is a collection of SaltStack states and pillar data that provide just the basics for provisioning Linux instances that may be built upon. alkali is a starter kit of sorts, to help new users to SaltStack get up-and-running quickly with the most commonly used, core packages.

https://github.com/zulily/alkali

29.27.3 buoyant

buoyant leverages docker to provide an alternative to VM-centric SaltStack development environments. buoyant containers may be spun up nearly instantly, once an initial docker image has been built.

https://github.com/zulily/buoyant

29.27.4 Salt Sandbox

Salt Sandbox is a multi-VM Vagrant-based Salt development environment used for creating and testing new Salt state modules outside of your production environment. It’s also a great way to learn firsthand about Salt and its remote execution capabilities.

https://github.com/elasticdog/salt-sandbox

29.27.5 Salt Vagrant Demo

A Salt Demo using Vagrant.

https://github.com/UtahDave/salt-vagrant-demo
See the version numbers page for more information about the version numbering scheme.

30.1 Latest Branch Release

Release Candidate

30.2 Previous Releases

30.2.1 Salt 3002 Release Notes - Codename Magnesium

New Features

Network Teaming Support Added (RHEL/CentOS)

Support for two new interface types (team and teamport) has been added to the network.managed state. See the documentation for example usage.

Execution Module Changes

The ip.get_bond and ip.build_bond functions have been removed from the ip module for RHEL/CentOS. Configuring bonding opts in modprobe configurations has not been necessary since RHEL 4, and Salt was in fact redundantly both creating modprobe configurations and using the BONDING_OPTS interface configuration parameter.

Removed

- removed boto_vpc.describe_route_table please use boto_vpc.describe_route_tables (#58636)
- removed show_ipv4 arg from all functions in from salt.runners.manage (#58638)
- removed kwargs from mandrill.send if you use "async" please use "asynchronous" (#58640)
- removed salt/modules/mac_brew_pkg.__fix_cask_namespace (#58641)
- zfs.mount Passing '-a' as name is deprecated please just pass 'None' (#58642)
- Remove include_localhost kwarg for connected_ids method in salt/utils/minions.py (#58224)
• deprecated opts default argument of none and removed deprecation warnings (#58635)

Deprecated

• The ssh parameter of virt.migrate has been deprecated. Use a libvirt URI target value instead. Both virt.migrate_non_shared and virt.migrate_non_shared_inc have been deprecated. Use the copy_storage parameter with virt.migrate instead. (#57947)

Changed

• Allow to specify a custom port for Proxmox connection (#50620)
• Changed the lvm.lv_present state to accept a resizefs switch. So, when the logical volume is resized, the filesystem will be resized too. (#55265)
• Change the enable_fqdns_grains setting to default to False on proxy minions as it is generally not needed and just slows down start up time. (#57676)
• Adds network teaming support to network.managed state for RHEL-based distros. Removes ip.get_bond and ip.build_bond for the same, as is redundant and not needed for any current RHEL/CentOS/Fedora/etc. release. (#57775)
• The serializer argument has been added to the file.serialize state, as an alternative to formatter. This brings it more in line with the serializer_opts and deserializer_opts arguments. formatter is still supported, but using both serializer and formatter will cause the state to fail. (#57858)

Fixed

• file.read exec module function no longer fails on binary data. (#58033)
• Remove py2 support from winrepo execution module and runner (#58596)
• Create ini file if does not exist when using ini.options_present state module. (#34236)
• Added an bool "strict" argument to sdb.get module to force module to fail if the sdb uri is not correct. (#39163)
• Fixed issue with postgres.has_privilege breaking on ALL. (#49063)
• fix frequent rest_tornado non-fatal tracebacks (#49572)
• Do not use reverse DNS of the target used in salt-ssh. Use the target the user provides. (#49840)
• Fixes startup issue where it tried to load the kernalparams grain on Windows (#49901)
• Fixed error in nilrt_ip.get_interfaces_details when loading config. (#50416)
• Doesn’t remove underscore when sanitizing hostname in network salt util (#50527)
• permit the use of int/float type for the version in:
  – the state postgres_cluster.present
  – the state postgres_cluster.absent
the module postgres.cluster_create
• the module postgres.cluster_remove (#50899)

• Cleaned up a trackback in lvm.pv_present when the disk doesn’t exist. (#52363)
• Fixed UnboundLocalError when using win_network.connect (#53371)
• Add accept_ra 2 option to modules.debian_ip (#54067)
• salt.runner test mode support (#54382)
• Fixed mkpart to allow the creation of a partition without filesystem (#54456)
• Fixes bogus warning message when an empty list is used for an environment in a topfile. This allows [] to be used as a placeholder in a topfile without needing to comment everything out as a workaround. (#54882)
• win_certutil state will no longer fail on non-English systems upon successful additions and deletions of a certificate. (#55024)
• Fixed file.directory state always showing mode change for symlinks. (#55878)
• check for a docker error that the swarm already exists when calling swarm.swarm_init on an existing docker swarm (#55949)
• Fixing stalekey engine so it deletes the keys when they are a list. (#55977)
• An invalid _schedule.conf configuration file is renamed to _schedule.confYAMLError. This avoids disabling the minion and busy polling the CPU on Windows. (#56216, #58177)
• Proper calculation of tpldir and related context parameters (#56410)
• Make gpg.encrypt examples work (#56646)
• Artifactory encoding of headers fixed for py3 (#56660)
• Fixed handling of extents extended attribute in file.managed state. (#57189)
• Remove buggy start parameter from virt.pool_running docstring (#57275)
• Fixed saltcheck rendering of map.jinja files from saltenv (#57327)
• Fix for virt.get_profiles resolves an error that appears due to new parameters introduced with _disk_profile() (#57431)
• Accept nested namespaces in spacewalk.api runner function. (#57442)
• virt.init fix the disk target names (#57477)
• Fix volume name for disk-typed pools in virt.defined (#57497)
• Fixes an issue with filesystems options ordering which kept already applied NFS fstab entries being updated. (#57520)
• Do not allow python2 to be added to salt-ssh tar since Salt deprecated Python 2. (#57647)
• Fixed exception on loading custom zipped modules. (#57674)
• corrected support for app_id or local vault configurations (#57705)
• Fix the registration of libvirt pool and nodedev events (#57746)
• Pass cmd.run state arguments to unless and onlyif when they exist (#57760)
• The 2004 release of Windows 10 introduced a bug in the InstallationBehavior COM object where you can no longer get properties from that object. Calls to this object are now wrapped in a try/except block with sane defaults when it fails to read attributes.
Additionally, some pre-flight checks have been added to the win_wua module to make sure Windows Update can actually run. (#57762)

- Changed get_repo in yumpkg.py to use "repo" as first parameter. This fixes #57778, a bug were every run of pkgrepo.managed state were marked as changed because the get_repo did fail to detect a previously applied run. (#57778)

- Raise SaltClientError in parse_host_port insted of ValueError so it is caught and handled properly when the minion is connecting to the master. (#57789)

- Fixed issue with the return dictionary from the workgroup() function in the salt.states.win_system module. This resulted in a windows-based minion logging an error and could also interfere with a highstate being applied. (#57790)

- Fixes broken block_device_mapping and block_device_mapping_v2 type checks in the OpenStack cloud driver. Salt was looking for a dict and the shade library was looking for a list of dicts. This made it impossible to use those params. (#57802)

- Fixed incorrect parsing of Set-Cookie response headers. (#57829)

- When using yumpkg, report stdout when stderr is redirected to stdout. (#57862)

- Fixes an issue on macOS where if you try and restart the macOS using servive.restart salt-minion it would fail because the service names are different on macOS. (#57878)

- Fixes an issue on macOS where salt would take extra time to run on a service.dead call and the service is missing. (#57907)

- Fixes an issue where a disabled macOS and Windows service would fail to start with service.running. (#57908)

- Use "use_bin_type" to differentiate between bytes and str when writing cache for pillar and grains. (#57918)

- Set the comment to "No minions responded" if salt.function fails to find any minions (#57920)

- Fix issue with __utils__ usage in the __virtual__ functions on a few of the execution modules. (#57948)

- remove encoding kwarg for both pack(b)/unpack(b) in msgpack for versions >=1.0.0 https://github.com/msgpack/msgpack-python/blob/master/ChangeLog.rst#100 (#57965)

- Replace deprecated cgi.escape() with html.escape() after it was removed from Python 3.8. (#57983)

- Fix btrfs state decorator, that produces exceptions when creating subvolumes. (#58012)

- Fix kubeadm token_list when the list of tokens is empty (#58116)

- Add a fix for the mac_service modules where it would fail to load in some new services and crash on Big Sur. (#58143)

- Fix blank tplfile context parameter when loading top level sls files (#58249)

- Do not include init directory in sls context parameters if explicitly specified (#58250)

- Fixing pillar caching when pillar environments are involved. (#58274)

- Make proxy_config read in the proxy specific configuration which is typically found in /etc/salt/proxy.d/minionid/. (#58307)

- Add timeout kwarg docs for service.running and service.dead (#58311)

- Return empty dict on win_pdh.get_counters rather than raising exception when no data are available (#58327)

- Leave boot parameters untouched if boot parameter is set to None in virt.update (#58331)

- Convert disks of volume type to file or block disks on Xen (#58333)
• Apparently Apple is using both "10.16" and "11" for versioning Big Sur, depending on where you look. The mac_softwareupdate module uses a different regex depending on OS version, and the determination was based on the osrelease_info grain. This results in a Big Sur machine not using the correct regex; osrelease_info[1] is 0 for Big Sur.

This change simply adds an additional clause to the if statement to handle osmajorrelease > 10. (#58340)

• Fixed zmq salt-call hang!

Some objects from the 3rd party module zmq fail to deconstruct if left to the GC when Python exits. This is because the objects get destroyed out of order. This only happens on some platforms like ubuntu 20.04 and some versions of FreeBSD. We fixed this hang by deconstructing all zmq objects in the right order before we exit salt-call. (#58364)

• Reactor runner functions will now ensure reactor system is available before attempting to run and error out if it is not available. (#58384)

• Fix endpoint typos (#58416)

• Make sure we repopulate __utils__ on Windows when a job is run from the scheduler. (#58437)

• Adding a check when a source is an HTTP or FTP URL to do a query to ensure the URL is valid before returning, then we know if we need to move onto the next source in the list or not. (#58441)

• Improved documentation for the LGPO state module (#58521)

• Remove old documented pending reboot key (#58530)

• On macOS, skip GUI dialog for Developer Command Line Tools when importing gitfs util. (#58575)

• Fixing a use case when multiple inotify beacons are defined but when notifications are fired the configuration from the first beacon are used. (#58655)

Added

• salt-api will now work on Windows platforms with limited support. You will be able to configure the rest_cherrypy module, without pam external authentication and without ssl support. (#49949)

• Added execution_timeout support to chocolatey.installed state (#50449)

• Add new verify_ssl option to file modules. This allows a user to not validate the server certificate for HTTPS source and source hash’s. (#52663)

• Added list target type support to the scan salt-ssh roster. (#52675)

• Added pvresize and lvextend to linux_lvm (#56089)

• Added COPR option to states.pkgrepo (#57258)

• Add "get_return" key for onlyif and unless requisites to parse deep module results (#57470)

• Allow setting VM boot devices order in virt.running and virt.defined states (#57544)

• Added grains to show the LVM Volume Groups and their Logical Volumes. (#57629)

• Memory Tuning Support which allows much greater control of memory allocation (#57639)

• Add output filter to saltcheck to only display test failures (#57788)

• Added an execution module for running idem exec modules

• Added a state module for running idem states (#57969)

• Added the ability for states to return sub_state_run’s results from external state engines (#57993)
• Added salt-cloud support for Linode APIv4 via the `api_version` provider configuration parameter. (#58093)
• Added support to manage services in Slackware Linux. (#58206)
• Added list_sources to chocolatey module to have an overview of the repositories present on the minions. Added `source_added` to chocolatey state in order to add repositories to chocolatey. (#58588)
• Adding tests for changes to virtual function for netmiko module. Adding tests for netmiko proxy minion module. (#58609)
• Added features config option for feature flags. Added a feature flag `enable_slsvars_fixes` to enable fixes to tpldir, tplfile and sls_path. This flag will be deprecated in the Phosphorus release when this functionality becomes the default. (#58652)

30.2.2 Salt 3002.1 Release Notes

Version 3002.1 is a CVE fix release for 3002.

Fixed

• Prevent shell injections in netapi ssh client (cve-2020-16846)
• Prevent creating world readable private keys with the tls execution module. (cve-2020-17490)
• Properly validate eauth credentials and tokens along with their ACLs. Prior to this change eauth was not properly validated when calling Salt ssh via the salt-api. Any value for 'eauth' or 'token' would allow a user to bypass authentication and make calls to Salt ssh. (CVE-2020-25592)

30.2.3 Salt 3002.2 Release Notes

Version 3002.2 is a bugfix release for 3002.

Fixed

• Change dict check to `isinstance` instead of `type()` for key_values in file.keyvalue. (#57758)
• Fail when func_ret is False when using the new module.run syntax. (#57768)
• Fix comparison of certificate values (#58296)
• When using ssh_pre_flight if there is a failure, fail on retcode not stderr. (#58439)
• Fix use of unauthd cached vmware service instance (#58691)
• Removing use of undefined variable in utils/slack.py. (#58753)
• Restored the ability to specify the amount of extents for a Logical Volume as a percentage. (#58759)
• Ensuring that the version check function is run a second time in all the user related functions incase the user being managed is the connection user and the password has been updated. (#58773)
• Allow bytes in gpg renderer (#58794)
• Fix issue where win_wua module fails to load when BITS is set to Manual (#58848)
• Ensure that `elasticsearch.index_exists` is available before loading the elasticsearch returner. (#58851)
• Log a different object when debugging if we’re using disk cache vs memory cache. The disk cache pillar class
has the dict object but the cache pillar object which is used with the memory cache does not include a _dict
object because it is a dict already. (#58861)

• Do not generate grains for every job run on Windows minions. This makes Windows conform more to the
way posix OSes work today. (#58904)

• Fixes salt-ssh authentication when using tty (#58922)

• Revert LazyLoader finalizer. Removed the weakref.finalizer code. On some occasions, the finalized would run
when trying to load a new module, firing a race condition. (#58947)

### 30.2.4 Salt 3002.3 Release Notes

Version 3002.3 is a CVE fix release for 3002.

**Fixed**

• CVE-2020-28243 - Fix local privilege escalation in the restartcheck module.

• CVE-2020-28972 - Ensure authentication to vcenter, vsphere, and esxi server validates the SSL/TLS certificate
by default. If you want to skip SSL verification you can use `verify_ssl: False`.

• CVE-2020-35662 - Ensure the asam runner, qingcloud, splunk returner, panos proxy, cimc proxy, zenoss mod-
ule, esxi module, vsphere module, glassfish module, bigip module, and keystone module validate SSL by default.
If you want to skip SSL verification you can use `verify_ssl: False`.

• CVE-2021-3148 - Fix a command injection in the Salt-API when using the Salt-SSH client.

• CVE-2021-3144 - Fix eauth tokens can be used once after expiration

• CVE-2021-25281 - Fix salt-api so it honors eauth credentials for the wheel_async client.

• CVE-2021-25282 - Fix the salt.wheel.pillar_roots.write method so it is not vulnerable to directory traversal.

• CVE-2021-25283 - Fix the jinja render to protect against server side template injection attacks.

• CVE-2021-25284 - Fix cmdmod so it will not log credentials to log levels info and error.

• CVE-2021-3197 - Fix ssh client to remove ProxyCommand from arguments provided by cli and netapi.

### 30.2.5 Salt 3002.4 Release Notes

Version 3002.4 is a bug fix release for 3002.

**Fixed**

• Fix runners that broke when patching for CVE-2021-25281

• Fix issue with runners in SSE
Known Issue

When using the Salt-API with the SSH client some of the SSH options are not working currently and will be fixed in an upcoming bug fix release. We are currently testing and fixing which options still need to be fixed, but have confirmed the following ones do not work in this release: extra-filerefs, pre-flight. This does not impact normal Salt-SSH usage on the cli.

30.2.6 Salt 3002.5 Release Notes

Version 3002.5 is a cve fix release for 3002.

Fixed

- Tests and fix for CVE-2021-25283

Known Issue

When using the Salt-API with the SSH client some of the SSH options are not working currently and will be fixed in an upcoming bug fix release. We are currently testing and fixing which options still need to be fixed, but have confirmed the following ones do not work in this release: extra-filerefs, pre-flight. This does not impact normal Salt-SSH usage on the cli.

30.2.7 Salt 3001 Release Notes - Codename Sodium

Python 2 Dropped

Python 2 support has been dropped in Salt 3001. See https://community.saltstack.com/blog/sunsetting-python-2-support/ for more info.

Salt mine updates

Syntax update

The syntax for defining salt functions in config or pillar files has changed to also support the syntax used in module.run. The old syntax for the mine_function - as a dict, or as a list with dicts that contain more than exactly one key - is still supported but discouraged in favor of the more uniform syntax of module.run.

State updates

The creates state requisite has been migrated from the docker_container and cmd states to become a global option. This acts similar to an equivalent unless: test -f filename but can also accept a list of filenames. This allows all states to take advantage of the enhanced functionality released in Neon, of allowing salt execution modules for requisite checks.

When using salt functions onlyif or unless requisites, a get_return key can now be used to specify a key to evaluate for truthiness. This can be used for execution modules which return status in a nested key.
The `state.test` function can be used to test a state on a minion. This works by executing the `state.apply` function while forcing the `test` kwarg to `True` so that the `state.apply` function is not required to be called by the user directly. This also allows you to add the `state.test` function to a minion's `minion_blackout_whitelist` pillar if you wish to be able to test a state while a minion is in blackout.

New Grains

`systempath`

This grain provides the same information as the `path` grain, only formatted as a list of directories.

Salt-SSH updates

`ssh_pre_flight`

A new Salt-SSH roster option `ssh_pre_flight` has been added. This enables you to run a script before Salt-SSH tries to run any commands. You can set this option in the roster for a specific minion or use the `roster_defaults` to set it for all minions.

Example for setting `ssh_pre_flight` for specific host in roster file

```
minion1:
  host: localhost
  user: root
  passwd: P@ssword
  ssh_pre_flight: /srv/salt/pre_flight.sh
```

Example for setting `ssh_pre_flight` using `roster_defaults`, so all minions run this script.

```
roster_defaults:
  ssh_pre_flight: /srv/salt/pre_flight.sh
```

The `ssh_pre_flight` script will only run if the thin dir is not currently on the minion. If you want to force the script to run you have the following options:

- Wipe the thin dir on the targeted minion using the `-w` arg.
- Set `ssh_run_pre_flight` to `True` in the config.
- Run `salt-ssh` with the `--pre-flight` arg.
set_path

A new salt-ssh roster option `set_path` has been added. This allows you to set the path environment variable used to run the salt-ssh command on the target minion. You can set this setting in your roster file like so:

```
minion1:
  host: localhost
  user: root
  passwd: P@ssword
  set_path: "$PATH:/usr/local/bin/
```

auto_detect

You can now auto detect the dependencies to be packed into the salt thin when using the `ssh_ext_alternatives` feature.

```
ssh_ext_alternatives:
  2019.2:
    # Namespace, can be anything.
    py-version: [2, 7] # Constraint to specific interpreter version
    path: /opt/2019.2/salt # Main Salt installation directory.
    auto_detect: True # Auto detect dependencies
    py_bin: /usr/bin/python2.7 # Python binary path used to auto detect dependencies
```

This new `auto_detect` option needs to be set to True in your `ssh_ext_alternatives` configuration. Salt-ssh will attempt to auto detect the file paths required for the default dependencies to include in the thin. If you have a dependency already set in your configuration, it will not attempt to auto detect for that dependency.

You can also set the `py_bin` option to set the python binary to be used to auto detect the dependencies. If `py_bin` is not set, it will attempt to use the major Python version set in `py-version`. For example, if you set `py-version` to be `[2, 7]` it will attempt to find and use the `python2` binary.

State Changes

- Adding a new option for the State compiler, `disabled_requisites` will allow requisites to be disabled during State runs.

Salt Renderer updates

A new renderer for toml files has been added.

```
#jinjatoml
{% set myvar = "sometext" %}

["some id"."test.nop"]
name = "{{ myvar }}"

["some id"."test.nop"]
txt = "hello"

["some id"."test.nop"]
"somekey" = "somevalue"
```
Execution Module updates

Vault Module

The vault module has been updated with the ability to cache generated tokens. By specifying uses and optionally ttl, the token generated on behalf of the minion will be allowed to persist and function for the defined time period or number of uses. Setting uses: 0 creates an unlimited use token, that is only constrained by the ttl.

```
vault:
  auth:
    uses: 25
```

This functionality is configured by default on the master and is thus shared behavior for all minion token generation. To delegate use count to individual minions, specify allow_minion_override: True in the master config, and define uses and ttl in the minion config as directed above.

```
vault:
  auth:
    method: token
    allow_minion_override: True
```

Additionally, the vault module now supports Vault secrets backend version 2. The appropriate secrets backend will be automatically detected, and cached in the same credentials file as long lived vault tokens mentioned above. For any configurations that worked around KV v2 handling by adding a manual data key to the end of vault lookups, `salt[vault].read_secret('secret/my/secret')['data']`, these are automatically detected and will continue to function, but will generate a debug log message and can be removed.

The long lived token and secret metadata cache file can be cleared with the new `vault.clear_token_cache` execution function.

30.2.8 Salt 3001.1 Release Notes

Version 3001.1 is a bugfix release for 3001.

Changed

- Change the `enable_fqdns_grains` setting to default to False on Windows to address some issues with slowness. (#56296, #57529)
- Handle the UCRT libraries the same way they are handled in the Python 3 installer (#57594)
- Changes the ‘SSDs’ grain name to ‘ssds’ as all grains needs to be resolved in lowered case. (#57612)

Fixed

- When running scheduled jobs from a proxy minion with multiprocessing turned off (default) a recursive error occurs as `__pub_fun_args` is repeated over and over again in the kwargs element in the data dictionary. Now we make a copy of data[‘kwargs’] instead of using a reference. (#57941)
- The `x509.certificate_managed` state no longer triggers a change because of sorting issues if the certificate being evaluated was previously generated under Python 2. (#56556)
- Added support to lo ip alias in network.managed state by checking if lo inet data from network.interfaces contains label with the name of managed interface. Return status True if match found. (#56901)
• Redact passwords in the return when setting credentials using `win_iis.container_setting` (#57285)
• Fixes issue with `cmd.powershell`. Some powershell commands do not return anything in stdout. This causes the JSON parser to fail because an empty string is not valid JSON. This changes an empty string to `[]` which is valid JSON and will not cause the JSON loader to stacktrace. (#57493)
• Improves performance. Profiling `test.ping` on Windows shows that 13 of 17 seconds are wasted when the esxi grain loads vsphere before noting that the OS is not a esxi host. (#57529)
• Fixed permissions issue with certain pip/virtualenv states/modules when configured for non-root user. (#57550)
• Allow running nox sessions either using our `nox-py2` fork or upstream `nox`. (#57583)
• Fixes issue with `lgpo.get` when there are unicode characters in the hostname (#57591)
• Fixes issue with virtual block devices, like loopbacks and LVMs, wrongly populating the "disks" or "ssds" grains. (#57612)
• Due to some optimization the `virtual` grain was never updated on illumos. Move the fallback in prtdiag output parsing outside the loop that now gets skipped due to the command exiting non-zero. (#57714)
• Grains module delkey and delval methods now support the force option. This is needed for deleting grains with complex (nested) values. (#57718)
• Moving import `salt.modules.vsphere` into `__virtual__` so we have access to test proxytype in opts, previously this was causing a traceback when run on proxy minion as `__opts__` does not exist outside of any functions. Introducing a new utils function, is_proxytype, to check that the device is a proxy minion and also that the proxy type matches. (#57743)
• Fixed `fail_with_changes` in the test state to use the comment argument when passed. (#57766)
• Adds a fix so salt can run on the latest macOS version Big Sur. (#57787)
• Fixes UnpackValueError when using GPG cache by using atomic open. (#57798)
• The `gid_from_name` argument was removed from the `user.present` state in version 3001, with no deprecation path. It has been restored and put on a proper deprecation path. (#57843)
• Fixes dictionary being changed during iteration. (#57845)

Added

• Added docs demonstrating how to apply an MSI patch with winrepo (#32780)

30.2.9 Salt 3001.2 Release Notes

Version 3001.2 is a CVE fix release for 3001.
Fixed

- Prevent shell injections in netapi ssh client (cve-2020-16846)
- Prevent creating world readable private keys with the tls execution module. (cve-2020-17490)

30.2.10 Salt 3001.3 Release Notes

Version 3001.3 is a CVE fix release for 3001.

Fixed

- Properly validate eauth credentials and tokens along with their ACLs. Prior to this change eauth was not properly validated when calling Salt ssh via the salt-api. Any value for ‘eauth’ or ‘token’ would allow a user to bypass authentication and make calls to Salt ssh. (CVE-2020-25592)

30.2.11 Salt 3001.4 Release Notes

Version 3001.4 is a bugfix release for 3001.

Fixed

- Fixes salt-ssh authentication when using tty (#58922)

30.2.12 Salt 3001.5 Release Notes

Version 3001.5 is a CVE fix release for 3001.

Fixed

- CVE-2020-28243 - Fix local privilege escalation in the restartcheck module.
- CVE-2020-28972 - Ensure authentication to vcenter, vsphere, and esxi server validates the SSL/TLS certificate by default. If you want to skip SSL verification you can use `verify_ssl: False`.
- CVE-2020-35662 - Ensure the asam runner, qingcloud, splunk returner, panos proxy, cimc proxy, zenoss module, esxi module, vsphere module, glassfish module, bigip module, and keystone module validate SSL by default. If you want to skip SSL verification you can use `verify_ssl: False`.
- CVE-2021-3148 - Fix a command injection in the Salt-API when using the Salt-SSH client.
- CVE-2021-3144 - Fix eauth tokens can be used once after expiration
- CVE-2021-25281 - Fix salt-api so it honors eauth credentials for the wheel_async client.
- CVE-2021-25282 - Fix the salt.wheel.pillar_roots.write method so it is not vulnerable to directory traversal.
- CVE-2021-25283 - Fix the jinja render to protect against server side template injection attacks.
- CVE-2021-25284 - Fix cmdmod so it will not log credentials to log levels info and error.
- CVE-2021-3197 - Fix ssh client to remove ProxyCommand from arguments provided by cli and netapi.
30.2.13 Salt 3001.6 Release Notes

Version 3001.6 is a bug fix release for 3001.

Fixed

- Fix runners that broke when patching for CVE-2021-25281
- Fix issue with runners in SSE

Known Issue

When using the Salt-API with the SSH client some of the SSH options are not working currently and will be fixed in an upcoming bug fix release. We are currently testing and fixing which options still need to be fixed, but have confirmed the following ones do not work in this release: extra-filerefs, pre-flight. This does not impact normal Salt-SSH usage on the cli.

30.2.14 Salt 3000 Release Notes - Codename Neon

Security Advisory

For historical reasons, Salt requires PyCrypto as a "lowest common denominator". However, PyCrypto is unmaintained and best practice is to manually upgrade to use a more maintained library such as PyCryptodome. See Issue #52674 and Issue #54115 for more info

New Versioning

The neon release has removed the date versioning. Going forward we will use a non-date based version schema beginning at 3000. The version will be MAJOR.PATCH. For a planned release containing features and/or bug fixes the MAJOR version will be incremented. Please review the approved SEP for further details.

The new versioning scheme is PEP 440 compliant, but distutils.StrictVersion will result in an error invalid version number. If using StrictVersion to compare Salt's versions, please use LooseVersion. There is also the packaging library you can use to compare versions. Another alternative is using the salt version module

Python 3.8 Not Supported

Please note that running Salt with Python 3.8 is currently not supported. It is recommended to not use a version higher than 3.7.

Vendored Tornado Code Base

The Tornado code base has been included as salt.ext.tornado. This was done to provide a consistent version of Tornado across all operating systems while we continue to work on upgrading Tornado to a recent version. New code that uses Tornado should import the module from salt.ext.tornado instead of importing the system version of Tornado.
**Msgpack 1.0.0rc1 Incompatibility**

Salt is currently incompatible with msgpack 1.0.0rc1. We recommend using versions < 1.0.0. This impacts the Salt Master's ability to run commands against minions. Please see Issue 56007 for more details and updates.

**Pip Installing Salt On Windows**

This release will not install correctly on windows when using pip to install salt. This issue is addressed in PR 56099. The workaround for this issue is:

```
pip install "pywin32==224" "WMI==1.4.9"
```

Those using the Salt Windows Installer are not affected by this issue.

**Saltcheck Updates**

Available since 2018.3, the `saltcheck` module has been enhanced to:

- Support saltenv environments
- Associate tests with states by naming convention
- Adds `report_highstate_tests` function
- Adds empty and notempty assertions
- Adds skip keyword
- Adds `print_result` keyword
- Adds `assertion_section` keyword
- Use `saltcheck.state_apply` to run `state.apply` for test setup or teardown
- Changes output to display test time
- Works with `salt-ssh`

Saltcheck provides unittest like functionality requiring only the knowledge of salt module execution and yaml. Saltcheck uses salt modules to return data, then runs an assertion against that return. This allows for testing with all the features included in salt modules.

In order to run state and highstate saltcheck tests, a sub-folder in the state directory must be created and named `saltcheck-tests`. Tests for a state should be created in files ending in `.tst` and placed in the `saltcheck-tests` folder. `tst` files are run through the salt rendering system, enabling tests to be written in yaml (or renderer of choice), and include jinja, as well as the usual grain and pillar information. Like states, multiple tests can be specified in a `tst` file. Multiple `tst` files can be created in the `saltcheck-tests` folder, and should be named the same as the associated state. The `id` of a test works in the same manner as in salt state files and should be unique and descriptive.
Usage

Example file system layout:

```
/srv/salt/apache/
  init.sls
  config.sls
  saltcheck-tests/
    init.tst
    config.tst
    deployment_validation.tst
```

Tests can be run for each state by name, for all apache/saltcheck/*.*tst files, or for all states assigned to the minion in top.sls. Tests may also be created with no associated state. These tests will be run through the use of `saltcheck.run_state_tests`, but will not be automatically run by `saltcheck.run_highstate_tests`.

```
salt '/*' saltcheck.run_state_tests apache,apache.config
salt '/*' saltcheck.run_state_tests apache check_all=True
salt '/*' saltcheck.run_highstate_tests
salt '/*' saltcheck.run_state_tests apache.deployment_validation
```

Example Tests

```
{% # will run the common salt state before further testing %}
setup_test_environment:
  module_and_function: saltcheck.state_apply
  args:
    - common
  pillar-data:
    data: value

{% for package in ["apache2", "openssh"] %}
  jinja_test_{{ package }}_latest:
    module_and_function: pkg.upgrade_available
    args:
      - {{ package }}
    assertion: assertFalse
{% endfor %}

validate_user_present_and_shell:
  module_and_function: user.info
  args:
    - root
  assertion: assertEqual
  expected-return: /bin/bash
  assertion_section: shell
  print_result: False

skip_test:
  module_and_function: pkg.upgrade_available
  args:
    - apache2
```

(continues on next page)
assertion: assertFalse
skip: True

Output Format Changes

Saltcheck output has been enhanced to display the time taken per test. This results in a change to the output format.

Previous Output:

```
local:
  |_---------
    ntp:
      |---------
      ntp-client-installed:
        Pass
      ntp-service-status:
        Pass
    |_---------
      TEST RESULTS:
      |---------
      Failed:
        0
      Missing Tests:
        0
      Passed:
        2
```

New output:

```
local:
  |_---------
    ntp:
      |---------
      ntp-client-installed:
        duration: 1.0408
        status: Pass
      ntp-service-status:
        duration: 1.464
        status: Pass
    |_---------
      TEST RESULTS:
      |---------
      Execution Time: 2.5048
      Failed:
```

(continues on next page)
Unless and onlyif Enhancements

The `unless` and `onlyif` requisites can now be operated with salt modules. The dictionary must contain an argument `fun` which is the module that is being run, and everything else must be passed in under the `args` key or will be passed as individual kwargs to the module function.

Note: Certain states have an `unless/onlyif` implementation that predates this feature, and may not work as expected:

- `states.git`
- `states.cmd`
- `states.macpackage`
- `states.file`
- `states.docker_container`

Examples:

```
check external ip address:
http.query:
  - name: https://icanhazip.com
  - status: 200
  - onlyif:
    - fun: file.file_exists
      path: /usr/local/bin/whatever
```

is equivalent to

```
check another ip address:
http.query:
  - name: https://icanhazip.com
  - status: 200
  - onlyif:
    - test -f /tmp/fnord.txt
```

Another example:

```
set mysql root password:
debconf.set:
  - name: mysql-server-5.7
  - data:
    ’mysql-server/root_password’: {’type’: ’password’, ’value’: {{pillar[’mysql.
      → pass’]}}}
  - unless:
```

(continues on next page)
- **fun**: pkg.version
  
  **args**:
  - mysql-server-5.7

---

**Keystore State and Module**

A new *state* and *execution module* for managing Java Keystore files is now included. It allows for adding/removing/listing as well as managing keystore files.

```bash
# salt-call keystore.list /path/to/keystore.jks changeit
local:
  |--
     |--
     |  alias:
     |     hostname1
     |     expired:
     |        True
     |     sha1:
     |     type:
     |        TrustedCertEntry
     |     valid_start:
     |        August 22 2012
     |     valid_until:
     |        August 21 2017

define_keystore:
  keystore.managed:
    - name: /tmp/statestore.jks
    - passphrase: changeit
    - force_remove: True
    - entries:
      |--
      |  alias: hostname1
      |     certificate: /tmp/testcert.crt
      |  alias: remotehost
      |     certificate: /tmp/512.cert
      |     private_key: /tmp/512.key
      |  alias: stringhost
      |     certificate: |
      |        -----BEGIN CERTIFICATE-----
      |        MIICEjCCAX
      |        Hn+GmxZA
      |        -----END CERTIFICATE-----
```
XML Module

A new state and execution module for editing XML files is now included. Currently it allows for editing values from an xpath query, or editing XML IDs.

```bash
# salt-call xml.set_attribute /tmp/test.xml ".//actor[@id='3']" editedby "Jane Doe"
local: True
# salt-call xml.get_attribute /tmp/test.xml ".//actor[@id='3']"
local: {
  editedby: Jane Doe
  id: 3
}
# salt-call xml.get_value /tmp/test.xml ".//actor[@id='2']"
local: Liam Neeson
# salt-call xml.set_value /tmp/test.xml ".//actor[@id='2']" "Patrick Stewart"
local: True
# salt-call xml.get_value /tmp/test.xml ".//actor[@id='2']"
local: Patrick Stewart
```

```yaml
ensure_value_true:
  xml.value_present:
    - name: /tmp/test.xml
    - xpath: .//actor[@id='1']
    - value: William Shatner
```

LGPO Execution Module

Multiple fixes were made to the win_lgpo to expand support for additional policies and improve performance. Issues with encoding and unsupported characters (smart-quotes, em-dash, etc) found in the ADML files as well as whitespace in some policies have been addressed.

Speed enhancements include:

- Caching the compiled xml from ADMX/ADML files in __context__
- Lowercasing all keys before compiling XML to remove an expensive XPath lookup

Additional functionality:

- Adds the lgpo.get_policy function that allows you to get the current settings for a single policy.
- Changes some policy names that were overly long
LGPO State Module

Multiple changes were made to the win_lgpo state to improve performance. It now uses the lgpo.get_policy function instead of the lgpo.get to avoid reloading all settings on the machine at the beginning and end of each state run. Supports the new shorter policy names but also attempts to resolve the older, longer policy names.

Win_network Salt Util

Now uses .NET libraries to obtain Interface information on Windows systems that support it. Unsupported systems fall back to the more expensive WMI calls. This is important as this data is gathered for grains and occurs each time a process is forked.

Jinja enhancements

Troubleshooting Jinja map files

A new execution module for map.jinja troubleshooting has been added. Assuming the map is loaded in your formula SLS as follows:

```{% from "myformula/map.jinja" import myformula with context %}
```

The following command can be used to load the map and check the results:

```
salt myminion jinja.load_map myformula/map.jinja myformula
```

The module can be also used to test json and yaml maps:

```
salt myminion jinja.import_yaml myformula/defaults.yaml
salt myminion jinja.import_json myformula/defaults.json
```

json_query filter

A port of Ansible json_query Jinja filter has been added. It allows making queries against JSON data using JMESPath language. Could be used to filter pillar data, yaml maps, and also useful with http_query. Depends on the jmespath Python module.

Slot Syntax Updates

The slot syntax has been updated to support parsing dictionary responses and to append text.

```yaml
demo dict parsing and append:
  test.configurable_test_state:
    - name: slot example
    - changes: False
    - comment: __slot__:salt:test.arg(shell="/bin/bash").kwargs.shell ~ / appended
```
Also, slot parsing is now supported inside of nested state data structures (dicts, lists, unless/onlyif args):

```yaml
demo slot parsing for nested elements:
  file.managed:
    - name: /tmp/slot.txt
    - source: salt://slot.j2
    - template: jinja
    - context:
      variable: __slot__:salt:test.echo(a_value)
    - unless:
      - fun: file.search
        args:
        # Slot as unless argument
        - __slot__:salt:test.echo(/tmp/slot.txt)
        - "DO NOT OVERRIDE"
      ignore_if_missing: True
```

State Changes

- The file.symlink state was fixed to remove existing file system entries other than files, directories and symbolic links properly.
- The onchanges and prereq requisites now behave properly in test mode, due to removing pchanges.
- Added new ssh_auth.manage state to ensure only the specified ssh keys are present for the specified user.
- Added new saltutil state to use instead of module.run to more easily handle change.

Module Changes

- Added new boto_ssm module to set and query secrets in AWS SSM parameters.
- Added new flatpak module to work with flatpak packages.
- The file.remove module was fixed to remove file system entries other than files, directories and symbolic links properly.
- The debian_ip module used by the network.managed state has been heavily refactored. The order that options appear in inet/inet6 blocks may produce cosmetic changes. Many options without an 'ipvX' prefix will now be shared between inet and inet6 blocks. The options enable_ipv4 and enabled_ipv6 will now fully remove relevant inet/inet6 blocks. Overriding options by prefixing them with 'ipvX' will now work with most options (i.e. dns can be overridden by ipv4dns or ipv6dns). The proto option is now required.
Enhancements to Engines

Multiple copies of a particular Salt engine can be configured by including the `engine_module` parameter in the engine configuration.

```yaml
engines:
  - production_logstash:
      host: production_log.my_network.com
      port: 5959
      proto: tcp
      engine_module: logstash
  - develop_logstash:
      host: develop_log.my_network.com
      port: 5959
      proto: tcp
      engine_module: logstash
```

- A new `fluent` engine has been added to export Salt events to fluentd.

```yaml
engines:
  - fluent
    host: localhost
    port: 24224

<source>
  @type forward
  port 24224
</source>
<match saltstack.**>
  @type file
  path /var/log/td-agent/saltstack
</match>
```

Enhancements to Beacons

Multiple copies of a particular Salt beacon can be configured by including the `beacon_module` parameter in the beacon configuration.

```yaml
beacons:
  watch_importand_file:
    files:
      /etc/important_file: {}
    beacon_module: inotify
  watch_another_file:
    files:
      /etc/another_file: {}
    beacon_module: inotify
```
Enhancements to chroot

- New functions added to chroot apply, sls, and highstate that allow executing states in sls files or running apply/highstate inside of a chroot.

Minion-side ACL

Salt has had master-side ACL for the salt mine for some time, where the master configuration contained mine_get that specified which minions could request which functions. However, now you can specify which minions can access a function in the salt mine function definition itself (or when calling mine.send). This targeting works the same as the generic minion targeting as specified here. The parameters used are allow_tgt and allow_tgt_type. See also the documentation of the Salt Mine. Please note that if you want to use this new feature both your minion and masters will need to be on at least version 3000.

Deprecations

Raet Deprecated

- The Raet transport has been deprecated. Please use the supported transport protocols tcp or zeromq.

Module Deprecations

- The hipchat module has been removed due to the service being retired. Google Chat, MS Teams, or Slack may be suitable replacements.
- The dockermod module has been changed as follows:
  - Support for the tags kwarg has been removed from the dockermod.resolve_tag function.
  - Support for the network_id kwarg has been removed from the dockermod.connect_container_to_network function. Please use net_id instead.
  - Support for the name kwarg has been removed from the dockermod.sls_build function. Please use repository and tag instead.
  - Support for the image kwarg has been removed from the following functions. In all cases, please use both the repository and tag options instead:
    * dockermod.build
    * dockermod.commit
    * dockermod.import
    * dockermod.load
    * dockermod.tag
- The heat module has removed the enviroment kwarg from the heat.create_stack and heat.update_stack functions due to a spelling error. Please use environment instead.
- The ssh execution module has been changed as follows:
  - Support for the ssh.get_known_host function has been removed. Please use the ssh.get_known_host_entries function instead.
  - Support for the ssh.recv_known_host function has been removed. Please use the ssh.recv_known_host_entries function instead.
The :py:mod:`firewalld <salt.modules.firewalld>` module has been changed as follows:

- The default setting for the `force_masquerade` option in the `firewalld.add_port <salt.module.firewalld.add_port>()` function has changed from `True` to `False`.
- Support for the `force_masquerade` option in the `firewalld.add_port_fwd <salt.module.firewalld.add_port_fwd>()` function has been changed from `True` to `False`.

**State Deprecations**

- The hipchat state has been removed due to the service being retired. MS Teams or Slack may be suitable replacements.
- The cmd state module has removed the `quiet` kwarg from the `cmd.run` function. Please set `output_loglevel` to `quiet` instead.
- The heat state module has removed the `enviroment` kwarg from the `heat.deployed` function due to a spelling error. Please use `environment` instead.
- The :py:mod:`firewalld <salt.states.firewalld>` state has been changed as follows:
  - The default setting for the `prune_services` option in the `firewalld.present` function has changed from `True` to `False`.

**Fileserver Deprecations**

- The hgfs fileserver had the following config options removed:
  - The `hgfs_env_whitelist` config option has been removed in favor of `hgfs_saltenv_whitelist`.
  - The `hgfs_env_blacklist` config option has been removed in favor of `hgfs_saltenv_blacklist`.
- The svnfs fileserver had the following config options removed:
  - The `svnfs_env_whitelist` config option has been removed in favor of `svnfs_saltenv_whitelist`.
  - The `svnfs_env_blacklist` config option has been removed in favor of `svnfs_saltenv_blacklist`.
- The gitfs fileserver had the following config options removed:
  - The `gitfs_env_whitelist` config option has been removed in favor of `gitfs_saltenv_whitelist`.
  - The `gitfs_env_blacklist` config option has been removed in favor of `gitfs_saltenv_blacklist`.
Engine Removal

- The hipchat engine has been removed due to the service being retired. For users migrating to Slack, the slack engine may be a suitable replacement.

Returner Removal

- The hipchat returner has been removed due to the service being retired. For users migrating to Slack, the slack returner may be a suitable replacement.

Grain Deprecations

For smartos some grains have been deprecated. These grains have been removed.

- The hypervisor_uuid has been replaced with mdata:sdc:server_uuid grain.
- The datacenter has been replaced with mdata:sdc:datacenter_name grain.

Cloud Deprecations

- The nova cloud driver has been removed in favor of the openstack cloud driver.

Jinja Filter Deprecations

- The following jinja filters are set to be removed in the Aluminium release:
  - json_decode_dict in favor of tojson
  - json_decode_list in favor of tojson

Utils Deprecations

- All of the functions in salt.utils.__init__.py have been removed. These include:
  - salt.utils.option
  - salt.utils.required_module_list
  - salt.utils.required_modules_error
  - salt.utils.get_accumulator_dir. Please use salt.state.get_accumulator_dir() instead.
  - salt.utils.fnmatch_multiple. Please use salt.utils.itertools.fnmatch_multiple() instead.
  - salt.utils.appendproctitle. Please use salt.utils.process.appendproctitle() instead.
  - salt.utils.daemonize. Please use salt.utils.process.daemonize() instead.
  - salt.utils.daemonize_if. Please use salt.utils.process.daemonize_if() instead.
  - salt.utils.reinit_crypto. Please use salt.utils.crypt.reinit_crypto() instead.
  - salt.utils.pem_finger. Please use salt.utils.crypt.pem_finger() instead.
  - salt.utils.to_bytes. Please use salt.utils.stringutils.to_bytes() instead.
- `salt.utils.to_str`. Please use `salt.utils.stringutils.to_str()` instead.
- `salt.utils.to_unicode`. Please use `salt.utils.stringutils.to_unicode()` instead.
- `salt.utils.str_to_num`. Please use `salt.utils.stringutils.to_num()` instead.
- `salt.utils.is_quoted`. Please use `salt.utils.stringutils.is_quoted()` instead.
- `salt.utils.dequote`. Please use `salt.utils.stringutils.dequote()` instead.
- `salt.utils.is_hex`. Please use `salt.utils.stringutils.is_hex()` instead.
- `salt.utils.is_bin_str`. Please use `salt.utils.stringutils.is_binary()` instead.
- `salt.utils.rand_string`. Please use `salt.utils.stringutils.random()` instead.
- `salt.utils.contains_whitespace`. Please use `salt.utils.stringutils.contains_whitespace()` instead.
- `salt.utils.build_whitespace_split_regex`. Please use `salt.utils.stringutils.build_whitespace_split_regex()` instead.
- `salt.utils.expr_match`. Please use `salt.utils.stringutils.expr_match()` instead.
- `salt.utils.check_whitelist_blacklist`. Please use `salt.utils.stringutils.check_whitelist_blacklist()` instead.
- `salt.utils.check_include_exclude`. Please use `salt.utils.stringutils.check_include_exclude()` instead.
- `salt.utils.print_cli`. Please use `salt.utils.stringutils.print_cli()` instead.
- `salt.utils.clean_kwvars`. Please use `salt.utils.args.clean_kwvars()` instead.
- `salt.utils.invalid_kwvars`. Please use `salt.utils.args.invalid_kwvars()` instead.
- `salt.utils.shlex_split`. Please use `salt.utils.args.shlex_split()` instead.
- `salt.utils.arg_lookup`. Please use `salt.utils.args.arg_lookup()` instead.
- `salt.utils.split_input`. Please use `salt.utils.args.split_input()` instead.
- `salt.utils.test_mode`. Please use `salt.utils.args.test_mode()` instead.
- `salt.utils.format_call`. Please use `salt.utils.args.format_call()` instead.
- `salt.utils.which`. Please use `salt.utils.path.which()` instead.
- `salt.utils.which_bin`. Please use `salt.utils.path.which_bin()` instead.
- `salt.utils.path_join`. Please use `salt.utils.path.join()` instead.
- `salt.utils.check_or_die`. Please use `salt.utils.path.check_or_die()` instead.
- `salt.utils.sanitize_win_path_string`. Please use `salt.utils.path.sanitize_win_path()` instead.
- `salt.utils.rand_str`. Please use `salt.utils.hashutils.random_hash()` instead.
- `salt.utils.get_hash`. Please use `salt.utils.hashutils.get_hash()` instead.
- `salt.utils.is_windows`. Please use `salt.utils.platform.is_windows()` instead.
- `salt.utils.is_proxy`. Please use `salt.utils.platform.is_proxy()` instead.
- `salt.utils.is_linux`. Please use `salt.utils.platform.is_linux()` instead.
- `salt.utils.is_darwin`. Please use `salt.utils.platform.is_darwin()` instead.
- salt.utils.is_sunos. Please use salt.utils.platform.is_sunos() instead.
- salt.utils.is_smartos. Please use salt.utils.platform.is_smartos() instead.
- salt.utils.is_smartos_globalzone. Please use salt.utils.platform.is_smartos_globalzone() instead.
- salt.utils.is_smartos_zone. Please use salt.utils.platform.is_smartos_zone() instead.
- salt.utils.is_freebsd. Please use salt.utils.platform.is_freebsd() instead.
- salt.utils.is_netbsd. Please use salt.utils.platform.is_netbsd() instead.
- salt.utils.is_openbsd. Please use salt.utils.platform.is_openbsd() instead.
- salt.utils.is_aix. Please use salt.utils.platform.is_aix() instead.
- salt.utils.safe_rm. Please use salt.utils.files.safe_rm() instead.
- salt.utils.is_empty. Please use salt.utils.files.is_empty() instead.
- salt.utils.fopen. Please use salt.utils.files.fopen() instead.
- salt.utils.flopen. Please use salt.utils.files.flopen() instead.
- salt.utils.rm_rf. Please use salt.utils.files.rm_rf() instead.
- salt.utils.mkstemp. Please use salt.utils.files.mkstemp() instead.
- salt.utils.istextfile. Please use salt.utils.files.is_text_file() instead.
- salt.utils.is_bin_file. Please use salt.utils.files.is_binary() instead.
- salt.utils.list_files. Please use salt.utils.files.list_files() instead.
- salt.utils.safe_walk. Please use salt.utils.files.safe_walk() instead.
- salt.utils.st_mode_to_octal. Please use salt.utils.files.st_mode_to_octal() instead.
- salt.utils.normalize_mode. Please use salt.utils.files.normalize_mode() instead.
- salt.utils.human_size_to_bytes. Please use salt.utils.files.human_size_to_bytes() instead.
- salt.utils.backup_minion. Please use salt.utils.files.backup_minion() instead.
- salt.utils.str_version_to_evr. Please use salt.utils.pkg.rpm.version_to_evr() instead.
- salt.utils.parse_docstring. Please use salt.utils.doc.parse_docstring() instead.
- salt.utils.compare_versions. Please use salt.utils.versions.compare() instead.
- salt.utils.version_cmp. Please use salt.utils.versions.version_cmp() instead.
- salt.utils.warn_until. Please use salt.utils.versions.warn_until() instead.
- salt.utils.kwargs_warn_until. Please use salt.utils.versions.kwargs_warn_until() instead.
- salt.utils.get_color_theme. Please use salt.utils.color.get_color_theme() instead.
- salt.utils.get_colors. Please use salt.utils.color.get_colors() instead.
- salt.utils.gen_state_tag. Please use salt.utils.state.gen_tag() instead.
- salt.utils.search_onfail_requisites. Please use salt.utils.state.search_onfail_requisites() instead.
- `salt.utils.check_onfail_requisites`. Please use `salt.utils.state.check_onfail_requisites()` instead.
- `salt.utils.check_state_result`. Please use `salt.utils.state.check_result()` instead.
- `salt.utils.get_user`. Please use `salt.utils.user.get_user()` instead.
- `salt.utils.get_uid`. Please use `salt.utils.user.get_uid()` instead.
- `salt.utils.get_specific_user`. Please use `salt.utils.user.get_specific_user()` instead.
- `salt.utils.chugid`. Please use `salt.utils.user.chugid()` instead.
- `salt.utils.chugid_and_umask`. Please use `salt.utils.user.chugid_and_umask()` instead.
- `salt.utils.get_default_group`. Please use `salt.utils.user.get_default_group()` instead.
- `salt.utils.get_group_list`. Please use `salt.utils.user.get_group_list()` instead.
- `salt.utils.get_group_dict`. Please use `salt.utils.user.get_group_dict()` instead.
- `salt.utils.get_gid_list`. Please use `salt.utils.user.get_gid_list()` instead.
- `salt.utils.get_gid`. Please use `salt.utils.user.get_gid()` instead.
- `salt.utils.enable_ctrl_logoff_handler`. Please use `salt.utils.win_functions.enable_ctrl_logoff_handler()` instead.
- `salt.utils.traverse_dict`. Please use `salt.utils.data.traverse_dict()` instead.
- `salt.utils.traverse_dict_and_list`. Please use `salt.utils.data.traverse_dict_and_list()` instead.
- `salt.utils.filter_by`. Please use `salt.utils.data.filter_by()` instead.
- `salt.utils.subdict_match`. Please use `salt.utils.data.subdict_match()` instead.
- `salt.utils.substr_in_list`. Please use `salt.utils.data.substr_in_list()` instead.
- `salt.utils.is_dictlist`. Please use `salt.utils.data.is_dictlist()` instead.
- `salt.utils.repack_dictlist`. Please use `salt.utils.data.repack_dictlist()` instead.
- `salt.utils.compare_dicts`. Please use `salt.utils.data.compare_dicts()` instead.
- `salt.utils.compare_lists`. Please use `salt.utils.data.compare_lists()` instead.
- `salt.utils.decode_dict`. Please use `salt.utils.data.encode_dict()` instead.
- `salt.utils.decode_list`. Please use `salt.utils.data.encode_list()` instead.
- `salt.utils.is_sorted`. Please use `salt.utils.data.sorted_ignorecase()` instead.
- `salt.utils.is_true`. Please use `salt.utils.data.is_true()` instead.
- `salt.utils.mysql_to_dict`. Please use `salt.utils.data.mysql_to_dict()` instead.
- `salt.utils.simple_types_filter`. Please use `salt.utils.data.simple_types_filter()` instead.
- `salt.utils.ip_bracket`. Please use `salt.utils.zeromq.ip_bracket()` instead.
- `salt.utils.gen_mac`. Please use `salt.utils.network.gen_mac()` instead.
salt.utils.mac_str_to_bytes: Please use salt.utils.network.mac_str_to_bytes() instead.
- salt.utils.refresh_dns: Please use salt.utils.network.refresh_dns() instead.
- salt.utils.dns_check: Please use salt.utils.network.dns_check() instead.
- salt.utils.get_context: Please use salt.utils.stringutils.get_context() instead.
- salt.utils.get_master_key: Please use salt.utils.master.get_master_key() instead.
- salt.utils.date_cast: Please use salt.utils.dateutils.date_cast() instead.
- salt.utils.date_format: Please use salt.utils.dateutils.strftime() instead.
- salt.utils.total_seconds: Please use salt.utils.dateutils.total_seconds() instead.
- salt.utils.find_json: Please use salt.utils.json.find_json() instead.
- salt.utils.import_json: Please use salt.utils.json.import_json() instead.
- salt.utils.namespaced_function: Please use salt.utils.functools.namespaced_function() instead.
- salt.utils.alias_function: Please use salt.utils.functools.alias_function() instead.
- salt.utils.profile_func: Please use salt.utils.profile.profile_func() instead.
- salt.utils.activate_profile: Please use salt.utils.profile.activate_profile() instead.
- salt.utils.output_profile: Please use salt.utils.profile.output_profile() instead.

salt.auth.Authorize Class Removal

- The salt.auth.Authorize Class inside of the salt/auth/__init__.py file has been removed and the any_auth method inside of the file salt/utils/minions.py. These method and classes were not being used inside of the salt code base.

30.2.15 Salt 3000.1 Release Notes

Version 3000.1 is a bugfix release for 3000.

Statistics

- Total Merges: 53
- Total Issue References: 15
- Total PR References: 54
- Contributors: 16 (Ch3LL, UtahDave, bryceml, cmcmarrow, dwoz, frogunder, garethgreenaway, lorengordon, mchugh19, oeufette, raddessi, s0undt3ch, sjorge, terminalmage, twangboy, waynew)
Changelog for v3000..v3000.1

Generated at: 2020-03-27 16:48:41 UTC

- **PR #56455**: (s0undt3ch) Fix gitpython windows requirement @ 2020-03-27 16:31:57 UTC
  - c5a700e01e Merge pull request #56455 from s0undt3ch/hotfix/gitpython
  - d9791c393f Revert and fix windows requirements
  - 4b573c1c94 Revert "Fix win deps"

- **PR #56446**: (frogunder) 3000.1 releasenotes updates @ 2020-03-24 20:28:23 UTC
  - 7ba36325d9 Merge pull request #56446 from frogunder/releasenotes_3000.1_updates
  - 6b4f474af 3000.1 releasenotes updates

- **PR #56435**: (twangboy) Update mac build scripts @ 2020-03-24 19:47:40 UTC
  - 4d2bc7004d Merge pull request #56435 from twangboy/update_mac_build_scripts
  - 5d244b0aa6 Merge branch 'master' into update_mac_build_scripts
  - 8fd52a243 Update gitpython to 2.1.15
  - afced5232 Remove --ignore-installed
  - e6cc2a6192 Separate pyobjc requirements
  - 262ad2e98a Compile static requirements
  - 224f72d0f2 Update noxfile and .precommit
  - 68a362e37 Add req_ext.txt
  - 5851a5c2cd Roll back changes, fix dependencies

- **ISSUE #56433**: (Ch3LL) integration.states.test_pip_state.PipStateTest.test_pip_installed_specific_env failing on MAC (refs: #56436)

- **PR #56436**: (Ch3LL) Fix #56433 - test_pip_installed_specific_env @ 2020-03-24 19:47:20 UTC
  - 8a8ae8ebe4 Merge pull request #56436 from Ch3LL/pip_custom_pypi
  - 5565ff96c Merge branch 'master' into pip_custom_pypi

- **PR #56423**: (Ch3LL) Update changelog with package fixes @ 2020-03-24 16:42:17 UTC
  - 3a993d73a9 Merge pull request #56423 from Ch3LL/changelog_again
  - 963c16e1a7 update pr number for mac build changes in changelog
  - 83e22b77c7 Update changelog with package fixes

- **PR #56417**: (twangboy) Update mac build scripts @ 2020-03-23 18:45:34 UTC
  - d2a5bd8add Merge pull request #56417 from twangboy/update_mac_build_scripts
  - 3bda8dd82 Update noxfile and pre-commit
  - de58c52d66 Merge branch 'update_mac_build_scripts' of https://github.com/twangboy/salt into update_mac_build_scripts
    - e7f08d5349 Update static requirements
    - a53977de5b Merge branch 'update_mac_build_scripts' of github.com:twangboy/salt into update_mac_build_scripts
    - 04e5cde9dd pkg/osx/req_ext.txt no longer exists
* be4a272d07 Update static requirements
  - 02dfe4119c Add pyobjc in its own requirements file
  - 6b2ac2be64 Remove pyobjc, enforce pip install location
  - 30ca5d04ec Remove cryptography, it gets installed by pyopenssl
  - fda8abf4a8 Update static requirements
  - 732ecc83c1 Update pre-commit config
  - 1fa9864e3d Don't set a version for pyopenssl
  - 461b198978 Update dependencies, remove req_ext.txt

• PR #56418: (Ch3LL) Ensure version.py included before we install @ 2020-03-23 18:27:46 UTC
  - 74575a6993 Merge pull request #56418 from Ch3LL/egg_version
  - 85d7c784ef Fix integration setup egg test
  - 8a8a22a4040 Ensure version.py included before we install
  - 86fe450c82 Fix #56433 - test_pip_installed_specific_env

• PR #56403: (frogunder) update 3000.1 releasenotes @ 2020-03-17 23:50:21 UTC
  - 249367b462 Merge pull request #56403 from frogunder/update_releasenotes_3000.1
  - 9d97c996e8 update 3000.1 releasenotes

• PR #56398: (Ch3LL) Add additional PRs to 3000.1 changelog @ 2020-03-17 18:08:15 UTC
  - 0de5c1e136 Merge pull request #56398 from Ch3LL/change_3000.1
  - 79c337b3db Add additional PRs to 3000.1 changelog

• PR #56376: (twangboy) Fix win deps @ 2020-03-17 17:02:46 UTC
  - 5ac09dec89 Merge pull request #56376 from twangboy/fixed_win_deps
  - 6c83bee9be Fix win deps

• PR #56378: (Ch3LL) Include _version.py if building wheel @ 2020-03-17 17:01:33 UTC
  - e72a8d2cbe Merge pull request #56378 from Ch3LL/wheel_version
  - 22cccd2107 Use virtualenv test helper that already exists and fix setup.py
  - 293b1fddf2 cleanup code
  - ddfb065bfb add bdist_wheel test
  - fceff0287c ensure name is included in new version
  - 0cbfa6d3246 Ensure SaltStackVersion attributes in _version.py correct
  - 39d5f3582d Include _version.py if building wheel

• PR #56387: (bryceml) update gpg key expiration date @ 2020-03-17 16:59:30 UTC
  - 6a9326fb70 Merge pull request #56387 from bryceml/update_gpg_key
  - b74b26ccf3 update gpg key expiration date

• PR #55822: (cmcmarrow) fix Indefinitely code @ 2020-03-16 17:34:11 UTC
  - fce6692c4a Merge pull request #55822 from cmcmarrow/win_task_repeat
  - e257fb2804 Merge branch 'master' into win_task_repeat
- 07cad0f8f Merge branch 'master' into win_task_repeat
- 4b80301338 Merge branch 'master' into win_task_repeat
- 9df94569c4 Merge branch 'master' into win_task_repeat
- 22a2d0b9ec Merge branch 'master' into win_task_repeat
- dee9c134e7 Merge branch 'master' into win_task_repeat
- bea05d514 Update test_win_task.py
- 6e923f75fc Merge branch 'master' into win_task_repeat
- 5839da81ee add test
- 2aa638ef00 fix Indefinitely code

- PR #56373: (frogunder) update 3000.1 releasenotes @ 2020-03-13 18:58:43 UTC
  - c11ef89200 Merge pull request #56373 from frogunder/releasenotes_3000.1
  - a5ca8b5277 Fix doc test errors
  - 47e483187e update 3000.1 releasenotes

- PR #56365: (Ch3LL) Update 3000.1 changelog @ 2020-03-13 17:21:02 UTC
  - 62857a9f0e Merge pull request #56365 from Ch3LL/changelog_3000.1
  - 851d7d8fc7 Update 3000.1 changelog

- PR #56360: (Ch3LL) Use virtualenv 20.0.10 for macosx tests @ 2020-03-13 16:39:57 UTC
  - a660e96fb2 Merge pull request #56360 from Ch3LL/mac_virtual
  - abda12508c Update static requirements files
  - dca3390c0c skip zcbuildout state test when virtualenv 20.0.0
  - fdea1f0e1 Use virtualenv 20.0.10 for macosx tests

- ISSUE #56324: (kiemlicz) Cannot use Saltcheck module (refs: #56327)

- PR #56327: (mchugh19) keep cache_copied_files variable a list @ 2020-03-13 16:39:32 UTC
  - d8fc07274c Merge pull request #56327 from mchugh19/56324
  - e1e2d2fb1d Merge branch 'master' into 56324
  - 6d7572706d use includes for saltcheck integration test
  - 5b7073b01d keep cache_copied_files variable a list

- PR #56023: (cmcmarrow) add fix for bin_env @ 2020-03-13 16:39:09 UTC
  - 2d31d61a9 Merge pull request #56023 from cmcmarrow/binary_fix_pip_bin_env
  - f780fd013e Merge branch 'master' into binary_fix_pip_bin_env
  - 6d42cf270 Merge branch 'master' into binary_fix_pip_bin_env
  - 82b39d26f8 Merge branch 'binary_fix_pip_bin_env' of https://github.com/cmcmarrow/salt into binary_fix_pip_bin_env
    - a5fa22528a Merge branch 'master' into binary_fix_pip_bin_env
  - 10ca0fa5d6 fix space
  - 22f6fc180 fix _pip_bin_env

30.2. Previous Releases 1875
- d5425e6630 Merge branch ‘master’ into binary_fix_pip_bin_env
- ceda3fde00 add full support for when missing kwargs or args
- cf4ab215b5 add fix for bin_env

• PR #56310: (twangboy) Only process ADMX files when loading policies @ 2020-03-11 23:47:50 UTC
  - 19bb6aae0c Merge pull request #56310 from twangboy/fix_lgpo_admx
  - 4bc5b05586 Fix some lint
  - ce282f9754 Mark destructive test
  - 8af09c31ca Add test case
  - 547d35cf4c Only process ADMX files when loading policies

• PR #56272: (twangboy) Properly resolve the policy name @ 2020-03-11 22:11:02 UTC
  - 2d78931ef Merge pull request #56272 from twangboy/fix_lgpo_names
  - 233ed12472 Add comments to helper function
  - a7369e41d7 Remove redundant code... some more
  - 1db3052b94 Consolidate duplicate code
  - b25b56299d Fix failing PY2 tests
  - 36a24ac28f Only load adml data once
  - bc13be6850 Add some tests
  - 2e9be6e461 Properly resolve the policy name

• PR #56358: (s0undt3ch) Fix version instantiation when minor is an empty string @ 2020-03-11 22:10:04 UTC
  - c6c6e2e3d9 Merge pull request #56358 from s0undt3ch/hotfix/version-parsing
  - cb22e78502 Fix version instantiation when minor is an empty string

• PR #56160: (twangboy) Fix issue with existing reg_dword entries @ 2020-03-11 22:09:21 UTC
  - b33047c574 Merge pull request #56160 from twangboy/fix_reg_dword
  - 80650c2a8c Make test more explicit
  - 67dd1c18c7 Fix issue with existing reg_dword entries

• PR #56337: (twangboy) Handle Adapter Type 53 and Undefined Types @ 2020-03-11 22:08:19 UTC
  - 8f23706871 Merge pull request #56337 from twangboy/fix_win_network_type
  - 18a31a0b22 Merge branch ‘master’ into fix_win_network_type
  - d92914ad91 Merge branch ‘master’ into fix_win_network_type
  - 224629bdeb Handle Adapter Type 53 and Undefined Types

• PR #56060: (twangboy) Fix regex string for **Del and **DelVals @ 2020-03-11 22:05:43 UTC
  - e551ff6a31 Merge pull request #56060 from twangboy/fix_lgpo_regex
  - ca260ef582 Use byte-strings in the test
  - 7c81874a5b Add some tests
  - 944b022f33 Fix regex string for **Del and **DelVals

• ISSUE #56131: (thusoy) Salt v3000 crashes with unless clause if pip is missing (refs: #56215)
• PR #56215: (dwoz) Fix for unless requisite when pip is not installed @ 2020-03-11 22:04:30 UTC
  - c9bc9431c1 Merge pull request #56215 from dwoz/issue-56131
  - 5dd8f8eabe Fix linter
  - 7492c2f7c7 Remove crufty prints from test
  - 8ceaa66f3 Only remove pip related modules
  - 69b21e5e68 Add regression test for issue 56131
  - 9d23f55adc Fix for unless requisite when pip is not installed

• PR #56339: (twangboy) Fix win_dns_client when used with scheduler @ 2020-03-11 22:01:32 UTC
  - 74b67ea741 Merge pull request #56339 from twangboy/fix_win_dns_client
  - d6a4f885f0 Fix bad test (lint)
  - 47bd67373f Add some tests
  - 995975649a Add missing import, improve docs

• ISSUE #56288: (lorenorgordon) win_lgpo: lgpo.set with secedit policy always generates KeyError: u'lgpo.secedit_data' (refs: #56290)

• PR #56290: (lorenorgordon) Ensures popping lgpo.secedit_data does not throw KeyError @ 2020-03-11 17:27:04 UTC
  - 7701e8762d Merge pull request #56290 from lorenorgordon/pop-secdatal
  - 62453bb6ce Merge branch 'master' into pop-secdatal
  - 95d5ca9ff Merge branch 'master' into pop-secdatal
  - 2979158a8b Tests the if_secedits: logic path in lgpo.set_
  - d1f776178c Ensures popping lgpo.secedit_data does not throw KeyError

• ISSUE #56119: (finalduty) Release notes for v3000 do not mention changes to slspath variable (refs: #56341)

• PR #56341: (dwoz) Revert "Don't remove one directory level from slspath" @ 2020-03-11 17:03:33 UTC
  - 84c60708cd Merge pull request #56341 from dwoz/issue-56119
  - afe6e84c36 Clarify slspath documentation
  - 6dfc09fd1 Add debug for test asserts
  - 9fa9dab8b2 Fix linter warts
  - fd707bddd4 Add regression test for #56119
  - 3d3b673ece Revert "Don't remove one directory level from slspath"

• PR #56185: (terminalmage) Fix regression in service states with reload argument @ 2020-03-11 16:45:58 UTC
  - 49f813a94c Merge pull request #56185 from terminalmage/issue56167
  - 65b3f4c9a0 Merge branch 'master' into issue56167
  - 7b41a0b4f Merge branch 'master' into issue56167
  - 8f7034d946 Merge branch 'master' into issue56167
  - e9fb634e1 Skip on OSX for now
  - 5996280241 Add __opts__ and __grains__ just in case
  - af3e841d08 Fix failing test
- 586f21aecd Add functional test
- 1af9c10f0 Fix regression in service states with reload argument

- **PR #56068**: (s0undt3ch) Update the bootstrap script to latest version, v2020.02.24 @ 2020-03-11 16:44:23 UTC
  - 74f8b2a926 Merge pull request #56068 from s0undt3ch/hotfix/update-bootstrap
  - ce83b190ed Merge branch 'master' into hotfix/update-bootstrap
  - ccd231d82d Merge branch 'master' into hotfix/update-bootstrap
  - 88a52f88ff Update the bootstrap script to latest version, v2020.02.24
  - 012fb5bc4b Update the bootstrap script to latest version, v2020.02.04

- **PR #56321**: (oeuftete) Tidy up formatting in boto_secgroup docs @ 2020-03-11 08:14:48 UTC
  - 154257e2e9 Merge pull request #56321 from oeuftete/tidy-boto-secgroup-docs
  - 616f11b33e Merge branch 'master' into tidy-boto-secgroup-docs
  - 412bb4d62d Tidy up formatting in boto_secgroup docs

- **PR #56336**: (Ch3LL) Fix test_issue_2594_non_invalidated_cache test (update zope.interface) @ 2020-03-11 00:08:43 UTC
  - 11d33e3d90 Merge pull request #56336 from Ch3LL/fix_56330
  - bbf37e090b Fix test_issue_2594_non_invalidated_cache test (update zope.interface)

- **PR #56346**: (frogunder) Update man pages to 3000.1 @ 2020-03-11 00:07:31 UTC
  - a640bd30fc Merge pull request #56346 from frogunder/man_pages_3000_1
  - 6d7c1b6482 Update man pages to 3000.1

- **PR #56099**: (s0undt3ch) Fix Windows and macOS requirements handling in setup.py @ 2020-03-11 00:04:37 UTC
  - 2f783d247e Merge pull request #56099 from s0undt3ch/hotfix/requirements
  - c19f4a3fae Merge branch 'master' into hotfix/requirements
  - 1e7bc8fc8f Also take into account macOS requirements
  - 7ee1f14952e Also include req_win.txt

- **PR #56218**: (raddessi) Changed StrictVersion checking of setuptools to LooseVersion @ 2020-03-10 23:59:54 UTC
  - 7c4d879073 Merge pull request #56218 from raddessi/master.v3000-conda
  - 445566d57 Merge branch 'master' into master.v3000-conda
  - 566c03b786 Merge branch 'master' into master.v3000-conda
  - 82773a9799 Removed now-unused StrictVersion import from setup.py
  - 31bbof7cd1 Changed StrictVersion checking of setuptools to LooseVersion

- **PR #56128**: (waynew) Update CHANGELOG with release date and unreleased. @ 2020-03-10 23:58:15 UTC
  - acbd3556e5 Merge pull request #56128 from waynew/master
  - e3216db3e5 Update CHANGELOG with release date and unreleased.

- **PR #55937**: (twangboy) Update windows build scripts @ 2020-03-10 23:55:55 UTC
  - 12140545ab Merge pull request #55937 from twangboy/update_deps
- f00a504a48 Add back the pylauncher
- 30b9c32356 Revert changes to req and req_win
- 98d0e970c Fix some warts in the build_env scripts
- 8404141f65 Update dependencies

- **PR #55906** (sjorge) smartos.vm_present could not handle nics with vrrp_vrid property @ 2020-03-10 23:54:44 UTC
  - 485a47cdf1 Merge pull request #55906 from sjorge/smartos_vrrp
  - 5bd7d009a Merge branch 'master' into smartos_vrrp
  - f77719c179 smartos state should handle vrrp config

- **ISSUE #55185** (sjorge) salt.modules.pdbedit doesn't work on samba older than 4.8 (refs: #55894)

- **PR #55894** (sjorge) #55185 pdbedit module should check for version 4.8.x or newer @ 2020-03-10 23:54:21 UTC
  - 1fa855360 Merge pull request #55894 from sjorge/pdbedit_55185
  - 9dc7b71122 Merge branch 'master' into pdbedit_55185

- **ISSUE #56195** (lorengordon) Windows: Using inline powershell in args with cmd.script and shell: powershell (refs: #56197)

- **PR #56197** (lorengordon) Allows use of inline powershell for cmd.script args @ 2020-03-10 23:52:47 UTC
  - 3e57d58db2 Merge pull request #56197 from lorengordon/file-or-no-file
  - fcd1699f5e Allows use of inline powershell for cmd.script args
  - be2e67c0a0 Tests that powershell processes inline powershell in args

- **ISSUE #53152** (jbeaird) daily highstate fails after 2019.2 upgrade (refs: #56149)

- **PR #56149** (garethgreenaway) [master] Fix to scheduler for use of when and splay @ 2020-03-10 23:52:16 UTC
  - 547c73e4cc Merge pull request #56149 from garethgreenaway/53152_fix_schedule_when_splay
  - 80686f6f9f9 Fix for when using a combination of when and splay. Previously comparing the wrong value when determining if the job should be run and next_fire_time updated. This resulted in multiple job runs when when and splay were used together. Code updated and test updated to ensure only one run at the specific time. Skip eval tests if dateutil.parser is unavailable.

- **PR #56345** (s0undt3ch) Bump Windows Py3 builds timeout to 10 hours @ 2020-03-10 20:43:41 UTC
  - 192ce76a95 Merge pull request #56345 from s0undt3ch/hotfix/win-py3-timeouts
  - 1bde38ae3 Bump Windows 2019 Py3 builds timeout to 10 hours

- **PR #55888** (s0undt3ch) Disable codecov PR comments and status checks @ 2020-03-10 15:45:52 UTC
  - a204906c80 Merge pull request #55888 from s0undt3ch/hotfix/coverage-reporting
  - 4b8dc8a586 Disable codecov PR comments and status checks
  - cb0f4d8f87 Apply the suggestion given by the codecov team

- **ISSUE #56177** (jodok) mysql states fail because conv is ``` instead of None (refs: #56174)

- **ISSUE #56170** (jeffdyke) mariadb socket access must be enabled before highstate - salt 3K still tries empty password (refs: #56174)

- **ISSUE #56124** (ymasson) MySQL state and module broken after upgrade to 3000 (refs: #56174)

- **PR #56174** (garethgreenaway) [master] MySQL module fixes @ 2020-03-10 04:03:23 UTC
- 3e913631bb Merge pull request #56174 from garethgreenaway/56124_mysql_module_state_fixes
- fcc061368b Removing quotes from the plugin_status query. Updating tests to reflect changes.
- 3dc66393b2 Adding better error reporting around plugins. Updating tests. Only attempt to delete a user if they exist.
- 1337da1e4e Ensure _mysql_user_exists is using auth_socket. Updating mysql and mariadb chpass functions to ensure that the respective plugins are enabled before attempting to use them.
- 34995ba4e8 Reworking the unix_socket code to support the differences between MySQL and MariaDB. Adding some functions to install, remove, and check the status of plugins which we can then use when adding users which will use the unix_socket & auth_socket plugins. Adding additional tests for these new functions as well as test to ensure the correct SQL is being generated when using passwordless and unix_socket options.
- 5bfd67c13e Minor tweak to mysql module. Fixing failing tests.
- e871a3ffdf1 Various fixes to the mysql module to break out the handling of user management into different functions based on MySQL variant.

- **PR #56333**: ([Ch3LL]) add pylint ignore in django returner @ 2020-03-09 20:42:42 UTC
30.2.16 Salt 3000.2 Release Notes

Version 3000.2 is a CVE-fix release for 3000.

Security Fix

CVE-2020-11651

An issue was discovered in SaltStack Salt before 2019.2.4 and 3000 before 3000.2. The salt-master process ClearFuncs class does not properly validate method calls. This allows a remote user to access some methods without authentication. These methods can be used to retrieve user tokens from the salt master and/or run arbitrary commands on salt minions.

CVE-2020-11652

An issue was discovered in SaltStack Salt before 2019.2.4 and 3000 before 3000.2. The salt-master process ClearFuncs class allows access to some methods that improperly sanitize paths. These methods allow arbitrary directory access to authenticated users.
Known Issue

Part of the fix for CVE-2020-11651 added better validation of the methods allowed to be called by remote clients. Both AESFuncs and ClearFuncs now have an explicit list of methods that can be called. The name of one of these whitelisted methods on AESFuncs had a typo. The _minion_runner method should be minion_runner (without the underscore prefix). This typo breaks the publish module’s runner method. Calling runners, for example:

```
salt minion publish.runner manage.down
```

Will not work, and you will receive and empty reply from the salt master.

This will be addressed in the 3001 release of Salt set for mid-June 2020.

30.2.17 Salt 3000.3 Release Notes

Version 3000.3 is a bug-fix release for 3000.

Statistics

- ISSUE #57016: (idontwanttosignin) [BUG] Requested method not exposed: minion_runner (refs: #57100)
- PR #57100: (dwoz) Address Issues in CVE Release @ 2020-05-05 22:09:25 UTC

30.2.18 Salt 3000.4 Release Notes

Version 3000.4 is a CVE fix release for 3000.

Fixed

- Prevent shell injections in netapi ssh client (cve-2020-16846)
- Prevent creating world readable private keys with the tls execution module. (cve-2020-17490)
30.2.19 Salt 3000.5 Release Notes

Version 3000.5 is a CVE fix release for 3000.

Fixed

- Properly validate eauth credentials and tokens along with their ACLs. Prior to this change eauth was not properly validated when calling Salt ssh via the salt-api. Any value for 'eauth' or 'token' would allow a user to bypass authentication and make calls to Salt ssh. (CVE-2020-25592)

30.2.20 Salt 3000.6 Release Notes

Version 3000.6 is a bugfix release for 3000.

Fixed

- Fixes salt-ssh authentication when using tty (#58922)

30.2.21 Salt 3000.7 Release Notes

Version 3000.7 is a CVE fix release for 3000.

Fixed

- CVE-2020-28243 - Fix local privilege escalation in the restartcheck module.
- CVE-2020-28972 - Ensure authentication to vcenter, vsphere, and esxi server validates the SSL/TLS certificate by default. If you want to skip SSL verification you can use verify_ssl: False.
- CVE-2020-35662 - Ensure the asam runner, qingcloud, splunk returner, panos proxy, cimc proxy, zenoss module, esxi module, vsphere module, glassfish module, bigip module, and keystone module validate SSL by default. If you want to skip SSL verification you can use verify_ssl: False.
- CVE-2021-3148 - Fix a command injection in the Salt-API when using the Salt-SSH client.
- CVE-2021-3144 - Fix eauth tokens can be used once after expiration
- CVE-2021-25281 - Fix salt-api so it honors eauth credentials for the wheel_async client.
- CVE-2021-25282 - Fix the salt.wheel.pillar_roots.write method so it is not vulnerable to directory traversal.
- CVE-2021-25283 - Fix the jinja render to protect against server side template injection attacks.
- CVE-2021-25284 - Fix cmdmod so it will not log credentials to log levels info and error.
- CVE-2021-3197 - Fix ssh client to remove ProxyCommand from arguments provided by cli and netapi.
30.2.22 Salt 3000.8 Release Notes

Version 3000.8 is a bug fix release for 3000.

Fixed

- Fix runners that broke when patching for CVE-2021-25281
- Fix issue with runners in SSE

Known Issue

When using the Salt-API with the SSH client some of the SSH options are not working currently and will be fixed in an upcoming bug fix release. We are currently testing and fixing which options still need to be fixed, but have confirmed the following ones do not work in this release: extra-filerefs, pre-flight. This does not impact normal Salt-SSH usage on the cli.

30.2.23 Salt 2019.2.0 Release Notes - Codename Fluorine

Python 2.7 Deprecation

In light of Python 2.7 reaching its End of Life (EOL) on Jan 1st 2020, Python 2 will be deprecated from SaltStack no earlier than the 3001 release, that is either the 3001 release or a later release. This decision is pending further community discussion.

Known Issues

The following are known issues for the 2019.2.0 release and will be fixed for 2019.2.1:

- #51699

Non-Backward-Compatible Change to YAML Renderer

In earlier releases, this was considered valid usage in Python 2, assuming that data was a list or dictionary containing keys/values which are unicode types:

```
/etc/foo.conf:
  file.managed:
    - source: salt://foo.conf.jinja
    - template: jinja
    - context:
      data: {{ data }}
```

One common use case for this is when using one of Salt’s custom Jinja filters which return lists or dictionaries, such as the ipv4 filter.

In Python 2, Jinja will render the unicode string types within the list/dictionary with the "u" prefix (e.g. `{u'foo': u'bar'}`). While not valid YAML, earlier releases would successfully load these values.

As of this release, the above SLS would result in an error message. To allow for a data structure to be dumped directly into your SLS file, use the tojson Jinja filter:
Another example where the new filter needs to be used is the following state example:

```
grafana_packages:
    pkg.installed:
        - names: {{ server.pkgs }}
```

This will fail when pkgs is a list or dictionary. You will need to update the state:

```
grafana_packages:
    pkg.installed:
        - names: {{ server.pkgs|tojson }}
```

This test case has also been tested with the `yaml` and `json` filters successfully.

**Note:** This filter was added in Jinja 2.9. However, fear not! The 2018.3.3 release added a `tojson` filter which will be used if this filter is not already present, making it available on platforms like RHEL 7 and Ubuntu 14.04 which provide older versions of Jinja.

**Important:** The `json_encode_dict` and `json_encode_list` filters do not actually dump the results to JSON. Since `tojson` accomplishes what those filters were designed to do, they are now deprecated and will be removed in the 3000 release. The `tojson` filter should be used in all cases where `json_encode_dict` and `json_encode_list` would have been used.

---

**Ansible Playbook State and Execution Modules**

Along with the including the `ansible` modules in the Oxygen release, running playbooks has been added in 2019.2.0 with the `playbooks` function. This also includes an `ansible playbooks state module` which can be used on a targeted host to run ansible playbooks, or used in an orchestration state runner.

```
install nginx:
    ansible.playbooks:
        - name: install.yml
        - git_repo: git://github.com/gtmanfred/playbook.git
        - git_kwargs:
            rev: master
```

The playbooks modules also includes the ability to specify a git repo to clone and use, or a specific directory can to used when running the playbook.
Network Automation

Beginning with this release, Salt provides much broader support for a variety of network operating systems, and features for configuration manipulation or operational command execution.

NetBox

Added in the previous release, 2018.3.0, the capabilities of the netbox Execution Module have been extended, with a much longer list of available features:

- netbox.create_circuit
- netbox.create_circuit_provider
- netbox.create_circuit_termination
- netbox.create_circuit_type
- netbox.create_device
- netbox.create_device_role
- netbox.create_device_type
- netbox.create_interface
- netbox.create_interface_connection
- netbox.create_inventory_item
- netbox.create_ipaddress
- netbox.create_manufacturer
- netbox.create_platform
- netbox.create_site
- netbox.delete_interface
- netbox.delete_inventory_item
- netbox.delete_ipaddress
- netbox.get_circuit_provider
- netbox.get_interfaces
- netbox.get_ipaddresses
- netbox.make_interface_child
- netbox.make_interface_lag
- netbox.openconfig_interfaces
- netbox.openconfig_lacp
- netbox.update_device
- netbox.update_interface

Besides this Execution Module, Salt users can load data directly from NetBox into the device Pillar, via the netbox External Pillar module.
Netmiko

Netmiko, the multi-vendor library to simplify Paramiko SSH connections to network devices, is now officially integrated into Salt. The network community can use it via the netmiko Proxy Module or directly from any Salt Minions, passing the connection credentials - see the documentation for the netmiko Execution Module.

Arista

Arista switches can now be managed running under the pyeapi Proxy Module, and execute RPC requests via the pyeapi Execution Module.

Cisco Nexus

While support for SSH-based operations has been added in the release codename Carbon (2016.11), the new nxos_api Proxy Module and nxos_api allow management of Cisco Nexus switches via the NX-API.

It is important to note that these modules don’t have third party dependencies, therefore they can be used straight away from any Salt Minion. This also means that the user may be able to install the regular Salt Minion on the Nexus switch directly and manage the network devices like a regular server.

General-purpose Modules

The new ciscoconfparse Execution Module can be used for basic configuration parsing, audit or validation for a variety of network platforms having Cisco IOS style configuration (one space indentation), as well as brace-delimited configuration style.

The iosconfig can be used for various configuration manipulation for Cisco IOS style configuration, such as: configuration cleanup, tree representation of the config, etc.

NAPALM

Commit At and Commit Confirmed

Beginning with this release, NAPALM users are able to execute scheduled commits (broadly known as "commit at") and "commit confirmed" (revert the configuration change unless the user confirms by running another command). These features are available via the commit_in, commit_at, revert_in, or revert_at arguments for the net.load_config and net.load_template execution functions, or netconfig.managed.

The counterpart execution functions net.confirm_commit, or net.cancel_commit, as well as the State functions netconfig.commit_cancelled, or netconfig.commit_confirmed can be used to confirm or cancel a commit.

Please note that the commit confirmed and commit cancelled functionalities are available for any platform whether the network devices supports the features natively or not. However, be cautious and make sure you read and understand the caveats before using them in production.
Multiple Templates Rendered Simultaneously

The `template_name` argument of the `net.load_template` Execution and `netconfig.managed` State function now supports a list of templates. This is particularly useful when a very large Jinja template is split into multiple smaller and easier to read templates that can eventually be reused in other States. For example, the following syntax is not correct to manage the configuration of NTP and BGP simultaneously, using two different templates and changing the device configuration through one single commit:

```
manage_bgp_and_ntp:
  netconfig.managed:
    - template_name:
      - salt://templates/bgp.jinja
      - salt://templates/ntp.jinja
    - context:
      bpg: {{ pillar.bgp }}
      ntp: {{ pillar.ntp }}
```

Connection Re-establishment on Demand

Beginning with this release, any NAPALM command executed when running under a NAPALM Proxy Minion supports the `force_reconnect` magic argument.

Proxy Minions generally establish a connection with the remote network device at the time of the Minion startup and that connection is going to be used forever.

If one would need to execute a command on the device but is connecting using different parameters (due to various causes, e.g., unable to authenticate the user specified in the Pillar as the authentication system - say TACACS+ is not available, or the DNS resolver is currently down and would like to temporarily use the IP address instead, etc.), it implies updating the Pillar data and restarting the Proxy Minion process restart. In particular cases like that, you can pass the `force_reconnect=True` keyword argument, together with the alternative connection details, to enforce the command to be executed over a separate connection.

For example, if the usual command is `salt '*' net.arp`, you can use the following to connect using a different username instead:

```
salt '*' net.arp username=my-alt-usr force_reconnect=True
```

The same goes with any of the other configuration arguments required for the NAPALM connection - see NAPALM proxy documentation.

Configuration Replace Features

To replace various configuration chunks, you can use the new `net.replace_pattern` execution function, or the `netconfig.replace_pattern` State function. For example, if you want to update your configuration and rename a BGP policy referenced in many places, you can do so by running:

```
salt '*' net.replace_pattern OLD-POLICY-CONFIG new-policy-config
```

Similarly, you can also replace entire configuration blocks using the `net.blockreplace` function.
Configuration Save Features

The `net.save_config` function can be used to save the configuration of the managed device into a file. For the State subsystem, the `netconfig.saved` function has been added which provides a complete list of facilities when managing the target file where the configuration of the network device can be saved.

For example, backup the running configuration of each device under its own directory tree:

```
/var/backups/{{ opts.id }}/running.cfg:
netconfig.saved:
  - source: running
  - makedirs: true
```

All the new network automation modules mentioned above are directly exposed to the NAPALM users, without requiring any architectural changes, just eventually install some requirements:

**Junos**

The features from the existing `junos` Execution Module are available via the following functions:

- `napalm.junos_cli`: Execute a CLI command and return the output as text or Python dictionary.
- `napalm.junos_rpc`: Execute an RPC request on the remote Junos device, and return the result as a Python dictionary, easy to digest and manipulate.
- `napalm.junos_install_os`: Install the given image on the device.
- `napalm.junos_facts`: The complete list of Junos facts collected by the `junos-eznc` underlying library.

**Note:** To be able to use these features, you must ensure that you meet the requirements for the `junos` module. As `junos-eznc` is already a dependency of NAPALM, you will only have to install `jxmlease`.

Usage examples:

```
salt '*' napalm.junos_cli 'show arp' format=xml
salt '*' napalm.junos_rpc get-interface-information
```

**Netmiko**

The features from the newly added `netmiko` Execution Module are available as:

- `napalm.netmiko_commands`: Execute one or more commands to be execute on the remote device, via Netmiko, and return the output as a text.
- `napalm.netmiko_config`: Load a list of configuration command on the remote device, via Netmiko. The commands can equally be loaded from a local or remote path, and passed through Salt's template rendering pipeline (by default using Jinja as the template rendering engine).

Usage examples:

```
salt '*' napalm.netmiko_commands 'show version' 'show interfaces'
```
Arista pyeapi

For various operations and various extension modules, the following features have been added to gate functionality from the pyeapi module:

- `napalm.pyeapi_run_commands`: Execute a list of commands on the Arista switch, via the pyeapi library.
- `napalm.pyeapi_config`: Configure the Arista switch with the specified commands, via the pyeapi Python library. Similarly to `napalm.netmiko_config`, you can use both local and remote files, with or without templating.

Usage examples:

```
salt '*' napalm.pyeapi_run_commands 'show version' 'show interfaces'
salt '*' napalm.pyeapi_config config_file=salt://path/to/template.jinja
```

Cisco NX-API

In the exact same way as above, the user has absolute control by using the following primitives to manage Cisco Nexus switches via the NX-API:

- `napalm.nxos_api_show`: Execute one or more show (non-configuration) commands, and return the output as plain text or Python dictionary.
- `napalm.nxos_api_rpc`: Execute arbitrary RPC requests via the Nexus API.
- `napalm.nxos_api_config`: Configures the Nexus switch with the specified commands, via the NX-API. The commands can be loaded from the command line, or a local or remote file, eventually rendered using the templating engine of choice (default: jinja).

Usage examples:

```
salt '*' napalm.nxos_api_show 'show bgp sessions' 'show processes' raw_text=False
```

Ciscoconfparse

The following list of function may be handy when manipulating Cisco IOS or Junos style configurations:

- `napalm.config_filter_lines`: Return a list of detailed matches, for the configuration blocks (parent-child relationship) whose parent and children respect the regular expressions provided.
- `napalm.config_find_lines`: Return the configuration lines that match the regular expression provided.
- `napalm.config_lines_w_child`: Return the configuration lines that match a regular expression, having child lines matching the child regular expression.
- `napalm.config_lines_wo_child`: Return the configuration lines that match a regular expression, that don't have child lines matching the child regular expression.

**Note:** These functions require the ciscoconfparse Python library to be installed.

Usage example (find interfaces that are administratively shut down):
Salt Documentation, Release 3002.5

```
salt '*' napalm.config_lines_w_child 'interface' 'shutdown'
```

**IOSConfig**

For Cisco IOS style configuration, the following features have been added to the `napalm` Execution Module:

- `napalm.config_tree`: Transform Cisco IOS style configuration to structured Python dictionary, using the configuration of the interrogated network device.
- `napalm.config_merge_tree`: Return the merge tree of the configuration of the managed network device with a different configuration to be merged with (without actually loading any changes on the device).
- `napalm.config_merge_text`: Return the merge result (as text) of the configuration of the managed network device with a different configuration to be merged with.
- `napalm.config_merge_diff`: Return the merge diff after merging the configuration of the managed network device with a different configuration (without actually loading any changes on the device).

**SCP**

Reusing the already available connection credentials provided for NAPALM, the following features are now available:

- `napalmscp_put`: Transfer files and directories to remote network device.
- `napalmscp_get`: Transfer files and directories from remote network device to the localhost of the Minion.

**PeeringDB**

The `peeringdb` Execution Module is useful to gather information about other networks you can potentially peer with, and automatically establish BGP sessions, e.g., given just a specific AS number, the rest of the data (i.e., IP addresses, locations where the remote network is available, etc.) is retrieved from PeeringDB, and the session configuration is automated with minimal to no effort (typing the IP addresses manually can be both tedious and error prone).

**New Docker Proxy Minion**

Docker containers can now be treated as actual minions without installing salt in the container, using the new `docker proxy minion`.

This proxy minion uses the `docker executor` to pass commands to the docker container using `docker.call`. Any state module calls are passed through the corresponding function from the `docker` module.

```
proxy:
  proxytype: docker
  name: keen_proskuriakova
```
**Terraform Salt-SSH Roster**

You can now dynamically generate a Salt-SSH roster from the terraform resources defined with `terraform-provider-salt`.

This allows you to combine both terraform and Salt-SSH to provision and configure your hosts. See the terraform roster for an example on how to setup and use.

**Grains Dictionary Passed into Custom Grains**

Starting in this release, if a custom grains function accepts a variable named `grains`, the Grains dictionary of the already compiled grains will be passed in. Because of the non-deterministic order that grains are rendered in, the only grains that can be relied upon to be passed in are `core.py` grains, since those are compiled first.

**More Precise virtual Grain**

This release improves the accuracy of the `virtual` grain when running Salt in a nested virtualization environment (e.g. `systemd-nspawn` container inside a VM) and having `virt-what` installed.

Until now, the `virtual` grain was determined by matching against all output lines of `virt-what` instead of individual items which could lead to not quite precise results (e.g. reporting HyperV inside a `systemd-nspawn` container running within a Hyper-V-based VM.

**Configurable Module Environment**

Salt modules (states, execution modules, returners, etc.) now can have custom environment variables applied when running shell commands. This can be configured by setting a `system-environment` key either in Grains or Pillar. The syntax is as follows:

```
system-environment:

  <type>:
    <module>:
      # Namespace for all functions in the module
      _:
        <key>: <value>
      # Namespace only for particular function in the module
      <function>:
        <key>: <value>
```

- `<type>` would be the type of module (i.e. `states`, `modules`, etc.).
- `<module>` would be the module's name.

**Note:** The module name can be either the virtual name (e.g. `pkg`), or the physical name (e.g. `yumpkg`).

- `<function>` would be the function name within that module. To apply environment variables to all functions in a given module, use an underscore (i.e. `_`) as the function name. For example, to set the same environment variable for all package management functions, the following could be used:

```
system-environment:
  modules:
    pkg:
```

(continues on next page)
To set an environment variable in `pkg.install` only:

```yaml
system-environment:
  modules:
    pkg:
      install:
        LC_ALL: en_GB.UTF-8
```

To set the same variable but only for SUSE minions (which use zypper for package management):

```yaml
system-environment:
  modules:
    zypper:
      install:
        LC_ALL: en_GB.UTF-8
```

Note: This is not supported throughout Salt; the module must explicitly support this feature (though this may change in the future). As of this release, the only modules which support this are the following `pkg` virtual modules:

- `aptpkg`
- `yumpkg`
- `zypper`

"Virtual Package" Support Dropped for APT

In APT, some packages have an associated list of packages which they provide. This allows one to do things like run `apt-get install foo` when the real package name is `foo1.8`, and get the right package installed.

Salt has traditionally designated as "virtual packages" those which are provided by an installed package, but for which there is no real package by that name installed. Given the above example, if one were to run a `pkg.installed` state for a package named `foo`, then `pkg.list_pkgs` would show a package version of simply 1 for package `foo`, denoting that it is a virtual package.

However, while this makes certain aspects of package management convenient, there are issues with this approach that make relying on "virtual packages" problematic. For instance, Ubuntu has four different mutually-conflicting packages for `nginx`:

- `nginx-core`
- `nginx-full`
- `nginx-light`
- `nginx-extras`

All four of these provide `nginx`. Yet there is an `nginx` package as well, which has no actual content and merely has dependencies on any one of the above four packages. If one used `nginx` in a `pkg.installed` state, and none of the above four packages were installed, then the `nginx` metapackage would be installed, which would pull in `nginx-core`. Later, if `nginx` were used in a `pkg.removed` state, the `nginx` metapackage would be removed, leaving `nginx-core` installed. The result would be that, since `nginx-core` provides `nginx`, Salt would now see `nginx`
as an installed virtual package, and the `pkg.removed` state would fail. Moreover, *nginx would not actually have been removed*, since `nginx-core` would remain installed.

Starting with this release, Salt will no longer support using "virtual package" names in `pkg` states, and package names will need to be specified using the proper package name. The `pkg.list_repo_pkgs` function can be used to find matching package names in the repositories, given a package name (or glob):

```
# salt myminion pkg.list_repo_pkgs 'nginx*'
myminion:
    nginx:
        - 1.10.3-0ubuntu0.16.04.2
        - 1.9.15-0ubuntu1
    nginx-common:
        - 1.10.3-0ubuntu0.16.04.2

Minion Startup Events

When a minion starts up it sends a notification on the event bus with a tag that looks like this: salt/minion/\<minion_id>/start. For historical reasons the minion also sends a similar event with an event tag like this: minion_start. This duplication can cause a lot of clutter on the event bus when there are many minions. Set enable_legacy_startup_events: False in the minion config to ensure only the salt/minion/\<minion_id>/start events are sent.

The new enable_legacy_startup_events minion config option defaults to True, but will be set to default to False beginning with the 3001 release of Salt.

The Salt Syndic currently sends an old style syndic_start event as well. The syndic respects enable_legacy_startup_events as well.

Failhard changes

It is now possible to override a global failhard setting with a state-level failhard setting. This is most useful in case where global failhard is set to True and you want the execution not to stop for a specific state that could fail, by setting the state level failhard to False. This also allows for the use of onfail*-requisites, which would previously be ignored when a global failhard was set to True. This is a deviation from previous behavior, where the global failhard setting always resulted in an immediate stop whenever any state failed (regardless of whether the failing state had a failhard setting of its own, or whether any onfail*-requisites were used).

Pass Through Options to file.serialize State

This allows for more granular control over the way in which the dataset is serialized. See the documentation for the new serializer_opts and deserializer_opts options in the file.serialize state for more information.

file.patch State Rewritten

The file.patch state has been rewritten with several new features:

- Patch sources can now be remote files instead of only salt:// URLs
- Multi-file patches are now supported
- Patch files can be templated

In addition, it is no longer necessary to specify what the hash of the patched file should be.

30.2. Previous Releases
New no_proxy Minion Configuration

Pass a list of hosts using the no_proxy minion config option to bypass an HTTP proxy.

Note: This key does nothing unless proxy_host is configured and it does not support any kind of wildcards.

```
no_proxy: [ '127.0.0.1', 'foo.tld' ]
```

Changes to slack Engine

The output returned to Slack from functions run using this engine is now formatted using that function’s proper outputer. Earlier releases would format the output in YAML for all functions except for when states were run.

Enhancements to wtmp Beacon

A new key, action, has been added to the events fired by this beacon, which will contain either the string login or logout. This will simplify reactors which use this beacon’s data, as it will no longer be necessary to check the integer value of the type key to know whether the event is a login or logout.

Additionally, in the event that your platform has a non-standard utmp.h, you can now configure which type numbers indicate a login and logout.

See the wtmp beacon documentation for more information.

Deprecated and Removed Options

API Removed Arguments

Support for LocalClient’s expr_form argument has been removed. Please use tgt_type instead. This change was made due to numerous reports of confusion among community members, since the targeting method is published to minions as tgt_type, and appears as tgt_type in the job cache as well.

Those who are using the LocalClient (either directly, or implicitly via a netapi module) need to update their code to use tgt_type.

```
>>> import salt.client
>>> local = salt.client.LocalClient()
>>> local.cmd('*', 'cmd.run', ['whoami'], tgt_type='glob')
{'jerry': 'root'}
```

Minion Configuration Deprecated Option

The master_shuffle configuration option is deprecated as of the 2019.2.0 release. Please use the random_master option instead.
Module Removed Options

- The `napalm_network` module has been changed as follows:
  - Support for the `template_path` has been removed from `net.load_template` function. This is because support for NAPALM native templates has been dropped.

- The `pip` module has been changed as follows:
  - Support for the `no_chown` option has been removed from `pip.install` function.

- The `trafficserver` module has been changed as follows:
  - The `trafficserver.match_var` function was removed. Please use `trafficserver.match_metric` instead.
  - The `trafficserver.read_var` function was removed. Please use `trafficserver.read_config` instead.
  - The `trafficserver.set_var` function was removed. Please use `trafficserver.set_config` instead.

- The `win_update` module has been removed. It has been replaced by `win_wua`.

- The `win_wua` module has been changed as follows:
  - The `win_wua.download_update` and `win_wua.download_updates` functions have been removed. Please use `win_wua.download` instead.
  - The `win_wua.install_update` and `win_wua.install_updates` functions have been removed. Please use `win_wua.install` instead.
  - The `win_wua.list_update` function has been removed. Please use functions have been removed. Please use `win_wua.get` instead.
  - The `win_wua.list_updates` function has been removed. Please use functions have been removed. Please use `win_wua.list` instead.

Pillar Removed Option

- The `vault` external pillar has been changed as follows:
  - Support for the `profile` argument was removed. Any options passed up until and following the first `path=` are discarded.

Roster Removed Option

- The `cache` roster has been changed as follows:
  - Support for `roster_order` as a list or tuple has been removed. As of the 2019.2.0 release, `roster_order` must be a dictionary.
  - The `roster_order` option now includes IPv6 in addition to IPv4 for the private, public, global or local settings. The syntax for these settings has changed to `ipv4-*` or `ipv6-*`, respectively.
State Removed Modules and Options

- The `docker` state module has been removed
  - In 2017.7.0, the states from this module were split into four separate state modules:
    - `docker_container`
    - `docker_image`
    - `docker_volume`
    - `docker_network`
  - The `docker` module remained, for backward-compatibility, but it has now been removed. Please update SLS files to use the new state names:
    - `docker.running` => `docker_container.running`
    - `docker.stopped` => `docker_container.stopped`
    - `docker.absent` => `docker_container.absent`
    - `docker.network_present` => `docker_network.present`
    - `docker.network_absent` => `docker_network.absent`
    - `docker.image_present` => `docker_image.present`
    - `docker.image_absent` => `docker_image.absent`
    - `docker.volume_present` => `docker_volume.present`
    - `docker.volume_absent` => `docker_volume.absent`

- The `docker_network` state module has been changed as follows:
  - The `driver` option has been removed from `docker_network.absent`. It had no functionality, as the state simply deletes the specified network name if it exists.

- The deprecated `ref` option has been removed from the `git.detached` state. Please use `rev` instead.

- The `k8s` state module has been removed in favor of the `kubernetes` state module. Please update SLS files as follows:
  - In place of `k8s.label_present`, use `kubernetes.node_label_present`
  - In place of `k8s.label_absent`, use `kubernetes.node_label_absent`
  - In place of `k8s.label_folder_absent`, use `kubernetes.node_label_folder_absent`

- Support for the `template_path` option in the `netconfig.managed <salt.states.netconfig.managed()>` state has been removed. This is because support for NAPALM native templates has been dropped.

- Support for the `no_chown` option in the `pip.insalled` state has been removed.

- The `trafficserver.set_var` state has been removed. Please use `trafficserver.config` instead.

- Support for the `no_chown` option in the `virtualenv.managed` state has been removed.

- The `win_update` state module has been removed. It has been replaced by `win_wua`.

- Support for virtual packages has been removed from the `virtualenv managed <salt.states.virtualenv.managed()>` function has been removed.

- Support for the `no_chown` option in the `pip.insalled` state has been removed.
Utils Removed Options

The cloud utils module had the following changes:

• Support for the cache_nodes_ip function in salt utils module has been removed. The function was incomplete and non-functional.

The vault utils module had the following changes:

• Support for specifying Vault connection data within a 'profile' has been removed. Please see the vault execution module documentation for details on the new configuration schema.

Dependency Deprecations

Salt-Cloud has been updated to use the pypexec Python library instead of the winexe executable. Both winexe and pypexec run remote commands against Windows OSes. Since winexe is not packaged for every system, it has been deprecated in favor of pypexec.

Salt-Cloud has deprecated the use impacket in favor of smbprotocol. This changes was made because impacket is not compatible with Python 3.

SaltSSH Major Updates

SaltSSH now works across different major Python versions. Python 2.7 - Python 3.x are now supported transparently. Requirement is, however, that the SaltMaster should have installed Salt, including all related dependencies for Python 2 and Python 3. Everything needs to be importable from the respective Python environment.

SaltSSH can bundle up an arbitrary version of Salt. If there would be an old box for example, running an outdated and unsupported Python 2.6, it is still possible from a SaltMaster with Python 3.5 or newer to access it. This feature requires an additional configuration in /etc/salt/master as follows:

```
ssh_ext_alternatives:
  2016.3:
    py-version: [2, 6]  # Constraint to specific interpreter version
    path: /opt/2016.3/salt  # Main Salt installation
    dependencies:
      jinja2: /opt/jinja2
      yaml: /opt/yaml
      tornado: /opt/tornado
      msgpack: /opt/msgpack
      certifi: /opt/certifi
      singledispatch: /opt/singledispatch.py
      singledispatch_helpers: /opt/singledispatch_helpers.py
      markupsafe: /opt/markupsafe
      backports_abc: /opt/backports_abc.py
```

It is also possible to use several alternative versions of Salt. You can for instance generate a minimal tarball using runners and include that. But this is only possible, when such specific Salt version is also available on the Master machine, although does not need to be directly installed together with the older Python interpreter.

SaltSSH now support private key's passphrase. You can configure it by:

• --priv-passwd for salt-ssh cli
• salt_priv_passwd for salt master configure file
• priv_passwd for salt roster file
State Module Changes

salt State Module (used in orchestration)

The `test` option now defaults to None. A value of `True` or `False` set here is passed to the state being run and can be used to override a `test: True` option set in the minion's config file. In previous releases the minion's config option would take precedence and it would be impossible to run an orchestration on a minion with test mode set to True in the config file.

If a minion is not in permanent test mode due to the config file and the 'test' argument here is left as None then a value of `test=True` on the command-line is passed correctly to the minion to run an orchestration in test mode. At present it is not possible to pass `test=False` on the command-line to override a minion in permanent test mode and so the `test: False` option must still be set in the orchestration file.

event.send State

The `event.send` state does not know the results of the sent event, so returns changed every state run. It can now be set to return changed or unchanged.

influxdb_user.present Influxdb User Module State

The `password` parameter has been changed to `passwd` to remove the name collusion with the influxdb client configuration (`client_kwargs`) allowing management of users when authentication is enabled on the influxdb instance.

Old behavior:

```
influxdb_user.present:
    - name: exampleuser
    - password: exampleuserpassword
    - user: admin
    - password: adminpassword
```

New behavior:

```
influxdb_user.present:
    - name: exampleuser
    - passwd: exampleuserpassword
    - user: admin
    - password: adminpassword
```

winrepo_cache_expire_min Windows Package Definitions Caching

The `winrepo_cache_expire_min` has been changed from 0 to 1800 (30 minutes) For example if you run highstate the package definitions are normally updated, however now if the package definitions are younger than `winrepo_cache_expire_min` (30 minutes) the package definitions will not be refreshed, reducing the amount of time taken to run a 2nd highstate. To get the old behaviour change the value back to 0 in the minion configuration file. This also effects the behaviour of other functions which default to refresh. The `pkg.refresh_db` will always refresh the package definitions.
LDAP External Authentication

_freeipa groupattribute support_

Previously, if Salt was using external authentication against a freeipa LDAP system it could only search for users via the `accountattributename` field. This release add an additional search using the `groupattribute` field as well. The original `accountattributename` search is done first then the `groupattribute` allowing for backward compatibility with previous Salt releases.

**Jinja Include Relative Paths**

When a jinja include template name begins with `.//` or `../` then the import will be relative to the importing file. Prior practices required the following construct:

```
{% from tpldir ~/'/foo' import bar %}
```

A more "natural" construct is now supported:

```
{% from './foo' import bar %}
```

Comparatively when importing from a parent directory - prior practice:

```
{% from tpldir ~/'/../foo' import bar %}
```

New style for including from a parent directory:

```
{% from '../foo' import bar %}
```

**salt-api**

**salt-api Windows support**

Previously, salt-api was was not supported on the Microsoft Windows platforms. Now it is! salt-api provides a RESTful interface to a running Salt system. It allows for viewing minions, runners, and jobs as well as running execution modules and runners of a running Salt system through a REST API that returns JSON. See [Salt-API documentation](https://docs.saltstack.com/en/latest/topics/netapi/index.html).

**Logging Changes**

**Include Job ID (JID) in Minion and Master Logs**

The Job ID (JID) can now be optionally included in both the minion and master logs by including `jid` in either the `log_fmt_console` or `log_fmt_logfile` configuration option:

```
log_fmt_console: "[%(levelname)-8s] %(jid)s %(message)s"
```

The will cause the JID to be included in any log entries that are related to a particular Salt job. The JID will be included using the default format, `[JID: %jid]` but can be overridden with the `log_fmt_jid` configuration item.

```
log_fmt_jid: "[JID: %(jid)s]"
```

30.2. Previous Releases
Security

Windows runas changes

A password is no longer required with runas under normal circumstances. The password option is only needed if the minion process is run under a restricted (non-administrator) account. In the aforementioned case, a password is only required when using the runas argument to run command as a different user.

New Modules

**Execution Modules**

- `salt.modules.ciscoconfparse_mod`
- `salt.modules.jira`
- `salt.modules.google_chat`
- `salt.modules.iosconfig`
- `salt.modules.netmiko`
- `salt.modules.nxos_api`
- `salt.modules.peeringdb`
- `salt.modules.purefb`
- `salt.modules.pyeapi`

**Pillar Modules**

- `netbox`

**Proxy Modules**

- `salt.proxy.netmiko`
- `salt.proxy.nxos_api`
- `salt.proxy.pyeapi`

30.2.24 Salt 2019.2.1 Release Notes

Version 2019.2.1 is a bugfix release for 2019.2.0.
Known Issues

- **ISSUE #54751**: Proxy minion fails to start. Fix planned in 2019.2.2 release.
- **ISSUE #54762**: URIs with IPv6 addresses are broken, preventing master-minion communication in IPv6-only environments. Fix planned in 2019.2.2 release.
- **ISSUE #54776**: Minion fails to start when it contains `ping_interval` in minion configuration file. Fix planned in 2019.2.2 release.
- **ISSUE #54731**: Returners (except for default salt master returner) not loading properly in Py3. Fix planned in 2019.2.2 release.
- **ISSUE #54758**: salt-call state.show_states gives "Passed invalid arguments" error when a sls defined in top.sls file is missing. Fix planned in 2019.2.2 release.
- **ISSUE #54765**: Jinja from import is broken. Fix planned in 2019.2.2 release.
- **ISSUE #54771**: Affects only Debian 10. pkgrepo.managed does not work if used with proxy (configured at salt-minion). No fix date available yet.
- **ISSUE #54759**: Deprecation warnings for pyzmq. No fix date available yet.

Change to YAML Renderer

```
/etc/foo.conf:
  file.managed:
    - source: salt://foo.conf.jinja
    - template: jinja
    - context:
      data: {{ data }}
```

In 2019.2.0, the above SLS will result in an error message following changes to the YAML renderer that now require the new Jinja filter `tojson`.

```
/etc/foo.conf:
  file.managed:
    - source: salt://foo.conf.jinja
    - template: jinja
    - context:
      data: {{ data|tojson }}
```

In 2019.2.1, we introduce a new configuration option for both the Salt master and Salt minion configurations to be able to support the older YAML renderer. Using the option `use_yammloader_old` will allow the YAML renderer to function as before.

  - 730a007 Merge pull request #54388 from dwoz/54256-re-fix-empty-api-token-2019.2.1
  - 80651d3 Fix linter
  - 982ed3d Delete bad API token files

• ISSUE #54256: (sleminov-tc) Empty salt api token file breaks maintenance process. (refs: #54325, #54324, #54388, #54376)

• ISSUE #37945: (gstachowiak) Missing exception handling in salt.master.Maintenance. Process never completes. (refs: #54325, #54324, #54388, #54376)

• PR #54376: (dwoz) Move tokens in place with an atomic operation @ 2019-09-03 20:40:50 UTC
  - 11016ce Merge pull request #54376 from dwoz/tmp_token
  - 0b28c60 Fix linter complaints
  - 8e33343 Move tokens in place with an atomic operation

• PR #54386: (twangboy) Fix unit.utils.test_win_dacl (2019.2.1) @ 2019-09-03 16:57:25 UTC
  - 5161203 Merge pull request #54386 from twangboy/fixed-test_win_dacl_2019.2.1
  - b8fa7d3 Sort the perms

• PR #54355: (s0undt3ch) [2019.2.1] [GitPillar Tests] Have the started processes log instead of just writing to stdout/stderr @ 2019-08-29 23:26:50 UTC
  - b4caaad Merge pull request #54355 from s0undt3ch/hotfix-test-daemons-2019.2.1
  - 561c0a2 Have the started processes log instead of just writing to stdout/stderr
  - c2a3115 Don't overwritethe stderr logger

• PR #54353: (cmcmarrow) adds @skipIf not windows @ 2019-08-29 19:33:11 UTC
  - ce5b109 Merge pull request #54353 from cmcmarrow/2019_win_system_skip
  - 8e28074 adds @skipIf not windows

• PR #54338: (dwoz) Log server closes completely during shutdown @ 2019-08-29 17:14:05 UTC
  - 94c03e5 Merge pull request #54338 from dwoz/logging_fixup
  - a3e227e Log server closes completely during shutdown

• PR #54327: (garethgreenaway) [2019.2.1] Catch the AccessDenied exception and continue when running under Py3. @ 2019-08-29 16:59:34 UTC
  - 490ee69 Merge pull request #54327 from garethgreenaway/more_test_program_fixes
  - 97b4d86 Catch the AccessDenied exception and continue when running under Py3.

• PR #54316: (Akm0d) Azure cleanup @ 2019-08-27 16:14:09 UTC
  - bb911c3 Merge pull request #54316 from Akm0d/azure-clean-up
- 2072773 pass longer timeout to msazure destroyinstance
- 34eb477 Merge branch '2019.2.1' of https://github.com/saltstack/salt into azure-cleanup
- 7ae48b1 Allow azure tests enough time to clean up interfaces
- b45ae74 Clean up azure instances properly

**PR #54314: (garethgreenaway) [2019.2.1] Do not raise the exception in testprogram.py @ 2019-08-26 23:59:37 UTC**
- 9334e4e Merge pull request #54314 from garethgreenaway/testprogram_access_denied_do_not_raise
- a53bach Do not raise the exception if a process can not be access, just continue

**PR #54305: (dwoz) Fix wart in test_process tests on windows @ 2019-08-26 17:59:12 UTC**
- 71fb051 Merge pull request #54305 from dwoz/winfix
- 4e68860 Fix wart in test_process tests on windows

**PR #54303: (dwoz) Fix wart in periodic callback interval @ 2019-08-24 20:04:35 UTC**
- 4d80f0a Merge pull request #54303 from dwoz/periodic_cb
- bf57de Fix wart in periodic callback interval

**ISSUE #54219: (KChandrashekhar) integration.shell.test_call.py and tests/integration/shell/test_proxy.py (refs: #54259)**

**ISSUE #54153: (KChandrashekhar) Ubuntu 16.04 Proxy failures (refs: #54259)**

**PR #54259: (dwoz) Call os.fork less to avoid race conditions @ 2019-08-24 02:12:42 UTC**
- 5838851 Merge pull request #54259 from dwoz/less_forking
- bf4d0dd Fix process list tests on windows py3
- 316ec78 Allow more time for slow test
- 9ba86f Do not remove attributes from process class
- e7b6a8 Clean up cruft
- ed7103a Attempt to fix integration.shell.test_call test
- 659c805 Change noise log to debug
- 0660b1a Clean up typoses
- 9f1fe42 Call os.fork less to avoid race conditions

**ISSUE #50814: (doesitblend) Minion continues trying down master (refs: #54239, #53417)**

**ISSUE #49680: (doesitblend) Beacon events handled differently than event.send (refs: #53344, #54239)**

**ISSUE #49663: (doesitblend) Beacon only fires to single random master in HA mode (refs: #53344, #54239)**

**PR #54247: (DmitryKuzmenko) 2019.2.1 with multimaster bb fixes @ 2019-08-23 20:19:19 UTC**
- PR #54239: (DmitryKuzmenko) Multimaster tests with bb fixes (refs: #54247)
- PR #53848: (DmitryKuzmenko) Features/multimaster tests (refs: #54239)
- PR #53417: (DmitryKuzmenko) Multimaster minion hang on fire_master (refs: #54239, #53848)
- PR #53344: (DmitryKuzmenko) Run beacons on the only one minion instance. Return to all masters. (refs: #54239, #53848)
- 531f3aa Merge pull request #54247 from DSRCorporation/2019.2.1_with_multimaster_bb_fixes
• PR #54235: (github-abcde) Fix 46034 2019.2.1 @ 2019-08-22 22:32:09 UTC
  - 993c341 Merge pull request #54235 from ogd-software/fix_46034-2019.2.1
  - 93bd30d Add alternative fix for "!" stomping Apparently (after watching Jenkins tests fail), what yaml.safe_load returns depends not on the version of salt, but on some other external dependency. Because of this, fix both possible return values.
  - c95dd4d Add test for this specific bugfix
  - efc29d8 Prevent yamlify_arg from stomping "!

• PR #54282: (Akm0d) clean up renamed instances in the teardown @ 2019-08-22 22:13:51 UTC
  - 5d1a4d0 Merge pull request #54282 from Akm0d/clean-up-renamed
  - 11c1117 Removed redundant parenthesis
  - 802235d don't delete shutting down ec2 instances
  - 3602942 reversed the order in which an instance was renamed
  - 5500ede renamed _alt_name function
  - 23beab4 clean up renamed instances in the teardown

• PR #54252: (s0undt3ch) [2019.2.1] More control on spun test daemons on git pillar tests @ 2019-08-22 22:13:08 UTC
  - c181f5a Merge pull request #54252 from s0undt3ch/hotfix/git-pillar-2019.2.1
  - 4eb85fa Skip tests on RHEL family < 7
  - 64a1be8 Don't even go through the transport to get the system grains
  - d0f8efa Don't keep recreating the git repos. Restore from backup.
  - 6114e9d All prep work is done in setUpClass.
  - 5b030dd Daemons are now started/stopped on tests, not by salt
  - ed60f0d We don't actually need grains
  - 911446d Lock uwsgi requirement.
  - 805f0ac Merge branch '2019.2.1' into 2019.2.1_with_multimaster_bb_fixes

• PR #54214: (Ch3LL) Remove unnecessary logging from minion.py @ 2019-08-22 18:08:26 UTC
  - b40c6bf Merge pull request #54214 from Ch3LL/fix_logging
  - 8fd24cf Remove unnecessary logging from minion.py
  - 9d28098 Merge branch '2019.2.1' into 2019.2.1_with_multimaster_bb_fixes

• PR #54277: (dwoz) Win runas plus @ 2019-08-21 23:59:16 UTC
  - de77762 Merge pull request #54277 from dwoz/win_runs_plus
  - f719591 Update tests
  - d8749d9 Do not remove attributes from process class
  - ac5a2a4 Only close handle if it got created

• PR #54278: (Akm0d) Correctly detect when an ms_azure instance is deleted @ 2019-08-21 23:14:01 UTC
  - 93cf40a Merge pull request #54278 from Akm0d/cloud-test-logging
- 2dc1520 Merge branch '2019.2.1' into cloud-test-logging
- 3867448 Fixed incorrect arguments
- bdce5f4 Fix detecting msazure deletion with multiple tries

• PR #54263: (s0undt3ch) [2019.2.1] Exit test suite if test daemons fail to start @ 2019-08-21 22:06:52 UTC
  - 94f77a0 Merge pull request #54263 from s0undt3ch/test-daemons-2019.2.1
  - 655ef6d Rearrange logging termination
  - 28fa5d2 Prevent traceback on python interpreter shutdown
  - 9035731 Write to stderr a message with the exit code
  - 5666e20 Exit the test suite if one of the test daemons fails to start

• PR #54270: (s0undt3ch) [2019.2.1] Speedup testing helpers decorators @ 2019-08-21 20:33:25 UTC
  - 3b9fd44 Merge pull request #54270 from s0undt3ch/requires-system-grains-2019.2.1
  - 9f99bff Speedup testing helpers decorators

• ISSUE #53931: (KChandrashekhar) integration.states.test_pip_state.PipStateTest.test_issue_6912_wrong_owner_requirements_file (refs: #54274)

• PR #54274: (felippeb) #53931 never fail on codecov curls @ 2019-08-21 18:12:19 UTC
  - 2c4afa0 Merge pull request #54274 from felippeb/2019.2.1
  - 9c0b216 #53931 never fail on codecov curls

• PR #54264: (dwoz) Fix unit utils jinja when run on their own @ 2019-08-21 17:22:10 UTC
  - b3c70c3 Merge pull request #54264 from dwoz/jinja_units
  - 10a6d53 Fix unit utils jinja when run on thier own

• PR #54266: (Akm0d) Fix incorrect types on failing cloud tests @ 2019-08-21 17:14:40 UTC
  - 308ba55 Merge pull request #54266 from Akm0d/cloud_test_ultimate_fix
  - ff2125a Invert assertion to test for instance gone
  - 82136a8 test for ec2 instance shutting down
  - 283f631 run cloud --query if delete string is not available
  - 33e6b6d changed deprecated assertEquals
  - 41e6bc8 Cloud tests run correctly everywhere
  - 03a8b2c reverted literal_eval

• PR #54251: (Akm0d) reduced query calls to salt-cloud @ 2019-08-20 20:10:59 UTC
  - 25d0b52 Merge pull request #54251 from Akm0d/cloud_test_optimization
  - 5fe6bfc Optimized salt-query calls
  - 43418a4 Merge pull request #7 from Ch3LL/cloud_provider_files
    - 93944b Remove joyent config cloud test files
    - bd37849 Rename provider azure-config to azurearm-config
  - c7c06cb Added longer delays for ec2 tests
  - 5ceb47e Correctly check for GCE and EC2 deletion
- 52c178c Added pretty yaml formatting to cloud-test logs
- 4fc5e9e re-fixed simultaneous GCE tests
- 326e9f2 Merge pull request #6 from Ch3LL/cloud_provider_files
  - adb1464 fix pylint
  - 51ce819 Move provider config setup into Setup/Teardown class
- e5840a Merge pull request #5 from Ch3LL/cloud_provider_files
  - ab8adcc Only use the provider conf.d file we are testing
- 76609ad Merge branch '2019.2.1' into cloud_test_optimization
- f764bc0 Clean up expensive queries
- b3d02df reduced query calls to salt-cloud

- **PR #54240:** (Ch3LL) Fix TypeError python3 in get_image_id ec2 cloud @ 2019-08-20 20:10:01 UTC
- ba81ca3 Merge pull request #54240 from Ch3LL/get_image_ec2
- a3a39f3 Use ami variable instead in test
- dc1ae52 Fix TypeError python3 in get_image_id
  - d6a4df75 Merge branch '2019.2.1' into 2019.2.1_with_multimaster_bb_fixes

- **PR #54246:** (dwoz) Cut down on log noise @ 2019-08-19 17:20:03 UTC
- 8404ec2 Merge pull request #54246 from dwoz/log_noise
- e572711 Cut down on log noise

- **PR #54245:** (dwoz) Fix the sshd pid file @ 2019-08-19 17:19:32 UTC
- 5b3e925 Merge pull request #54245 from dwoz/sshd_pid_file
- d9f5347 Fix the sshd pid file

- **PR #54237:** (dwoz) Do not dup2 things without fileno @ 2019-08-18 17:13:29 UTC
- 268803b Merge pull request #54237 from dwoz/dup2
- 2ebd22b Fix linter
- 63c616a Do not dup2 things without fileno
  - 0b33498 Workaround for beacons.list_available slowness.
  - b7a1058 Minor: Better support of named multimaster tests.
  - a5ccdf Minor: remove unneded logging
  - fcb8ff0 Properly set HAS_IPTABLES from __virtual__ return.
  - a75db01 Multimaster related fixup: don't run test engine on minions
  - 8a88542 Multimaster beacons fix: put list into a dict to fire on the bus
  - 790fb41 Inotify beacons test logging and cleanup update
  - d84c8851 Inotify beacon test fixes and improvements.
  - 472ff0 Give minion more time to handle beacon creation.
  - 17ceee0 Fixed Lint errors
0bcf53c Fixed the unicode and timing inotify test issues.
f17bcf3 Improved assertion error diagnostic for master down test.
db0bae8 Run multimaster as well tests when no specific group is set
723f363 Ignore the multimaster minion subgroup test in module names test.
612191c Fixed lint failures
c1efa6 Multimaster test for events handling on master disconnect
1654fe8 Multimaster inotify beacons test
65dc47c Multimaster tests environment and test module test.
2c178b0 Moved annoying message to trace log level.
3e497c1 Handle minion events asynchronously.
909323a Tests fixes
6dad18f Cleanup event object
2bf55be Run beacons on the only one minion instance. Return to all masters.

- **PR #54121:** (Akm0d) Refactored cloud tests @ 2019-08-16 17:24:14 UTC
  - 27d89bd Merge pull request #54121 from Akm0d/gce_cloud_test
  - 48c57b3 Try multiple times to detect deletion of an instance
  - 74300eb return a valid set
  - 2d63b87 Wait for an instance to be fully created if necessary
  - 83ad8b3 Merge branch '2019.2.1' of github.com:SaltStack/salt into gce_cloud_test

- **ISSUE #54174:** (dwoz) SignalHandlingMultiprocessingProcess bugs (refs: #54204)

- **PR #54204:** (dwoz) Fix signal handling in subprocesses @ 2019-08-16 00:46:40 UTC
  - c5ee91c Merge pull request #54204 from dwoz/signal_proc
  - 09e5e49 Merge branch '2019.2.1' into signal_proc

- **ISSUE #7745:** (mgwilliams) yaml 'module' has no attribute 'Dumper' (refs: #54223)

- **PR #54223:** (dwoz) Test verify logs without a whole minion @ 2019-08-16 00:46:09 UTC
  - 99a8fc5 Merge pull request #54223 from dwoz/7754_test_removal
  - 4be711e Fix up linter warts
  - 7573826 Remove crufty un-needed tests
  - e77a77e Test verify logs without a whole minion
    - b40f41f Revert fallback to default signals change
    - 1d83b10 Fix signal handling in subprocesses
      - f90fe66 Reverted foo/bar creds per #46265
      - 3f56bad Reduced the amount of informtaion in debuggings tatement
      - de53bf0 Merge branch '2019.2.1' of github.com:SaltStack/salt into gce_cloud_test

- **PR #54203:** (dwoz) Run transport test loops in single thread @ 2019-08-15 20:10:20 UTC
  - 8d440e0 Merge pull request #54203 from dwoz/transport_tests
- 22b9d38 Run transport test loops in single thread
  * f6180a6 Even better logging of errors
  * a15dc4b better formatting and error reporting
  * 51fbc2a better logging on instance create failure
  * 1f7dd52 removed hack fixes from gce
  * 31cdc7c WAR ROOM SKIP GCE TESTS
  * 7d603be hasattr cannot find parent properties starting with __
  * 686cab9 Separated assertInstanceDestroy and _destry_instance
  * 158a38c Revert "Removed subclass from cloud name"
  * b7cf43d Removed subclass from cloud name
  * 8c5eb18 fixed pylint error on format string
  * 59e20bc Merge branch '2019.2.1' of https://github.com/saltstack/salt into gce_cloud_test

  - PR #54191: (garethgreenaway) [2019.2.1] Addition logging in testprogram used by integration.shell.test_minion.MinionTest.test_exit_status_correct_usage @ 2019-08-13 21:44:41 UTC
    - a05018e Merge pull request #54191 from garethgreenaway/test_program_test_mininion
    - 8463f84 Adding some additional logging when the call to "proc_cmdline = proc.cmdline()" results in a AccessDenied exception, so we can see what the process is and who the process is running as.

  - PR #54202: (waynew) Only run one filter test @ 2019-08-13 21:33:32 UTC
    - e5e9299 Merge pull request #54202 from waynew/shorter-jinja-ssh-tests
    - c333ac8 Only run one filter test
      * 5912f24 Switched to Azurearm over msazure

  - PR #54172: (Ch3LL) Migrate from azure to azurearm tests @ 2019-08-13 20:07:34 UTC
    - a13cb3e Merge pull request #54172 from Ch3LL/azurearm_tests
    - 465523f Migrate from azure to azurearm tests

  - ISSUE #50535: (wyarldle) salt errors with current azure-storage because of no version set (refs: #50567)

  - PR #54173: (Ch3LL) Cherry Pick #50567 and #53238 into 2019.2.1 @ 2019-08-13 20:07:09 UTC
    - PR #53238: (nicholasmhughes) Azure: Fixed ability to pass SSH key to Linux VMs (refs: #54173)
    - PR #50567: (rombert) azurefs: gracefully handle AttributeError (refs: #54173)
    - 39d0c59 Merge pull request #54173 from Ch3LL/azure_fixes
    - 9052af reverting log string handling
    - a1a61ee fixed ability to pass ssh key to Linux VMs
    - 4a141a1 azurefs: gracefully handle AttributeError
      * 6a28de fixed underscores
        - c35379a Moved finding installer into class
      * 9548f8 Moved finding installer into class
      * a86ae34 moved installer finder to SetUp method
      * 933964a removed default user/pass from profitbricks test file

30.2. Previous Releases
- 2a2437d fixed dictionary access
- b9ee411 Fixed broken tests
- 80ef626 fixed misspelled provider information
- 511779b removed unused imports
- 1cd1c13 setUp all cloud tests the same way
- d322408 Got rid of unnecessary delay
- 98ba18c fixed pylint error
- c34c17e Merge branch ‘2019.2.1’ of https://github.com/saltstack/salt into gce_cloud_test

- **PR #54178:** (dwoz) Fix flaky set_computer_name in mac_system module @ 2019-08-12 18:26:40 UTC
  - 19f4d5e Merge pull request #54178 from dwoz/mac_computer_name
  - e51100e Fix skip on non macos platforms
  - a3a9d92 Fix linter
  - c499d44 Revert unwanted flaky from non computer name tests
  - 941fcc8 Fix flaky set_computer_name in mac_system module
    - 90e8350 Merge branch ‘2019.2.1’ of https://github.com/saltstack/salt into gce_cloud_test

- **PR #54180:** (dwoz) Point test-kitchen to my keepalive_maxcount branch @ 2019-08-12 18:18:26 UTC
  - 6fe6799 Merge pull request #54180 from dwoz/keepalive_maxcount
  - dc9ee21 Add reminder about kitchen version
  - 19a1ff1b Point test-kitchen to my keepalive_maxcount branch
    - 60f8351 Fixed failing Ec2 Tests
    - e2f085c removed py3-only function call
    - 4406c57 fixed lint errors, more descriptive fails
    - 6840df5 assert instances exist in unified way
    - 03da233 skip EOL joyent tests, secure delete instances
    - 3123b571 Merge branch ‘2019.2.1’ of https://github.com/saltstack/salt into gce_cloud_test

- **ISSUE #53306:** (doesitblend) Fully Qualify CMD on Windows Minions (refs: #53311, #54033)

- **PR #54033:** (twangboy) Backport #53311 to 2019.2.1 @ 2019-08-09 16:46:36 UTC
  - PR #53311: (doesitblend) Add fully qualified cmd call (refs: #54033)
  - 9f5302d Merge pull request #54033 from twangboy/fix_win_service_2019.2.1
  - 2850fab Merge branch ‘2019.2.1’ into fix_win_service_2019.2.1
  - 0e2a2b8 Merge branch ‘2019.2.1’ into fix_win_service_2019.2.1
  - 16c704e Backport #53311 to 2019.2.1

- **PR #53900:** (twangboy) Fix inconsistent full names in LGPO @ 2019-08-09 09:15:41 UTC
  - c0e4df9 Merge pull request #53900 from twangboy/fix_lgpo
  - e05abdf Merge branch ‘2019.2.1’ into fix_lgpo
  - e4e71cd Remove duplicate test
- 68c632b Add some tests
- 3c34075 Fall back to slower method if new method not available
- 0108bcd Avoid using the lowercase method in XPath
- fcc0405 Fix telemetry issue, add some timing logs

- **PR #52818:** (twangboy) Add watchdog as a bundled dependency on Windows @ 2019-08-09 04:26:54 UTC
  - 9eb2938 Merge pull request #52818 from twangboy/add_watchdog
  - 2658634 pre-commit
  - 35691f2 Add watchdog to Linux and OSX .in files
  - 5ef5969 Rremove opensuse 42 static files
  - ec285d0 Remove watchdog from the rest of the .in files
  - 86e64ae Remove unused import, remove Windows reference
  - b934d53 Remove watchdog from windows.in
  - cfbee96 Fix and unify watchdog beacon tests for all OS's
  - cc73204 Put Windows tests in their own class
  - 6fb1a3 Remove unused import... lint
  - 832a1db Fix windowsisms
  - 4f47d50 Update static requirements
  - 762fe3b Remove some fluff
  - 946076c Add watchdog for tests
  - 02248dc Fix modified test to account for OS variances
  - 15ee479 Compile static requirements
  - 78a5723 Add watchdog to Linux and OSX .in files
  - 9a0f08a Update static requirements
  - 5cad13b Rremove opensuse 42 static files
  - 105f8ee Remove watchdog from the rest of the .in files
  - 121595a Remove unused import, remove Windows reference
  - c410a4b Remove watchdog from windows.in
  - 05a0845 Fix and unify watchdog beacon tests for all OS's
  - 200e230 Put Windows tests in their own class
  - 6cc8d96 Remove unused import... lint
  - a4abb72 Fix windowsisms
  - 005bed9 Update static requirements
  - c1bc627 Remove some fluff
  - 92c8d47 Add watchdog for tests
  - 9544624 Add watchdog as a bundled dependency on Windows

- **PR #54143:** (Akm0d) Don't call potentially missing shade library (#53734) @ 2019-08-09 01:05:26 UTC
- **PR #53734**: (Akm0d) Don't call potentially missing shade library (refs: #54143)
- 5bef520 Merge pull request #54143 from Akm0d/openstack_fix
- 3f58885 Merge branch '2019.2.1' into openstack_fix
- 71f5f38 Don't call potentially missing shade library (#53734)
  - 29ee7ce removed print statements, optimized query
  - 14b7539 added back print statements for easy debug
  - 823b3b2 Removed print statements and broken re
  - 9696ed9 experiment with subclass names
  - 2fa6157 more verbose instance names based on test
  - 2acb2df undercased non-const variable and added print statements
  - c5e875d Merge branch '2019.2.1' of https://github.com/saltstack/salt into gce_cloud_test

- **PR #54001**: (garethgreenaway) [2019.2.1] Porting metaproxy changes in #50183 to 2019.2.1 @ 2019-08-08 04:24:31 UTC
  - **PR #50183**: (cro) Allow proxy minion types to be dynamically loaded (refs: #54001)
  - 584e3f2 Merge pull request #54001 from garethgreenaway/add_metaproxy_2019_2_1
  - 8353467 Merge branch 'add_metaproxy_2019_2_1' of github.com:garethgreenaway/salt into add_metaproxy_2019_2_1
    - 1892d86 Merge branch '2019.2.1' into add_metaproxy_2019_2_1
  - ab72e1b Adding unit.test_proxy_minion to ignore list
  - 09f6fed Removing match tests, functionality does not exist in 2019.2.1
  - 4af95e4 Adding tests to ensure _metaproxy_call to called when ProxyMinion objects are created.
  - d162a88 Adding salt/metaproxy/proxy.py and tests/unit/modules/test_match.py
  - 51726b1 POrting metaproxy changes in #50183 to 2019.2.1

- **ISSUE #51008**: (cdalvaro) cwd option not working with cmd.run and runas (refs: #52632, #54079)

- **PR #54136**: (ScoreUnder) Fix cmd.run on MacOS (rebased) @ 2019-08-08 04:20:31 UTC
  - **PR #54079**: (ScoreUnder) Fix cmd.run on MacOS -- wrong environment variables (refs: #54136)
  - **PR #52632**: (cdalvaro) Prevent shell injection as root with cmd.run on macOS (refs: #54079)
  - **PR #47212**: (weswhet) fix macOS running as user. (refs: #54079)
  - bf863d0 Merge pull request #54136 from ScoreUnder/2019.2.1-patch-macos-cmd.run
  - 1182eb9 Add integration test justifying strange use of braces after cd in cmd.run
  - 733d2e7 Fixes to ITs
  - da38993 Add integration tests for cwd/runas changes on MacOS
  - ab8b39c Fix environment in cmd.run runas on MacOS
    - c9cb18f Don't call potentially missing shade library (#53734)
    - 5ef8414 Added more verbose logging to cloud tests
    - 2f3942f better logging and fail messages
    - 945f4c Fixed pylint errors and temporary print statements
- fd13ce1 Further refactored cloud test code
- b03cc48 Assume the instance exists and needs to be deleted
- 0991ff5 fixed pylint errors and failed tests
- 55e502a Merge branch '2019.2.1' of https://github.com/saltstack/salt into gce_cloud_test

- **PR #53974**: (Ch3LL) [2019.2.1] Add pygit2 requirement @ 2019-08-06 17:32:05 UTC
  
  - e268b95 Merge pull request #53974 from Ch3LL/add_pygit2
  - 11864a0 Merge branch '2019.2.1' into add_pygit2
  - d1b1452 Merge branch '2019.2.1' into add_pygit2
  - a5698cc Merge branch '2019.2.1' into add_pygit2
  - 7dd97a6 Merge branch '2019.2.1' into add_pygit2
  - 358974a Skip Pygit2 tests on windows
  - bc64961 Use accurate file:// URI on windows for gitfs tests
  - 894f958 Fix GitFS support for pygit2 >= 0.28.0
  - 4580030 [2019.2.1] Add pygit2 requirement
    - 4009bb5 fixed pylint errors
    - 459b16d put cloudtest base in separate file so that only one change needs to be made
    - 8e72335 Merge branch 'gce_cloud_test' of github.com:Akm0d/salt into gce_cloud_test
      - 0e2621e Merge branch '2019.2.1' into gce_cloud_test
    - 9f98b16 finished merge

- **PR #54108**: (dwoz) More robust azure instance deletion @ 2019-08-03 03:58:20 UTC
  
  - 46f5e2e Merge pull request #54108 from dwoz/azure_test
  - 754b719 Fix linter
  - 773235d Fix missing time import
  - 5a8f2ec More robust azure instance deletion

- **PR #54017**: (dmurphy18) Allow for main thread having terminated pid, before ThreadPoolExecutor threads @ 2019-08-02 18:11:48 UTC
  
  - 2cb5a0b Merge pull request #54017 from dmurphy18/fix_deb9_build90_tests
  - 2866520 Skip process kill tests on Windows
  - 5577f14 Clean up lint errors
  - 4ca709e Merge branch '2019.2.1' into fix_deb9_build90_tests
  - 264c767 Merge pull request #1 from dwoz/fix_deb9_build90_tests
    - 9bb9466 Add unit tests for weird pid does not exist cases
    - 64d9752 Add warning messages to help determine why pids do not exist
  - 406d382 Adjusted for review comments
  - 2d20f6e Adjusted try/except statements on process checking
  - e189177 Removed typos
- 2e3ca43 Updated for review comments
- 68c29af Allow for main thread having terminated pid, before ThreadPoolExecutor threads
  - e3158c8 refactored all cloud tests
  - 194e0c7 Refactored GCE cloud test

- **PR #54080**: (dmurphy18) Disabling random website tests till allow for quota usage @ 2019-07-31 21:16:54 UTC
  - 4e2efcd Merge pull request #54080 from dmurphy18/u1804_py3_random_skip
  - 0660e6e Disabling random website tests till allow for quota usage
- **PR #54063**: (twangboy) Make the skip apply to any system missing crypt @ 2019-07-30 19:22:07 UTC
  - dbbbcc9 Merge pull request #54063 from twangboy/fix_test_pycrypto_2019.2.1
  - 6fcf035 Make the skip apply to any system missing crypt
- **PR #54050**: (cmcmarrow) fixes integration terminate error @ 2019-07-30 13:38:55 UTC
  - 4df6271 Merge pull request #54050 from cmcmarrow/integration_terminate_fix
  - ebb07f4 Merge branch '2019.2.1' into integration_terminate_fix
- **PR #54057**: (dmurphy18) Added support for is_fedora and skip Minion test test_issue_7754 on Fedora @ 2019-07-29 22:41:25 UTC
  - 9d1bd63 Merge pull request #54057 from dmurphy18/fix_fedora30_test
  - 30f3bda Added support for is_fedora and skip Minion test test_issue_7754
  - b3293a9 Merge branch '2019.2.1' into integration_terminate_fix

- **ISSUE #53948**: (KChandrashekhar) integration.shell.test_call.CallTest.test_issue_2731_masterless (refs: #54040)

- **ISSUE #2731**: (cwood) Masterless Broken in 0.10.5 (refs: #54040)
- **PR #54040**: (waynew) Remove dead test @ 2019-07-29 17:23:45 UTC
  - 5d3bcd7 Merge pull request #54040 from waynew/remove-dead-test
  - e9a5a57 Remove dead test
  - ba3e867 Merge branch '2019.2.1' into integration_terminate_fix

- **PR #54051**: (twangboy) Skip get time test @ 2019-07-29 16:54:50 UTC
  - 70ffcec Merge pull request #54051 from twangboy/fix_test_system
  - ceaba05 Skip get time test
- **PR #54038**: (Ch3LL) Pyton3 digital ocean test fix: to_str on key @ 2019-07-29 16:54:19 UTC
  - 4aed833 Merge pull request #54038 from Ch3LL/do_py3_fix
  - f7346db Pyton3 digital ocean test fix: to_str on key
    - 05cd93f fixes integration terminate error
    - 69c3106 fixes integration terminate error
- **PR #53735**: (twangboy) Fix Windows tests in test_system @ 2019-07-26 22:38:28 UTC
  - 3cedac3 Merge pull request #53735 from twangboy/fix_test_system
  - a9e9c97 Add timeouts and account for those in assert
  - d3a160e Merge branch '2019.2.1' into fix_test_system
- f95f0e7 Merge branch '2019.2.1' into fix_test_system
- 87e02b8 Use setUpClass
- 6a685bd Fix some tests in the Windows Class

- **PR #53953**: (Ch3LL) Send SIGTERM to webserver in teardown of gitfs tests @ 2019-07-25 21:12:42 UTC
  - cc1cda1 Merge pull request #53953 from Ch3LL/improve_git_test
  - 347ea1e Use Sigkill and add time.sleep before check
  - 637bf95 Merge branch '2019.2.1' into improve_git_test
  - c0be147 Send SIGTERM webserver during teardown of gitfs tests
  - b776c0c Check if gitfs server fails to setup for tests

- **PR #53999**: (Ch3LL) Generate new key each time for digital ocean key test @ 2019-07-25 21:07:45 UTC
  - 2324167 Merge pull request #53999 from Ch3LL/improve_git_test
  - b0663b Generate new key each time for digital ocean key test

- **PR #53970**: (Ch3LL) [2019.2.1] Adding a WAR ROOM Skip for test_directory_clean_require_with_name @ 2019-07-25 21:03:49 UTC
  - 32fe66 Merge pull request #53970 from garethgreenaway/osx_skip_test_directory_clean_require_with_name
  - 362b84a Adding a WAR ROOM Skip for test_directory_clean_require_with_name

- **PR #54003**: (dwoz) War room skip for tcp build @ 2019-07-24 22:52:18 UTC
  - 213dff Merge pull request #54003 from dwoz/skip_test
  - 6c9b9fa War room skip for tcp build

- **PR #53897**: (cmcmarrow) patches salt grains locale_info decode error @ 2019-07-23 13:19:00 UTC
  - 048e097 Merge pull request #53897 from cmcmarrow/timezone_fix
  - d9a402d Merge branch '2019.2.1' into timezone_fix

- **PR #53920**: (s0undt3ch) [2019.2.1] Update CI pipelines. Remove old jenkins cruft. @ 2019-07-20 12:33:01 UTC
  - 9a846b4 Merge pull request #53920 from s0undt3ch/hotfix/ci-pipelines-2019.2.1
  - b09963b Update CI pipelines. Remove old jenkins cruft.

- **PR #53728**: (garethgreenaway) [2019.2.1] Disabling test_get_set_computer_name on OS X and Py3 @ 2019-07-19 17:18:33 UTC
  - 15acce7 Merge pull request #53728 from garethgreenaway/2019_2_1_mac_system_disable_test_get_set_computer_name
  - a6d853e Merge branch '2019.2.1' into 2019_2_1_mac_system_disable_test_get_set_computer_name
  - 5d537ed Missing six import. Updating skip message.
  - ac6d6cc Disabling test_get_set_computer_name on OS X and Py3.

- **PR #53913**: (garethgreenaway) [2019.2.1] skip test_issue_2594_non_invalidated_cache on MacOS @ 2019-07-19 17:17:36 UTC
  - 5a4ec89 Merge pull request #53913 from garethgreenaway/disble_test_issue_2594_non_invalidated_cache_macos
  - c65cd5f Skip the test test_issue_2594_non_invalidated_cache on MacOS where it is flakey.

- **PR #53902**: (twangboy) Skip tests that modify date or time @ 2019-07-18 17:53:31 UTC
  - b091eb7 Merge pull request #53902 from twangboy/skip_dt
- 76cf936 Skip tests that modify date or time

- **PR #53901**: (s0undt3ch) [2019.2.1] Don't fail when combining coverage files @ 2019-07-18 17:46:32 UTC
  - 22b7b1a Merge pull request #53901 from s0undt3ch/hotfix/wrap-coverage-combine
  - b459a48 Don't fail when combining coverage files

- **PR #53542**: (dwoz) Fix leak of SaltMessageClient instances when using tcp transport @ 2019-07-18 17:44:44 UTC
  - 84e798a Merge pull request #53542 from dwoz/tcp_leak
  - 3daeb4f Update TCP pipelines
  - 52f9556 Merge branch '2019.2.1' into tcp_leak
  - f5313fd Fix tcp message client test
  - 3419bf5 Merge branch '2019.2.1' into tcp_leak
  - 3125cd3 Merge branch '2019.2.1' into tcp_leak
  - 9a33582 Merge branch '2019.2.1' into tcp_leak
  - 7eb5d41 Merge branch '2019.2.1' into tcp_leak
  - 481372b Fix torando loop thread issue
  - aff15d4 Fix linter wart
  - 9606db7 Comment the tcp message client test better
  - dcf576f Add unit test for tcp message client close method
  - 4420556 Download artifacts for tcp jobs
  - 66a09dd Merge remote-tracking branch 'origin/tcp_leak' into tcp_leak
    - f484f3f Merge branch '2019.2.1' into tcp_leak
  - 4a37234 Add tcp suffix to github notifications
  - 4a2848b Add transport PR tests
  - 9a4b407 Fix leak of SaltMessageClient instances when using tcp transport
    - 592f3fe undo test
    - bc550ad wip pytest test david
    - 75571e4 fixes timezone decode error
    - d041660 fixes timezone decode error
    - 1dd1a9 fixes timezone decode error
    - e75dafa patches timezone grain
    - eca473 patches salt grains locale_info decode error

- **PR #53873**: (bryceml) increase sleep time between kitchen create failures to account for api limits @ 2019-07-16 23:46:09 UTC
  - 61e9e6f Merge pull request #53873 from bryceml/2019.2.1-increase-sleep
  - aae0bf6 increase sleep time between kitchen create failures to account for api limits

- **PR #53750**: (twangboy) Fix memory error when the test suite cleans up (2019.2.1) @ 2019-07-16 23:00:07 UTC
  - 317d9af Merge pull request #53750 from twangboy/fix_helpers
- fa0e9c3 Merge branch '2019.2.1' into fix_helpers

- **PR #53851**: (dwoz) Master stats revert @ 2019-07-16 16:05:38 UTC
  - 6c2b3a5 Merge pull request #53851 from dwoz/master_stats_revert
  - 0bc72e4 Revert "Merge pull request #53822 from dwoz/master_stats_test"

  - PR #52065: (twangboy) Use the dism binary that matches system architecture (refs: #53690)
  - 54c4220 Merge pull request #53690 from twangboy/fix_win_dism_2019.2.1
  - fae9f1a Merge branch '2019.2.1' into fix_win_dism_2019.2.1

- **PR #53719**: (s0undt3ch) [2019.2.1] PR Pipeline Enhancements @ 2019-07-04 20:29:06 UTC
  - 78c45eb Merge pull request #53719 from s0undt3ch/features/f30-reqs-2019.2.1
  - 76b99fd Enhance lint report
  - 45f19af Use milestones to abort previous, still running, builds, on new builds

- **PR #53697**: (s0undt3ch) [2019.2.1] Add Fedora 30 requirements files @ 2019-07-04 04:26:02 UTC
  - 3db42db Merge pull request #53697 from s0undt3ch/features/f30-reqs-2019.2.1
  - 36198cd Delete Opensuse 42 static requirements
  - 4413626 Delete Fedora 28 static requirements
  - 41809e5 Add Fedora 30 requirements files

- **PR #53680**: (Ch3LL) Pytest 5.0 contextmanager str: call value on ExceptionInfo objects @ 2019-07-04 00:12:56 UTC
  - f5c5da4 Merge pull request #53680 from Ch3LL/pytest_5_changes
  - b5e2b0b Merge branch '2019.2.1' into pytest_5_changes

- **PR #53682**: (twangboy) Fix compare issue in lgpo state module @ 2019-07-03 04:43:22 UTC
  - 727843c Merge pull request #53682 from twangboy/fix_lock_1740_lgpo
  - 62450db Merge branch '2019.2.1' into fix_lock_1740_lgpo
  - f6276a3 Fix compare issue in lgpo state module
    - 110b953 Pytest 5.0 contextmanager str: call value on ExceptionInfo objects
    - b71b655 Merge forward #52065
    - 023c47d Fix typo
    - 43dd7b3 Merge Forward #52593

- **PR #53678**: (twangboy) Fix LGPO when string object is None @ 2019-07-02 23:47:05 UTC
  - 491bfa8 Merge pull request #53678 from twangboy/fix_lock_1688_lgpo
  - 7b05b8f Merge branch '2019.2.1' into fix_lock_1688_lgpo

- **PR #53220**: (twangboy) Don’t remove the pythonwin directory (2019.2.1) @ 2019-07-02 22:43:43 UTC
  - 4aa91b Merge pull request #53220 from twangboy/fix_pywin32_2019.2.1
  - 748bf1c Merge branch '2019.2.1' into fix_pywin32_2019.2.1
• **PR #53614**: (Ch3LL) Increase flaky attempts on mac tests using systemsetup @ 2019-07-02 21:33:56 UTC
  - c2be0e2 Merge pull request #53614 from Ch3LL/mac_flaky
  - 5460031 Merge branch '2019.2.1' into mac_flaky
  - 7daa0f0 Increase flaky attempts on mac tests using systemsetup

• **PR #53624**: (Ch3LL) Allow yaml list notation for nodegroup expansion @ 2019-07-02 21:32:43 UTC
  - 02460cb Merge pull request #53624 from Ch3LL/nodegroup_group_list
  - 475d904 Merge branch '2019.2.1' into nodegroup_group_list
  - fbb15cd Add nodegroup list test
  - ee59d39 Merge branch '2019.2.1' into nodegroup_group_list
  - d236bd4 Allow yaml list notation for nodegroup expansion

• **PR #53562**: (Ch3LL) Move create key call into try/except in Digital Ocean key test @ 2019-07-02 16:08:08 UTC
  - 8857dbd Merge pull request #53562 from Ch3LL/do_key_test
  - 315eb35 Merge branch '2019.2.1' into do_key_test
  - 75ac708 Merge branch '2019.2.1' into do_key_test
  - 128ba07 Move create key call into try/except in Digital Ocean key test
    - 22da43a Merge branch '2019.2.1' into fix_pywin32_2019.2.1
    - 6b50d7 Merge branch '2019.2.1' into fix_pywin32_2019.2.1
    - 534c984 Merge branch '2019.2.1' into fix_pywin32_2019.2.1
    - 382c637 Merge branch '2019.2.1' into fix_pywin32_2019.2.1
    - fb4090d update py3 script
    - 0ea70ba Don’t remove pythonwin directory
      - ba37276 Use string_types instead of text_types
      - f60084 Add some unit tests, raise error on non-string types
      - 35ed8be Create function for encoding string values
      - c4c1082 Return encoded null when string value is None

• **PR #53627**: (dmurphy18) Cherry pick pr 53370 from 2018.3 into 2019.2.1 @ 2019-06-28 19:54:13 UTC
  - 164aaeb Merge pull request #53627 from dmurphy18/cherry-pick-pr-53370
  - 450d23d Merge branch '2019.2.1' into cherry-pick-pr-53370

• **ISSUE #53411**: (cro) Events can grow stale when event_listen_queue is set. (refs: #53587, #53412)

• **PR #53587**: (cro) Forward port from 2018.3 Add event_listen_queue_max_seconds to fix #53411 @ 2019-06-28 16:49:46 UTC
  - 53412: (cro) Stale events 53411 (refs: #53587)
  - 6559e4c Merge pull request #53587 from cro/53412-2019.2.1
  - 9e69bd4 Merge branch '2019.2.1' into 53412-2019.2.1
  - 949a026 Merge branch '2019.2.1' into 53412-2019.2.1
  - f5d81c9 Merge branch '2019.2.1' into 53412-2019.2.1
- d74c313 Merge branch '2019.2.1' into 53412-2019.2.1
- b3c3f52 Make doc build test pass.
- 8001130 Add event-listen_queue_max_seconds to fix #53411
- 34e38d7 Merge branch '2019.2.1' into cherry-pick-pr-53370

• ISSUE #53283: (Ch3LL) integration.states.test_file.FileTest.test_directory_broken_symlink (refs: #53295)
• PR #53295: (DmitryKuzmenko) Recurse kwarg of state.directory state shall be a list or None @ 2019-06-27 23:20:10 UTC
  - 14efced Merge pull request #53295 from DSRCorporation/bugs/test_file_recurse_set
  - 2927b78 Merge branch '2019.2.1' into bugs/test_file_recurse_set
  - 9c01670 Merge branch '2019.2.1' into bugs/test_file_recurse_set
  - 571d82a Merge branch '2019.2.1' into bugs/test_file_recurse_set
  - ee8f0e3 Merge branch '2019.2.1' into bugs/test_file_recurse_set
  - 013e04c Recurse kwarg of state.directory state shall be a list of None

• ISSUE #52926: (waynew) integration.states.test_beacon.BeaconStateTestCase.test_present_absent - Beacon "diskusage" is not available (refs: #53493, #53466)
• ISSUE #52245: (twangboy) integration.states.test_beacon.BeaconStateTestCase.test_present_absent (refs: #53493, #53466)
• PR #53466: (dwoz) More robust beacon state test @ 2019-06-27 23:17:01 UTC
  - 75175bb Merge pull request #53466 from dwoz/test_pres_abs
  - f24bf06 Use new pipeline format
  - a74580b Clean up cruft
  - 68958f5 Do not create duplicate minion ids
  - c47eeb4 Add amazon 2 to PR tests
  - dc90b47 More robust beacon state test
    - 95b1819 Initial working tests for gpg fixes and import keys, signing
    - b2c9ae2 Update access to str/bytes with to_unicode/to_bytes for Python 3

• PR #53609: (s0undt3ch) CI Pipelines. Timeout after getting a node. Report exit code. @ 2019-06-27 16:09:54 UTC
  - 582ac5f Merge pull request #53609 from s0undt3ch/hotfix/fix-nox-bypass-2019.2.1
  - 024be84 CI Pipelines. Timeout after getting a node. Report exit code.

• PR #53574: (s0undt3ch) [2019.2.1] Minor fixes/adjustments to the new CI pipelines @ 2019-06-25 18:48:25 UTC
  - f568796 Merge pull request #53574 from s0undt3ch/hotfix/fix-nox-bypass-2019.2.1
  - e85e2f4 Minor fixes/adjustments to the new CI pipelines

• PR #53584: (dwoz) Add unit tests for recent SaltCacheLoader changes @ 2019-06-24 23:40:43 UTC
  - PR #53563: (twangboy) SaltCacheLoader does not create multiple FileClients (refs: #53584)
  - 77b7fc4 Merge pull request #53584 from dwoz/client_cache
  - e9b61dc Add unit tests for recent SaltCacheLoader changes
* 5558a0a Add reg to the whitelist

- **PR #53563**: (twangboy) SaltCacheLoader does not create multiple FileClients (refs: #53584) @ 2019-06-22 23:23:03 UTC
  - 6ed6c31 Merge pull request #53563 from twangboy/py3_windows_hang
  - 369720e Allow the file_client to be overridden
  - f6c592c Don't instantiate the file_client every time

- **PR #53432**: (garethgreenaway) [2019.2.1] Various fixes for 2019.2.1 to ensure tests pass on Mac OS X @ 2019-06-22 23:23:03 UTC
  - c606952 Merge pull request #53432 from garethgreenaway/2019_2_1_mac_fixes
  - 1974f11 Disabling a couple more tests in integration.modules.test_cp that hang on OS X and Py2.
  - 7721151 Fixing lint.
  - 1d4e228 Updating various skips for tests to only skip if OS is OS X and Python is Python2.
  - 01dafdc Skipping integration.modules.test_cp.CPModuleTest.test_get_file_str_https on OS X
  - c02db20 Disabling integration.modules.test_state.StateModuleTest.test_parallel_state_with_long_tag
  - 8788877 Skip integration.states.test_file.FileTest.test_issue_11003_immutable_lazy_proxy_sum and integration.states.test_pip_state.PipStateTest.test_22359_pip_installed_unless_does_not_trigger_warnings when running on OS X.
  - cf78627 Removing wrong import of skipIf
  - b10e1e7 Moving the skipIf for OS X from the beacon state tests to the renderer state tests.
  - d2fe9a Disabling beacon state tests on OS X for the time being.
  - 1741bb0 Adding some timeouts to see if it helps the tests pass on OS X.
  - fd0ba0a Ensure the user and group used by @with_system_user_and_group are consistent.
  - e03ab81 Using salt.utils.path.which to find false, on OSX it lives under /usr/bin/
  - 353f9d4 Fixing the beacons.reset function. Once the reset has taken place in beacons/__init__.py we need to fire an event back to complete the loop and ensure that everything worked as expected.
  - ee3bc7 fix to how the depends decorator works. Only run the dependancy commands for the module we're checking.
  - 8440176 Fixing a log issue that pops up after test_gen_thin_compression_fallback_py3 on "OS X, need to ensure that salt.utils.thin.os.close is mocked.
  - 9767ddd Format for the sqlite3 database used for the assistive information changed in Mojave, additional columns added.
  - 9c8a7e6 Fixing a bug when the roots fileserver and the location is a symlink to another location. This fix ensures that when fsroot is referenced we are using the real path and not the symlink path.

- **PR #53210**: (Ch3LL) Cherry-Pick #52787 into 2019.2.1 @ 2019-06-20 13:33:13 UTC
  - PR #52787: (garethgreenaway) [2018.3] Fixes to test_pip state sls files (refs: #53210)
  - f5f80af Merge pull request #53210 from Ch3LL/cp-52787
- f27c434 Merge branch '2019.2.1' into cp-52787

- **PR #53467**: (twangboy) Check valid username first (fixes failing symlink test) @ 2019-06-19 17:04:30 UTC
  - fd6cb35 Merge pull request #53467 from twangboy/fix_test_win_file
  - 92950c5 Merge branch '2019.2.1' into fix_test_win_file
  - 6a21ed3 Merge branch '2019.2.1' into fix_test_win_file
  - 31ce1fb Fix some lint, skip some tests
  - 6de46be Monkeypatch in the class instead of globally
  - d663a1f Fix the failing BlockReplace test cases on Windows
  - 299f88f Update test_managed_contents
  - 81110e5 Fix test_file_copy_make_dirs that was failing on Linux
  - 8d0529d Fix some lint
  - 4a9c020 Fix issues with win_runas
  - bcefa1 Remove privs message
  - 54be0a6 Verify username early in win_runas

- **PR #53475**: (Ch3LL) Add pypsexec requirement for cloud tests @ 2019-06-19 13:30:25 UTC
  - 3230078 Merge pull request #53475 from Ch3LL/add_pypsexec
  - ab59a55 Merge branch '2019.2.1' into add_pypsexec
  - f954363 Merge branch '2019.2.1' into add_pypsexec
  - 8f7cbfc Merge branch '2019.2.1' into add_pypsexec
  - fa22b39 Add pypsexec requirement for cloud tests

- **PR #53491**: (Ch3LL) Update test_gen_hash for macosx @ 2019-06-19 13:16:04 UTC
  - bdd7c2c Merge pull request #53491 from Ch3LL/crypt_test_mac
  - 85e96bd Merge branch '2019.2.1' into crypt_test_mac
  - 700338e Merge branch '2019.2.1' into crypt_test_mac
  - 4ce7fb1 Merge branch '2019.2.1' into crypt_test_mac
  - 832ded6 Merge branch '2019.2.1' into crypt_test_mac
  - 775fb8c Merge branch '2019.2.1' into crypt_test_mac
  - 0832b49 Update test_gen_hash for macosx

- **PR #53494**: (Ch3LL) Always delete digital ocean key for test_key_management test @ 2019-06-19 13:14:51 UTC
  - 8c2e952 Merge pull request #53494 from Ch3LL/do_cloud_test
  - 5053ab Merge branch '2019.2.1' into do_cloud_test
  - 64a3e8d Merge branch '2019.2.1' into do_cloud_test
  - 45c0c43 Merge branch '2019.2.1' into do_cloud_test
  - 3826c56 Allows delete digital ocean key for test_key_management test
  - 6b6dc6e Merge branch '2019.2.1' into cp-52787

- **PR #53434**: (weswhet) Update documentation for newer mac_service module. @ 2019-06-19 01:15:19 UTC
- 2e3778b Merge pull request #53434 from weswhet/patch-2
- 89398a9 Update salt.modules.service.rst
- b9c1b1a Update salt.modules.service.rst
- a962a64 Merge branch '2019.2.1' into patch-2

**PR #53498: (amendlik) Fix broken documentation links @ 2019-06-18 23:44:05 UTC**
- f72ebba Merge pull request #53498 from amendlik/links
- e360a70 Fix broken documentation links for service virtual module
- 56f65ec Fix broken documentation links for pkg virtual module
  * 010a2c5 Update documentation for newer mac_service module.
  * 1bbdc7f Merge branch '2019.2.1' into cp-52787

**PR #53514: (Ch3LL) Revert logging changes from #53492 @ 2019-06-18 20:49:04 UTC**
- PR #53492: (dwoz) Fix syndic connection when using tcp transport (refs: #53514)
- 0793272 Merge pull request #53514 from Ch3LL/disable_py3_logging
- 8c8f0ac import six runtests log handler
- f442b33 Revert "Enable logging for test runs on py3"
  * b62be16 Merge branch '2019.2.1' into cp-52787

**PR #53485: (s0undt3ch) [2019.2.1] Workaround nox's install only flag @ 2019-06-18 09:35:34 UTC**
- 98285f9 Merge pull request #53485 from s0undt3ch/hotfix/fix-nox-bypass-2019.2.1
- 69e1d84 Workaround nox's install only flag
  * 8622bba Merge branch '2019.2.1' into cp-52787

**PR #53369: (Akm0d) Added refs to AIX module documentation @ 2019-06-17 20:29:01 UTC**
- ff7370e Merge pull request #53369 from Akm0d/aix_docs
- 2ece253 Merge branch '2019.2.1' into aix_docs
- f2eda45 Merge branch '2019.2.1' into aix_docs
- e793ac Merge branch '2019.2.1' into aix_docs
- e800641 Merge branch '2019.2.1' into aix_docs
- 0ef9892 Merge branch '2019.2.1' into aix_docs
- 65cb718 Merge branch '2019.2.1' into aix_docs
- 32f4d7e Merge branch '2019.2.1' into aix_docs
- a59f45e Merge branch '2019.2.1' into aix_docs
- 29f89a4 Merge branch '2019.2.1' into aix_docs
- e74345c Merge branch '2019.2.1' into aix_docs
- 28fbd11 Merge branch '2019.2.1' into aix_docs
- 60129f0 Merge branch 'aix_docs' of github.com:Akm0d/salt into aix_docs
  * a1c4abc Merge branch '2019.2.1' into aix_docs
  * e2c9fcc Merge branch '2019.2.1' into aix_docs
- fd197d3 Merge branch '2019.2.1' of https://github.com/saltstack/salt into aix_docs
- 6d42cf7 Merge branch 'aix_docs' of github.com:Akm0d/salt into aix_docs
  - fae6045 Merge branch '2019.2.1' into aix_docs
- 97145b0 Merge branch '2019.2.1' of https://github.com/saltstack/salt into aix_docs
- 6d16343 Updated 'used for' description of aixpkg
- 6092683 Added aixpkg to index
- 2867d07 Added refs to AIX module documentation
  - 458fe9f Merge branch '2019.2.1' into cp-52787

- **PR #53461**: (waynew) Update file.chattr @ 2019-06-14 21:16:52 UTC
  - 8df7684 Merge pull request #53461 from waynew/fi-chattr-problems
  - a8d8174 Merge branch '2019.2.1' into fi-chattr-problems

- **ISSUE #52926**: (waynew) integration.states.test_beacon.BeaconStateTestCase.test_present_absent - Beacon 'diskusage' is not available (refs: #53493, #53466)

- **ISSUE #52245**: (twangboy) integration.states.test_beacon.BeaconStateTestCase.test_present_absent (refs: #53493, #53466)

- **PR #53493**: (dwoz) Cherry-pick and merge beacon event change @ 2019-06-14 20:36:10 UTC
  - cfe866d Merge pull request #53493 from dwoz/cherry_pick_test_fix
  - fb104bb Cherry-pick and merge beacon event change

- **PR #53492**: (dwoz) Fix syndic connection when using tcp transport (refs: #53514) @ 2019-06-14 19:23:41 UTC
  - a1f4136 Merge pull request #53492 from dwoz/tcp_syndic_fix
  - 17c983b Fix linter
  - 9393425 Enable logging for test runs on py3
  - f1b65d1 Fix syndic connection when using tcp transport

- **PR #53437**: (twangboy) Fix failing symlink test @ 2019-06-12 22:53:32 UTC
  - e852596 Merge pull request #53437 from twangboy/fix_test_win_file
  - 8c30dbd Add priv info to error message
  - a7d41a8 Make them non-destructive tests
  - d8bede0 Remove duplicate test
  - 89aaf2e Remove duplicate test
  - 184ec4a Skip test on linux
  - c97ea99 Mark it a destructive test
  - 9da7090 Fix failing symlink test

- **PR #53408**: (s0undt3ch) [2019.2.1] Fix static requirements @ 2019-06-12 22:52:33 UTC
  - 19629a0 Fix unit.templates.test_jinja.TestCustomExtensions.test_http_query
  - 5aae99b Take into account the packaging requirements for OSX
  - b9618f6 Take into account the packaging requirements for windows

30.2. Previous Releases
- ff63ae4 Stop compiling static TCP requirements.
  * 62e590b Update file.chattr

- **PR #53165**: (Ch3LL) Update ami's used for windows cloud tests @ 2019-06-11 15:54:41 UTC
  - ab9fe46 Merge pull request #53165 from Ch3LL/ami_window_cloud
  - 1d0b0a6 Merge branch '2019.2.1' into ami_window_cloud
  - a77a05c Merge branch '2019.2.1' into ami_window_cloud
  - a1204dc Merge branch '2019.2.1' into ami_window_cloud
  - d15c8f2 Merge branch '2019.2.1' into ami_window_cloud
  - 941778f Update ami's used for windows cloud tests
  - PR saltstack/salt#53332: (s0undt3ch) Non optional full test runs for 2019.2.1 (refs: #53431)

- **PR #53431**: (dwoz) Revert "Non optional full test runs for 2019.2.1" @ 2019-06-10 21:44:30 UTC
  - d806b58 Merge pull request #53431 from saltstack/revert-53332-hotfix/full-test-run-2019.2.1
  - 701218c Revert "Non optional full test runs for 2019.2.1"

- **ISSUE #52174**: (amendlik) file.stat function not working under Python 3 (refs: #53430)
  - PR #53430: (Akm0d) Cherry-pick #52174 into 2019.2.1
    * 7811971 Merge branch '2019.2.1' into cp-52787

- **PR #53389**: (bryceml) only keep last 10 builds of every pr on jenkins to reduce disk usage @ 2019-06-10 17:18:48 UTC
  - 6b800a2 Merge pull request #53389 from bryceml/2019.2.1
  - 05368a1 Merge branch '2019.2.1' into 2019.2.1

- **PR #53332**: (s0undt3ch) Non optional full test runs for 2019.2.1 @ 2019-06-10 15:51:41 UTC
  - fe18c40 Merge pull request #53332 from s0undt3ch/hotfix/full-test-run-2019.2.1
  - 2372733 Merge branch '2019.2.1' into hotfix/full-test-run-2019.2.1
  - f8bd47b Merge branch '2019.2.1' into hotfix/full-test-run-2019.2.1
  - 45c3c06 Non optional full test runs for 2019.2.1
    * 928b05f only fetch pr target branch instead of all branches to save time and disk space
    * ccc6106 only keep last 10 builds of every pr on jenkins to reduce disk usage
      - b970bde Merge branch '2019.2.1' into cp-52787

- **PR #53287**: (twangboy) Fix win system @ 2019-06-06 23:35:47 UTC
  - d0810d7 Merge pull request #53287 from twangboy/fix_win_system
  - 0fc88fb Add TypeError
  - 5b4160d Try NumberOfEnabledCores
  - 49cbfd4 Add a note about skipping unavailable items
  - 044b56b Fix get_system_info for older versions of Windows

- **ISSUE #52173**: (amendlik) file.directory fails to check directory permissions correctly (refs: #53385)
  - PR #53385: (Akm0d) Check dir_mode recursively in file.directory
• PR #53386: (dwoz) Fix missing import @ 2019-06-06 20:45:59 UTC
  - cf98b83 Merge pull request #53386 from dwoz/missing_import
  - a23d6d9 Fix missing import

• ISSUE #49559: (zyguy) Salt-cloud - proxmox driver - returns AttributeError: 'generator' object has no attribute 'next' (refs: #53240)
  - PR #53240: (FireGrace) change .next() to next() py2=>py3 leftover

• ISSUE #53274: (Ch3LL) integration.states.test_pkg failing on amazon 1 py2 (refs: #53323)
• PR #53323: (dmurphy18) Fix for issue #53274, test on Amazon Linux 1 @ 2019-06-06 17:31:18 UTC
  - 18991f9 Merge pull request #53232 from dmurphy18/fixed_53274
  - 6814852 Merge branch '2019.2.1' into fixed_53274
  - bb6c97a Merge branch '2019.2.1' into fixed_53274
  - b84833d Merge branch '2019.2.1' into fixed_53274
  - 7085f36 Fixed pylint issue on PR not showing when run pylint locally
  - 1200031 Updated to use package bash-doc if Amazon Linux 1 after review comments
  - b2a4a5e Fix for issue #53274, test on Amazon Linux 1
  - PR #53356: (Akm0d) Updated paramiko to version 2.2.3 for python3.7 support

• ISSUE #53137: (bryceml) update doc pr's to be built using python3 and sphinx 2.0.1 (refs: #53273)
• PR #53273: (s0undt3ch) [2019.2.1] Switch docs building under Py3 @ 2019-06-05 10:01:03 UTC
  - 1cf57e9 Merge pull request #53273 from s0undt3ch/hotfix/py3-nox-docs-2019.2.1
  - 98653c0 Allow docs to be built on Python >= 3.5, not just Python 3.6
  - c54f06f Have sphinx turn errors into warnings
  - 07f4327 Switch docs building under Py3

• PR #53361: (s0undt3ch) [2019.2.1] Only make a new log record if it's a dictionary. @ 2019-06-05 09:56:15 UTC
  - dfd36a2 Merge pull request #53361 from s0undt3ch/hotfix/fix-mp-logging-2019.2.1
  - d70d61f Fully revert 962b11687

• ISSUE #53171: (twangboy) integration.states.test_network.NetworkTest.test_managed (refs: #53351)
• PR #53351: (waynew) Add checks for Amazon Linux to ip module @ 2019-06-04 19:25:58 UTC
  - 5efb670 Merge pull request #53351 from waynew/53171-fix-network-managed
  - e801afe Add checks for Amazon Linux to ip module

• PR #53242: (s0undt3ch) [2019.2.1] newer msgpack ipc fixes @ 2019-06-03 23:39:09 UTC
  - PR #52934: (twangboy) Update msgpack calls for newer msgpack (refs: #53242)
  - PR #52755: (dwoz) Fix non raw msg pack msg decoding (refs: #53242)
  - PR #52488: (terminalmage) Fix deprecation warning in msgpack >= 0.5.2 (2018.3) (refs: #52755)
  - PR #52487: (terminalmage) Fix deprecation warning in msgpack >= 0.5.2 (develop) (refs: #53242)
  - ce5d79a Merge pull request #53242 from s0undt3ch/hotfix/msgpack-ipc-2019.2.1
  - d27a524 Merge branch '2019.2.1' into hotfix/msgpack-ipc-2019.2.1
• **PR #53289**: (cmcmarrow) stops pylint E1120 from showing @ 2019-06-01 04:57:27 UTC
  - df448c2 Merge pull request #53289 from cmcmarrow/test_kubernetes_lint_failures_silenced
  - 03ec4ac Merge branch '2019.2.1' into test_kubernetes_lint_failures_silenced

• **PR #53304**: (s0undt3ch) [2019.2.1] Refactor Jenkins PR pipelines to download artifacts after timeout @ 2019-05-31 17:10:19 UTC
  - 6fac22b Merge pull request #53304 from s0undt3ch/hotfix/jenkins-pipelines-refactor-2019.2.1
  - 6e778ef Refactor Jenkins PR pipelines to download artifacts after timeout

• **PR #53297**: (s0undt3ch) [2019.2.1] The TCP transport needs the exact same requirements as the ZeroMQ one @ 2019-05-30 19:42:29 UTC
  - d359513 Merge pull request #53297 from s0undt3ch/hotfix/tcp-transport-tests
  - bec7fa5 The TCP transport needs the exact same requirements as the ZeroMQ one
  - f93e7d3 stops pylint E1120 from showing
  - cbe6423 stops pylint E1120 from showing
  - c5a5d43 test_kubernetes_lint_failures_silenced
  - b838395 test_kubernetes_lint_failures_silenced
  - 997da08 stops pylint E1120 from showing
    - 5542fa8 Add the missing, and required, top pillar file.
    - 0ae2ef0 Under Py2 we still want raw to be set to True
    - 714d663 Re-submit #52934 fixed after being reverted in #52755
    - 243b512 Update msgpack calls for newer msgpack
      - 0f9077b Merge branch '2019.2.1' into cp-52787

• **PR #53264**: (s0undt3ch) [2019.2.1] Minion blackout tests - Add the missing, and required, top pillar file @ 2019-05-29 07:30:45 UTC
  - 50e31ec Merge pull request #53264 from s0undt3ch/2019.2.1
  - acabb70 Merge branch '2019.2.1' into 2019.2.1

• **PR #52966**: (s0undt3ch) Always run the full test suite on the 2019.2.1 release branch @ 2019-05-28 15:43:12 UTC
  - 749c626 Merge pull request #52966 from s0undt3ch/hotfix/full-test-run
  - 247c461 Always run the full test suite on the 2019.2.1 release branch

• **PR #53138**: (frogunder) vultr cloudtest fix @ 2019-05-28 14:34:22 UTC
  - a7af3d1 Merge pull request #53138 from frogunder/fix_vultr_cloudtest
  - 9f4550c vultr cloudtest fix
    - 912b9b3 Add the missing, and required, top pillar file.
      - 9d21b75 Merge branch '2019.2.1' into cp-52787

• **PR #53258**: (s0undt3ch) [2019.2.1] Fix multiprocessing logging queue dict changing during iteration errors @ 2019-05-27 19:26:27 UTC
  - d011beb Merge pull request #53258 from s0undt3ch/2019.2.1
  - ad01dd2 More robust minion blackout tests
- a0346d1 Try harder to get the minion grains
- 36717bd Try and address the test flakyness
- ce07d8c Add more information when the assertion fails
- b99e914 Attempt to fix mine tests
- fca981c One more known to return None
- 951df48 One more known to return None
- eb5fd3e Fix integration.modules.test_mine.MineTest.test_get for sub_minion
- 26314f5 Fix multiprocessing logging queue dict changing during iteration errors

• PR #53153: (s0undt3ch) [2019.2.1] Add Amazon Linux 2018.3 and 2 static requirements @ 2019-05-27 12:02:20 UTC
  - b69e080 Merge pull request #53153 from s0undt3ch/2019.2.1
  - 166067c Use currentBuild.resultIsBetterOrEqualTo instead
  - ceffd90 Stop error messages about missing roster file on syndic master
  - 6b8f46 Don't complain when attempting to close sockets at this stage
  - e3f3cc9 Add Amazon Linux 2018.3 and 2 static requirements
  - 872acc0 Switch the ubuntu-14.04 exception with amzn-1
  - PR saltstack/salt#52934: (twangboy) Update msgpack calls for newer msgpack (refs: #53235)

• PR #53235: (s0undt3ch) Revert "Update msgpack calls for newer msgpack" @ 2019-05-24 13:35:20 UTC
  - 14ae6ea Merge pull request #53235 from saltstack/revert-52934-fix_msgpack
  - 3295aea Revert "Update msgpack calls for newer msgpack"

• PR #53131: (s0undt3ch) [2019.2.1] Update to salt-bootstrap v2019.05.20 @ 2019-05-24 07:45:57 UTC
  - 6923a27 Merge pull request #53131 from s0undt3ch/hotfix/update-bootstrap-2019.2.1
  - 4ce4f4 Merge branch '2019.2.1' into hotfix/update-bootstrap-2019.2.1
  - 6751e1e Merge branch '2019.2.1' into hotfix/update-bootstrap-2019.2.1
  - 6988e07 Update to salt-bootstrap v2019.05.20

• PR #52934: (twangboy) Update msgpack calls for newer msgpack (refs: #53242) @ 2019-05-23 23:18:23 UTC
  - a61d2b0 Merge pull request #52934 from twangboy/fix_msgpack
  - f02a12e Merge branch '2019.2.1' into fix_msgpack
  - 7e2cd34 Merge branch '2019.2.1' into fix_msgpack
  - bc9ce8e Merge branch '2019.2.1' into fix_msgpack
  - 0abd1ec Update msgpack calls for newer msgpack
    - 3366d59 update pylint exceptoin
    - 6c452b3 removing unwanted commits from this branch
    - e0b0ba8 Handling in flaky when maximum number of attempts raised and the exception should be raised. Different approaches depending on Py2 vs Py3.
    - 434dcda Disabling two tests when using Python 3 and OS X

30.2. Previous Releases
Disabling integration.shell.test_minion.MinionTest.test_issue_7754 test on OS X because it hangs the test suite.

Dropping the version check for InstallationError down to anything 1.0 or greater. Removing the test that simulates versions of pip below 1.0.

Adding an if statement to only the python parameter if the result from get_python_executable is a valid value. Maintaining backwards compatibility to run tests without Nox.

PR #53192: (twangboy) Skip test_gen_hash test on Windows @ 2019-05-23 05:33:13 UTC
  - 8a57270 Merge pull request #53192 from twangboy/skip_test_gen_hash
  - 758d020 Skip test on Windows

PR #53157: (twangboy) Fix unit.modules.test_win_file.WinFileTestCase.test_issue_52002_check_file_remove_symlink @ 2019-05-22 22:32:26 UTC
  - 446e70c Merge pull request #53157 from twangboy/fix_test_win_file_symlink
  - 5672076 Merge branch '2019.2.1' into fix_test_win_file_symlink

PR #53141: (Ch3LL) Check for all non-word characters when calling secure_password @ 2019-05-22 17:24:54 UTC
  - 6fbe9aa Merge pull request #53141 from Ch3LL/shadow_fed_fix
  - a3c4066 Merge branch '2019.2.1' into shadow_fed_fix

PR #53161: (Ch3LL) Add HAS_REQUIRED_CRYPTO var for m2crypto in joyent @ 2019-05-22 13:36:07 UTC
  - fb29512 Merge pull request #53161 from Ch3LL/joyent_m2crypto
  - 08d03c0 Add HAS_REQUIRED_CRYPTO var for m2crypto in joyent
  - 16ef3d2 Merge branch '2019.2.1' into shadow_fed_fix
  - 09ff867 Check for all non-word when calling secure_password
    - 334c93b Elevate token before creating symlink

PR #53073: (Ch3LL) salt-ssh: python binary exists before version check @ 2019-05-20 22:36:34 UTC
  - 85e9b2f Merge pull request #53073 from Ch3LL/ssh_py3_log
  - 383e781 Improve logging in salt-ssh gen_thin
  - 4371434 salt-ssh: python binary exists before version check

PR #52957: (Ch3LL) Set default_flow_style=None in yaml.dump calls @ 2019-05-16 19:42:35 UTC
  - bd02ea6 Merge pull request #52957 from Ch3LL/yaml_flow_style
  - 5f6581a Merge branch '2019.2.1' into yaml_flow_style

PR #53072: (Ch3LL) Backport #52754 into 2019.2.1 @ 2019-05-16 19:29:22 UTC
  - PR #52754: (garethgreenaway) [2018.3] Fixes to multiprocesssing queue when using MacOS (refs: #53072)
    - f410346 Merge pull request #52754 from Ch3LL/bp-52754-2019.2.1
  - 13e5e55 The maximum for the multiprocessing queue on MacOS is 32767, so if we running on MacOS then we use that maximum.

ISSUE #52817: (waynew) unit.modules.test_telegram.TelegramModuleTest.test_post_message (refs: #52972)

PR #52972: (garethgreenaway) [2019.2.1] Fix to unit.modules.test_telegram @ 2019-05-15 07:50:13 UTC
- 06fa91b Merge pull request #52972 from garethgreenaway/52817_unit_modules_test_telegram_telegrammoduletest_test_post_message
- cea7131 Removing global declaration.
- 5bf9a95 Fixing lint.
- 4d3c46d fixing broken unit.modules.test_telegram test.
- PR #53025: (Ch3LL) Change package name for suse pkg tests @ 2019-05-15 07:41:44 UTC
  - d340cbe Merge pull request #53025 from Ch3LL/suse15_pkg_test
  - 0a213ee Change package name for suse pkg tests
- PR #53020: (Ch3LL) Change ssh tops log message to debug @ 2019-05-14 16:56:42 UTC
  - c56bb0 Merge pull request #53020 from Ch3LL/ssh_tops
  - cbbc764 Merge branch ’2019.2.1’ into ssh_tops
  - ce099aa Merge pull request #52973 from twangboy/fix_test_pip_state
  - 21838a1 Merge branch ’2019.2.1’ into fix_test_pip_state
- PR #52986: (Ch3LL) Revert ”Make sure --run-expensive runtests.py arg works” @ 2019-05-13 19:38:17 UTC
  - 055d374 Merge pull request #52986 from Ch3LL/expensive_revert
  - 368c012 Revert ”Make sure --run-expensive runtests.py arg works”
  - cce263e Merge branch ’2019.2.1’ into fix_test_pip_state
  - 351d415 Return path to Python instead of None
    * c0538d2 Change ssh tops log message to debug
    * e317186 Merge branch ’2019.2.1’ into yaml_flow_style
- PR #52968: (s0undt3ch) [2019.2.1] Salt >= 2018.3.x supports Py3.7 @ 2019-05-12 21:44:57 UTC
  - ee05da5 Merge pull request #52968 from s0undt3ch/2019.2.1
  - 73c3726 Salt >= 2018.3.x supports Py3.7
- ISSUE #50310: (xuhcc) acme.cert falsely reports changes (refs: #50400)
- PR #52796: (Ch3LL) Backport #50400 and #50402 into 2019.2.1 @ 2019-05-10 19:30:12 UTC
  - PR #50402: (xuhcc) Fix typo in salt.modules.acme (refs: #52796)
  - PR #50400: (xuhcc) Fix incorrect change reporting in acme.cert (refs: #50402, #52796)
    - cae51c2 Merge pull request #52796 from Ch3LL/bp-50400
    - 0c2e5e7 Merge branch ’2019.2.1’ into bp-50400
    - 1268e3e Merge branch ’2019.2.1’ into bp-50400
    - 09fa9e3 Fix typo
    - 9be5e0c Fix incorrect change reporting in acme.cert
      * 9a27fb3 Merge branch ’2019.2.1’ into yaml_flow_style
- PR #52770: (twangboy) Fix test_file_managed_should_fall_back_to_binary on Windows @ 2019-05-09 20:35:02 UTC
  - 20cccd8 Merge pull request #52770 from twangboy/fix_test_file
- ac27e69 Merge branch '2019.2.1' into fix_test_file
- 30a5093 Merge branch '2019.2.1' into fix_test_file
- c08b10d Merge branch '2019.2.1' into fix_test_file
- 340ee23 Pass encoding to _validate_str_list
  - 0d0e354 Fix yamldumper test for both py2/py3
  - 20bc954 Update docs for yamldumper test
  - bf648e5 Update tests/unit/utils/test_yamldumper.py
  - 70d578a Set default_flow_style=None in yaml.dump calls

• PR #52943: (Ch3LL) Fix elasticsearch state module: allow user to define empty aliases @ 2019-05-09 15:46:38 UTC
  - 4437764 Merge pull request #52943 from Ch3LL/fix_elasticsearch
  - 451fb7e Merge branch '2019.2.1' into fix_elasticsearch
  - ebff9b9 Fix elasticsearch state module: allow user to define empty aliases

• PR #52952: (stundt3ch) [2019.2.1] More nox changes and test fixes @ 2019-05-09 15:03:07 UTC
  - 9b290b6 Merge pull request #52952 from stundt3ch/merge-forward/2018.3-to-2019.2.1-cherry
  - a06d7ce We need to call the decorator
  - 77185af Partial revert since this is a class method
  - f5c5771 Lint fixes
  - 3e43c87 Revert "fix compare_versions method"
  - 0e139bf Fix GOLDEN_IMAGES_CI_BRANCH value
  - 12a9408 Add Py3.7 static requirements
  - 8e50f5fb Move tests to existing test modules
  - 4681609 tests/unit/config/__init__.py -> tests/unit/config/test_config.py
  - b1dc7f6 Pin to moto<=1.3.7 because of https://github.com/spulec/moto/pull/1952
  - 0ffe7ca We no longer test against Ubuntu 14.04 which reached EOL
  - 33743fc Don't traceback when trying to close a closed socket
  - da2e147 Always cleanup the changed environ
  - 087c74d No globals in tests, specially dictionaries!
  - a814fc0 Fix underscore wart (and linter)
  - 74b8f5f Fix deprecation warning in msgpack >= 0.5.2
  - 962b116 Try to address dict changing during iteration
  - c58af57 Tweak codeclimate settings for less noise
  - 5bb786f fix linter
  - 0b81841 Cherry-pick test fix
  - 99f9e1c fix compare_versions method

• PR #52853: (stundt3ch) [2019.2.1] Bring nox into 2019.2.1 @ 2019-05-09 09:52:42 UTC
- a510edf Merge pull request #52853 from s0undt3ch/merge-forward/2018.3-to-2019.2.1-cherry
- a8f7b46 Test is not destructive.
- 63663cf We no longer test against Ubuntu 14.04 which reached EOL
- 62574ee Typo
- e3e3761 Proper english in requirements comments
- e9f6a12 identical_signature_wrapper adds __wrapped__ to function globals
- 10283b4 Upload coverage reports on full test runs
- 6e0b61b Less flaky mine tests
- 3709ed7 msgpack returns string_types
- a36b15e Add regression test
- ce782ff Fix non raw msg pack msg decoding
- f193f0f Update Issue Template: questions removed
- 4417095 Fix underscore wart (and linter)
- e6c2ae4 Fix deprecation warning in msgpack >= 0.5.2
- 6375944 Add ubuntu1804 to pr tests
- 8fdb04d SIGKILL is not always available use a local variable
- 4d6b8da Fix linter
- 759bccc Fix test_doc on windows by using grep yay!
- 0ce086d Fix remaining failures on ubuntu 1404 and add to PR tests
- fdf80fd Change py3 windows timeout from 6 to 8 hours
- b0aa287 Fix missing class wart
- 21ecb74 fix linter
- 62c0f9f Skip tests when no libcloud
- 1d92290 Fix unused import
- 72dc891 Fix linter
- 7cfc9e8 Fix NOX_ENV_NAME
- 2087c91 Fix NOX_ENV_NAME
- 2f1aff5 Rename kitchen-centos6-py3 to kitchen-centos6-py2
- 1eea990 Fix linter
- 89533ba Fix NOX_ENV_NAME
- 7cfc9e8 Fix NOX_ENV_NAME
- 34ce86c Ignore super not called
- b7ace9c Fix linter

30.2. Previous Releases
- aceb6d3 Skip libcloud unit tests when no libcloud
- f73420b Install mock on Python < 3.6
- 28f8de1 Add moto to the windows dependencies
- 8cbcc1 Pin kubernetes to < 4.0
- 2acb0f3 Make sure --run-expensive runtests.py arg works
- 22c2e0 Remove ref restriciton from kitche-salt
- 67095df Add ‘runFull’ build parameter for PR tests
- 12d8d35 Stop w32time before and start after testing
- 7f1c22c Skip tests that fail on Windows
- f4ae7f5 Upgrade etcd to > 0.4.2
- 381f5fe Limit and reduce the amount of log records sent over the wire
- 0c94b5d More entries to ignore
- c3a21f5 As a script, not as a module
- 8948b69 Include COVERAGE_FILE as an env variable.
- 0af561e Each generated script is now prepared for code coverage
- 294d6f4 Use the system’s path separator
- e52ab87 Always combine and generate the XML coverage report
- 666ca9f Fix proxy minion startup issue on the test suite
- 7838ace impacket does not support Py3
- ba8d0fe Allow --install-only to gather the required information
- eed7d68 Create nox lint virtualenvs before running them
- e9e57cf Syndic roster not in 2017.7.9
- 111c63a4d Create the roster even when not running ssh
- 11c02a0 Fix unit.test_loader.LoaderGlobalsTest.test_states
- 8694db1 Fix windows tests
- 82e9ac5 Avoid race condition in even assertions
- 9443451 Revert part of 927219c since it is not a fix
- 5fee762 Fix timeout logic
- 517650f check timeout when queue empty
- 7c0a9af fix linter
- 961de40 Ignore missing variable in six module
- 0f5a7f0 Fix typo
- 6c8c418 Do not limit event assert to first event
- 3042292 Wait longer for ping reaction
- 8e10f5f Fix xml block causing docs to fail
- 6e5768a Add a nox session for the Jenkins tornado jobs
- 43321e8 Add a cloud nox session for both runtests and pytest
- b6b4e95 Lint cleanup
- 0670614 Add tests for wraps
- 1670b5d Use functools.wraps with decorators
- 5ae263c Update static requirements for 2018.3 branch
- 3482c4d Disable code coverage uploads.
- 0e5bc67 Lint fixes
- 337c737 Update CI jobs to point to 2018.3
- 72e8603 Skip test if required crypto libs are not available
- e6bc9f8 Default to Cryptodome, fallback to PyCrypto
- b2b0764 Be aware of the different path separators
- 7e79b18 We need to make sure the virtualenv path entry is removed when searching
- ff6d3c6 We don't need to be root to run these tests
- 5965ab4 Disable progress bars on pip installs
- 86a44e Use the real python executable path when running within a virtualenv
- 3d407e8 Add a helper to return the path to the real python executable
- ea9d246 We must also provide venv_bin when running within a virtualenv
- 31e91b0 Fix pip tests, in particular under windows
- 493f493 Don't fail if pkg_resources is not importable
- a1eb400 Specify the SHA we need
- 0b01f21 Let's fully unload pip
- 0b6f848 Fix docker entries
- 870b899 Remove unused argument
- 1656cb4 Disable re-running failed tests for now
- 6db4141 Also ignore multiprocessing coverage files
- 83dc97d Actually write the lint reports.
- 5f97270 Try to make sure some pip internal functions are always present in sys.modules after reloads
- 0090c55 Try and address the fact that some python packages are only provided by the distro
- 4a072fe These tests aren't destructive
- 5c7a956 Don't fail the build if the issue was sending a slack notification
- 361ef6e Don't try to change ownership on non existing paths
- 7b17352 More insight(context) on failure reports
- 93b6b95 Lock supervisor to 3.3.5, last known working(passing tests) version
- 51114aa Watch out for too long shebang's
- d97fe82 The output is important to know why it failed.
- 9f6f385 Strings and integers are not comparable under Python 3
- d308dce Be verbose in a CI context
- 8b7105e Fix failed tests re-run logic
- d6d8db1 Blacklist `enum34` on Py>=3.4. Update requirements.
- 1cd00c0 Update PR CI jobs for nox
- 19a83d5 Blacklist pycrypto and install pycryptodome instead
- 91376b3 Ignore the generated docs archive
- 207b83a Update compiled requirements
- 535e7a7 Add TCP transport nox sessions
- 680b3e5 Compile requirements for the TCP transport
- 49a1ebe Throw error when running either on Py<2.7 or Py>=3.7
- 10528b9 Don't repeat filed tests on missing/empty failed test files file
- 4886809 We currently only support running lint under Py2.7
- a76981b Remove dead code
- 7b2c1ce Don't require six
- a27ed35 Add nox env to build docs
- e1b3f1d Lock docs python requirements
- c8de644 Fix lint issues under tests
- 0372718 Fix lint issues on salt
- 9eab9f4 Add nox session/env/target to run lint against Salt and its test suite
- 123f771 Lock lint requirements
- 8df33ad Back to `+apache-libcloud==1.0.0` and skip windows for now
- 43e3ae6 Bump apache-libcloud requirement because 1.0.0 fails to install on windows
- d5f7813 Remove requiremens for platforms which aren't tested under Py3
- 8f02ee9 Recompile requirements
- 66626f2 Remove pycryptodome from compiled requirements files
- 75693e5 Use pycryptodomex on windows and PyCrypto on the rest
- 4a9c19c Update(fix) requirements
- 33a3467 We don't test OSX nor Windows under Py3.4
- fd44fce We want a more verbose pip-compile output
- c2ae2d5 We now compile requirements for each of the supported minor version
- 6ee1260 Static requirements are now placed on `py<major>..<minor>` subdirectories
- 3504804 The required crypto library is pulled in from zeromq.txt or raet.txt
- 3ffe03c PyZMQ is pulled in from zeromq.txt
- 7c2fe16 Instead of quoting session parameters, proxy nox sessions
- d3ae77b Add separate crypto sessions
- 0399620 Parametrize the transport
- d33fd03 Update/Generate static requirements to new layout
- 52ac533 Add pre-commit config to generate static requirements
- 3cfcb13 Be aware of the new static requirements layout
- dc7e16a Don’t lock the docker requirement. It’s not locked on the other platforms
- 5476ba2 Kubernetes 3.0.0 does include the requirements files. pip-compile chokes on that
- 79a8261 Previously generated requirements were py2 only
- 1e29666 IOFLO is pulled in from the raet requirements
- 4945e35 Fix pylint on 2017.7.9
- 036bf68 Rerun failed tests
- 03a9601 Ignore .nox directory
- 50cb630 We have long files
- db2392f Update CodeClimate settings
- 899c80e Fix integration.client.test_kwarg test timeouts

• ISSUE #52836: (Ch3LL) unit.utils.test_args.ArgsTestCase.test_argspec_report failing (refs: #52852)

• PR #52852: (garethgreenaway) [2019.2.1] Fixes to unit.utils.test_args.test_argspec_report @ 2019-05-07 19:25:48 UTC
  - 77355e2 Merge pull request #52852 from garethgreenaway/52836_test_argspec_report_failing
  - eee5a38 Merge branch '2019.2.1' into 52836_test_argspec_report_failing

• PR #52845: (Ch3LL) Backport #52780 into 2019.2.1 @ 2019-05-07 16:27:21 UTC
  - PR #52780: (sbrennan4) Handle ipv6 in _netlink_tool_remote_on (refs: #52845)
  - dcc5fde Merge pull request #52845 from Ch3LL/bp-52780
  - dff09b Merge branch '2019.2.1' into bp-52780

• PR #52851: (Ch3LL) Reload matcher loader when ext_pillar_first set @ 2019-05-07 13:12:07 UTC
  - 2e4f296 Merge pull request #52851 from Ch3LL/matcher_ext_pillar
  - bdca5d Add docs for new reload kwarg
  - fc70884 Reload matcher loader when ext_pillar_first set
  - 8ac74e2 Merge branch '2019.2.1' into bp-52780
  - 226c7ce Merge branch '2019.2.1' into bp-52780
  - c1eae84 Add test
  - 69fe65b Use rsplit
    * 8fde48c Removing create_autospec and having salt.utils.args.argspec_report run against the
      _test_spec function directly. Depending on the python version, create_autospec gives different
      results and cause the test to fail. The test is now more accurate at testing the arguments for the
      function.

• PR #52842: (s0undt3ch) libcrypto.OpenSSL_version_num might be a callable @ 2019-05-06 17:00:37 UTC
  - cc7a0d1 Merge pull request #52842 from s0undt3ch/2019.2.1
  - a944017 libcrypto.OpenSSL_version_num might be a callable
• PR #52839: (twangboy) Add support for EC2 @ 2019-05-04 17:28:54 UTC
  - b625a6a Merge pull request #52839 from twangboy/fix_test_grain
  - 1c9b372 Add support for EC2

• ISSUE #51982: (arsiesys) topic (minion_id) need to be encoded before being hash and sent using zeroMQ (refs: #51983)

• PR #52767: (Ch3LL) [2019.2.1] Add tests to PR #51983 @ 2019-05-03 08:35:27 UTC
  - PR #51983: (arsiesys) encode topic before using hashlib (refs: #52767)
  - 6002939 Merge pull request #52767 from Ch3LL/zmq_filter_test
  - 1ee8f37 Merge branch '2019.2.1' into zmq_filter_test
  - d74b6ee Merge branch '2019.2.1' into zmq_filter_test
  - 3210274 Fix linter warnings
  - e7c9d6e increase timeout when gathering results
  - 784786d Add zmq_filter unit tests
  - 805cSee encode topic before using hashlib

• PR #52827: (twangboy) Add pymssql dependency for Windows builds @ 2019-05-03 08:21:40 UTC
  - 5996932 Merge pull request #52827 from twangboy/add_pymssql
  - 6f0b8e2 Add pymssql dependency for Windows builds

• ISSUE #52717: (Ch3LL) debian9 tests segmentation fault (refs: #52797)

• PR #52797: (garethgreenaway) [2019.2.1] Only run the libcrypto init if less than OpenSSL 1.1.0 @ 2019-05-03 05:12:31 UTC
  - e3918c5 Merge pull request #52797 from garethgreenaway/52717_debian_tests_segmentation_fault
  - 7ab0961 Merge branch '52717_debian_tests_segmentation_fault' of github.com:garethgreenaway/salt into 52717_debian_tests_segmentation_fault
    * f8d816e Merge branch '2019.2.1' into 52717_debian_tests_segmentation_fault

• PR #52771: (twangboy) Fix test_gpg tests on Windows @ 2019-05-02 13:30:18 UTC
  - b68544f Merge pull request #52771 from twangboy/fix_test_gpg
  - c7f45c2 Pass encoding to stringutils.to_unicode

• PR #52783: (Ch3LL) Fix boto_apigateway tests for PyYAML 5.1 @ 2019-05-02 13:26:34 UTC
  - 316d05b Merge pull request #52783 from Ch3LL/fix_boto_yaml
  - cde29cb Fix boto_apigateway tests for PyYAML 5.1
  - 6ffba5 Fixing lint.
  - e24f2f8 Only run the libcrypto init if less than OpenSSL 1.1.0.

• PR #52769: (twangboy) Remove domain grain from tests for Windows @ 2019-04-30 21:14:26 UTC
  - 3509465 Merge pull request #52769 from twangboy/fix_test_core
  - 0049f85 Remove domain grain from tests

• PR #52768: (twangboy) Remove pchanges… again… @ 2019-04-30 20:24:27 UTC
  - 30dc14b Merge pull request #52768 from twangboy/fix_test_win_dacl
- 123b607 Remove pchanges... again...

- **PR #52753**: (twangboy) Skip test_gen_thin_compression_fallback_py3 @ 2019-04-30 03:36:27 UTC
  - 3e46f51 Merge pull request #52753 from twangboy/skip_test_gen_thin
  - 811b381 Skip test_gen_thin_compression_fallback_py3

- **ISSUE #52721**: (Ch3LL) unit.cloud.clouds.test_ec2 test failing (refs: #52736)

- **PR #52736**: (dwoz) Skip password decryption test when no libraries available @ 2019-04-29 17:07:56 UTC
  - 6bfc9a4 Merge pull request #52736 from dwoz/ec2test
  - 04ad027 Merge branch '2019.2.1' into ec2test

- **PR #52624**: (tanlingyun2005) fix TypeError: argument of type int is not iterable @ 2019-04-29 13:15:42 UTC
  - 9a1ed78 Merge pull request #52624 from tanlingyun2005/2019.2.1
  - 2c6867e add test case to tests/unit/cli/test_batch.py
  - cb7742e Merge branch '2019.2.1' into 2019.2.1
  - c943900 Merge branch '2019.2.1' into 2019.2.1
  - d4abddd fix TypeError: argument of type int is not iterable
  - ed908b3 Merge branch '2019.2.1' into 2019.2.1
  - 463b60e Merge branch '2019.2.1' into 2019.2.1
  - 65ee219 Merge branch '2019.2.1' of https://github.com/tanlingyun2005/salt into 2019.2.1
    * f71168d Merge branch '2019.2.1' into 2019.2.1
  - 509c797 bug fix salt/cli/batch.py
  - 211915c fix salt/cli/batch.py TypeError: argument of type int is not iterable
  - 070ae84 fix TypeError: argument of type int is not iterable
    * b770f96 Skip test requiring crypto when none available
    * e52b390 Warn when password decryption requested but not possible

- **PR #52696**: (Ch3LL) Backport #50087 into 2019.2.1 @ 2019-04-25 20:33:13 UTC
  - PR #50087: (rbthomp) Fix applying of attributes for returner rawfile_json (refs: #52696)
  - 806307a Merge pull request #52696 from Ch3LL/bp-50087
  - 66e97e7 Fix applying of attributes for returner rawfile_json

- **PR #52659**: (twangboy) Fix issues with the win_file tests @ 2019-04-22 23:34:36 UTC
  - 174f558 Merge pull request #52659 from twangboy/fix_test_win_file
  - 915c780 Fix issues with the win_file tests

- **PR #52655**: (dwoz) Parse chattr version and fix test case @ 2019-04-22 01:46:29 UTC
  - d1a61a6 Merge pull request #52655 from dwoz/cron_test_fix
  - e69fccc Fix typo
  - 859d088 Merge remote-tracking branch 'origin/cron_test_fix' into cron_test_fix
    * 7f7bb90 Merge branch '2019.2.1' into cron_test_fix

- **PR #52601**: (Ch3LL) Cherry-Pick #52415 into 2019.2.1 @ 2019-04-21 19:33:03 UTC
- PR #52415: (Ch3LL) Backport #49832 into 2018.3 (refs: #52601)
- PR #49832: (terminalmage) Replace pchanges with changes to make onchanges/prereq work in test mode (refs: #52415)
- f7d823c Merge pull request #52601 from Ch3LL/cp-52415
- ecd6802 Merge branch '2019.2.1' into cp-52415
- 538d5cf Remove pchanges from win_dacl
- 81b865f use same newfile message on linux for windows file state
- 93bdd08 Update dict correctly in file state
- f3c7f27 remove pchanges for windows file modules
- fb3b75d Fix tests for changes backport into 2018.3
- 0f296bb Update kernelpkg test to reflect pchanges removal
- 885d0ff Update file.touch unit tests to reflect addition of changes in test mode
- 4bc5fd0 Add integration tests for test mode onchanges/prereq
- ed214c4 Make it possible to use prereq with test and saltmod state mods
- ceb3f4d Add repack_state_returns to TestCase
- 982e93 Add exception logging in flaky decorator
- 0ba0df0 Add test mode changes to file.touch state
- 6db2beb Replace "pchanges" with "changes" to fix onchanges/prereq requisites
  * 169c2d5 Chattr version py3 fix
  * cf88c27 Fix linter issues
  * 0ea007d Parse chattr version and fix test case

- ISSUE #52508: (Ch3LL) integration.modules.test_publish test failures (refs: #52645)
- PR #52645: (dwoz) Fix salt.modules.publish and salt.states.x509 tests @ 2019-04-20 08:17:19 UTC
  - af4f204 Merge pull request #52645 from dwoz/test_fixes
  - 9b6f9f9 Clean up cruft
  - c3971a5 Fix salt.modules.publish and salt.states.x509 tests
- PR #52629: (dwoz) Fix event assertion race condition @ 2019-04-19 19:03:20 UTC
  - PR #52540: (dwoz) Fix race condition in event assertion (refs: #52629)
  - 0a4d2d9 Merge pull request #52629 from dwoz/ping_wait_2019.2.1
  - c001022 Fix linter
  - 423f6f9 Fix vent assertion race condition
- PR #52619: (dwoz) Remove unused method from pytest engine @ 2019-04-18 23:45:35 UTC
  - 4859e6c Merge pull request #52619 from dwoz/pytest_engine_2019.2.1
  - 105784a Remove unused method from pytest engine
- PR #52614: (Ch3LL) [2019.2.1] Update integration.modules.test_network.NetworkTest.test_network_ping... @ 2019-04-18 21:54:28 UTC
  - 77943e5 Merge pull request #52614 from Ch3LL/cp-test_network-2019.2.1
- `27c79d2` Update integration.modules.test_network.NetworkTest.test_network_ping test address

- **ISSUE #32245:** (tkwilliams) git_pillar should permit automatic mapping of environment to branch a-la gitfs (refs: #50768)

- **PR #52615:** (twangboy) Bring 51661 into 2019.2.1 @ 2019-04-18 21:53:35 UTC
  - **PR #51661:** (sathieu) git_pillar: Fix all_saltenvs on base env (refs: #52615)
  - **PR #51597:** (sathieu) git_pillar: Fix all_saltenvs on base env (refs: #51661)
  - **PR #50768:** (sathieu) git_pillar: Add support for all_saltenvs parameter (refs: #51597, #51661)
  - c6b4986 Merge pull request #52615 from twangboy/gitfs_2019.2.1
  - d952674 Merge branch '2019.2.1' into gitfs_2019.2.1

- **ISSUE #52547:** (cbosdo) virt.purge throws a libvirt exception on Xen hypervisor (refs: #52548)

- **PR #52548:** (cbosdo) Virt purge fix @ 2019-04-18 20:07:36 UTC
  - 8ee15a9 Merge pull request #52548 from cbosdo/virt-purge-fix
  - 6ca8f6b Try/except undefineFlags() as this operation is not supported on bhyve
    - 5a0464b Bring 51661 into 2019.2.1

- **PR #52591:** (Ch3LL) [2019.2.1] Update test_schema to mirror the new ValidationErrors in 3.0.0 @ 2019-04-18 16:34:22 UTC
  - e03aed5 Merge pull request #52591 from Ch3LL/fix_jsonschema_2019.2
  - e09be842 Update test_schema to mirror the new ValidationErrors in 3.0.0

- **ISSUE #52525:** (lomeroe) deserializer_opts are not passed the serializer in file.serialize (refs: #52526)

- **PR #52526:** (lomeroe) Fix use of deserializer_opts in file.serialize @ 2019-04-17 14:08:52 UTC
  - 21d6365 Merge pull request #52526 from lomeroe/deserializer_opts_fix
  - ea0520c update test for serialization opts
  - 84ff03a Correct attempting to use the serializer_name to pull deserializer_opts when deserializer_name is used as the key in the deserializer_options dict.

- **ISSUE #49147:** (furgerf) Log filled with "Exception occurred while Subscriber handling stream: Already reading" (refs: #51963)

- **PR #52570:** (DmitryKuzmenko) Simplify IPCClient and prevent corrupt messages (Turn 2) 2019.2 @ 2019-04-17 14:03:02 UTC
  - **PR #52564:** (DmitryKuzmenko) Simplify IPCClient and prevent corrupt messages (Turn 2) (refs: #52570)
  - **PR #52445:** (dwoz) Simplify IPCClient and prevent corrupt messages (refs: #52564)
  - **PR #51963:** (DmitryKuzmenko) Allow multiple instances of IPCMessageSubscriber in one process (refs: #52564)
  - e522ffe Merge pull request #52570 from DSRCorporation/bugs/revert_51963_2019.2
  - fabbcac A couple of race conditions fixes and a test update.
  - 9c85734 Drop singleton from IPCClient
  - 7cf6d54 Revert "Support parallel work of multiple IPCMessageSubscribers in one process"
  - 7f26e76 Revert "Update doc conf with the new import tornado.queues"
  - 69e9416 Revert "Minor: Fix typo in docstring"
• ISSUE #52449: (Ch3LL) integration.cloud.clouds.test_gce.GCETest.test_instance_extra failure (refs: #52551)
  • PR #52551: (garethgreenaway) [2019.2] Marking the two tests in test_gce as flaky @ 2019-04-17 14:00:39 UTC
    - b173406 Merge pull request #52551 from garethgreenaway/52449_test_gce_random_failures
    - 28af717 Marking the two tests in test_gce as flaky.
• ISSUE #51842: (mattLLVW) salt.auth.django docs use wrong model name (refs: #52553)
  • PR #52553: (mattLLVW) fix: #51842 @ 2019-04-17 13:59:45 UTC
    - 8352362 Merge pull request #52553 from mattLLVW/fix_django_auth_docs
    - 3baedf fix: #51842
• ISSUE #52134: (sploenix) Regression: Include list of pillar files under different keys in 2019.2 (refs: #52490)
• ISSUE #22063: (jeanpralo) Wildcard inside top.sls file for pillar (refs: #52490)
  • PR #52490: (dwoz) Fix pillar include regression @ 2019-04-17 13:54:39 UTC
    - 9faa49c Merge pull request #52490 from dwoz/issue_52134
    - 876dd18 Fix merge wart
    - 2ed650b Merge remote-tracking branch 'saltstack/2019.2' into issue_52134
    - b0af11f Run include tests when pillar source changes
    - 307cec6 Fix pillar tests
    - 1a33bde import __future__.absolute_import
    - 5dc5de9 Use file encoding and add docstring
    - e84cd41 Fix pillar include wart
    - c79f496 Add pillar include tests
    - 7745242 Revert "Fix #22063: pillar wildcard support include"
• PR #52552: (twangboy) Bring 52170 into 2019.2 @ 2019-04-17 13:54:17 UTC
  • PR #52170: (twangboy) Fix issue when task doesn't have delay_random defined (refs: #52552)
    - b0c0237 Merge pull request #52552 from twangboy/fix_win_task_2019.2
    - fd19cca Remove some warts in the docs
    - deb0b10 Fix some lint
    - a279d45 Final doc fixes
    - 58f0cd2 Fix docs... attempt 6
    - a66716e Fix docs... attempt 5
    - f6f3381 Fix docs... attempt 4
    - 18fc15 Fix docs... attempt 3
    - c691e0d More doc fixes
    - e01077b Fix docs issue... maybe...
    - b649495 Honor 80 character line limit
    - eba4507 Bring 52170 into 2019.2
• PR #52528: (Ch3LL) [2019.2] Merge forward from 2018.3 to 2019.2 @ 2019-04-17 13:53:46 UTC
- cc0cd5d Merge pull request #52528 from Ch3LL/merge-2019.2
- 87cf385 increase timeout on test_state for windows
- 3442202 Increase timeout for test_kwarg tests
- 2c3f2f Merge branch '2019.2' into merge-2019.2

**PR #52534:** (twangboy) Add TLS support up to TLS 1.2 @ 2019-04-13 22:56:41 UTC
- e91240b Merge pull request #52534 from twangboy/tls_support_2019.2
- 9ec54c4 Add TLS support up to TLS 1.2
  - 474efa1 Fix pylint and state test failure
  - 048a82e Merge branch '2019.2’ into merge-2019.2

**PR #52536:** (twangboy) Bring #52191 into 2019.2 branch @ 2019-04-12 21:31:23 UTC
- 795a7f6 Fix windows tests - increase timeout
- c70772c Fix linux state tests- add new comment
- 2941567 Merge branch '2018.3' into '2019.2'
- 262516c Merge pull request #52209 from twangboy/fix_choco_retcode
  - 7a4408c Merge branch '2018.3’ into fix_choco_retcode
- b394d50 Handle new enhanced retcode 2
- dd7a4ba Merge pull request #52046 from twangboy/use_reg_timezone
  - 3b4f870 Merge branch '2018.3’ into use_reg_timezone
  - 59ba1d9a Revert back to using reg to get timezone
- 57e478c Merge pull request #52396 from dmurphy18/fix_aix_ssh
  - 8b9a240 Correct typo
- 6d98577 Altered code to support salt-ssh on AIX
- 576478e Merge pull request #52473 from Ch3LL/bp-49437
  - 781385f Merge branch '2018.3’ into bp-49437
  - 3a3114d Fix merge conflict wart
  - bbfd412 Merge branch '2018.3’ into bp-49437
  - 48ee82d Merge branch '2018.3’ into bp-49437
  - f66d474 Add support to avoid calling refresh_db in opkg.del_repo
- d830bc6 Merge pull request #52493 from dwoz/ping_reaction_test
  - 8b05e77 Merge branch '2018.3' into ping_reaction_test
  - 7083d21 Merge branch '2018.3' into ping_reaction_test
  - 7c963c1 Merge branch '2018.3' into ping_reaction_test
  - 75dde3 fix linter
  - e3e1d2f fix reactor ping test
- 9b7a0d1 Merge pull request #52505 from bloomberg/2018_zmq_uri
  - b682ec5 transport.zmq: fix bug introduced by b7df7e75cf2
- 452b2eb Merge pull request #52512 from dwoz/supervisord_2018.3
  - cd5cd7d The exit code matters.
- 53228ae Merge pull request #52475 from Ch3LL/bp-49464
  - a891fd3 Make opkg.del_repo be compatible with pkrepo state module
- 6e79e24 Merge pull request #52500 from terminalmage/invalid-archive-source
  - e9d175b Fix traceback when invalid source passed to archive.extracted
- 2df74ca Merge pull request #52476 from bloomberg/win_cmd_2018
  - 0e0c42e 2018 backport: modules.cmdmod: handle windows environ better
- 4dfb2f8 Merge pull request #52474 from Ch3LL/bp-49984
  - c8d547e Use prune option in PyGit2 provider when fetching
- d699485 Merge pull request #52393 from waynew/52087-mine-delete-test-enhancements
  - e3f5be3 Use uncommon item in mine delete test
- 89bd258 Merge pull request #52445 from dwoz/ipc_fixes_2018.3
  - 1bdaf29 Ensure exceptions in service future are handled
  - c7ad732 Use six.reraise for py3 compatibility
  - 29999b0 Close message service on subscriber close
  - 47203f7 Fix ipc unit tests
  - 2b35437 Fix linter issues
  - 503cdd2 Remove IPCClient singleton
  - f2aebf9 Assume file contents are binary

• ISSUE #51879: (whytwolf) 2019.2.0 binary pillar unicode error returns. (refs: #52334)
• PR #52334: (waynew) 51879 fix binary pillar return error @ 2019-04-12 03:45:17 UTC
  - 6eb2bce Merge pull request #52334 from waynew/51879-fix-binary-pillar-return-error
  - ead856e Merge branch '2019.2' into 51879-fix-binary-pillar-return-error
  - 2aa971d lint cleanup
  - 28e2945 keep_pillar not needed
  - fb010c0 Add binary pillar to the docs
  - f2aebf9 Assume file contents are binary
- 2b8c782 Test gpg render with replace newlines
- c4b385b Allow binary pillar data
- 604b671 Return binary data from gpg renderer
- 32aafab Ignore vscode and fix swap ignore

- **ISSUE #52041:** (arsiesys) 2019.2 influxdb_retention_policy.present broken when used extra arguments (refs: #52043)

- **PR #52043:** (arsiesys) fix missing client_args in influxdb module @ 2019-04-12 03:43:03 UTC
  - 2d59705 Merge pull request #52043 from arsiesys/fix_influxdb_state_rp
  - e617ce5b Merge branch '2019.2' into fix_influxdb_state_rp
  - 7661860 fix missing client_args in influxdb module

- **PR #52146:** (twangboy) Add missing symlink test @ 2019-04-12 00:51:16 UTC
  - 1b969c3 Merge pull request #52146 from twangboy/fix_test_symlink_2019.2
  - 8e1c882 Merge branch '2019.2' into fix_test_symlink_2019.2
  - a429542 Merge branch '2019.2' into fix_test_symlink_2019.2
  - 401c253 Merge branch '2019.2' into fix_test_symlink_2019.2
  - cce6200 Fixing lint
  - c7cb009 Merge branch '2019.2' into fix_test_symlink_2019.2
  - 3eae05a Merge branch '2019.2' into fix_test_symlink_2019.2
  - 83bed46 Add missing symlink test

- **PR #52341:** (cbosdo) virt.pool_running: fix pool start @ 2019-04-12 00:14:52 UTC
  - 7a1b8ca Merge pull request #52341 from cbosdo/virt-state-fixes
  - 89f0bd8 Merge branch '2019.2' into virt-state-fixes
  - 25b9681 virt.pool_running: fix pool start
  - 30981d2 Remove unneeded kwargs in virt states
  - 0871e02 virt: allow defining the VM type and arch when creating it
  - 1c65d25 Updating running domains in virt.running
  - 13d7819 Add missing virt states unit tests
  - 0681d86 virt.running support for all virt.init options
  - c6a444b Add test case for virt.running
  - 2db7a98 Let virt running state provide errors

- **ISSUE #52350:** (Ch3LL) Re-Add Python 2 unicode string literals in YAML renderer (refs: #52427)

- **PR #52427:** (garethgreenaway) [2019.2] Support for old yaml render @ 2019-04-12 00:06:37 UTC
  - 6040282 Merge pull request #52427 from garethgreenaway/52350_read_and_gate_unicode_string_literal_support
  - 82f010a Merge branch '2019.2' into 52350_read_and_gate_unicode_string_literal_support
  - ae81ffe Merge branch '2019.2' into 52350_read_and_gate_unicode_string_literal_support
  - b618d44 Merge branch '2019.2' into 52350_read_and_gate_unicode_string_literal_support
1950 Chapter 30. Release Notes

- b191bc0 Merge branch ‘2019.2’ into 52350_readd_and_gate_unicode_string_literal_support
- 38a9818 Merge branch ‘2019.2’ into 52350_readd_and_gate_unicode_string_literal_support
- 2767984 Removing logging entry
- 71cd303 Adding missing yamloader_old.py
- f848aa4 Adding support back in with, a gated configuration option, for the old YAML Loader.

• ISSUE #51865: (magenbrot) salt.match.search_by resulting in 'None' since 2019.2 (refs: #52234)
  - PR #52234: (garethgreenaway) [2019.2] Fixes to matchers when used in pillar @ 2019-04-12 00:05:48 UTC
  - 05ba7c5 Merge pull request #52234 from garethgreenaway/51865_match_search_by_master
  - 1760245 Merge branch ‘2019.2’ into 51865_match_search_by_master
  - d50f111 Merge branch ‘2019.2’ into 51865_match_search_by_master
  - b0cbb60 Merge branch ‘2019.2’ into 51865_match_search_by_master
  - 799a08b Merge branch ‘2019.2’ into 51865_match_search_by_master
  - 21891d6 Merge branch ‘2019.2’ into 51865_match_search_by_master
  - a2173d7 Fixing a typo where attempting to get a list from __opts__ instead of an individual item
  - 6a5b5b2 swapping out if...else approach for __opts__.get approach.
  - aa2c626 With the change/addition of the matcher subsystem in 2019.2, the match.search_by when used in pillar broke when targeting the minion that was also the salt master. This was caused by the id in __opts__ being used in all cases. This change updates the glob_match function to use the preserved minion_id of the master if it is available so that targeting works as expected.

• PR #52160: (cbosdo) Virt whitespace fix @ 2019-04-12 00:04:25 UTC
  - 80d7aea Merge pull request #52160 from cbosdo/virt-whitespace-fix
  - fd1f539 Merge branch ‘2019.2’ intovirt-whitespace-fix
  - b297e7d virt: handle whitespaces in VM names

• ISSUE #51832: (nocturo) pillar include stopped working (refs: #52008)

• PR #52008: (waynew) Allow / in pillar includes @ 2019-04-12 00:02:40 UTC
  - b551bbd Merge pull request #52008 from waynew/51832-re-allow-slash-includes
  - ee3115f Allow leading dots and / as pillar separators
  - 29c676d Ensure _closing exists
  - eb517e1 Swap ‘/’ for ‘:’ when matching

• ISSUE #51821: (OrangeDog) 'comment' is an invalid keyword argument for 'test.fail_without_changes' (refs: #51937)

• PR #51937: (garethgreenaway) [2019.2] Fix to test state functions to allow arguments that mod_watch uses @ 2019-04-11 23:57:44 UTC
  - d3159cb Merge pull request #51937 from garethgreenaway/51821_ensure_result_comment_changes_valid_arguments
  - 866c65b5 Merge branch ‘2019.2’ into 51821_ensure_result_comment_changes_valid_arguments
  - 0966d61 Merge branch ‘2019.2’ into 51821_ensure_result_comment_changes_valid_arguments
  - 5527dff Ensure the comment, changes, and result are valid arguments for various test state functions as they are valid arguments for mod_watch.
• ISSUE #51818: (syphernl) salt.nacl.dec: expected str, bytearray, or unicode (refs: #51913)

    * 008cf49 Merge branch '2018.3' into bugs/49147_ipc_subscriber
    * 01e9a3d Merge branch '2018.3' into bugs/49147_ipc_subscriber
710ab50 Support parallel work of multiple IPCMessageSubscribers in one process
- 87bb513 Fix failing symlink test (#52145)
- 8255901 document `regex_replace` Jinja filter (#52326)
- 3211397 Merge pull request #52310 from garethgreenaway/merge-2018.3
  - 9324b83 Merge branch '2018.3' into merge-2018.3
- 71e9b66 Merge pull request #52312 from terminal-labs/zone-clarification
  - ae0e18f Merge branch '2018.3' into zone-clarification
- e8c8dba Added in an explanation of the `--zone` flag approved in #52251
  - 4908ed3 Merge branch '2017.7' into merge-2018.3
  - b6a0161 Merge remote-tracking branch 'upstream/2017.7.9' into 2017.7
  - 1f99e28 Let's not include raet by default
  - 4306779 Merge branch '2017.7.9' into 2017.7
  - 36ed50d Lock to unittest-xml-reporting 2.2.1
  - 3e6cb79 Merge branch '2017.7.9' into 2017.7
  - 57348ca Add static requirements for Arch linux
  - cc6fb46 Additionally ignore files in nox virtualenvs and CI artifacts directories
  - bf9c55e Previously have setuptools-git installed if ioflo is to be installed
  - 973e1ca Merge remote-tracking branch 'upstream/2017.7.9' into 2017.7
  - 981335a Revert "Avoid a traceback on tornado.testing test classes"
  - f48ba6a Merge remote-tracking branch 'upstream/2017.7.9' into 2017.7
  - b039cee Windows now has a static requirements file and no longer needs hacks
  - a86af2b Merge pull request #52226 from dwoz/jenkins_build
  - 8c0f46b Use windows state to bootstrap windows builds
  - 7263956 Lock coverage and xml-unittest-reporting versions
  - dce44fa Avoid a traceback on tornado.testing test classes

- PR #52314: (twangboy) Add the ability to pass a timeout to beacons @ 2019-03-27 19:11:13 UTC
  - d3f4c9d Merge pull request #52314 from twangboy/fix_beacon_tests
  - a5fa99a Add missing **kwargs
  - 7e88d04 Add the ability to pass a timeout to beacons

- PR #52311: (garethgreenaway) [2019.2] Merge forward from 2018.3 to 2019.2 @ 2019-03-26 18:31:32 UTC
  - bad4e47 Merge pull request #52311 from garethgreenaway/merge-2019.2
  - 11ed485 Merge branch '2018.3' into merge-2019.2
  - 582d306 Merge pull request #52307 from Akm0d/doc_fix
    - 4da0fd6 Fix x509 inconsistent file name in state example
  - 2c8f8e Merge pull request #52276 from terminal-labs/replace-github-dead-link
    - a2fbb2c Merge branch '2018.3' into replace-github-dead-link

30.2. Previous Releases
Chapter 30. Release Notes

- 8fa0e51 Merge pull request #52290 from Akm0d/doc_fix
  * ca00e4b Merge branch '2018.3' of github.com:saltstack/salt into doc_fix
  * 8e1ec15 Add missing master/minion docs for log_rotate*
    - 08728cf Merge branch '2018.3' into replace-github-dead-link
- d2fd84f Merge pull request #51724 from clinta/docker-create-with-ip
  * c933663 Merge branch '2018.3' into docker-create-with-ip
- 838a7aa Merge pull request #51753 from terminal-labs/docs-sphinx-ref-deadlink-fix
  * f2b6abd Merge branch '2018.3' into docs-sphinx-ref-deadlink-fix
  * 9857f53 Merge branch '2018.3' into docs-sphinx-ref-deadlink-fix
  * 8a11d27 Merge branch '2018.3' into docs-sphinx-ref-deadlink-fix
  * 842ec84 Merge branch '2018.3' into docs-sphinx-ref-deadlink-fix
  * 9275207 Merge branch '2017.7' into docs-sphinx-ref-deadlink-fix
    - 2330c2a makefile had an old sphinx-doc link, updated to new general front page of sphinx docs.
    - 8d70e3b Replaced all bad sphinx links with ones from the new sphinx doc site.
    - ebdfb0d replaced two python sphinx deadlinks with sphinx new relevant documentation pages.
      - a4e3e34 Merge branch '2018.3' into docker-create-with-ip
- eb9ec0 Merge pull request #52215 from garethgreenaway/bp-52212
  * 65857ef Merge branch '2018.3' into bp-52212
  * a96bf24 Back-port PR #52212 to 2018.3
    - 5ce553c add networking_config to container_create for custom network_mode
    - 5c99dbd add test to expose ip not added to custom network #51723
- 679c4b2 Merge pull request #52269 from garethgreenaway/merge-2018.3
  * ee58560 Merge branch '2018.3' into merge-2018.3
- 418e543 Merge pull request #52261 from dwoz/update_kitchen
  * a87c6ea Use windows state to bootstrap windows builds
  * 1aa1bd8 Merge branch '2017.7' into merge-2018.3
  * 2962e94 Lock coverage and xml-unittest-reporting versions
  * 595303b Merge remote-tracking branch 'upstream/2017.7.9' into 2017.7
    - 55e150c Proper setup and teardown
    - b9b6009 Don't run distro on windows
    - 3cb5c82 Merge pull request #52208 from s0undt3ch/2017.7.9
  * b14db9c Merge branch '2017.7.9' into 2017.7
    - 6a78941 Update static requirements
    - cee9480 Lock PyYAML to < 5.1
    - a4f241d The kitchen nox verifier already takes care of the single -v flag.
    - 0cb641e Fix static requirements search bad logic
- 45a3e4a distro reports Opensuse 15 as Opensuse Leap 15
- de7bb24 Ubuntu 18.04 locked requirements files
- bc08e3c Ubuntu 16.04 locked requirements files
- 0d353d2 Ubuntu 14.04 locked requirements files
- 1186122 Opensuse 42 locked requirements files
- fa6888b Opensuse 15 locked requirements files
- b6578b8 Fedora 29 locked requirements files
- 777dbb0 Fedora 28 locked requirements files
- 4388fa9 Debian 9 locked requirements files
- 2f9030f Debian 8 locked requirements files
- 1b18ec5 CentOS 7 locked requirements files
- 6e9f0c0 CentOS 6 locked requirements
- 7415846 Start handling static(and platform specific) requirements files
- ea4d370 Allow overriding some requirements based on distro information
- 17017a1 Merge pull request #51361 from olipovch/cloud-sync-after-install
- 8fde3a0 Merge branch '2017.7' into cloud-sync-after-install
- ab00151 Fix salt-cloud sync_after_install functionality
  - ff54f53 The kitchen nox verifier already takes care of the sinlge -v flag.
  - a2aa708 Fix static requirements search bad logic
  - 621b047 distro reports Opensuse 15 as Opensuse Leap 15
  - bc00a26 Ubuntu 18.04 locked requirements files
  - d5ed9e1 Ubuntu 16.04 locked requirements files
  - 03879bf Ubuntu 14.04 locked requirements files
  - c3d7a18 Opensuse 42 locked requirements files
  - b29d986 Opensuse 15 locked requirements files
  - 73154d0 Fedora 29 locked requirements files
  - bf36cd4 Fedora 28 locked requirements files
  - 52cc5bb Debian 9 locked requirements files
  - cb4a823 Debian 8 locked requirements files
  - 2128a79 CentOS 7 locked requirements files
  - 4a29e93 CentOS 6 locked requirements
  - 0d96e64 Start handling static(and platform specific) requirements files
- 0fc82bd Merge pull request #52193 from Ch3LL/bp-47005
  - 1a54fd1 Merge branch '2018.3' into bp-47005
- 0f3cd2a Merge pull request #52194 from Ch3LL/bp-52149
  - bff3f3c Merge branch '2018.3' into bp-52149

30.2. Previous Releases
- 7e459a1 example names parameter in file.managed state
  - f68caa6 Merge branch '2018.3' into bp-47005
- 85be178 Merge pull request #52201 from max-arnold/rename-beacon-validate
  - e1e9a2b Merge branch '2018.3' into rename-beacon-validate
- 0383ac3 Merge pull request #52189 from Ch3LL/merge-2018.3
  - 9972980 Merge branch '2018.3' into merge-2018.3
  - 79962ab Merge branch '2017.7' into '2018.3'
    - fd6068e Allow overriding some requirements based on distro information
    - 659ec11 Merge remote-tracking branch 'upstream/2017.7.9' into 2017.7
    - 18bbbec We need to nest require req_win.txt
    - 956a84c Merge pull request #51995 from s0undt3ch/2017.7
    - 0bf9d62 Merge remote-tracking branch 'upstream/2017.7.9' into 2017.7
    - ba6fd9 Merge pull request #51974 from s0undt3ch/features/nox-2017.7
    - ee4df3a Lint fixes
    - 56f841f Windows needs special treatment
    - c3cb447 Requirements fixes
    - 6a67531 We need a fixed winrm-fs so that dotfiles are also included
    - 15c6a53 use kitchen-salt from my fork for now
    - b745332 Merge pull request #51800 from dwoz/typo_fix
    - 5bbe5e0 Fix up docstring
    - 9f3c583 Fix typo in docstring
    - 75accce1 Rename obsolete beacon validation function
    - d1700f3 Merge branch '2018.3' into bp-47005
- 03f228d Merge pull request #52112 from Ch3LL/proxy_gs
  - 7ad4758 Update device names in proxy getting started docs
    - 25ae7c8 remove freebsd-upstream reference
    - b70c45c Remove salt FreeBSD repo which is now 2 years out of date
    - 62e5404 github issue tracker link and sends you to the url for listed issues.
    - cc6a506 Replaced a dead link for github issue tracker with another github link for the issue tracker and added a link to show more options for closing issues in commit messages.

- PR #52190: (Ch3LL) [2019.2] Merge forward from 2018.3 to 2019.2 @ 2019-03-23 01:09:33 UTC
  - 3ac6dbd Merge pull request #52190 from Ch3LL/merge-2019.2
  - 68c02b9 Merge branch '2019.2' into merge-2019.2
- PR #52240: (soer7022) Fix Typos "swtich" to "switch" @ 2019-03-23 00:08:50 UTC
  - f5fc807 Merge pull request #52240 from soer7022/patch-2
  - d130832 Merge branch '2019.2' into patch-2
- 3b6fd8 Merge branch '2019.2' into patch-2
- 5db7a3f Fix Typos "swtich" to "switch"
  * 34d601e Merge branch '2019.2' into merge-2019.2

- **ISSUE #52036:** (ghost) rsync.synchronized: "An exception occurred in this state: 'Changes' should be a dictionary." (refs: #52040)
- **PR #52040:** (garethgreenaway) [2019.2] Fix to rsync state @ 2019-03-21 19:08:19 UTC
  - a00245e Merge pull request #52040 from garethgreenaway/52036_rsync_state_no_changes_when_error
  - 09d1672 Merge branch '2019.2' into 52036_rsync_state_no_changes_when_error

    * b217f94 Merge branch '2018.3' into py3_doc
    * 605bfaf Update futures dependency for python2 only
    * 072cd84 Update supported python versions in installation docs
  * 892cdae Merge pull request #52038 from terminalmage/docs
- 4d82146 Minor documentation tweak for file.replace state
- a7a9754 Merge pull request #51896 from twangboy/win_disks
  - 057d415 Merge branch '2018.3' into win_disks
  - 0d419e3 Fix some lint
  - aa61dab Add tests
  - 9f6ec53 Add all attached drives to the disks grain
- 48d298c Merge pull request #51918 from twangboy/fix_compat
  - a791901 Fix compat, add tests
  - 2837bb9 Fix _compat for py3
- 02328a6 Merge pull request #52030 from Ch3LL/bp-52004
  - b4e3183 Fixed comparison of None with constants
- aa82fcc Merge pull request #52029 from Ch3LL/bp-52003
  - fcac9f3 Skip Test on Non-Windows systems
  - f42d17d Derive from LoaderModuleMockMixin
  - 5052017 Define __opts__ dict
  - b7b571e Define __opts__ dict
  - ee3ad08 Define __opts__ dict
  - 64d8451 Use default file module
  - 886ef19 Fix name of makedirs_method
  - 4cc5f77 Check for path to be a symlink
- 5ff1725 Merge pull request #52028 from Ch3LL/bp-50384
  - 6493eb0 Fix issue #50381
  - f2b4ec8 Don't log debug messages during close
- 7ab1281 Merge pull request #51936 from gtmanfred/2018.3
  - faa3471 Merge branch '2018.3' into 2018.3
- 2ebfa22 Merge pull request #51967 from twangboy/add_compat_tests
  - 2056578 Merge branch '2018.3' into add_compat_tests
  - e85f004 Merge branch '2018.3' into add_compat_tests
  - ea69062 Fix lint
  - eb984f5 Add unit tests for _compat.py
- c8e2971 Merge pull request #51980 from Ch3LL/merge-2018.3
  - 9ad19e Merge branch '2017.7' into '2018.3'
  - bfba6a9 Merge pull request #51895 from twangboy/win_update_2017.7
  - b2cb1eb Merge branch '2017.7' into win_update_2017.7
  - 76d280d Merge pull request #51875 from dwoz/avoid_ssl_race
  - e99654d Merge branch '2017.7' into avoid_ssl_race
30.2. Previous Releases

- c0bb1f7 Merge pull request #51850 from waynew/cherry-pick-ping-fix
- 6da495f Fix linter
- f78b360 fix reactor ping test
- ad7a9ec Merge pull request #51893 from twangboy/gate_zfs_2017.7
- e0d58eb Gate zfs module on Windows
- f758a10 Avoid race condition when initializing OpenSSL
- 0f125db Add __virtual__ to win_update
- 864d4be Merge pull request #51770 from Ch3LL/doc_conf_2017
- 25d9ca2 Update release versions for the 2017.7 branch
- 3cf3099 Merge pull request #51774 from terminal-labs/py3-server-docs-update
- 1f00ec89 Added in python 3 server according to the consensus from #51748
- bb9d87 added the python3 command for startign the python http server.
- b4153d3 Merge pull request #51757 from twangboy/fixed_case_2017.7
- 6b0b5d2 Fix failing py3 tests
- feb29f3 Make recurse and directory case sensitive
  - 2c4dff6 Merge pull request #51905 from aplanas/fixtures
    - ac68df mount: fix extra -t parameter
  - 4b2e8cc Merge pull request #51815 from garethgreenaway/51673_multiple_file_sections_with_excludes
    - 58ef51d Merge branch '2018.3' into 51673_multiple_file_sections_with_excludes
    - 8c4485d Merge branch '2018.3' into 51673_multiple_file_sections_with_excludes
    - b55a894 Fixing some code that was not working correctly with Python 3.
    - 63da8be Fixing a bug that caused excludes to not work as expected when multiple file options were in place, the excludes of the last file section were being used over any previous ones. Including a test to ensure excludes work as expected when multiple file sections are in place.
  - 1bf3fc8 Merge pull request #51867 from Oloremo/mysql-module-fix-for-python3
    - dfcebd Merge branch '2018.3' into mysql-module-fix-for-python3
    - b6d217c Merge branch '2018.3' into mysql-module-fix-for-python3
    - 9745b0a Fixed typo
    - 8149e9e Merge branch '2018.3' into mysql-module-fix-for-python3
    - 58d8a2e Merge branch '2018.3' into mysql-module-fix-for-python3
    - 964962 Added handling of empty server_version
    - 58791e9 Decode mysql_version for python3 compatibility
  - 7f05a8 Merge pull request #51908 from garethgreenaway/51862_icinga_fixes
    - 233dbaf Adding __salt__ to utils/icinga so cmd.run_all is available.
    - 1e7490c update kubernetesmod in index.rst
    - 1f3be1c fix import in test
• 8572c17 rename kubernetes module to kubernetesmod

• PR #52032: (Ch3LL) Add azure state and execution modules to doc index @ 2019-03-11 15:46:49 UTC
  - 7d6b53c Merge pull request #52032 from Ch3LL/fix_azure_docs
  - 8a8a5fa Add azure module ref pages and fix doc errors
  - 6a1d06a fix additional azure state module doc errors
  - 65d8f27 Update doc failures in azure modules
  - 92dbe2a Merge branch ‘2019.2’ into fix_azure_docs

• PR #52037: (Ch3LL) Backport #51201 into 2019.2 @ 2019-03-07 19:45:18 UTC
  - PR #51201: (terminalmage) Lint: Fix str-format-in-logging, len-as-condition, etc. (2) (refs: #52037)
  - 96935c9 Merge pull request #52037 from Ch3LL/bp-51201
  - 1fb0697 Remove develop modules not needed in 2019.2
  - e3adc2f Lint: Fix str-format-in-logging, len-as-condition, etc. (2)

• PR #52034: (terminalmage) fileclient: Fix traceback when template file cannot be cached @ 2019-03-07 19:41:24 UTC
  - 75398e4 Merge pull request #52034 from terminalmage/fixed-get-template
  - 744dfd9 fileclient: Fix traceback when template file cannot be cached

• PR #51984: (Ch3LL) [2019.2] Merge forward from 2018.3 to 2019.2 @ 2019-03-07 17:58:42 UTC
  - 7af4f5c Merge pull request #51984 from Ch3LL/merge-2019.2
  - 54ea40a Merge branch '2019.2' into merge-2019.2
  - 227ddbb Fix linter
  - a168913 Merge branch '2018.3' into '2019.2'
    * c68744a Merge pull request #51975 from s0undt3ch/features/nox-2018.3
      - af4ae91 Lint fixes
      - 33955c9 Windows needs special treatment
      - d4f899f Requirements fixes
      - e550c60 We need a fixed winrm-fs so that dotfiles are also included
      - ada1ef3 use kitchen-salt from my fork for now
    * a689177 Merge pull request #51807 from Ch3LL/2018.3.5_rn
      - 2c0b85c Add 2018.3.5 release notes
    * 6aee2c4 Merge pull request #51806 from twangboy/fixed_beacon
      - 2bf6179 Fix some lint
      - 0f38eea Add lowercase test
      - 1459985 Make sure drive letter is uppercase for re compare
      - 7cdc660 Add some tests
      - 48ae8c6 Fix disk.usage beacon on Windows
    * da815ba Merge pull request #51966 from twangboy/use_winapi_com
· a38300b Use winapi.com instead of coinitialize
· 7673c69 Merge pull request #51920 from twangboy/add_zabbix
  · e2d496c Add zabbix to the Windows builds
· 77c2796 Merge pull request #51802 from garethgreenaway/merge-2018.3.4
  · 2e20939 Merge branch '2018.3' into merge-2018.3.4
  · 769f002 Merge branch '2018.3.4' into merge-2018.3.4

  · 9c128aa Merge pull request #51732 from s0undt3ch/features/nox-2017.7
  · 328989d Add initial nox configuration. Tell tox'ers to use nox'.
  · 99c4e8d Merge pull request #51712 from dwoz/gemstestagain
  · 0d3b227 Fix ruby gems tests, again
  · 18452c4 Merge pull request #51528 from twangboy/backport_51471
  · 8c79f02 Merge branch '2017.7' into backport_51471
- 20a7ee5 Backport 51471
- ee80ce3 Merge pull request #51655 from garethgreenaway/49661_starting_salt_master_openssl
- f647b95 Merge branch '2017.7' into 49661_starting_salt_master_openssl
- 1831e64 Removing options from libcrypto.OPENSSL_init_crypto so it will simply use the defaults.
- 8d0f801 removing salt.crypt from payload.py which is not used and causing salt-key to break.
- a5a54c4 Removing unused import which is causing salt-master to not start when using openssl 1.1.1-1.
- c9c082c Fix azurearm field list doc error
- af0537f Add azure state and execution modules to doc index
- **PR #52004**: (chdamianos) Fixed comparison of None with constants (refs: #52030) @ 2019-03-06 17:41:52 UTC
  - 01bcca0 Merge pull request #52004 from chdamianos/fix-constants-comparison
  - 6fd60af Fixed comparison of None with constants
- **PR #51981**: (bryceml) Fix typo in 2019.2.0 release notes @ 2019-03-05 23:59:33 UTC
  - 8d6bb5d Merge pull request #51981 from bryceml/2019.2
  - ecf0ef0 Fix typo in 2019.2.0 release notes
    - a65e621 Adding an additional note warning that the file will not be changed because test=True, but could be changed by other states.
    - 6c0dcf2 Swapping pchanges for changes in file state.
- **ISSUE #51825**: (OrangeDog) schedule.disable doesn't work in 2019.2.0 (refs: #51855)
- **PR #51855**: (garethgreenaway) [2019.2] Global enable/disable was being ignored @ 2019-03-05 19:40:34 UTC
  - c3105df Merge pull request #51855 from garethgreenaway/51825_scheduled_global_enabled
  - 301e773 Merge branch '51825_scheduled_global_enabled' of github.com:garethgreenaway/salt into 51825_scheduled_global_enabled
    - ae7ab66 Merge branch '2019.2' into 51825_scheduled_global_enabled
    - ff13833 Merge branch '2019.2' into 51825_scheduled_global_enabled
  - 9e7e4ed Fixing broken add_job test.
  - 72466a5 Global enable/disable was being ignored
- **ISSUE #51745**: (fayak) Systemd update 241 on archlinux breaks systemd.py version() function (refs: #51946)
- **PR #51946**: (Ethyling) Fix retrieve systemd version using regex @ 2019-03-05 19:20:19 UTC
  - be28623 Merge pull request #51946 from Ethyling/fix-systemd-version
  - b557707 Add test for systemd version from git describe
  - 94809d0 Fix retrieve systemd version using regex
- **ISSUE #51816**: (jkrauz) pillar_ldap broken in 2019.2.0 (refs: #51964)
- **PR #51964**: (dwoz) [2019.2] Make sure ldap attrs are string types on python 2 @ 2019-03-05 19:18:30 UTC
  - c310022 Merge pull request #51964 from dwoz/issue_51816
- a879140 Merge branch '2019.2' into issue_51816
- 0e61cf3 Fix linter errors/warnings
- 171217a Revert debug logging
- 8c641c6 make LDAP attr defaults string types on py2

**PR #51976:** (s0undt3ch) [2019.2] Nox fixes @ 2019-03-05 18:56:49 UTC
- cb817f1 Merge pull request #51976 from s0undt3ch/features/nox-2019.2
- 0b4e68c Lint fixes
- 257b3fc Windows needs special treatment
- 2b98da0 Requirements fixes
- 4f45a7e We need a fixed winrm-fs so that dotfiles are also included
- fa70af2 use kitchen-salt from my fork for now

**PR #51761:** (sdodsley) Add new module to release notes for 2019.2.0 @ 2019-03-05 09:44:56 UTC
- PR #51681: (sdodsley) Add new module to release notes for 2019.2.0 (refs: #51761)
- f867e6e Merge pull request #51761 from sdodsley/cheery_pick_fb_releasenotes
- 80192c8 Add new module to release notes for 2019.2.0

**PR #51799:** (s0undt3ch) Catch attribute error @ 2019-03-05 09:38:08 UTC
- 08e3956 Merge pull request #51799 from s0undt3ch/2019.2
- 342244a Merge branch '2019.2' into 2019.2
- 3e8a17e Catch attribute error

**PR #51810:** (Ch3LL) Add 2019.2.1 release notes @ 2019-03-05 09:26:47 UTC
- ff5d7d6 Merge pull request #51810 from Ch3LL/2019.2.1_rn
- aae5fa Add 2019.2.1 release notes

**ISSUE #51824:** (OrangeDog) schedule.present state not idempotent in 2019.2.0 (refs: #51849)

**PR #51849:** (garethgreenaway) [2019.2] Fix to schedule.list function to filter out attributes that are None @ 2019-03-01 19:56:17 UTC
- PR #51647: (dwoz) [develop] increase batch test timeout on windows (refs: #51849)
- 3732004 Merge pull request #51849 from garethgreenaway/51824_splay_breaking_schedule_present
- a0af441 Merge branch '2019.2' into 51824_splay_breaking_schedule_present

**PR #51878:** (Ch3LL) Add new terraform salt-ssh roster feature to release notes @ 2019-02-27 19:18:49 UTC
- 3fd5b56 Merge pull request #51878 from Ch3LL/terraform_rn
- 502d197 fix spelling error in release notes
- 4d53b41 Add new terraform salt-ssh roster feature to release notes

**PR #51837:** (stratusjerry) Update win_pkg.py @ 2019-02-26 16:51:35 UTC
- PR #49039: (stratusjerry) Update win_pkg.py (refs: #51836, #51837)
- e63c872 Merge pull request #51837 from stratusjerry/backport_49039_2019.2
- 531b23d Update win_pkg.py

30.2. Previous Releases
- 39b5645 Splay defaulting to None internally, broke schedule.present causing it to always report differences when a state is run. Updating the schedule.list function to check if an attribute is None and remove it.

- **PR #51772**: (Ch3LL) Update release versions for the 2019.2 branch @ 2019-02-25 14:16:40 UTC
  - 27dd9fb Merge pull request #51772 from Ch3LL/doc_conf_2019
  - f28ec9b [2019.2] change build_type and release in doc/conf.py
  - 4c670e2 Update release versions for the 2019.2 branch

- **PR #51776**: (garethgreenaway) [2019.2] Merge forward from 2018.3 to 2019.2 @ 2019-02-24 22:08:58 UTC
  - 45425a4 Merge pull request #51776 from garethgreenaway/merge-2018.3
  - 186306a reverting change in release notes, adding change to doc/ref/modules/all/index.rst.
  - 1ef140a Fixing lint.
  - 6173578 Fixing lint errors
  - 38dca99 fixing lint
  - e37fc20 Merge branch '2018.3' into merge-2018.3
  - 7e3e71c Merge pull request #51756 from twangboy/fix_case_sensitive
    - 4c55040 Fix failing py3 tests
    - 64f45f8 Make recurse and directory case sensitive
  - e75fc1c Merge pull request #51747 from ymasson/fix_mysql_grants
    - f614dd0 Fix escaping for special characters
  - b1f7e85 Merge pull request #51387 from chrillux/make-binarydata-output-possible
    - 010393e Make binary data output possible
  - 3475813 Merge pull request #51694 from assafShapira/2018.3
    - 895b97a Merge branch '2018.3' into 2018.3
    - bc2d27 Fix minion bootstrapping issue "/usr/lib/python2.7/site-packages/salt/utils/cloud.py", line 472 Configuration value u'provider' needs to be set
  - c7136cb Merge pull request #51738 from garethgreenaway/nftables_cleanup
    - 8201d1e Fixing lint.
    - d681064 Merge branch '2018.3' into nftables_cleanup
    - e37458e Fixing a couple tests.
    - ed1b743 Additional cleanup. Adding additional documentation for state module.
    - dc4afbb More updates to nftables module, state modules, and unit tests.
    - 3ec96c3 initial work to cleanup the nftables module, state module, and the unit tests.
  - 2121049 Merge pull request #51733 from s0undt3ch/features/nox-2018.3
    - 97532c2 Add initial nox configuration. Tell tox’ers to use nox’.
  - f4adf33 Merge pull request #51728 from gtmanfred/virtualnames
    - 61b4390 fix modulenames from virtualnames tests
  - d681fb9 Merge pull request #51721 from dwoz/solarisipstests
30.2. Previous Releases

- 3263d31 Merge remote-tracking branch ‘saltstack/2018.3’ into solarisipstests
  - fb0a538 Merge pull request #51676 from Ch3LL/merge-2018.3.4
    - 8111479 Merge branch '2018.3' into merge-2018.3.4
  - e08f08d Merge pull request #50812 from gtmanfred/virtualnames
    - d59952f Merge branch '2018.3' into virtualnames
    - 33bb5bf fix use of virtualname
    - 2ca1253 Merge branch 'merge-2018.3.4' of github.com:Ch3LL/salt into merge-2018.3.4
    - 6d6910a Merge branch '2018.3' into merge-2018.3.4
    - b5a6265 Fix ruby gems tests, again
    - 05f2797 Merge branch '2018.3' into merge-2018.3.4
    - 9f0999f Merge branch '2018.3' into merge-2018.3.4
    - 139daa8 Merge branch '2018.3.4' into 2018.3
    - 9741289 Merge pull request #51646 from dwoz/batch_exit_2018.3.4
    - a8f25bb increase batch test timeout on windows
    - 9caafec Skip solarisips when not on solaris
  - 31c6785 Merge pull request #51714 from dwoz/gemstestagain_2018.3
    - fab74bb Fix ruby gems tests, again
  - 39aaddb Merge pull request #51689 from gtmanfred/2018.3
    - 8c35d51 fix import
    - 6a55cfdf specify minimum version of shade module
  - a475b70 Merge pull request #51469 from s0undt3ch/hotfix/fix-suse-locale-docker
    - 14f49b5 Don't prevent get/locale from working when running under docker
  - a59585d Merge pull request #51671 from Ch3LL/merge-2018.3
    - 64322db Fix _windows utils call
    - a5c8df0 Fix pylint
    - 547889b Merge branch ’2017.7’ into ’2018.3’
      - bcc13db Merge pull request #51562 from gilbrechbuhler/fix_rabbitmq_policy_change_check
      - ed2b1e1 Fix RabbitMQ policy definition update check
      - cafaa98 Merge pull request #51648 from dwoz/increase_wait
      - e2377a9 Merge branch ’2017.7’ into increase_wait
      - e3d28d9 Merge pull request #51643 from dwoz/batch_exit
      - 42d1d02 increase batch test timeout on windows
      - 7c2d7a4 Increase minion wait for slow boxes
      - b5ae53a Merge pull request #51631 from Ch3LL/lint-2017
      - c0aa4dc Fix linter by ignoring async await check.
• 396622c Merge branch '2017.7' into lint-2017
• ba8d0ea Merge pull request #51547 from s0undt3ch/2017.7

  - ddc017c Merge branch '2018.3' into add_tests_51534
- c4bbe1a Merge pull request #51177 from nullify005/51069-ri-and-rdoc-removed
  - 6b1a201 Merge branch '2018.3' into 51069-ri-and-rdoc-removed
  - f339608 Merge branch '2018.3' into 51069-ri-and-rdoc-removed
  - e586370 Merge branch '2018.3' into 51069-ri-and-rdoc-removed
  - 13d3288 Fix lint issues
  - 5de5e64 Update tests
  - 22eda16 Fix lint violations
  - 2e6252c Support rubygems 3 cli param changes
  - 9e3a01b Use existing file instead of tzutil
  - 30c1832 Use tempfile to get temp dir
  - e3d3c5a Add tests for issue 51309
  - 1168141 Add test for explicit lists
  - 84f5d63 Merge branch '2018.3' into fix_51566
  - 7376cb9 Handle explicit lists properly
  - 28fc070 Merge branch '2018.3' into 51266_schedule_enable_disable_break_save
  - 0760133 adding integration.scheduler.test_helpers to various files to by pass the test_module_name_source_match check.
  - 1552fba lint cleanup
  - 086066b Adding a test to ensure _get_schedule which is used by the save functionality works when there is an enabled attribute.
  - 1c6d4fb When looping through the schedule to remove hidden attributes, we should only do that if the item in question is a dictionary. It could be the attribute that determines if the entire schedule is enabled or disable.
  - 5ed8eb6 Properly create the value for a "True" boolean element item
- f1e29c8 Merge pull request #51548 from s0undt3ch/2018.3
  - 611065e Merge branch '2018.3' into 2018.3
* 00a6246 Merge pull request #51622 from brejoc/2018.3-empty-job-workaround
  - d263410 Prevents crash when there is no job entry
  - 5342305 Allow NOT to install pip dependencies
* fdb13a3 Merge pull request #51523 from lomeroe/solarisips_fixes
  - e8e91e3 Merge branch '2018.3' into solarisips_fixes
  - b7bfe17 lint fixes
  - cdaccf4 add tests to validate command being sent to cmd.run_all
  - eaa229d add unit test
  - 432428d Don't assume that each item in "pkgs" is a dict (as packed by pkg.installed state).
* e3d5fbe Merge pull request #51577 from garethgreenaway/merge-2017.7
  - e060b97 Merge branch '2018.3' into merge-2017.7
  - 3eee038 Fixing a couple issues that did not merge properly.
  - 25b2ca6 Merge branch '2018.3' into merge-2017.7
  - c337fce Merge branch '2018.3' into merge-2017.7
  - f9d6828 Fixing missed merge.
  - a041775 Merge branch '2017.7' into merge-2017.7
  - 61889ba Merge pull request #51452 from terminalmage/bp-50963
  - 54d2e02 Merge branch '2017.7' into bp-50963
  - 0c989f0 Merge pull request #51437 from twangboy/fix_raise_2017.7
  - ecd1637 Merge branch '2017.7' into fix_raise_2017.7
  - f3c9cd4 Add missing raise statement
  - d06526c Allow for kwargs to be used in object initialization
  - 0e760b5 pip states: Use case-insensitive dictionaries for pip.list return
  - 5ca9f82 Add a CaseInsensitiveDict implementation
  - 2aaa9f9 pip.installed: Fix traceback when _find_key doesn't return a match
  - 67b7d28 Merge pull request #51370 from dwoz/setup_py_req_fix
  - e1e06a0 Fix python 3 path for shell test cases
  - 09cd5fc Merge branch '2017.7' into setup_py_req_fix
  - 0de189d Handle pipenv like version restrictions
  - e9b3d94 Merge pull request #51367 from dwoz/cloud_config_2017
  - 3f4c5ae Merge branch 'cloud_config_2017' of github.com:dwoz/salt into cloud_config_2017
  - 8bb8d41a Merge branch '2017.7' into cloud_config_2017
  - 7bb4ceb Fix python 3 path for shell test cases
  - a2bbf6d Fix linter issues
  - 004d9b8 Cloud provider and profile configs are merged
  - 3a21afa Coverage on windows chokes with the tox env var COVERAGE_PROCESS_START

30.2. Previous Releases
1c62e27 Switch required PyTest dependency
b80320d Merge pull request #51402 from dwoz/win_test_fix
21359e6 Merge branch '2017.7' into win_test_fix
1199530 Merge pull request #51397 from dwoz/gemtest
43ac36e Use gems.github.com no longer exists, use gemcutter.org
bac652f Add testing path to run_script commands
f511ad2 Merge pull request #51227 from astronouth7303/doc-modules-additional-globals
cbe1e17 Merge branch '2017.7' into doc-modules-additional-globals
2a9bf17 Merge pull request #51312 from s0undt3ch/features/tox-runtests
3840af8 "Tell" coverage to track subprocesses.
f67a529 Remove unused imports
15ab061 Show objects on assertion failure
0281fc5 Don't fail the test because of order
9a31be7 Don't call .keys() on dictionaries
97ced3a Add pytest-salt-from-filenames to pytest requirements
8d2c4d2 Remove duplicate dependency
5eecc4a Add .coveragerc
80a3826 Run tests from tox, wether runtests or pytest
1945c30 Document the client-defined dunders
5bb9b32 Merge pull request #51393 from garethgreenaway/various_documentation_fixes
8bb7535 Merge branch '2018.3' into various_documentation_fixes
c15406a Merge branch '2018.3' into various_documentation_fixes
33bb4e4 Merge branch '2018.3' into various_documentation_fixes
3582f6e Fixing the underline.
a8f42a0 Various documentation fixes.
884981f Merge pull request #51465 from ezh/50556
a3ee70c fix #50556 state.orchestrate_show_sls
231d6e2 Merge pull request #51541 from bdrung/silence-linux_distribution-deprecation-warning
c4feca1 Merge branch '2018.3' into silence-linux_distribution-deprecation-warning
e1dcb5 Silence linux_distribution deprecation warning
f87d5ec Merge pull request #51558 from bdrung/test-zypp-plugin
c34967d Merge branch '2018.3' into test-zypp-plugin
edb1093 Merge pull request #51609 from dwoz/wait_minions_2018.3
d794edf fix linter
d6720d2 Wait for minions to be pingable before starting tests
• 8d79359 Merge pull request #51599 from terminalmage/bp-51510
  - ed194c7 grains: assign os_family Debian to Debian derivative TurnKey Linux
• 24aa083 Merge pull request #51598 from terminalmage/add-grain-option-documentation
  - 4ee9440 Improve ec2 pillar documentation
  - 9c02104 Add link to metadata grain module docs
  - 997ce26 Add documentation for the metadata_server_grains config option
• d89e489 Merge pull request #51491 from terminalmage/issue51268
  - 550e9ab Don't log shell warning if output_loglevel is quiet
  - 7678c28 Do not load zyppnotify file on module import
• c6dfed Merge pull request #51588 from dwoz/script_fix_2018.3
  - cbac390 Use the code directory instead of cwd for python path
• PR #51658: (dwoz) [2019.2] Let memcopy make the null bytes, better py3 support @ 2019-02-15 05:42:37 UTC
  - PR #51586: (garethgreenaway) [2019.2] Merge forward from 2018.3 to 2019.2 (refs: #51658)
  - 1ea6f4b Merge pull request #51658 from dwoz/pip_test_fix
  - c811a70 Let memcopy make the null bytes, better py3 support
• PR #51650: (dwoz) [2019.2] Increase minion wait for slow boxes @ 2019-02-14 16:31:59 UTC
  - 22a04c1 Merge pull request #51650 from dwoz/increase_wait_2019.2
  - ad294f3 Merge branch '2019.2' into increase_wait_2019.2
• PR #51645: (dwoz) [2019.2] increase batch test timeout on windows @ 2019-02-14 16:29:26 UTC
  - a0982f7 Merge pull request #51645 from dwoz/batch_exit_2019.2
  - 1a882d7 Merge branch '2019.2' into batch_exit_2019.2
• PR #51586: (garethgreenaway) [2019.2] Merge forward from 2018.3 to 2019.2 (refs: #51586) @ 2019-02-14 16:25:29 UTC
  - 705a62d Merge pull request #51586 from garethgreenaway/merge-2018.3
  - 09fb3e7 Merge branch '2019.2' into merge-2018.3
  - 95c505a Merge branch '2019.2' into merge-2018.3

  - 41e25a6 Merge pull request #51580 from garethgreenaway/merge-2018.3.4
    - 84e15ce Fixing lint
    - e891b3f Merge branch '2018.3.4' into merge-2018.3.4
    - d0cad3e Merge pull request #51553 from twangboy/update_libsodium
    - 477f6a9 Update url to libsodium for mac builds
    - 564a65a Merge pull request #51544 from twangboy/fix_test_ssh_2018.3.4
    - 7771632 Fix ssh on Windows
    - b4299a3 Merge pull request #51532 from frogunder/new_releasenotes
1974 Chapter 30. Release Notes

09fa0b Merge branch '2018.3.4' into new_releasenotes

c6bfe53 2018.3.4 releasenotes

c37dbd7 Merge pull request #51534 from twangboy/fix_51309

3ad5b Convert data to string using salt util

5b41af3 Merge pull request #51530 from garethgreen-away/48204_mysql_module_handle_mariadb_versions

cdf5298 Later versions of MariaDB still support "ALL PRIVILEGES"

d31c902 Updating the mysql module to handle MariDB versions.

f3f345c Merge pull request #51529 from frogunder/releasenotes

fb678ee fix escaped asterisks

6a4f0da 2018.3.4 releasenotes

a37fb7d Merge pull request #51525 from twangboy/backport_51095_2018.3.4

b6acc92 Backport 51095

602dcd8 Merge pull request #51520 from frogunder/man_pages

0ce3f Update man pages for 2018.3.4

1f981c6 Merge pull request #51429 from yosnoop/replace-noclass-with-nocl-for-dig

5231e73 Merge branch '2018.3.4' into replace-noclass-with-nocl-for-dig

14e6b7 In case the test machine can't resolve

95e8a2f The +nocl is supported much wider than +noclass

a00d708 Test dig options for salt.utils.dns.lookup

209ef32 Merge pull request #51441 from Ch3LL/bp-51366

5bc466e Fix python 3 path for shell test cases

5351e5c Add testing path to run_script commands

2d8a364 Fix linter issues

9b8718a Cloud provider and profile configs are merged

90a8682 Merge pull request #51458 from twangboy/add_py2_warning

0552c0 Merge branch '2018.3.4' into add_py2_warning

b492021 Merge pull request #51460 from twangboy/update_installer_mac_2018.3.4

3c92688 Merge branch '2018.3.4' into update_installer_mac_2018.3.4

892d98c Merge pull request #51471 from twangboy/fix_test_win_dns_client

c9f6b01 Merge branch '2018.3.4' into fix_test_win_dns_client

a5505d Merge pull request #51462 from ShantonRU/fix-insecure-sql-queries-in-mysql-module-1

d3ef2cb Merge branch '2018.3.4' into fix-insecure-sql-queries-in-mysql-module-1

f47eda6 Fix improper use of socket authentication in mysql.user_chpass

ed62a2f Fix insecure SQL queries in mysql.user_chpass

33922e9 Fix the failing dns test on Windows
- 48936c2 Merge pull request #51445 from terminalmage/fix-custom-grains-traceback
- 191235d Remove custom grains module from 2018.3 branch
- 72fd1a2 Roll back icon change
- 7dd1704 Add welcome_py2.rtf
- c93e9e3 Add Py2 Warning to installer package
- b658900 Add Py2 Warning for Py2 Installer
- a880e42 Merge pull request #51438 from twangboy/fix_raise_2018.3.4
- 5830fad Add missing raise statement
- 28b898c Merge pull request #51432 from Ch3LL/bp-51324
- bd41ff0 Fixing various bits in x509 module and unit test to ensure tests are passing on python2 & python3
- 01717d2 Merge pull request #51377 from twangboy/fix_auditpol_2018.3.4
- 19e5181 Fix issue when directory doesn't exist
- 43a9d2f Merge pull request #51338 from Ch3LL/bp-51207
- 345ae67 Backport PR# 50771 to 2018.3 branch
- 3dcd11d Merge pull request #51337 from Ch3LL/bp-51170
- 4e85505 Merge branch '2018.3.4' into bp-51170
- 7656aa5 Merge pull request #51340 from Ch3LL/bp-51252
- e74a6c6 Fix py3 managed.file test failure
- 6f2c7cf Remove un-needed log statement
- 824950c Fix 50221 regression test on Windows
- 1840af9 Preserve newlines from pillar data for file.managed
- e90ca1d Merge pull request #51290 from s0undt3ch/hotfix/fix-network
- da3aace Merge branch '2018.3.4' into hotfix/fix-network
- 04f16b8 Fix tests. We no longer get ipaddress instances back.
- c3fa82a Fix minion start issue
- c893dc4 Fix saltmod roster test
- b61854f Roster defines the roster system not a file
- 484bab4 Fix linter
- 5e2db2f Honor roster file for ssh orchestrations
- c8db7e3 Merge pull request #51317 from terminalmage/fix-pr-50417
- 4be2891 Merge branch '2018.3.4' into fix-pr-50417
- e246db Merge pull request #51311 from twangboy/fix_test_file.test_managed
- f4177e0 Remove mode parameter on Windows
- 4c4ded3 Fix regression in dynamic pillarenv
- 40b20126 Merge pull request #51292 from Ch3LL/bp-51226
· aba114e Merge branch '2018.3.4' into bp-51226
· fc0bec5 Merge pull request #51295 from Ch3LL/bp-51279
· 5c4a7a4 Merge branch '2018.3.4' into bp-51279
· dacd1ea Merge pull request #51293 from Ch3LL/bp-51233-2
· a155fd7 Accounting for when permissions are not returned from file.check_perms, eg. windows systems.
· 53ba068 When test=True and there are permissions changes, report it.
· d2eba77 Remove network.py patch
· d431c71 Add __context__ support
· de6c13d Handle spaces in fstab opts, similar fix to #39593
· 1abfb2 Merge pull request #51278 from dwoz/issue51248
· c614198 Use pillar roots validation method
· 0d2b0c6 Fix linter warnings
· 5b98895 Fix wart in pillar_roots validation
* f7d50b1 Merge pull request #50784 from sathieu/dynamic_file_roots
  · 7ca2aa4 Allow dynamic file_roots
* 5e84oa5 Merge pull request #51527 from garethgreenaway/bp-51475
  · 801abf2 Fix Elasticsearch retuner
* 1f6da6a Merge pull request #50921 from terminalmage/issue49894
  · a35c023 Don’t use a decorator that assumes /etc/apt/sources.list.d exists
  · 6a62e79 Add integration test for architecture support
  · 67ae5a5 Add support for architectures for APT pkgrepo.managed states
* 3f17776 Actually, remove python-ldap. It needs system deps. Have salt-jenkins do it.
* afcb6bd Fix the ldap package name in requirements/tests.txt
* 588cb87 Merge pull request #51454 from terminalmage/fix-deprecation-warning
  · 529cce0 Fix deprecation warning in nested outputter
* 13de0b8 Merge pull request #50963 from terminalmage/issue50942
  · c84be3f Allow for kwargs to be used in object initialization
  · 2bf93fd pip states: Use case-insensitive dictionaries for pip.list return
  · 792f054 Add a CaseInsensitiveDict implementation
  · 1410164 pip.installed: Fix traceback when _find_key doesn’t return a match
* 60953b7 Merge pull request #51366 from dwoz/cloud_config_merge
  · ae351eb Fix python 3 path for shell test cases
  · 48062c8 Merge branch '2018.3' into cloud_config_merge
  · eeeea289 Add testing path to run_script commands
  · 542d857 Fix linter issues
a8af3ba Cloud provider and profile configs are merged

9ab2ec6 Coverage on windows choking with the tox env var

4994c38 Switch required PyTest dependency

89710a7 Merge pull request #51401 from dwoz/run_script_win
  - 77fd3f5 Add testing path to run_script commands

1438a62 Merge pull request #51389 from terminalmage/proxy-fixes
  - 3ecce85 Normalize results if test proxy is enabled

8acda9e Merge pull request #51368 from s0undt3ch/hotfix/tests
  - f4e1692 Fix test

ab60782 Merge pull request #51319 from terminalmage/issue51255
  - 04eb66b Merge branch '2018.3' into issue51255

fd2cf4 Merge pull request #51250 from yosnoop/fixed-salt-utils-dns-lookup
  - 0ddfad1 Merge branch '2018.3' into fixed-salt-utils-dns-lookup
  - 9fb4abe Merge branch '2018.3' into fixed-salt-utils-dns-lookup
  - 67e4131 Merge branch '2018.3' into fixed-salt-utils-dns-lookup
  - 9a34bcd Unit test for lookup with servers option
  - 9498fde Fix _lookup_host to make it work when server specified

af867e1 Remove excessive whitespaces
  - 0d074a4 Fix a comment
  - 1363d2b Proper way to specify _server_ to query with _host_
  - 7b2facb Fix broken lookup in salt/utils/dns.py

73528a5 Merge pull request #51339 from dwoz/aws_role_backport
  - 156f532 Backport aws role support

7908875 Merge pull request #51341 from Ch3LL/bp-51299
  - e3080f1 Add sleep before sending stop over UDP

326425c Merge pull request #51352 from garethgreenaway/fixing_service_beacon_documentation
  - 021fe85 Fixing the documentation for the service beacon. If no options are provided for the service then there needs to be an empty dictionary.

14a84e8 Merge pull request #51333 from Ch3LL/merge-2018.3
  - 27d7a89 Merge branch '2018.3' into merge-2018.3

31b921f Merge pull request #51304 from terminalmage/issue51270
  - 36673fb Merge branch '2018.3' into issue51270

2c3ae7f Merge pull request #51313 from s0undt3ch/features/tox-runtests-2018.3
  - 2eaf5c5 "Tell" coverage to track subprocesses.
  - f6baeb7 Remove unused imports
  - ff6824c Don't fail the test because of order
- 4d12ccb Show objects on assertion failure
- ee2f10a Add `pytest-salt-from-filenames` to pytest requirements
- 4f4d019 Remove duplicate dependency
- 1d4b9f5 Add `.coveragerc`
- 78c6d68 Run tests from tox, wether runtests or pytest
- c02757d gitfs: Fix use of deprecated pygit2 function
- ae62ebc Merge branch '2017.7' into '2018.3'
- 9309639 Merge pull request #51305 from s0undt3ch/2017.7
- 09b20df Add 2017.7 codecov config
- 4fa2a02 Merge pull request #51267 from ethframe/fix-file-directory
- c108825 Fix missing file error in file.directory.
- ad17ac5 Fix mocks to reflect changes to git.latest state
- c817213 Don’t try to run git.config_get_regexp from nonexistant cwd
- f8c3e44 git.latest: add auth to merge/reset calls when LFS used with SSH auth
- 4b11d6b increase batch test timeout on windows
- a5af9c5 Increase minion wait for slow boxes

**PR #51549:** (s0undt3ch) [2019.2] Allow NOT to install pip dependencies @ 2019-02-13 18:16:52 UTC
- e7ee04e Merge pull request #51549 from s0undt3ch/2019.2
- d2125aa Allow NOT to install pip dependencies

**PR #51595:** (mirceaulinic) Fix ipaddress imports @ 2019-02-13 17:33:08 UTC
- c96464b Merge pull request #51595 from mirceaulinic/mircea/port-824e0e5
- 91bcf4f Merge branch '2019.2' into mircea/port-824e0e5
- 84fc76d Fix ipaddress imports

**PR #51517:** (damianosSemmle) Fixed string format index out of range error @ 2019-02-13 08:18:38 UTC
- e3c9a3e Merge pull request #51517 from damianosSemmle/fixed-string-format-index
- c0959e2 Merge branch '2019.2' into fix-string-format-index

**PR #51581:** (garethgreenaway) [2019.2] Merge forward from 2019.2.0rc1 to 2019.2 @ 2019-02-13 04:11:15 UTC
- 8250bb Merge pull request #51581 from garethgreenaway/merge-2019.2.0rc1
- b00e7e8 Merge branch '2019.2' into merge-2019.2.0rc1

**PR #51607:** (dwoz) [2019.2] Wait for minions to be pingable before starting tests @ 2019-02-13 00:48:47 UTC
- edb5e94 Merge pull request #51607 from dwoz/wait_minions_2019.2
- ab0a6a3 fix linter
- f2e4a30 Wait for minions to be pingable before starting tests

**PR #51584:** (dwoz) [2019.2] Use the code directory instead of cwd for python path @ 2019-02-12 18:43:46 UTC
- 1e0275e Merge pull request #51584 from dwoz/script_fixes
- dbf4356 Use the code directory instead of cwd for python path
- cd24006 Merge branch '2019.2' into merge-2019.2.0rc1
- 6e55164 Merge branch '2019.2.0.rc1' into merge-2019.2.0rc1
  * ac73745 Merge branch '2019.2' into fix-string-format-index

- PR #51583: (dwoz) Add testing path to run_script commands @ 2019-02-11 21:38:51 UTC
  - f446c52 Merge pull request #51583 from dwoz/scriptfix
  - e49ba86 Add testing path to run_script commands
  - 788f7e0 Fixed string format index out of range error

- PR #51405: (aplanas) Documentation: fix typo in "equivalent" @ 2019-02-01 21:11:12 UTC
  - c3e27be Merge pull request #51405 from aplanas/backport_49669
  - 58279b4 Documentation: fix typo in "equivalent"

- PR #51406: (aplanas) states_pt3: fix rST link format @ 2019-02-01 21:10:43 UTC
  - 5c26652 Merge pull request #51406 from aplanas/backport_49670
  - 204432d Merge branch '2019.2' into backport_49670

- PR #51426: (aplanas) mount: cache blkid information @ 2019-02-01 21:09:51 UTC
  - fb70bd3 Merge pull request #51426 from aplanas/backport_51135
  - ac790a6 Merge branch '2019.2' into backport_51135
  - 66743d6 mount: cache blkid information

- PR #51425: (aplanas) cmdmod: add sysfs into the chroot @ 2019-02-01 21:09:00 UTC
  - 2e8bf05 Merge pull request #51425 from aplanas/backport_51094
  - 9193106 cmdmod: add sysfs into the chroot

- PR #51419: (aplanas) file: update attributes for lsattr and chattr @ 2019-02-01 21:04:54 UTC
  - d7a47f0 Merge pull request #51419 from aplanas/backport_50607
  - ab8a8b8 file: update attributes for lsattr and chattr

- PR #51414: (aplanas) service: SUSE is not based on sysvinit anymore @ 2019-02-01 21:02:33 UTC
  - 7e020dd Merge pull request #51414 from aplanas/backport_50396
  - b5cfe17 service: SUSE is not based on sysvinit anymore

- PR #51408: (aplanas) parted: fix the ordering of list command @ 2019-02-01 21:00:19 UTC
  - PR #50473: (aplanas) parted: support variable length output for print (refs: #51408)
  - PR #49804: (aplanas) parted: fix the ordering of list command (refs: #51408)
  - 9fb7dda Merge pull request #51408 from aplanas/backport_49804
  - 467da2f parted: support variable length output for print
  - da2e632 parted: fix the ordering of list command

- ISSUE #50097: (aplanas) lowpkg.diff refers to a package name, but a package file is required (refs: #51410)

- PR #51410: (aplanas) Fix lowpkg.diff documentation and parameter name @ 2019-02-01 20:57:50 UTC
  - 7e14499 Merge pull request #51410 from aplanas/backport_50126
  - d38622e Fix lowpkg.diff documentation and parameter name

30.2. Previous Releases

1979
- e61a077 states_pt3: fix rST link format
- **PR #51404** (aplanas) blockdev: fix url from comment @ 2019-01-30 20:05:54 UTC
  - a16461b Merge pull request #51404 from planas/backport_49668
  - da2e30d blockdev: fix url from comment
- **PR #51407** (aplanas) parted: fix _validate_partition_boundary @ 2019-01-30 20:05:02 UTC
  - 756c367 Merge pull request #51407 from planas/backport_49803
  - b004b33 parted: fix _validate_partition_boundary
- **PR #51435** (damianosSemmle) Fixed not raised exceptions @ 2019-01-30 18:32:57 UTC
  - 1d45664 Merge pull request #51435 from damianosSemmle/fix-raise-exception
  - 7a9ff59 Fixed not raised exceptions
- **PR #51336** (Ch3LL) [2019.2] Merge Forward from 2019.2.0.rc1 to 2019.2 @ 2019-01-27 23:55:08 UTC
  - d4b9093 Merge pull request #51336 from Ch3LL/merge-2019.2.0.rc1
  - 62a20b1 Remove unused import
  - 2284a5 Merge branch '2019.2' into merge-2019.2.0.rc1
  - 18bbf26 Merge branch '2019.2.0.rc1' into 2019.2
- **PR #51334** (Ch3LL) [2019.2] Merge forward from 2018.3 to 2019.2 @ 2019-01-27 23:49:32 UTC
  - 02b43a0 Merge pull request #51334 from Ch3LL/merge-2019.2
  - 25ec653 Merge branch '2018.3' into '2019.2'
    - f62cc11 Merge pull request #51324 from garethgreenaway/1257_something_something_bytes_argh_python2
      - bd7072f Merge branch '2018.3' into 1257_something_something_bytes_argh_python2
    - b44cd84 Merge pull request #51323 from garethgreenaway/network_dns_check_test
      - 055eadc Merge branch '2018.3' into network_dns_check_test
    - be57a0f Merge pull request #51321 from terminalmage/issue51256
      - d9c4462 Fix 500 error when using wheel_async
      - c847f54 Swap passed addr for string rather than ipaddress object.
      - 87f3972 removing another debugging log.
      - ad64efb Use MagicMock
      - 172ad2e removing debugging
      - 5812eae Adding a test to ensure dns_check works as expected.
      - 0e542c5 Fixing various bits in x509 module and unit test to ensure tests are passing on python2 & python3
    - 85e7ac6 Merge pull request #51306 from s0undt3ch/2018.3
      - 5f0f296 Add 2018.3 codecov config
    - 5a3983 Merge pull request #51207 from twangboy/fix_test_pkg
      - d4ab6d8 Merge branch '2018.3' into fix_test_pkg
    - 7a97cb4 Merge pull request #51252 from dwoz/issue-50221
* 8a89cb2 Merge pull request #51279 from twangboy/backport_lgpo
  
  * 6b1545 Remove network.py patch
  * 2356f25 Add __context__ support
  * a5255f0 Merge remote-tracking branch 'saltstack/2018.3' into issue-50221

* 6796e65 Merge pull request #51276 from garethgreenaway/merge-2018.3
  
  * 42ddc43 Merge branch '2018.3' into merge-2018.3

* 0adde9b Merge pull request #51220 from sathieu/artifactory-classifier-2018.3
  
  * a85f146 fixes #31179 by applying the same logic as used in the nexus module

* f6a7cad Merge pull request #51225 from astronouth7303/loader-docs-2018.3
  
  * e67da95 Add the tokens system.
  * 7e2838c Add reference to the execution module docs
  * f30f9e8 Remove search system
  * f0cc183 Fileserver modules can be loaded from the fileserver.

* 1a2f680 Merge pull request #51239 from garethgreenaway/51208_file_manage_escaped_double_quotes
  
  * 4251c0c Merge branch '2018.3' into 51208_file_manage_escaped_double_quotes
  * 6a9daa7 Merge branch '2018.3' into 51208_file_manage_escaped_double_quotes
  * 0bf468c Fixing lint. Using a constant instead of looking for the condition in the string.
  * a233dbc Ensuring we can handle a string that contains single quote + an escaped double quote.

* d614127 Merge pull request #51261 from OrangeDog/patch-2
  
  * d809b9b Avoid double-counting errors and ignore test runs
  * 6ca7deb Remove unused host parameter and average/disaster keys
  * 2d44527 Just let zabbix_sender use the config file
  * 6404e2c Fix fallback command so it's actually run
  * b79a55a Fix KeyError in Zabbix returner
  * 0971035 Merge branch '2018.3' into merge-2018.3
  * 243dc06 Merge branch '2017.7' into merge-2018.3
• acfb7d8 Update pytest requirements
• c19479b Move all of PyTest requirements to its own requirements file

  - d39d8b7 Merge branch `2018.3` into merge-2018.3
- b79c09e Merge pull request #51161 from amendlik/long-hostname
  - 6fccc4ad Merge branch `2018.3` into long-hostname
* 1424734 Merge pull request #51159 from rkiereger/fixed-issue-51067
  - 1440ccf Prevent crash by testing for 'manufacturer' in osdata on OpenBSD
  - 1a4e307 Ignore exceptions when generating the minion ID
* 5e37326 Merge pull request #51146 from terminalmage/fixed-vsphere-tuple-issue
  - 5d60022 Fix invalid assignment in vsphere module
* fad8621 Merge pull request #51154 from twangboy/auditpol
  - 9064376 Add support for Advanced Audit policies
* f7a100c Merge pull request #51151 from Ch3LL/bp_51061
  - ffdac27 When writing output to stdout we want to ensure that the data is a string not bytes.
    Under py2 the salt.utils.data.encode function results in a string but under py3 the result is a bytestring.
    Swapping out salt.utils.data.encode for salt.utils.stringutils.to_str.
* 3a50a57 Merge pull request #51150 from Ch3LL/bp-49508
  - 7ae53ad Do not silently ignore errors.
  - deb0134 Convert to string before sending via 'publish'.
  - 651c551 Use to_str salt.utils when writing to a file.
* 8bb589d Merge pull request #51152 from garethgreenaway/50433_handle_grants_better
  - f7ca4d Fixing lint
  - e8c8c0f Adding some tests to ensure "ALL PRIVILEGES" is handled correctly in 8.0 and 5.6
  - b4bdf9f Add additional grants. Adding logic to handle when ALL or ALL PRIVILEGES is passed for the grant, including some logic to handle the fact that the grants are split when show grants is run for a particular user.
  - 74edfd9 Fix pylint
  - 81a3d4f Merge branch '2017.7' into '2018.3'
  - 8a76a19 Merge pull request #50858 from jasonarewhy/bugfix-2017.7/ubuntu-networking-searchdomain
  - 3395a3d Merge branch '2017.7' into bugfix-2017.7/ubuntu-networking-searchdomain
  - 69d25aa update debian_ip test
  - a6b896c get searchdomain in Ubuntu 12+
* dda1ebb Merge pull request #51133 from SuperShoot/issue-#50849
  - ec14e13 Fixes mysql server version comparison.
* 9d4321d Merge pull request #50878 from max-arnold/output-docs
  - d7403da Fix profile outputter docs
* ce87504 Merge pull request #51076 from OrangeDog/patch-1
  - 568e4fb Revert add - check
  - 4d7be7c7 Typos in index_template_present documentation
* d08abf4 Merge pull request #51081 from garethgreenaway/merge-2018.3
  - 027804a Merge branch '2018.3' into merge-2018.3
* 335088b Merge pull request #51080 from garethgreenaway/50966_nxos Ensure kwarg list

30.2. Previous Releases

1987
• PR #51234: (KChandrashekhar) Added a note in Release notes about py 2.7 EOL @ 2019-01-18 15:53:51 UTC
  - e6ab913 Merge pull request #51234 from KChandrashekhar/2019.2-docs
  - e4af81 Addressing Megan’s comment to fix the py2.7 deprecation message in release notes
  - 8ec0296 Added a note in Release notes about py 2.7 EOL

• PR #51198: (Ch3LL) [2019.2] Merge forward from 2019.2.0.rc1 to 2019.2 @ 2019-01-17 21:23:34 UTC
  - 644ef8c Merge pull request #51198 from Ch3LL/merge-2019.2-rc
  - 810c611 Merge branch '2019.2.0.rc1' into 2019.2
  - 3f61e77 Fix pdbedit module on samba 4.9 (Fixes #50538)

• PR #51148: (Ch3LL) [2019.2] Merge forward from 2018.3 to 2019.2 @ 2019-01-14 22:49:02 UTC
  - 12901c3 Merge pull request #51148 from Ch3LL/merge-2019.2
  - 1d7329a Fix pylint
  - 5271636 Fixes mysql server version comparison.
  - b53f171 Ensure kwargs is a list before we attempt to loop through. Similar fix to https://github.com/rallytime/salt/commit/430c462f34eb4eedf2384e06fbee8dc19b8026f6 in the proxy module.
  - d0f2d15 Revert add -> check
  - 437d8b5 Typos in index_template_present documentation
  - 3bf189e Add unit test to ensure we don’t diff bare repos
  - 2f8e391 Fix profile outputter docs

• PR #51100: (dwoz) Fix typo in method name (2019.2) @ 2019-01-08 18:12:23 UTC
  - 4c2d76d Merge pull request #51100 from dwoz/cloud_typo
  - 60f53d0 Fix typo in method name

• PR #51099: (terminalmage) Fix improper exception raises (2019.2) @ 2019-01-08 17:55:53 UTC
  - 39b28f4 Merge pull request #51099 from terminalmage/fix-exception-raise
  - 2a25530 Fix improper exception raise

• PR #51084: (s0undt3ch) [fluorine] Cleanup the singleton instances map. @ 2019-01-07 22:03:29 UTC
  - 8827193 Merge pull request #51084 from s0undt3ch/merge-singleton-last-ref-close-fluorine
  - 979fbac Merge branch '2019.2' into merge-singleton-last-ref-close-fluorine
  - 63f051a Merge branch '2019.2' into merge-singleton-last-ref-close-fluorine
  - bd6c46d Cleanup the singleton instances map.
30.2.25 Salt 2019.2.2 Release Notes

Version 2019.2.2 is a bugfix release for 2019.2.0.

Statistics

- Total Merges: 26
- Total Issue References: 12
- Total PR References: 26
- Contributors: 13 (Akm0d, Ch3LL, Oloremo, OrlandoArcapix, bryceml, dhiltonp, dwoz, frogunder, gareth-greenaway, javierbertoli, pizzapanther, s0undt3ch, twangboy)

Changelog for v2019.2.1..v2019.2.2

Generated at: 2019-10-11 20:54:15 UTC

- PR #54919: (twangboy) Add missing docs for win_wusa state and module (2019.2.1) @ 2019-10-11 18:28:11 UTC
  - 7d253bc Merge pull request #54919 from twangboy/update_docs
  - 57ff199 Add docs for win_wusa

- ISSUE #54941: (UtahDave) Pillar data is refreshed for EVERY salt command in 2019.2.1 and 2019.2.2 (refs: #54942)

- PR #54942: (dwoz) Fix for 54941 pillar_refresh regression @ 2019-10-11 18:27:31 UTC
  - 2f817bc Merge pull request #54942 from dwoz/fix-54941
  - cb5d326 Add a test for 54941 using test.ping
  - 348d1c4 Add regression tests for issue 54941
  - 766f3ca Initial commit of a potential fix for 54941

- PR #54897: (bryceml) update version numbers to be correct @ 2019-10-05 01:59:14 UTC
  - f783108 Merge pull request #54897 from bryceml/2019.2.1_fix_docs
  - e9a2a70 update version numbers to be correct

- PR #54894: (bryceml) 2019.2.1 fix docs @ 2019-10-04 22:31:26 UTC
  - 3233663 Merge pull request #54894 from bryceml/2019.2.1_fix_docs
  - 2456aaa Porting PR #52948 to 2019.2.1
  - 94a1e3b Porting PR #52752 to 2019.2.1
  - c7b7474 modifying saltconf ads
  - d48057b add new saltconf ads

- PR #54858: (frogunder) remove in progress from releasenotes 2019.2.2 @ 2019-10-02 20:42:59 UTC
  - 4b06eca Merge pull request #54858 from frogunder/releasenotes_remove2019.2.2
  - a697abd remove in progress from releasenotes 2019.2.2

- PR #54854: (frogunder) releasenotes 2019.2.2 @ 2019-10-02 18:58:21 UTC
  - aaf2d1c Merge pull request #54854 from frogunder/release_notes_2019.2.2
• PR #54852: (frogunder) Update man pages for 2019.2.2 @ 2019-10-02 18:27:07 UTC
  - 10d433f Merge pull request #54852 from frogunder/man_pages_2019.2.2
  - 92bc4b2 Update man pages for 2019.2.2

• PR #54845: (s0undt3ch) Remove debug print @ 2019-10-02 17:38:21 UTC
  - 8ca6b20 Merge pull request #54845 from s0undt3ch/hotfix/event-return-fix-2019.2.1
  - 3937890 Remove debug print

• ISSUE #54755: (Reiner030) 2019.2.1/2019.2.0 pip failures even when not using pip (refs: #54826)

• PR #54826: (dwoz) Fix issue 54755 and add regression tests @ 2019-10-01 20:07:46 UTC
  - 9e3914a Merge pull request #54826 from dwoz/issue_54755
  - 0bad9cb Handle locals and globals separately
  - bcbe9a2 Only purge pip when needed
  - d2f98ca Fix issue 54755 and add regression tests

• PR #54830: (frogunder) Add known issues to 2019.2.1 release notes @ 2019-10-01 16:23:30 UTC
  - ba569d0 Merge pull request #54830 from frogunder/update_relasenotes_2019.2.1
  - 8cdb27b Update 2019.2.1.rst
  - 14f955c Add known issues to 2019.2.1 release notes

• ISSUE #54521: (Oloremo) [Regression] Failhard, batch and retcodes (refs: #54806)

• PR #54806: (Oloremo) [Regression] Batch with failhard fix @ 2019-10-01 14:51:47 UTC
  - 433b6fa Merge pull request #54806 from Oloremo/failhard-batch-fix-2019.2.1
  - 6684793 Merge branch '2019.2.1' into failhard-batch-fix-2019.2.1
  - 3e0e928 Added tests for cli and runner
  - 2416516 Made batch work properly with failhard in cli and runner

• ISSUE #54820: (OrangeDog) schedule.present not idempotent when scheduler disabled (refs: #54828)

• PR #54828: (garethgreenaway) [2019.2.1] Fix global disabling code in scheduler @ 2019-10-01 09:27:49 UTC
  - ed94aa5 Merge pull request #54828 from garethgreenaway/54820_fix_schedule_disabled_job_enabled_bug
  - be15a28 Rework code that handles individual jobs being disabled and scheduler being globally being disabled. Previously disabling the schedule would result in individual jobs being disabled when they were run through eval. This change does not change schedule items.

• PR #54778: (Akm0d) fix broken salt-cloud openstack query @ 2019-10-01 09:23:27 UTC
  - 435b40c Merge pull request #54778 from Akm0d/master_openstack_query_fix
  - ba4ba2a fixed pylint errors in openstack test
  - d9a8517 Added openstack tests for openstack --query fix
  - 59214ad Fallback to image id if we don't have an image name
  - 3a42a4d fixed pylint error
  - 0074d18 created unit tests for openstack
- 4255e3e Merge branch '2019.2.1' of https://github.com/saltstack/salt into HEAD
- 1c2821b Return a configured provider, not a bool
- c585550 fix broken salt-cloud openstack query

**ISSUE #54762**: (margau) 2019.2.1: Breaks Minion-Master Communication (refs: #54823, #54784, #54807)

**PR #54823**: (dhiltonp) ip_bracket can now accept ipv6 addresses with brackets @ 2019-10-01 01:13:34 UTC
  - 93b1c4d Merge pull request #54823 from dhiltonp/maybe-bracket
  - faa1d98 ip_bracket can now accept ipv6 addresses with brackets

**ISSUE #54762**: (margau) 2019.2.1: Breaks Minion-Master Communication (refs: #54823, #54784, #54807)

**PR #54807**: (dwoz) Fix pip state pip >=10.0 and <=18.0 @ 2019-09-30 09:20:14 UTC
  - PR #54772: (OrlandoArcapix) Fix import of pip modules (refs: #54807)
  - b61b30d Merge pull request #54807 from dwoz/patch-2
  - 664806b Add unit test for pip state fix
  - e637658 Revert change to pip version query
  - 42810a2 Fix import of pip modules

**ISSUE #54741**: (kjkeane) Schedulers Fail to Run (refs: #54799)

**PR #54799**: (garethgreenaway) Fix to scheduler when job without a time element is run with schedule.run_job @ 2019-09-30 00:19:43 UTC
  - 4ee1ff6 Merge pull request #54799 from garethgreenaway/54741_run_job_fails_without_time_element
  - 44caa81 Merge branch '54741_run_job_fails_without_time_element' of github.com:garethgreenaway/salt into 54741_run_job_fails_without_time_element
    * 3ae4f75 Merge branch '2019.2.1' into 54741_run_job_fails_without_time_element
  - 8afdd8 Fixing test_run_job test to ensure the right data is being asserted. Updating unit/test_module_names.py to include integration.scheduler.test_run_job.
  - 7d716d6 Fixing lint.
  - ec68591 If a scheduled job does not contains a time element parameter then running that job with schedule.run_job fails with a traceback because data['run'] does not exist.

**PR #54785**: (Ch3LL) Fix state.show_states when sls file missing in top file @ 2019-09-30 00:00:34 UTC
  - b90c3f2 Merge pull request #54785 from Ch3LL/fix_show_states
  - 96540be Clean up files after state.show_states test
  - ad265ae Fix state.show_states when sls file missing

**ISSUE #54768**: (paul-palmer) 2019.2.1 Some Jinja imports not found (refs: #54780)

**ISSUE #54765**: (awerner) 2019.2.1: Jinja from import broken (refs: #54780)

**PR #54780**: (dwoz) Fix masterless jinja imports @ 2019-09-29 22:12:48 UTC
  - b9459e6 Merge pull request #54780 from dwoz/fix-masterless-jinja-imports
  - 5d873cc Merge branch '2019.2.1' into fix-masterless-jinja-imports
  - e901a83 Add regression tests for jinja import bug
- 3925bb7 Fix broken jinja imports in masterless salt-call

- **ISSUE #54776**: (javierbertoli) Setting `ping_interval` in salt-minion’s config (version 2019.2.1) prevents it from starting (refs: #54777)

- **PR #54777**: (javierbertoli) Fix minion's remove_periodic_callback() @ 2019-09-29 21:33:53 UTC
  - 4c240e5 Merge pull request #54777 from netmanagers/2019.2.1
  - 459c790 Merge branch ‘2019.2.1’ into 2019.2.1

- **PR #54805**: (bryceml) improve lint job @ 2019-09-29 21:24:05 UTC
  - 83f8f5c Merge pull request #54805 from bryceml/2019.2.1_update_lint_salt
  - ffa4ed6 improve lint job
  - fa1a767 Merge branch ‘2019.2.1’ into 2019.2.1

- **ISSUE #54751**: (jnmatlock) NXOS_API Proxy Minions Error KeyError: ‘proxy.post_master_init’ after upgrading to 2019.2.1 (refs: #54783)

- **PR #54783**: (garethgreenaway) Ensure metaproxy directory is included in sdist @ 2019-09-29 02:17:23 UTC
  - 6b43fbc Merge pull request #54783 from garethgreenaway/54751_fixing_missing_metaproxy_directory
  - 67d9938 Merge branch ‘2019.2.1’ into 54751_fixing_missing_metaproxy_directory
  - a35e609 Adding __init__.py to metaproxy directory so that metaproxy is included when running setup.py.

- **ISSUE #54762**: (margau) 2019.2.1: Breaks Minion-Master Communication (refs: #54823, #54784, #54807)

- **PR #54784**: (dhiltonp) fix dns_check to return uri-compatible ipv6 addresses, add tests @ 2019-09-28 08:36:51 UTC
  - 7912b67 Merge pull request #54784 from dhiltonp/ipv46
  - 042a101 Merge branch ‘2019.2.1’ into ipv46

- **PR #54779**: (frogunder) Add 2019.2.2 release notes @ 2019-09-27 17:45:46 UTC
  - 2f94b44 Merge pull request #54779 from frogunder/releasenotes_2019.2.2
  - 67f564b Add 2019.2.2 release notes
  - ac6b54f Merge branch ‘2019.2.1’ into ipv46
  - 93ebd09 update mock (py2) from 2.0.0 to 3.0.5
  - 37bcc4c fix dns_check to return uri-compatible ipv6 addresses, add tests
    - dd86c46 Merge pull request #1 from waynew/pull/54777-callback-typo
      - a57f7d0 Add tests
    - c19d0b0 Fix minion’s remove_periodic_callback()

- **PR #54731**: (pizzapanther) Fix returners not loading properly @ 2019-09-26 17:24:27 UTC
  - 46bcb3c Merge pull request #54731 from pizzapanther/not-so-__new__-and-shiny
  - bdf24f4 Make sure we tests salt-master’s `event_return` setting
  - 5499518 remove unnecessary import
  - 3f8a382 fix module import
  - 0746aa7 remove __new__ method since it was removed from parent class
30.2.26 Salt 2019.2.3 Release Notes

Version 2019.2.3 is a CVE-fix release for 2019.2.0.

Security Fix

CVE-2019-17361

With the Salt NetAPI enabled in addition to having a SSH roster defined, unauthenticated access is possible when specifying the client as SSH. Additionally, when the raw_shell option is specified any arbitrary command may be run on the Salt master when specifying SSH options.

30.2.27 Salt 2019.2.4 Release Notes

Version 2019.2.4 is a CVE-fix release for 2019.2.0.

Security Fix

CVE-2020-11651

An issue was discovered in SaltStack Salt before 2019.2.4 and 3000 before 3000.2. The salt-master process ClearFuncs class does not properly validate method calls. This allows a remote user to access some methods without authentication. These methods can be used to retrieve user tokens from the salt master and/or run arbitrary commands on salt minions.

CVE-2020-11652

An issue was discovered in SaltStack Salt before 2019.2.4 and 3000 before 3000.2. The salt-master process ClearFuncs class allows access to some methods that improperly sanitize paths. These methods allow arbitrary directory access to authenticated users.

Known Issue

Part of the fix for CVE-2020-11651 added better validation of the methods allowed to be called by remote clients. Both AESFuncs and ClearFuncs now have an explicit list of methods that can be called. The name of one of these whitelisted methods on AESFuncs had a typo. The _minion_runner method should be minion_runner (without the underscore prefix). This typo breaks the publish module’s runner method. Calling runners, for example:

```
salt minion publish.runner manage.down
```

Will not work, and you will receive an empty reply from the salt master.

This will be addressed in the 3001 release of Salt set for mid-June 2020.
30.2.28 Salt 2019.2.5 Release Notes

Version 2019.2.5 is a bug-fix release for 2019.2.0.

Statistics

- Total Merges: 2
- Total Issue References: 2
- Total PR References: 2
- Contributors: 2 (dwoz, frogunder)

Changelog for v2019.2.4..v2019.2.5

Generated at: 2020-05-05 22:43:12 UTC

- PR #57096: (frogunder) Update man_pages 2019.2.5 @ 2020-05-05 22:10:46 UTC
  - 6877b7259a Merge pull request #57096 from frogunder/man_pages_2019.2.5
  - 58ea351a59 Update man_pages 2019.2.5

- ISSUE #57027: (ecarson) [BUG] Master running 2019.2.4 or 3000.2 unable to synchronize files using saltutil.sync_all to 2017.7.1 minion due to CVE fix (refs: #57090)

- ISSUE #57016: (idontwanttosignin) [BUG] Requested method not exposed: minion_runner (refs: #57090)

- PR #57090: (dwoz) Address Issues in CVE Release @ 2020-05-05 22:09:25 UTC
  - 8fe0f66f94 Merge pull request #57090 from dwoz/bugs_n_stuff
  - f3e8590bac Describe SEPs
  - aa1a9d340d Update hardening doc to mention 4505/4506
  - ca303f7c0c Add link to salt-announce to documentation
  - c63253ef9c Address issues in cve release

30.2.29 Salt 2019.2.6 Release Notes

Version 2019.2.6 is a CVE fix release for 2019.2.0.

Fixed

- Prevent shell injections in netapi ssh client (cve-2020-16846)
- Prevent creating world readable private keys with the tls execution module. (cve-2020-17490)
30.2.30 Salt 2019.2.7 Release Notes

Version 2019.2.7 is a CVE fix release for 2019.2.0.

Fixed

- Properly validate eauth credentials and tokens along with their ACLs. Prior to this change eauth was not properly validated when calling Salt ssh via the salt-api. Any value for 'eauth' or 'token' would allow a user to bypass authentication and make calls to Salt ssh. (CVE-2020-25592)

30.2.31 Salt 2019.2.8 Release Notes

Version 2019.2.8 is a bugfix release for 2019.2.0.

Fixed

- Fixes salt-ssh authentication when using tty (#58922)

30.2.32 Salt 2018.3.0 Release Notes - Codename Oxygen

**Warning**: If you are using Jinja to dump lists or dictionaries in your SLS files, this will now cause errors in Python 2 since Jinja does not produce YAML-compatible output when strings in the data structures contain unicode types. The dictionary must be passed through a Jinja filter to produce YAML-compatible strings.

The below is an example of invalid SLS:

```plaintext
/etc/foo.conf:
  file.mangaged:
    - source: salt://foo.conf
    - template: jinja
    - defaults: {{ mydict }}
```

To make it valid, use either one of Salt's own json or yaml filters:

```plaintext
/etc/foo.conf:
  file.mangaged:
    - source: salt://foo.conf
    - template: jinja
    - defaults: {{ mydict | json }}
```

**Unicode/Python 3 Compatibility Improvements**

This release fixes a number of nagging issues with Unicode strings in Salt under Python 2 (ex. 'ascii' codec can't decode byte 0xd0). For best results, use a UTF-8 locale (such as by setting the LANG environment variable to one which supports UTF-8. For example en_US.UTF-8, de_DE.UTF-8, ru_RU.UTF-8, C.UTF-8). Additionally, a number of Python 3 compatibility fixes have been made, many of them having to do with file I/O and str/bytes mismatches.

We continue to work toward improving both Unicode and Python 3 compatibility and welcome any feedback.
Lots of Docker Improvements

Much Improved Support for Docker Networking

The `docker_network.present` state has undergone a full rewrite, which includes the following improvements:

Full API Support for Network Management

The improvements made to input handling in the `docker_container.running` state for 2017.7.0 have now been expanded to `docker_network.present`. This brings with it full support for all tunable configuration arguments.

Custom Subnets

Custom subnets can now be configured. Both IPv4 and mixed IPv4/IPv6 networks are supported. See here for more information.

Network Configuration in `docker_container.running` States

A long-requested feature has finally been added! It is now possible to configure static IPv4/IPv6 addresses, as well as links and labels. See here for more information.

Note: While the `containers` argument to `docker_network.present` will continue to be supported, it will no longer be the recommended way of ensuring that a container is attached to a network.

Improved Handling of Images from Custom Registries

Rather than attempting to parse the tag from the passed image name, Salt will now resolve that tag down to an image ID and use that ID instead.

Important: Due to this change, there are some backward-incompatible changes to image management. See below for a full list of these changes.

Backward-incompatible Changes to Docker Image Management

Passing image names to the following functions must now be done using separate `repository` and `tag` arguments:

- `docker.build`
- `docker.commit`
- `docker.import`
- `docker.load`
- `docker.tag`
Additionally, the `tag` argument must now be explicitly passed to the `docker_image.present` state, unless the image is being pulled from a docker registry.

**State and Execution Module Support for `docker run` Functionality**

The `docker_container.running` state is good for containers which run services, but it is not as useful for cases in which the container only needs to run once. The `start` argument to `docker_container.running` can be set to `False` to prevent the container from being started again on a subsequent run, but for many use cases this is not sufficient. Therefore, the `docker.run_container` remote-execution function was added. When used on the Salt CLI, it will return information about the container, such as its name, ID, exit code, and any output it produces.

State support has also been added via the `docker_container.run` state. This state is modeled after the `cmd.run` state, and includes arguments like `onlyif`, `unless`, and `creates` to control whether or not the container is run.

**Full API Support for `docker.logs`**

This function now supports all of the functions that its Docker API counterpart does, allowing you to do things like include timestamps, and also suppress stdout/stderr, etc. in the return.

**`start` Argument Added to `docker.create` Function**

This removes the need to run `docker.start` separately when creating containers on the Salt CLI.

```
salt myminion docker.create image=fedora:24 command=/path/to/command start=True
```

**Use SaltSSH Minions like regular Master-Minions**

The Master process can now also call SSH minions as if they were connected to the master using ZeroMQ. By setting `enable_ssh_minions: True` in the master config file, the master will create a Salt SSH client process which connects to the minion and returns the output for the `salt` CLI to use like a regular minion. This can be used anywhere the LocalClient is used.

**Exceptions Raised for Authentication/Authorization Errors**

When sending `publish` commands via `master.py` and `masterapi.py` and an authorization or authentication problem is encountered, Salt will now raise the appropriate exceptions instead of returning an empty string: `''.

The reasoning behind this change is to make it easier to debug various scenarios surrounding authentication and authorization issues more effectively.
Comparison Operators in Package Installation

Salt now supports using comparison operators (e.g. \texttt{>=1.2.3}) when installing packages on minions which use \texttt{yum/dnf} or \texttt{apt}. This is supported both in the \texttt{pkg.installed} state and in the \texttt{pkg.install} remote execution function.

Master Tops Changes

When both \texttt{Master Tops} and a \texttt{Top File} produce SLS matches for a given minion, the matches were being merged in an unpredictable manner which did not preserve ordering. This has been changed. The top file matches now execute in the expected order, followed by any master tops matches that are not matched via a top file.

To make master tops matches execute first, followed by top file matches, set the new \texttt{master_tops_first} minion config option to \texttt{True}.

Several Jinja Filters Renamed

The following Jinja filters (originally added in 2017.7.0) have been renamed due to the fact that they were inaccurately named when initially added. The original names will be supported until the 3000 release of Salt.

- \texttt{rand_str} renamed to \texttt{random_hash}
- \texttt{jinja_decode_dict} renamed to \texttt{jinja_encode_dict}
- \texttt{jinja_decode_list} renamed to \texttt{jinja_encode_list}

Return Codes for Runner/Wheel Functions

When using \texttt{orchestration}, runner and wheel functions used to report a \texttt{True} result if the function ran to completion without raising an exception. It is now possible to set a return code in the \texttt{__context__} dictionary, allowing runner and wheel functions to report that they failed. Here's some example pseudocode:

```python
def myrunner():
    ...
    # do stuff
    ...
    if some_error_condition:
        __context__["retcode"] = 1
    return result
```

Variable Update Intervals for Fileserver Backends

Prior to this release, fileservers would be updated as part of a dedicated "maintenance" process, in which various routine maintenance tasks were performed. This tied the update interval to the \texttt{loop_interval} config option, and also forced all fileservers to update at the same interval.

2018.3.0 adds the following configuration options for the various fileserver backends:

- \texttt{roots_update_interval}
- \texttt{azurefs_update_interval}
- \texttt{gitfs_update_interval}
- \texttt{hgfs_update_interval}
• `minionfs_update_interval`
• `s3fs_update_interval`
• `svnfs_update_interval`

These allow for update intervals to be set for each individual backend. The default value for each of these is 60 seconds.

In addition, for `GitFS` it is also possible to apply intervals to individual remotes. See [here](#) for examples.

**Note:** `git_pillar` does not yet support variable update intervals, this is targeted for the next feature release (2019.2.0).

**LDAP via External Authentication Changes**

In this release of Salt, if LDAP Bind Credentials are supplied, then these credentials will be used for all LDAP access except the first authentication when a job is submitted. The first authentication will use the user’s credentials as passed on the CLI. This behavior is to accommodate certain two-factor authentication schemes where the authentication token can only be used once.

In previous releases the bind credentials would only be used to determine the LDAP user’s existence and group membership. The user’s LDAP credentials were used from then on.

**Stormpath External Authentication Removed**

Per Stormpath’s announcement, their API will be shutting down on 8/17/2017 at noon PST so the Stormpath external authentication module has been removed.

https://stormpath.com/oktaplusstormpath

**New (Proxy) Minion Configuration Options**

To be able to connect the Minion to the Master using a certain source IP address or port, the following options have been added:

• `source_interface_name`
• `source_address`
• `source_ret_port`
• `source_publish_port`

**environment** config option renamed to **saltenv**

The `environment` config option predates referring to a salt fileserver environment as a `saltenv`. To pin a minion to a single environment for running states, one would use `environment`, but overriding that environment would be done with the `saltenv` argument. For consistency, `environment` is now simply referred to as `saltenv`. There are no plans to deprecate or remove `environment`, if used it will log a warning and its value will be used as `saltenv`. 

---

30.2. Previous Releases
lock_saltenv config option added

If set to True, this option will prevent a minion from allowing the saltenv argument to override the value set in saltenv when running states.

Failed Minions for State/Function Orchestration Jobs Added to Changes Dictionary

For orchestration jobs which run states (or run remote execution functions and also use a fail function to indicate success or failure), minions which have False results were previously included as a formatted string in the comment field of the return for that orchestration job. This made the failed returns difficult to parse programatically. The failed returns in these cases are now included in the changes dictionary, making for much easier parsing.

Grains

- fc_wwn - Show all fibre channel world wide port names for a host, must be enabled with fibre_channel_grains
- iscsi_iqn - Show the iSCSI IQN name for a host
- swap_total - Show the configured swap_total for Linux, *BSD, OS X and Solaris/SunOS
- virtual:
  - identifies reports KVM and VMM hypervisors when running an OpenBSD guest
  - for detecting Solaris Logical Domains (LODMs) running on T-Series SPARC hardware. The virtual_subtype grain is populated as a list of domain roles.

Salt Minion Auto-discovery

Using auto-discovery, the Salt Minion now no longer needs to be configured against a specific DNS name or IP address of a Master.

For this feature Salt Master now requires port 4520 for UDP broadcast packets to be opened and the Salt Minion be able to send UDP packets to the same port.

Configuration

By default, automatic discovery is disabled.

**Warning:** Due to the current limitations that will be changing in a future release, before you turn on auto-discovery, make sure your network is secured and trusted.

Auto-discovery is configured on Master and Minion. Both of them are configured via the discovery option as follows:

**Master configuration**

To use the default configuration, which accepts any minion, simply set discovery to True:

```
discovery: true
```

A sub-option called mapping allows auto-discovery to help find the proper Master. The mapping contains an arbitrary set of key/value pairs, which the Minion configuration can target. By default, no mappings are set.

Example:
It is also possible to change the port used from the default of 4520, by setting a `port` option under the Master's `discovery` configuration:

```yaml
discovery:
  port: 4567
```

Note: When using a port number other than the default, the Minion's `discovery` configuration must also have a port specified, otherwise the Minion will still attempt to contact the Master on port 4520.

Minion configuration

In addition to the `mapping` and `port` options, the following additional options are available to Minions:

- **attempts** - This option specifies how many broadcast requests should be sent to the network, waiting for any Master response. Each attempt takes a couple of seconds, so raising this value may result in a slower Minion startup. Note that, on a properly-configured network, autodiscovery should succeed on the first attempt. By default, this value is set to 3.
- **match** - This option can be set to either `all` or `any`, and it determines how the values configured in `mapping` are matched. If set to `all`, then all of the key/value pairs in the Minion's `mapping` must match a given Master. If set to `any` (the default), then any match to a key/value mapping will constitute a match.
- **pause** - The interval in seconds between attempts (default: 5).
- **fibre_channel_grains** - Enables the `fc_wwn` grain. (Default: False)
- **iscsi_grains** - Enables the `iscsi_iqn` grain. (Default: False)

Connection to a type instead of DNS

By now each Minion was connecting to a Master by DNS or IP address. From now on it is possible also to connect to a _type_ of a Master. For example, in a network there are three different Masters, each corresponds for a particular niche or environment or specific role etc. The Minion is supposed to connect only to one of those Masters that is described appropriately.

To achieve such an effect, each `/etc/salt/master` configuration should have a `discovery` option, which should have a `mapping` element with arbitrary key/value pairs. The same configuration should be on the Minion, so then when mapping matches, Minion recognises Master as its connection target.

Example for Master configuration (/etc/salt/master):

```yaml
discovery:
  mapping:
    description: SES 5.0
    node: 1
```

The example above describes a system that is running a particular product, where `description` is an arbitrary key and `SES 5.0` is just a string. In order to match exactly this Master, the following configuration at Minion should be present:
discovery:
  match: all  # Can be "all" or "any"
  mapping:
    description: SES 5.0
    node: 1

Notice match criteria is set to all. This would mean that from all found Masters select only that, which description is set to SES 5.0 and node is set to 1. All other Masters will be ignored.

Limitations

This feature has a couple of _temporary_ limitations that are subject to change in the future:

- Only one Master on the network is supported. Currently the Minion cannot select which Master out of few the same to choose. This will change to choosing the Master that is least loaded.
- Minions will accept _any_ master that matches connection criteria without any particular security applied (priv/pub key check, signature, fingerprint etc). That implies that administrator is expected to know his network and make sure it is clean.

New Modules

- salt.modules.purefa

New NaCl Renderer

A new renderer has been added for encrypted data.

New support for Cisco UCS Chassis

The salt proxy minion now allows for control of Cisco USC chassis. See the cimc modules for details.

New support for Cassandra v3

The cassandra_cql module now supports Cassandra v3 which has changed its internal schema to define keystaces and columns.

New salt-ssh roster

A new roster has been added that allows users to pull in a list of hosts for salt-ssh targeting from a ~/.ssh configuration. For full details, please see the sshconfig roster.
New GitFS Features

Two new features which affect how GitFS maps branches/tags to fileserver environments (i.e. saltenvs) have been added:

1. It is now possible to completely turn off Salt's default mapping logic (aside from the mapping of the base saltenv). This can be triggered using the new `gitfs_disable_saltenv_mapping` config option.

   **Note:** When this is disabled, only the base saltenv and any configured using `per-saltenv configuration parameters` will be available.

2. The types of refs which Salt will use as saltenvs can now be controlled. In previous releases, branches and tags were both mapped as environments, and individual commit SHAs could be specified as saltenvs in states (and when caching files using `cp.cache_file`). Using the new `gitfs_ref_types` config option, the types of refs which are used as saltenvs can be restricted. This makes it possible to ignore all tags and use branches only, and also to keep SHAs from being made available as saltenvs.

Additional output modes

The `state_output` parameter now supports `full_id`, `changes_id` and `terse_id`. Just like `mixed_id`, these use the state ID as name in the highstate output. For more information on these output modes, see the docs for the Highstate Outputter.

Windows

Python Version

Python 2 Windows API was design when Windows did not support Unicode. Windows now supports Unicode however to keep backwards compatibility Python 2 Windows API has not been changed. Python 3 Windows API supports Unicode. Salt Python 3 installer is the recommend choice for users who need characters other than Non-ASCII (7bit) characters.

pkg Execution module changes

Significant changes have been made to the `win_pkg` execution module. Users should test this release against their existing package sls definition files. These changes are also in 2016.11.9 & 2017.7.3.

- `pkg.list_available` no longer defaults to refreshing the winrepo meta database.
- `pkg.install` without a `version` parameter no longer upgrades software if the software is already installed. Use `pkg.install version=latest` or in a state use `pkg.latest` to get the old behavior.
- `pkg.list_pkgs` now returns multiple versions if software installed more than once.
- `pkg.list_pkgs` now returns 'Not Found' when the version is not found instead of '{value not set}' which matches the contents of the sls definitions.
- `pkg.remove()` will wait up to 3 seconds (normally about a second) to detect changes in the registry after removing software, improving reporting of version changes.
- `pkg.remove()` can remove `latest` software, if `latest` is defined in sls definition.
- Documentation was update for the execution module to match the style in new versions, some corrections as well.

30.2. Previous Releases
All install/remove commands are prefix with cmd.exe shell and cmdmod is called with a command line string instead of a list. Some sls files in saltstack/salt-winrepo-ng expected the commands to be prefixed with cmd.exe (i.e. the use of &).

Some execution module functions results, now behave more like their Unix/Linux versions.

**Installer**

**Changes to config handling**

Behavior with existing configuration has changed. With previous windows installers the existing config was used and the master and minion id could be modified via the installer. It was problematic in that it didn't account for configuration that may be defined in the minion.d directory. This change gives you the option via a drop-down list to use one of the following:

- Default Config: Use the config that comes with the installer
- Existing Config: Use the current config without changes
- Custom Config: Select a custom config using the file picker

The existing config option will only be available if the installer detects an existing config. If there is an existing config, and you choose Default or Custom, the existing config will be deleted, including the minion.d directory, and replaced by your selection.

The Default Config and Custom Config options will allow you to modify the Master and the Minion ID. Existing Config will leave the existing configuration unchanged.

These settings can be defined on the command line using the following switches:

- /default-config
- /custom-config=C:\Path\To\Custom\Config\minion

If neither option is passed and there is an existing config, the default is to use the existing config. If there is no existing config (new install) the default config will be used.

**Multi-master configuration**

The installer now has the ability to apply a multi-master configuration either from the GUI or the command line. The master field in the GUI can accept either a single master or a comma-separated list of masters. The command-line switch (/master=) can accept the same.

**Command-line help**

The Windows installer will now display command-line help when a help switch (/?) is passed.
New utils module `salt.utils.pkg.win`  

A new utils module has been added, which gathers information about windows installed software. This is currently not used by any salt execution module or state at this time. Users are encouraged to run this and report any issues. Running the command with the `detail` option will be useful for anyone developing windows package definitions. With salt installed in the default location the following command will print the help message.

```
chcp 65001
\c:\salt\bin\python.exe \c:\salt\bin\lib\site-packages\salt\utils\pkg\win.py
c:\salt\bin\python.exe c:\salt\bin\lib\site-packages\salt\utils\pkg\win.py detail
```

Salt Cloud Features

OpenStack Revamp

The OpenStack Driver has been rewritten mostly from scratch. Salt is now using the `shade` driver <https://docs.openstack.org/shade/latest/>.

With this, the `nova` driver is being deprecated.

Openstack driver

There have also been several new modules and states added for managing OpenStack setups using shade as well.

```bash
keystone keystone role grant keystone group keystone role keystone service
keystone user keystone domain keystone project keystone endpoint glance
glance_image neutron neutron subnet neutron secgroup neutron secgroup rule
neutron network
```

Pre-Flight Commands

Support has been added for specified "preflight commands" to run on a VM before the deploy script is run. These must be defined as a list in a cloud configuration file. For example:

```
my-cloud-profile:
  provider: linode-config
  image: Ubuntu 16.04 LTS
  size: Linode 2048
  preflight_cmds:
    - whoami
    - echo 'hello world!'
```

These commands will run in sequence before the bootstrap script is executed.
New salt-cloud Grains

When salt-cloud creates a new minion, it will now add grain information to the minion configuration file, identifying the resources originally used to create it.

The generated grain information will appear similar to:

```yaml
grains:
salt-cloud:
  driver: ec2
  provider: my_ec2:ec2
  profile: ec2-web
```

The generation of salt-cloud grains can be suppressed by the option `enable_cloud_grains: 'False'` in the cloud configuration file.

Upgraded Saltify Driver

The salt-cloud Saltify driver is used to provision machines which are not controlled by a dedicated cloud supervisor (such as typical hardware machines) by pushing a salt-bootstrap command to them and accepting them on the salt master. Creation of a node has been its only function and no other salt-cloud commands were implemented.

With this upgrade, it can use the salt-api to provide advanced control, such as rebooting a machine, querying it along with conventional cloud minions, and, ultimately, disconnecting it from its master.

After disconnection from ("destroying" on) one master, a machine can be re-purposed by connecting to ("creating" on) a subsequent master.

New Vagrant Driver

The salt-cloud Vagrant driver brings virtual machines running in a limited environment, such as a programmer's workstation, under salt-cloud control. This can be useful for experimentation, instruction, or testing salt configurations.

Using salt-api on the master, and a salt-minion running on the host computer, the Vagrant driver can create (`vagrant up`), restart (`vagrant reload`), and destroy (`vagrant destroy`) VMs, as controlled by salt-cloud profiles which designate a Vagrantfile on the host machine.

The master can be a very limited machine, such as a Raspberry Pi, or a small VagrantBox VM.

Python PyWinRM Module

Versions of `pywinrm>=0.2.1` are finally able to disable validation of self signed certificates. Here for more information.
DigitalOcean

The DigitalOcean driver has been renamed to conform to the company name. The new driver name is digitalocean. The old name digital_ocean and a short one do will still be supported through virtual aliases, this is mostly cosmetic.

Azure Cloud

The azure sdk used for the azurearm cloud driver now depends on azure-cli>=2.0.12

New saltclass pillar/master_tops modules

This module clones the behaviour of reclass (http://reclass.pantsfullofunix.net/), without the need of an external app, and add several features to improve flexibility. Saltclass lets you define your nodes from simple yaml files (.yml) through hierarchical class inheritance with the possibility to override pillars down the tree.

Features

- Define your nodes through hierarchical class inheritance
- Reuse your reclass data with minimal modifications
  - applications => states
  - parameters => pillars
- Use Jinja templating in your yaml definitions
- Access to the following Salt objects in Jinja
  - __opts__
  - __salt__
  - __grains__
  - __pillars__
  - minion_id
- Chose how to merge or override your lists using ^ character (see examples)
- Expand variables $[] with possibility to escape them if needed $[] (see examples)
- Ignores missing node/class and will simply return empty without breaking the pillar module completely - will be logged

An example subset of data is available here: https://git.mauras.ch/salt/saltclass/src/branch/master/examples

<table>
<thead>
<tr>
<th>Terms usable in yaml files</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>classes</td>
<td>A list of classes that will be processed in order</td>
</tr>
<tr>
<td>states</td>
<td>A list of states that will be returned by master_tops function</td>
</tr>
<tr>
<td>pillars</td>
<td>A yaml dictionary that will be returned by the ext_pillar function</td>
</tr>
<tr>
<td>environment</td>
<td>Node saltenv that will be used by master_tops</td>
</tr>
</tbody>
</table>

A class consists of:

- zero or more parent classes
- zero or more states

30.2. Previous Releases
• any number of pillars

A child class can override pillars from a parent class. A node definition is a class in itself with an added environment parameter for saltenv definition.

Class Names

Class names mimic salt way of defining states and pillar files. This means that default.users class name will correspond to one of these:

- `<saltclass_path>/classes/default/users.yml`
- `<saltclass_path>/classes/default/users/init.yml`

Saltclass Tree

A saltclass tree would look like this:

```
<saltclass_path>
  └── classes
      ├── app
      │   ├── borgbackup.yml
      │   └── ssh
      │       └── server.yml
      └── default
          │   ├── init.yml
          │   └── motd.yml
          └── users.yml
      └── roles
          ├── app.yml
          │   └── nginx
          │       └── init.yml
          │       └── server.yml
          └── subsidiaries
              ├── gnv.yml
              └── qls.yml
        └── nodes
            └── zurich
                ├── zrh.node1.yml
                └── zrh.node2.yml
```

Examples

```
<saltclass_path>/nodes/lausanne/qls.node1.yml
```

```
environment: base
classes:
```
(continues on next page)
- subsidiaries.{{ __grains__["id"].split(\'\')[0] }}

<saltclass_path>/classes/default/init.yml

```yaml
classes:
  - default.users
  - default.motd

states:
  - openssh

pillars:
  default:
    network:
      dns:
        srv1: 192.168.0.1
        srv2: 192.168.0.2
        domain: example.com
      ntp:
        srv1: 192.168.10.10
        srv2: 192.168.10.20
```

<saltclass_path>/classes/subsidiaries/gnv.yml

```yaml
pillars:
  default:
    network:
      sub: Geneva
      dns:
        srv1: 10.20.0.1
        srv2: 10.20.0.2
        srv3: 192.168.1.1
        domain: gnv.example.com
    users:
      adm1:
        uid: 1210
        gid: 1210
        gecos: 'Super user admin1'
        homedir: /srv/app/adm1
      adm3:
        uid: 1203
        gid: 1203
        gecos: 'Super user adm
```

Variable expansions:

Escaped variables are rendered as is - $\{test\}$

Missing variables are rendered as is - $\{net:dns:srv2\}$
srv1: ${default:network:dns:srv1}
srv2: ${net:dns:srv2}
uri: https://application.domain/call?$\{test\}
prod_parameters:
- p1
- p2
- p3
pkg:
- app-core
- app-backend

List override:
Not using ^ as the first entry will simply merge the lists

pillar:
app:
  pkg:
    - ^
    - app-frontend

Known limitation
Currently you can’t have both a variable and an escaped variable in the same string as the escaped one will not be correctly rendered - ‘${xx}’ will stay as is instead of being rendered as ‘${xx}’

Lists of comments in state returns
State functions can now return a list of strings for the comment field, as opposed to only a single string. This is meant to ease writing states with multiple or multi-part comments.

Beacon configuration changes
In order to remain consistent and to align with other Salt components such as states, support for configuring beacons using dictionary based configuration has been deprecated in favor of list based configuration. All beacons have a validation function which will check the configuration for the correct format and only load if the validation passes.

avahi_announce

Old behavior:

```yaml
beacons:
avahi_announce:
  run_once: True
  servicetype: _demo._tcp
  port: 1234
  txt:
    ProdName: grains.productname
    SerialNo: grains.serialnumber
    Comments: 'this is a test'
```

New behavior:

```yaml
beacons:
avahi_announce:
  run_once: True
  servicetype: _demo._tcp
  port: 1234
  txt:
    ProdName: grains.productname
    SerialNo: grains.serialnumber
    Comments: 'this is a test'
```
beacons:
   avahi_announce:
      - run_once: True
      - servicetype: _demo._tcp
      - port: 1234
      - txt:
          ProdName: grains.productname
          SerialNo: grains.serialnumber
          Comments: 'this is a test'

Bonjour_announce

Old behavior:
beacons:
   bonjour_announce:
      run_once: True
      servicetype: _demo._tcp
      port: 1234
      txt:
         ProdName: grains.productname
         SerialNo: grains.serialnumber
         Comments: 'this is a test'

New behavior:
beacons:
   bonjour_announce:
      - run_once: True
      - servicetype: _demo._tcp
      - port: 1234
      - txt:
          ProdName: grains.productname
          SerialNo: grains.serialnumber
          Comments: 'this is a test'

btmp

Old behavior:
beacons:
   btmp: {}

New behavior:
beacons:
   btmp: []
glxinfo

Old behavior:

```yaml
beacons:
  glxinfo:
    user: frank
    screen_event: True
```

New behavior:

```yaml
beacons:
  glxinfo:
    - user: frank
    - screen_event: True
```

haproxy

Old behavior:

```yaml
beacons:
  haproxy:
    - www-backend:
      threshold: 45
      servers:
      - web1
      - web2
    - interval: 120
```

New behavior:

```yaml
beacons:
  haproxy:
    - backends:
        www-backend:
          threshold: 45
          servers:
          - web1
          - web2
        - interval: 120
```

inotify

Old behavior:

```yaml
beacons:
  inotify:
    /path/to/file/or/dir:
      mask:
      - open
      - create
      - close_write
      recurse: True
      auto_add: True
```

(continues on next page)
**exclude:**
- /path/to/file/or/dir/exclude1
- /path/to/file/or/dir/exclude2
- /path/to/file/or/dir/regex[a-m]*$:

  **regex:** True

  **coalesce:** True

New behavior:

**beacons:**

  **inotify:**
  - **files:**
    - /path/to/file/or/dir:
      **mask:**
      - open
      - create
      - close_write
      **recurse:** True
      **auto_add:** True
      **exclude:**
      - /path/to/file/or/dir/exclude1
      - /path/to/file/or/dir/exclude2
      - /path/to/file/or/dir/regex[a-m]*$:
        **regex:** True
        **coalesce:** True

    - **sshd:**
      **SYSLOG_IDENTIFIER:** sshd
      **PRIORITY:** 6
load

Old behavior:

```yaml
beacons:
  load:
    1m:
      - 0.0
      - 2.0
    5m:
      - 0.0
      - 1.5
    15m:
      - 0.1
      - 1.0
  emitatstartup: True
  onchangeonly: False
```

New behavior:

```yaml
beacons:
  load:
    - averages:
      1m:
        - 0.0
        - 2.0
      5m:
        - 0.0
        - 1.5
      15m:
        - 0.1
        - 1.0
        - emitatstartup: True
        - onchangeonly: False
```

log

Old behavior:

```yaml
beacons:
  log:
    file: <path>
    <tag>:
      regex: <pattern>
```

New behavior:

```yaml
beacons:
  log:
    - file: <path>
    - tags:
      <tag>:
        regex: <pattern>
```
network_info

Old behavior:

```yaml
beacons:
  network_info:
    - eth0:
      type: equal
      bytes_sent: 100000
      bytes_recv: 100000
      packets_sent: 100000
      packets_recv: 100000
      errin: 100
      errout: 100
      dropin: 100
      dropout: 100
```

New behavior:

```yaml
beacons:
  network_info:
    - interfaces:
      eth0:
        type: equal
        bytes_sent: 100000
        bytes_recv: 100000
        packets_sent: 100000
        packets_recv: 100000
        errin: 100
        errout: 100
        dropin: 100
        dropout: 100
```

network_settings

Old behavior:

```yaml
beacons:
  network_settings:
    eth0:
      ipaddr:
      promiscuity:
        onvalue: 1
    eth1:
      linkmode:
```

New behavior:

```yaml
beacons:
  network_settings:
    - interfaces:
      - eth0:
        ipaddr:
        promiscuity:
          onvalue: 1
```

(continues on next page)
- eth1:
  linkmode:

proxy_example

Old behavior:

```yaml
beacons:
  proxy_example:
    endpoint: beacon
```

New behavior:

```yaml
beacons:
  proxy_example:
    - endpoint: beacon
```

ps

Old behavior:

```yaml
beacons:
  ps:
    - salt-master: running
    - mysql: stopped
```

New behavior:

```yaml
beacons:
  ps:
    - processes:
      salt-master: running
      mysql: stopped
```

salt_proxy

Old behavior:

```yaml
beacons:
  salt_proxy:
    - p8000: {}
    - p8001: {}
```

New behavior:

```yaml
beacons:
  salt_proxy:
    - proxies:
      p8000: {}
p8001: {}
```
sensehat

Old behavior:

```yaml
beacons:
    sensehat:
        humidity: 70%
        temperature: [20, 40]
        temperature_from_pressure: 40
        pressure: 1500
```

New behavior:

```yaml
beacons:
    sensehat:
        sensors:
            humidity: 70%
            temperature: [20, 40]
            temperature_from_pressure: 40
            pressure: 1500
```

service

Old behavior:

```yaml
beacons:
    service:
        salt-master:
        mysql:
```

New behavior:

```yaml
beacons:
    service:
        services:
            nginx:
                onchangeonly: True
                delay: 30
                uncleanshutdown: /run/nginx.pid
```

sh

Old behavior:

```yaml
beacons:
    sh: {}
```

New behavior:

```yaml
beacons:
    sh: []
```
status

Old behavior:
```
beacons:
    status: {}
```

New behavior:
```
beacons:
    status: []
```

telegram_bot_msg

Old behavior:
```
beacons:
    telegram_bot_msg:
        token: "<bot access token>"
        accept_from:
            - "<valid username>"
        interval: 10
```

New behavior:
```
beacons:
    telegram_bot_msg:
        - token: "<bot access token>"
        - accept_from:
            - "<valid username>"

        - auth_token: "<auth token>"
        - twilio_number: "+15555555555"
        - interval: 10
```
wtmp

Old behavior:

```
beacons:
  wtmp: {}
```

New behavior:

```
beacons:
  wtmp: []
```

New requisites available in state compiler

**require_any**

The use of require_any demands that one of the required states executes before the dependent state. The state containing the require_any requisite is defined as the dependent state. The states specified in the require_any statement are defined as the required states. If at least one of the required state's execution succeeds, the dependent state will then execute. If all of the executions by the required states fail, the dependent state will not execute.

**watch_any**

The state containing the watch_any requisite is defined as the watching state. The states specified in the watch_any statement are defined as the watched states. When the watched states execute, they will return a dictionary containing a key named "changes".

If the "result" of any of the watched states is True, the watching state will execute normally, and if all of them are False, the watching state will never run. This part of watch mirrors the functionality of the require requisite.

If the "result" of any of the watched states is True and the "changes" key contains a populated dictionary (changes occurred in the watched state), then the watch requisite can add additional behavior. This additional behavior is defined by the mod_watch function within the watching state module. If the mod_watch function exists in the watching state module, it will be called in addition to the normal watching state. The return data from the mod_watch function is what will be returned to the master in this case; the return data from the main watching function is discarded.

If the "changes" key contains an empty dictionary, the watch requisite acts exactly like the require requisite (the watching state will execute if "result" is True, and fail if "result" is False in the watched state).

**onchanges_any**

The onchanges_any requisite makes a state only apply one of the required states generates changes, and if one of the watched state's "result" is True. This can be a useful way to execute a post hook after changing aspects of a system.
onfail_any

The onfail_any requisite allows for reactions to happen strictly as a response to the failure of at least one other state. This can be used in a number of ways, such as executing a second attempt to set up a service or begin to execute a separate thread of states because of a failure.

The onfail_any requisite is applied in the same way as require_any and watch_any.

Basic Slots support in state compiler

Slots extend the state syntax and allows you to do things right before the state function is executed. So you can make a decision in the last moment right before a state is executed.

Slot syntax looks close to the simple python function call. Here is a simple example:

```python
# Example

# Using Slots

# Function

copy-some-file:

file.copy:
    - name: __slot__:salt:test.echo(text=/tmp/some_file)
    - source: __slot__:salt:test.echo(/etc/hosts)
```

Read more [here](#).

Cryptographic layer changes

M2Crypto is coming back. We are making the crypto backend modular but in this release M2Crypto is enabled if it's importable by Python. If not Cryptodome or PyCrypto is used as it was in the previous releases. M2Crypto is used in the same way as PyCrypto so there would be no compatibility issues, different nodes could use different backends.

NaCL Module and Runner changes

In addition to argument changes in both the NaCL module and runner for future removal in the 3000 release, the default "box_type" has changed from secretbox to sealedbox. SecretBox is data encrypted using private key sk and Sealedbox is encrypted using public key pk.

utils functions reorganized into separate modules

The Salt utility functions from salt.utils (typically used by those developing extension modules for Salt) have been moved into different modules, grouped logically based on their functionality. The old function names will continue to work until the 3000 release of Salt (due around Q1 2019).

The renamed functions are:

- `salt.utils.appendproctitle`: use `salt.utils.process.appendproctitle` instead.
- `salt.utils.daemonize`: use `salt.utils.process.daemonize` instead.
- `salt.utils.daemonize_if`: use `salt.utils.process.daemonize_if` instead.
- `salt.utils.reinit_crypto`: use `salt.utils.crypt.reinit_crypto` instead.
- `salt.utils.to_bytes`: use `salt.utils.stringutils.to_bytes` instead.
- `salt.utils.to_str`: use `salt.utils.stringutils.to_str` instead.
- `salt.utils.to_unicode`: use `salt.utils.stringutils.to_unicode` instead.
• `salt.utils.str_to_num`: use `salt.utils.stringutils.to_num` instead.
• `salt.utils.is_quoted`: use `salt.utils.stringutils.is_quoted` instead.
• `salt.utils.dequote`: use `salt.utils.stringutils.dequote` instead.
• `salt.utils.is_hex`: use `salt.utils.stringutils.is_hex` instead.
• `salt.utils.is_bin_str`: use `salt.utils.stringutils.is_bin_str` instead.
• `salt.utils.rand_string`: use `salt.utils.stringutils.random` instead.
• `salt.utils.contains_whitespace`: use `salt.utils.stringutils.contains_whitespace` instead.
• `salt.utils.build_whitespace_split_regex`: use `salt.utils.stringutils.build_whitespace_split_regex` instead.
• `salt.utils.expr_match`: use `salt.utils.stringutils.expr_match` instead.
• `salt.utils.check_whitelist_blacklist`: use `salt.utils.stringutils.check_whitelist_blacklist` instead.
• `salt.utils.check_include_exclude`: use `salt.utils.stringutils.check_include_exclude` instead.
• `salt.utils.print_cli`: use `salt.utils.stringutils.print_cli` instead.
• `salt.utils.clean_kwargs`: use `salt.utils.args.clean_kwargs` instead.
• `salt.utils.invalid_kwargs`: use `salt.utils.args.invalid_kwargs` instead.
• `salt.utils.shlex_split`: use `salt.utils.args.shlex_split` instead.
• `salt.utils.arg_lookup`: use `salt.utils.args.arg_lookup` instead.
• `salt.utils.argspec_report`: use `salt.utils.args.argspec_report` instead.
• `salt.utils.split_input`: use `salt.utils.args.split_input` instead.
• `salt.utils.test_mode`: use `salt.utils.args.test_mode` instead.
• `salt.utils.format_call`: use `salt.utils.args.format_call` instead.
• `salt.utils.which`: use `salt.utils.path.which` instead.
• `salt.utils.which_bin`: use `salt.utils.path.which_bin` instead.
• `salt.utils.path_join`: use `salt.utils.path.join` instead.
• `salt.utils.check_or_die`: use `salt.utils.path.check_or_die` instead.
• `salt.utils.sanitize_win_path_string`: use `salt.utils.path.sanitize_win_path` instead.
• `salt.utils.rand_str`: use `salt.utils.hashutils.random_hash` instead.
• `salt.utils.get_hash`: use `salt.utils.hashutils.get_hash` instead.
• `salt.utils.is_windows`: use `salt.utils.platform.is_windows` instead.
• `salt.utils.is_proxy`: use `salt.utils.platform.is_proxy` instead.
• `salt.utils.is_linux`: use `salt.utils.platform.is_linux` instead.
• `salt.utils.is_darwin`: use `salt.utils.platform.is_darwin` instead.
• `salt.utils.is_sunos`: use `salt.utils.platform.is_sunos` instead.
• `salt.utils.is_smartos`: use `salt.utils.platform.is_smartos` instead.
- `salt.utils.is_smartos_globalzone`: use `salt.utils.platform.is_smartos_globalzone` instead.
- `salt.utils.is_smartos_zone`: use `salt.utils.platform.is_smartos_zone` instead.
- `salt.utils.is_freebsd`: use `salt.utils.platform.is_freebsd` instead.
- `salt.utils.is_netbsd`: use `salt.utils.platform.is_netbsd` instead.
- `salt.utils.is_openbsd`: use `salt.utils.platform.is_openbsd` instead.
- `salt.utils.is_aix`: use `salt.utils.platform.is_aix` instead.
- `salt.utils.safe_rm`: use `salt.utils.files.safe_rm` instead.
- `salt.utils.is_empty`: use `salt.utils.files.is_empty` instead.
- `salt.utils.fopen`: use `salt.utils.files.fopen` instead.
- `salt.utils.flopen`: use `salt.utils.files.flopen` instead.
- `salt.utils.fpopen`: use `salt.utils.files.fpopen` instead.
- `salt.utils.rm_rf`: use `salt.utils.files.rm_rf` instead.
- `salt.utils.mkstemp`: use `salt.utils.files.mkstemp` instead.
- `salt.utils.istextfile`: use `salt.utils.files.is_text_file` instead.
- `salt.utils.is_bin_file`: use `salt.utils.files.is_binary` instead.
- `salt.utils.list_files`: use `salt.utils.files.list_files` instead.
- `salt.utils.safe_walk`: use `salt.utils.files.safe_walk` instead.
- `salt.utils.st_mode_to_octal`: use `salt.utils.files.st_mode_to_octal` instead.
- `salt.utils.normalize_mode`: use `salt.utils.files.normalize_mode` instead.
- `salt.utils.human_size_to_bytes`: use `salt.utils.files.human_size_to_bytes` instead.
- `salt.utils.backup_minion`: use `salt.utils.files.backup_minion` instead.
- `salt.utils.str_version_to_evr`: use `salt.utils.pkg.rpm.version_to_evr` instead.
- `salt.utils.parse_docstring`: use `salt.utils.doc.parse_docstring` instead.
- `salt.utils.compare_versions`: use `salt.utils.versions.compare` instead.
- `salt.utils.version_cmp`: use `salt.utils.versions.version_cmp` instead.
- `salt.utils.warn_until`: use `salt.utils.versions.warn_until` instead.
- `salt.utils.kwvars_warn_until`: use `salt.utils.versions.kwars_warn_until` instead.
- `salt.utils.get_color_theme`: use `salt.utils.color.get_color_theme` instead.
- `salt.utils.get_colors`: use `salt.utils.color.get_colors` instead.
- `salt.utils.gen_state_tag`: use `salt.utils.state.gen_tag` instead.
- `salt.utils.search_onfail_requisites`: use `salt.utils.state.search_onfail_requisites` instead.
- `salt.utils.check_state_result`: use `salt.utils.state.check_result` instead.
- `salt.utils.get_user`: use `salt.utils.user.get_user` instead.
- `salt.utils.get_uid`: use `salt.utils.user.get_uid` instead.
• salt.utils.get_specific_user: use salt.utils.user.get_specific_user instead.
• salt.utils.chugid: use salt.utils.user.chugid instead.
• salt.utils.chugid_and_umask: use salt.utils.user.chugid_and_umask instead.
• salt.utils.get_default_group: use salt.utils.user.get_default_group instead.
• salt.utils.get_group_list: use salt.utils.user.get_group_list instead.
• salt.utils.get_group_dict: use salt.utils.user.get_group_dict instead.
• salt.utils.get_gid_list: use salt.utils.user.get_gid_list instead.
• salt.utils.get_gid: use salt.utils.user.get_gid instead.
• salt.utils.enable_ctrl_logoff_handler: use salt.utils.win_functions.enable_ctrl_logoff_handler instead.
• salt.utils.traverse_dict: use salt.utils.data.traverse_dict instead.
• salt.utils.traverse_dict_and_list: use salt.utils.data.traverse_dict_and_list instead.
• salt.utils.filter_by: use salt.utils.data.filter_by instead.
• salt.utils.subdict_match: use salt.utils.data.subdict_match instead.
• salt.utils.substr_in_list: use salt.utils.data.substr_in_list instead.
• salt.utils.is_dictlist: use salt.utils.data.is_dictlist instead.
• salt.utils.repack_dictlist: use salt.utils.data.repack_dictlist instead.
• salt.utils.compare_dicts: use salt.utils.data.compare_dicts instead.
• salt.utils.compare_lists: use salt.utils.data.compare_lists instead.
• salt.utils.decode_dict: use salt.utils.data.encode_dict instead.
• salt.utils.decode_list: use salt.utils.data.encode_list instead.
• salt.utils.exactly_n: use salt.utils.data.exactly_n instead.
• salt.utils.exactly_one: use salt.utils.data.exactly_one instead.
• salt.utils.is_list: use salt.utils.data.is_list instead.
• salt.utils.is_iter: use salt.utils.data.is_iter instead.
• salt.utils.isorted: use salt.utils.data.sorted_ignorecase instead.
• salt.utils.is_true: use salt.utils.data.is_true instead.
• salt.utils.mysql_to_dict: use salt.utils.data.mysql_to_dict instead.
• salt.utils.simple_types_filter: use salt.utils.data.simple_types_filter instead.
• salt.utils.ip_bracket: use salt.utils.zeromq.ip_bracket instead.
• salt.utils.gen_mac: use salt.utils.network.gen_mac instead.
• salt.utils.mac_str_to_bytes: use salt.utils.network.mac_str_to_bytes instead.
• salt.utils.refresh_dns: use salt.utils.network.refresh_dns instead.
• salt.utils.dns_check: use salt.utils.network.dns_check instead.
• salt.utils.get_context: use salt.utils.stringutils.get_context instead.
• salt.utils.get_master_key: use salt.utils.master.get_master_key instead.
Deprecations

Configuration Option Deprecations

- The requests_lib configuration option has been removed. Please use backend instead.

Profitbricks Cloud Updated Dependency

The minimum version of the profitbrick python package for the profitbricks cloud driver has changed from 3.0.0 to 3.1.0.

Execution Module Deprecations

- The blockdev execution module has been removed. Its functions were merged with the disk module.
- The lxc execution module has been changed as follows:
  - The dnsservers option to lxc.cloud_init_interface no longer defaults to 4.4.4.4 and 8.8.8.8.
  - The dns_via_dhcp option to lxc.cloud_init_interface now defaults to True instead of False.
- The win_psget module has been changed as follows:
  - The psget.psversion function was removed. Please use cmd.shell_info instead.
- The win_service module (which provides the service module on Windows platforms) has been changed as follows:
  - The config function was removed. Please use service.modify instead.
  - The following arguments to the service.create function have been renamed:
    * binpath has been renamed to bin_path
    * depend has been renamed to dependencies
* DisplayName has been renamed to display_name
* error has been renamed to error_control
* group has been renamed to load_order_group
* obj has been renamed to account_name
* password has been renamed to account_password
* start has been renamed to start_type
* type has been renamed to service_type

- The nacl module has been changed as follows:
  - The following arguments have been renamed in the nacl.keygen, nacl.enc, and nacl.dec:
    * key_file has been renamed to sk_file
    * key has been renamed to sk

**Runner Deprecations**

- The manage runner has been changed as follows:
  - root_user argument was removed from the manage.bootstrap function. Please use salt-ssh roster entries for the host instead.

- The nacl runner has been changed as follows:
  - The following arguments have been renamed in the nacl.keygen, nacl.enc, and nacl.dec:
    * key_file has been renamed to sk_file
    * key has been renamed to sk

**State Deprecations**

- In the archive state, the tar_options and zip_options options were removed. Please use options instead.

- The cmd state had the following changes:
  - The user and group options were removed from the following functions (please use runas instead):
    * cmd.run
    * cmd.script
    * cmd.wait
    * cmd.wait_script

- In the file states, the show_diff option was removed in all states where it was previously supported. Please use show_changes instead.
Grain Deprecations

- For `smartos`, some grains have been deprecated. These grains will be removed in 3000:
  - The `hypervisor_uuid` grain has been replaced with `mdata:sdc:server_uuid`
  - The `datacenter` grain has been replaced with `mdata:sdc:datacenter_name`

Pillar Deprecations

The legacy configuration for `git_pillar` has been removed. Please use the new configuration for `git_pillar` which was added in 2015.8.0, which is documented here.

Utils Deprecations

- In `salt.utils.cloud`, the `fire_event` function now requires a `sock_dir` argument. It was previously optional.

Other Miscellaneous Deprecations

- In `version.py`, the `rc_info` function was removed. Please use `pre_info` instead.
- Warnings for moving away from the `env` option were removed. `saltenv` should be used instead. The removal of these warnings does not have a behavior change. Only the warning text was removed.

Minion Blackout

During a blackout, minions will not execute any remote execution commands, except for `saltutil.refresh_pillar`. Previously, support was added so that blackouts are enabled using a special pillar key, `minion_blackout` set to `True` and an optional pillar key `minion_blackout_whitelist` to specify additional functions that are permitted during blackout. This release adds support for using this feature in the grains as well, by using special grains keys `minion_blackout` and `minion_blackout_whitelist`.

Sentry Log Handler

Configuring sentry raven python client via `project, servers, public_key` and `secret_key` is deprecated and won't work with sentry clients > 3.0. Instead, the `dsn` config param must be used.

RAET transport

We haven't been doing development on RAET for quite some time and decided that 2018.3.0 is the time to announce the deprecation. RAET support will be removed in 3000. Please consider to move to `zeromq` or `tcp` transport instead of `raet`.
30.2.33 Salt 2018.3.1 Release Notes

Version 2018.3.1 is a bugfix release for 2018.3.0.

Statistics

- Total Merges: 525
- Total Issue References: 74
- Total PR References: 255
- Contributors: 55 (Ch3LL, DmitryKuzmenko, Giandom, Kimol, L4rS6, LukeCarrier, OrlandoArcapix, TamCore, The-Loeki, UtahDave, aesposito91, bbinet, bdrung, boltronics, bosatsu, clan, corywright, damon-atkins, dincamihai, dmurphy18, dnABic, douglasjreynolds, dwoz, edgan, ejparker12, esell, ezh, femnad, folti, garethgreenaway, gtmanfred, isbm, jasperla, johnj, mateiw, mcalmer, mirceaulinic, morganwillcock, opdude, pcn, pruiz, psagers, psyer, rallytime, robinro, s0undt3ch, samodid, shengis, skjaro, tankywoo, terminalmage, twangboy, vutny, yannj-fr, zmedico)

Warning: If you are using Jinja to dump lists or dictionaries in your SLS files, this will now cause errors in Python 2 since Jinja does not produce YAML-compatible output when strings in the data structures contain unicode types. The dictionary must be passed through a Jinja filter to produce YAML-compatible strings.

The below is an example of invalid SLS:

```
/etc/foo.conf:
  file.mangaged:
    - source: salt://foo.conf
    - template: jinja
    - defaults: {{ mydict }}
```

To make it valid, use either one of Salt's own json or yaml filters:

```
/etc/foo.conf:
  file.mangaged:
    - source: salt://foo.conf
    - template: jinja
    - defaults: {{ mydict | json }}
```

Tornado 5.0 Support for Python 2 Only

Tornado 5.0 moves to using asyncio for all python3 versions. Because of this and changes in asyncio between python 3.4 and 3.5 to only be able to use one ioloop, which requires some rearchitecting, support for tornado 5.0 and python3 versions of salt has been delayed to a later release.

For now, to use tornado 5.0, the python 2 version of salt must be used.
Changes to Slack Engine pillars

When using `groups_pillar_name` for the slack engine, the engine should be used as part of a salt-minion process running on the master. This will allow the minion to have pillars assigned to it, and will still allow the engine to create a LocalClient connection to the master ipc sockets to control environments.

Changes to Automatically Updating the Roster File

In 2018.3.0 salt-ssh was configured to automatically update the flat roster file if a minion was not found for salt-ssh. This was decided to be undesireable as a default. The `--skip-roster` flag has been removed and replaced with `--update-roster`, which will enable salt-ssh to add minions to the flat roster file. This behavior can also be enabled by setting `ssh_update_roster: True` in the master config file.

Changes to `file.blockreplace` State

The `append_newline` argument was added to this state. Additionally, to improve idempotence, if the string represented by `marker_end` is found in the middle of the line, the content preceding the marker will be removed when the block is replaced. This allows one to remove `append_newline: False` from the SLS and have the block properly replaced if the end of the content block is immediately followed by the `marker_end` (i.e. no newline before the marker).

Note: This will require changes to your SLS if your `marker_end` does not include the very beginning of the content you want to keep.

See the `file.blockreplace` state documentation for further information.

Changelog for v2018.3.0..v2018.3.1

Generated at: 2018-06-06 17:43:01 UTC

- **ISSUE** #47955: (frogunder) 2018.3.1 Creating Windows machine in Amazon using salt-cloud fails. (refs: #47989)
- **PR** #47998: (rallytime) Back-port #47989 to 2018.3.1 @ 2018-06-06 17:08:04 UTC
  - **PR** #47989: (dwoz) Properly decode password from aws using m2crypto (refs: #47998)
  - 605463ca0d Merge pull request #47998 from rallytime/bp-47989
  - 1b7e9ac2d3 Lint fixes
  - 0545152ddd Properly decode password from aws using m2crypto
- **PR** #47965: (Ch3LL) Add PR 47924 from 2018.3 branch @ 2018-06-06 13:54:09 UTC
  - dbc798ac68 Merge pull request #47965 from Ch3LL/gitpy_mac_3.1
  - bf608bd44 Catch all exceptions in git import for salt.utils.gitfs
- **PR** #47973: (terminalmage) salt.modules.testinframod: fix TypeError invoking types.FunctionType @ 2018-06-06 13:53:46 UTC
  - 864d640633 Merge pull request #47973 from terminalmage/fix-testinfra
  - 4518c89484 Lint: Remove unused six import
  - c6816b2149 salt.modules.testinframod: fix TypeError invoking types.FunctionType
- **ISSUE** #47236: (MorphBonehunter) x509.private_key_managed broken after upgrade to 2018.3.0 (refs: #47957)
• PR #47967: (rallytime) Back-port #47957 to 2018.3.1 @ 2018-06-06 13:53:28 UTC
  - PR #47957: (garethgreenaway) [2018.8] Ensure x509 passphrase is a string (refs: #47967)
  - 5ddcfff420 Merge pull request #47957 from rallytime/bp-47957
  - 9a55579af1 removing unnecessary change
  - 329b2e5956 Ensuring that when a passphrase is passed in, it is returned as a string from the passphrase callback.

• PR #47902: (Ch3LL) Remove In Progress for 2018.3.1 Release Notes @ 2018-05-30 18:26:49 UTC
  - 9c964fdbe Merge pull request #47902 from Ch3LL/rn_in_progress

• PR #47897: (Ch3LL) Add changelog to 2018.3.1 release notes @ 2018-05-30 15:04:42 UTC
  - ea7b4fdce Merge pull request #47897 from Ch3LL/rn_2018
  - e27ece273a7 Add == line to changelog line for release notes
  - 61e56d275d Add changelog to 2018.3.1 release notes

• ISSUE #47784: (jpsv) win_lgpo.py line 5368; AttributeError: 'OrderedDict' object has no attribute 'lower' (refs: #47848)

• PR #47848: (twangboy) Fix some major issues with the LGPO module @ 2018-05-30 13:37:32 UTC
  - f15e636d5e Merge pull request #47848 from twangboy/fix_47784
  - 98facf8dc8 Remove log.debug statement in __virtual__
  - f037fa4064 Fix some major issues with the LGPO module

• PR #47881: (gtmanfred) quote python_version in requirements.txt @ 2018-05-29 21:12:05 UTC
  - 92b84c08e Merge pull request #47881 from gtmanfred/2018.3.1
  - 3d874b5529 quote python_version in requirements.txt

• PR #47874: (gtmanfred) Tornado 5.0 is only supported on python 2 for now @ 2018-05-29 19:45:44 UTC
  - 705bf8172d Merge pull request #47874 from gtmanfred/2018.3.1
  - 13f920415a add tornado5 note to 2018.3.1
  - aeacd2b49 allow tornado 5.0 to be installed only for python2

• PR #47820: (Ch3LL) Remove output_loglevel in mac_system module @ 2018-05-25 13:10:36 UTC
  - 09e85f0cd Merge pull request #47820 from Ch3LL/mac_system
  - 362414e53b Remove output_loglevel in mac_system module

• PR #47798: (rallytime) Back-port #47776 to 2018.3.1 @ 2018-05-23 15:10:43 UTC
  - PR #47776: (garethgreenaway) [2018.3] Fixes to failing _before_connect tests (refs: #47798)
  - 7e314c2dc8 Merge pull request #47776 from rallytime/bp-47776
  - ae881547d2 Fixing unit.test_minion.MinionTestCase.test_beacons_before_connect and unit.test_minion.MinionTestCase.test_scheduler_before_connect.

• PR #47782: (rallytime) Back-port #47775 to 2018.3.1 @ 2018-05-22 20:56:37 UTC
  - PR #47775: (gtmanfred) catch UnsupportedOperation with AssertionError (refs: #47782)
  - 9c610da0bc Merge pull request #47782 from rallytime/bp-47775
- `bab9c966c5` catch UnsupportedOperation with AssertionError

- **PR #47770**: (rallytime) Back-port #47769 to 2018.3.1 @ 2018-05-22 17:27:20 UTC
  - PR #47769: (gtmanfred) skip test that breaks test suite (refs: #47770)
  - 4adf10b20b Merge pull request #47770 from rallytime/bp-47769
  - 3cfb95c7bc skip test that breaks test suite

- **PR #47724**: (terminalmage) 2 master_tops/ext_nodes fixes @ 2018-05-21 15:59:04 UTC
  - bbe8e62a98 Merge pull request #47724 from terminalmage/master_tops_fixes
  - 48b8c5acd1 Merge branch '2018.3.1' into master_tops_fixes
  - 89b3070d4c Change deprecation warning to debug logging
  - ceb6e10f87 Fix spurious "Malformed request" error

- **ISSUE #47484**: (whytwolf) Windows: pkg.latest state not updating packages. (refs: #47702)

- **PR #47739**: (rallytime) Back-port #47702 to 2018.3.1 @ 2018-05-21 15:37:03 UTC
  - PR #47702: (damon-atkins) State pkg.latest called win pkg.install with list of pkgs and the required versions (refs: #47739)
  - 97d6fe7434 Merge pull request #47739 from rallytime/bp-47702
  - f79da64bb0 Update is_windows path to use platform
  - f04b19bb56 Ensure targeted_pkgs always contains value for non-windows.
  - 14659f9cad Adjusted based on feed back.
  - 9f18f7cdf5 Whitespace lint issues
  - 2a29b28ee6 pkg.install execution module on windows ensures the software package is installed when no version is specified, it does not upgrade the software to the latest. This is per the design. pkg.latest must provide the versions to install to pkg.install

- **PR #47730**: (rallytime) Back-port #47700 to 2018.3.1 @ 2018-05-21 15:36:16 UTC
  - PR #47700: (yamnj-fr) fix roots modification time check (refs: #47730)
  - cfbe0ba73e Merge pull request #47730 from rallytime/bp-47700
  - 9bc35b88ea fix roots modification time check

- **PR #47727**: (Ch3LL) Fix salt.utils.versions.warn_until spelling @ 2018-05-21 13:41:00 UTC
  - 3614d3d83a Merge pull request #47727 from Ch3LL/spelling
  - 47a8de5b73 Fix salt.utils.versions.warn_until spelling

- **PR #47736**: (Ch3LL) mac_utils test: patch __salt__['cmd.run*'] @ 2018-05-21 13:38:59 UTC
  - bb45daef Merge pull request #47736 from Ch3LL/fix_util_mac_test
  - ee9077a8 mac_utils test: patch __salt__['cmd.run*']

- **PR #47641**: (gtmanfred) fix _create_stream and tornado 5.0 @ 2018-05-18 14:25:36 UTC
  - 43930f8bac Merge pull request #47641 from gtmanfred/2018.3.1
  - 037f92f59 fix pylint
  - 75d42d8963 Fix last test for tornado
  - a046512287 allow using tornado 5.0
- 05e651f038 fix _create_stream and tornado 5.0

**ISSUE #47532**: (edgan) roster auto-add feature in salt-ssh-2018.3.0 (refs: #47541)

**PR #47541**: (gtmanfred) switch skip-roster to update-roster @ 2018-05-18 13:29:50 UTC
- 9f926bed1a Merge pull request #47541 from gtmanfred/2018.3
- 8c5c78292 switch skip-roster to update-roster

**PR #47719**: (rallytime) Back-port #47692 to 2018.3.1 @ 2018-05-18 13:22:02 UTC
- PR #47692: (dwoz) Default windows to m1.small for ec2-classic (refs: #47719)
- a963f1b558 Merge pull request #47719 from rallytime/bp-47692
- 1df9247f7 Default windows to m1.small for ec2-classic

**PR #47706**: (Ch3LL) Add cmd._run_all_quiet to mac_utils and __utils__ in mac_service @ 2018-05-18 01:11:46 UTC
- c9108893ab Merge pull request #47706 from Ch3LL/mac_service_util
- 3611af699f remove added space
- 9921ca143 fix pylint
- 317e41d3c0 use cmd._run_quiet and cmd._run_all_quiet instead of importing minion_mods in __salt__
- a78652515a Add __salt__ to mac_utils and __utils__ in mac_service

**PR #47664**: (rallytime) Back-port #47645 to 2018.3.1 @ 2018-05-15 18:25:27 UTC
- PR #47645: (Ch3LL) query the pip path for test test_issue_2087_missing_pip (refs: #47664)
- fb3bf1ff3e Merge pull request #47645 from rallytime/bp-47645
- 0a732d8e66 query the pip path for test test_issue_2087_missing_pip

**PR #47647**: (rallytime) Back-port #47601 and #47643 to 2018.3.1 @ 2018-05-15 14:07:54 UTC
- PR #47643: (dwoz) Remove unwanted file (refs: #47647)
- PR #47601: (dwoz) Skip tests when we can not use runas (refs: #47647)
- 9039fee104 Merge pull request #47647 from rallytime/bp-47601-and-47643-2018.3.1
- 7214fe17c8 Fix typo
- 506dced17 Remove unwanted file
- b6a21fdfa3 use ignore-undefined-variable
- 242f9fe8a Ignore pylint WindowsError
- 2d63682f6a Better doc string
- ec2add699 Skip tests when we can not use runas

**PR #47596**: (rallytime) Back-port #47568 to 2018.3.1 @ 2018-05-10 22:09:09 UTC
- PR #47568: (terminalmage) salt.serializers.yaml/yamlex: remove invalid multi_constructor (refs: #47596)
- 17b5265d95 Merge pull request #47596 from rallytime/bp-47568
- ecf5dc8b9f Add exception logging on serialize/deserialize exceptions
- 9659b19819 salt.serializers.yaml/yamlex: remove invalid multi_constructor

**PR #47595**: (rallytime) Back-port #47569 to 2018.3.1 @ 2018-05-10 22:08:53 UTC
- **PR #47569**: (Ch3LL) Update salt.utils.path mock in virtual core test (refs: #47595)
- `c4c400f3e9` Merge pull request #47595 from rallytime/bp-47569
- `0763f96458` update salt.utils.platform path for virt core test
- `71825c1ef` Update salt.utils.path mock in virtual core test

- **PR #47599**: (rallytime) Back-port #47570 to 2018.3.1 @ 2018-05-10 22:06:44 UTC
  - **PR #47570**: (gtmanfred) Update dependency to msgpack (refs: #47599)
  - `ec7de14b0e` Merge pull request #47599 from rallytime/bp-47570
  - `9334c03da9` Update dependency to msgpack

- **PR #47571**: (rallytime) [2018.3.1] Update man pages @ 2018-05-10 16:21:57 UTC
  - `2a10d92669` Merge pull request #47571 from rallytime/man-pages
  - `ade5f664` [2018.3.1] Update man pages

- **PR #47550**: (pcn) Fixes a bad deletion I did that only surfaced in 2018.3 @ 2018-05-09 13:36:33 UTC
  - `85284caaf9` Merge pull request #47550 from pcn/fix-disable-term-protect-in-2018.3
  - `d58a56877c` Fixes a bad deletion I did that only surfaced in 2018.3

- **ISSUE #47553**: (douglasjreynolds) Unicode version error in lxc (refs: #47554)
  - **PR #47554**: (douglasjreynolds) Converted unicode str version to a LooseVersion; matching line 2080. @ 2018-05-09 13:34:13 UTC
    - `f9083ff77e` Merge pull request #47554 from douglasjreynolds/lxc_unicode_fix
    - `e6bce581c6` Converted unicode str version to _LooseVersion to match line 2080.

- **PR #47518**: (Ch3LL) Fix 47364: ensure we are not caching zfs.is_supported @ 2018-05-09 13:29:07 UTC
  - `fe4e7f1fde` Merge pull request #47518 from Ch3LL/zfs_support
  - `d19f963e` remove unnecessary patch in zfs.is_supported test
  - `58c4f29f96` Fix 47364: ensure we are not caching zfs.is_supported

- **PR #47159**: (terminalmage) Fix for whitelist/blacklist checking for non-list iterables @ 2018-05-08 20:43:51 UTC
  - `332e9f13a6` Merge pull request #47159 from terminalmage/whitelist_blacklist-iter-fix
  - `ca93de37e` Treat empty whitelist/blacklist as no whitelist/blacklist
  - `bc4afe2621` Raise a TypeError when invalid input passed to check_whitelist_blacklist
  - `75480158b3` Lint: remove duplicate function in helpers.py
  - `5565d4e9b1` Update old utils paths with new utils paths
- 786076ac03 Merge branch '2017.7' into '2018.3'
  - 611ca1fc03 Merge pull request #47476 from gtmanfred/2017.7
    - 1f91a85587 specify cache dir for pip install
    - 99e150e09c check for kitchen-vagrant gem before loading windows tests
  - 7c3f2c56da Merge pull request #47412 from twangboy/fix_47125
    - c9bab0b8e3 Merge branch '2017.7' into fix_47125
    - 2600e404d5 Fix overly long line
    - 5c8db05769 Fix issue where the cwd was being removed
  - 4846957c4 Merge pull request #47467 from twangboy/cleanup_settings
    - 9d498293b1 Remove unused settings, update NSIS
  - da9871d36b Merge pull request #47196 from twangboy/fix_47024
    - 14ee5537b9 Add @with_tempdir helper
    - 6c3b5fa6fa Fix typo
    - f031710af2 Merge branch '2017.7' into fix_47024
    - 7c46d9d0d4 Fix integration.modules.test_pip
    - 22ac81df63 Fix integration.modules.test_pip
    - 57d98224d4 Merge pull request #9 from terminalmage/twangboy/fix_47024
    - 37a13d8004 Update pip unit tests to reflect changes
    - 7f86779be0 Lint fix
    - c48d8f4f61 DRY and other fixes in pip module
    - b1117896a0 Change from global variable to __context__``
    - 3e6e524eca Fix some tests``
    - c94f0f20e4 Fix lint error
    - fd47b21530 Fix merge conflict
  - e8c4524bae Merge pull request #47455 from Ch3LL/unreleased_rn
    - b6d0cc2ab7 Add In Progress Warning for 2017.7.6 Release Notes
  - 2c7a4b6179 Merge pull request #47459 from gtmanfred/2017.7
    - d228e72477 update ubuntu-rolling to 18.04
  - 64a64c0ed7 Merge pull request #47462 from terminalmage/docs
    - 6d7803ece0 Fix docs build on Sphinx 1.7+
  - 6cd0d31c03 Merge pull request #47438 from lomeroe/double_admx_test
    - 4902f1e2ba check if a policy has either an enabled value or enabled list entry or a disabled value or disabled list entry when determining the state of the policy
  - ed69821d19 Merge pull request #47433 from s0undt3ch/2017.7
    - 5abafdf25d6 Add missing requirements files not committed in #47106

• ISSUE #47443: (skylerberg) Input validation does not raise SaltInvocationError in win_dsc.py (refs: #47505)
- **PR #47516**: (rallytime) Back-port #47505 to 2018.3 @ 2018-05-08 13:32:33 UTC
  - **PR #47505**: (dwoz) Raise proper invocation errors (refs: #47516)
  - 9559ac7679 Merge pull request #47516 from rallytime/bp-47505
  - 7c60e4071e Raise proper invocation errors
- **ISSUE #47502**: (psagers) service.enable (and .disable) destroys /etc/rc.conf on FreeBSD (refs: #47503)
- **PR #47515**: (rallytime) Back-port #47503 to 2018.3 @ 2018-05-08 13:32:03 UTC
  - **PR #47503**: (psagers) Fix #47502: Remove an extraneous (accidentally introduced?) call to rstrip() (refs: #47515)
  - bf79acbf8c Merge pull request #47515 from rallytime/bp-47503
  - 821dbb88a0 Fix #47502: Remove an extraneous (accidentally introduced?) call to rstrip.
- **ISSUE #47511**: (joesusecom) sshconfig salt-ssh roster is missing in the documentation (refs: #47531)
- **PR #47531**: (gtmanfred) add ssh config doc for rosters @ 2018-05-07 22:26:30 UTC
  - 779b3ed056 Merge pull request #47531 from gtmanfred/2018.3
  - 92ded7162c add ssh config doc for rosters
- **PR #47520**: (rallytime) Cleanup weird spaces @ 2018-05-07 19:50:58 UTC
  - 95b2f9db30 Merge pull request #47520 from rallytime/cleanup-spaces
  - e9cb08a000 Cleanup weird spaces
- **PR #47495**: (dwoz) Fix crufty nssm.exe reference @ 2018-05-07 19:12:49 UTC
  - 05fc52f124 Merge pull request #47495 from dwoz/uninstall_wart
  - caa36c9064 Merge branch '2018.3' into uninstall_wart
- **ISSUE #47322**: (masau) lxc clone not working (refs: #47494)
- **PR #47494**: (ejparker12) Fixed lxc.clone unhandled exception in salt/modules/lxc.py @ 2018-05-07 19:03:58 UTC
  - 3cc7d3ae7c Merge pull request #47494 from ejparker12/lxc-clone
  - e0e2c9782d Fixed lxc.clone unhandled exception in salt/modules/lxc.py
- **ISSUE #47496**: (mateiw) salt-ssh --extra-filerefs doesn't include any files if no refs in state files (refs: #47497)
- **PR #47497**: (mateiw) Fix salt-ssh --extra-filerefs to include files even if no refs in states to apply @ 2018-05-07 19:02:50 UTC
  - adde83f639 Merge pull request #47497 from mateiw/2018.3-fix-ssh-extra-files-refs-issue-47496
  - d67239aae7 --extra-filerefs include files even if no refs in states to apply
- **ISSUE #47404**: (shengis) Localized version of yum breaks pkg.install (refs: #47441)
- **PR #47441**: (shengis) Fix _run to reset LANGUAGE env variable @ 2018-05-07 18:29:25 UTC
  - 34b1b1ee53 Merge pull request #47441 from shengis/fixed-run-env-reset
  - 62fc16b721 Merge branch '2018.3' into fix-run-env-reset
  - 3b02bbbdc1 Merge branch '2018.3' into fix-run-env-reset
  - ee2ab38c8c Fix _run to reset LANGUAGE env variable
- **ISSUE #47479**: (whytwolf) win_task.info on py3 throwing error, but works in py2 (refs: #47507)
- **PR #47507**: (gtmanfred) fix win_task for py3 @ 2018-05-07 17:41:21 UTC
- 17cfd4f7cf Merge pull request #47507 from gtmanfred/2018.3
- 19db39f402 fix win_task for py3

- **PR #47472**: (terminalmage) salt.utils.hashutils: Fix UnicodeEncodeError in several funcs @ 2018-05-07 13:31:07 UTC
  - 4ac2d8fb2 Merge pull request #47472 from terminalmage/hashutils
  - 7266e9984d salt.utils.hashutils: Fix UnicodeEncodeError in several funcs

- **PR #47485**: (gtmanfred) add openstack modules to doc index.rst @ 2018-05-07 13:11:42 UTC
  - 8b0a370189 Merge pull request #47485 from gtmanfred/2018.3
  - c86163d79f add openstack modules to doc index.rst
    * PR #47482: (gtmanfred) add all autodoc for new salt openstack modules @ 2018-05-04 21:03:38 UTC
      - 8df37f734a Merge pull request #47482 from gtmanfred/2018.3
      - 1f65d5cb73 add all autodoc for new salt openstack modules
    * PR #47447: (dwoz) Fix failing test due to windows console encoding @ 2018-05-04 16:41:29 UTC
      - d20ca15c5d Merge pull request #47447 from dwoz/strv
      - 8c01773833 Use the same non decodable bytes for all tests
      - 983881a2a1 Add bytes that will not decode using cp1252
    * PR #47466: (dwoz) bytes file that decodes the same utf-8 and cp1252 @ 2018-05-04 15:54:24 UTC
      - 8c5b30b541 Merge pull request #47466 from dwoz/randbytes
      - fd9bc06aab bytes file that decodes the same utf-8 and cp1252
    * ISSUE #46660: (mruepp) top file merging same does produce conflicting ids with gitfs (refs: #47354, #46751)
    * PR #47435: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-05-04 13:05:32 UTC
      - fa293f8fac Merge pull request #47435 from rallytime/merge-2018.3
      - be0731da5f Add skipIfs back in for rest_tornado tests
      - fd98ee3dct Lint: Add missing blank line
      - 561718b20b Update old is_windows utils path to new utils path
      - a94cf8a0d Merge branch '2017.7' into '2018.3'
        * 7ae3497b0c Merge pull request #47429 from gtmanfred/2017.7
          - 8ae32033cc server_list_min should use state, not status
        * 2f5fc4ecccc Merge pull request #47399 from isbm/isbm-zeromq17-deprecationwarning-2017.7.2-v2
          - a36e49fd27 fix pylint
- 98b5629b36 Fix imports
- d94c0f0152 Remove unnecessary variable
- 8e377b5653 Lintfix: E0203 and attribute access
- 2aab70b1b8 Install ZMQ handler if <15 version
- 296c589f4b Use ZMQ switch utility in the integration tests
- ab5fa34d7c Use ZMQ_VERSION_INFO constant everywhere
- 43b5558b82 Add trace logging on ZMQ sockets communication
- 16420a9fe Remove duplicate code for ZMQ monitor handling
- 834b1e4ff0 Remove obsolete ZMQIOLoop direct instance
- 1c90c5db3c Remove an empty line
- ef2e0acd66 Add logging on ZMQ socket exception
- 38ceed371d Lintfix: ident
- 1ece6a5f52 Lintfix: line too long
- 4e650c0b44 Remove code duplicate by reusing utilities functions
- 57da54b676 Fix imports
- 948368e9a1 Add libzmq version info builder
- 0b4a17b859 Update log exception message
- 116e1809fc Put a message alongside the exception to the logs
- 4bc43124b7 Remove unnecessary ZMQ import and check for its presence
- 05fd40269 Use utility for ZMQ import handling in SSH client
- 457ef7d9a5 Use utility for ZMQ import handling in flo/zero
- 08dee65bd Use utility for ZMQ import handling
- e2a353cb0 Remove unnecessary ZMQ extra-check for cache utils
- c8f2cc271d Remove unnecessary ZMQ extra-check for master utils
- 3940677bb9 Remove old ZMQ import handling
- f34a53eb29 Use ZMQ utility for version check
- cbb26dcb28 Use ZMQ installer for master
- 453e83210a Add ZMQ version build
- af960e21d Use ZMQ importer utility in async
- d50b2b2023 Incorporate tornado-5 fixes
- 1fd9af0653 Add ZMQ backward-compatibility tornado installer for older versions
- ad4b4015cf Add one place for handling various ZMQ versions and IOLoop classes
  - b14e974b5f Merge pull request #47343 from Ch3LL/win_srv_test
  - 2173b6f549 ensure we are enabling/disabling before test
  - d58be06751 Add additional service module integration tests and enable for windows
  - b0f3fb577f Merge pull request #47375 from terminalmage/issue47310
· fa2bea52bb Remove extra blank line to appease linter
· f8ab2be81c Add debug logging if we fail to detect virtual packages
· 67c4fc56ac Warn on use of virtual packages in pkg.installed state

* 56235032f4 Merge pull request #47415 from kstreee/fix-local-client-tgt-bug
  · b8d37e0a1e To add a test case for the syndic environment, copies the test case which was
    written by @matt-p that was already merged into develop branch, related pr is #46692.
    · 4627bad1fd Realizes 'tgt' field into actual minions using ckminions to subscribe results of
      the minions before publishing a payload.
* d65ceaae03 Merge pull request #47286 from baniobloom/vpc_peering_connection_name_fix
  · a968965087 Merge branch '2017.7' into vpc_peering_connection_name_fix
* 8a5d4437bb Merge pull request #47270 from meaksh/2017.7-fix-retcode-on-schedule-utils
  · d299cf3385 Merge branch '2017.7' into 2017.7-fix-retcode-on-schedule-utils
  · b6da600ff Initialize __context__ recode for functions handled via schedule util module
* 5b51075384 Merge pull request #47371 from rallytime/fix-47264
  · a43485b49c Fix "of pass" typo in grains.delval docs: change to "or pass"
* a86e53be66 Merge pull request #47389 from dwoz/moregittestfix
  · 67745c1362 Older GitPython versions will not have close
* a5367ea6f3 Merge pull request #47388 from dwoz/test_pip_fix
  · eb26321e8b Fix missing import
* 9b59b991c2 Merge pull request #47380 from gtmanfred/2017.7
  · 93d144ec1 add io_loop handling to runtests engine
* 37822c0cb bb Merge pull request #47384 from dwoz/test_pip_fix
  · a37a9da1fb Fix py2 version of pip test
* eefd96732e Merge pull request #47382 from dwoz/gitfs_tests
  · 1570708fac Close the repo and fix multiple tests
* 57c75ff660 Merge pull request #47369 from terminalimage/ldap_pillar
  · 085883ae2d Return an empty dict if no search_order in ldap ext_pillar config file
* bcc66dd9bf Merge pull request #47363 from DSRCorporation/bugs/replace_exc_info_with_exception
  · 3f7b93a23c Tornado5.0: Future.exc_info is dropped
* bcefb34f7e1 Merge pull request #47334 from terminalimage/ldap_pillar
  · 0175a8687c pillar_ldap: Fix cryptic errors when config file fails to load
  · 65c3ba7ff1 Remove useless documentation
  · 5d67cb27de Remove unnecessary commented line
  · 8de3d41adb fixed vpc_peering_connection_name option

* PR #47464: (dwoz) Skip tests not applicable to windows @ 2018-05-04 13:04:38 UTC
  · 51d21af4d4f Merge pull request #47464 from dwoz/skiP_syslog_tests
Salt Documentation, Release 3002.5

- ca9393b7f Skip tests not applicable to windows

- **PR #47456**: (dwoz) Sysname returns text type @ 2018-05-04 02:57:50 UTC
  - 3219430dc Merge pull request #47456 from dwoz/sysname
  - 559ee1961f Sysname returns text type

- **PR #47458**: (Ch3LL) Add In Progress Warning for 2018.3.1 Release Notes @ 2018-05-03 20:40:46 UTC
  - f3918514a7 Merge pull request #47458 from Ch3LL/unreleased_rn_2018
  - 6a261e5e3a Add In Progress Warning for 2018.3.1 Release Notes

- **PR #47448**: (dwoz) Fix missing import in test suite @ 2018-05-03 14:30:23 UTC
  - 9fd6cbe994 Merge pull request #47448 from dwoz/transport_import
  - 7e04eb82e1 Fix missing import in test suite

- **ISSUE #47260**: (mew1033) disable_saltenv_mapping not working as expected (refs: #47410)

- **PR #47410**: (terminalmage) gifs: Fix identification of base env when saltenv mapping is disabled @ 2018-05-03 14:12:27 UTC
  - 157a32a7f Merge pull request #47410 from terminalmage/issue47260
  - 3ab332a9f Update tests to reflect bugfix
  - 7b8127f336 gifs: Fix identification of base env when saltenv mapping is disabled

- **PR #47413**: (dmurphy18) Repobuild improvements for Ubuntu 18.04 lack of gpg2 and better error checking @ 2018-05-02 16:21:31 UTC
  - 0914cf99a6 Merge pull request #47413 from saltstack/relobuild_improv
  - c0640321f0 Removed extra spaces for pylint
  - 20e50b33f0 Minor cleanup due to review comments
  - 143b39e9a0 Update for Ubuntu 18.04 lack of gpg2 and enhanced error checking

- **PR #47216**: (twangboy) Reg docs @ 2018-05-02 13:33:27 UTC
  - 5e5774fd37 Merge pull request #47216 from twangboy/reg_docs
  - 0bee85b1f Fix lint, add bytes
  - bad441f8de Fix some lint`
  - af5139f2f Add additional examples
  - 24df6ec1b7 Additional docs formatting
  - ff46b27a06 Update reg docs, fix formatting issues

- **PR #47417**: (gtmanfred) revert instantiating a Caller Client in the engine @ 2018-05-01 18:56:06 UTC
  - 63ba4c4f8 Merge pull request #47417 from gtmanfred/slack
  - 5c8ea7f506 Update slack.py
  - ee8a5eeb10 revert instantiating a Caller Client in the engine

- **ISSUE #45790**: (bdarnell) Test with Tornado 5.0b1 (refs: #46066, #47106, #47433)

- **PR #47368**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-05-01 18:56:20 UTC
  - PR #47106: (DmitryKuzmenko) Tornado50 compatibility fixes (refs: #47374, #47368, #47433)
  - PR #46002: (ismb) Pyzmq 17.0.0 proper handling (refs: #47374, #47368)
- 0bdfaa5ffe Merge pull request #47368 from rallytime/merge-2018.3
- 46806e595b Update test assertion comment for pip pkgs
- d9d24d49e Lint: Add missing import
- c7b73d132e Merge branch '2017.7' into '2018.3'
  - 31db8ca7ad Merge pull request #47347 from dwoz/test_mysql_fix_again
    - add78fb618 Fix linter warnings
    - 2644cc7553 Fix linter nits
    - 799c601184 Proper fix for mysql tests
- fefc0cc3ca Update old utils paths to use new utils paths
- 13e8124031 Merge branch '2017.7' into '2018.3'
  - e573236848 Merge pull request #47359 from gtmanfred/2017.7
    - 6214ed8133 add mention of the formulas channel to the formulas docs
  - 629503b2a8 Merge pull request #47317 from dwoz/threadshutdown
    - 6db2a0e4d3 Log exceptions at exception level
    - d4ae787595 Do not join a thread that is stopped
  - aacd5cfe3 Merge pull request #47304 from cachedout/test_cli_timeout_arg
    - 85025a83c Pass timeout to salt CLI for tests
  - 55534fb659 Merge pull request #47311 from Ch3LL/firewall_windows
    - 4e16c18c16 Add firewall module windows tests to whitelist
    - 4b2f4ec66 Add windows firewall execution modules integration tests
  - 1667375a80 Merge pull request #47348 from dwoz/no_symlinks
    - 94a70ee847a Ignore gitfs tests when symlinks not enabled
  - dac04261b5 Merge pull request #47342 from dwoz/test_mysql_fix
    - 7496f4c5a8 Fix mysql test cases
  - 34e78ef564 Merge pull request #47341 from dwoz/inet_pton_fix
    - 85451f48d4 Fix python 3 support for inet_pton function
  - e4779f3246 Merge pull request #47339 from dwoz/ssh_key_test_fix
    - e37a931ca Remove redundant close call
    - b2ae5889b7 Close the temporary file handle
    - 9f7f83a975 Use salt.utils.fopen for line ending consistancy
  - b221860151 Merge pull request #47335 from dwoz/pip_test_fix
    - dcb6a22c00 Remove un-needed string-escape
  - 1c527bfd3a Merge pull request #47331 from dwoz/py3_wingroup_fix
    - cc154ef857 Do not encode usernames
  - 708078b152 Merge pull request #47329 from cachedout/frank_credit
    - 33c064ac4 Credit Frank Spierings
* a545e55543 Merge pull request #47281 from Ch3LL/system_test
  - c9181a75a6 Add destructivetest decorator on tests
  - 0d0c8987fc Add win_system integration module tests
* b64d930df0 Merge pull request #47283 from Ch3LL/ntp_test
  - ced7f86546 Add windows ntp integration module tests
* 910aff910f Merge pull request #47314 from Ch3LL/net_mac_test
  - 67be1451c Skip netstat test on macosx as its not supported
* 0549ef7c16 Merge pull request #47307 from rallytime/bp-47257
  - 6c5b2f92bc Role is not a list but a dictionary
* d6ff4689f6 Merge pull request #47312 from rallytime/update-bootstrap-release
  - 765ce06a2 Update bootstrap script to latest release: 2018.04.25
* e0765f5719 Merge pull request #47279 from dwoz/py3_build_fix
  - 21dc1bab91 Pep-8 line endings
  - 717abeda7 Fix comman wart
  - 4100dc64c Close might get called more than once
  - dbe671f943 Stop socket before queue on delete
  - 95875c69e Silence pylint import-error for six.moves
  - 4b0c7d3b34 Fix typo
  - 05ad7c2b1 Use six.moves for queue import
  - fe340778fa Gracefully shutdown worker threads
* 44f19b2f94 Merge pull request #47113 from jfindlay/iptables_state
  - 8d08012ee modules,states.iptables support proto for policy ext
* b7a6206330 Merge pull request #47302 from Ch3LL/dead_code
  - daa68b4877 Add virtual grains test for core grains
  - a59dd2785d Remove dead code in core grains file for virt-what
* e29362acfc Merge pull request #47303 from baniobloom/bug_fix_doc
  - b97c9df5f3 added clarity on how to figure out what is the oldest supported main release branch
* 0d9d55e013 Merge pull request #47106 from DSRCorporation/bugs/tornado50
  - 39e403b18d Merge branch '2017.7' into bugs/tornado50
  - 6706b3a2d1 Run off of a temporary config
  - d6873800d5 Allow running pytest>=3.5.0
  - 2da3983740 Tornado 5.0 compatibility fixes
* 2e014f4746 Merge pull request #47271 from gtmanfred/amazon
  - 8a53908908 Do not load rh_service module when booted with systemd
  - e4d1d5bf11 Revert "support amazon linux 2 for service module"
59b0ed1e9 Merge pull request #47246 from cloudflare/fix-44847-2017.7
  * ad80028104 This way, we can pass flags such as `debug` into the state, but also `test`.
4e2e1f0719 Merge pull request #47220 from benediktwerner/fix-pip-2017.7
  * 0197c3e973 Fix pip test
  * 34bf6c09f Fix pip.installed with pip>=10.0.0
92e606251f Merge pull request #47272 from rallytime/reg-windows-codeowners
  * 9445af0185 Add windows tests and reg module/state to CODEOWNERS file for team-windows
9dca5c0221 Merge pull request #47252 from rallytime/codeowners-fixes
  * 204b6af92b Fix the matching patterns in the CODEOWNERS file to use fnmatch patterns
3de1bb49c8 Merge pull request #47177 from fpicot/fix_47173_pkg_normalize
  * 149f846f34 fix normalize parameter in pkg.installed
10e30515dc Merge pull request #47251 from Ch3LL/pub_fix_rn
  * fa4c2e6575 Update Docs to remove unnecessary + sign
bb7850a431 Merge pull request #47249 from Ch3LL/pub_fix_rn
  * 24dea2497e Add CVE number to 2016.3.6 Release
56933eb0b2 Merge pull request #47227 from pruiz/pruiz/zfs-dataset-present-slow-2017.7
  * fded61f19b Fix issue #47225: avoid zfs.filesystem_present slowdown when dataset has lots of snapshots
9825065048 Merge pull request #47167 from smitty42/vbox-skd-fix
  * 5de53139cd Merge branch '2017.7' into vbox-skd-fix
976f031170 Merge pull request #47213 from dwoz/py3win
  * ad9c7f63f0 Fix coverate on py3 windows builds
  * 91252ac95 Adding updates for python3 compatibility and new virtualbox SDK version support.
cebcd6d069 Merge pull request #47197 from dwoz/testfix
  * 25803c9176 Move process target to top level module namespace
d4269c2b70 Merge pull request #47193 from Ch3LL/network_test
  * bbff987c19 Add network module integration tests
c777248a78 Merge pull request #47189 from Ch3LL/autoruns
  * 6a88bedb7a Add autoruns to windows whitelist
  * e9e444af70 Add autoruns.list integration test for Windows

- **PR #47403:** (rallytime) Back-port #47356 to 2018.3 @ 2018-05-01 15:19:06 UTC
  - **PR #47356:** (robinro) Fix sysctl translate (refs: #47403)
- 4e6870305c Merge pull request #47403 from rallytime/bp-47356
- 9b682bc48e Fix sysctl translate
- **PR #47407:** (terminalmage) Reduce severity of missing X_update_interval key @ 2018-05-01 15:18:46 UTC
- 7e0cdd6145 Merge pull request #47407 from terminalmage/update-interval-log
- abc592bfff Reduce severity of missing X_update_interval key

**ISSUE #47042**: (valentin2105) [ERROR] Unable to manage file: 'utf8' codec can't decode byte (refs: #47061)

**PR #47405**: (terminalmage) Fix file.get_diff regression in 2018.3 branch @ 2018-05-01 15:16:46 UTC
  - PR #47061: (terminalmage) Fix diffing binary files in file.get_diff (refs: #47405)
  - 1377942bcc Merge pull request #47405 from terminalmage/binary-diff
  - 89ddb08026 Use a lambda instead of defining a one-line function
  - b79f04fda Remove no-longer-used enumerate
  - e03b865359 Add unit test for file.get_diff
  - 5bdc9e9bd5 Fix UnboundLocalError in file.get_diff

**ISSUE #47325**: (robertodocampo) docker_container.running creates containers using the image ID as the image name (refs: #47367)

**PR #47367**: (terminalmage) Start docker containers with image name instead of ID @ 2018-04-30 18:46:13 UTC
  - c267e6083e Merge pull request #47367 from terminalmage/issue47325
  - 798134c6a9 Add regression test for creating images with image name instead of ID
  - 4ed47839c Start docker containers with image name instead of ID

**ISSUE #47006**: (cedwards) marathon & fx2 grain modules cause master and minion failure (refs: #47401)

**PR #47401**: (gtmanfred) fix proxy virtual checks for marathon and fx2 @ 2018-04-30 18:44:46 UTC
  - 3bb00cb55 Merge pull request #47401 from gtmanfred/proxy
  - 99f9231759 fix proxy virtual checks for marathon and fx2

**PR #47397**: (rallytime) Add 2018.3.1 Release Notes @ 2018-04-30 14:44:38 UTC
  - c160fe36ce Merge pull request #47397 from rallytime/2018.3.1-release-notes
  - 3b40cdad2a Add 2018.3.1 Release Notes

**ISSUE #45790**: (bdarnell) Test with Tornado 5.0b1 (refs: #46066, #47106, #47433)

**PR #47374**: (DmitryKuzmenko) tornado50 merge forward for 2018.3 @ 2018-04-29 16:29:12 UTC
  - PR #47106: (DmitryKuzmenko) Tornado50 compatibility fixes (refs: #47374, #47368, #47433)
  - PR #46002: (isbm) Pyzmq 17.0.0 proper handling (refs: #47374, #47368)
  - 3400f829c4 Merge pull request #47374 from DSRCorporation/bugs/tornado50-2018.3
  - 400999c54f fix pyzmq
  - 47b6d409d1 add io_loop handling to runtests engine
  - fd074fbd7d use salt.utils.zeromq
  - 4ae33c5d9a Run off of a temporary config
  - 7913bb906e Allow running pytest>=3.5.0
  - 34058c181c Tornado 5.0 compatibility fixes

**ISSUE #47124**: (mchugh19) Vault module problem in 2018.3.0 (refs: #47379)

**PR #47379**: (dwoz) Properly encode messages when creating/validating signatures with m2crypto @ 2018-04-28 08:38:23 UTC
- 2afe4bee95 Merge pull request #47379 from dwoz/m2crypto_regression
- 068f2d430d Always sign and verify bytes
- 7810ebab9 Add sign regression tests
- f4441c3a1c Adding regression test for 47124

- **PR #47277:** (morganwillcock) Fix minion crash on NetBSD @ 2018-04-27 15:02:21 UTC
  - 7390b72808 Merge pull request #47277 from morganwillcock/netbsdswap
  - 0bcb1a079a Merge branch '2018.3' into netbsdswap
  - 30478e8c9c Use swapctl for NetBSD

- **PR #47320:** (twangboy) Change from NSSM to SSM @ 2018-04-27 14:37:50 UTC
  - 2b7c7ef704 Merge pull request #47320 from twangboy/win_ssm
  - 5549d83aee Use ssm instead of nssm

- **PR #47308:** (rallytime) Back-port #47287 to 2018.3 @ 2018-04-27 13:50:49 UTC
  - **PR #47287:** (esell) convert unicode ssh pass to str for azure (refs: #47308)
  - b6df5facee Merge pull request #47308 from rallytime/bp-47287
  - 5f392a23fe convert unicode ssh pass to str for azure

- **ISSUE #47324:** (rlschilperoort) archive.extracted keep and/or keep_source not working (refs: #47332)

- **PR #47332:** (garethgreenaway) [2018.3] Removing duplicate code from state/archive.py @ 2018-04-27 13:12:51 UTC
  - efa3aab800 Merge pull request #47332 from garethgreenaway/47324_archive_extracted_keep_keep_source
  - cc10bfe6b Removing redundant code which is preventing keep & keep_source from being set.

- **PR #47326:** (The-Loeki) Some Redis fixes @ 2018-04-26 17:12:47 UTC
  - 245d62ca16 Merge pull request #47326 from The-Loeki/redis-cache-sockets
  - d868b5dbd redis_return: add unix_socket_path to docs
  - ee9f533765 redis_cache: document UNIX socket access
  - 5337558a5a redis_return: Let redis handle pool creation, add UNIX socket support
  - c90f83b0f9 redis_return: cluster_mode default to False in __virtual__ to prevent KeyError stacktraces
  - 71e3286829 redis_return: Fix code blocks in docs
  - e660f1c78e redis_cache fix code blox in docs
  - 40e67747ee redis_cache: add socket to options

- **PR #47319:** (dwoz) Skip unix group tests on windows. @ 2018-04-26 15:59:35 UTC
  - 27a438f0ff Merge pull request #47319 from dwoz/skip_tests
  - d9442d043e Skip tests not applicable to windows

- **PR #47293:** (dwoz) The grp module is not available on windows @ 2018-04-25 20:22:34 UTC
  - 057f668788 Merge pull request #47293 from dwoz/win_build_fix
  - 0386216005 Fix sneaky indentation
  - 082b8d0b3d Use salt.utils.platform

• PR #47153: (terminalmage) salt.modules.ssh: properly encode/decode I/O @ 2018-04-25 14:53:51 UTC
  – 100cd312b Merge pull request #47153 from terminalmage/salt.modules.ssh: properly encode/decode I/O
• ISSUE #47199: (tkaczn) Targeting by list (-L) broken for minions behind syndic? (refs: #47275)
• PR #47275: (terminalmage) Fix false failure events sent when using syndic @ 2018-04-25 13:56:47 UTC
  – b5d64f1a70 Merge pull request #47275 from terminalmage/issue47199
  – 8012ad128 Fix false failure events sent when using syndic
• ISSUE #47267: (skjaro) Problem with beacon diskusage on windows platform in 2018.3 (refs: #47284)
• PR #47284: (skjaro) Fix beacon diskusage documentation for the new beacon behavior mentioned in issue #47267 @ 2018-04-25 13:52:30 UTC
  – 6215a995d8 Merge pull request #47284 from skjaro/beacon_diskusage_doc_fix
  – f0c042a56 Fix beacon documentation for the new behavior mentioned in issue #47267
• PR #47291: (bosatsu) Fix proxy minion beacon doc @ 2018-04-25 13:42:36 UTC
  - 3ef4fe6ed2 Merge pull request #47291 from bosatsu/fix-proxy-minion-beacon-doc
  - 01980b4c43 Fix topics/releases/2018.3.0.rst to include correct example of proxy_example beacon yaml configuration.
  - 9682e26eee Fix topics/proxyminion/beacon.rst to include correct example of salt_proxy beacon yaml configuration.

• ISSUE #47239: (bosatsu) Unable to load salt_proxy beacon on minion in 2018.3.0 (refs: #47255)

• PR #47255: (garethgreenaway) [2018.3] Fixes to salt_proxy beacon and beacon tests @ 2018-04-25 13:41:51 UTC
  - ea2d68b865 Merge pull request #47255 from garethgreenaway/47239_fixes_to_salt_proxy_beacon
  - a2a8d78cb0 Fixing status beacon tests.
  - c87d6cae23 Ensure the salt_proxy is returning the correct tuple when the configuration is valid. Update various beacon unit tests to ensure they are testing the results of the validate function for a True result.

• PR #47292: (dwoz) Fix decorator wart @ 2018-04-25 04:25:23 UTC
  - PR #47290: (dwoz) Run cache_master test in tmp dir (refs: #47292)
  - 19f9e8258f Merge pull request #47292 from dwoz/cp_fix_again
  - 7d045eb235 Fix decorator wart

• PR #47285: (dwoz) Fix reg grains test @ 2018-04-25 00:16:56 UTC
  - da532aa1ac Merge pull request #47285 from dwoz/core_test_fix
  - 884f4c1829 Fix extra space
  - 8a9027c0c9 Fix reg grains test

• PR #47290: (dwoz) Run cache_master test in tmp dir (refs: #47292) @ 2018-04-24 23:37:21 UTC
  - f591cf643 Merge pull request #47290 from dwoz/test_cp_fix
  - 5ff51affbd Run cache_master test in tmp dir

• ISSUE #47092: (syphernl) [2018.3.0] pkg.installed breaks with virtual packages (refs: #47250)

• ISSUE #38838: (Zorlin) Failing to remove nginx (refs: #44455)

• PR #47250: (terminalmage) Fix virtual package detection @ 2018-04-24 19:22:24 UTC
  - PR #44455: (samodid) Fix for #38838 (refs: #47250)
  - 6d323aa8f0 Merge pull request #47250 from terminalmage/issue47092
  - b8630a70bc Fix virtual package detection

• ISSUE #47225: (pruiz) zfs.filesystem_present takes forever on a dataset with lots (10k+) of snapshots (refs: #47228, #47227, #47226)

• PR #47228: (pruiz) Fix issue #47225: avoid zfs.filesystem_present slowdown when dataset has lots of snapshots (2018.3 branch) @ 2018-04-24 13:35:21 UTC
  - PR #47226: (pruiz) Fix issue #47225: avoid zfs.filesystem_present slowdown when dataset has lots of snapshots (refs: #47228, #47227)
  - 428e915d6a Merge pull request #47228 from pruiz/pruiz/zfs-dataset-present-slow-2018.3
  - cbff136ab2 Fix issue #47225: avoid zfs.filesystem_present slowdown when dataset has lots of snapshots

• ISSUE #46943: (Auha) Slack.Engine could not start (refs: #47262, #47109)
• **PR #47262:** (garethgreenaway) [2018.3] Fixes to targeting in Slack engine @ 2018-04-24 13:18:36 UTC
  - 0b836106b9 Merge pull request #47262 from garethgreenaway/slack_engine_target_fix
  - bcede61e8 Removing target and tgt_type from the cmdline that is passed along to Salt, the target is used elsewhere and including it in the cmdline causes problem when it is passed along. Adding an additional test to ensure we are getting the right target.

• **ISSUE #47047:** (Giandom) Pillars aren’t evaluated when alias is passed in Slack Engine (refs: #47142)

• **PR #47142:** (garethgreenaway) [2018.3] pillar and output formatting fixes to Slack engine @ 2018-04-23 19:55:07 UTC
  - 2ed4b38b02 Merge pull request #47142 from garethgreenaway/47047_passing_pillar_to_slack_aliases
  - 6f183e1d80 Initial commit for unit/engines/test_slack_engine
  - a2840fc230 Only include the rest of the cmdline if the cmd is an alias.
  - e846df7409 Fixing a bug when passing pillar values to aliases for the Slack engine. Cleaned up the formatting of the results, color codes don’t translate well into Slack output. For any state runs, eg. highstate, apply, sls, we run the output through the highstate formater. For anything else run it through the yaml outputer. Running it though highstate causes errors when the output does match what the highstate output is expecting.

• **PR #47245:** (terminalmage) Ensure we pass hexid as bytes when zmq_filtering enabled @ 2018-04-23 16:54:57 UTC
  - 42a0e655dc Merge pull request #47245 from terminalmage/zeromq-bytes
  - a7acc0548 Ensure we pass hexid as bytes when zmq_filtering enabled

• **PR #47242:** (aesposito91) PY3 fix for zeromq setsockopt @ 2018-04-23 16:38:09 UTC
  - 73525d1460 Merge pull request #47242 from aesposito91/2018.3
  - b225351e6d Update napalm_syslog.py

• **ISSUE #47117:** (prashanthtuttu) Napalm / Capirca Issue (refs: #47241)

• **PR #47241:** (mirceaaulinic) Fix the imports into the netacl execution and state modules @ 2018-04-23 14:56:32 UTC
  - b78295ae9 Merge pull request #47241 from cloudflare/fix-47117
  - 26c558326d #47117: fix the napalm imports in the netacl state module
  - 48396467c1 #47117: fix the napalm imports in the netacl execution module

• **PR #47219:** (garethgreenaway) [2018.3] Fixing a backward compatibility issue with vault module & runner @ 2018-04-23 14:10:19 UTC
  - 88557ea991 Merge pull request #47219 from garethgreenaway/vault_backward_compatibility
  - 1758081f8 When using the vault module on a 2018.3 minion against a 2017.7 master, the 2018.3 minion is expecting a verify element in the results from the Salt runner on the master. The runner in 2017.7 did not include a verify element, which results in an error. This change accounts for this by using the default in 2018.3 which is not to verify if not configured.

• **PR #47186:** (dmurphy18) backport of issue 46933, updated ZFS handling to Salt 2018.3.x @ 2018-04-23 14:07:06 UTC
  - 370feedbd2 Merge pull request #47186 from dmurphy18/zfs_backport_46933
  - 283359f315 Corrected typo in comma-separated and 2018.3.0 -> 2018.3.1
  - b7f8d5a2f Replace use of Fluorine with 2018.3.0 for comma-separated warnings
- 3f30ab2ed6 ZFS backport of 46933 to 2018.3.1
- **PR #47217**: (twangboy) Remove installation of pywin32 from setup.py @ 2018-04-23 13:32:54 UTC
  - bf3a67d11b Merge pull request #47217 from twangboy/fix_setup
  - eb3d45bb08 Remove installation of pywin32 from setup.py
- **PR #47195**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-04-20 19:25:30 UTC
  - 8e21703f13 Merge pull request #47195 from rallytime/merge-2018.3
  - f90fd8c663 Test fix: file strings must be unicode in master config
  - bee4948df1 Lint: use full path for event utils function
  - 120c5446b7 Update old utils paths to new utils paths
  - 4718d31e53 Merge branch '2017.7' into '2018.3'
  - 65f344e371 Merge pull request #47184 from Ch3LL/status_test
    - 25a84428b8 Add status module integration modules tests for Windows
  - 965600ad6c Merge pull request #47163 from rallytime/jenkins-autodoc
    - 0039395017 Update jenkins module autodocs to use jenkinsmod name instead
  - 0a43d6e5fc Merge pull request #47185 from twangboy/add_tests
    - 345daa0423 Add additional integration tests to whitelist
  - 1a600bb9a4 Merge pull request #47172 from dwoz/cover_without_admin
    - cadd759727 Use warnings to warn user
    - 144c68e214 Allow non admin name based runs on windows
  - d59972301 Merge pull request #47110 from kstreee/fix-misusing-of-timeout
    - 062aee0ed Fixes misusing of the timeout option.
  - 87ca2b4003 Merge pull request #40961 from terminalmage/issue40948
    - 6ba66cc4a1 Fix incorrect logic in exception check
    - fed5041c5f Make error more specific to aid in troubleshooting
    - 8c67ab53b4 Fix path in log message
    - 3198ca8b19 Make error more explicit when PKI dir not present for salt-call
  - f5e63584d4 Merge pull request #47134 from Ch3LL/user_win_test
    - e7c9bc4038 Add user integration tests for windows OS
  - da2f6a3fac Merge pull request #47131 from gtmanfred/cli
    - 1b1c29bf62 add __cli for master processes
  - 9b8e6ff8c Merge pull request #47129 from rallytime/bp-47121
    - 11da526b21 add ImportError
    - bd0c2339c6 fix pip.req import error in pip 10.0.0
  - eb5ac51a48 Merge pull request #47102 from gtmanfred/2017.7
    - 3dc93b310b fix tests
    - 8497e08f8e fix pip module for 10.0.0
- 4c07a3d1e9 fix other tests
- b71e3d8a04 dont allow using no_use_wheel for pip 10.0.0 or newer
  * c1dc42e67e Merge pull request #47037 from twangboy/fix_dev_scripts
    * 990a24d7ed Fix build_env scripts
- **ISSUE #46906**: (whytwolf) Windows failure with PR 46541 (refs: #47168)
- **PR #47168**: (gtmanfred) fix metadata grain for py3 and windows @ 2018-04-20 19:07:50 UTC
  - a56eb7e05d Merge pull request #47168 from gtmanfred/metadata
  - 396f7906e3 fix metadata grain for py3 and windows

- PR #47061: (terminalmage) Fix diffing binary files in file.get_diff (refs: #47045) @ 2018-04-18 18:52:10 UTC
  - 13ae1a2413 Merge pull request #47061 from terminalmage/issue47042
  - 87f6cefa3 Rewrite flaky utf8 state to make it easier to troubleshoot
  - df6e535f05 Fix diffing binary files in file.get_diff
• **PR #47058**: (terminalmage) Fix calls to file.lsattr when lsattr is not installed @ 2018-04-18 16:30:12 UTC
  - cbaf0f13cd9 Merge pull request #47058 from terminalmage/lsattr
  - eeb06e7910 Fix calls to file.lsattr when lsattr is not installed
• **ISSUE #46929**: (noelmcloughlin) 2018.3 regression file.managed.context parsing (refs: #47104)
• **PR #47104**: (terminalmage) yamlloader: Properly handle colons in inline dicts @ 2018-04-18 16:22:47 UTC
  - b96cea23b3f Merge pull request #47104 from terminalmage/issue46929
  - 33bf6463cd Add additional test for plain scalars
  - 508659b682 yamlloader: Properly handle colons in inline dicts
• **ISSUE #46887**: (julientravelaer) ldap.managed broken with 2018.3.0 (refs: #47029)
• **ISSUE #46859**: (cheribral) pillar_ldap causing TypeError exceptions in python-ldap with unicode objects (refs: #47029)
• **PR #47076**: (terminalmage) pillar_ldap: Load config options as str types @ 2018-04-18 16:16:22 UTC
  - PR #47029: (terminalmage) ldapmod.py/ldap3.py: Force modlist for search/modify/etc. to be str types (refs: #47076)
  - c12697b173 Merge pull request #47076 from terminalmage/issue46859
  - c06e859caf pillar_ldap: Load config options as str types
• **PR #47107**: (twangboy) Fix issues with reg state, add tests @ 2018-04-18 15:53:02 UTC
  - 50bd885ec7 Merge pull request #47107 from twangboy/fixed_46932
  - a8eab2ab1a Fix tests for py3, enable tearDown
  - 3cf4ac1475 Add integration tests for reg state
  - cc259b146f Cast vdata to appropriate type in reg state
• **ISSUE #46909**: (epelc) Binary contents_pillar with file.managed raises UnicodeDecodeError (refs: #47041)
• **PR #47041**: (terminalmage) Force null bytes to be str types @ 2018-04-18 14:08:25 UTC
  - d6c59696be Merge pull request #47041 from terminalmage/issue46909
  - e1482715be Special check specifically for bytes types
  - e900d5d95 Merge branch '2018.3' into issue46909
  - 0e99343a7f Use the same way of defining contents in both file.managed states
  - 5741d287b5 Move back to using null byte check for contents
  - 8e214c9fa9 file.managed: Add test to ensure binary contents work
  - 7b7dc94610 Use salt.utils.stringutils.is_binary to check if contents are binary
  - e3c969da81 PY3: Ensure binary contents work with file.managed
  - df98a8bedd Make salt.utils.stringutils.to_binary work for bytestrings
  - 1024000369 Force null bytes to be str types
• **PR #47007**: (twangboy) Fix some issues with the win_servermanager module @ 2018-04-17 20:57:04 UTC
  - 9a9f6524f8 Merge pull request #47007 from twangboy/fix_46968
  - 432db7c6ec Lint: Remove unused import
  - 10341e8f8b Remove erroneous pop statement
- 56582f293a Remove redundant try/except block from state`
- 6ad2427279 Remove unnecessary try/except blocks
- 92eeaa51bd Put some error checking in the shell command

- **ISSUE #46943**: (Auha) Slack.Engine could not start (refs: #47262, #47109)
- **PR #47109**: (garethgreenaway) [2018.3] fixes to Slack engine @ 2018-04-17 13:56:27 UTC
  - a52137ee36 Merge pull request #47109 from garethgreenaway/46943_slack_engine_fixes
  - 02baa76595 Fixing a bug that occurred when a comment was added to a message sent to Slack by Salt. Also making slack_engine:groups_pillar optional.
- **PR #47045**: (tankywoo) Fix ba7d00f5 for gentoo pkg.installed method @ 2018-04-17 13:55:45 UTC
  - 6c16a34c44 Merge pull request #47045 from tankywoo/fixed-gentoo-pkg-installed
  - 551f4e10cf Fix ba7d00f5 for gentoo pkg.installed
- **PR #47053**: (clan) handle jinja error in <module> level @ 2018-04-16 22:47:54 UTC
  - 86c7c7ef56 Merge pull request #47053 from clan/jinja-error
  - a847466946 handle jinja error in <module> level
- **PR #47062**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-04-16 19:58:32 UTC
  - 7bfa608e9f Merge pull request #47062 from rallytime/merge-2018.3
  - 59f5880e72 lint fix
  - 1dd8e584b Update old utils files to new new util files path
  - 28a79ebba4 Merge branch '2017.7' into '2018.3'
  - * 1700a10ebc Merge pull request #46326 from kstreee/fixed-client-local
    - 0f3589c9e9 Fixes a timing bug of saltnado's client local.
  - * c3c00316c5 Merge pull request #46913 from lomeroe/2017_7-fix46877
    - 369a0645ed move exception for clarity
    - 32ce5bfda5 Use configparser serializer object to read psscript.ini and script.ini startup/shutdown script files.
  - * 9e37cfc9d6 Merge pull request #47025 from terminalmage/fix-server_id-windows
    - cb0cf89ed3 Fix server_id grain in PY3 on Windows
  - * 2e193cb45 Merge pull request #47027 from rallytime/bp-44508
    - 8e72f362f4 Add priority field to support the latest capirca.
    - 112f92baab Add priority field to support the latest capirca.
  - * 385fe2bc1e Merge pull request #47020 from rallytime/bp-46970
    - 9373df52b Update test_pkgrepo.py
    - 13cf9eb5b1 Removing debugging.
    - a61a8593e5 Removing use from pkgrepo comments tests. the pkgrepo functions in SUSE pkg module do not support comments.
- **PR #47066**: (terminalmage) Fix regression in handling of environment/saltenv @ 2018-04-16 19:57:12 UTC
  - fa27e64a33 Merge pull request #47066 from terminalmage/issue46979

**30.2. Previous Releases**
- 5c4c0468ad Fix regression in handling of environment/saltenv

- **PR #47051**: (rallytime) Simplify LooseVersion check in __virtual__ check in mac_assistive module @ 2018-04-13 19:43:33 UTC
  - 8761b81a69 Merge pull request #47051 from rallytime/fix-lint
  - d52b3689d9 Simplify LooseVersion check in __virtual__ check in mac_assistive module

- **PR #47057**: (corywright) Fix copy/paste typo in minionfs tutorial @ 2018-04-13 19:43:01 UTC
  - bbb8018b55 Merge pull request #47057 from corywright/fix-minionfs-whitelist-docs
  - 9b7ee97d12 Fix copy/paste typo in minionfs tutorial

- **ISSUE #46931**: (anlutro) file.managed diff is switched when using template in salt-ssh 2018.3 (refs: #47046)

- **PR #47046**: (clan) switch order of file to be diffed @ 2018-04-13 13:40:13 UTC
  - d5afa4a2c5 Merge pull request #47046 from clan/file_diff
  - bb5860c54 switch order of file to be diffed

- **ISSUE #46985**: (OrlandoArcapix) grafana4_user.present and grafana4_org.present states not working in 2018.3.0 (refs: #47048)

- **PR #47048**: (OrlandoArcapix) Issue46985 fix grafana4 state (refs: #47060) @ 2018-04-12 19:43:01 UTC
  - ec9251ecd3 Merge pull request #47048 from OrlandoArcapix/Issue46985-fix-grafana4-state
  - 259d747414 Remove accidentally added copy of a file
  - 6c833da74d Return an empty dict instead of 'None' from grafana4 states

- **PR #47017**: (rallytime) Back-port #46919 to 2018.3 @ 2018-04-12 19:43:01 UTC
  - PR #46917: (rallytime) Replace failing is and is not tests with == and != (refs: #47017)
  - 5b7544eaa0 Merge pull request #46919 from rallytime/bp-46919
  - 68376c613e Replace failing is and is not tests with == and !=

- **ISSUE #46919**: (boltronics) mysql_grants.present broken with database: somedatabase.* (refs: #46919)

- **PR #47019**: (rallytime) Issue46887 fix grafana4 state (refs: #47060) @ 2018-04-13 13:33:29 UTC
  - 7691dee4ed Add to_str option to decode funcs

- **ISSUE #46887**: (julientravelaer) ldap.managed broken with 2018.3.0 (refs: #47029)

- **ISSUE #46859**: (cheribral) pillar_ldap causing TypeError exceptions in python-ldap with unicode objects (refs: #47029)

- **PR #47029**: (terminalmage) ldapmod.py/ldap3.py: Force modlist for search/modify/etc. to be str types (refs: #47076) @ 2018-04-12 19:41:29 UTC
  - ac2d54d78a Merge pull request #47029 from terminalmage/issue46859
  - ab631424b ldapmod.py/ldap3.py: Force modlist for search/modify/etc. to be str types
  - 7691dee4ed Add to_str option to decode funcs

- **ISSUE #46868**: (tiyang) 2017.7.4 to 2018.3.0 upgrade issue: Salt request timed out. The master is not responding (refs: #46930)

- **PR #46930**: (dwoz) Clean up bad public key headers @ 2018-04-12 18:57:37 UTC
  - e6e07720fa Merge pull request #46930 from dwoz/ctdomekeyfix
- f2e484ed54 Merge branch '2018.3' into cryptodomekeyfix
- e1995a92ee Fix verify signature test
- 0ba32118d9 Add test for bad public key without m2crypto
- a44c356233 Clean up bad public key headers

- **ISSUE #46951**: (Giandom) Slack engine error using aliases: TypeError unhashable type (refs: #47008)
- **PR #47008**: (garethgreenaway) [2018.3] Fixing aliases in slack engine @ 2018-04-12 15:24:40 UTC
  - 0e43becc12 Merge pull request #47008 from garethgreenaway/46951_fixing_slack_engine_aliases
  - dc2a72d44f Fixing aliases in slack engine

- **ISSUE #46947**: (Giandom) Slack engine groups error (refs: #47009)
- **PR #47009**: (garethgreenaway) [2018.3] fixes to slack engine documentation @ 2018-04-12 15:20:54 UTC
  - c33de7c82d Merge pull request #47009 from garethgreenaway/46947_slack_documentation_update_catch_non_dicts
  - f0fadbb4ce Fixing indentation for slack documentation. Updating try..except to ensure we catch when groups aren’t dicts.

- **PR #47023**: (rallytime) Back-port #46997 to 2018.3 @ 2018-04-12 15:05:24 UTC
  - **PR #46997**: (LukeCarrier) Fix respository (= repository) typo in sls_build (refs: #47023)
  - **PR #44638**: (terminalmage) Many improvements to docker network and container states (refs: #46997)
    - 68d17c71f1 Merge pull request #47023 from rallytime/bp-46997
    - c2c60f4fc Fix repository (= repository) typo in sls_build

- **PR #47026**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-04-12 14:39:41 UTC
  - 9cfc6406a Merge pull request #47026 from rallytime/merge-2018.3
  - ba70df9d62 Use msgpack utils for loads call, import msgpack for UnpackValueError
  - 34a478dfe5 Update old fopen path with new utils files path
  - 590c7fc13f Merge branch '2017.7' into '2018.3'
    - 8f994e7cf9 Merge pull request #46539 from jfoboss/patch-1
      - 6890122e41 Merge pull request #1 from twangboy/pull_46539
      - 19c3fadbe5 Fix unit test for win_ntp
      - 826a8d3099 Fixing #46504
    - 7d70e95a5 Merge pull request #46999 from gtmanfred/2017.7
      - 791a8f6ce switch pip test package
    - 8adaf7526 Merge pull request #46023 from bloomberg/parallel-orch
      - 0ac0b3ca29 Merge branch '2017.7' into parallel-orch
    - 39d65a39cf Merge pull request #46613 from myinitialsarepm/fixed_puppet.fact_and_puppet.facts
      - 44ec13abc Update tests to use cmd.run_all
      - 7d7d40f541 Merge branch '2017.7' into fix_puppet.fact_and_puppet.facts
      - 0ce1520bd0 Merge branch '2017.7' into fix_puppet.fact_and_puppet.facts
      - 69e1f6f681 Fix puppet.fact and puppet.facts to use stdout.
• 3d5e69600b address lint issues raised by @isbm
• a9866c7a03 fix parallel mode py3 compatibility
• 6d7730864a removing prereq from test orch
• 6c8a25778f add integration test to runners/test_state to exercise parallel
• 2c86f16b39 cherry-pick cdata KeyError prevention from #39832
• 26a96e8933 record start/stop duration for parallel processes separately
• e4844bdf2b revisit previous join() behavior in check_requisites
• f00a359cdf join() parallel process instead of a recursive sleep
• 6c7007a4dc add parallel support for orchestrations

• PR #47021: (garethgreenaway) [2018.3] Fixing integration.modules.test_state_jinja_filters.StateModuleJinjaFiltersTest.test_path_which
  @ 2018-04-12 13:12:39 UTC
    - d3be828696 Merge pull request #47021 from garethgreenaway/920_state_module_jinja_filters_test_test_path_which
    - 2ccf2c5fe0 Fixing test_path_which to check that the filter is available rather than results.

• PR #47022: (corywright) Add auth.file module to auth documentation page @ 2018-04-11 21:11:10 UTC
  - 66e8445b82 Merge pull request #47022 from corywright/add-auth-file-module-to-docs
  - bd0918fc40 Add auth.file module to auth documentation page

• PR #45774: (twangboy) Fix __virtual__ issue in mac_system.py @ 2018-04-11 14:26:13 UTC
  - 12ecfdee93 Merge pull request #45774 from twangboy/mac_add_service_util
  - 5796696617 Fix tests for Py3
  - 7b40218790 Fix lint, remove sentence from docstring
  - 781880f0fc Add _available_services function for testing
  - 6080633613 Add assert_called_with
  - 1bf70b2033 Add more tests for available_services
  - b429fc3e74 Add tests for mac_utils
  - b5f67130cc Used *args and **kwargs
  - ed061617a2 Fix unicode_literal issue in mac_assistive
  - 82e17e5fc8 Fix args/kwargs
  - 455146500a Move some functions into mac_utils
  - 125586264b Add utilsmac_service.py

• ISSUE #46953: (cskowronnek) salt-cloud azurearm [ERROR ] There was a profile error: Parameter 'subscription_id' must be str. (refs: #47012)

• PR #47012: (terminalmage) Azure: ensure subscription_id is a str type @ 2018-04-11 13:57:08 UTC
  - 79347f108a Merge pull request #47012 from terminalmage/issue46953
  - 5192622a32 Azure: ensure subscription_id is a str type

• PR #46526: (Ch3LL) Add tests for new source_* minion options @ 2018-04-10 19:56:45 UTC
  - 6503bf8dfe Merge pull request #46526 from Ch3LL/ip_conf
  - c01180ff47 Patch ZMQ versions for master_uri test
- da38f332a5 Change comment and salt.utils.network import
- e972ebdf1a Add for new source_* minion options

**PR #46993:** (L4rS6) Fix: tuple instead of string @ 2018-04-10 17:07:59 UTC
- 03907d3f0c Merge pull request #46993 from L4rS6/fix-broken-keystone-auth/2018.3
- e33ba1b3d5 Fix: tuple instead of string

**PR #46990:** (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-04-10 17:07:33 UTC
- ffaee26540 Merge pull request #46990 from rallytime/merge-2018.3
- ccc5bad2df Merge branch '2017.7' into merge-2018.3
  * ba5421d988 Merge pull request #46991 from gtmanfred/windows
    - 98588c1dc5 use saltstack salt-jenkins
  * 2f1cf3e511 Merge branch '2017.7' into '2018.3'
    * 00c4067585 Merge pull request #46975 from gtmanfred/windows
      - 1f69c0d78c make sure windows outputs xml junit files
      - 4a2ec1bb3 support new versions of winrm-fs
      - b9efec8526 remove libnacl on windows
      - 2edd5eaf9e fix path
      - b03e272e44 windows work
    * 3cf2353e41 Merge pull request #46945 from vutny/doc-faq-fix-jinja
      - b6df54e61d [DOC] Fix Jinja block in FAQ page
    * fc2f728665 Merge pull request #46925 from terminalimage/fix-file.patch-docstring
      - 97695657f0 Remove reference to directory support in file.patch state
    * eef6c518e1 Merge pull request #46900 from rallytime/bp-46801
      - 6a41e8b457 rename jenkins to jenkinsmod
    * 71839b0303 Merge pull request #46899 from rallytime/bp-45116
      - b2f908da4 fix adding parameters to http.query from sbd yaml

**PR #46339:** (DmitryKuzmenko) SSH State test failures @ 2018-04-10 17:06:51 UTC
- a34b92ae82 Merge pull request #46339 from DSRCorporation/bugs/ssh_state_test_failures
- bd98c49dc7 Merge branch '2018.3' into bugs/ssh_state_test_failures
- 6fd4c58a7f Increase timeout for run_run in ShellCase
- 8e60ccdbf Give background task more chance to start.
- e068678acf One more useful assert for better test results.
- 92a6e43c73 More logging and assertion fixes. Extended ssh ops timeout.
- 6ebdd17ac4 Advanced logging in the failing SSH State tests.

**PR #46989:** (Ch3LL) Fix redis cache log debug line @ 2018-04-10 16:35:12 UTC
- 9924100c44 Merge pull request #46989 from Ch3LL/redis_log
- 6160bc06c6 Fix redis cache log debug line
• ISSUE #46834: (oeufette) strftime filter not found in 2018.3.0 (refs: #46848)

• ISSUE #46668: (anlutro) Jinja2 filter strftime stopped working in salt-ssh 2018.3 (refs: #46848, #46744)

• PR #46848: (garethgreenaway) [2018.8] salt-ssh jinja filters tests @ 2018-04-10 16:19:51 UTC
  - c6431936cb Merge pull request #46848 from garethgreenaway/testing_jinja_filters_available_via_salt_ssh
  - 5fdf33ef78 Merge branch '2018.3' into testing_jinja_filters_available_via_salt_ssh
  - 0adfee9b11 Updating a couple tests. Fixing check_whitelist_blacklist to work with PY3 when non-iterables are passed. Adding warning about lst_avg results being wrong and future updates in Neon.
  - f3f42146ca Removing expected from strftime and hashsum tests since the results are always different and we are only concerned about the filter being available.
  - 86023ac045 Fixing lint.
  - 08916b580 fixing docstring
  - c894e4b2e cleaning up some imports.
  - 0597795ed5 cleaning up some test doc strings.
  - dced5eb88 Moving all jinja filter tests into support/jinja_filters.py. Updating integration/ss/test_jinja_filters.py to use those tests. Adding integration/modules/test_state_jinja_filters.py to also use the common jinja filter tests.
  - 07d7e3ca01 Adding a new integration test and corresponding state files to test availability of jinja filters when using salt-ssh.

• ISSUE #46880: (liquidgecka) rabbitmq_policy broken in 2018.3.0 (refs: #46973)

• PR #46973: (rallytime) New "apply_to" kwarg in rabbitmq module should be added at the end @ 2018-04-10 14:42:32 UTC
  - PR #41233: (dnABic) added parameter apply_to for rabbitmq policy (refs: #46973)
  - fbbcb7584c Merge pull request #46973 from rallytime/fix-46880
  - 8e1f982c New "apply_to" kwarg in rabbitmq module should be added at the end

• ISSUE #46934: (d601) GPG encrypted binary data in pillars breaks in 2018.3.0 (refs: #46966)

• PR #46966: (terminalmage) Fix traceback when attempting to decode binary data to unicode @ 2018-04-10 14:08:35 UTC
  - 58f59cfb8f Merge pull request #46966 from terminalmage/issue46934
  - df43f2b8f salt.payload.Serial: fix traceback when unpacking binary blob
  - 40a9358c9 gpg renderer: fix traceback when decrypted ciphertext contains binary data
  - 17a888f571 Include exc_info in pillar render errors to aid in troubleshooting

• ISSUE #46881: (SynPrime) Cron.file - source file not found (refs: #46944)

• PR #46944: (garethgreenaway) [2018.3] cron.file with salt source URL @ 2018-04-10 13:34:03 UTC
  - e3e0792e2a Merge pull request #46944 from garethgreenaway/46881_Cron_file_source_file_not_found
  - 438aaecb03 Adding kwargs to calls into file module functions
  - 14d12b1d6b Remove unused imports. Gating tests so they do not run on Windows
  - 623d96f21a Adding dummy cron file for integration/states/test_cron
  - c8e01871d6 Adding an integration test to test cron.file.
- ddc55d8f9b Fixing bug that made cron_file unable to use a file via a Salt URL.

- **PR #46937**: (gtmanfred) enable_ssh_minions does not work with subset yet @ 2018-04-07 02:54:56 UTC
  - 08e88782f6 Merge pull request #46937 from gtmanfred/2018.3
  - 3fb75e903c enable_ssh_minions does not work with subset yet

- **PR #46936**: (gtmanfred) don't copy __pycache__ or .pyc files for kitchen @ 2018-04-06 19:15:46 UTC
  - ac4e7cd73f Merge pull request #46936 from gtmanfred/2018.3
  - 91474878f8 don't copy __pycache__ or .pyc files for kitchen

- **ISSUE #46659**: (stamak) [salt-cloud] [new oxygen openstack driver ] no public_ips and floating_ips in salt-cloud output (refs: #46912)

- **PR #46912**: (gtmanfred) pull latest vm data after building for openstack shade driver @ 2018-04-06 13:46:42 UTC
  - 8105fd9715 Merge pull request #46912 from gtmanfred/openstack
  - 5ef35f8f8d pull latest vm data after building for openstack shade driver

- **PR #46908**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-04-05 21:27:03 UTC
  - 735ea12960 Merge pull request #46908 from rallytime/merge-2018.3
  - 102e966512 Remove redundant section in log setup
  - 177c686b52 Update old utils paths to new utils paths
  - 0a297e7319 Merge branch '2017.7' into '2018.3'
    - d05b43753 Merge pull request #44926 from frogunder/whitelisted_acl
      - 18e460fc30 Merge branch '2017.7' into whitelisted_acl
      - 1ad4d7d988 fix assert errors
      - e6a56016df update test
      - 9a224c8778 whitelist_acl_test
    - 7d822f99ec Merge pull request #46464 from gtmanfred/orchestration
      - 6373c6b7b fix pylint
      - 0151013d2b document cli option for cmd_subset
      - 4a3ed6607d add test for subset in orchestration
      - 3112359dd6 fix salt subset in orchestrator
    - 805ed1c964 Merge pull request #46879 from dwoz/cloudtestfix
      - dc54c53c3 Fix multiple typos causing tests to fail
    - f70f0ed2872 Merge pull request #46647 from twangboy/win_fix_test_grains
      - c179388b0e Fix the tear down function in integration.modules.test_grains.GrainsAppendTestCase
    - 91c078ce12 Merge pull request #46756 from nages13/bugfix-grain-virtual_subtype
      - 781f5030a4 Merge branch 'bugfix-grain-virtual_subtype' of https://github.com/nages13/salt into bugfix-grain-virtual_subtype
      - cd1ac4b7f9 Merge branch '2017.7' into bugfix-grain-virtual_subtype
- 0ace76c0e7 Merge branch '2017.7' into bugfix-grain-virtual_subtype
- 9eb6f5c0d0 Merge branch '2017.7' into bugfix-grain-virtual_subtype
- 73d6d9d365 Merge branch '2017.7' into bugfix-grain-virtual_subtype
- a4a17eba6a Merge branch '2017.7' into bugfix-grain-virtual_subtype
- bf5034dbdb Merge branch '2017.7' into bugfix-grain-virtual_subtype
- 8d12770951 Merge branch '2017.7' into bugfix-grain-virtual_subtype
- 7e704c0e81 Moved down container check code below hypervisors to validate containers type running in virtual environment. Fixes #46754 & #43405
- 710f74c4a6 fix grains['virtual_subtype'] to show Docker on xen kernels
* 058bbed221 Merge pull request #46799 from garethgreenaway/46762_prereq_shenanigans_tests
  - 13875e78cf Fixing documentation string for test.
  - 3d288c44d4 Fixing test documentation
  - 6cff02e6a Adding tests for #46788
* d9770bf3f8 Merge pull request #46867 from terminalmage/unicode-logging-normalization
  - 7652688e83 Backport string arg normalization to 2017.7 branch
* 9eb98b1f6e Merge pull request #46770 from twangboy/fix_46433
  - 89a0a6222 Merge branch '2017.7' into fix_46433
  - 6bd2697578 Remove unused import (ling)
  - 9302fa5ab0 Clean up code comments
  - b383b9b330 Change the order of SID Lookup
* 9c776cfff7 Merge pull request #46839 from gtmanfred/tupletarget
  - 3b7208ce27 match tuple for targets as well
* 7db251dc11 Merge pull request #46845 from rallytime/bp-46817
  - 36a06d8ca address filehandle/event leak in async run_job invocations
* e3d17ab7bc Merge pull request #46847 from dwoz/missing-strdup
  - 55845f4846 strdup from libc is not available on windows
* f2dd7df9c4 Merge pull request #46776 from gtmanfred/2017.7
  - edc1059ee0 fix shrinking list in for loop bug
* PR #46653: (terminalmage) Add back date_format filter @ 2018-04-05 20:33:50 UTC
  - 9a47af33b Merge pull request #4653 from terminalmage/date_format_filter
  - 266d13a665 Add back date_format filter
* PR #46882: (jasperla) Backport #46280 #46849 #46852 to 2018.3 @ 2018-04-05 14:29:12 UTC
  - PR #46852: (jasperla) fix creating a nic tag on a link with double 0 in the MAC (refs: #46882)
  - PR #46849: (jasperla) Unbreak creating etherstubs on SmartOS (refs: #46882)
  - PR #46280: (jasperla) Remove unneeded checks for binaries in SmartOS modules (refs: #46882)
  - a064a3e695 Merge pull request #46882 from jasperla/smartos/backports
- 47a66975ff fix creating a nic tag on a link with double 0 in the MAC
- a3cb0e576e Unbreak creating etherstubs on SmartOS
- e703254990 Remove unneeded checks for binaries in SmartOS modules

**PR #46873: (terminalmage)** Attempt UTF-8 first when decoding/encoding @ 2018-04-05 14:16:28 UTC
- 4e5e291c99 Merge pull request #46873 from terminalmage/utf8-first
- cf28eb74aa Don’t log command when output_loglevel == 'quiet'
- f59ee28db Remove hacky workarounds to get encode/decode tests to pass on Windows
- 76e5d81bb4 Remove hacky workaround to get Windows to decode deserialized data properly
- 0b5729e58a Remove hacky workaround to get git state/exec module to work properly on Windows
- 22ff48518f Attempt UTF-8 first when decoding/encoding

**ISSUE #43499: (tyeapple)** zmq setsockopt need to adapt python3 (refs: #46874)

**PR #46878: (terminalmage)** Backport #46874 to 2018.3 @ 2018-04-05 13:26:04 UTC
- PR #46874: (johnj) Use bytestrings for PY3 compatibility when running setsockopt for zmq.SUBSCRIBE (refs: #46878)
- 1518762465 Merge pull request #46878 from terminalmage/bp-46874
- d9511d04d4 #43499, zmq setsockopt need to adapt python3

**ISSUE #46862: (kivoli)** Setting locale.system fails in 2018.3 (refs: #47280, #46869)

**PR #46869: (gtmanfred)** Always return dictionary for _localectl_status @ 2018-04-05 13:25:14 UTC
- 67894e3ee9 Merge pull request #46869 from gtmanfred/2018.3
- 1496e985f7 fix pylint
- 75425fdd20 fix tests for localemod
- 2d7c7b5e33 Always return dictionary for _localectl_status

**PR #46870: (mirceaulinic)** Correct the documentation for two new proxy modules @ 2018-04-04 21:48:41 UTC
- 58c8ff18ec2 Merge pull request #46870 from cloudflare/proxy-doc
- f4b6184476 Corect and add the cimc proxy module to autodoc
- a99bce202b9 Correct & add Panos to autodoc

**PR #46729: (terminalmage)** Performance improvement/error catching in expr_match @ 2018-04-04 20:25:57 UTC
- d7e4b9d755 Merge pull request #46729 from terminalmage/expr_match
- 70cfae299 Add test case
- 250039b11f Restore original variable name
- ae0f112a49 Log an exception when non-string val/expr passed to expr_match
- dac42a672b Performance improvement/error catching in expr_match

**PR #46872: (terminalmage)** Backport #46863 to 2018.3 @ 2018-04-04 19:04:40 UTC
- PR #46863: (TamCore) fixed top function which was broken since commit 002aa88a97e (refs: #46872)
- e0b383af8c Merge pull request #46872 from terminalmage/bp-46863
- be284e5b99 Add skipIf when older mock present

30.2. Previous Releases 2059
- db8faae56 Add unit tests for ext_nodes master_tops module
- ee437f7c0f fixed top function which was broken since commit 002aa88a97e

- **PR #46850:** (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-04-04 18:07:44 UTC
  - 5c76d98d1a Merge pull request #46850 from rallytime/merge-2018.3
  - a0fd5c053 Fix test_cp failure: forgot to add tgt to test when @with_tempfile is present
  - d0202cab72 Resolve bad merge: there should only be one test_get_file_from_env_in_url test
  - e28f71b418 Lint: use full salt utils path
  - 4ad50bbdee Update old utils paths to new paths
  - 893196d3e6 Merge branch '2017.7' into '2018.3'
    - 1941426218 Merge pull request #46838 from gtmanfred/npm
      - bff61dd291 use http registry for npm
    - e54254e7b Merge pull request #46823 from rallytime/fix-42312
      - dafa820f93 Improve __virtual__ checks in sensehat module
    - 37fd2de35 Merge pull request #46641 from skizunov/develop3
      - c624aa4827 Make LazyLoader thread safe
    - 989508b100 Merge pull request #46837 from rallytime/merge-2017.7
      - 8522c1d634 Merge branch '2016.11' into '2017.7'
      - 3e844ed1df Merge pull request #46739 from rallytime/2016.11_update_version_doc
      - 4d9fc5c0df Update release versions for the 2016.11 branch
    - 307e7f35f9 Merge pull request #46740 from rallytime/2017.7_update_version_doc
      - 7edf98d224 Update 2018.3.0 information and move branch from "latest" to "previous"
      - 5336e866ac Update release versions for the 2017.7 branch
    - ebf5dd276b Merge pull request #46783 from twangboy/fix_46680
      - da5ce25ef3 Fix unit tests on Linux
      - b7fa377cd Add space I removed
      - f1c6b5a9b5 Fix network.managed test=True on Windows
    - f652f25cc1 Merge pull request #46821 from rallytime/fix-mantest-failures
      - 209a8029c3 Fix the new test failures from the mantest changes
    - c460f62081 Merge pull request #46800 from lomeroe/2017_7-46627
      - 2bee383e9d correct create list item value names if the valuePrefix attribute does not exist
        on the list item, the value is the value name, other wise, the valuename a number with the
        valuePrefix prepended to it
    - df26f2641e Merge pull request #46675 from dwoz/inspectlib-tests
      - d39f4652d8 Handle non-zero status exception
      - 83c005802b Handle cases where git can not be found
      - 628b87d5c4 Skip test when git symlinks are not configured
    - 4083e7c460 Merge pull request #46815 from terminalmage/bp-46809
71d5601507 Fix sharedsecret authentication
3bac9717f4 Merge pull request #46769 from dwoz/wincloudtest
   eabc234e5d Fix config override name
   5c22a0f88d Use absolute imports
   810042710d Set default cloud test timeout back to 500 seconds
   5ac89ad307 Use winrm_verify_ssl option causing tests to pass
   71858a709c allow not verifying ssl winrm saltcloud
   ba5f11476c Adding windows minion tests for salt cloud
f1be939763 Merge pull request #46786 from twangboy/fix_46757
   b0053250ff Remove int(), just return -1
   7d56126d74 Fixes some lint
   49b3e937da Return int(-1) when pidfile contains invalid data
89bf24b15c Merge pull request #46814 from terminalmage/bp-46772
   a9f26f2ab8 avoid breaking if AutoRemove is not found
   97779c965d fix container removal if auto_remove was enabled
5ea4f8b5d6 Merge pull request #46813 from terminalmage/event-debug-log
   5d6de3a2eb Get rid of confusing debug logging
5933b7182d Merge pull request #46766 from twangboy/win_fix_test_git
   5af66452c Remove unused/redundant imports
   88fd72c52c Use with_tempfile decorator where possible
69d450db84 Merge pull request #46778 from terminalmage/salt-jenkins-906
   bbfd35d3ea Replace flaky SPM man test
c935ff8740 Merge pull request #46788 from garethgreenaway/46762_prereq_shenanigans
   fa7aed6424 Ensure failed tags are added to self.pre.
395b78f8dc Merge pull request #46655 from dwoz/pyobjects-46350
   5aabd442f2 Fix up import and docstring syntax
   62d64c9230 Fix missing import
   18b1730320 Skip test that requires pywin32 on *nix platforms
   45dce1a485 Add reg module to globals
   09f9322981 Fix pep8 wart
   73d066f664b Fix linter error
   009a8f56ea Fix up environ state tests for Windows
   b4be10b8fc Fixing cleanUp method to restore environment
af45ec9c42 Merge pull request #46632 from dwoz/file-recurse-36802
   44db77ae79 Fix lint errors and typo
   cb5619537f Only change what is essential for test fix
• eb822f5a12 Fix file.recurse w/ clean=True #36802
  • 6e9f504ed1 Merge pull request #46751 from folti/2017.7
    • 7058f10381 same top merging strategy works again
  • d3623e0815 Merge pull request #46691 from Ch3LL/win_group_test
    • 7cda25e90 Add groupadd module integration tests for Windows
  • 14ab50d3f4 Merge pull request #46696 from dwoz/win_test_client
    • ec4634fc06 Better explanation in doc strings
    • d9ae2abb34 Fix spilling in docstring
    • b40efc5db8 Windows test client fixes
• PR #46581: (rallytime) Back-port #46844 to 2018.3 @ 2018-04-04 18:04:59 UTC

- 127156a89 Merge pull request #46519 from rallytime/man-pages-2017.7.5
- 782a5584f5 Update man pages for 2017.7.5
- df12135439 Merge pull request #46584 from twangboy/lgpo-46568
- 661017104b Detect disabled reg_multi_sz elements properly
- 2fd3aa47c Merge pull request #46624 from twangboy/win_fix_installer
- fa0b0efe46 Fix some installer script inconsistencies
- f038e3c452 Merge pull request #46571 from garethgreenaway/46552_onfail_and_require
  - 152c43c843 Accounting for a case when multiple onfails are used along with requires. Previously if you have multiple states using 'onfail' and two of those states using a 'require' against the first one state, the last two will run even if the 'onfail' isn't met because the 'require' is met because the first state returns true even though it didn't execute. This change adds an additional hidden variable that is used when checking requisities to determine if the state actually ran.
- 2677330e19 Merge pull request #46520 from gtmanfred/2017.7
  - caefedc095 make sure utils is empty for pickling for windows
  - 2883548e6b pass utils to the scheduler for reloading in modules
- 7bc3c2e588 Merge pull request #46531 from terminalmage/issue44299
  - b70c3389da Fix case where no comments specified
  - ce391c53f4 Add regression test for #44299
  - c3e36a6c94 Fix regression in yumpkg._parse_repo_file()
  - f0c79e3da3 Slight modification to salt.utils.pkg.rpm.combine_comments()
- b80ed5d26 Merge pull request #46567 from dwoz/runtest-n-wart
  - 3b6901e19d Honor named tests when running integration suites
- 1dcd2e767 Merge pull request #46580 from twangboy/win_update_docs_dism
  - d52b99d7a3 Clarify some issues with msu files in win_dism.py
- 0a68c22332 Merge pull request #46541 from gtmanfred/metadata
  - 19bd1d9db5 handle user-data for metadata grains
- ISSUE #46668: (anlutro) Jinja2 filter strftime stopped working in salt-ssh 2018.3 (refs: #46848, #46744)
- PR #46744: (garethgreenaway) [2018.3] Ensure salt.utils.dateutils is available for templates via salt-ssh @ 2018-03-28 21:09:46 UTC
  - ef68df7f3a Merge pull request #46744 from garethgreenaway/46668_jinja2_filter_strftime_unavailable
  - 0b30955c00 Including salt.utils.dateutils so various jinja_filters are available when using salt-ssh.
- ISSUE #46334: (sjorge) [2018.3.0rc1] Stacktrace on call to nacl.dec (refs: #46426)
• **PR #46720**: (rallytime) Bump deprecation notices in nacl module & runner to Neon @ 2018-03-27 21:15:46 UTC
  - **PR #46426**: (garethgreenaway) [2018.3.0rc1] fixes to nacl module & runner (refs: #46639, #46720)
  - 65bb37effd Merge pull request #46720 from rallytime/bump-nacl-deprecation
  - 51020310c Bump deprecation notices in nacl module & runner to Neon
• **PR #46733**: (rallytime) [2018.3] Merge forward from 2018.3.0rc1 to 2018.3 @ 2018-03-27 18:46:43 UTC
  - c83d9e66fe Merge pull request #46733 from rallytime/merge-2018.3
  - 0044eb26f3 Merge branch '2018.3.0rc1' into '2018.3'
• **PR #46565**: (twangboy) Create reg salt util (2018.3) @ 2018-03-26 22:03:33 UTC
  - 0faced1d54 Merge pull request #46565 from twangboy/win_fix_cmd_powershell_2018.3
  - 5ee64e9b0e Fix lint (spelling error)
  - 0de54ed953 Additional tests
  - fc9ecd75e2 Skip unit.state.test_reg unless on Windows
  - aa98bdf250 Fix some lint
  - e0d201a96f Make sure the docs are correct for the tests
  - f15f92318d Add tests for salt.utils.win_reg
  - f7112b19a2 Submit #46527 against 2018.3
• **ISSUE #46334**: (sjorge) [2018.3.0rc1] Stacktrace on call to nacl.dec (refs: #46426)
• **PR #46639**: (terminalmage) Use the correct path for nacl certificates in Windows @ 2018-03-26 19:20:10 UTC
  - **PR #46426**: (garethgreenaway) [2018.3.0rc1] fixes to nacl module & runner (refs: #46639, #46720)
  - dd52368f90 Merge pull request #46639 from terminalmage/nacl-default-path
  - 2f7660fe35 Use the correct path for nacl certificates in Windows
• **PR #46416**: (dincamihai) Fix cp.push empty file @ 2018-03-26 17:52:47 UTC
  - 2efef52a3e Merge pull request #46416 from dincamihai/fixed-cp.push-empty-file
  - 536ba0fa1e Fix cp.push empty file
• **PR #46643**: (mcalmer) fix docker return @ 2018-03-26 15:52:31 UTC
  - 84579e7652 Merge pull request #46643 from mcalmer/fix-docker-return
  - 3ceb63f607 fix checking test results
  - af64632bf3 add unit test for failed login
  - 0fc7989236 make it possible to use login, pull and push from module.run and detect errors
• **PR #46650**: (Ch3LL) Mirror libnacl imports in test from the nacl module @ 2018-03-26 14:48:40 UTC
  - c67a9ebe36 Merge pull request #46650 from Ch3LL/nacl_test
  - 9f6f8bc431 Mirror libnacl imports in test from the nacl runner
  - f11d58a8e9 Mirror libnacl imports in test from the nacl module
• **PR #46645**: (terminalmage) Add Unicode / Python 3 update to 2018.3.0 release notes @ 2018-03-26 14:43:53 UTC
  - 03b58a01cf Merge pull request #46645 from terminalmage/release-notes
  - 986c7bcd87 Rewrite unicode/py3 section

30.2. Previous Releases

2067
• ISSUE #46150: (whytwolf) With chocolately.version some packages don’t work with check_remote=True (refs: #46661)
  • PR #46661: (Kimol) Chocolatey - Lowered name of local and remote packages before comparing versions. @ 2018-03-26 14:35:39 UTC
    – 308c9ddf63 Merge pull request #46661 from Kimol/2018.3-fix_chocolatey_check_remote_packages
    – 52581e79f18 Removed trailing whitespace
    – 123a86947c Chocolatey - Added lowering local packages for unifying both local and remote names to lowercase for comparison.
    – 4be1a991c2 Lowered name of available packages before comparing with local packages
• PR #46569: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 (refs: #46631) @ 2018-03-21 20:57:04 UTC
  – 2e1f7c37f7 Merge pull request #46569 from rallytime/merge-2018.3
  – 46ba72fb1c Fix pillar unit test failures: file_roots and pillar_roots environments should be lists
  – fe2d4ed0c Better merge conflict resolution for setup.py windows changes
  – 8886b61576 Update old utils paths to new paths
  – 8d1e1e7f94 Merge branch ‘2017.7’ into ‘2018.3’
    * 048b2ba3f6 Merge pull request #46547 from garethgreenaway/46427_service_module_cumulus
      - edd0b11447 Merge branch ‘2017.7’ into 46427_service_module_cumulus
      - ea3c16080e Disable the service module on Cumulus since it is using systemd.
    * 98e3260b9a Merge pull request #46548 from Ch3LL/profit_test
      - db96c4e72e check for foo,bar username,password set in profitbrick config
    * 79f2a76609 Merge pull request #46549 from Ch3LL/dimension_test
      - bb338c464c Fix dimensionsdata test random_name call
    * 083846fe0e Merge pull request #46529 from gtmanfred/kitchen
      - 50d6e2c7be retry if there is a segfault
    * 5cc11129f1 Merge pull request #46511 from rallytime/bp-45769
      - a8ffceda53 Surpress boto WARNING during decode, reference: https://github.com/boto/boto/issues/2965
    * 0e90c8ca6f Merge pull request #46493 from terminalmage/issue46207
      - f06ff68f10 salt-call: don’t re-use initial pillar if CLI overrides passed
    * b11a8fc8e0 Merge pull request #46450 from gtmanfred/salt_runner
      - 7974ff7264 load grains for salt.cmd runner
    * 22d753364b Merge pull request #46337 from gtmanfred/2017.7
      - d69ec36359 add tests for names and listen/listen_in
      - 3f8e0db572 let listen_in work with names
      - 7161f4d4df fix listen to be able to handle names
    * b7191b8782 Merge pull request #46413 from meaksh/2017.7-explore-result-in-depth
- Add new unit test to check state.apply within module.run
- Rename and fix recursive method
- Fix Python3 and pylint issue
- Explore 'module.run' response to catch the 'result' in depth

- Merge pull request #46496 from gtmanfred/kitchen
  - da002f78d0 include virtualenv path for py3 windows
  - fe2ef03ea remove duplicate setup

- Merge pull request #46330 from bdrung/fix_kubernetes_test_create_deployments
  - Fix ValueError for template in AppsV1beta1DeploymentSpec

- Merge pull request #46482 from rongshengfang/fix-keyerror-in-instance_present
  - ed8c83e89a Fix KeyError in salt/states/boto_ec2.py when an EIP is being associated to an existing instance with the instance_present state.

- Merge pull request #46463 from terminalmage/mock-2.0
  - b958b4699c Update requirements files to depend on mock>=2.0.0

- Merge pull request #46422 from rallytime/bp-46300
  - 829dfe8e8e Change stringutils path to old utils path for 2017.7
  - 91db2e0782 Python 3 support

- Merge pull request #46320 from mcalmer/warn-kubernetes
  - c493ced415 add warning about future config option change

- Merge pull request #46449 from bdrung/make-doc-theme-configurable
  - 4a5da2d144 Make documentation theme configurable

- Merge pull request #46162 from rallytime/team-suse-zypper-owner
  - 13a295a3b7 Add pkg and snapper to team-suse
  - 35c7b7b0d3 Add btrfs, xfs, yumpkg, and kubernetes file to team-suse
  - 485d777ac0 Add team-suse to CODEOWNERS file for zypper files

- Merge pull request #46434 from gtmanfred/highstate_return
  - d18f1a55a7 fix pylint
  - 9e2c3f7991 split return key value correctly

- Merge pull request #46455 from whytewolf/Issue_44452_unicode_cloud
  - 5fe474b1a8 .format remove fix for #44452

- Merge pull request #46428 from twangboy/win_fix_reqs
  - e7ab97cc17 Remove six as a hard dep for Salt
  - cc67e5c2ef Set six to 1.11.0

- Merge pull request #46454 from gtmanfred/kitchen
  - b8ab8434a5 fix windows for kitchen

- Merge pull request #46452 from gtmanfred/spm_cache_dir
• 169cf7a4e2 make spm cache_dir instead of all cachedirs
  • a188984cd9 Merge pull request #46446 from bdrung/fix-typos
    • 7e6e80be87 heat: Fix spelling mistake of environment
    • a3c54b50f6 Fix various spelling mistakes
  • e35fc5263c Merge pull request #46309 from bdrung/dynamic-pillarenv
    • 584b451fd1 Support dynamic pillar_root environment
  • 35fe9827fe Merge pull request #46430 from terminalmage/issue44032
    • f9f187e915 Improve reliability/idempotence of file.blockreplace state
  • 2bad0a21c0 Merge pull request #46429 from twangboy/win_fix_snmp
    • 8995a9b8de Fix problem with __virtual__ in win_snmp
  • 93a572f229 Merge pull request #46100 from jfindlay/resolv_scope
    • d5561bedaf tests.unit.grains.core add scoped IPv6 nameserver
    • 4e2e62d508 salt.utils.dns parse scope param for ipv6 servers
  • 5acc1d5c54 Merge pull request #46420 from bdrung/2017.7
    • e48c13d9e0 Fix SSH client exception if SSH is not found
  • ca6a76e317 Merge pull request #46379 from angeloudy/2017.7
    • 3acb59c74c Merge branch '2017.7' into 2017.7
    • d971e0c08b Fix indent
    • 269514683f Update http.py
    • 908c040ac3 Update http.py
    • 51ba3c135b Update http.py
    • 14aba24111 fix bytes-object required error in python 3
  • 73f9233557 Merge pull request #46404 from gtmanfred/kitchen
    • c56ba95a8 clone .git for the version tests
    • 3620611b5b fix unhold package for debian
    • 5219f7d2ba fix minion log path
  • ca28cf4ae4 Merge pull request #46310 from twangboy/win_update_installer_build
    • bcf8b19566 Update the installer build
  • deccbcbe3 Merge pull request #46316 from twangboy/win_fix_dsc
    • 2042d33d59 Fix issues with the DSC module

• PR #46620: (rallytime) [2018.3] Merge 2018.3.0rc1 into 2018.3 @ 2018-03-20 22:45:00 UTC
  • 8ccd56b9dc Merge pull request #46620 from rallytime/merge-2018.3.0rc1-into-2018.3
  • b03cda3cea Merge branch '2018.3.0rc1' into '2018.3'

• PR #46606: (Ch3LL) add autodoc topics for infoblox state modules @ 2018-03-19 21:35:46 UTC
  • 2d2fe22ae2 Merge pull request #46606 from Ch3LL/infoblox_docs
  • 6eab6a7dc4 add autodoc topics for infoblox state modules
• PR #46540: (s0undt3ch) Some missing :isinstance: checks. @ 2018-03-15 16:17:19 UTC
  - 1191d5b379 Merge pull request #46540 from s0undt3ch/2018.3
  - fa1d68774 Some missing :isinstance: checks. Committed again through a PR.
• PR #46513: (rallytime) [2018.3] Merge forward from 2018.3.0rc1 to 2018.3 @ 2018-03-15 15:58:59 UTC
  - 5429438e4b Merge pull request #46513 from rallytime/merge-2018.3
  - aa76033a1 Merge branch '2018.3.0rc1' into '2018.3'
• ISSUE #43208: (mitar) Prevent user.present to change uid and gid of existing user (refs: #46502)
• PR #46502: (terminalmage) user.present: don't change uid/gid unless explicitly told to @ 2018-03-13 14:25:20 UTC
  - 3e073c7e8a Merge pull request #46502 from terminalmage/issue43208
  - 4106840deb user.present: don't change uid/gid unless explicitly told to
• PR #46398: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-03-12 20:25:19 UTC
  - 7cdb00ca9c Merge pull request #46398 from rallytime/merge-2018.3
  - d22e5ba442 Merge fix: return back wb+ mode in crypt.gen_keys.
  - c7dddaf8ce Lint: Use log variable, not logger.
  - ca1860cd91 Use new get_umask function in mask calls in virt.py
  - 19ec7b6de1 Update old utils paths with new utils paths
  - d83727fd9 Merge branch '2017.7' into '2018.3'
  - 95586678c3 Merge pull request #46394 from Ch3LL/mac_doc
    - 158a6d6661 change oxdownload to oxdownload-{python_version}
    - 21aa848c89 Add mac py2 and py3 packages to mac installation docs
  - 07b5d09ac1 Merge pull request #46338 from rallytime/fix-44831
    - 90771d999 Remove cmd.wait deprecation reference in docs
  - 3b13f37b44 Revert changes in the code and change docs instead
    - 3811465d8 Fixes color parameter mismatch and handles 204 responses correctly
  - a8f210b063 Merge pull request #46322 from terminalmage/issue44935
    - 85ac6a9893 yamlify_arg: don't treat leading dashes as lists
  - da5c282cb2 Merge pull request #46327 from samilaine/fix-vmware-cloud-fqdn
    - 4b8db326f Modify the way a FQDN is handled in the vmware cloud provider.
  - 78c45d3786 Merge pull request #46318 from terminalmage/squelch-warnings
    - 5889b36646 Skip type-checking for several gitfs/git_pillar/winrepo params
  - bb0d6fc263 Merge pull request #46312 from gtmanfred/2017.7
    - 749ae580ed add module_dirs to salt ssh thin tarball
  - 88b5f7383d Merge pull request #46242 from redbaron4/fix-46127
    - 06dba51617 Make changes from review
- 727ebe1056 Merge branch '2017.7' into fix-46127
- 08d1ee8baf Fix Python3 test errors
- aa9d709015 Pass env_vars to pip.freeze
- * a0716643e4 Merge pull request #46265 from Ch3LL/profit_cloud
  - d4893eab4c Add username/password to profitbricks conf for cloud tests
- * ed7bfa7e0 Merge pull request #46306 from rallytime/bp-46256
  - 6439bce4a8 Don't install msgpack 0.5.5
- * 8c2c4e3316 Merge pull request #46208 from terminalmage/audit-umask-usage
  - 9c92adce8 Disable blacklisted-function check for legitimate uses
  - 58a11aaa26 Disable pylint check in salt-ssh shim
  - ecad67659 Blacklist os.umask
  - 31b1d98fc8 Replace direct use of os.umask with use of existing context manager
  - 82ce546e18 Prevent failed os.makedirs from leaving modified umask in place
- * 978e869490 Merge pull request #46293 from eliasp/2017.7-44624-py3-compat
  - 2e08b0d9c8 Fix Python3 comparison TypeError in salt.modules.upstart
- * bee4a66d0c Merge pull request #46264 from terminalmage/issue46128
  - 68000b7211 Fix incorrect merge conflict resolution
- * 1e0b3aa348 Merge pull request #46296 from vutny/doc-pillar-get
  - 1faa8331e1 [DOC] Add missing params to pillar.get docstring
- * c490a50452 Merge pull request #45874 from GwiYeong/2017.7-local-client-hotfix
  - 949aefc82b Merge branch '2017.7' into 2017.7-local-client-hotfix
  - 45d663f435 fix for local client timeout bug
- * 8e8a3a2897 Merge pull request #46261 from rallytime/merge-2017.7
  - 8256ae5e5 Merge branch '2016.11' into '2017.7'
  - 140ef4d6b9 Merge pull request #46253 from rallytime/doc-banners
  - 07ed8c7db3 Update docbanner for SaltConf18
  - 9fe86ee520 Merge pull request #46179 from wedge-jarrad/cifs-remount-fix
  - 9ca25e4313 Add credentials and secretfile to mounted mounted mount_invisible_keys
- **PR #46421:** (bdrung) Skip SSHPasswordTests if ssh binary is not found @ 2018-03-09 16:21:02 UTC
  - 9c089aa4de Merge pull request #46421 from bdrung/skip-ssh-tests-if-ssh-is-missing
  - 3d6f658309 Skip SSHPasswordTests if ssh binary is not found
- **PR #46453:** (bdrung) Fix various spelling mistakes in 2018.3 @ 2018-03-09 14:48:33 UTC
  - **PR #46446:** (bdrung) Fix various typos (refs: #46453)
  - 4cbfde5839 Merge pull request #46453 from bdrung/fix-typos-2018.3
  - 3d37eca847 Fix various spelling mistakes
- **ISSUE #44032:** (PhilippeAB) blockreplace marker_end isn’t applied with newline (refs: #46430)
• PR #46437: (terminalmage) Improve reliability/idempotence of file.blockreplace state (2018.3 branch) @ 2018-03-08 15:38:53 UTC
  - PR #46430: (terminalmage) Improve reliability/idempotence of file.blockreplace state (refs: #46437)
  - a43d999fb8 Merge pull request #46437 from terminalmage/issue44032-2018.3
  - 4798187035 Improve reliability/idempotence of file.blockreplace state (2018.3 branch)
• PR #46328: (dincamihai) Fix openscap push @ 2018-03-07 17:51:41 UTC
  - 0c66507aff Merge pull request #46328 from dincamihai/2018.3.0rc1
  - b5e508f339 Fix openscap push
• PR #46174: (twangboy) Fix a unicode issue with the git module on Windows @ 2018-03-06 18:53:53 UTC
  - 82cb2ea5a0 Merge pull request #46174 from twangboy/win_fix_test_git_2
  - 80e3a47dd4 Add output_encoding argument to git state, and add docs
  - 661a0687ec Fix git utf-8 issues for Windows
• PR #46235: (twangboy) Fix unit.modules.test_ssh for Windows @ 2018-03-05 20:39:44 UTC
  - 7690cf8564 Merge pull request #46235 from twangboy/win_fix_test_ssh
  - 9ea02d7045 Use write instead of writelines for Windows
• PR #46332: (terminalmage) Update the merge-forward docs to reference the 2018.3 branch @ 2018-03-05 19:39:56 UTC
  - c4f366cdd9 Merge pull request #46332 from terminalmage/merge-forward-docs
  - 0411845cec Update the merge-forward docs to reference the 2018.3 branch
• PR #46307: (rallytime) [2018.3] Merge forward from 2018.3.0rc1 to 2018.3 @ 2018-03-03 12:56:07 UTC
  - 241611aca5 Merge pull request #46307 from rallytime/merge-2018.3
  - c9fa21f62c Merge branch '2018.3.0rc1' into '2018.3'
• PR #46314: (terminalmage) Merge 2017.7 branch into 2018.3 @ 2018-03-03 12:54:27 UTC
  - 30c34f0c62 Merge pull request #46314 from terminalmage/merge-2017.7-2018.3
  - 61ab47ee70 Merge branch '2017.7' into merge-2017.7-2018.3
    - 88a3166589 Merge pull request #46276 from terminalmage/issue44046
      - a14d4daf8c salt.utils.docker.translate_input: operate on deepcopy of kwargs
    - da60399b8f Merge pull request #46183 from oeufette/fx-docker-container-running-host-config-ulimits
      - 5b09644429 Sort lists from Ulimits before comparing
      - 0b80f02226 Update old dockering doc ref
    - 509429f08c Merge pull request #46260 from terminalmage/git_pillar
      - b1ce2501fd Normalize global git_pillar/winrepo config items
    - a97a3e6f0a Merge pull request #46101 from jfindlay/openrc_ret
      - 2eef3c65a6 tests.unit.modules.gentoo_service add retcode arg
      - 81ec66f8db modules.gentoo_service handle stopped retcode
    - 1a17593c05 Merge pull request #46254 from rallytime/enterprise-banner
Chapter 30. Release Notes

Salt Documentation, Release 3002.5

- f5fae3dedf Update enterprise banner
  - 8c50ff32bd Merge pull request #46250 from terminalmage/runner-docs
  - 91b4895087 Add documentation to the fileserver runner
  - 53067cca43 Merge pull request #46243 from racker-markh/fix-openstack-private-network-issue
  - 50c1e140f0 Don’t check deny private_ips already in the original list of private_ips
  - 15405c8760 Merge pull request #46239 from terminalmage/issue46109
    - 586d8b0def archive.extracted: don’t check source file when if_missing path exists

- ISSUE #33177: (robnagler) pillar.stack should not continue after errors (refs: #46287)

- PR #46287: (bbinet) Update PillarStack stack.py to latest upstream version @ 2018-03-02 21:39:52 UTC
  - 194b0317ac Merge pull request #46287 from bbinet/upstream-pillarstack
  - b14b6f2c95 Update PillarStack stack.py to latest upstream version

- PR #46227: (Ch3LL) Mock file_client call in smtp return test @ 2018-02-28 22:12:22 UTC
  - 7382654c70 Merge pull request #46227 from Ch3LL/smtp_file_client
  - 280dc9a2b6 Mock file_client call in smtp return test

- PR #46232: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-02-28 19:16:37 UTC
  - 123625213e Merge pull request #46232 from rallytime/merge-2018.3
  - 04f24c1794 Lint: fix from a bad merge
  - aad61c77bd Update old utils paths to new paths
  - 7243ba2c0 Merge branch '2017.7' into '2018.3'
    - 633e1208e4 Merge pull request #46221 from terminalmage/salt-jenkins-854
      - 0eb012659c Fix hanging tests in integration suite
    - 7917277345 Merge pull request #46214 from vutny/formulas-readme-formatting
      - d702846961 [DOC] Replace note rST block for GitHub
    - a2e099b744 Merge pull request #46203 from Ch3LL/7.5_release
      - 6ddf3246ce Add 2017.7.5 Release Notes File
    - 973b227818 Merge pull request #46201 from rallytime/merge-2017.7
      - 9ac2101baa Merge branch '2016.11' into '2017.7'
      - a4c5417d23 Merge pull request #46132 from rallytime/2016.11_update_version_doc
      - d2196b6df3 Update release versions for the 2016.11 branch
    - 89cf2e5061 Merge pull request #46139 from bdrung/os-grains
      - 0b445f2a37 tests: Add unit tests for _parse_os_release()
      - f6069b77ed Fix osfinger grain on Debian
      - 8dde55a761 tests: Add os_grains test cases for Debian
      - ff02ab9937 tests: Add Ubuntu 17.10 (artful) os_grains test case
      - 77d5356aba Fix incorrect oscodename grain on Ubuntu
      - 7e62dc9fd2 tests: Support reading os-release files from disk
· a92ec0db1b Make _parse_os_release() always callable
· eee1fe5b38 tests: Dissolve _run_ubuntu_os_grains_tests
· 1d6ef731fe tests: Deduplicate _run_os_grains_tests()
  * c8c71e75ca Merge pull request #46133 from rallytime/2017.7_update_version_doc

    · PR #45932: (The-Loeki) Fix cmd run_all bg error (refs: #46172)
    · PR #39980: (vutny) [2016.3] Allow to use bg kwarg for cmd.run state function (refs: #46172, #45932)
    · 20d869c228 Merge pull request #46172 from The-Loeki/fix_cmd_run_all_bg_oxygen
    · 3ecf5018d0 Merge branch '2018.3' into fix_cmd_run_all_bg_oxygen
    · b5315e817b Merge branch '2018.3' into fix_cmd_run_all_bg_oxygen

## 30.2. Previous Releases

2075
- beabf4f06b cmdmod: reimplementation of #45932 for Oxygen

- **PR #46238**: (terminalmage) Don't allow salt.utils.files.fopen() to open stdin/stdout/stderr @ 2018-02-28 19:08:23 UTC
  - 687575b582 Merge pull request #46238 from terminalmage/fds-in-fopen
  - fe1527a3c4 Don't allow salt.utils.files.fopen() to open stdin/stdout/stderr

- **PR #46219**: (twangboy) Fix unit.modules.test_network for Windows @ 2018-02-28 15:45:02 UTC
  - 3da5dcb313 Merge pull request #46219 from twangboy/win_fix_inet_pton
  - 46f1d2cc09 Use six.text_type instead of six.u

- **PR #46228**: (twangboy) Fix unit.modules.test_pip for Windows @ 2018-02-28 15:37:49 UTC
  - 44343f8063 Merge pull request #46228 from twangboy/win_fix_test_pip
  - 415821eee9 Fix encoding issue

- **PR #46198**: (rallytime) [2018.3] Merge forward from 2018.3.0rc1 to 2018.3 @ 2018-02-27 15:17:51 UTC
  - ade8950bbe Merge pull request #46198 from rallytime/merge-2018.3
  - 1b4dc71930 Lint fix
  - 776f2e5d67 Merge branch '2018.3.0rc1' into '2018.3'

- **ISSUE #45849**: (Epiclemonaid) XenServer Provisioning errors out on this line. removing it succeeds. (refs: #46168)

- **PR #46168**: (gtmanfred) driver and provider should be specified @ 2018-02-26 16:17:13 UTC
  - 06d2dff3ac Merge pull request #46168 from gtmanfred/2018.3
  - ac99bd26db driver and provider should be specified

- **PR #46161**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-02-26 15:29:39 UTC
  - 605e5eff73 Merge pull request #46161 from rallytime/merge-2018.3
  - 69ac4b4aca Update utils paths
  - cffbf52c10 Lint fix: remove extra line
  - 79bed6cf1f Merge branch '2017.7' into '2018.3'
    - 0398ce0482 Merge pull request #46135 from rallytime/bp-46088
      - 57a0f62a3 fix kernel subpackages install bug
    - 1fcbdb1e02 Merge pull request #46136 from rallytime/bp-46115
      - 0a481d707f update digitalocean salt-cloud driver
    - 11e5e8eb86 Merge pull request #45911 from twangboy/win_fix_lgpo_unicode
      - bcde5cc625 Update log statement
      - 0a481d707f update digitalocean salt-cloud driver
    - 524a6a72a0 Merge pull request #46123 from gtmanfred/2017.7
      - 8d36730eef7 If no pubkey is passed in openmode fail
    - e48fa58012 Merge pull request #46131 from vutny/doc-formula-formatting
      - d8f0b051e44 [DOC] Fix code-blocks for reStructuredText
* 6cea44ee95 Merge pull request #46118 from rallytime/bp-44603
  - 2a2c23c66b Fix acme state to correctly return on test
* 16c382b55b Merge pull request #46121 from rallytime/merge-2017.7
  - 4c2f504a85 Merge branch '2016.11' into '2017.7'
  - e197a0fbc5 Merge pull request #46076 from rallytime/bp-46066
  - b94d73c53e Pin tornado version in requirements file
  - c72c1bde5f Merge pull request #46093 from wedge-jarrad/contributing-doc-typo
  - 5a0fe104f7 Fix contributing doc typo
  - 3cb83ea87e Merge pull request #45992 from bgridley/fix-routes-present-state
  - 679787699c Add vpc_peering_connection_id to describe_route_tables route_keys
  - 8a60635da0 Merge pull request #46000 from terminalmage/issue45910
  - 8cf13325ee salt.states.reg.present: Prevent traceback when reg data is binary
  - 1f44e285dc Merge pull request #46011 from terminalmage/fixed-solaris-runs
  - 8ee0a3a28b Move Solaris USER workaround up a bit
  - 13c652690 cmdmod.py: runs workaround for platforms that don't set a USER env var
  - 30b8f7be0 Merge pull request #45467 from twangboy/win_exclude_hidden
  - ea41215646 Make the regex pattern less greedy
  - 6d223c9fa7 Add tip about passing bogus saltenv
  - 1282ae3a93 Skip hidden first
  - 437a457911 Skip hidden dirs in genrepo
  - 87dc554dc3 Add final updates to docs
  - 3646d5c897 Fix some docs formatting, add some warnings
  - 35c81fa5fa Log the source_dir when caching the files
  - 91c3da8dfd Improve docs for pkg.refresh_db
  - 4803d92707 Add some documentation
  - 08b82e0875 Fix lint error, use raw
  - 2f712691cf Exclude hidden directories in pkg.refresh_db
* b92346645b Merge pull request #46107 from amendlik/yumpkg-assumeeyes
  - 8d9a432fb2 Add --assumeeyes to yum/dnf commands in yumpkg.refresh_db
* 14fe423e0c Merge pull request #46094 from ktreee/fixed-memory-leak
  - 4808041b8e Fixes memory leak, saltclients should be cleaned after used.
  - aba00805f4 Adds set_close_callback function to removes stream instance after closed from a set streams.
* 320c2037e1 Merge pull request #46097 from vutny/fix-https-link
  - 2062fd0e5c [DOC] Put https link to the formulas doc page
* 0eb137f45e Merge pull request #46103 from bdrung/2017.7
• dd3f936557 Fix skipping Kubernetes tests if client is not installed
  • c3a938e994 Merge pull request #46070 from Ch3LL/fix-doc-dns
    • 2a5d855d97 add required arg to dns_check jinja doc example
  • 01042e9d77 Merge pull request #46067 from rallytime/bp-45994
    • a07bb48726 Correct formatting for lint
    • e8678f633d Fix Comment being None not ” and inject quotes into the TXT ChangeRecords
  • 5e0e2a30e2 Merge pull request #45932 from The-Loeki/fix_cmd_run_all_bg
    • f83da27ca5 Merge branch ’2017.7’ into fix_cmd_run_all_bg
    • 771758fbc2 Merge branch ’2017.7’ into fix_cmd_run_all_bg
    • c54fcf7a2d cmd: move separate DRY logging blocks into _run, prevent logging on bg=True, don’t use_vt on bg
    • ebb181a9b cmd run: when running in bg, force ignore_retcode=True
  • 45ace39961 Merge pull request #46062 from vutny/pg-user-state-fix-typo
    • a5f8e9e95e Fix typo in postgres_user.present state function
  • edcb64de76 Merge pull request #45763 from twangboy/win_fix_path_rehash
    • b9a2bc7b29 Fix hyperlinks
    • 29912adc15 Move the test_rehash test to test_win_functions
    • adc594c183 Remove duplicate link
    • e84628c1eb Add some comments to the code
    • d50d5f582f Add additional info to docs for broadcast_setting_change
    • 3a54e09cd9 Rename setting to message
    • a39e99bc0 Change to a generic function to broadcast change
    • 79299361c3 Create refresh_environment salt util
    • 967b83940c Fix rehash function
  • a46fbc546c Merge pull request #46042 from jfindlay/file_tree_doc
    • 0ba4954a4b salt.pillar.file_tree revise module documentation
    • 3c6a5bf967 salt.pillar.file_tree provide better debug info
    • bb1cde451e salt.pillar.file_tree no stack trace when nodegroups undefined
  • de86126dd8 Merge pull request #46013 from rallytime/bp-45598
    • 2ea3fe5f43 No lazy logging
    • f427b0fdebe Change formatting style of logging lines per review
    • ebb24396b Patch around ResourceRecords needing to be present for AliasTarget entries to work

• PR #46160: (rallytime) Mark 2 tests as flaky @ 2018-02-23 19:10:06 UTC
  • 05b771bfd7 Merge pull request #46160 from rallytime/flaky-tests
  • 49e49ae51b Mark 2 tests as flaky

• PR #46006: (dincamihai) Remove obsolete unicode handling in pkg.info_installed @ 2018-02-22 19:22:36 UTC
- 9b2bc1982c Merge pull request #46006 from dincamihai/oxygen.rc1
- 99079fc442 Remove obsolete unicode handling in pkg.info_installed

- **PR #46078**: (rallytime) [oxygen] Merge forward from oxygen.rc1 to oxygen @ 2018-02-20 21:49:04 UTC
  - 93dab45307 Merge pull request #46078 from rallytime/merge-oxygen
  - 2d0f81fd1b Merge branch 'oxygen.rc1' into 'oxygen'

- **ISSUE #45938**: (edgan) zookeeper.present state doesn't deal with an existing zode with no ACL specified (refs: #46043)

- **PR #46071**: (rallytime) Back-port #46043 to oxygen @ 2018-02-16 19:56:36 UTC
  - **PR #46043**: (edgan) Allow zookeeper znode creation to not require an ACL (refs: #46071)
  - 8d99e3b8fe Merge pull request #46071 from rallytime/bp-46043
  - b82c88d630 Allow zookeeper znode creation to not require an ACL

- **PR #46056**: (Ch3LL) Fix mac_assistive module not loading @ 2018-02-16 14:57:46 UTC
  - 5a31422432 Merge pull request #46056 from Ch3LL/ver_mac
  - e44f5133c5 Fix mac_assistive module not loading

- **PR #46041**: (rallytime) [oxygen] Merge forward from 2017.7 to oxygen @ 2018-02-16 14:55:51 UTC
  - cdca28f5da Merge pull request #46041 from rallytime/merge-oxygen
  - e060a74fd8 Merge branch '2017.7' into 'oxygen'

  - 07e5735471 Merge pull request #46016 from rallytime/bp-45826
    - 1916e5c4a4 Fix selinux.fcontext_policy_present for Centos 6

  - a1f4092811 Merge pull request #46015 from rallytime/bp-45785
    - ef6f1b492 Resolve linting errors
    - 8047066c46 Remove unused import
    - 8f7ce4593a Add tests for salt.modules.selinux.fcontext_get_policy
    - ba97b446a6 Ensure parsed fields are stripped
    - a830ae819 m/selinux.fcontext_get_policy allow long filespecs

  - 96097c037e Merge pull request #46012 from rallytime/bp-45462
    - 9f76836a6c emit port cli version, variants as separate args

  - 12799245f Merge pull request #45991 from terminalmage/fix-duplicate-extra-opts
    - 916766651 yumpkg: Fix a couple issues with _get_extra_opts

  - 8b9adc258e Merge pull request #46017 from rallytime/merge-2017.7
    - a06645ce71 Merge branch '2017.7.3' into '2017.7'
    - 6d5c4c6e7e Merge pull request #46009 from Ch3LL/rn_7.4
    - ac09af4bab Add 2017.7.4 Release Notes with PRs
    - ca76a0b328 Merge pull request #45981 from gtmanfred/2017.7.3
    - 0d48457dc apparently local is not set by default
    - 2a92f4bc16 use local config for vault when masterless
- 6530649dbc Merge pull request #45953 from rallytime/bp-45928-2017.7.3
- 85363189d1 Fixing vault when used with pillar over salt-ssh
- fb378ceb00 Merge pull request #45934 from rallytime/bp-45902
- bb83e8b345 Add regression test for issue 45893
- cdda66d759 Remove duplicated section in docstring and fix example
- 4b6351cda6 Check the effective saltenv for cached archive
- 0d74151c71 Merge pull request #45935 from rallytime/bp-45742
- 6a0b5f7af3 Removed the chained copy
- ad1150fad4 list.copy() is not compatible with python 2.7
  - d20ff89414 Merge pull request #45888 from rallytime/bp-45797
    - 953a400d79 follow symlinks
- b18087cee0 Merge pull request #45711 from bdrung/fix-unicode-tests
  - b6181b5ed6 Fix Unicode tests when run with LC_ALL=POSIX
- 5271fb1d40 Merge pull request #45878 from damon-atkins/2017.7_fix_ec2_pillar
  - 0e74025714 Merge branch '2017.7' into 2017.7_fix_ec2_pillar
  - b4d0b23891 py3 fix
    - 75d9e20d8a Add ignoring 'terminated', 'stopped' instances, to improve changes of a single match
    - 0093472a37 added tag_key_list and tag_key_sep to create ec2_tags_list
    - afb3968aa7 ec2_pillar could not find instance-id, resolved. add support to use any tag to compare minion id against.
- cf367dbd04 Merge pull request #45942 from terminalmage/issue45679-2017.7
  - 89ebd72a0d Don't try to sort ports when translating docker input
  - 9cd47b39dd Fix incorrect translation of docker port_bindings -> ports
- dae41de7a8 Merge pull request #45959 from rallytime/state-doc-update
  - 6f781cb95d A couple of grammar updates for the state compiler docs
- 007214f7bf Merge pull request #45908 from DimensionDataResearch/fix/issue/45884
  - 1a75786b5a Fix linter warnings.
    - 82ec0b589c Revert to using salt.utils.cloud.is_public_ip.
    - 9b6b01873b Fix violations reported by flake8.
    - a2bc155c73 Use __utils__['cloud. '] instead of salt.cloud.utils.
    - 98907a32cb Ensure 'auth' parameter is correctly passed to dimensiondata driver.
    - de26b03e2c Fix copy/paste bug in dimensiondata provider integration test.
    - 6b16b4e427 Add integration tests for dimensiondata cloud provider.
    - f6ea9fed7d Ensure that event data provided by the dimensiondata driver is serialisable.
- efcfba868c Merge pull request #45985 from garethgreenaway/2017.7_fixing_mac_tests_again
  - 7b8dc14433 Missing format in the call to write.
* bf03abd07c Merge pull request #45958 from garethgreenaway/backport-fixing_mactests_queue_full
  * 25ffaae91 Backporting #45935
* bab365d6c6 Merge pull request #45949 from rallytime/merge-2017.7
  * f51687e903 Merge branch '2016.11' into '2017.7'
  * 7779fa7ba Merge pull request #45940 from dmurphy18/fix_aix_cmdmod
  * dd2788419b Fix use of 'su' for AIX to use '-'
* 7fd00ec752 Merge pull request #45928 from garethgreenaway/45915_fixing_vault_pillar_for_salt_ssh
  * 259e60b3e move log_file option to changeable defaults
* 9d14ad9ccf Merge pull request #45925 from terminalmage/fix-spelling
  * 7a143fe454 Fix spelling error in docstring

- **PR #45972:** (mcalmer) move log_file option to changeable defaults @ 2018-02-15 18:57:24 UTC
  * 057e895af Merge pull request #45972 from mcalmer/allow-salt-ssh-define-log_file
  * f89a20b3c move log_file option to changeable defaults

- **PR #46007:** (rallytime) [oxygen] Merge forward from oxygen.rc1 to oxygen @ 2018-02-13 18:50:09 UTC
  * d4377d4678 Merge pull request #46007 from rallytime/merge-oxygen
  * d6c2d0693a Merge branch 'oxygen.rc1' into 'oxygen'

- **PR #45944:** (mirceaulinic) Add NetBox module autodoc @ 2018-02-13 00:01:48 UTC
  * 069f790b3c Merge pull request #45944 from cloudflare/netbox-autodoc
  * ed69b987cf Add NetBox module autodoc

- **PR #45984:** (garethgreenaway) [oxygen] Missing format in the call to write. @ 2018-02-12 19:06:04 UTC
  * 2a6285d313 Merge pull request #45984 from garethgreenaway/fixing_mac_tests_again
  * ae7791d30b Missing format in the call to write.

- **PR #45922:** (rallytime) [oxygen] Merge forward from 2017.7 to oxygen @ 2018-02-09 20:24:26 UTC
  * 88f481a3df Merge pull request #45922 from rallytime/merge-oxygen
  * 9c49c8d47c Remove extra patch
  * b9664c78a Remove duplicate import in cmdmod.py
  * 34ecdd2a71 Replace old utils paths with new paths
  * d80547e0b8 Merge branch '2017.7' into 'oxygen'
  * 0ce93c609 Merge pull request #45920 from rallytime/merge-2017.7
    * e4e4744218 Merge branch '2016.11' into '2017.7'
    * 27f82f996 Merge pull request #45864 from rallytime/release-note-fix
      * 10a42d424 Remove extraneous ] in release notes for 2016.11.9

30.2.34 Salt 2018.3.2 Release Notes

Version 2018.3.2 is a bugfix release for 2018.3.0.

The 2018.3.2 release contains only a small number of fixes, which are detailed below.

This release fixes two critical issues.

The first is Issue #48038, which is a critical bug that occurs in a multi-syndic setup where the same job is run multiple times on a minion.

The second issue is #48130. This bug appears in certain setups where the Master reports a Minion time-out, even though the job is still running on the Minion.

Both of these issues have been fixed with this release.

Statistics

- Total Merges: 7
- Total Issue References: 2
- Total PR References: 10
- Contributors: 4 (cro, garethgreenaway, gtmanfred, rallytime)

Warning: If you are using Jinja to dump lists or dictionaries in your SLS files, this will now cause errors in Python 2 since Jinja does not produce YAML-compatible output when strings in the data structures contain unicode types. The dictionary must be passed through a Jinja filter to produce YAML-compatible strings.

The below is an example of invalid SLS:

```
/etc/foo.conf:
  file.manged:
    - source: salt://foo.conf
    - template: jinja
    - defaults: {{ mydict }}
```

To make it valid, use either one of Salt's own json or yaml filters:

```
/etc/foo.conf:
  file.manged:
    - source: salt://foo.conf
    - template: jinja
    - defaults: {{ mydict | json }}
```

Changelog for v2018.3.1..v2018.3.2

Generated at: 2018-06-17 19:17:16 UTC

- ISSUE #48130: (rmarchei) Minion timeouts with 2018.3.1 (refs: #48158)
- PR #48158: (gtmanfred) always listen when gathering job info @ 2018-06-17 19:04:03 UTC
  - 521e92e458 Merge pull request #48158 from gtmanfred/2018.3.2
  - cecf564433 always listen when gathering job info
- PR #48138: (rallytime) Update man pages for 2018.3.2 @ 2018-06-14 21:22:34 UTC
- f154545aff Merge pull request #48138 from rallytime/man-pages-2018.3.2
- 8c340134f5 Update man pages for 2018.3.2

**PR #48137:** (gtmanfred) [2018.3.2] bootstrap kitchen branch tests with 2017.7.6 @ 2018-06-14 21:20:28 UTC
- b49271b76d Merge pull request #48137 from gtmanfred/2018.3.2
- 6128519e8b bootstrap kitchen branch tests with 2017.7.6

**PR #48129:** (rallytime) Add release notes for 2018.3.2 @ 2018-06-14 15:48:36 UTC
- 21aaf1c8b4 Merge pull request #48129 from rallytime/release-notes-2018.3.2
- 0b13be1111 Add release notes for 2018.3.2

**PR #48100:** (rallytime) Back-port #48014 to 2018.3.2 @ 2018-06-14 12:54:52 UTC
- PR #48014: (cro) Find job pause (refs: #48100)
- 36b99ae80a Merge pull request #48100 from rallytime/bp-48014
- 77fecc5c4 Lint: Add blank line
- 159b052962 One more case where returner doesn't respond
- 91b45b4cc4 Catch two cases when a returner is not able to be contacted--these would throw a stacktrace.

**PR #48099:** (rallytime) Back-port #47915 to 2018.3.2 @ 2018-06-14 12:54:23 UTC
- PR #47915: (garethgreenaway) [2018.3] state runner pause resume kill (refs: #48099)
- 40c1bfdec9 Merge pull request #48099 from rallytime/bp-47915
- 3556850058 fixing typo in alias_function call.
- 4b0ff496fa Some fixes to the set_pause and rm_pause function in the state runner, renaming to in line with the functions in the state module. Including aliases to previous names for back-ward compatibility. Including a soft_kill function to kill running orchestration states. A new test to test soft_kill functionality.

**ISSUE #48038:** (austinpapp) jobs are not dedup'ing minion side (refs: #48075)

**PR #48097:** (rallytime) Back-port #48075 to 2018.3.2 @ 2018-06-14 12:52:44 UTC
- PR #48075: (garethgreenaway) [2017.7] Ensure that the shared list of jids is passed (refs: #48097)
- 074a97dca1 Merge pull request #48097 from rallytime/bp-48075
- e4c719b55f Ensure that the shared list of jids is passed when creating the Minion. Fixes an issue when minions are pointed at multiple syndics.

### 30.2.35 Salt 2018.3.3 Release Notes

Version 2018.3.3 is a security and bugfix release for 2018.3.0.
Statistics

- Total Merges: 548
- Total Issue References: 69
- Total PR References: 341
- Contributors: 55 (Ch3LL, FedericoCeratto, KaiSforza, L4rS6, Lutseslav, The-Loeki, Vaelatern, adm, aesposito91, asenci, astorath, azelezni, babs, bbeceu, bbinet, brejoc, cro, daa, dmurphy18, dubb-b, dwoz, eliasp, ezh, garethgreenaway, gtmanfred, isbm, jeduardo, kt97679, kuetrzi, linoplit, lomeroe, lusche, mateiw, maxarnold, maxim-sermin, meaksh, mmulqueen, morganwillcock, mtorromeo, nullify005, paulcollinsii, pritambaral, rallytime, rares-pop, rmarchei, rosscdh, sizgiyaev, sjorge, tofik, terminalmage, travispaul, twangboy, vinian, weswhet, zertimon)

**Warning:** If you are using Jinja to dump lists or dictionaries in your SLS files, this will now cause errors in Python 2 since Jinja does not produce YAML-compatible output when strings in the data structures contain unicode types. The dictionary must be passed through a Jinja filter to produce YAML-compatible strings.

The below is an example of invalid SLS:

```
/etc/foo.conf:
file.mangaged:
  - source: salt://foo.conf
  - template: jinja
  - defaults: {{ mydict }}
```

To make it valid, use either one of Salt's own `json` or `yaml` filters. Another option would be to use Jinja’s `tojson` filter.

```
/etc/foo.conf:
file.mangaged:
  - source: salt://foo.conf
  - template: jinja
  - defaults: {{ mydict | tojson }}
```

Security Fix

CVE-2018-15751 Remote command execution and incorrect access control when using salt-api.

CVE-2018-15750 Directory traversal vulnerability when using salt-api. Allows an attacker to determine what files exist on a server when querying /run or /events.

Credit and thanks for discovery and responsible disclosure: nullbr4in, xcuter, koredge, loupos, blackcon, Naver Business Platform

Changes to win_timezone

Improves timezone detection by using the pytz module.

`timezone.get_offset` and `timezone.get_zonecode` now work properly.

Adds `timezone.list` to list supported timezones in either Windows or Unix format.
New Jinja Filter

The `tojson` filter (from Jinja 2.9 and later) has been ported to Salt, and will be used when this filter is not available. This allows older LTS releases such as CentOS 7 and Ubuntu 14.04 to use this filter.

You can use this filter any time you wish to dump a list or dictionary into an SLS file, to ensure that the result is able to be loaded by the YAML renderer. For example:

```yaml
foo:
  bar.baz:
    - some_arg: {{ mydict | tojson }}
```

MacOSX escape characters with runas

You are now required to escape quotes when using the runas argument with the cmd module on macosx.

Example:

```bash
cmd.run 'echo "h="baz""' runas=macuser
```

  - 608a1ae7ba Account for file renames
  - e86a46a2b Fix directory unit test
  - 2f865c398e Fix is_windows checks
  - 6460f7f217 Account for normalized dirs in unit tests
  - f4b7101a35 Simplify dict keys lookup
  - 942b68bf8c Fix remaining file state integration tests (py3)

- **PR #49441**: (rallytime) Back-port #49240 to 2018.3.3 @ 2018-08-30 18:02:40 UTC
  - **PR #49240**: (dwoz) file state fixes (refs: #49362, #49441)
    - f4906346a Merge pull request #49441 from rallytime/bp-49240
    - 22ed452479 Work around listdir encoding issues on py2 windows
    - f5be275835 file state test fixes

- **PR #49440**: (rallytime) Back-port #49258 to 2018.3.3 @ 2018-08-30 18:02:25 UTC
  - **PR #49258**: (gtmanfred) flaky tests are flaky (refs: #49440)
    - cc27b67a37 Merge pull request #49440 from rallytime/bp-49258
    - 0191af1423 flaky tests are flaky yo
    - 720b671dda mark orchestration state tests as flaky

- **ISSUE #48880**: (damntoken) Can’t run cmd.run with UTF-8 chars as arguments / parameters. With custom module. (refs: #49322)

- **PR #49368**: (rallytime) Back-port #49322 to 2018.3.3 @ 2018-08-28 17:15:15 UTC
  - **PR #49322**: (dwoz) Encode shell commands explicitly. (refs: #49368)
    - af80e6456a Merge pull request #49368 from rallytime/bp-49322
    - 238853b9ec Encode shell commands explicitly.

- **PR #49363**: (rallytime) Back-port #49245 to 2018.3.3 @ 2018-08-28 17:14:18 UTC
  - **PR #49245**: (dwoz) Skip grep unit tests on windows (refs: #49363)
    - 0fee3e878e Merge pull request #49363 from rallytime/bp-49245
    - cc606509d0 Fix is_windows call - use the right path
    - 5488f3ea38 Skip grep unit tests on windows

- **PR #49361**: (rallytime) Back-port #49244 to 2018.3.3 @ 2018-08-28 17:12:58 UTC
  - **PR #49244**: (dwoz) Test fixes: unit.filesrvr.test_gifs (refs: #49361)
    - dbcd2fc726 Merge pull request #49361 from rallytime/bp-49244
    - e0909d3a25 Simplify by using to_unicode helper
    - 4723c69092 Older GitPython version do not have a close method
- d5feeba716 Fix up fileserver.test_gitfs tests on windows
- 4b688f6347 Remove unicode filenames on windows python 2

- **PR #49362**: (rallytime) Back-port #49240 to 2018.3.3 @ 2018-08-28 17:00:25 UTC
  - PR #49240: (dwoz) file state test fixes (refs: #49362, #49441)
  - b4a1e1d365 Merge pull request #49362 from rallytime/bp-49240
  - 16ca5b9694 Work around listdir encoding issues on py2 windows
  - 7650208dbc file state test fixes

- **PR #49365**: (rallytime) Back-port #49270 to 2018.3.3 @ 2018-08-28 16:56:23 UTC
  - PR #49270: (dwoz) Add async helper to test_sock_path_len (refs: #49365)
  - 9ca9a775ff Merge pull request #49365 from rallytime/bp-49270
  - 1b337a8b8 Add async helper to test_sock_path_len

- **PR #49364**: (rallytime) Back-port #49243 to 2018.3.3 @ 2018-08-28 16:55:55 UTC
  - PR #49243: (dwoz) Revert newline translation change (refs: #49364)
  - bbff57da16 Merge pull request #49364 from rallytime/bp-49243
  - 5db77c6229 Revert newline translation change

- **ISSUE #32737**: (Lothiraldan) No support for compound matcher in external auth configuration (refs: #49236)
- **PR #49313**: (rallytime) Back-port #49236 to 2018.3.3 @ 2018-08-24 20:59:16 UTC
  - PR #49236: (terminalmage) Allow compound matching in eauth config expressions (refs: #49313)
  - 64d7b0eac6 Merge pull request #49313 from rallytime/bp-49236
  - 1a5e996ec3 Add 'minion_data_cache: True' to mocked opts for minions unit tests
  - 549f5d5a86 Allow compound matching in eauth config expressions

- **ISSUE saltstack/salt-jenkins#1075**: (Ch3LL) [2018.3.3] arch python3 tests do not finish (refs: #49303, #49451)
- **PR #49311**: (rallytime) Back-port #49303 to 2018.3.3 @ 2018-08-24 17:48:23 UTC
  - PR #49303: (gtmanfred) use os._exit instead of sys.exit when daemonizing (refs: #49311)
  - 7a894a4ca8 Merge pull request #49311 from rallytime/bp-49303
  - 3fca1c87751 use os._exit instead of sys.exit when daemonizing

- **PR #49294**: (Ch3LL) Move run_function call from __init__ to setup @ 2018-08-24 12:41:35 UTC
  - 7bb356f11e Merge pull request #49294 from Ch3LL/fed_28_tests
  - 0a5d44a3db Move run_function call from __init__ to setup

---

**30.2. Previous Releases**

2091
• **PR #49302**: (twangboy) Fix installer 2018.3.3 @ 2018-08-24 12:41:14 UTC
  - a607f9332f Merge pull request #49302 from twangboy/fix_installer_2018.3.3
  - 68fd37575e Fix erroneous NSSM reference
  - 103fc289e Remove delete vcredist line
  - 007a16638e Bring installer updates from 2017.7.8 to 2018.3.3

• **PR #49241**: (terminalmage) Don't silently catch SystemExit @ 2018-08-22 12:57:58 UTC
  - bc0b4ac513 Merge pull request #49241 from terminalmage/salt-jenkins-1078
  - 08d14f2c7 Don't silently catch SystemExit
  - c0fd818f7 Don't use a bare except!

• **PR #49239**: (Ch3LL) Use yaml's safe_dump in windows ec2 tests @ 2018-08-22 08:48:13 UTC
  - 0fb9ecf60a Merge pull request #49239 from Ch3LL/win_yaml_test
  - f5b42db24 import salt.utils.yaml
  - 67290eaf7 Use yaml's safe_dump in windows ec2 tests

• **PR #49182**: (terminalmage) Fix hanging syndic test @ 2018-08-18 12:10:32 UTC
  - 134f125b96 Merge pull request #49182 from terminalmage/salt-jenkins-1078
  - a2d2cd317b Fix hanging syndic test

• **PR #49172**: (Ch3LL) [2018.3.3] cherry pick #49118 @ 2018-08-17 20:54:05 UTC
  - PR #49118: (dwoz) Multiple fixes for integration.states.test_file (refs: #49172)
  - PR #49088: (dwoz) Multiple file state test fixes (refs: #49118)
  - PR #49087: (dwoz) Filter out scheme’s that are not valid (refs: #49118)
  - b3a247bbfbb Merge pull request #49172 from Ch3LL/bp-49118
  - ce517dbbd update is_windows salt.utils to correct path
  - 38ef11240f Multiple fixes for integration.states.test_file

• **PR #49173**: (Ch3LL) [2018.3.3] cherry pick #49167 @ 2018-08-17 20:30:27 UTC
  - PR #49167: (dwoz) Fix remaining file state integration tests (py3) (refs: #49173, #49442)
  - a1a298a13c Simplify dict keys lookup
  - 3d26affa10 Fix remaining file state integration tests (py3)

• **PR #49171**: (Ch3LL) [2018.3.3] cherry pick #49103 @ 2018-08-17 20:23:32 UTC
  - PR #49103: (dwoz) Install the launcher so we can execute py files (refs: #49171)
  - ee54eaf73 Merge pull request #49171 from Ch3LL/bp-49103
  - 05a2b91fb2 Install the launcher so we can execute py files

• **PR #49132**: (Ch3LL) [2018.3.3] backport PR #49062 @ 2018-08-17 14:51:50 UTC
  - PR #49062: (weswhet) fix memoize on available macOS services (refs: #49132)
  - 58034c9dc3 Merge pull request #49132 from Ch3LL/bp-49062
- 990fdb6a52 decorator link fix, updating context names, as well as updating macutils tests for latest changes
- 3ab5d282be fixing an issue with memoize on macOS services, switching to using `__context__` instead

- **PR #49142** (Ch3LL) Remove `-Z script_arg` for cloud tests @ 2018-08-16 16:12:59 UTC
  - 01f8f83ec0 Merge pull request #49142 from Ch3LL/rm_z_arg
  - a1ef6a88a6 Remove `-Z script_arg` for cloud tests

- **PR #49137** (Ch3LL) [2018.3.3] Update bootstrap script to latest release (2018.08.15) @ 2018-08-15 19:49:22 UTC
  - a03828884b Merge pull request #49137 from Ch3LL/bootstrap_2018.3.3
  - eb9a612096 [2018.3.3] Update bootstrap script to latest release (2018.08.15)

- **PR #49110** (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-08-14 17:11:25 UTC
  - b412bf534 Merge pull request #49110 from rallytime/merge-2018.3
  - 4649f60209 Update old utils paths with new paths
  - 49c2a784bb Merge branch `2017.7` into `2018.3`
    - d46e23f4c2 Merge pull request #49109 from rallytime/merge-2017.7
      - 3c5527f300 Merge branch `2017.7.8` into `2017.7`
      - 01cf2c71ff Merge pull request #49051 from rallytime/bp-49046
      - fc0817cb35 The osfullname grain differs when using Python2 vs Python3, swapping this out for the "OS" grain which is consistent.
    - 8954dd269f Merge pull request #49090 from dwoz/file_line_fix
      - 0dca634e3c Search for (but do not include) CRLF line ending
    - b99edc3dce Merge pull request #49088 from dwoz/file_hash_diffs
      - 054af8197 Multiple file state test fixes
    - 274977b6c4 Merge pull request #49087 from dwoz/url_file_test_fixes
      - 632b65f975 Filter out scheme's that are not valid
    - db5fb3232a Merge pull request #49086 from rallytime/new-doc-img
      - 90954203cb Update the DOCBANNER image for saltconf
    - af6ec1dce2 Merge pull request #49045 from twangboy/fix_43164
      - 589456d08f Fix lint errors
      - e79243566d Add rallytime's suggestions
      - d1ae6b3d6d Fix docs for the registry module and state
    - a840fe1a11 Merge pull request #49083 from rallytime/bootstrap-2017.7
      - 358e14cdac [2017.7] Update bootstrap script to latest release
    - 9db6cd5654 Merge pull request #49059 from twangboy/fix_37984
      - 7ed45b5b00 Remove import
      - 7fb1ed469 Fix docs to clarify uptime output on Windows
    - f9db72f00c Merge pull request #49061 from saltstack/revert-48982-new_logo_2017.7
      - 98a8da728b Revert "New logo 2017.7 (WIP)"
• bbcd1869ec Merge pull request #48982 from newwebash/new_logo_2017.7
  - 5c1c311f77 Update Salt Conf ad
  - 72dc63c426 Merge branch '2017.7' of https://github.com/saltstack/salt into new_logo_2017.7
  - 9f4e78a7b9 Revert "Update saltconf ad"
  - 3ab8c6b882 Update saltconf ad

• ISSUE #48665: (dgengtek) salt-api auth ldap generates a valid token when using bindpw and an invalid request (refs: #48901)

• PR #48901: (garethgreenaway) [2018.3] fix to auth/ldap.py @ 2018-08-14 16:10:19 UTC
  - e78fc0e0eb Merge pull request #48901 from garethgreenaway/48665_auth_ldap_valid_token_failed_auth
  - d4e4f2e803 Fixing a typo in a comment.
  - 2eb167ea42 Fixing issue when a valid token is generated even when invalid user credentials are passed. This change verifies that the binddn credentials are valid, then verifies that the username & password (if not None) are also valid.

• ISSUE #49081: (frogunder) Fluorine - I see error/traceback when running minion in debug mode (refs: #49085)

• PR #49099: (rallytime) Back-port #49085 to 2018.3 @ 2018-08-14 12:42:51 UTC
  - PR #49085: (gtmanfred) fix async call to process manager (refs: #49099)
  - 484c1e0123 Merge pull request #49099 from rallytime/bp-49085
  - 024d9cb843 fix async call to process manager

• ISSUE #49018: (Ch3LL) add MasterPillarUtil tests (refs: #49034)

• PR #49071: (rallytime) Back-port #49034 to 2018.3 @ 2018-08-13 20:15:31 UTC
  - PR #49034: (garethgreenaway) [fluorine] Adding tests for MasterPillarUtil (refs: #49071)
  - bc033da677 Merge pull request #49071 from rallytime/bp-49034
  - 8108a4d31a Adding some tests for the grains, pillar and mine functions in the cache runner. These will also ensure that the relevant functions in salt.utils.master.MasterPillarUtil are functioning properly.

• PR #49077: (rallytime) Back-port #49075 to 2018.3 @ 2018-08-13 20:00:00 UTC
  - PR #49075: (gtmanfred) fix last async issue (refs: #49077)
  - 90c2f026b3 Merge pull request #49077 from rallytime/bp-49075
  - 5e07b8306b fix last async issue

• PR #49096: (rallytime) Update the DOCBANNER image for saltconf @ 2018-08-13 19:59:39 UTC
  - 6942ef1102 Merge pull request #49096 from rallytime/new-doc-img-2018.3
  - 75080705ce Update the DOCBANNER image for saltconf

• PR #49055: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-08-13 19:20:11 UTC
  - 0e1ed7b923 Merge pull request #49055 from rallytime/merge-2018.3
  - 83a15cb623 Add optimization_order config to mocked opts
  - ea6883ee55 Update old utils paths to new utils paths
  - 201031fa8a Merge branch '2017.7' into '2018.3'
    * 0d2a495378 Merge pull request #49050 from rallytime/merge-2017.7
30.2. Previous Releases

- ed6fb8b739 Merge branch '2017.7.8' into '2017.7'
- 189e28691f Merge pull request #49044 from Ch3LL/vultr_test
- 0dedfae4d1 increase timeout on vultr cloud integration test
- c606a32cf2 Merge pull request #49042 from rallytime/flaky-jinja-test
- a43d9b4ba6 Mark a jinja template test as flaky
- 6415b6f73b Merge pull request #49041 from Ch3LL/ec2_fix
- cf7f2459b8 [2017.7.8] backport PR #48212
- 1db036406b Merge pull request #49030 from rallytime/update-client-tests
- f08e66c6ae Update netapi client tests

- 70be9ac9b1 Merge pull request #49046 from garethgreen-away/1022_fixing_test_failing_py3_Debian_test
  - fa2339bb91 The osfullname grain differs when using Python2 vs Python3, swapping this out for the "OS" grain which is consistent.
- 69c9b0af81 Merge pull request #49036 from cspeidel/doc-fix-netyang
  - f7ac085eb5 minor doc fix in netyang.py
- c5f3fd82b2 Merge pull request #48997 from AVeenstra/patch-1
  - 0e535f2c8c Unpacking dict with the six iterator
  - 5e82685b89 Python 3 related fix in highstate_return.py
- c06a3c531 Merge pull request #49021 from rallytime/merge-2017.7
  - ca82b3d57a Merge branch '2017.7.8' into merge-2017.7
  - f73ba21bc7 Merge pull request #49024 from rallytime/fixed-code-generation-test
  - a9c16d9137 Fix test error in test_compiler jinja check
  - c6f8429e41 Merge branch '2017.7.8' into '2017.7'
  - 6b6d86c615 Merge pull request #49020 from rallytime/fixed-grains-test
  - f72a3ac6be Make grains integration test more robust
  - 92d6c25c7f Merge pull request #49002 from rallytime/skip-jinja-deep-error-test
  - 23b66eff8bb Skip test_jinja_deep_error on Debian 8
  - 41df11eb3 Merge pull request #48999 from rallytime/fixed-boto-test
  - d0136b1be5 Update expected return value in boto test
- 2ddba6391a Merge pull request #49010 from Ch3LL/univention
  - c09bce9afe Add univention OS to debian_os_family mapping
- 41bd36842e Merge pull request #48636 from terminalmage/loader-fixes
  - 0441cd56ef Add optimization_order to mocking
  - 2256fad320 Process pycache files after .py files
  - a78663a301 Lint
  - 0728b88b6 Add note about Python 3.5+ only support for optimization_order
  - 76496e0c08 Add a test to confirm that .py files are still loaded correctly
• 0f60beb6b6 Fix bad copypasta
• fbc1d42ea2 Add configuration docs for optimization_order config option
• 8af2d580f3 Only compile the suffix_order/map once per LazyLoader instance
• 4b95e5f313 Don't put __pycache__ dir in the file list
• e7c10196da Quiet the byte compiling for PY2
• 9338370477 Add unit tests for loader optimization levels
• c3622933c1 PY3: Support different optimization levels
• 6fc8da5bab Add optimization_order config option with default value
• dfe423a1e0 Remove commented-out log message

• PR #49084: (rallytime) [2018.3] Update bootstrap script to latest release @ 2018-08-13 18:14:42 UTC
  – db7ec46875 Merge pull request #49084 from rallytime/bootstrap-2018.3
  – 28dc8ce954 [2017.7] Update bootstrap script to latest release
  – 990936992c Keep runner API unchanged
  – 46bafcafe6 Fix nag-message
  – 5c887ac2ae Support original API
  – 2c22e794d4 Use kwargs instead of directly named parameters
  – 7d095491d9 Update docstring
  – 980738dbb7 Add 'async' backward compatibility
  – e8608aa9be Revert api call: it is about "functionname.Async" suffix.
  – 0543578336 Deprecate 'async' parameter in Mandrill API
  – 1107de0dec Lintfix: PEP8 requires two empty lines
  – 2a18e335af Fix function signatures in Cassandra module
  – 603f94e2a3 Cleanup docstrings at module level
  – b9718d3a09 Fix log error/info/warning and exception messages
  – 6e77a6f69a Fix local opts from CLI
  – 493e48dbd5 Remove internal variables/properties with the reserved words
  – be07f64bc4 Change internal function signatures to avoid reserved word
  – 7d095e0bb6 Rename async function to asynchronous
  – 35eabbb8a4 Fix docstrings
  – 7a597f19b5 Fix comments
- 69920366ae Fix CLI config
- 173f3d7aa8 Fix docstring typo
- b7da571624 Fix imports
- 7ec3954bef Rename module to full wording

- **ISSUE #48557**: (whytwolf) file.line in python3 on windows 2012 r2 is adding extra CR line endings. (refs: #49026)
- **PR #49026**: (dwoz) Fix file.line line endings @ 2018-08-13 13:05:43 UTC
  - 338ecb70ef Merge pull request #49026 from dwoz/issue_48557
  - a4d22fda2f Merge remote-tracking branch 'origin/issue_48557' into issue_48557
    - 702e76cfc9 Merge branch '2018.3' into issue_48557
  - 6cf93e8fc4 Skip newline in binary mode
  - 2cf80c1595 Fix linter errors
  - baf291b4c8 Fix file.line line endings

- **PR #49038**: (gtmanfred) disable enable_ssh_minions to see if it is slowing down 2018.3 tests @ 2018-08-10 18:07:59 UTC
  - 602fed7806 Merge pull request #49038 from gtmanfred/slowtest
  - 6bc44c91c4 remove localhost from tests
  - 7b168a5aac disable enable_ssh_minions to see if it is slowing down 2018.3 tests

- **ISSUE #48996**: (jils2013) file.get_diff not work on version:2018.3.2 (refs: #49033)
- **PR #49033**: (terminalmage) Fix file.get_diff for remote files @ 2018-08-09 21:06:53 UTC
  - 4eeb75f028 Merge pull request #49033 from terminalmage/issue48996
  - 163aea71c8 Lint
  - d6e5038022 Fix file.get_diff for remote files

- **ISSUE #48856**: (travispaul) Salt fails to start on NetBSD 8 (refs: #48926)
- **PR #48926**: (travispaul) Handle ifconfig output differently for NetBSD >= 8.0 @ 2018-08-09 20:07:44 UTC
  - b24e96a292 Merge pull request #48926 from travispaul/fix-netbsd-8-new-ifconfig
  - d59b6d8269 Add unit test for NetBSD 8 ifconfig changes
  - 80f8a667d1 Handle ifconfig output differently for NetBSD >= 8.0

- **PR #48803**: (dmurphy18) Support for execution modules and states mount on AIX @ 2018-08-09 17:51:55 UTC
  - 7d6b9ed0a5 Merge pull request #48803 from dmurphy18/aix_filesystems
  - 92818f816b Fixes for testing
  - 77dd7a1743 Adjust unit tests
  - eae033cde Updated for review comments and adjusted locking when writing files
  - 5bf9e6085b Update due to review comments
  - 9fb5641dc7 Mount unit tests for modules and states for AIX
  - b28f427432 Save off work after laptop issue
  - e5c2741fe7 module and states mount support for AIX

30.2. Previous Releases

2097
Further updates to support for mount on AIX
210076276f Initial support for handling /etc/filesystems on AIX

**ISSUE #48496:** (icy) Salt-key unable to delete the certificate Test=True (refs: #48929)

**PR #48929:** (terminalmage) 2 salt-key fixes @ 2018-08-09 17:50:07 UTC
- 2a38905a8a Merge pull request #48929 from terminalmage/issue48496
- 7ac10f9ea2 salt-key fixes

**ISSUE #47481:** (whytewolf) Oxygen: task.add_trigger with start_date stating strptime needs a string not int. (refs: #49022)

**PR #49022:** (dwoz) Document time format idiosyncrasies @ 2018-08-09 17:47:12 UTC
- bb9d23bfa1 Merge pull request #49022 from dwoz/47481_docs
- 313a3d93d6 Document time format idiosyncrasies

**PR #48932:** (twangboy) Fix pkg.install when pkg already installed @ 2018-08-09 17:45:51 UTC
- 9b6a9ff4f1 Merge pull request #48932 from twangboy/fix_win_repo
- 075ea29d29 remove .lower(), fix debug messages
- d7c2f476ac Remove current: version for latest as well
- 522ac26459 Fix typo in code comment
- 47b2898a85 return empty dict on no changes
- 6532706d2f Make the tests run on Linux
- cfe55a391a Add tests for pkg.install output
- 8ec05f498 Clarify code comment
- 8af2cfd54a Fix issues where current is not returned

**PR #49011:** (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-08-09 17:34:18 UTC
- d7b7a92ef6 Merge pull request #49011 from rallytime/merge-2018.3
- 0267096d00 Apply fix to ssh init file that was there before merge
- 7f1f7915e4 Revert "Allow for not being prompted to supply a password to deploy keys to a minion with salt-ssh"
- 00416d54d1 Revert "add key-deploy test"
- c26fa0d6c4 Mark orchestration test as expensive
- fce6b8d6f Update old utils paths to use new paths
- 3e6445a9d6 Merge branch '2017.7' into '2018.3'
  * b49eeaca6e9 Merge pull request #49003 from rallytime/boto-test-2017.7
    - 1a23bb233f Update expected return value in boto test
  * 51eed1f3f3 Merge pull request #48988 from rallytime/merge-2017.7
    - df8699e2e7 Merge branch '2017.7.8' into '2017.7'
    - a1e54634dc Merge pull request #48976 from rallytime/tornado
    - 0bd838a6c Skip unreliable tornado tests
    - 22713be9c1 Merge pull request #48979 from rallytime/bp-48959
03aa0e49b0 Merge pull request #48970 from Ch3LL/back_48962
3ce1b8a3c9 Update the elif block to only be true for versions below Debian 9.
e6ce5e3c7 Merge pull request #48968 from rallytime/man-pages
64e3be41a Update man pages for 2017.7.8 release
10fd4661ff Merge pull request #48978 from gtmanfred/2017.7
6108363f82 clean up gemfile
5b2423e527 Merge pull request #48959 from rallytime/flaky-tests
aa9f8d728 Mark one grains test as flaky & convert to pytest notation
e7e5abcf48 Mark 2 matcher tests as flaky
79994ecab4 Merge pull request #48962 from garethgreen-away/1022_test_service_disable_debian_part_deux
9e71551b36 Update the elif block to only be true for versions below Debian 9.
a1bda00cb Merge pull request #48960 from dwoz/block_replace_tests
94ac2b4fc7 Multiple block replace test fixes
93b862f350 Merge pull request #48957 from whytewolf/beacons_log_doc_change
a77fd16869 Update salt.beacons.log to reflect that re module is used for matching.
0245c0fbb0 Merge pull request #48955 from terminalmage/service-systemd
23f87bd536 Don't load service.py if minion is running a non-sysvinit init system
848d583438 Merge pull request #48950 from KaiSforza/kitchenfix-2017.7
5242cb143a Added a quote to kitchen Jenkinsfiles
928d688d65 Merge pull request #48943 from rallytime/flaky-tests
668a57ab9 Mark some shell and runner integration tests as flaky
cd42510d3a Merge pull request #48940 from rallytime/bp-48852
fa4ef92e79 Record all the artifacts from the build
43649a68be Merge pull request #48935 from garethgreen-away/1045_test_pkg_015_installed_held_centos
0bb10107b6 Merge branch '2017.7' into 1045_test_pkg_015_installed_held_centos
24d5e6a22f Fixing the test_pkg_015_installed_held test to be able to successfully run on CentOS
2421e2a570 Merge pull request #47100 from gtmanfred/ssh
5b443af7ae add key-deploy test
a131c9beeb Allow for not being prompted to supply a password to deploy keys to a minion with salt-ssh
d541bd6446 Merge pull request #48891 from damon-atkins/2017.7_win_pkg.list_pkgs_not_found
a4af1dbb1 Fix win_pkg issues introduced Jan 2018. If DisplayVersion does not exist it should return version as "Not Found"
5f6a56f5dc Merge pull request #48896 from rallytime/bp-48730
57aa204c9d Merge branch '2017.7' into bp-48730
- 4995922584 Forgot variable in signature
- 0503bc18b6 Fix batch install using pkgng

- 0c64bba865 Merge pull request #48933 from garethgreenaway/1022_debian_8_failing_service-test
  - 280d1d2ad2 Fixing failing test, integration.modules.test_service.ServiceModuleTest.test_service_disable_does_not_exist on Debian 8 and higher.
- 0c3d2c6a09 Merge pull request #48922 from rallytime/cache-doc-error
  - 8ca89df7e8 Update backticks on job_cache docs
- 8d1fc4f8e5 Merge pull request #48866 from Ch3LL/cmd_win_tests
  - 905da13653 Merge branch '2017.7' into cmd_win_tests
- 57d58e7541 Merge pull request #48920 from rallytime/bp-48904-2017.7
  - a55f92954a No rehashing in parallel
  - 3be11e6fe Add docs for new escape kwarg
  - 391bb8a411 use a specific path for just the cmd._run call
  - 62c66ba489 make sure we lower the check on shell
  - 9312a993a5 Add cmd module integration tests for windows and fix space in path issue

- ISSUE #48123: (c-wicklein) file.directory with recurse fails when it encounters a broken symbolic link (refs: #48985)

- PR #48985: (garethgreenaway) [2018.3] Fix to salt/modules/file.py @ 2018-08-09 15:03:09 UTC
  - 3325b7d4c0 Merge pull request #48985 from garethgreenaway/48123_file_directory_recurse_fails_broken_symlink
  - 10c4eca206 Merge branch '2018.3' into 48123_file_directory_recurse_fails_broken_symlink
  - a404cc030f Fixing the issue when using the file.directory state with recurse if the directory contains a broken symbolic link. This fix adds an additional conditional, is_link, before running lsattr since lsattr does not work on symlinks and causes issues when that symlink is broken.

- ISSUE #47695: (AmbicaY) Continuous error in the proxy minion logs (refs: #49019)

- PR #49019: (garethgreenaway) [2018.3] Fix to scheduler when global enabled key is present @ 2018-08-09 13:06:26 UTC
  - d353c02a8c Merge pull request #49019 from garethgreenaway/47695_fixing_scheduler_bug_when_enabled_is_present
  - aff1b8f6d4 Lint.
  - 8935e08141 Fixing a bug that occurs if the "enabled" key is present in the scheduler items dictionary. Adding a test to ensure scheduler runs as expected when that key is present.

- PR #49023: (The-Loeki) Salt SSH appends IdentityFile=agent-forwarding @ 2018-08-09 12:55:59 UTC
  - a56bc7ff9 Merge pull request #49023 from The-Loeki/patch-1
  - 8b53571c70 Salt SSH appends IdentityFile=agent-forwarding

- PR #48981: (Ch3LL) Add warning to mac runas docs about escaping characters @ 2018-08-08 19:43:43 UTC
  - 4590494b50 Merge pull request #48981 from Ch3LL/mac_runas_quote
  - 826b55b84 remove unnecessary spaces in cmdmod.py docs
  - 757daf7d7e add runas macosx warning in 2018.3.3 release notes
  - 4e9e985b14 Add warning to mac runas docs about escaping characters
• PR #49004: (rallytime) Port #48999 to 2018.3 @ 2018-08-08 15:32:46 UTC
  - PR #48999: (rallytime) Update expected return value in boto test (refs: #49004, #49003)
  - b87bf905c2 Merge pull request #49004 from rallytime/boto-test-2018.3
  - 90b9a1073 Update expected return value in boto test
• PR #48987: (twangboy) Fix issue with win_iis.create_cert_binding @ 2018-08-08 13:29:06 UTC
  - 630f61e625 Merge pull request #48987 from twangboy/fix_48786
  - 86d0836f90 Fix issue with iterating over None
• ISSUE #48777: (jonasgit) file.recurse fails on file contents encoding not utf-8 (refs: #48934)
• PR #48934: (terminalmage) Properly handle latin-1 encoding in file diffs @ 2018-08-07 21:02:24 UTC
  - ab1a719bc3 Merge pull request #48934 from terminalmage/issue48777
  - 52c64e4d51 Fix to_unicode test
  - e2d19f40b6 Only try latin-1 from get_diff instead of by default
  - d39fa889f3 Add stringutils.get_diff to mocks
  - 5b191c9120 Fix incorrect use of __salt__ when __utils__ is needed
  - 53ba10ad5f Skip pylint false-positives
  - f14f4ae22 Add unit test for latin-1 fallback, multi-encoding
  - 906644a80f PY3 scoping fix
  - 726dd43c1f Add integration test for latin-1 file diffs
  - 2d1f312d3 Use BASE_FILES instead of redundant STATE_DIR
  - 612ff5fe8 Use new get_diff helper in file module
  - c632265802 Make to_unicode/to_str/to_bytes helpers attempt latin-1
  - 2acb49b01 Add get_diff to salt.utils.stringutils
• ISSUE #47766: (zerthimon) salt-cloud: openstack driver: crash on instance creation (refs: #48956)
• PR #48956: (gtmanfred) if booted from volume, use string from image @ 2018-08-07 16:39:45 UTC
  - bad995462c Merge pull request #48956 from gtmanfred/openstack
  - 4cb1636c4b if booted from volume, use string from image
• ISSUE #48306: (davidscholberg) Documentation update for custom returners used for master job cache (refs: #48319)
• PR #48319: (gtmanfred) don’t break older returners right now @ 2018-08-06 13:19:43 UTC
  - 71f58edd7 Merge pull request #48319 from gtmanfred/jid
  - 084e7f0e4f Merge branch `2018.3` into jid
  - 60661b4cd0 document minions required on save_load
  - a8c243071d document passing in minions
  - d493810c0b6 don't break save_load backwards compat
  - cfcacf953a don’t break older returners right now
• PR #48941: (rallytime) Back-port #48912 to 2018.3 @ 2018-08-06 13:09:38 UTC

30.2. Previous Releases
– PR #48912: (maxim-sermin) make jboss7.py compatible with 2018.3.0 and later (refs: #48941)
  – 1623e53ef4 Merge pull request #48941 from rallytime/bp-48912
  – 3f5b2f89e make jboss7.py compatible with 2018.3.0 and later

• PR #48897: (rallytime) Back-port #48863 to 2018.3 @ 2018-08-05 19:15:51 UTC
  – PR #48863: (admd) Decode file contents for python2 as well (refs: #48897)
  – 070af9d925 Merge pull request #48897 from rallytime/bp-48863
  – 0ee1940232 Merge branch '2018.3' into bp-48863
  – f40b966d99 decode file contents for python2 as well

• PR #48928: (Ch3LL) fix test_runas integration test for macosx @ 2018-08-05 14:24:13 UTC
  – abd7f1312d Merge pull request #48928 from Ch3LL/mac_runas
  – 3d6455dbcd remove unnecessary comment in setup
  – 8e30db0217 move destructivetest to testname
  – 708dec8740 add destructivetest to setup and teardown for runas test
  – c0730ff968 fix test_runas integration test for macosx

• PR #48899: (Ch3LL) remove base_top_file file in teardown and add sleep @ 2018-08-05 14:23:42 UTC
  – dbd300ff70 Merge pull request #48899 from Ch3LL/unit_state
  – 0272cadff8 Merge branch '2018.3' into unit_state
  – 5896c7fe36 remove base_top_file file in teardown and add sleep

• PR #48898: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-08-05 14:23:19 UTC
  – ffa1fcd682 Merge pull request #48898 from rallytime/merge-2018.3
  – 1f093ce4a4 Merge branch '2018.3' into merge-2018.3
  – b3a5aa49d7 Merge branch '2017.7' into '2018.3'
    * e79cc35b1 Merge pull request #48876 from Vaelatern/make-network-learning-optional
      * a4905b0e5d Make IP_LEARNING optional
    * fb0faabf9f Merge pull request #48890 from Ch3LL/cmd_test
      * acda4ed9ab add sleep in test_cmd integration test
    * 52722f6ded Merge pull request #48885 from rallytime/flaky-tests-shadow
      * da871a2d57 Mark shadow module integration test as flaky
    * bf089565de Merge pull request #48884 from rallytime/flaky-tests-matchers
      * 38d9eae537 Merge branch '2017.7' into flaky-tests-matchers
    * a567666938 Merge pull request #48868 from terminalmage/fix-loader-race
      * 5f1169b9a2 Fix race when SIGTERM/SIGINT received while lazyloading a module
    * 0ca0b6f2f2 Merge pull request #48883 from terminalmage/salt-jenkins-1023
      * 61f75cb50 Fix failing git worktree tests
      * 3660ff13e2 Separate compound matcher tests into individual tests
    * a84f5155a1 Merge pull request #48869 from Ch3LL/mac_shell_tests

2102 Chapter 30. Release Notes
- 373b41ec89 Catch socket.error exception in testprogram
- 7f56b8bf44 Merge pull request #48867 from rallytime/skip-tornado-test
- 7320aa9104 Skip unreliable tornado test.

- PR #48893: (Ch3LL) handle when ca_certs is None in utils.http @ 2018-08-03 20:30:48 UTC
  - 848e26ed0b Merge pull request #48893 from Ch3LL/http_tests
  - 16d251f7ff Merge branch '2018.3' into http_tests
  - 5674dddb2a handle when ca_certs is None in utils.http

- PR #48903: (Vaelatern) Wrap ElementTree.tostring to make strs, not bytes @ 2018-08-03 19:12:34 UTC
  - PR #48877: (Vaelatern) Wrap ElementTree.tostring to make strs, not bytes (refs: #48903)
  - f1aad56017 Merge pull request #48903 from Vaelatern/improve-salt-cloud-python3-virt
  - c45447fe0b Wrap ElementTree.tostring to make strs, not bytes

- PR #48900: (Ch3LL) skip getpwnam check on mac in unit test_cmdmod @ 2018-08-03 16:38:51 UTC
  - d23471262d Merge pull request #48900 from Ch3LL/cmd_unit
  - b82dd708be skip getpwnam check on mac in unit test_cmdmod

- PR #48921: (rallytime) Back-port #48904 to 2018.3 @ 2018-08-03 15:17:15 UTC
  - PR #48904: (KaiSforza) No rehashing in parallel (refs: #48921, #48920)
  - d622a49b58 Merge pull request #48921 from rallytime/bp-48904
  - b50425f61 No rehashing in parallel

- PR #48877: (Vaelatern) Wrap ElementTree.tostring to make strs, not bytes (refs: #48903) @ 2018-08-02 19:28:56 UTC
  - 1e150923aa Merge pull request #48877 from Vaelatern/improve-salt-cloud-libvirt-python3-libvirt
  - fb785315c Wrap ElementTree.tostring to make strs, not bytes

- PR #48824: (rallytime) Bump deprecation in win_servermanager state to Neon @ 2018-08-02 18:01:34 UTC
  - 1bf7d9431b Merge pull request #48824 from rallytime/win_servermanager_deprecations
  - 6ef5412528 Bump deprecation in win_servermanager state to Neon

- ISSUE #37512: (ChristianBeer) What's the precedence if multiple master configurations are specified? (refs: #48888)

- PR #48888: (terminalmage) Explicitly document the configuration override priority @ 2018-08-02 16:57:18 UTC
  - ec8e07e8ce Merge pull request #48888 from terminalmage/issue37512
  - 7dece7de14 Explicitly document the configuration override priority

- PR #48871: (dwoz) Remove unicode key pairs from environ after test @ 2018-08-01 22:33:41 UTC
  - d4bb3a0963 Merge pull request #48871 from dwoz/test_cleanup
  - f2e15c7f1d Do not re-define tearDown
  - 4fb8191a69 Remove unicode key pairs from environ after test

- PR #48843: (isbm) Prevent u'something' to appear in help info. @ 2018-08-01 20:38:58 UTC
  - bce79e83a3 Merge pull request #48843 from isbm/isbm-log-level-names-fix-2
  - a63686180d Merge branch '2018.3' into isbm-log-level-names-fix-2
- Prevent u'something' to appear in help info.

- **PR #48855**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-08-01 17:44:59 UTC
  - a8376b537a Merge pull request #48855 from rallytime/merge-2018.3
  - 44998c208e Lint: Fix undefined logger variable
  - 92c9317a25 Update old utils paths to use new paths
  - 15bfa7143 Merge branch '2017.7' into '2018.3'
    - 05f26d65ed3 Merge pull request #48853 from rallytime/bp-48850
      - 3c33ee554a Skip tests in integration.shell.test_master
    - 8a1285239a Merge pull request #48426 from garethgreen-away/46689_fixing_pkg_held_when_package_is_installed
      - 9b0f5dd212 Fixing indentation, removing some unnecessary conditionals.
      - 727964ab55 One last cleanup.
      - 11cb5e6eb General cleanup in pkg state, reducing duplicate code. Fixing the requires_salt_modules decorator, sys.doc was returning too much information for the event to handle. This change specifically calls sys.doc with the module name.
      - 16b6ae635 Make sure pkg.hold and pkg.unhold are available before running the test.
      - 99b5a1102d Fixing a situation when a package is already installed via salt or manually and a state attempts to set that package to be held. Previously the holding/unholding logic was only being run against packages that were being installed. This change moves the holding logic outside and runs it against all desired packages. Adding a new test to test holding logic.
    - c8e69431f Merge pull request #47734 from OrlandoArcapix/Issue47689-pip-state-performance
      - 662bd1f780 Merge branch '2017.7' into Issue47689-pip-state-performance
      - 66936b4f41 Changed string comparison in pip test to match new confirmation string - ref PR #47734.
      - bb5939d6ef Merge branch '2017.7' into Issue47689-pip-state-performance
      - d6a49ae41c Merge branch '2017.7' into Issue47689-pip-state-performance
      - d4083f9cd1 Merge branch 'Issue47689-pip-state-performance' of github.com:OrlandoArcapix/salt into Issue47689-pip-state-performance
      - 779b5fa785 Merge branch '2017.7' into Issue47689-pip-state-performance
      - f365349bab Removed whitespaces at end of added comments lines
      - db11f2ff4b Merge branch '2017.7' into Issue47689-pip-state-performance
      - eac0178de2 Ref: #47689 - document additional kwarg passed to pip._check_if_installed function
      - 0d19803106 Merge branch '2017.7' into Issue47689-pip-state-performance
      - d3678fa2f3 #47689 fix lint errors
      - 4fe8f86bce #47698 improve run-speed of pip package state checks by only loading the current package list once when checking multiple packages
    - 83a5b3cc47 Merge pull request #48844 from AVeenstra/fix-python3-incompatibility
      - f238779a62 Merge branch '2017.7' into fix-python3-incompatibility

---

2104 Chapter 30. Release Notes
6b1805afc6 Fixed Python 3 incompatibility in methods in nilrt_ip and debian_ip.
136ff6735a Merge pull request #48662 from slaws/fix-retention-schedule-48637
   3c8f5f5b3d pylint fix
   5539eff39e Excluding relative dirs in state.file.retention_schedule
1fc04f281b Merge pull request #48840 from gtmanfred/docs
   8d2d268e4a fix links in pkg doc.
0a19f845ea Merge pull request #48834 from gtmanfred/slsutil
   f9441d2bef read output of stringio if it is readable
2e00939a6e Merge pull request #48788 from Ch3LL/timezone_windows
   de95a6a215 add unused import to timezone test file
   22e424859e add unused import to import
   0840fc3117 disable pylint import error
   f09d1a2c7e Add timezone windows integration tests and fix get_zone

• ISSUE #48659: (dstoliker) file.grep with glob (*) in path produces file not found error (refs: #48830)
• PR #48830: (garethgreenaway) [2018.3] Fixes to file.grep @ 2018-07-31 21:30:04 UTC
   e23ba01cd2 Merge pull request #48830 from garethgreenaway/48659_file_grep_glob_fix
   0791b0a03c FileGrepTestCase tests back to 2018.3
   2e01c55e7e Fixing a bug that prevents specifying wildcards for filenames.
• PR #48814: (isbm) dmidecode race conditions check @ 2018-07-31 20:48:29 UTC
   9fda70b3d0 Merge pull request #48814 from isbm/isbm-2018.3-smbios-bugfix
   5f1141dc05 Merge branch '2018.3' into isbm-2018.3-smbios-bugfix
   b00ee5feef Update clean clause
   b1b2e9c222 Remove multiple returns and combine logic to just one clause
   fd77f760ee Rephrase explanatory comment
   1031e06443 Remove unnecessary code
   c379b7e4ed Get rid of global variable
• PR #48804: (Ch3LL) Use brew path from which cmd in mac_brew module @ 2018-07-31 20:24:33 UTC
   3d16a63ff2 Merge pull request #48804 from Ch3LL/mac_brew
   e818c752b3 Merge branch '2018.3' into mac_brew
   41e3d17f29 Use brew path from which cmd in mac_brew module
• PR #48836: (dwoz) Fix unicode directory listing on py2 @ 2018-07-31 20:22:53 UTC
   950c1014aa Merge pull request #48836 from dwoz/unicode_names_py2
   47e158b9f0 Optimize if statement
   9b462394b2 Fix unicode directory listing on py2
• PR #48847: (terminalmage) Update file.blockreplace docs to reflect changed functionality @ 2018-07-31 18:11:30 UTC
– baf8c5784a Merge pull request #48847 from terminalmage/issue48695
– e2bdf7fb92 Update file.blockreplace docs to reflect changed functionality

• PR #48587: (twangboy) Fix lgpo issue on Py3 @ 2018-07-31 18:05:58 UTC
  – 644af4ff8 Merge pull request #48587 from twangboy/fix_lgpo
  – a42621c817 Write file in normal mode
  – bfcbdeca3b Fix lgpo issue on Py3

• PR #48796: (Ch3LL) Remove fake su used in integration tests @ 2018-07-31 17:08:54 UTC
  – 2bacc23481 Merge pull request #48796 from Ch3LL/remove_su
  – d3b7f2cb18 Remove fake su used in integration tests

• ISSUE #38310: (ghost) Unable to checkout external pillar git repo using its git tag (refs: #48689)

• PR #48689: (linoplit) Fix ext_pillar remote checkout using tag (pygit2) @ 2018-07-31 16:15:58 UTC
  – 00d06bda76 Merge pull request #48689 from linoplit/fix_38310_pygit2_checkout_ext_pillar_remote_using_tag
  – eb4361dcc2 Merge branch '2018.3' into fix_38310_pygit2_checkout_ext_pillar_remote_using_tag
  – c20977e3bc Merge branch '2018.3' into fix_38310_pygit2_checkout_ext_pillar_remote_using_tag
  – b0157e215b Fix ext_pillar remote checkout using tag (pygit2)

• PR #48838: (sizgiyaev) Fixed: added additional return code 200 for succeeded vault api request @ 2018-07-31 16:14:22 UTC
  – 5e14e36195 Merge pull request #48838 from sizgiyaev/fix-vault-policy-state
  – 02d09c6281 Fixed: added additional return code 200 for succeeded api request

• PR #48714: (dwoz) Always transfer bytes from fileserver roots @ 2018-07-30 22:37:13 UTC
  – 69f81214d1 Merge pull request #48714 from dwoz/state_echo_fix
  – ce3ed43dab Always use unix line endings
  – d5e60090bc Merge pull request #2 from terminalmage/state_echo_fix
    • 52fc1c955d Simplify file contents in roots fileserver test
    • b6f73e8e57 Remove trailing whitespace on what should be a blank line
  – 95329ab1e Fileserver transfers bytes
  – aa34a80997 Always trasfer bytes from fileserver roots

• PR #48822: (Ch3LL) Fix salt-ssh state.sls_id TypeErro  key must be a string @ 2018-07-30 20:29:29 UTC
  – 16cad4ec2eb Merge pull request #48822 from Ch3LL/ssh_2018_id
  – 01f6a15da0 Fix salt-ssh state.sls_id TypeError key must be a string

• ISSUE #47999: (arthurlogilab) Carbon returner failing when run through scheduler on log.trace (refs: #48757)

• PR #48791: (rallytime) Back-port #48757 to 2018.3 @ 2018-07-27 21:30:44 UTC
  – PR #48757: (kuetrzi) Update carbon_return.py (refs: #48791)
  – 488ff7e16d4 Merge pull request #48791 from rallytime/bp-48757
  – f440ebe9f1 Update carbon_return.py

• PR #48799: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-07-27 21:30:13 UTC
- fae29f4257 Merge pull request #48799 from rallytime/merge-2018.3
- 487458ad4b Update old utils paths to use new utils paths
- 436510796f Merge branch '2017.7' into '2018.3'
  * 8e61f3dce0 Merge pull request #48742 from frogunder/45014
    - f08058b043 Merge branch '45014' of https://github.com/frogunder/salt into 45014
    - 757fde70c6 Merge branch '2017.7' into 45014
    - 33c20c1ec0 fix tests
    - a7a914060d add windows integration tests for states.file
  * d74f47b340 Merge pull request #48795 from rallytime/fx-48417
    - 5123b17ff1 Update linting docs to contain .testing.pylintrc use
  * bbea9ae936 Merge pull request #48789 from rallytime/bp-48783
    - 682a05bebe Threshold was wrong
    - d4ca0e3a97 test: except for OSError only
    - 4547231909 Only run lint checks against changed files
  * 41464db39f Merge pull request #48731 from zero/def/virt-runner-init-args
    - a1f081ad0 Documentation to missing parameters in virt.init runner.
    - 365ebf539 Fixed enable_vnc runner arg being passed into seed_cmd module arg in virt.init.
  * 169afea16a Merge pull request #48749 from Ch3LL/logo_docs
    - 73b1fc29f0 Update Saltstack Logo banner on docs.saltstack.com

- ISSUE #48020: (calvinhp) mine.get not returning data in a state.orchestrate sls (refs: #48765)
- PR #48765: (FedericoCeratto) [2018.3] Fix mine.get not returning data @ 2018-07-27 18:01:06 UTC
  - bd67d2a805 Merge pull request #48765 from FedericoCeratto/fx_mine.get_not_returning_data
  - 7183a660e8 Workaround for #48020
- PR #48747: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-07-26 18:14:34 UTC
  - 6978ce5d1d Merge pull request #48747 from rallytime/merge-2018.3
  - 4122da40b5 Merge branch '2017.7' into '2018.3'
    * 781c6a6c9e6 Merge pull request #48743 from rallytime/saltconf-ad-2017.7
      - 6df8d8652 Update DOCBANNER with new SaltConf18 image
    * ce4e22224e Merge pull request #48720 from Ch3LL/mac_file_path
      - 01d25fae19 Fix testManagedSourceHashIndifferentCase on macosx to correct tmp path
    * 4bf037d4d3 Merge pull request #48719 from Ch3LL/service_mac_state
      - f44a2fc349 Enable service if disabled before running state service tests
    * b2431ebab0 Merge pull request #48715 from rallytime/flaky-tests
      - 7332ccce567 [2017.7] Mark some tornado tests as flaky
    * 801ea3b8ed Merge pull request #48672 from frogunder/45012
      - 0747f2e58a add service enabled test
• ISSUE #48676: (djneades) salt-ssh should not target wrong minion from roster file as a result of reverse-DNS lookups (refs: #48771)

• PR #48771: (gtmanfred) only do reverse dns lookup on ips for salt-ssh @ 2018-07-26 15:41:40 UTC
  - 5ea43817ab Merge pull request #48771 from gtmanfred/2018.3
  - 535f88e78 only do reverse dns lookup on ips for salt-ssh

• PR #48752: (garethgreenaway) [2018.3] Fix when state file is integers @ 2018-07-25 15:03:02 UTC
  - f2ef2d3ef6 Merge pull request #48752 from garethgreenaway/fix_state_file_all_integers
  - 790801c67e Fixing a case where the state module would fail if the state file being passed was all integers. Added a new tests for this edge case.

• ISSUE #46896: (Poil) Proxy + file.managed => Comment: Failed to cache xxx invalid arguments to setopt (refs: #48754)

• PR #48754: (lomeroe) send proxy/ca_cert parameters as strings (not unicode) to tornado httpclient @ 2018-07-25 14:55:42 UTC
  - 030c921914 Merge pull request #48754 from lomeroe/fix-tornado-proxy
  - d33056704b pass proxy_user, proxy_password, proxy_host, and ca_certs through salt.utils.stringutils.to_str()

• PR #48769: (Ch3LL) Update Saltstack Logo banner on docs.saltstack.com @ 2018-07-25 14:47:19 UTC
  - 1eee4b136b Merge pull request #48769 from Ch3LL/update_doc_2018.3
  - 0cb4ac798 Update Saltstack Logo banner on docs.saltstack.com

• PR #48760: (dwoz) Multiple windows test fixes @ 2018-07-24 23:38:32 UTC
  - 8ae9f6d9960 Merge pull request #48760 from dwoz/test_file_fixes
  - b7a37efc11 merge branch '2018.3' into fix_prepend

• ISSUE #48536: (whytewolf) diskusage beacon does not recognize tmpfs disks in linux. (refs: #48718)

• PR #48718: (garethgreenaway) [2018.3] beacon diskusage fixes @ 2018-07-24 17:45:26 UTC
  - 62fe7ccf Merge pull request #48718 from garethgreenaway/48536_beacon_diskusage_fixes
  - 38a68e8b3 Fixing test_diskusage_nomatch and test_diskusage_match_regex
  - 6ecca166f Updating psutil.disk_partitions to pull in all mounts not just the physical ones. Check to see if the mount point from the configuration ends with a $ (regular expression end of line) if not we add one in to ensure that a simple / does not end up matching all mount points. Updating tests accordingly.

• PR #48711: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-07-24 17:38:58 UTC
  - e873621009 Merge pull request #48711 from rallytime/merge-2018.3
  - ea5c063237 Update old utils paths to use new paths
- e740d3b208 Merge branch ’2017.7’ into ’2018.3’
  - 689c231d2b Merge pull request #48691 from Ch3LL/win_repo_pkg_test
    - 4b7d6d80c5 Remove unnecessary jinja in curl.sls file
    - 2bedafdb Add windows pkg module integration tests
  - 83e4ba916 Merge pull request #48635 from nbraud/acme
    - 3673bae9de modules/acme: explicitly ignore the perms return value
    - 1800a231e8 Fixup some schema expectations
    - 8c718c417 acme: Make the private key mode configurable
    - 917dea6761 modules/acme: Use file.check_perms ret-morphing powers
    - d2241ceb2d module/acme: Do not exit early when the certificate already exists
    - 98af0db826 modules/acme: Set the private key filemode to 0640
  - 85991680c8 Merge pull request #48345 from twangboy/fix_48169
    - ead19725b6 Merge branch ’2017.7’ into fix_48169
    - 653fcb383 Fix some docs errata
    - 8898e5ff11 Add warn_until Fluorine
    - 707906ac15 Fix unit.state.test_powercfg
    - 32c5014eb6 Fix unit tests
    - 0d9c56e540 Add some more logging
    - b20453de9f Use minutes to set
    - 7dc7eb11c2 Fix documentation to denote seconds when setting
  - 96447ce541 Merge pull request #48656 from Ch3LL/windows_ip_mod
    - 90c3f568b1 Add windows ip module integration tests
  - 0c5ff3dc8 Merge pull request #48638 from twangboy/fix_vcredist
    - e30d17099d Use goto instead of if statement
    - e1042fa084 Remove vcredist for Py3
  - 1ebd96d909 Merge pull request #48664 from Ch3LL/srv_disable_mac
    - f1fbfad387 move the disable call up in try block
    - f60d21bda4 reverse assertion order for service disable test
    - 3727d1b3b9 switch try/except to match 2018.3
    - fb953c2369 [2017.7] Fix service.disabled test for macosx
  - 3da3cf23f Merge pull request #48625 from Ch3LL/ssh_state
    - f590eb2b02 Update state.py
    - 9790ee3d0d Follow up to PR #48555
  - 33812f78f1 Merge pull request #48673 from Ch3LL/mac_port
    - 87dd85a220 Use different pub and ret ports for testprogram integration tests
  - 5f6a7c4d89 Merge pull request #48675 from Ch3LL/mac_disable
· c78efab828 Fix mac service.disable tests
* 93d2f51d2b Merge pull request #48658 from wyardley/wyardley-npm-json-output-2017
  · 7ff3c9c5ff Improve handling of npm json output (#43138)
* 3e29b0513 Merge pull request #48678 from OrlandoArcapix/fix-npm-dryrun-test
  · 851a4046b Fix for issue #48677 - return True when no changes are to be made with npm.bootstrap with test=true
* 07a1f6520f Merge pull request #48580 from rallytime/fix-46884
  · 736b382e91 Don't error on retcode 0 in libcrypto.OPENSSL_init_crypto call
* 9874429741 Merge pull request #48628 from terminalmage/testinfra
  · 5ace9f01ec Fix NameError in testinfra module
* 0d4c80205f Merge pull request #48651 from gtmanfred/pylint-2017.7
  · b6ee52f859 handle pyzmq for python3.4
* 160ae29cf2 Merge pull request #48647 from gtmanfred/pylint-2017.7
  · ff818c4ca2 disable checks on pylint
* 47b1032efa Merge pull request #48593 from pritambaral/fix/2017.7-importlib-pyc-loading-order
  · add7894dee loader: Fix suffix order when importlib is used
* 9da7b2ec8d Merge pull request #48630 from dubb-b/pipeline-updates
  · 8594a8dd05 Adding PY_COLORS=1 as PY_COLORS = 1 instead
  · 314b0e3599 Adding PY_COLORS=1 for python programs to use ANSI Colors
  · b705e8f7a5 Adding correct spacing to options section
  · 9d8a7e07db Adding options to Jenkins pipeline builds
* a8ae2ad6f4 Merge pull request #48633 from saltstack/revert-48610-2017.7
  · bab4a769d4 Revert "only run pylint on files that change"
* 6e32bb7f74 Merge pull request #48614 from rallytime/bp-48562
  · cb654bbf2c Add timeouts to all s3 queries
* 1b6e6388f8 Merge pull request #48588 from garethgreenaway/48415_event_send_multi_master
  · fab25af1a9 Adding some quick documentation about why we are setting ret=True following the channel.send.
  · bf78f4b188 If the channel send is successful and does not raise an exception, we set ret to True, in case a previous exception from a previous channel send to another master has sent it to False.
  · 8d1551c5fb When using Salt multi-master, if we encounter a salt master that has not accepted the minion key yet we should not exit right away, rather continue on and try the next salt master available in the list.
* 24ffda49ba Merge pull request #48610 from gtmanfred/2017.7
  · 779d1a3dcb only run pylint on files that change
* 5391dd0a8d Merge pull request #48584 from Ch3LL/mac_user_grp
  · 585ee9db90 Fix grp import for mac in test_user integration test
- 61572b6780 Merge pull request #48555 from Ch3LL/ssh_id
  - f69932f506 fix pylint
  - 70e36764ee Add more tests for salt-ssh state.sls_id
  - dab80e805c Fix state.sls_id to run on ssh minion and not master
- aa6dcf39e8 Merge pull request #48583 from Ch3LL/mac_flaky_tests
  - 4ba2299a87 import flaky decorator on mac tests
  - 811220b41e Add flaky decorator to mac_system and mac_timezone tests
- 6973152057 Merge pull request #48534 from xetix fix-zypper-latest_version
  - 9985f0b4c1 Lint: remove extra blank line
  - 5fbead8a36 Merge branch '2017.7' into fix-zypper-latest_version
  - 56ac449271 Merge branch 'fix-zypper-latest_version' of https://github.com/xetix/salt into fix-zypper-latest_version
  - 44e87f5a0f Adding testcase for this fix.
  - b354ce686c Fix behaviour of function latest_version in zypper module when multiple packages are passed to function. Function now properly return dict with empty string as version if latest packages is already installed, and multiple packages are passed to function
  - db35d0c1e1 Adding testcase for this fix.
  - d2513757ed Fix behaviour of function latest_version in zypper module when multiple packages are passed to function. Function now properly return dict with empty string as version if latest packages is already installed, and multiple packages are passed to function
- 10124034cb Merge pull request #48582 from dwoz/test_prepend_fix
  - f37571e0bd Merge branch '2017.7' into test_prepend_fix
- 13f67335f3 Merge pull request #48564 from dwoz/test_prepend_fix
  - 136dd5f54 Finally fix prepend for real
  - 66b25e65bf Fix failing prepend test
- b8ce27729f Merge pull request #48558 from dwoz/test_file_fix
  - c858bf477f Remove which mock to get the test passing
- a15c65202d Merge pull request #48552 from KaiSforza/jenkins-junit-2017
  - 72b1830974 Set up junit in jenkins
- f73108026e Merge pull request #48550 from gtmanfred/2017.7
  - d5c603d9b6 add posargs to tox pylint
- 113b0426f8 Merge pull request #48535 from asnell/asnell-patch-2
  - 328f8e434d Update manage_file helptext

- PR #48744: (rallytime) [2018.3] Update DOCBANNER with new SaltConf18 image @ 2018-07-24 17:15:40 UTC
  - 6c7f1e549d Merge pull request #48744 from rallytime/saltconf-ad-2018.3
  - dbc1f8b777 Update DOCBANNER with new SaltConf18 image

- PR #48726: (dwoz) Skip test when syslog not available @ 2018-07-24 16:12:44 UTC
  - 04ab17a4d6 Merge pull request #48726 from dwoz/syslogtest
- 00f04cfd59 Skip test when syslog not available

- **PR #48727**: (dwoz) Windows compatible cp test @ 2018-07-24 14:41:34 UTC
  - af837424aa Merge pull request #48727 from dwoz/file_cp_test_fix
  - 6e7824266b Windows compatible cp test

- **ISSUE #40004**: (te-af-github) svn changes report (refs: #47510)

- **ISSUE #21025**: (RobertFach) svn.export reports invalid change data (2014.7.x) (refs: #47510)

- **PR #48710**: (rallytime) Back-port #47510 to 2018.3 @ 2018-07-23 21:11:18 UTC
  - **PR #47510**: (daa) Fix svn export invalid changes data (refs: #48710)
  - 04125b077d Merge pull request #48710 from rallytime/bp-47510
  - ebcd3b1c6b fixed test for svn.export
  - e79f4aa5cc put name under "new" key in changes dictionary to be in line with svn.latest
  - 163f99089c made svn.export changes data dictionary, fixes #21025, #40004
    - 3a941055c1 Use salt.utils.platform.is_windows
    - 33e48f7ad7 Finally fix prepend for real

- **PR #48699**: (terminalmage) Add missing release notes mention of file.blockreplace changes @ 2018-07-23 13:34:32 UTC
  - e1dd10be70 Merge pull request #48699 from terminalmage/issue48695
  - 7ad832e901 Add missing release notes mention of file.blockreplace changes

- **PR #48700**: (dwoz) Call sync_modules to fix Windows test case @ 2018-07-22 22:23:48 UTC
  - ab44a05fe4 Merge pull request #48700 from dwoz/ext_mod_test
  - d731edf8e Call sync_all to fix Windows test case

- **PR #48653**: (terminalmage) docker_container.running: Fix regression in test mode @ 2018-07-20 19:15:47 UTC
  - 6a494205f2 Merge pull request #48653 from terminalmage/docker-unboundlocal
  - b0440871a0 Merge branch '2018.3' into docker-unboundlocal
  - 9515dd17ff docker_container.running: Fix regression in test mode

- **ISSUE #47059**: (OrlandoArcapix) Some states incorrectly return None instead of an empty dict when there are no changes (refs: #48685)

- **ISSUE #46985**: (OrlandoArcapix) grafana4_user.present and grafana4_org.present states not working in 2018.3.0 (refs: #48685)

- **PR #48685**: (bbinet) Use empty dict for 'changes' instead of None @ 2018-07-20 17:12:43 UTC
  - **PR #48671**: (bbinet) Few fixes to the grafana module and states (refs: #48685)
  - 26662506 Merge pull request #48685 from bbinetnone-changes
  - 842eb3da24 Use empty dict for 'changes' instead of None

- **PR #48670**: (bbinet) Add the "traverse" jinja filter @ 2018-07-20 16:36:21 UTC
  - 5a67a085e Merge pull request #48670 from bbinet/traverse
  - 32b6d22cf2 Fix RST syntax issue in doc
  - 37a41226d5 Add the "traverse" jinja filter
• **PR #48594**: (pritambaral) Backport 48418 @ 2018-07-20 14:57:19 UTC
  - **PR #48418**: (pritambaral) Fix multi-sls `salt.state` orchestration in masterless systems (refs: #48594)
  - ff11763fd3 Merge pull request #48594 from pritambaral/bp-48418
  - adcee2884 Fix multi-sls `salt.state` orchestration in masterless systems

• **ISSUE #48184**: (mmulqueen) Invalid DMI prevents salt-minion from running (refs: #48440)

• **PR #48440**: (mmulqueen) Make core.py tolerant of invalid chars in DMI data @ 2018-07-20 14:48:07 UTC
  - **PR #48216**: (Ch3LL) Fix UnicodeDecodeError when reading file to determine virtual grain (refs: #48440)
  - 111908f519 Merge pull request #48440 from mmulqueen/patch-1
  - 5bbdce74cd Make core.py tolerant of invalid chars in DMI data

• **PR #48663**: (Ch3LL) [2018.3] Fix service.disabled test for macosx @ 2018-07-20 14:32:22 UTC
  - 4e77b242f2 Merge pull request #48663 from Ch3LL/srv_disable_mac_2018
  - bddfd75d2 reverse assertion order for service disable test
  - 2bfa7fe89 Fix service.disabled test for macosx

• **PR #48304**: (Ch3LL) Fix macosx grains when swapusage returns comma @ 2018-07-20 14:30:59 UTC
  - dfe1582475 Merge pull request #48304 from Ch3LL/swap_mac
  - 5d6135e1e2 Fix macosx grains when swapusage returns comma

• **PR #48671**: (bbinet) Few fixes to the grafana module and states (refs: #48685) @ 2018-07-20 13:58:02 UTC
  - 9d7eabdb24e Merge pull request #48671 from bbinet/grafana-fixes
  - 3c5083f550 Add support for dry run (test=True) of grafana states
  - 7e7ae8ace7 influxdb: fix conflicts in function arg names with client_args
  - 73a24b774a Ignore readOnly option when diffing
  - 81f0cf8af3 Add missing profile argument to grafana4.get_user_data

• **PR #48585**: (astorath) [2018.3] handle pyzmq for python3.4 @ 2018-07-16 14:11:02 UTC
  - fb7b242f2 Merge pull request #48585 from astorath/pyzmq-2018.3
  - e828167114 Merge pull request #48585 from gtmanfred/pylint-2018.3
  - c3c5083f550 Add support for dry run (test=True) of grafana states

• **PR #484648**: (gtmanfred) [2018.3] disable checks on pylint @ 2018-07-18 16:21:37 UTC
  - a688acf4d4c Merge pull request #484648 from gtmanfred/pylint-2018.3
  - 7c34e2965e disable checks on pylint

• **PR #48634**: (dwoz) Sync modules for state tests @ 2018-07-17 20:33:06 UTC
  - 01c9c59a97 Merge pull request #48634 from dwoz/state-module-test-fix
  - 9df3d2ae392 Sync modules for state tests

• **PR #48585**: (astorath) replaced meta tag @ 2018-07-16 14:11:02 UTC
  - fb7b242f2 Merge pull request #48585 from astorath/fixed-vault-meta
  - 42fd3d5f67 replaced meta tag

• **PR #48579**: (Ch3LL) Fix python2 syslog returner expecting string bytes not unicode @ 2018-07-13 19:50:16 UTC
  - 4b16537a29 Merge pull request #48579 from Ch3LL/fixed_syslog
- d8288a0ff0c add unicode type for syslog test for tag
- 17e9382d5 Fix python2 syslog returner expecting string bytes not unicode

- **ISSUE #48542**: (calvinhp) Missing state git.cloned is listed in the docs as new for 2018.3.2 (refs: #48547)
- **PR #48547**: (gtmanfred) fix git.cloned doc versionadded @ 2018-07-13 18:46:25 UTC
  - 3549e408d Merge pull request #48547 from gtmanfred/git.cloned
  - b596a945ea Merge branch '2018.3' into git.cloned
  - e14f922a0 fix git.cloned doc versionadded

- **ISSUE #48110**: (whytwewolf) file.line on windows not treating unix line endings correctly. (refs: #48503)
- **PR #48503**: (rallytime) Back-port #46291 to 2018.3 @ 2018-07-13 17:14:47 UTC
  - PR #48380: (twangboy) Detect and preserve line endings (refs: #48503)
  - PR #46291: (t0fik) Line mixed line ends (refs: #48503)
  - PR #45498: (t0fik) Added support for mixed line ending in file (refs: #46291)
  - ee257a1f91 Merge pull request #48503 from rallytime/bp-46291
  - 8bc71688ea Remove /sr.* pattern from test
  - 5e2e2a63fa Update file unit tests to handle "writelines" change
  - 5d38aa8b33 Update file.line to use writelines instead of joining
  - d0b6e82eb8 Add 'name' as the passed in filepath for test_line_insert_ensure_before_first_line test
  - d8920db61f Update test_line_insert_ensure_before_first_line to use new mock_open methodologies
  - 475f075d8e Handle list of lines instead of strings in file.line func
  - b9b0653b04 Added comments
  - f3517a1852 List comprehension replaced
  - adfa3aed0d Empty match on delete or replace not causing IndexError exception
  - 5169b1fbfd Comprehensions converting to unicode replaced by salt.utils.data.decode_list
  - d3e8ef0e05 Removed regex compilation
  - f29815b49e Fixed file permissions
  - d2af8e19e87 Make integration green. Added test for mode ensure insert before first line
  - 9b7df671a5 file.line function refactored
  - 3af551eb1d /sr.* pattern should raise exception
  - 935a9b9d56 test_line_insert_end fixed
  - 7d6e3ad2e2 Make tests green
  - 75a7e368a6 Setting end of line
  - 489e381100 Added _set_line_eol and _get_eol functions
  - aacb8c0e2 line function refactored to work on list
  - de668166f9 _regex_to_static refactored to work on lists
  - 464ef6dfe1 _get_line_indent renamed to _set_line_indent

- **ISSUE #48507**: (emersonveenstra) mysql_grants.present escape option incorrectly reports failure (refs: #48561)
• PR #48561: (garethgreenaway) [2018.3] fixes to grants in mysql module @ 2018-07-13 14:24:58 UTC
  - 2d923f2943 Merge pull request #48561 from garethgreenaway/48507_mysql_grants_incorrect_failure
  - 14c59da72c Following a successful grant application in the MySQL module, the new grant and the desired grant are mismatched because the new grant from Mysql included hashmarks. This change adds the replace which is included for other items such as database name and username.

• PR #48529: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-07-12 17:59:35 UTC
  - 5b5a930449 Merge pull request #48529 from rallytime/merge-2018.3
  - f9b8c4b257 Use () when using with_tempfile decorator in tests
  - d3190ca0c0 Update old utils paths to new utils paths
  - 29b05ffdd1 Merge branch '2017.7' into '2018.3'
    * 0c0c05c2bc Merge pull request #48527 from saltstack/revert-48525-2017.7
      - 18d06c193 Revert "add kazoo for testing zookeeper."
    * 05bad3e71c Merge pull request #48526 from twangboy/rollback_certifi-win32
      - 361b3dc2f Rollback python-certifi-win32
    * db066e4e4 Merge pull request #48521 from Martin819/2017.7
      - d5d01f6698 Fix for GlusterFS 4.0 and above
    * ed0bd2bbec Merge pull request #48525 from gtmanfred/2017.7
      - d7a6b2b2b2 add kazoo for testing zookeeper.
    * ad5a959ab9 Merge pull request #48388 from garethgreenaway/48277_2017_7_file_roots_wrong
      - 6f11da35a7 Fixing a few things in the new test.
      - cf747b14ec Fixing lint issue
      - 16d36ec79c8 When pillar items are compiled a new render is instantiated but the file_roots is the pillar_roots. This change forces the __opts__['file_roots'] to be set to what is set in actual_file_roots for all renderers once compile_pillar has finished. Adding a test when this situation is run via a orchestration runner.
    * 38df812257 Merge pull request #48512 from gtmanfred/npm
      - 9ba06b3a0 pin pm and grunt packages for npm tests
    * 04ba31147f Merge pull request #48513 from rallytime/merge-2017.7
      - a466a4880f Merge branch '2017.7.7' into '2017.7'
      - cfd21ed22c Merge pull request #48172 from rallytime/2017.7.7-release-notes
      - a0ad794132 Update release notes for 2017.7.7
      - 8af4452134 Merge pull request #48157 from gtmanfred/2017.7.7
      - d8209e8a40 always listen when gathering job info
      - b98c52ee51 Merge pull request #48140 from rallytime/man-pages-2017.7.7
      - 8893b0f0d4c Update man pages for 2017.7.7
      - baa036336 Merge pull request #48136 from gtmanfred/2017.7.7
      - fce1c31146 bootstrap kitchen branch tests with 2017.7.6
      - b0ba08f4d9 Merge pull request #48134 from rallytime/release-notes-2017.7.7
217005b8f1 Add missing v for tag reference
2d53569d1e3 Add release notes file for 2017.7.7
084de927fe Merge pull request #48098 from rallytime/bp-48075-2017.7.7
e462e8b3a Ensure that the shared list of jids is passed when creating the Minion. Fixes an issue when minions are pointed at multiple syndics.

• **PR #48339**: (terminalmage) Backport tojson filter from #48309 to 2018.3 @ 2018-07-02 17:52:53 UTC
  - PR #48309: (terminalmage) Drop support for Python 2 unicode string literals in YAML renderer (refs: #48339)
  - 5b38019ca0 Merge pull request #48339 from terminalmage/backport-tojson-filter
  - 4433bec891 Add release notes for tojson jinja filter
  - ac36998801 Tweak docs to reflect backported filter
  - c636b18cf0 Add unit test for tojson filter
  - e34e39f0e2 Document filter deprecation
  - b9a4f288b2 Deprecate json_encode_dict and json_encode_list jinja filters
  - 3896e3468c Use upstream tojson filter, if present
  - 1499c6abcf Implement tojson jinja filter for those using Jinja < 2.9

• **ISSUE #48274**: (ipmb) s3.get signature failure with + in the object name (refs: #48328)

• **PR #48328**: (garethgreenaway) [2018.3] Fixes to utils/s3.py @ 2018-07-02 13:22:31 UTC
  - 2221d6e5db Merge pull request #48328 from garethgreenaway/48274_s3_get_signature_fail
  - 22cafc8334 fixing lint issue
  - 131486203e Need to pass the URL path through quote to ensure any special characters are being quoted properly. if we include local_file for a PUT, read the file into data before passing it along to requests.requests.

• **PR #48358**: (Ch3LL) Fix corrupt public key with m2crypto python3 @ 2018-07-02 13:10:32 UTC
  - d3c658bdef Merge pull request #48358 from Ch3LL/m2crypto_fix
  - 8fdd34d430 m2crypto open file in rb mode for pub key
  - a964db4663 Fix corrupt public key with m2crypto python3

• **ISSUE #48367**: (asenci) salt.proxy.fx2: dictionary changed size during iteration (refs: #48368)

• **ISSUE #46765**: (roskens) pkg.mod_repo fails with a python error when removing a dictionary key (refs: #46776)

• **PR #48384**: (rallytime) Back-port #48368 to 2018.3 @ 2018-07-01 04:19:10 UTC
  - PR #48368: (asenci) Fix issue #48367 using the same approach as PR #46776 (refs: #48384)
  - PR #46776: (gtmanfred) fix shrinking list in for loop bug (refs: #48368)
  - 2fd65d66dc Merge pull request #48384 from rallytime/bp-48368
  - 430c462f34 Fix issue #48367 using the same approach as PR #46776

• **PR #48394**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-07-01 04:13:03 UTC
  - 3b53e2d206 Merge pull request #48394 from rallytime/merge-2018.3
  - 0475b5f39 Update old utils paths to new utils paths
  - c4fd2a0930 Merge branch '2017.7' into '2018.3'
  - 7e25f26837 Merge pull request #48362 from twangboy/fix_48276
    * 77629f640a Fix module unit tests
    * b5ca560b73 Fix lint error
    * 210e280ecf Use explicit parameter names
- 776db98a5c Handle missing registry entries
  - 80222b6b7c Merge pull request #48383 from rallytime(bp-48379
    - 9fc7815594 Clean up the workspaces at the end for every job
  - a68aa774a Merge pull request #48382 from rallytime(bp-48346
    - 6a70ba222e Use the right ssh key to destroy kitchen
  - 9519f640e7 Merge pull request #48381 from rallytime(bp-48330
    - 6857bedcc2 Add warnings plugin to replace violations
  - 14db0aa35d Merge pull request #48363 from dubb-b/2017.7
    - c0b962c28d Changing debug to info for logging
  - 5b29cd326f Merge pull request #48352 from Ch3LL/wheel_doc
    - 89ada68165 Add missing key to accept_dict function in wheel docs
  - 02cf19ee3b Merge pull request #48329 from rallytime/codeowners-roster-files
    - 5e5661e00 Trigger review requests for team-ssh for roster files
  - 53cf1794be Merge pull request #48349 from ralex/fix-manjaro-service-behaviour
    - 6cafce547e Disable the service module on Manjaro since it is using systemd
  - 89dfcf3a4e Merge pull request #48324 from Ch3LL/update_version_doc_2017.7
    - 47845ba810 Update release versions for the 2017.7 branch
  - ece4e30aac Merge pull request #48331 from rallytime(bp-48215
    - 9d6ba3e247 Set jobs to pending when they come in
    - 727d2b4ffe Use proper creds with githubNotify
    - d355861c5c Test using different credentials
  - ab05e00d8c Merge pull request #48332 from rallytime(bp-48321
    - d72af6ab4e Jenkins needs the / to get the directory

  - 19c104b6cd Update release notes for 2018.3.2

• PR #48166: (terminalmage) Add trace logging and optimize file handling in grains.core.os_data @ 2018-06-21 18:02:33 UTC
  - 51928f050 Merge pull request #48166 from terminalmage/salt-jenkins-1000
  - b73df0ab00 Change call_args to call.args to reflect changes to MockFH
  - 0c2cc07704 remove unused import
  - b8c0a55cf3 Add test for tell()
  - 1cebe89fee Add implementation of tell() for filehandle iteration
  - efb8f49d42 Add tests for read_data being a list, and containing unicode or bytestrings
  - 38df912fa6 Operate on a copy of the read_data
  - 71eeae1240 Update mount module unit tests to reflect changes in mock_open
  - 16c414e120 Update nfs3 module tests to reflect changes in mock_open
  - b7eab25d6c Update grub_legacy module tests to reflect changes in mock_open
  - cc002b8fd7 Update new network unit test to reflect changes in mock_open
  - a8f11594f1 Update new core grains tests to reflect changes in mock_open
  - 84e18d956 Update crypt unit tests to reflect changes in mock_open
  - 67c036dc2d Add MockCall to tests.support.mock to track calls
  - 2556a1e13d Remove unused import
  - fd9d700157 Add additional docs to MockOpen class
  - 6acbf4c83ec Update newly added test to reflect renaming of handles attribute
  - 77e5288d42 Update fibre_channel grains tests to reflect changes in mock_open
  - ed40371a06 Update timezone module tests to reflect changes in mock_open
  - f0aa9934f Track call_count in MockOpen
  - 2598d2453a Update snapper module tests to reflect changes in mock_open
  - 51b3faa7bd Add support for passing multiple strings for a given match in read_data
  - 55487c175c Fix mock_open call to use new multifile syntax
  - 7fb16fe73a Update puppet module tests to reflect changes in mock_open
  - 3ca97c4ecc Update btmp beacon tests to reflect changes in mock_open
  - b027cfa94 Update wtmp beacon tests to reflect changes in mock_open
  - f5823252bb Track call args/kwars in MockFH
  - 33591ca90 Mock the seek function in MockFH
  - 7eb4b1a1e1c Update cp.push test to reflect changes to mock_open
  - 2be19cfa89 Report correct location when reading using explicit size and EOF reached
  - 5ec95ba5ca On second thought, actually implement tell()
- 19022eb9e5 Add tell mock to MockFH
- 4b5a393445 Update junos tests to reflect changes to mock_open
- 278a222b09 Update dnsutil tests to reflect changes to mock_open
- 4e67955572 Replace the rest of mock_open with a class
- 75307a47c5 Update linux_sysctl tests to reflect changes to mock_open
- 05c68fd5d9 Use explicit config file and fix remaining mac_sysctl tests
- 836fde9a30 Allow Python 2 to accept an exception as read_data
- 543385fd02 Add writelines_calls property
- 42fa842456 Make read funcs mocks so their calls can be tracked
- 675f03c58f Update mac_sysctl tests to reflect new mock_open behavior
- 3d2c41d395 Update file module tests to reflect new mock_open behavior
- b9200dbc3e add a dict containing the handles to the mock_open return object
- 852ba4b982 Add mocked close() function to MockFH
- f6b46bc608 Remove unused import
- 20f60a769b Add blank lines to appease linter
- 48d7cfa6d3 Add multfile tests for mock_open
- 1861e9b944 mock_open: rewrite multi-file support
- 5e6b539770 Use function for empty string
- cb2620ad2b Update core grains tests to reflect EAFP changes
- 5d09b178d7 Separate mocked file contents per filename, not glob
- 875102f538 Modify mock_open to support multiple file paths
- 096ace74df Move lsb_release parsing into its own function
- 6a0828beed Add unit tests for mock_open
- 8ba6cadac7 More mock_open bugfixes
- 329dea218e Add a bunch of logging for linux os_data core grains
- 2c64b270df Add timestamp to the minion’s log_fmt_console

- **PR #48216**: (Ch3LL) Fix UnicodeDecodeError when reading file to determine virtual grain (refs: #48440) @ 2018-06-20 16:53:41 UTC
  - 6072d1ef9c Merge pull request #48216 from Ch3LL/grains_unicode
  - c4334f3f14 Fix UnicodeDecodeError when reading file to determine virtual grain

- **PR #48080**: (lusche) Bugfix #47984 messed up cert serial (refs: #48209)
- **PR #47986**: (jeduardo) Fix serial number writing into CRL files with the x509 module (refs: #48209)
- de614d31f5 Merge pull request #48209 from rallytime/bp-47986
- f4b3bd5d2c Changed salt.utils.fopen to salt.utils.files.fopen
- 8686872909 Fixed typos, removed repeated unit tests, and applied code fixes suggested by linter.
- 382df4a72 Removed useless new line
- 5aa99d14c4 Added unit tests for CRL creation and certificate revocation with CRL
- cc12844922 Fixed a problem where the OpenSSL bindings refuse to consume unicode strings.
- 399cf08860 Stopped converting the certificate hexadecimal serial number to an integer in order to avoid breaking CRLs.

- **PR #48210**: (rallytime) [2018.3] Merge forward from 2018.3.1 to 2018.3 @ 2018-06-20 13:43:19 UTC
  - 1f88df6e89 Merge pull request #48210 from rallytime/merge-2018.3
  - dae65da256 Merge branch '2018.3.1' into '2018.3'

- **PR #48186**: (rallytime) Add autodoc module for saltcheck.py @ 2018-06-19 19:03:55 UTC
  - 5b4897f050 Merge pull request #48186 from rallytime/saltcheck-docs
  - 314fc2d889 Clean up some doc references
  - da7603d879 Add autodoc module for saltcheck.py

- **PR #48191**: (twangboy) Use the --disable-pip-version-check option @ 2018-06-19 18:13:44 UTC
  - 7274a33c80 Merge pull request #48191 from twangboy/fix_pip_check
  - 5c00f0e6bf Use the --disable-pip-version-check option

- **ISSUE #48122**: (pasmon) Salt minion 2017.7.6 disregards "bin_env" in pip state (refs: #48189)

- **PR #48189**: (gtmanfred) If pip binary is passed to bin_env, use that pip binary (refs: #48207) @ 2018-06-19 18:08:13 UTC
  - 96f79b0674 Merge pull request #48189 from gtmanfred/pip
  - 96c69f3d93 If pip binary is passed to bin_env, use that pip binary

- **PR #48165**: (terminalmage) Fix regression with top_file_merging_strategy=same @ 2018-06-19 18:03:07 UTC
  - 71e385501b Merge pull request #48165 from terminalmage/issue48144
  - 92ac2a2d6a Remove unused imports
  - 15a44d5d4 Remove redundant top file merging tests
  - 12100d9bd3 Add more top file merging tests
  - 0ed686cb3f Add unit test for show_top with "same" merging strategy
  - 35e5492fb7 Revert 7058f10 / 3df0f7

- **ISSUE #46806**: (ezh) Lack of debug messages on authentication fail. (refs: #46807, #48179)

- **PR #48179**: (ezh) 2018.3 auth @ 2018-06-19 14:16:40 UTC
  - **PR #4807**: (ezh) Reduce initial authentication setup complexity (refs: #48179)
  - 2a8e1c6539 Merge pull request #48179 from ezh/2018.3-auth
  - 9ed2d2ec55 Fix integration.shell.test_key and integration.shell.test_runner
- 26a6f79730 Fix integration tests test_list_acc_wrong_eauth, test_salt_run_with_wrong_eauth
- b84c321c4 Add more verbose debug messages for auth subsystem

- **PR #48188**: (gtmanfred) allow virtual aliases to be used for the driver name @ 2018-06-18 21:49:16 UTC
  - 0231008cf8 Merge pull request #48188 from gtmanfred/2018.3
  - 45249d5e10 allow virtual aliases to be used for the driver name

- **PR #48116**: (KaiSforza) Add jenkinsfiles to define tests in 2018 @ 2018-06-18 21:27:10 UTC
  - 0f95238da Merge pull request #48116 from KaiSforza/pr-lint-2018
  - f158bed5bd Add docs, kitchen tests
  - 904a70c187 Move .jenkins to .ci for future
  - 365fa0e51f Make it parallel so we don’t fail right away
  - e59479745 Add a .jenkins file to run pylint

- **ISSUE #48146**: (rmarchei) mysql_query.run: exception on 2018.3 (refs: #48164)

- **PR #48164**: (garethgreenaway) [2018.3] Fixes to mysql state @ 2018-06-18 13:10:20 UTC
  - 60c9490bdc Merge pull request #48164 from garethgreenaway/48146_mysql_output_to_file
  - a040643a82 Accounting for certain situations when the query result is not a string, but actually a dictionary.

- **ISSUE #48113**: (gaetanquentin) state file.line has error and erase file content complely, while with mode test=true it is ok (refs: #48156)

- **PR #48156**: (garethgreenaway) [2018.3] Unicode fixes for file.line @ 2018-06-17 19:34:08 UTC
  - 85ebcb3f2 Merge pull request #48156 from garethgreenaway/48113Ensure_writing_strings_with_file_dot_line
  - 5a9ef0d1ae Unless we're using py2 and Windows, ensure we're writing out a string when using file.line

- **PR #48161**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-06-17 19:33:29 UTC
  - 33400e72db Merge pull request #48161 from rallytime/merge-2018.3
  - 0733fa1b02 Update utils path for which function to new path
  - 398cc78224 Merge branch '2017.7' into '2018.3'
  - df2a156338 Merge pull request #48061 from garethgreenaway/port_47049_2017_7
    - 7c472fed51 Fixing failing test_set_hwclock_aix test.
    - ccb0ace958 Porting #47049 to 2017.7.
  - 5ec3ef2dd4 Merge pull request #48143 from Ch3LL/fix_long_job
    - 48bd2e9d3 Add timeout argument to run_salt for ShellCase
  - e1e566d1f8 Merge pull request #48135 from rallytime/release-notes-2017.7
    - 7a97f157b3 Add missing v for tag reference
    - 2f2b69ed37 Add "in progress" notation to 2017.7.7 release notes
    - 06a1151a63 Add release notes file for 2017.7.7
    - 885b2862ce Move 2017.7.7 release notes to 2017.7.8
  - ac9dabbfaa Merge pull request #48105 from rallytime/merge-2017.7
    - cdb45874de Merge branch '2017.7.6' into '2017.7'
- 16916d6bd2 Merge pull request #47880 from gtmanfred/2017.7.6
- 987ae6358b quote python_version in requirements.txt
- 27670168ea Merge pull request #47875 from rallytime/release-notes-dot-six
- 58dee4c829 Remove sentence about the release being in progress
- b3dcb7330e Remove "in progress" too
- 99e1df7823 Update 2017.7.6 release notes: remove "unreleased" text
- 1f0bada07c Merge pull request #47873 from gtmanfred/2017.7.6
- a1c1b5b5cf allow tornado 5.0 to be installed only for python2
  - 2da56a69d9 Merge pull request #48101 from rallytime/update-doc-refs-2017.7
    - 7ba6f5fb36 Update 2017.7.7 reference to 2017.7.8
- 5a0e3d46e7 Merge pull request #48091 from terminalmage/fix-file_roots-monkeypatching
  - 6fe711ad76 Reverse monkeypatching after test_symlink_list finishes
- 053b019a8f Merge pull request #48088 from rallytime/update_version_doc_2017.7
  - 1b8d1c936b Remove "in progress" info for 2017.7.6 release notes
  - 9a0f4d190a Update release versions for the 2017.7 branch
- d6d2c5ee18 Merge pull request #48075 from garethgreenaway/48038_jobs_are_not_deduping_minion_side
  - c537b3275b Ensure that the shared list of jids is passed when creating the Minion. Fixes an issue when minions are pointed at multiple syndics.
- aa33c0b0c Merge pull request #48071 from terminalmage/gitfs-docs
  - 24545204b3 Fix inaccurate gitfs_saltenv example in GitFS Walkthrough
- fb4ceacb88 Merge pull request #48053 from rallytime/bp-48040
  - 265b22b194 states/github.py fix for incorrect positional argument
- f37daac6d Merge pull request #48024 from gtmanfred/2017.7
  - 56b7a427a7 allow specifying a different state to run on converge
  - cc9c4b4d5a add pytest coverage and xml junits
- ISSUE #48145: (max-arnold) Failed to load ext_pillar saltclass: can only assign an iterable (refs: #48155)
- PR #48155: (max-arnold) Do not fail on empty saltclass classes (fix for #48145) @ 2018-06-15 20:21:28 UTC
  - 9aa9a83b10 Merge pull request #48155 from max-arnold/2018.3
  - 63ab0c2648 Do not fail on empty saltclass classes declaration #48145
  - 3d4fcb3aa Add test for issue #48145
- PR #48104: (twangboy) Fix unit.modules.test_win_status @ 2018-06-15 17:05:34 UTC
  - 152c09ec0e Merge pull request #48104 from twangboy/test_win_status
  - 1ec3f436ee Fix test_error_logged_if_process_get_owner_fails
- PR #48147: (brejoc) Fix for sorting of multi-version packages @ 2018-06-15 17:03:18 UTC
  - 8cf0310d4 Merge pull request #48147 from brejoc/2018.3-multi-version-fix
  - 90ed25447d Swtiching to salt.utils.versions like linter suggested

Chapter 30. Release Notes
- ed09574073 Fix for sorting of multi-version packages (bsc#1097174 and bsc#1097413)

- **PR #47956**: (dmurphy18) Improved support for mount on AIX @ 2018-06-15 13:40:01 UTC
  - 2ede5f5442 Merge pull request #47956 from dmurphy18/aix_mount_support
  - f2a3e321db Improved support for mount on AIX

- **ISSUE #48012**: (Timandes) Found UnicodeDecodeError when trying to start Salt Master (refs: #48081)

- **PR #48081**: (terminalmage) Fix UnicodeDecodeError when parsing hosts file with non-ascii @ 2018-06-15 12:41:13 UTC
  - c05e176782 Merge pull request #48081 from terminalmage/issue48012
  - 8d2fb0bf25 Fix cp.push test
  - e230a7223f Fix definition of test data for wtmp/btmp beacon tests
  - 82874a8c10 Import six like we do everywhere else
  - 54f9a2ab54 Remove unused import
  - 767cc7e87f fix tabs
  - db19636f56 Get rid of additional newline append
  - 7427e192ba Fix more crappy mocking
  - 4ee05789ce Fix crappy mocking
  - 248467edc Add regression test for _generate_minion_id()
  - 5e62d6d45f Fix UnicodeDecodeError when parsing hosts file with non-ascii
  - e6a4f4f85 Use errno instead of hard-coding error 2
  - ff63f6932 Fixes / enhancements for mock_open

- **PR #48133**: (rallytime) Updates the 2018.3.2 and 2018.3.3 release notes files @ 2018-06-14 21:21:15 UTC
  - **PR #48129**: (rallytime) Add release notes for 2018.3.2 (refs: #48133)
  - 5d92e2763a Merge pull request #48133 from rallytime/release-notes-2018.3
  - afe191972 Add "in progress" notation to 2018.3.2 release notes
  - 3e4272ac09 Add release notes for 2018.3.2
  - 88c584cb0d Move 2018.3.2 release notes to 2018.3.3

- **PR #48103**: (terminalmage) Fix for gitfs base env being pinned to commit ID @ 2018-06-14 16:29:24 UTC
  - 0e3f846836 Merge pull request #48103 from terminalmage/gitfs-base-pinned-to-commit
  - 31ab2fe8de Fix for gitfs base env being pinned to commit ID

- **PR #48077**: (twangboy) Fix issue with salt.utils.parsers on Windows @ 2018-06-14 16:22:57 UTC
  - 4b6f1c7f75 Merge pull request #48077 from twangboy/fix_parsers
  - 0fd7691a2 Call logger in each case
  - 0e99dd741c Fix logic for non-root
  - 2d2534a688 Fix parsers for Windows, fix tests

- **PR #48096**: (twangboy) Fix unit.utils.test_which on Windows @ 2018-06-14 13:15:14 UTC
  - 80332b32a7 Merge pull request #48096 from twangboy/fix_test_which

30.2. Previous Releases
- d26fc56f13 Use os.sep for paths
- **PR #48102**: (rallytime) [2018.3] Update 2018.3.2 references to 2018.3.3 @ 2018-06-14 13:14:26 UTC
  - 66b2200913 Merge pull request #48102 from rallytime/update-doc-refs-2018.3
  - 1c9bece3d8 Update 2018.3.2 references to 2018.3.3
- **PR #48109**: (rallytime) Back-port #47851 to 2018.3 @ 2018-06-14 13:09:04 UTC
  - **PR #47851**: (rares-pop) Fixup! add master.py:FileserverUpdate **kwargs (refs: #48109)
  - 2902ee0b14 Merge pull request #48109 from rallytime/bp-47851
  - e9dc30bf8e Fixup! add master.py:FileserverUpdate **kwargs
- **ISSUE #47925**: (JonGriggs) GitFS looking for files in the master branch only (refs: #47943)
- **PR #47943**: (terminalmage) Make sure we set the effective environment when lock_saltenv is True @ 2018-06-13 20:02:00 UTC
  - 2529292568 Merge pull request #47943 from terminalmage/issue47925
  - 534a17100 Merge branch '2018.3' into issue47925
- **PR #48089**: (rallytime) Update release versions for the 2018.3 branch @ 2018-06-13 14:03:44 UTC
  - 9e1d0040e4 Merge pull request #48089 from rallytime/update_version_doc_2018.3
  - fa60a0991e Remove "in progress" info for 2018.3.1 release notes
  - a3b3b0a0e1 Remove "in progress" info for 2017.7.6 release notes
  - f9be1b9125 Update release versions for the 2018.3 branch
- **PR #48054**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-06-13 12:58:46 UTC
  - b10b7355a0 Merge pull request #48054 from rallytime/merge-2018.3
  - 508d70f4bf Update old util paths to use new paths
  - 3d2ea1563a Merge branch '2017.7' into '2018.3'
    - f3ee3576ec Merge pull request #48044 from twangboy/wua_add_fail_code
      - d41d0c25eb Add fail code for WinHTTP send/receive error
    - 871a910fcb Merge pull request #48009 from dwoz/winswarmfix
      - 5027c7bb84 minionswarm runs on windows
    - 0dcaead36d Merge pull request #47968 from gtmanfred/2017.7
      - ae1b0d28bb pass LANG and HOME into tox commands
      - 8d15b93d00 remove tox virtualenvs from doc tests
      - e1872e2036 simplify tox.ini
      - 81bd0f5af add tests.txt for running tests with tox requirements
      - 556a2067fc fix masterapi test to use testing directory for configs
      - 5a41f8b4ef add EXPENSIVE_TESTS
      - 055cd5a6ba set DESTRUCTIVE_TESTS environment variable for pytest
    - 42d6b83eb Merge pull request #47978 from twangboy/fixed_test_pkg
      - 8bb36b3a4b Add try/finally, fix typo in 7zip def file
• a67b21ef3d Merge pull request #47959 from twangboy/fix_test_service
  - 0cd47aa81e Remove unused import
  - d4b42540e3 Fix failing test when service doesn’t exist
• b81d482067 Merge pull request #47983 from garethgreenaway/backport_47843_2017_7
  - 7b7fbbf5d5 Adding missing test sls file.
  - 54e51bc627 Backporting #47843 to 2017.7, updating test for 2017.7.
• d56dad22c Merge pull request #47533 from twangboy/fix_47178
  - 24717cbe21 Change version added to 2017.7.7
  - 0592f1bac2 Fix issues with functions that user makedirs on Windows
• 5c56b8c755 Merge pull request #47827 from twangboy/fix_47791
  - fbbd91f09e Add more descriptive debug message
  - 365f81651b Fix deprecated exception handling
  - 8dd7610b93 Use local instead of network
  - 980d99d74b Fix issue when archive is on mapped drive

- **PR #48060:** (gtmanfred) mark test as expensive @ 2018-06-13 12:58:21 UTC
  - c83818e4f9 Merge pull request #48060 from gtmanfred/2018.3
  - 914935e4d4 Merge branch '2018.3' into 2018.3
- **PR #48057:** (terminalmage) Fix link without target in 2018.3.0 release notes @ 2018-06-11 18:50:17 UTC
  - a4eb41623d Merge pull request #48057 from terminalmage/docs-2018.3
  - 20f71ff6f6 Fix link without target in 2018.3.0 release notes
  - d8c035e5e5 mark test as expensive
- **PR #48042:** (terminalmage) Switch to trace level logging for further test failure troubleshooting @ 2018-06-11 14:03:48 UTC
  - 09a3122df Merge pull request #48042 from terminalmage/salt-jenkins-1000
  - b33a0b5eaa Switch to trace level logging for further test failure troubleshooting
- **PR #48041:** (terminalmage) salt.utils.hashutils: Only decode to utf-8 on Windows @ 2018-06-11 13:31:41 UTC
  - 6c5389189a Merge pull request #48041 from terminalmage/hashutils-fix-windows
  - 58c7ed33d7 salt.utils.hashutils: Only decode to utf-8 on Windows
- **PR #48014:** (cro) Find job pause @ 2018-06-08 13:48:45 UTC
  - dcae209950 Merge pull request #48014 from cro/find_job_pause
  - 440a67c4f4 Lint: Add blank line
  - 7b0e99a511 One more case where returner doesn’t respond
  - 5abed8f822 Catch two cases when a returner is not able to be contacted--these would throw a stacktrace.
- **PR #47915:** (garethgreenaway) [2018.3] state runner pause resume kill @ 2018-06-07 16:08:30 UTC
  - ea85f882bc Merge pull request #47915 from garethgreenaway/state_runner_pause_resume_kill
  - 2ecbe9c034 fixing typo in alias_function call.
Some fixes to the set_pause and rm_pause function in the state runner, renaming to in line with the functions in the state module. Including aliases to previous names for back-ward compatibility. Including a soft_kill function to kill running orchestration states. A new test to test soft_kill functionality.

- PR #48002: (rallytime) Back-port #47923 to 2018.3 @ 2018-06-07 15:25:39 UTC
  - PR #47923: (isbm) Prevent crash if files in file.recurse (refs: #48002)
  - 5c11fcede60 Merge pull request #48002 from rallytime/bp-47923
  - 9465e5f1e9 Use to_unicode from stringutils avoid deprecation warning
  - 73d33cbfc3 Prevent crash if files in file.recurse

- PR #48003: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-06-07 15:25:19 UTC
  - 3d0a087c71 Merge pull request #48003 from rallytime/merge-2018.3
  - a6533a9332 Merge branch '2017.7' into '2018.3'
    * 998a1c13d5 Merge pull request #47966 from mbunkus/fix-postfix-prefix-free-key-names-assumption
      - 0ae402d1b5 Fix postfix.set_main’s assumption of prefix-free key names
    * df50ce7b1b Merge pull request #47824 from twangboy/fix_setup.py
      - 4538b3abb3 Remove 'len-as-condition' disablement
      - d4efcc3c8b Skip lint errors
      - 1b3977f8d4 Remove m2crypto download for Windows
    * 3e91a31134 Merge pull request #47922 from damon-atkins/2017.7_win_pkg_keys_fix
      - 7129203b1b Merge branch '2017.7' into 2017.7_win_pkg_keys_fix
    * 8008fca2f6 Merge pull request #47933 from terminalmage/add-pillar.get-docs
      - 4eb022675 Clarify pillar.get docs
    * ab565bfaa3 Merge pull request #47944 from terminalmage/fix-git.detached-docs
      - 1d082b4389 Replace use of deprecated argument name in git.detached docstring
      - 6253793cb6 Merge branch '2017.7' into 2017.7_win_pkg_keys_fix
      - 4ce0fe6546 win_pkg under py3 keys returns a view instead of a list, wrap keys in list()

- PR #48022: (morganwillcock) win_wua state: fix function name in examples @ 2018-06-07 15:03:52 UTC
  - 0a05212f60 Merge pull request #48022 from morganwillcock/patch-1
  - 443fd6df21 win_wua state: fix function name in examples

- ISSUE #47546: (ender8282) archive.extracted fails when archive includes files with non-ascii names with 2018.3.0 (refs: #48015, #47572)

- PR #48015: (garethgreenaway) [2018.3] more unicode nonsense in archive module @ 2018-06-07 14:44:55 UTC
  - 406e60e1b61e Merge pull request #48015 from garethgreenaway/47546_more_unicode_nonsense
  - f457f9cb84 Adding a test to ensure archive.list returns the right results when a tar file contains a file with unicode in its name.
  - 9af49bc595 Ensure member names are decoded before adding to various lists.

- ISSUE #47955: (frogunder) 2018.3.1 Creating Windows machine in Amazon using salt-cloud fails. (refs: #47989)
• PR #47989: (dwoz) Properly decode password from aws using m2crypto @ 2018-06-06 20:44:28 UTC
  - 1ce7d6c38a Merge pull request #47989 from dwoz/awscloud
  - 23ab272be Fix lint errors
  - 6c8daa2b85 Properly decode password from aws using m2crypto

• PR #47976: (terminalmage) Capture and log output of processes that timed out and were killed @ 2018-06-06 19:17:08 UTC
  - 76068c83f5 Merge pull request #47976 from terminalmage/salt-jenkins-1000
  - 41e5a75027 Add catch_timeout to run_script
  - 551ada8e4d Capture and log output of processes that timed out and were killed

• PR #47990: (terminalmage) Docs fixes in 2018.3 release branch @ 2018-06-06 17:15:17 UTC
  - f12a52736e Merge pull request #47990 from terminalmage/2018.3-docs
  - f89d2cdd30 Clean up Sphinx warnings
  - f5fe936865 Add clarifying comment so that we don’t break this
  - 94849780ac fix docs build error due to IndexError

• PR #47982: (twangboy) Fix unit.modules.test_win_dns_client tests @ 2018-06-06 15:02:10 UTC
  - 9d56af3cad Merge pull request #47982 from twangboy/fix_test_win_dns_client
  - 2dcd6788c Force string to ModuleType

• PR #47985: (twangboy) Fix unit.states.test_reg test failure @ 2018-06-06 14:56:03 UTC
  - 1b4c72345b Merge pull request #47985 from twangboy/fix_test_reg
  - 4ce551811f Remove the unnecessary to_unicode stuff
  - 863ded39fa Mock reg.cast_vdata

• ISSUE #47236: (MorphBonehunter) x509.private_key_managed broken after upgrade to 2018.3.0 (refs: #47957)

• PR #47957: (garethgreenaway) [2018.8] Ensure x509 passphrase is a string @ 2018-06-05 13:27:33 UTC
  - 84100570f7 Merge pull request #47957 from garethgreenaway/47236 Ensure passphrase is a string
  - 99bad3ca6 removing unnecessary change
  - e22df8473d Ensuring that when a passphrase is passed in, it is returned as a string from the passphrase callback.
    - d0cf06a24d Make sure we set the effective environment when lock_saltenv is True
      - 8da6ce45dc Finish the docstring for git.cloned state
      - 4a8260a5e5 Add tests for git.cloned state
      - 311179da05 Add git.cloned state

• PR #47926: (dmurphy18) Backport of PR 47808 to 2018.3, improved grains support for AIX @ 2018-06-04 19:31:24 UTC
  - PR #47808: (dmurphy18) Updated AIX support for grains reported (refs: #47926)
  - c355daa93d Merge pull request #47926 from dmurphy18/backport_pr47808
  - ac15d209a Backport of PR 47808 to 2018.3, improved grains support for AIX

• PR #47927: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-06-04 18:55:12 UTC
- a46e42ab11 Merge pull request #47927 from rallytime/merge-2018.3
- 5baab66f4b Lint: Whitespace fix
- 7e1d278d19 Update old utils paths to use new utils paths
- 3273bbda7 Merge branch '2017.7' into '2018.3'
  * a2b588299b Merge pull request #47860 from terminalmage/state-writing-docs
    - 8cb33d3dec Quiet the linter
    - af51e1ef23 Use more elegant RST syntax
    - 91cd57d1e0 Update mocking to reflect changes in service module
    - b9ace5a859 Fix crappy mocking
    - bc9e3acef3 Lint fixes
    - d37f7e4f04 Add 2017.7.6 release notes
    - 9dddeefab Improve documentation on syncing states
    - f465fa3ca7 Add best practices docs for writing states
    - 93ee5ee2b0 Fix all Sphinx warnings
    - 64b9b4d0b8 Clarify that name would override the id declaration
  * d2f3377b5b Merge pull request #47877 from dwoz/sleep_audit
    - ebc7cde9cb Revert job chunk wait time change
  * 735e92093e Merge pull request #47917 from dwoz/winsuite
    - 118601ebd6 Fix windows tests suite breakage
  * 63efb76d51 Merge pull request #47822 from Ch3LL/win_user_test
    - 3a691b405f add user_home path for both windows and linux
    - 788ab771e Add user state integration tests to windows
  * b9da4f1221 Merge pull request #47876 from doesitblend/add-file-read-windows
    - 3f7e7ec327 Add file.read function to Windows module
  * cbe2ecfae8 Merge pull request #47882 from frogunder/45013
    - 38d114a2d2 add whoami test
- PR #47931: (rallytime) Back-port #47913 to 2018.3 @ 2018-06-04 14:39:16 UTC
  - PR #47913: (rarepop) Fixup! beacons/avahi_announce.py finding grains (refs: #47931)
  - 4db1f8c603 Merge pull request #47931 from rallytime/bp-47913
  - c51e732f4d Fixup! beacons/avahi_announce.py finding grains
- PR #47930: (rallytime) Back-port #47725 to 2018.3 @ 2018-06-04 14:38:58 UTC
  - PR #47725: (bbczeuz) network_settings beacon: Update example to follow new cfg convention (refs: #47930)
  - d05a6c70d3 Merge pull request #47930 from rallytime/bp-47725
  - 5c666409f3 Spelling fix
  - cfe0a5bb42 network_settings: Fix doc using new list/dict syntax
• **PR #47557**: (L4rS6) fix broken rabbitmq list policies in rabbitmq version 3.7 @ 2018-06-04 13:25:07 UTC
  - 484d83014b Merge pull request #47557 from L4rS6/fix-broken-rabbitmq-list-policies
  - 6d7ef27557 Merge branch '2018.3' into fix-broken-rabbitmq-list-policies
  - e043ea2833 refactored list_policies code and added more tests
  - eea81feb7b fix broken rabbitmq list policies in rabbitmq version 3.7

• **PR #47949**: (terminalmage) Continued troubleshooting on salt-jenkins 1000 @ 2018-06-04 13:17:14 UTC
  - 866a2bf5e Merge pull request #47949 from terminalmage/salt-jenkins-1000
  - 9c369c6aa8 Remove temp logging from test
  - af02d5ba7b Add result logging to run_script, make returns DRY

• **PR #47941**: (terminalmage) Update test logging for salt-jenkins @ 2018-06-03 02:40:56 UTC
  - 0b85d1273f Merge pull request #47941 from terminalmage/salt-jenkins-1000
  - fb66368a9 Create test logging for salt-jenkins 1000

• **PR #47924**: (Ch3LL) Catch all exceptions in git import for salt.utils.gitfs @ 2018-06-01 21:06:58 UTC
  - 58b5f2b4dd Merge pull request #47924 from Ch3LL/mac_gitpy
  - 75c51ad69b Catch all exceptions in git import for salt.utils.gitfs

• **ISSUE #47269**: (isdig) Reopen Windows Minion That Has IAM Role Cannot Access to S3 (refs: #47879)

• **PR #47879**: (dwoz) Fix ami role usage warts #47269 @ 2018-06-01 14:11:55 UTC
  - b88ec5258d Merge pull request #47879 from dwoz/ami_role_fix
  - 3884c2cf5 Fix ami role usage warts #47269

• **PR #47788**: (twangboy) Use pytz to calculate timezones @ 2018-05-31 18:33:20 UTC
  - b09596982b Merge pull request #47788 from twangboy/fix_47559
  - 0d229c6182 Merge branch '2018.3' into fix_47559
  - 9e612ec9e7 Fix markup in release notes
  - 60499d18f0 Skip test if pytz not present
  - 72cc361c7b Move pytz to 3rd party import, add to __virtual__
  - b8a6488688 Update __virtual__ function
  - 9923176b68 Use __utils__, fix unit tests
  - 73e033f555 Return offset in the same format as Unix
  - 5656183c5e Add timezone.list, add 2018.3.2 release notes
  - 986f6c9b2a Use pytz to calculate timezones

• **PR #47899**: (terminalmage) salt-jenkins issue 1000 @ 2018-05-31 18:24:49 UTC
  - ae73cb947 Merge pull request #47899 from terminalmage/salt-jenkins-1000
  - 25af9c932f7 WIP salt-jenkins issue 1000

• **PR #47753**: (Ch3LL) Add stderr launchctl helper class and fix service mac tests @ 2018-05-31 18:16:57 UTC
  - 8f78e3ae6 Merge pull request #47753 from Ch3LL/service_mac
  - 185c9e9ae2 only stop service if its running

30.2. Previous Releases
Salt Documentation, Release 3002.5

- e15e674955 Add stderr launchctl helper class and fix service mac tests

- **PR #47908:** (meaksh) Align SUSE salt-master.service 'LimitNOFILES' limit with upstream Salt @ 2018-05-31 18:13:27 UTC
  - 828bf39695 Merge pull request #47908 from meaksh/2018.3-align-suse-salt-master-service
  - efe308013a Align SUSE salt-master.service 'LimitNOFILES' limit with upstream Salt

- **PR #47868:** (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-05-30 21:20:38 UTC
  - b4bac9b41b Merge pull request #47868 from rallytime/merge-2018.3
  - e5d386e91c Update solaris core grains test
  - 267f09c1a0 Lint: Remove unused import
  - 120ee16b70 Replace old utils paths with new utils paths
  - dc32b67c03 Merge branch '2017.7' into '2018.3'

  * 4b28e510f1 Merge pull request #47853 from dwoz/py3-cloud-test
  * c2f8ae7f7c5 Fix for py3 ec2 cloud tests

  * 215efa6b73 Merge pull request #47847 from garethgreen-away/47833_reactor_runner_documentation
    * 03676712de Adding some addition documentation to the reactor runner indicating that the reactor system must be active prior to using it.

  * 0bf651b470 Merge pull request #47846 from Ch3LL/p_refresh_test
    * 019edad8e4 Fix flaky refresh pillar integration test

  * 799f5e979d Merge pull request #47552 from twangboy/fix_46981
    * cff9b7806 Merge branch '2017.7' into fix_46981
    * 81308a4a44 Add release notes for 2017.7.7
    * 008af0ac6b Fix unit tests
    * 87097ee586 Add comments about how get is returning data
    * 019edad8e4 Fix flaky refresh pillar integration test

  * ffc26bc373 Merge pull request #47691 from lomeroe/solaris_product_grains
    * 6889bec6b Merge branch '2017.7' into solaris_product_grains
    * 49053bc106 lint fix
    * 6f185c9179 another lint fix
    * dbfba6876 fix tons of errors in my tests
    * 8c9355d34c Lint fix
    * b29ec75d7a Update regexes in core grains for detecting the 'product' grain on Solaris Sparc systems. Additionally, copy the 'product' grain to 'productname' to be consistent with other OSes.

  * 96b7c0cc7e Merge pull request #47778 from Ch3LL/win_state_pkg
    * e1786de6b0 Merge branch '2017.7' into win_state_pkg
    * f8c467d3e6 Fix text editor error
    * 872e162137 Add test_pkg integration state tests to windows
* 6f934c2259 Merge pull request #47823 from Ch3LL/win_dns_test
  • 7848114d6a Add win_dns module integration tests for windows
* e63e04602d Merge pull request #47838 from rallytime/bp-47810
  • bd2b62fa66 better debug message
  • 83565c55df Address PR feedback
  • 50bce3a2f3 make decode_linode_plan_label a private function
  • 2ba4fc4ceafix raising when a ‘GB’ format invalid plan is supplied
  • 3afbe50d5a2 slight cleanup
  • 319fb3d3406 match quotation mark types properly
  • 9502d5a2d5 more consistent use of paren in logged warning
  • f52926ca87 log a warning when the user supplied a label we could decode but was not in the proper format
  • 121303d827 reduce complexity of get_plan_id by moving decoding of the user-supplied label to its own function
  • cf534c7314 Fix Linode plan selection
* 9ef6e60617 Merge pull request #47805 from twangboy/add_sign.bat
  • 66d8b0331a Add sign.bat script for signing packages
* 934209503d Merge pull request #47500 from dwoz/winuser
  • 0ca5224cbf Merge branch ’2017.7’ into winuser
  • e5948902af Use salt utils method for this_user
  • a056a293f1 Centralize test username lookup
  • 6a6ab69722 Get the current username on windows
* 552526f309 Merge pull request #47802 from rallytime/bp-40892
  • bb357da084 add minion function to reload beacon #35960
* c9ccc5b399 Merge pull request #47816 from Ch3LL/disable_windows
  • 2509d36888 Add windows to service disable ERROR check in tests
* 2cb6634c6b Merge pull request #47773 from frogunder/45011
  • 7c9b0bda33 add win_servermanager.list_available test
* e65dece202 Merge pull request #47807 from dwoz/winrmtests
  • 1f1cc1357a Increase instance size for cloud tests
  • be83cd21f1 Try an even bigger timeout

• PR #47900: (rallytime) [2018.3] Merge forward from 2018.3.1 to 2018.3 @ 2018-05-30 18:09:41 UTC
  • 21550dbd2d Merge pull request #47900 from rallytime/merge-2018.3.1-to-2018.3
  • 2801e9eb26 Merge branch ’2018.3.1’ into ’2018.3’

• ISSUE #30367: (paulfanelli) salt-run orchestration via state.sls always successful; it is ignoring state return value (refs: #47843)

30.2. Previous Releases
• **PR #47843**: (garethgreenaway) [2018.3] orchestration results False when function is False (refs: #47983) @ 2018-05-30 17:21:54 UTC
  - a0bf565741 Merge pull request #47843 from garethgreenaway/30367_orch_return_false_when_function_fails
  - 09242697b8 Merge branch '2018.3' into 30367_orch_return_false_when_function_fails

• **PR #47866**: (rallytime) Back-port #47814 to 2018.3 @ 2018-05-29 19:55:24 UTC
  - **PR #47814**: (travispaul) Bugfixes and unit tests for pkgin module (refs: #47866)
    - da6f7a5538 Merge pull request #47866 from rallytime/bp-47814
    - d500ab96b Lint test_pkgin.py
    - 4dac0b4a31 pkgin latest_version bugfix
    - 4ae031797 Bugfixes and unit tests for pkgin module

• **PR #47865**: (rallytime) Back-port #47600 to 2018.3 @ 2018-05-29 19:54:44 UTC
  - **PR #47600**: (travispaul) Prevent crash on NetBSD and OpenBSD when no swap is configured. (refs: #47865)
    - d9e7f2b5b1 Merge pull request #47865 from rallytime/bp-47600
    - f9f464af51 Prevent crash on NetBSD and OpenBSD when no swap is configured.

• **PR #47221**: (azelezni) Fix boto_ec2 unused parameter "network_interfaces" @ 2018-05-26 14:41:35 UTC
  - 61561a8279 Merge pull request #47221 from azelezni/fix-boto_ec2-network_interfaces
  - 03ee0023eb Fix unused network_interfaces parameter
  - 1ece61dafa Fix unused network_interfaces parameter
  - 3e07489c3c Fixing lint
  - 02609b6e61 Adding state files for new test.
  - 377e34c697 Updating function in saltmod to ensure that the result is a failure if the function being run returns as False.

• **PR #47850**: (rallytime) Fix autodoc for new swarm module @ 2018-05-26 01:53:16 UTC
  - c4d828c986 Merge pull request #47850 from rallytime/swarm-autodoc
  - 467c8fa4e5 Fix autodoc for new swarm module

• **PR #47800**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-05-26 01:17:40 UTC
  - 30b31c5db5 Merge pull request #47800 from rallytime/merge-2018.3
  - 9e3ee39e8 Typo: test_type --> text_type
  - 8877489386 Fix bad merge caught by test in zpool state
  - c328450be2 Update old utils paths to new paths
  - 4abfd26e68 Merge branch '2017.7' into '2018.3'
    * 46618d2ce7 Merge pull request #47765 from meaksh/2017.7-fix-zypper-error-reading-repo
      - 4475ba19b8 Prevent zypper from parsing repo configuration from not .repo files
    * 0e87559ee3 Merge pull request #47781 from rallytime/update-linode-sizes
      - a90c1b760e Update cloud test profile and docs to use new Linode size labels
    * 3ddc56cb9b Merge pull request #47748 from rallytime/merge-2017.7
- b75f5ae38e Merge branch '2017.7.6' into '2017.7'
- edf94c915e Merge pull request #47775 from gtmanfred/2017.7.6
- 548f65d056 catch UnsupportedOperation with AssertionError
- 17596f3025 Merge branch '2017.7.6' into '2017.7'
- 8c38ec75f Merge pull request #47769 from gtmanfred/2017.7.6
- 3fd8c0a82 skip test that breaks test suite
  - e458fa031 Merge branch '2017.7.6' into '2017.7'
- 0d5b473e2 Merge pull request #47747 from Ch3LL/rn_2017.7.6
- 8a5b34f7d9 Merge pull request #47702 from damon-atkins/2017.7.6_fix_pkg.latest_state
- adcc094e08 Merge branch '2017.7.6' into 2017.7.6_fix_pkg.latest_state
- d610c192d9 Merge pull request #47700 from yannj-fr/2017.7.6
- 961c1ef61e fix roots modification time check
  - 2a73e90df Merge branch '2017.7.6' into 2017.7.6
- 266749420f Merge pull request #47632 from gtmanfred/2017.7.6
- 2c50c0d2f5 fix pylin
  - 4a29057b16 Fix last test for tornado
- 550ef2e272 allow using tornado 5.0
- 6e468448b handle new _create_stream in tornado 5.0
- 2643c356af Merge pull request #47720 from rallytime/bp-47692-2017.7.6
- 6e5cb36839 Default windows to m1.small for ec2-classic
- 20d9785244 fix roots modification time check
- aef37dd1ce fix roots modification time check
- d51662e053 Ensure targeted_pkgs always contains value for non-windows.
- 83b4224cf8 Adjusted based on feedback.
- 12f983ce9f Whitespace lint issues
- 075d3d3c49 pkg.install execution module on windows ensures the software package is installed when no version is specified, it does not upgrade the software to the latest. This is per the design. pkg.latest must provide the versions to install to pkg.install
  - 0ddc864f90 Merge pull request #47779 from dwoz/winrmtest
    - d5e0af9d53 Use common timeout variable
    - 7e948eb540 Increase ec2 cloud timeouts to 1000
  - 17c4c8443c Merge pull request #47430 from baniobloom/vpc_association_not_found
    - 0f1d007f91 added catch for VPCAssociationNotFoundException
  - 9c5dde1449 Merge pull request #47525 from baniobloom/duplicate_sec_group_rule
    - d5c5df489 if we are trying to add the same rule then we are already in the desired state, return true
• 536ce2fa42 Merge pull request #47772 from gtmanfred/2017.7
  - 67756a50fd lock down dependencies for kitchen-salt
• 12b330f049 Merge pull request #47749 from terminalmage/issue47717
  - cd484be6f9 Fix "dnf list upgrades" parsing
• 5cd18b9e70 Merge pull request #47755 from dwoz/winrmtests
  - 57dd89e6c3 Default to ec2 classic compatible images
  - f89668920a Be explicit about winrm setting
• f45a96ba1d Merge pull request #47668 from Ch3LL/win_pkg_test
  - a8981024de Add pkg.latest_version windows test
• 7b12444df0 Merge pull request #47750 from dwoz/cloudtest
  - 63b722ba21 Allow ssh_interface to default to public_ips
• 27ff42210 Merge pull request #47737 from dwoz/win_timeout
  - e88833a07d Cloud test fixup
• 1a93f060f0 Merge pull request #47729 from UtahDave/fix_get_info_doc
  - 443a2d72a2 fix cli example to match function name
• 00a13761c7 Merge pull request #47682 from terminalmage/issue47182
  - d0243e8f23 Suppress spurious lint failure
  - 3b449f11fc Add regression test for excludes issue
  - 28a7d2b81c Skip __exclude__ in find_sls_ids
• 518f7bce62 Merge pull request #47708 from darkpixel/47696-do-not-enumerate-none
  - 54e9bf9ec9 Merge branch '2017.7' into 47696-do-not-enumerate-none
• cad062ea7 Merge pull request #47681 from rallytime/merge-2017.7
  - 6c06cb3ae3 Merge branch '2017.7.6' into '2017.7'
• fd2d45d9c2 Merge pull request #47683 from Ch3LL/mac_user_test
  - 5a1b2b9c7 Remove unnecessary setUp in states.test_user test for mac
• f323799c42 Merge pull request #47692 from dwoz/win_instance_type
  - 20b607d54 Default windows to m1.small for ec2-classic
• 990ee5c5d5 Merge pull request #47665 from gtmanfred/cloud
  - fd8a02decb use dictupdate to update the providers dictionary and merge lists
• a2ed8cb77f Merge pull request #47151 from zer0def/configparser-defaultsect
  - a8f2ad977e Merge branch '2017.7' into configparser-defaultsect
  - cca2a806c9 Made interaction with [DEFAULT] section in ConfigParser as sane as upstream permits.
• e6fb8342ef Merge pull request #47673 from terminalmage/bp-45808
  - 454291ad62 Fix errors when attempting to cache files with long names or URLs
• b0446aab07 Merge pull request #47670 from gtmanfred/2017.7
- dfd5a8715f add a pytest.ini and update a dependency for kitchen
- 0d06da6944 Merge pull request #47626 from gtmanfred/2017.7
  - 418364a533 make dev_python27.txt have the same message as dev_python34.txt
  - d53b44d10f remove lock file
  - 493edf93d use the toml dict format
  - e0f7cc1447 add proxy tests decorator to pytest conftest
  - 0a621dd0ec add Pipfile for managing dependencies in salt
  - f78b81db94 simplify dev and base.txt to single files
- a07a8906a0 Merge pull request #47578 from Ch3LL/mac_service_disabled
  - 6032a01f55 change disable check for upstart service on ubuntu14
  - 33b4cfbc5b Change service assertion check for systemd platforms
  - 14896f9743 change codeauthor and class name
  - 502c5bfdf5 Ensure mac_service.disabled is correctly querying services

  95d4488f01 Merge branch '2017.7.6' into 47696-do-not-enumerate-none
  16c2153385 Merge pull request #47667 from Ch3LL/mac_service_disabled
  ba40d3d1a1 Update test_mac_service_enabled_auto_login to test both py2 and py3
  a4921e86c9 Merge pull request #47645 from Ch3LL/py3_rm_pip
  225d90ad4c query the pip path for test test_issue_2087_missing_pip
  e441733ac1 Merge pull request #47646 from rallytime/bp-47601-and-47643
  9e1d1a5ef8 Fix typo
  4e94609136 Remove unwanted file
  0109249c78 use ignore-undefined-variable
  37caeb7f4 Ignore pylint WindowsError
  c1135d90c7 Better doc string
  e53b9ed9 Skip tests when we can not use runas
  041e4c6dddb Wrap properties loop with a check for None. Closes GH-47696

- PR #47581: (twangboy) Add get_encoding salt util @ 2018-05-25 20:40:07 UTC
  - da9eaa1825 Merge pull request #47581 from twangboy/fix_47274
  - ff6600f25e Merge branch '2018.3' into fix_47274
  - 6eff2f847b Add suggested changes
  - e27e9fd1e7 Fix tests on Py3
  - f398cbbdda Use os.linesep.join instead of textwrap.dedent
  - 771392e299 Fix unit tests, add newline=\n to io.open
  - c0f735dde3 Remove comment
  - 6d877bb48b Add comment
- 9f369d3f22 Remove to_encoding, create get_encoding
- 68be0f9ed2 Add is_encoding salt util

- **ISSUE #47694**: (thuhak) utils/boto and utils/boto3 load error (refs: #47726)
- **PR #47726**: (gtmanfred) rename boto to botomod @ 2018-05-25 20:37:37 UTC
  - b860d95b2c Merge pull request #47726 from gtmanfred/2018.3
  - 43997a466e fix tests
  - 59180e09a8 switch all salt.utils.boto* calls to __utils__ calls
  - 7e30f459e9 rename boto to botomod

- **ISSUE #47701**: (babs) elasticsearch.index_template_present state with check_definition: True fails. (refs: #47703)
- **PR #47804**: (rallytime) Back-port #47761 to 2018.3 @ 2018-05-23 20:11:55 UTC
  - **PR #47803**: (rallytime) Back-port #47703 to 2018.3 @ 2018-05-23 20:12:30 UTC
    - PR #47703: (babs) Fix elasticsearch.index_template_present with check_definition (refs: #47803)
    - 2a270162d0 Merge pull request #47803 from rallytime/bp-47703
    - 8fce0c562d Fix elasticsearch with check_definition
  - **PR #47761**: (zerthimon) Fix userdata in openstack instances (refs: #47804)
    - 780043e6fd Merge pull request #47804 from rallytime/bp-47761
    - b7bc30633 Fix userdata in openstack instances

- **PR #47776**: (garethgreenaway) [2018.3] Fixes to failing _before_connect tests @ 2018-05-23 15:10:35 UTC
  - 1e8f891c42 Merge pull request #47776 from garethgreenaway/970_two_minion_unit_tests_failing
  - a5011b49ab Merge branch '2018.3' into 970_two_minion_unit_tests_failing

- **PR #47783**: (rallytime) [2018.3] Merge forward from 2018.3.1 to 2018.3 @ 2018-05-23 14:51:56 UTC
  - 4a6ca67883 Merge pull request #47783 from rallytime/merge-2018.3
  - 1adb8e2a7f Merge branch '2018.3.1' into '2018.3'

- **PR #47149**: (meaksh) [2018.3] Strip trailing commas on Linux user's GECOS fields @ 2018-05-22 21:18:49 UTC
  - f86a85d28 Merge pull request #47149 from meaksh/2018.3-remove-trailing-commas-on-linux-user-gecos-fields
  - 60ec3230db Merge branch '2018.3' into 2018.3-remove-trailing-commas-on-linux-user-gecos-fields

- **ISSUE #46938**: (racooper) Beacons documentation update for 2018.3 (refs: #47740)
- **PR #47740**: (garethgreenaway) [2018.3] Updating Beacon topic to include list based configuration for Beacons @ 2018-05-21 13:58:01 UTC
  - 19f4137b63 Merge pull request #47740 from garethgreenaway/46938_beacons_documentation
  - 5d23ef4dd8 Updating Beacon topic to include list based configuration for Beacons

- **PR #47710**: (terminalmage) salt.loader: add error logging when whitelist lookup fails @ 2018-05-18 16:56:18 UTC
  - 22807ac756 Merge pull request #47710 from terminalmage/fix-loader-whitelist
- 6192391b7b Add additional missing modules to whitelist
- 7192c38f66 Change key -> function to make log message more clear
- 91f9fd38fd Fix loader whitelists in unit tests
- d4f2662e5b Add error logging when whitelist lookup fails

**PR #47680:** (rallytime) [2018.3] Merge forward from 2018.3.1 to 2018.3 @ 2018-05-17 21:30:27 UTC
- b91c0f5647 Merge pull request #47680 from rallytime/merge-2018.3
- 9b1773a763 Merge branch '2018.3.1' into '2018.3'

**PR #47545:** (dmurphy18) Fix non-root build and signing for rpm packages @ 2018-05-17 21:20:10 UTC
- dbf12f9be2 Merge pull request #47545 from dmurphy18/fix_nonroot_build
- 220f887fa6 Fixed review comment, changed file.chown to file.makedirs_perms
- b15a1652b5 Changed versionadded from 2018.3.1 to 2018.3.2, to reflect when change should be accepted
- 90eb03e375 Additional error checking and minor cleanup
- 40d77e03d2 Correct building rpms with non-root user

**ISSUE #47546:** (ender8282) archive.extracted fails when archive includes files with non-ascii names with 2018.3.0 (refs: #48015, #47572)

**PR #47572:** (garethgreenaway) [2018.3] archive module, filenames with Unicode characters @ 2018-05-17 20:41:11 UTC
- 69056e5b67 Merge pull request #47572 from garethgreenaway/47546_archive_non_ascii_filenames
- 5e97b8b44a Updating with requested changes.
- cc1aa75a2f only convert to bytes when using Python2
- 0fe32f4066 Updating integration/modules/test_archive to include filenames with unicode characters.
- 5a9cadd125 Accounting for when files in an archive contain non-ascii characters

**PR #47661:** (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-05-16 15:53:36 UTC
- cb04d9c37e Merge pull request #47661 from rallytime/merge-2018.3
- dd3e63f0a Merge branch '2017.7' into '2018.3'
  * f63d801858 Merge pull request #47639 from rallytime/merge-2017.7
    - 1503f1020f Merge branch '2017.7.6' into '2017.7'
    - 6f178ca908 Merge pull request #47570 from gtmanfred/2017.7.6
    - 84aa034e03 Update dependency to msgpack
    - 98bd598701 Merge pull request #47523 from rallytime/man-pages
    - 48ec8a78dec [2017.7.6] Update man pages
    - e608ea9617 Merge pull request #47517 from rallytime/bp-47505-2017.7.6
    - 0734578533 Raise proper invocation errors
  * db0ee5e8eb Merge pull request #47643 from dwoz/runas_detect
    - 8c5e54b8b3 Fix typo
    - 69bc88f1c6 Remove unwanted file
  * 6dd3ab9f06 Merge pull request #47601 from dwoz/runas_detect
Salt Documentation, Release 3002.5

- 3235ac08cb use ignore-undefined-variable

    - f079939500 Do not override jid on returners, only sending back to master

  * 662f6086db Merge pull request #4713 from Circuitsoft/2017.7
    - 237560b745 Merge branch '2017.7' into 2017.7
    - cb674f1bc6 Enable opkg as pkgrepo handler on Poky
    - 7a58fd157e Enable opkg on non-NILinuxRT systems
    - 139360c55f Add Poky to OS Information Grains
    - d74057224d Un-normalize os_family in pkgrepo state

- **PR #47672**: (terminalmage) Backport #47487 to 2018.3 @ 2018-05-16 13:55:40 UTC
  - **PR #47487**: (rosscdh) bad ref to error fix (refs: #47672)
  - d17a16b648 Merge pull request #47672 from terminalmage/bp-47487
  - 12abbf0cf7 bad ref to error fix

- **ISSUE #47501**: (mateiw) salt-ssh doesn't propagate pillar when overriding pillar in module.run + state.apply (refs: #47504)

- **PR #47504**: (mateiw) Fix pillar propagation in salt-ssh when overriding pillar in module.run + state.apply @ 2018-05-16 13:55:05 UTC
  - 9d4f5203a7 Merge pull request #47504 from mateiw/2018.3-salt-ssh-pillar-propagation-issue-47501
  - 3ffa412ee5 Merge branch '2018.3' into 2018.3-salt-ssh-pillar-propagation-issue-47501
- 2f1485e067 Option to merge current pillar with opts['pillar'] during pillar compile

**PR #47212**: (weswhet) fix macOS running as user. @ 2018-05-16 13:54:23 UTC
- 4fe78bb9f Merge pull request #47212 from weswhet/fix-macos-runs
- 8ee11d74af Merge branch '2018.3' into fix-macos-runs
- e78fa45927 adding in requested changes
- 33c1492099 Merge branch '2018.3' into fix-macos-runs
- 0ecabcae78 adding in a fix for running commands as a user on macos

**ISSUE #47587**: (FedericoOlivieri) --out=table broken in 2018.3.0 'str' object but received a 'unicode' (refs: #47674)

**PR #47674**: (terminalmage) Fix regression in table outpuffer due to unicode types @ 2018-05-16 13:41:04 UTC
- 0c7439a955 Merge pull request #47674 from terminalmage/issue47587
- 43e3dcd398 Fix Python 3 incompatibility in table outpuffer
- d729656703 Add unit tests for table outpuffer
- 907d182dea Fix regression in table outpuffer due to unicode strings

**PR #47617**: (aesposito91) Update napalm.py @ 2018-05-15 15:44:35 UTC
- d1a1a594e9 Merge pull request #47617 from aesposito91/2018.3
- 9fd5b01d77 Update napalm.py

**ISSUE #46871**: (guettli) Sentry Logging Handler (refs: #47649)

**PR #47649**: (paulcollinsiii) Some additional details about Sentry for the docs @ 2018-05-15 15:41:36 UTC
- 049abe2850 Merge pull request #47649 from paulcollinsiii/sentry_docs
- 2a8df6d65d7 Some additional details about Sentry for the docs

**PR #47642**: (garethgreenaway) [2018.3] Updating templates used by salt-extend for unicode goodness @ 2018-05-15 15:38:26 UTC
- 8a21b864df Merge pull request #47642 from garethgreenaway/unicode_update_salt_extend_templates
- 68d73f7afc Updating the templates that the salt-extend utility uses to include unicode_literals & print_function
  * 0232a6e1ad Add 'other' as valid kwargs for 'user.add' method
  * ff861d9089 Merge branch '2018.3' into 2018.3-remove-trailing-commas-on-linux-user-gecos-fields

**PR #47603**: (terminalmage) Move/merge more test modules @ 2018-05-14 20:48:43 UTC
- 99f53c0a9f Merge pull request #47603 from terminalmage/more-test-renaming
- d612bd27e4 Move/merge more test modules

**PR #47640**: (rallytime) [2018.3] Merge forward from 2018.3.1 to 2018.3 @ 2018-05-14 17:59:06 UTC
- cc3aa88f3 Merge pull request #47640 from rallytime/merge-2018.3
- 2827c56399 Merge branch '2018.3.1' into '2018.3'
  * f1680f1d9b Do make comparisons in a single line
  * 7de455c12 Add unit test for new method 'user.chother'
  * 694882632c Add 'other' attribute to GECOS fields to avoid inconsistencies with chfn

30.2. Previous Releases

2147
- 6c089c9de1 Fix unsupported chars checking on GECOS fields
- d5c9ca0fbc Add unit tests for GECOS fields
- ed940c4f58 Strip trailing commas on Linux user GECOS fields

- PR #47589: (Ch3LL) Remove duplicate file id in watch_any doc example @ 2018-05-10 22:06:00 UTC

  - 806fb298a Add masterless mode docs to gitfs tutorial
  - 476ba053d1 Merge pull request #47538 from terminalmage/pip-docs
  - 98e8ffe8a4 Fix/clarify some of the pip module documentation
  - 7cc8d9d30a Merge pull request #47524 from dwoz/whitelistlines
  - 2605ff8712 Gracefully handle blank lines in whitelist.txt
  - f1a5b13072 Merge pull request #47527 from dwoz/test_file_name
  - 4ae7ca57a Update doc string
  - b3289e5a1c Fix test file name
  - e9c1723175 Merge pull request #47408 from Ch3LL/skip_diskusage
  - 068da8ad7d Merge branch '2017.7' into skip_diskusage
  - 1a7ff8e0d return error if diskusage not available
  - 10bd63a976 Skip status.diskusage integration tests on macosx
  - 2f50ff7bc8 Merge pull request #47480 from baniobloom/ConflictingDomainExists
  - d22ed7dffa added handling for the aws error ConflictingDomainExists
  - 7f53be6e92 Merge pull request #47444 from terminalmage/render_state-spurious-error
  - a1e9fe00fd Skip trying to render a template for a nonexistent SLS file
  - 50b9e4d79d Merge pull request #47478 from terminalmage/rename-pip-state-test
  - 9f7a9ebebd Rename pip state test modules to match naming convention
  - e78ac0f9b7 Merge pull request #47505 from dwoz/win_dsc_fixes
  - d1fcb40d1c Raise proper invocation errors
  - 0d4d5047d8 Merge pull request #47499 from dwoz/win_run_timeout_again
  - c6697b9f16 Move kill process tree and re-use it
PR #47565: (rallytime) Back-port #47440 to 2018.3 @ 2018-05-10 18:15:50 UTC
  - PR #47440: (kt97679) fix for the race condition, details are here: https://github.com/salt...
  - b22657ff9e Merge pull request #47565 from rallytime/bp-47440
  - 7c43417d46 addressed feedback
  - 1abe05207c fix for the race condition, details are here: https://github.com/saltstack/salt/issues/33223#

PR #47590: (Ch3LL) Fix firewalld prune_services deprecation warning @ 2018-05-10 17:01:48 UTC
  - 17e0fdca6c Merge pull request #47590 from Ch3LL/firewall_warn
  - d29b8e0ae2 Fix firewalld prune_services deprecation warning

PR #47568: (terminalmage) salt.serializers.yaml/yamlex: remove invalid multi_constructor (refs: #47598) @ 2018-05-10 16:18:07 UTC
  - 8e26624db3 Merge pull request #47568 from terminalmage/salt-jenkins-971

ISSUE #38671: (MikeSpaceG) zpool.get error (refs: #47224)

PR #47563: (rallytime) Back-port #47224 to 2018.3 @ 2018-05-10 16:18:07 UTC
  - PR #47224: (sjorge) Zpool zol fixes (refs: #47563)
  - c3ee7053fb Merge pull request #47563 from rallytime.bp-47224
  - 1d191445a7 FIX #38671 - zpool.get should support older zfs version
  - 23705b12cb zpool.scub docs should mention pause is not always available
  - d73885aa5c Make sure the docs mention that createboot is only available on illumos

PR #47569: (Ch3LL) Update salt.utils.path mock in virtual core test @ 2018-05-10 15:18:31 UTC
  - 8e26624db3 Merge pull request #47569 from Ch3LL/core_virt

PR #47576: (rallytime) [2018.3] Small Documentation Fixes @ 2018-05-10 14:08:11 UTC
  - f93715eea Merge pull request #47576 from rallytime/doc-updates
  - ca927fc14b Add extra lines that are needed for proper code-block formatting
  - b330d763a4 Remove infoblox state autodoc file

30.2.36 Salt 2018.3.4 Release Notes

Version 2018.3.4 is a bugfix release for 2018.3.0.
Salt Documentation, Release 3002.5

State Changes

- The `host.present` state can now remove the specified hostname from IPs not specified in the state. This can be done by setting the newly-added `clean` argument to `True`.

  - a37fb7d Merge pull request #51525 from twangboy/backport_51095_2018.3.4
  - b6acc92 Backport 51095
- **PR #51520**: (frogunder) Update man pages for 2018.3.4 @ 2019-02-06 18:42:13 UTC
  - 602ddc8 Merge pull request #51520 from frogunder/man_pages
  - 0cbe3f8 Update man pages for 2018.3.4
- **ISSUE #51428**: (yosnoop) salt.utils.dns.lookup fails with dig method on EL7 (refs: #51429)
- **PR #51429**: (yosnoop) The `+nocl` is supported much wider than `+noclass` @ 2019-02-06 17:48:48 UTC
  - 1f981c6 Merge pull request #51429 from yosnoop/replacement-noclass-with-nocl-for-dig
  - 5231e73 Merge branch '2018.3.4' into replacement-noclass-with-nocl-for-dig
  - 14e6f7b In case the test machine can't resolve
  - 95e8a2f The `+nocl` is supported much wider than `+noclass`
  - a00d708 Test dig options for salt.utils.dns.lookup
- **ISSUE #49226**: (defanator) salt-cloud grains inheritance from provider to profile (2018 vs 2016) (refs: #51366)
- **PR #51441**: (Ch3LL) Backport #51366 into 2018.3.4 @ 2019-02-06 17:42:19 UTC
  - PR #51366: (dwoz) Cloud provider and profile configs are merged [2018.3] (refs: #51441)
  - 209e632 Merge pull request #51441 from Ch3LL/bp-51366
  - 5bc466e Fix python 3 path for shell test cases
  - 5351e5c Add testing path to run_script commands
- 2d8a364 Fix linter issues
- 9b8718a Cloud provider and profile configs are merged

- **PR #51458**: (twangboy) Add Py2 Warning for Py2 Installer @ 2019-02-06 17:33:02 UTC
  - 90a8682 Merge pull request #51458 from twangboy/add_py2_warning
  - 05522c0 Merge branch '2018.3.4' into add_py2_warning

- **PR #51460**: (twangboy) Update installer mac 2018.3.4 @ 2019-02-06 17:31:18 UTC
  - b492021 Merge pull request #51460 from twangboy/update_installer_mac_2018.3.4
  - 3c92688 Merge branch '2018.3.4' into update_installer_mac_2018.3.4

- **PR #51471**: (twangboy) Fix the failing dns test on Windows @ 2019-02-03 22:03:34 UTC
  - 892d98c Merge pull request #51471 from twangboy/fixed_test_win_dns_client
  - c9f6b01 Merge branch '2018.3.4' into fixed_test_win_dns_client

- **PR #51462**: (ShantonRU) Fix insecure SQL queries in MySQL module @ 2019-02-01 21:19:20 UTC
  - a0530d5 Merge pull request #51462 from ShantonRU/fix-insecure-sql-queries-in-mysql-module
  - d3ef2cb Merge branch '2018.3.4' into fix-insecure-sql-queries-in-mysql-module
  - f47dda6 Fix improper use of socket authentication in mysql.user_chpass
  - ed6a2f Fix insecure SQL queries in mysql.user_chpass

- **PR #51445**: (terminalmage) Remove custom grains module from 2018.3 branch @ 2019-02-01 16:48:13 UTC
  - 48936c2 Merge pull request #51445 from terminalmage/fix-custom-grains-traceback
  - 191235d Remove custom grains module from 2018.3 branch
  - 72fd1a2 Roll back icon change
  - 7dd1704 Add welcome_py2.rtf
  - c93e9e3 Add Py2 Warning to installer package
  - b658900 Add Py2 Warning for Py2 Installer

- **PR #51438**: (twangboy) Add missing raise statement @ 2019-01-30 20:04:05 UTC
  - a880e42 Merge pull request #51438 from twangboy/fix_raise_2018.3.4
  - 5830fad Add missing raise statement

- **PR #51432**: (Ch3LL) Backport #51324 into 2018.3.4 @ 2019-01-30 17:51:50 UTC
  - PR #51324: (garethgreenaway) [2018.3] Fixes to x509 module and test (refs: #51432)
  - 28b898e Merge pull request #51432 from Ch3LL/bp-51324
  - bd41ff0 Fixing various bits in x509 module and unit test to ensure tests are passing on python2 & python3

- **PR #51377**: (twangboy) Fix issue when directory doesn’t exist in LGPO module (2018.3.4) @ 2019-01-29 17:33:25 UTC
  - 01717d2 Merge pull request #51377 from twangboy/fixed_auditpol_2018.3.4
  - 19e5181 Fix issue when directory doesn’t exist

- **PR #51338**: (Ch3LL) Backport #51207 into 2018.3.4 @ 2019-01-27 23:44:59 UTC
- **PR #51207**: (twangboy) Backport 50771 to 2018.3 (refs: #51338)
- **PR #50771**: (terminalmage) Fix failing opensuse tests (refs: #51207)
- 43a9d2f Merge pull request #51338 from Ch3LL/bp-50771
- 345ae67 Backport PR #50771 to 2018.3 branch
- **ISSUE #51158**: (AndreiPashkin) saltmod.state doesn’t respect “roster” argument (refs: #51170)
- **PR #51337**: (Ch3LL) Backport #51170 into 2018.3.4 @ 2019-01-27 23:44:24 UTC
  - **PR #51170**: (dwoz) Honor roster system for ssh orchestrations (refs: #51337)
  - 3dcd11d Merge pull request #51337 from Ch3LL/bp-51170
  - 4e85505 Merge branch '2018.3.4' into bp-51170
- **ISSUE #50221**: (tkaehn) file.managed: contents_pillar and pillar.file_tree with keep_newline is broken in 2018.3.3 (refs: #51252)
- **PR #51340**: (Ch3LL) Backport #51252 into 2018.3.4 @ 2019-01-27 23:42:49 UTC
  - **PR #51252**: (dwoz) Preserve newlines from pillar data for file.managed [2018.3] (refs: #51340)
  - 7656aa5 Merge pull request #51340 from Ch3LL/bp-51252
  - e74ac6c Fix py3 managed.file test failure
  - 6f2c7cf Remoe un-needed log statement
  - 824950c Fix 50221 regression test on Windows
  - 1840af9 preserve newlines from pillar data for file.managed
- **PR #51290**: (s0undt3ch) [2018.3.4] Fix minion start @ 2019-01-25 15:14:47 UTC
  - 90ca1d Merge pull request #51290 from s0undt3ch/hotfix/fix-network
  - da3ace Merge branch '2018.3.4' into hotfix/fix-network
  - 04f16b8 Fix tests. We no longer get ipaddress instances back.
  - c3fa82a Fix minion start issue
    - * c893dc4 Fix saltmod roster test
    - * b61854f Roster defines the roster system not a file
    - * 484ab48 Fix linter
    - * 5e2db2f Honor roster file for ssh orchestrations
- **PR #51317**: (terminalmage) Fix regression in dynamic pillarenv @ 2019-01-25 09:29:44 UTC
  - c8db7e3 Merge pull request #51317 from terminalmage/fix-pr-50417
  - 4be2891 Merge branch '2018.3.4' into fix-pr-50417
- **PR #51311**: (twangboy) Fix failing test unit.states.test_file.TestFileState.test_managed on Windows @ 2019-01-24 21:09:35 UTC
  - e246f04 Merge pull request #51311 from twangboy/fix_test_file.test_managed
  - f4177e0 Remove mode parameter on Windows
  - 4c4ded3 Fix regression in dynamic pillarenv
- **ISSUE #51195**: (littleski) fstab improperly escaped when spaces are used in options (refs: #51226)
- **ISSUE #27160**: (martinadolfi) salt.states.mount persistence error using spaces in route (refs: #39593)
• PR #51292: (Ch3LL) Backport #51226 into 2018.3.4 @ 2019-01-24 11:11:34 UTC
  - PR #51226: (garethgreenaway) [2018.3] Handle spaces in fstab opts, similar fix to #39593 (refs: #51292)
  - PR #39593: (zwo-bot) Fix issue #27160 - escape whitespaces in fstab entry in module mount when persist=True (refs: #51226)
  - 40b20126 Merge pull request #51292 from Ch3LL/bp-51226
  - aba114e Merge branch '2018.3.4' into bp-51226
• PR #51295: (Ch3LL) Backport #51279 into 2018.3.4 @ 2019-01-24 11:10:19 UTC
  - PR #51279: (twangboy) Backport __context__ support from develop (refs: #51295)
  - fc0bec5 Merge pull request #51295 from Ch3LL/bp-51279
  - 5c4a7a4 Merge branch '2018.3.4' into bp-51279
• PR #51293: (Ch3LL) Backport #51233 into 2018.3.4 @ 2019-01-24 09:17:49 UTC
  - PR #51233: (Ch3LL) Backport #51105 to 2018.3 (refs: #51293)
  - PR #51105: (garethgreenaway) [develop] Report permission changes in test mode (refs: #51233)
  - dacd1ea Merge pull request #51293 from Ch3LL/bp-51233-2
  - a155fd7 Accounting for when permissions are not returned from file.check_perms, eg. windows systems.
  - 53ba068 When test=True and there are permissions changes, report it.
  - d2eba77 Remove network.py patch
  - d431c71 Add __context__ support
    * de6c13d Handle spaces in fstab opts, similar fix to #39593
• ISSUE #51248: (johnnybubonic) "[WARNING ] The file_roots parameter is not properly formatted, using defaults" (refs: #51278)
• PR #51278: (dwoz) Warn about proper validation option @ 2019-01-22 22:13:13 UTC
  - 1abff2b Merge pull request #51278 from dwoz/issue51248
  - c614198 Use pillar roots validation method
  - 0d2b0c6 Fix linter warnings
  - 5b98895 Fix wart in pillar_roots validation
• PR #51230: (Ch3LL) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2019-01-18 19:50:10 UTC
  - e53e9b1 Merge pull request #51230 from Ch3LL/merge-2018.3
  - 0ef7675 Merge branch '2017.7' into '2018.3'
  - 4a12c5f Merge pull request #50852 from mirceaulinic/fx-capirca
    * fa91267 Merge branch '2017.7' into fix-capirca
    * 71913ff Merge branch '2017.7' into fix-capirca
    * 6fc3484 Lint?
    * 3d56750 Extra newline for lint
    * 5176cd8 Improve the Capirca and related modules for ACL config generation
  - 3f4759b Merge pull request #50923 from astronouth7303/patch-2
    * 4f631a6 Document [% include %]
- 210e817 Merge pull request #51111 from s0undt3ch/2017.7
  - 08e0ae7 Update to salt-bootstrap v2019.01.08

- **ISSUE #51211**: (sathieu) file_roots envs with slash leads to "No such file or directory: '/var/cache/salt/master/file_lists/roots/.foo/bar.w'" (refs: #51212)

- **ISSUE #48132**: (BenjaminSchiborr) Dynamic File Roots (refs: #51212)

- **PR #51212**: (sathieu) Allow slashes in file_roots envs. @ 2019-01-17 17:29:18 UTC
  - 26008ef Merge pull request #51212 from sathieu/file_roots_slash
  - b769f18 Allow slash in file_roots envs
  - f9437e2 Test for file_roots envs with slash leads to "No such file or directory"

- **PR #51209**: (garethgreenaway) [2018.3] Back-port PR #51124 to 2018.3 @ 2019-01-17 13:28:32 UTC
  - PR #51124: (Ch3LL) Handle encoding when opening file for both py2/py3 (refs: #51209)
  - 5916282 Merge pull request #51209 from garethgreenaway/bp-51124
  - 82acce4 Handle encoding when opening file for both py2/py3

- **PR #51184**: (twangboy) Fix win_lgpo_auditpol salt util on Windows @ 2019-01-16 18:08:01 UTC
  - 094bd33 Merge pull request #51184 from twangboy/fix_auditpol
  - 2e68d35 directly call cmd.run_all

- **PR #51191**: (Ch3LL) Backport #50918 into 2018.3 @ 2019-01-16 18:02:19 UTC
  - PR #50918: (twangboy) Fix test_debian_ip on Windows (refs: #51191)
  - ac71922 Merge pull request #51191 from Ch3LL/bp-50918
  - 7300d84 Skip debian tests on Windows
  - 4622433 Fix test_debian_ip on Windows

- **ISSUE #49883**: (kiemlicz) salt-cloud azurearm is not working (refs: #51144)

- **PR #51144**: (jgleissner) 2018.3 azurearm py3 @ 2019-01-15 16:46:35 UTC
  - e7f3a3 Merge pull request #51144 from jgleissner/2018.3-azurearm-py3
  - 3178f1a msazure.py: remove unused imports
  - 99a4b9d azurearm: fix list_locations
  - aeebe34b azurearm: fix show_instance function
  - d80669f msazure: fix object_to_dict for python 3

- **PR #51171**: (twangboy) Add random sleep time to avoid overloading Windows @ 2019-01-15 16:45:33 UTC
  - 1206f92 Merge pull request #51171 from twangboy/fix_crypt
  - 6ca93b Add random sleep time to avoid overloading Windows

- **PR #51174**: (jpsv) Update OpsGenie to use their V2 API (2018.3) @ 2019-01-15 16:44:54 UTC
  - a96deed Merge pull request #51174 from jpsv/2018.3
  - 055823e Update opsgenie.py
  - 501c8df Merge branch '2018.3' into 2018.3
  - 220aa8a Update opsgenie.py
- 5dc21cc Update to from V1 API to V2
- f93ce7c Update to V2 API

• ISSUE #42280: (michaelgibson) make ldap eauth 2 factor compatible (refs: #42426, #45347)

• PR #51010: (amendlik) Allow unauthenticated bind for listing LDAP groups @ 2019-01-15 16:43:42 UTC
  - PR #45811: (gtmanfred) Fix ldap eauth (refs: #51010)
  - PR #45347: (amendlik) LDAP group membership (refs: #51010)
  - PR #42426: (michaelgibson) adding 2-factor auth capability to ldap eauth module - #42280 (refs: #45347)
  - 563d487 Merge pull request #51010 from amendlik/ldap-groups
  - cd33ed Merge branch '2018.3' into ldap-groups
  - 94f8ee4 Update unit tests for auth.ldap
  - 08e36d0 Allow unauthenticated bind for listing LDAP groups

• PR #51112: (s0undt3ch) [2018.3] Update to salt-bootstrap v2019.01.08 @ 2019-01-15 16:42:09 UTC
  - 6dc3752 Merge pull request #51112 from s0undt3ch/2018.3
  - 4f1d846 Update to salt-bootstrap v2019.01.08

• PR #51097: (terminalmage) Fix improper exception raises (2018.3) @ 2019-01-15 16:38:25 UTC
  - b19c990 Merge pull request #51097 from terminalmage/fix-keyerror-raise
  - a3c0b49 Fix poorly-written test
  - c0ff7b1 Fix more incorrect exception raises
  - f1d1bc Fix improper KeyError raise

• PR #51169: (twangboy) More descriptive error when missing GitPython or PyGit2 @ 2019-01-15 16:37:44 UTC
  - 8920a86 Merge pull request #51169 from twangboy/fix_git_state
  - 2f2d11b8 More descriptive error when missing GitPython or PyGit2

• ISSUE #51160: (amendlik) Minion crashes with long hostname under Python 3 (refs: #51173, #51161)

• PR #51173: (dwoz) Avoid exceptions by passing bytes to idna @ 2019-01-15 16:32:31 UTC
  - PR #51161: (amendlik) Ignore exceptions when generating the minion ID (refs: #51173)
  - 58eed6 Merge pull request #51173 from dwoz/issue51160
  - 11cc7b3 Remove un-needed test
  - 0f87812 Merge develop, Revert exception handling
  - 7365a1a Pass bytes to idna

• PR #51147: (Ch3LL) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2019-01-15 02:05:51 UTC
  - 06854cf Merge pull request #51147 from Ch3LL/merge-2018.3
  - d39d8b7 Merge branch '2018.3' into merge-2018.3

• ISSUE #51160: (amendlik) Minion crashes with long hostname under Python 3 (refs: #51173, #51161)

• PR #51161: (amendlik) Ignore exceptions when generating the minion ID (refs: #51173) @ 2019-01-14 22:47:54 UTC
  - b79c09e Merge pull request #51161 from amendlik/long-hostname
• **ISSUE #51067**: (rkrieger) KeyError u'manufacturer' causes salt-minion crash on start with OpenBSD arm64 system (refs: #51159)

• **ISSUE #3**: (thatchb45) libvirt module (refs: #51159)

• **PR #51159**: (rkrieger) Prevent crash by testing for 'manufacturer' in osdata on OpenBSD @ 2019-01-14 18:08:22 UTC
  - 1424734 Merge pull request #51159 from rkrieger/fix-issue-51067
  - 1440ccf Prevent crash by testing for 'manufacturer' in osdata on OpenBSD
  - 1aae307 Ignore exceptions when generating the minion ID

• **PR #51146**: (terminalmage) Fix invalid assignment in vsphere module @ 2019-01-12 21:44:33 UTC
  - 5e37326 Merge pull request #51146 from terminalmage/fix-vsphere-tuple-issue
  - 5d60022 Fix invalid assignment in vsphere module

• **PR #51154**: (twangboy) Add support for Advanced Audit policies @ 2019-01-12 21:43:27 UTC
  - fad8621 Merge pull request #51154 from twangboy/auditpol
  - 9064376 Add support for Advanced Audit policies

• **PR #51151**: (Ch3LL) Backport #51061 to 2018.3 @ 2019-01-12 03:18:44 UTC
  - **PR #51061**: (garethgreenaway) [fluorine] fix to salt.utils.vt.Terminal (refs: #51151)
  - f7a100c Merge pull request #51151 from Ch3LL/bp_51061
  - ffdae27 When writing output to stdout we want to ensure that the data is a string not bytes. Under py2 the salt.utils.data.encode function results in a string but under py3 the result is a bytestring. Swapping out salt.utils.data.encode for salt.utils.stringutils.to_str.

• **PR #51150**: (Ch3LL) Back-port #49508 to 2018.3 @ 2019-01-12 03:18:19 UTC
  - **PR #49508**: (bergmannf) Fix X509 remote signing on python3 (refs: #51150)
  - 3a50a57 Merge pull request #51150 from Ch3LL/bp-49508
  - 7aee53 Do not silently ignore errors.
  - deb0134 Convert to string before sending via 'publish'.
  - 651c551 Use to_str salt.utils when writing to a file.

• **ISSUE #50433**: (zerthimon) Wildcard grant fails in mysql_grants.present in mysql 8.x (refs: #51152)

• **PR #51152**: (garethgreenaway) [2018.3] Fixes to mysql module to handle ALL PRIVILEGES grant @ 2019-01-12 03:17:15 UTC
  - 8bb589d Merge pull request #51152 from garethgreenaway/50433_handle_grants_better
  - ftca4d Fixing lint
  - e8c8c0f Adding some tests to ensure "ALL PRIVILEGES" is handled correctly in 8.0 and 5.6
  - b4bf69f Add additional grants. Adding logic to handle when ALL or ALL PRIVILEGES is passed for the grant, including some logic to handle the fact that the grants are split when show grants is run for a particular user.
    - 74edfd9 Fix pylint
    - 81a3d47 Merge branch '2017.7' into '2018.3'
* 8a76a19 Merge pull request #50858 from jasonarewhy/bugfix-2017.7/ubuntu-networking-searchdomain
  - 3395a3d Merge branch '2017.7' into bugfix-2017.7/ubuntu-networking-searchdomain
  - 69d25aa update debian_ip test
  - a6b896c get searchdomain in Ubuntu 12+

* ISSUE #50849: (SuperShoot) MySQL version needs to be decoded (refs: #51133)

* PR #51133: (SuperShoot) Fixes mysql server version comparison. @ 2019-01-10 16:45:38 UTC
  - dda1ebb Merge pull request #51133 from SuperShoot/issue-50849
  - ec14e13 Fixes mysql server version comparison.

* PR #50878: (max-arnold) Fix profile outputter docs @ 2019-01-08 18:32:40 UTC
  - 9d4321d Merge pull request #50878 from max-arnold/output-docs
  - d7403da Fix profile outputter docs

* PR #51076: (OrangeDog) Typos in index_template_present documentation @ 2019-01-08 18:25:20 UTC
  - ce87504 Merge pull request #51076 from OrangeDog/patch-1
  - 5684fb Revert add -> check
  - 4d7ebe7 Typos in index_template_present documentation

* PR #51081: (garethgreenaway) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2019-01-07 20:34:16 UTC
  - d08abf4 Merge pull request #51081 from garethgreenaway/merge-2018.3
  - 027804a Merge branch '2018.3' into merge-2018.3

* ISSUE #50966: (klafkoff) 2018.3.3 missing a patch to salt/modules/nxos.py (refs: #51080)

* PR #51080: (garethgreenaway) [2018.3] Fix to nxos module @ 2019-01-07 18:07:25 UTC
  - 335088b Merge pull request #51080 from garethgreenaway/50966_nxos_ensure_kwargs_list
  - 230a66b Merge branch '2018.3' into 50966_nxos_ensure_kwargs_list
  - 629dc25 Ensure kwargs is a list before we attempt to loop through. Similar fix to https://github.com/rallytime/salt/commit/430c462f34eb4eedf2384e06fbee8dc19b8026f6 in the proxy module.
    - a20791b Merge branch '2018.3' into merge-2018.3

* PR #51079: (terminalmage) Fix shadow.set_date/shadow.set_expire on F28 @ 2019-01-07 16:28:36 UTC
  - c47b646 Merge pull request #51079 from terminalmage/salt-jenkins-1238
  - ccd5c15 Fix shadow.set_date/shadow.set_expire on F28

* ISSUE #47043: (xBytez) lsattr slowing down archive.extracted (refs: #51044)

* PR #51044: (terminalmage) archive.extracted: Don't run lsattr when enforcing user/group ownership @ 2019-01-03 19:26:03 UTC
  - aeeb047 Merge pull request #51044 from terminalmage/issue47043
  - 787b79a archive.extracted: Don't run lsattr when enforcing user/group ownership

  - PR #50959: (bbh-kmd) #46886: Use correct path to config_dir when running salt from alternate place-
    ment. (refs: #50984)
  - 110bc66 Merge pull request #50984 from garethgreenaway/bp-50959
  - 20fa5c9 Update sudo.py

30.2. Previous Releases
• **PR #50958**: (bdrung) Fix twilio version checking @ 2018-12-25 10:46:15 UTC
  - 8fc89a0 Merge pull request #50958 from bdrung/fix-twilio
  - df8d7b9 Fix twilio version checking
    * d89c9b5 Merge branch '2018.3' into merge-2017.7

• **ISSUE #50947**: (cachedout) Log full of IPv6 warnings (refs: #50962)

• **PR #50962**: (terminalmage) Remove redundant overrides for ip_address/ip_interface @ 2018-12-21 22:04:34 UTC
  - bb87822 Merge pull request #50962 from terminalmage/ipv6-warnings
  - 773b983 Merge branch '2018.3' into ipv6-warnings
  - f3b1254 Remove redundant overrides for ip_address/ip_interface
    * cca01e7 Updating valigdate_tgt to ensure tests pass.
    * f04a87e One last lint fix.
    * df363b Fixing various lint errors.
    * 6a65bf9 Merge branch '2017.7' into merge-2017.7
  - 747dd69 Merge pull request #50876 from terminalmage/issue50153
    * 676a12a Fix compound matching in eauth
    * 07fca64 Merge pull request #50909 from damon-atkins/jenkins_pylint
      * da1fc32 change params.CHANGE_BRANCH to env.CHANGE_BRANCH
    * e7f0ab6 Merge pull request #50873 from Ch3LL/bp-50740
      * 5fd9ed9 Merge branch '2017.7' into bp-50740
    * 2f77b2d Merge pull request #50869 from garethgreenaway/50848_mysql_exception_test
      * 3767df4 Merge branch '2017.7' into 50848_mysql_exception_test
      * af3e145 Cleanup.
      * b85c5bf Adding a test to ensure exception handling is correct.
      * 4242e64 Merge branch '2017.7' into bp-50740
    * a5caab7 Merge pull request #50872 from Ch3LL/bp-50864
      * fc9e64b fix typo in file.managed documentation
      * f73f86 Catch UnicodeDecodeErrors in id verification

• **PR #50937**: (Ch3LL) Fix external_pillars documentation @ 2018-12-20 19:15:20 UTC
  - 49f2a35 Merge pull request #50937 from Ch3LL/pillar_doc
  - 1f01489 Fix external_pillars documentation

• **ISSUE #50919**: (dpkirchner) state.apply test documentation unclear (refs: #50940)

• **PR #50940**: (terminalmage) Fix confusing state module documentation @ 2018-12-20 18:29:26 UTC
  - 4213527 Merge pull request #50940 from terminalmage/issue50919
  - 3318927 Fix confusing state module documentation
• PR #50929: (twangboy) Fix `unit.utils.test_lgpo_netsh` on Windows for Py3 (2018.3) @ 2018-12-20 17:50:37 UTC
  - 421e4f4 Merge pull request #50929 from twangboy/fix_test_lgpo_netsh_2018.3
  - 01f9beb Fix failing lgpo netsh tests

• PR #50917: (dwoz) Cherry pick test fixes from fluorine @ 2018-12-19 17:56:19 UTC
  - b08b7e1 Merge pull request #50917 from dwoz/test_fixes
  - 16d10fb Fix linter warnings
  - b22f827 Increase and standardize ShellCase timeouts
  - a5c8e18 Do not pass unicode in environment

• PR #50913: (bdrung) Fix documentation build @ 2018-12-19 16:03:55 UTC
  - 59df0b4 Merge pull request #50913 from bdrung/fix-doc-build
  - ecdb452 doc: Indroduce MOCK_MODULES_MAPPNG
  - cfe4824 doc: Move mock_decorator_with_params up
  - 08e66b9 doc: Address pylint issues in conf.py
  - 67a3e37 doc: Mark preamble variable as raw string
  - b1e608b doc: Fix reference to salt executors
  - e48b32c doc: Replace xa0 (non-breaking space) by spaces
  - b97c7a doc: Fix iterating over the Mock object in Python 3
  - bb29948 doc: Do not mock non-existing __mro_entries__ attribute
  - e6cf3e4 Do not mock json when building the documentation
  - 4acaf45 Fix sphynx error about tornado.version_info

• ISSUE #50892: (cruscio) archive.extracted source_hash is case sensitive (refs: #50906)

• PR #50906: (garethgreenaway) [2018.3] Ensure source_hash returned from get_source_sum is lowercase. @ 2018-12-19 04:22:23 UTC
  - f4e6b88 Merge pull request #50906 from garethgreenaway/50892_archive_extracted_source_hash_case_sensitive
  - bcf8f06 fixing lint
  - 543ec7b Ensure source_hash returned from get_source_sum is lowercase.

• PR #50867: (Ch3LL) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-12-14 21:32:23 UTC
  - b95b44f Merge pull request #50867 from Ch3LL/merge-2018.3
  - 512293f Remove dunder_dictionaries.rst. Was added to modules/developing.rst
  - 89b4e09 Merge branch '2017.7' into '2018.3'
  - 858cfa5 Merge pull request #50863 from 5uper5hoot/fix-issue-50848
    * c90d201 Unpack exception args in python3 compatible way.
  - 6b2b2b2 Merge pull request #50752 from kstreee/fix-memory-leak
    * 98cc63a Fixes a memory leak un-cleared stream connections.
  - 1f57602 Merge pull request #50837 from Ch3LL/pyren_doc
    * a873019 Clarify py render docs when data context is available
- fdf675 Merge pull request #50844 from twangboy/fix_grains
  - 473f4d7 Fix some unrelated lint
  - fd1a072 Fix grains for future windows releases
- 32dfaba Merge pull request #50816 from dubb-b/2017.7
  - dc7ff48 Pinning bootstrap to the tagged version of salt.
- b1e5f3f Merge pull request #50709 from mattLLVW/service_unmask
  - b199255 Merge branch '2017.7' into service_unmask
  - 38add1 salt style guideline
  - 823c4ad Implement unmask in states.services
  - 91a6bf5 Functional unmask, must add tests
- e4e9563 Merge pull request #50633 from astronouth7303/loader-docs
  - 03e3168 whitelist_modules is linked via enable_whitelist_modules for some reason? idk
  - 5ca1f8e Typos
  - 7cb1a87 Add a quick index of loader-related settings
  - 318ca48 Make a note to not import modules
  - 6294658 Merge remote-tracking branch 'origin/2017.7' into loader-docs
  - 678958e Editing
  - 9d59629 Merge branch '2017.7' into loader-docs
  - 374d0e9 Finish the last sections
  - 1bdd49d Add more links and write some system summaries
  - bd3796a Update TOC
  - 3a9ab1b Merge dunders into developing, expand to cover all dunders.
  - d06739a Add short writeups for a bunch of systems.
  - 705e7e4 Add a bunch of cross linking
  - 40f9b16 Add missing module type sections
  - 172d8c2 Refactor headings
  - 53154a0 Oops, missed that
  - 0dcd341 Possible horrific use of toctrees? maybe
  - bed3509 Refactor, add a TOC
  - f647c1d Fill in some missing modules
  - 9d4b596 Merge branch '2017.7' into loader-docs
  - 26468df Add missing blank line
  - 205fea9 Some more revising
  - d4a8f7e Remove some code from some links
  - 65e4199 I feel like it should be up there
* d44f5ce Rephrase footnote
* 125e46e Add section on how modules get loaded, including giant table of names
* 5bfc6c6 Update reference to modules/index
* 4b096c1 Move all the module-development documentation into a single folder
  - dcdb9b2 Merge pull request #50750 from bewing/pepa12
    - 9931a41 Fix last key detection in pepa key_value_to_tree
  - cb85d5d Merge pull request #50733 from marmarek/patch-3
    - 1011421 Report salt-call exit code from ssh_py_shim.py
  - b086ff3 Merge pull request #50756 from GwiYeong/local-client-fix
    - c488092 fix local client missing minion return

• ISSUE #50850: (akrus) key_cache: sched prints error messages in logs (refs: #50859)

• PR #50859: (garethgreenaway) [2018.3] Fixes for key_cache and python3 @ 2018-12-13 23:57:07 UTC
  - 216fa14 Merge pull request #50859 from garethgreenaway/50850_python_key_cache_file_binary
  - ebc9a01 When reading and writing the key cache file, when using Python3, ensuring the file is read &
    written in binary mode.

• PR #50828: (twangboy) Fix issues with lgpo state and util @ 2018-12-13 16:37:33 UTC
  - 6b45aad Merge pull request #50828 from twangboy/fix_lgpo
  - 05baa95 Merge branch '2018.3' into fix_lgpo

• PR #50843: (bdrung) Fix RemoveCapacityFromDiskgroupTestCase require pyvmomi @ 2018-12-12 20:36:32 UTC
  - 6ea059d Merge pull request #50843 from bdrung/fix-tests
  - 0d00ae4 Fix RemoveCapacityFromDiskgroupTestCase require pyvmomi

• ISSUE #50829: (ghost) process.absent UnicodeDecodeError (refs: #50839)

• PR #50839: (terminalmage) Fix UnicodeDecodeError in ps module @ 2018-12-12 19:59:12 UTC
  - 14d7d1d Merge pull request #50839 from terminalmage/issue50829
  - 3a3db7 Ensure that unicode types returned from compatibility funcns
  - 1a00abc Add unit test for _get_proc_cmdline
  - 9ea2ed Remove extraneous comments

• ISSUE saltstack/salt#49393: (Poil) file.directory recurse not always changing perms (refs: #50653)

• PR #50653: (lexvella) Check file_mode in file.directory and _check_directory @ 2018-12-12 16:30:52 UTC
  - 264a042 Merge pull request #50653 from lexvella/2018.3
  - 4ea9386 Merge branch '2018.3' into 2018.3
  - 42e4ab3 Merge branch '2018.3' into 2018.3
  - 79f6b42 Check file_mode in file.directory and _check_directory
    - 1233e2b Fix some lint
    - 56c0e55 Fix issues with lgpo state and util

• ISSUE #45026: (angeloudy) bytes error in mysql module (refs: #50823)
- **PR #50823**: (terminalmage) salt.modules.mysql: Decode fetch results before making string comparisons @ 2018-12-11 21:04:41 UTC
  - a8ad17a Merge pull request #50823 from terminalmage/issue45026
  - ec8e116 Decode fetch results before making string comparisons
- **PR #50817**: (dubb-b) Adding git ‘v’ to the bootstrap options @ 2018-12-11 17:28:10 UTC
  - e31e731 Merge pull request #50817 from dubb-b/2018.3
  - 48fc01f Adding git ‘v’ to the bootstrap options
- **PR #50780**: (twangboy) Add netsh mechanism in the LGPO module @ 2018-12-10 22:09:20 UTC
  - 9b6b39c Merge pull request #50780 from twangboy/lgpo_netsh
  - 5eea728 Fix some lint
  - f077783 Add some tests
  - 2dde12a Fix one more lint item
  - c55b7b4 Fix some lint
  - 1247598 Add more policies
  - b2b9795 Fix overly long lines
  - f18d1aa Add additional policies that use netsh
  - cb50648 Add versionadded tags
  - 00cbf26 Add the netsh mechanism to the lgpo module
- **PR #50783**: (sathieu) gitfs/git_pillar: Fix UnicodeDecodeError while cleaning stale refs @ 2018-12-10 20:34:53 UTC
  - 0351296 Merge pull request #50783 from sathieu/gitfs_stalerefs_unicode
  - ef160a6 gitfs/git_pillar: Fix UnicodeDecodeError while cleaning stale refs
- **ISSUE #45867**: (Nick2253) Icinga2 Module uses incorrect paths (refs: #50615)
- **PR #50765**: (ClaudiuPID) Fix icinga2 cert path @ 2018-12-10 18:10:24 UTC
  - **PR #50615**: (ClaudiuPID) Fixes icinga2 certs path for newer versions 2.8+ (refs: #50765)
  - deadf9c Merge pull request #50615 from ClaudiuPID/fix-icinga2-cert-path
  - ce1842e Merge branch ’2018.3’ into fix-icinga2-cert-path
  - 31878d5 Pylint fixes
  - 47bba1 Migrated to cmd.run_all and tested on working srv
  - a1dddec Fixes icinga2 certs path for newer versions 2.8+
- **PR #50692**: (terminalmage) Update a couple test modules to use with_tempdir/with_tempfile decorators @ 2018-12-10 17:24:02 UTC
  - 9f8829b Merge pull request #50692 from terminalmage/update-tests
  - 36a4a1a Merge branch ’2018.3’ into update-tests
  - be14517 Make x509 tests use tempfiles instead of hard-coding them
  - a394cd7 Update file integration tests to use decorator for tempdirs
• ISSUE #32245: (tkwilliams) git_pillar should permit automatic mapping of environment to branch a-la gitfs (refs: #50768)

• PR #50768: (sathieu) git_pillar: Add support for all_saltenvs parameter @ 2018-12-10 16:39:37 UTC
  – 3a71567 Merge pull request #50768 from sathieu/git_pillar_all_saltenvs
  – e971412 git_pillar: Add support for all_saltenvs parameter

• ISSUE #48801: (dstoliker) salt.states.user.present - mindays, warndays, and inactdays won't return to salt’s default values (refs: #50796)

• PR #50796: (dwoz) Fix #48801 min, max, inact, and warn changes @ 2018-12-10 16:30:14 UTC
  – 12a8447 Merge pull request #50796 from dwoz/issue48801
  – 6b95223 fix linter errors
  – 87a04df Fix #48801 min, max, inact, and warn changes

• ISSUE #46388: (dynek) IPv4 & v6 network configuration on Debian (refs: #49355)

• ISSUE #40262: (pjediny) Salt enforces configuration from /etc/network/interfaces.d/* to /etc/network/interface (refs: #49355)

• ISSUE #38672: (valentin2105) IPv6 Network states is incomplete (refs: #49355)

• PR #50804: (Ch3LL) Back-port #49355 to 2018.3 @ 2018-12-10 16:21:31 UTC
  – PR #49355: (MTecknology) Improve management of interfaces in debian-based distributions (refs: #50804)
  – PR #46980: (MTecknology) Fix broken rendering debian_eth.jinja. (refs: #49355)
  – b266ec8b Merge pull request #50804 from Ch3LL/bp-49355
  – d34ede Use a temp file instead of /etc/network/interfaces for unit tests.
  – 622c354 Support reading multiple addresses from interface files.
  – 15c34fe Support unicode in space-delimited list; fixes unit tests in py2.
  – 0b5961 Added documentation about debian.interfaces.d/*. (Fixes: #40262)
  – 1b096fb Removed python lint.
  – 6e41225 Finished adding support for multiple IP addresses.
  – 4c7df5f Cleaned up documentation/examples in states.network:
    – 601f43 Added support for -ipaddrs and -ipv6ipaddrs to modules.debian_ip().
    – 638f899 Added support for loopback devices to modules.debian_ip(). (Fixes: #38672)
    – cf61c8d Added a bunch of unit tests for modules.debian_ip.build_interface().
    – b905fc6 Added support for dns_[nameservers,search] being a list or string.

• PR #50767: (dwoz) Make sure ldap passwords are honored @ 2018-12-05 22:59:17 UTC
  – dc9414c Merge pull request #50767 from dwoz/ldap_no_pass
  – 67aa591 Fix linter errors
  – be3945a Remove crufty import
  – 91f50a4 Add more ldap auth tests for ZD-2993
  – 0558d5 Make sure ldap passwords are honored
• ISSUE #50364: (sathieu) git_pillar mountpoint ignores the root parameter (refs: #50626)

• PR #50626: (sathieu) git_pillar: Allow root and mountpoint parameters together @ 2018-12-05 17:46:59 UTC
  - 60aa0d5 Merge pull request #50626 from sathieu/git_pillar_mountpoint_and_root
  - 5423c27 git_pillar: Allow root and mountpoint parameters together

• PR #50745: (bbinet) Fix grafana dashboard updating when nothing has changed @ 2018-12-04 19:26:32 UTC
  - c02387e Merge pull request #50745 from bbinet/fix-grafana-dashboard-update
  - 7019d47 Fix grafana dashboard updating when nothing has changed

• PR #50737: (garethgreenaway) [develop] Merge forward from 2017.7 to 2018.8 @ 2018-12-04 16:02:13 UTC
  - ae81498 Merge pull request #50737 from garethgreenaway/merge-2017.7
  - fde8db5 Merge branch '2017.7' into merge-2017.7
  - 246c055 Merge pull request #50718 from dwoz/run_run_timeout
    * edc8486 Honor run_run timeout for shell tests
  - 979b3aa Merge pull request #50702 from damon-atkins/jenkins_pylint
    * 5936066 ensure archiveArtifacts are always collected. Use CHANGE_BRANCH to detect merge-forward
  - 22acaaa Merge pull request #50632 from astronouth7303/loader-exception-handler
    * 0f72815 Merge branch '2017.7' into loader-exception-handler
  - d9e7be1 Merge pull request #50670 from damon-atkins/jenkins_pylint
    * b6d1605 ci/lint corrected filenames and test condition on full lint Also fix CODEOWNER team name
      * 194801a Merge branch 'loader-exception-handler' of github.com:astronouth7303/salt into loader-exception-handler
      * da6ebd0 Merge branch '2017.7' into loader-exception-handler
      * 8697744 Use single quotes per style guide
      * 07868f1 Improve logging output
      * fb05bd5 Eat an exception from an entry point instead of letting it kill the system.

• PR #50685: (Ch3LL) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-11-30 18:46:07 UTC
  - edaa9fe Merge pull request #50685 from Ch3LL/merge_2018.3
  - d46aff0 Merge branch 2017.7 into 2018.3
    * 6dc3af1 Merge pull request #50672 from garethgreenaway/49691_file_replace_search_only_return_false
      * 7e7df06 lint
      * 6b73c76 When using file.replace, with the search_only option, if the pattern does not exist in the file then we should return False.
    * 1236b51 Merge pull request #50659 from garethgreenaway/49954_gem_installed_less_than_greater_than_support
      * 0ec8bce When using the gem installed state, when passing a version that includes greater than or less than symbols, ensure that the installed versions meets that requirement.
    * 6317f3a Merge pull request #50583 from damon-atkins/jenkins_pylint
- 2d1f51c Fix lint only changes, full lint on merge forwards - lint only changes previous diff picked up out of data files, when the branch was out of date. - full limit on merge forward to pick up changes in the lint checks between versions. - update CODEOWNERS for .ci/*

- 15bf09a Merge pull request #50605 from Oloremo/fix-supervisord-dead-state-idempotency
  - ba3f281 Merge branch '2017.7' into fix-supervisord-dead-state-idempotency
  - cf9ab84 Merge branch '2017.7' into fix-supervisord-dead-state-idempotency
  - af3862 Fixed the supervisord.dead state idempotency

- ISSUE #50016: (abednarik) State augeas.change do not update config file (refs: #50690)

- PR #50690: (garethgreenaway) [2018.3] fixes to augeas_cfg module @ 2018-11-30 18:44:42 UTC
  - 7cb2405 Merge pull request #50690 from garethgreenaway/50016_ensure_path_is_str
  - cec7cb4 Older versions of python-augeas need the path passed to aug.match to be a string.

- ISSUE #49392: (Poil) hosts not replacing existing entry (refs: #50657)

- PR #50657: (terminalmage) Rewrite host.present state to allow for removal of entries not matching IP @ 2018-11-29 17:58:40 UTC
  - a5c7639 Merge pull request #50657 from terminalmage/issue49392
  - 2ddb587 Add release notes for new "clean" option
  - e4946f9 Rename "remove" argument to "clean"
  - 7fd3bce Add remove parameter to host.present state
  - 2671a30 Add unit tests for host.present state
  - 30f1b85 Remove non-matching IPs from hosts file
  - ec297a0 Performance improvements in hosts module
  - d1c2038 Add generic ip address validation function
  - 9f547f0 Add ignore ability to process_read_exception

- ISSUE #48759: (MyIgel) acme.cert: Fail to update certificate after adding aliases / missing --expand (refs: #50683)

- PR #50683: (garethgreenaway) [2018.3] Fixes to acme module when adding aliases to existing certificate @ 2018-11-29 17:46:54 UTC
  - b604785 Merge pull request #50683 from garethgreenaway/48759_adding_aliases_include_expand
  - 3940af0 When adding alises to an existing Certbot certificate, if we see a message about expanding in the stderr returned from cmd.run_all we should rerun the cmd with --expand included.

- ISSUE #50406: (glkappe) salt-ssh can’t use Mongo returner (refs: #50664)

- PR #50664: (garethgreenaway) [2018.3] Fix to logic for configuring returners @ 2018-11-28 05:24:30 UTC
  - 15f9ae4 Merge pull request #50664 from garethgreenaway/50406_salt_ssh_returner_configuration
  - 3525411 When pulling values out of the available configuration for returners we should always default to using keys for those returners, eg. mongo.user for the username. Otherwise in certain situations, eg. when using salt-ssh we will end up with the wrong value for the user.

- PR #50652: (twangboy) Fix unit.utils.test_mac_utils on Windows @ 2018-11-27 20:45:41 UTC
  - afbcf03 Merge pull request #50652 from twangboy/fix_test_mac_utils
  - c4cb729 Fix path issues with the tests
• **PR #50640:** (garethgreenaway) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-11-26 22:33:22 UTC
  - 61a82af Merge pull request #50640 from garethgreenaway/merge-2017
  - 409c98f Merge branch '2018.3' into merge-2017

• **ISSUE #50403:** (prometheanfire) tornado 5.1.1 is not co-installable with salt on python2.7 (refs: #50639)

• **PR #50639:** (dwoz) Handle pipenv like version restrictions @ 2018-11-26 19:42:11 UTC
  - 20a2de3 Merge pull request #50639 from dwoz/pipfix
  - 9c6f653 Handle pipenv like version restrictions
  - fed78b lint
  - 45a1aa3 Merge branch '2017.7' into merge-2017
  - b2cf134 Merge pull request #50463 from dwoz/zmqpubserv
    - a289e3c Merge branch '2017.7' into zmqpubserv
  - 6679242 Merge pull request #50590 from garethgreenaway/bp-50333
    - 1f5a4b pkg.installed currently fails when sources is used along with hold: True. This was due to a change in #48426 that swapped out sending the pkgs variable for the desired variable instead. This caused problems with pkg.hold because desired and sources are always populated, and pkg.hold can only include one or the other. This change just includes desired in the call to pkg.hold since desired has the same value for sources.
    - 39e811b Add issue url to tests
    - c4d7a43 Add debug log when connecting
    - 4f81432 Set subscribe via sockopt for better compatibility
    - 6882209 More reliable pub server publishing

• **ISSUE #49957:** (whytwolf) salt-master scheduled items ignore maxrunning. (refs: #50130)

• **PR #50130:** (garethgreenaway) [2018.3] Fixes to schedule maxrunning on master @ 2018-11-26 18:35:35 UTC
  - 5b7ab35 Merge pull request #50130 from garethgreenaway/49957_master_schedule_ignoring_maxrunning
  - 2f6dac9 Updating test_maxrunning.master to Mock get_running_jobs.
  - abda0a4 Reverting changes to doc/conf.py.
  - 6d072fc Some additional cleanup.
  - 4bd0406 Adding integration.scheduler.test_maxrunning to ignore list.
  - 45e160d Adding integration.scheduler.test_maxrunning to filename_map.yml
  - 2201a46 Fixing lint
  - 6c0ee32 removing unused cache_jobs function from utils/master.py
  - c2ed1d4 Adding some logging when the cache files are unable to be removed.
  - 44940d6 Ensure minion tests using minion options.
  - 722be43 Fixing lint
  - 65b4421 Adding some master specific functions to uitls/masters.py to determine if a Salt process is running. Updating utils/schedule.py to use the appropriate running function either from utils/master.py or utils/minion.py depending on where the scheduled job is running. Adding tests to test maxrunning in scheduled jobs for both the minion and master.
- 0d65304 Swapping manual mocking to autodoc_mock_imports

- **ISSUE #50542**: (doug-stratoscale) mysql.user_exists doesn’t work with Mysql 8.0.13 (refs: #50551)

- **PR #50551**: (garethgreenaway) [2018.3] Fixes to verify_login in mysql module @ 2018-11-26 17:44:25 UTC
  - 26759c2 Merge pull request #50551 from garethgreenaway/50542_mysql_ensure_verify_login_uses_connection_host
  - 96742aed4 Merge branch '2018.3' into 50542_mysql_ensure_verify_login_uses_connection_host
  - eb510a6 Merge branch '2018.3' into 50542_mysql_ensure_verify_login_uses_connection_host
  - 6d2309d Merge branch '2018.3' into 50542_mysql_ensure_verify_login_uses_connection_host
  - db89b27 Merge branch '2018.3' into 50542_mysql_ensure_verify_login_uses_connection_host
  - 0284323 Ensure that verify_login is using the host from the connection_args and not the host associated with the user. Adding a test to ensure user_exists when the passed host is the MySQL wildcard %.

- **PR #50619**: (s0undt3ch) Don’t squash tracebacks and Unicode fixes @ 2018-11-26 17:04:31 UTC
  - 14c4fd5 Merge pull request #50619 from s0undt3ch/2018.3
  - a477ld2 UNICODE!
  - 72205a5 DO! NOT! SQUASH! TRACEBACKS!

- **ISSUE #50562**: (soostdijck) scheduled highstate ignores blackout (refs: #50586)

- **PR #50586**: (garethgreenaway) [2018.3] minion_blackout for scheduled jobs @ 2018-11-23 11:15:38 UTC
  - 59809a1 Merge pull request #50586 from garethgreenaway/50562_minion_blackout_scheduler
  - 48673b7 Adding some defaults for minion_blackout code when pillar & grains are not available in opts. Removing some debugging code.
  - 9f422b2 Moving the minion_blackout code to the start of the try...except. Adding a test to ensure we get a log.exception when minion_blackout is True.
  - 2bf8fa5 Adding support for minion_blackout for jobs that are run from the Salt scheduler.

- **PR #50576**: (garethgreenaway) Back-port PR #50549 to 2018.3 @ 2018-11-21 14:39:55 UTC
  - PR #50549: (cachedout) Add security credits to release notes (refs: #50576)
  - 5c28179 Merge pull request #50576 from garethgreenaway/bp-50549
  - 807068d Typo fix
  - 2ef8307 Typo fix
  - 7c8957a Typo fix
  - c1ca603 Merge branch '2018.3' into bp-50549
  - b163380 Add security credits to release notes

- **PR #50599**: (terminalmage) Merge Sphinx fixes from 2017.7 to 2018.3 @ 2018-11-21 13:31:18 UTC
  - c9531d8 Merge pull request #50599 from terminalmage/merge-2018.3
  - ba82b07 Merge remote-tracking branch 'upstream/2017.7' into merge-2018.3
  - 1b8a8ac Merge pull request #50592 from terminalmage/docs-2017.7
    - db15776 Remove overline from section title
    - 8127dd5 Disable unused shorturls plugin

- **ISSUE #50254**: (jmcook1) file.line adding line every time (refs: #50366)
• PR #50366: (t0fik) 2018.3 fix issue50254 @ 2018-11-20 20:31:30 UTC
  - 60b4622 Merge pull request #50366 from jdsieci/2018.3-fix-issue50254
  - a9b9fa2 Fixed pylint warnigs
  - 342786b Issue #50254 fixed
  - 1ab59e7 Added integration tests
  - 110f74f Added unit tests reproducing issue

• ISSUE #50558: (angeloudy) 'test=True' does not work with artifactory.download (refs: #50580)

• ISSUE #50155: (mikemartino) artifactory.downloaded state is not respecting test=True (refs: #50580)

• PR #50580: (garethgreenaway) [2018.3] Adding test=True to artifactory.download. @ 2018-11-20 16:37:14 UTC
  - 735c9f4 Merge pull request #50580 from garethgreenaway/50155_artificatory_download_state_test_true
  - 7dd57d0 Lint.
  - 3661ee0 Adding test=True to artifactory.download.

• ISSUE #46292: (asymetrixs) win_wua should have possibility to specify source file (refs: #50397)

• PR #50577: (garethgreenaway) Back-port PR #50397 to 2018.3 @ 2018-11-19 21:28:42 UTC
  - PR #50397: (tlemarchand) Add Win WUSA management, to install Windows Update files (.msu). (refs: #50577)
  - 015834d Merge pull request #50577 from garethgreenaway/bp-50397
  - dd2d872 Documentation
  - af6d21f Import unicode_literals from future and add versionadded tag
  - 09dc09d Disable powershell modules list Add list_kbs function
  - 05852d0 pchanges to changes named parameters
  - 16525e4 Add Win WUSA management, to install Windows Update files (.msu).

• PR #50570: (garethgreenaway) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-11-19 20:04:05 UTC
  - 12e0d80 Merge pull request #50570 from garethgreenaway/merge-2018.3
  - 4c85119 merge-forward 2017.7 to 2018.3
  - 02238a7 Merge pull request #50520 from dwoz/issue_50459
    * 1aa2e34 Simplifie and portable homedir lookup
    * f14f747 Fix windows home dir lookup
    * d3620c3 Always set .gitconfig dir to user's home
  - edd9738 Merge pull request #50532 from dubb-b/2017.7
    * 009e52d Adding tag to ec2 cloud tests
  - b0446f5 Merge pull request #50500 from terminalmage/2017.7-docs
    * 870a364 Set docs jenkins job to treat warnings as errors
    * e03bdcf Update docs references for states with func_alias
    * 8a2c08f Disable custom sphinx automodule

• ISSUE #50266: (4815162342lost) grains.virtual show incorrect info (refs: #50519)
• PR #50519: (garethgreenaway) [2018.3] Fix to virtual core grain @ 2018-11-16 23:42:18 UTC
  – 6ba83c Merge pull request #50519 from garethgreenaway/50266_core_virtual_grain_fixes
  – dcae2f0 Merge branch '2018.3' into 50266_core_virtual_grain_fixes

  - 5754b4a Fix 2018.3 build

- **PR #50496:** (terminalmage) Fix 2018.3 docs build warnings @ 2018-11-13 17:21:09 UTC

  - 6f4b23f Merge pull request #50496 from terminalmage/2018.3-docs
  - cb25641 Fix header underline length to avoid another sphinx warning
  - 9272f7b Fix more sphinx build errors
  - 18a8104 Late import to fix docs build errors
  - d457132 Fix sphinx build warnings in 2018.3 branch

- **ISSUE #50227:** (sheagcraig) mac_utils _available_services will fail with malformed launchd plists present (refs: #50228)
• **PR #50492**: (rallytime) Back-port #50228 and #50443 to 2018.3 @ 2018-11-13 16:59:15 UTC
  - **PR #50443**: (weswhet) fix when checking for service Label on macOS (refs: #50492)
  - **PR #50228**: (sheagcraig) Fix 50227 malformed plists (refs: #50492, #50443)
  - 6b272c1 Merge pull request #50492 from rallytime/bp-50228-and-50443
  - 7879a2d Fix logging format
  - f578392 Lint Fix: add mock_open import
  - e5b999b add try/except when checking for service Label
  - 3c36bdc Fix linting errors.
  - fab57de Write tests to handle invalid launchd plist XML.
  - bb429b0 Condense service result assertions, add a binary plist test.
  - a809f9e Factor out another helper function, implement broken symlink test.
  - 216f7ef Update testing for mac_utils services.
  - 89d8267 Fix trailing-slash bug in User LaunchAgent appending.
  - 0e23b6e Handle bad plists by ignoring them, with py2 and py3 specific approaches
  - fa44149 Avoid AttributeError when checking for exception types.
  - fd62b33 Add secondary exception handler for malformed plists.
  - ae6f49b Make test correctly generate a double exception.
• **PR #50486**: (twangboy) Back port lgpo from Fluorine @ 2018-11-13 09:40:17 UTC
  - da980d9 Merge pull request #50486 from twangboy/lgpo_2018.3
  - bbbc07b Back port lgpo from Fluorine
• **ISSUE #50218**: (ata-sql) git.latest with unless command fails after upgrade to 2018.3.3 (refs: #50456)
• **PR #50456**: (terminalmage) Two bugfixes @ 2018-11-13 06:06:52 UTC
  - 7dd3438 Merge pull request #50456 from terminalmage/issue50218
  - 6143408 Add unit test for TimedProc regression
  - e2346ab Add support for list of commands in git states’ onlyif/unless
  - cb05c8 TimedProc: Don’t assume args is a string
  - 87de250 Exit gracefully when mod_run_check raises exception
• **PR #50455**: (dubb-b) Adding the released version as the bootstrap minion. @ 2018-11-12 22:52:53 UTC
  - d8514e6 Merge pull request #50455 from dubb-b/2018.3
  - fb61482 adding git
  - 181b8a4 removing stable
  - fc93ad6 Adding the released version as the bootstrap minion.
• **PR #50483**: (rallytime) Back-port #50272 to 2018.3 @ 2018-11-12 22:45:05 UTC
  - **PR #50272**: (jyurdal) Fix out of order docker Env comparison (refs: #50483)
  - cbf3351 Merge pull request #50483 from rallytime/bp-50272
  - 0f02da7 Remove unnecessary u prefix from string literals

30.2. Previous Releases 2173
- fc26ae8 Add unit test for comparing containers with the same env vars
- cf7cb4b extra blank line after function definition (pylint)
- 1de9ce3 Compare sorted docker environment

**PR #50481:** (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-11-12 22:44:15 UTC
- 360ae6a Merge pull request #50481 from rallytime/merge-2018.3
- 1517bb3 Update old utils paths to use new paths
- d8e7c47 Merge branch '2017.7' into '2018.3'
- e5f97cd Merge pull request #50467 from dwoz/test_kitchen_up
  * 8c5e93e Use patched version of test-kitchen until next release
- b16ff9c Merge pull request #50469 from dwoz/minion_timeout_test
  * 57f702d Fix linter warning
  * 686153a Fix up integration.minion.test_timeout
- 45b438e Merge pull request #50470 from dwoz/set_time_flaky
  * 794ba17 Reset date and time after changing
- c85561e Merge pull request #50442 from rallytime/replace-docbanner
  * 193325d Update docbanner hyperlink
- 7200568 Merge pull request #50439 from rallytime/bootstrap-contributing-docs
  * d2158aa Add bootstrap section to contributing docs
- cca7a36 Merge pull request #50441 from rallytime/replace-docbanner
  * 2af92bd Update SaltConf doc banner
- 1e72d20 Merge pull request #50414 from flassman/backmerge-for-typeerror-windows-python3
  * 20fff15 use exc.winerror not exc[0] to avoid python3 TypeError
- 93095cb Merge pull request #50415 from flassman/pass-cwd-to-runas_system
  * 0113137 cwd needs to be passed from runas() to runas_system()

**ISSUE #50461:** (absolutejam) elementaryOS 'pkg' __virtual__ returned false (refs: #50468)

**PR #50468:** (garethgreenaway) [2018.3] Adding elementary override to grains/core.py @ 2018-11-12 16:41:57 UTC
- 3aaad17 Merge pull request #50468 from garethgreenaway/50461_fix_elementary_os_family_grain
- 77e8dcc On later versions of elementary, the os_family is being populated as elementary. In order for the aptpkg module to function, we need to override is to be Debian.

**ISSUE #50311:** (marek-obuchowicz) pkg.installed state fails even though it succeeded (refs: #50590, #50333)

**ISSUE #46689:** (mxork) pkg.installed: hold: True not applied to a package which is already installed. (refs: #48426)

**PR #50333:** (garethgreenaway) [2018.3] Fix to pkg.installed for sources and hold: True (refs: #50590) @ 2018-11-08 18:02:33 UTC
- PR #48426: (garethgreenaway) [2017.7] fixes to states/pkg.py (refs: #50333)
- d9179fb Merge pull request #50333 from garethgreenaway/50311_pkg_installed_fails_sources_hold
- 7bc9b3d Merge branch '2018.3' into 50311_pkg_installed_fails_sources_hold
- 6e96728 pkg.installed currently fails when sources is used along with hold: True. This was due to a change in #48426 that swapped out sending the pkgs variable for the desired variable instead. This caused problems with pkg.hold because desired and sources are always populated, and pkg.hold can only include one or the other. This change just includes desired in the call to pkg.hold since desired has the same value for sources.

**PR #50434**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-11-08 17:40:39 UTC
- 193c80a Merge pull request #50434 from rallytime/merge-2018.3
- 83dfbb2 Merge branch '2017.7' into '2018.3'
  * 6e96728 pkg.installed currently fails when sources is used along with hold: True. This was due to a change in #48426 that swapped out sending the pkgs variable for the desired variable instead. This caused problems with pkg.hold because desired and sources are always populated, and pkg.hold can only include one or the other. This change just includes desired in the call to pkg.hold since desired has the same value for sources.
- 58ced12 log jid to payload size
- 3c537b5 Log message flow to publish daemon

**PR #50417**: (meaksh) Get the right target when using "_env__" on git_ext_pillar to avoid merging problems @ 2018-11-08 17:07:03 UTC
- 73ce80f Merge pull request #50417 from meaksh/2018.3-fix-git_pillar__env__-solving-for-merging
- 71af32d Remove unicode references
- b7af5e5 Test git_ext_pillar across multiple repos using __env__
- 59894e2 Resolve target branch when using __env__

**ISSUE #50292**: (dstoliker) sysctl in test=True mode results in [ERROR] Could not open sysctl file (refs: #50423)

**PR #50423**: (garethgreenaway) [2018.3] Fixes to sysctl modules and state @ 2018-11-08 14:13:00 UTC
- e9464c9 Merge pull request #50423 from garethgreenaway/50292_no_error_log_test_true
- 95a7f12 Adding file check and empty list return to freebsd_sysctl.py
- 469c090 Adding a check to see if the config file exists, if not then return an empty list so we get the would be changes. Adding a test for this functionality.

**ISSUE #50420**: (weswhet) mac_system virtual function fails to load on 2018.3.3 (refs: #50421)

**PR #50421**: (weswhet) fixing an issue on mac_system where the virtual function wouldnt load @ 2018-11-07 21:57:44 UTC
- fccf875 Merge pull request #50421 from weswhet/fix-mac_system-loader
- 042445d fixing an issue on mac_system where the virtual function wouldnt load

**PR #50409**: (casselt) Fix test mode for mount state if device_name_regex is used. @ 2018-11-07 16:04:45 UTC
- d2fc910 Merge pull request #50409 from casselt/mount-device_name_regex-test-mode-fix
- 56d5a32 Fix test mode for mount state if device_name_regex is used.

**PR #50383**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-11-06 15:51:53 UTC
- c2fda9d Merge pull request #50383 from rallytime/merge-2018.3
- e993692 Merge branch '2017.7' into '2018.3'
  * cd7c95f Merge pull request #50128 from mgomersbach/fix-py3-reload-compat
    * e453e82 Satisfy pylint, use naming instead of W or E classification
    * d20581c Merge branch 'fix-py3-reload-compat' of github.com:mgomersbach/salt into fix-py3-reload-compat
• 48c6a4f Merge branch '2017.7' into fix-py3-reload-compat
• 5cd9741 Satisfy pylint
• a2838db Satisfy pylint checks
• 05c598c Fix import error by utilizing six and strict version spec
• 95174e6 Merge branch '2017.7' into fix-py3-reload-compat
• ab8b5b4 Update workaround to root of file
• 37ab1f8 Update workaround to root of file
• 253ab11 Workaround for py2 builtin, =<3.3 imp and >=3.4 libimport quirks, solves #50127
  • aa6b149 Merge pull request #50354 from rallytime/version_num_docs
  • 0621f7d Add a few more feature release codenames to the version_numbers doc
• 6472100 Merge pull request #50359 from dwoz/clitest
  • 18b5d43 Increase cli batch test timeout for increased reliability
• 99c8f35 Merge pull request #50345 from dwoz/pub_d_logging
  • fd58523 Fix linter warnings
  • 5e1db3c Fix ZMQ PubServer daemon logging works on winndows
  • 8899832 Configure logging for ZMQ PubServer daemon
• 44f7af4 Merge pull request #50350 from dubb-b/2017.7
  • 346a831 Updating the AMI's and sizes for the test run.
• b947a18 Merge pull request #50274 from rallytime/bp-41472
  • 0a1e607 When the minion key is denied by the master then exit status 77 (permission denied)
• 4725acd Merge pull request #50195 from damon-atkins/jenkins_pylint
  • eb13407 capture some extra info
• ab8e845 Merge pull request #50329 from twangboy/fix_cloud_winrm
  • cf5f604 Check WinRM port before initiating connection
• e535b38 Merge pull request #50252 from dwoz/backport_ws_fix
  • 59ac284 Do not allow age to be a negative number

• ISSUE #49523: (MTecknology) [salt-cloud] Non-ascii chars cause an exception in salt-cloud (refs: #50146, #50236)
  • PR saltstack/salt#50174: (rallytime) Back-port #50146 to 2018.3 (refs: #50231)
• PR #50236: (rallytime) Fix salt-cloud UnicodeEncodeError when writing to stdout @ 2018-11-05 22:04:18 UTC
  • PR #50235: (rallytime) Don't encode the return values in utils/vt.py (refs: #50236)
  • PR #50231: (rallytime) Revert "Back-port #50146 to 2018.3" (refs: #50236)
  • PR #50230: (rallytime) Add various ssh tests to the filemap for salt/utils/vt.py changes (refs: #50291, #50235)
  • PR #50174: (rallytime) Back-port #50146 to 2018.3 (refs: #50236)
  • PR #50146: (MTecknology) Improve handling of non-ascii characters in terminal output. (Fixes: #49523)
    (refs: #50235, #saltstack/salt#50174, #50174, #50231, #50236)
- 46c7dc2d Merge pull request #50236 from rallytime/fix-cloud-vt
- c1984ec9 Fix salt-cloud UnicodeEncodeError when writing to stdout

- **ISSUE #50062**: (whytewolf) max_event_size does not always trim large events. (refs: #50382)

- **PR #50382**: (garethgreenaway) [2018.3] Fix to utils/dicttrim.py to honor max_event_size with nested dictionaries @ 2018-11-05 20:04:06 UTC
  - ed4fa87 Merge pull request #50382 from garethgreenaway/50062_max_event_size_does_not_always_trim_large_events
  - 039f3d1 Increase limit for trimming.
  - 7f77bfe Adding test for utils/dicttrim.py
  - 9b55ac7 Adding _trim_dict_in_dict to utils/dicttrim.py to be called from trim_dict when data contains a nested dictionary. This will ensure that values will still be trimmed correctly.

- **PR #50387**: (rallytime) Back-port #50339 to 2018.3 @ 2018-11-05 20:03:15 UTC
  - PR #50339: (bartlaarhoven) The driver requires dependency, not the other way around. (refs: #50387)
  - 493d653 Merge pull request #50387 from rallytime/bp-50339
  - a3f264d Lint: Add extra blank line
  - bd18412 The driver requires dependency, not the other way around.

- **ISSUE #41342**: (githubcdr) beacons.state does not save as list (refs: #50347)

- **PR #50347**: (garethgreenaway) [2018.3] Fixes to beacon state module @ 2018-11-05 14:19:41 UTC
  - 3022b7d Merge pull request #50347 from garethgreenaway/41342_beacon_state_module_fixes
  - 8885d1f Merge branch '2018.3' into 41342_beacon_state_module_fixes
  - c2354a9 Fixing beacon state test. Adding a reset function to beacon module to clear out beacon configuration. Useful for tests runs to ensure bits are left over between runs.
  - 2390f47 Adding SaltReturnAssertsMixin back in
  - 677d090 Remove zookeeper reference.
  - f3de43 Updating the beacon state module to ensure that the format of the beacon data that is being sent along to the beacon execution module is in the right format.

- **ISSUE #41583**: (seanjnkns) mount.swap for swap file test=True results wrong (refs: #50358)

- **PR #50358**: (garethgreenaway) [2018.3] fixes to function mount.swap in mount state @ 2018-11-05 14:16:50 UTC
  - 929525a Merge pull request #50358 from garethgreenaway/41583_mount_swap_test_true_wrong_results
  - b8ded8b Updating the swap function in the mount.swap function also check the device name when checking the fstab data. Updating tests to reflect new behavior.
    - d07c84d reordering ret dictionary in load test to ascending order
    - f704128 fixing type in load beacon module and adding option validators to config check function along with mock default values in test, fixes #48343
    - 4114a4f fixing type in load beacon module and adding option validators to config check function along with mock default values in test

- **ISSUE #49225**: (onnodb) [win_lgpo] lgpo_set always reports failure; Registry.pol corruption (refs: #50006)

- **ISSUE #48782**: (mike2523) [win_lgpo] Causes corrupt Registry.pol file (refs: #50006)

- **PR #50006**: (lomeroe) Correct more issues in lgpo @ 2018-11-02 16:32:29 UTC
- 3ffa392 Merge pull request #50006 from lomeroe/issue48782_2018.3
- dc58252 update to use a single line if statement when dealing with prepended text
- 0e011ad add runTest method to class for PY2
- 377ec09 add a test for #47784
- 0a14505 change backslashes in comment string to fix lint error
- 02181d3 add fix/test for #50079
- 05f2951 more lint fixes
- 94b3335 lint fixes in test
- 2a79626 update test to actually work
- 42840ec add missing comma in function call
- c283f50 Log a warning message instead of an exception when a SID cannot be converted to a username (for user rights assignments)
- 271bd70 capture and print exception information
- bc94b8e update method for creating size field of **delvals items for py3 compatibility
- d9fe28a fix clobbering of admx_search_results which was keeping some policies from being properly detected

• **PR #50340: (garethgreenaway) [2018.3] Backporting #48087 to 2018.3 @ 2018-11-01 18:15:37 UTC**
  - **PR #48087: (mat813) Fix patching sysctl.conf on FreeBSD. (refs: #50340)**
  - 12de4b9 Merge pull request #50340 from garethgreenaway/backport_48087_to_2018_3
  - 56c87ff Backporting #48087 to 2018.3

• **PR #50275: (rallytime) Back-port #49752 to 2018.3 @ 2018-11-01 16:50:17 UTC**
  - **PR #49752: (jodok) add support for clonenum parameter (refs: #50275)**
  - 5e46343 Merge pull request #50275 from rallytime/bp-49752
  - e463d99 Merge branch '2018.3' into bp-49752
  - 1e10c6e add support for clonenum parameter

• **ISSUE #47425: (raddessi) states/netyang.managed ignores models when passed as a kwarg (refs: #50301)**

• **PR #50316: (rallytime) Back-port #50301 to 2018.3 @ 2018-11-01 16:32:04 UTC**
  - **PR #50301: (tonybaloney) Fixes issues raised in #47425 for states.netyang (refs: #50316)**
  - 51e333a Merge pull request #50316 from rallytime/bp-50301
  - 367b689 Merge pull request #32 from tonybaloney/bp50301
    * 529687a update test assertions
    - 02a52ad remove unused import
    - 220e57f create 2 simple unit tests for the netyang state module and fix issue in #47425
    - 0bf306 reproduce bug in 47425

• **PR #50290: (twangboy) Fix test_state for Windows @ 2018-10-31 19:28:34 UTC**
  - af1075b Merge pull request #50290 from twangboy/fix_test_state
  - 69c02fc Fix some lint and some typos
- d184013 Fix typo
- 92b5ea0 Create salt util that copies file security info

- **ISSUE #50050**: (terminalmage) Backport runtests.py's --from-filenames functionality to 2018.3 branch (refs: #50308, #50291)

- **PR #50291**: (rallytime) Back-port #50230 to 2018.3 @ 2018-10-31 19:22:25 UTC
  - PR #50230: (rallytime) Add various ssh tests to the filemap for salt/utils/vt.py changes (refs: #50291, #50235)
  - 045d81c Merge pull request #50291 from rallytime/bp-50230
  - 1aae681 Merge branch '2018.3' into bp-50230
  - 1ef712a Add various ssh tests to the filemap for salt/utils/vt.py changes

- **PR #50315**: (rallytime) [2018.3] Merge forward from 2018.3.3 to 2018.3 @ 2018-10-31 14:16:34 UTC
  - 00437aa Merge pull request #50315 from rallytime/merge-2018.3
  - 422465e Merge branch '2018.3.3' into '2018.3'
  - 4d9e2a0 Merge pull request #50088 from vulnbe/fixincorrect-id-handling-2018-3-3
  - 619f2f2 Fix incorrect id handling in file state

- **PR #50309**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-10-30 16:07:25 UTC
  - 84ee7a3 Merge pull request #50309 from rallytime/merge-2018.3
  - 381a59d Merge branch '2017.7' into '2018.3'
  - 11fa33e Merge pull request #50295 from dubb-b/remove-cloud-change
    - 80982ad Removing an un needed change and maybe fixing the lint error
    - e00c507 Merge pull request #50287 from whytwolf/boto_vpc
      - 5a39644 minor correction to boto_vpc.route_table_present example, subnet_names was on wrong indent level
    - 37ae06c Merge pull request #50280 from gtmanfred/2017.7
      - 5808074 fix InstallRequirement.from_line for pip 18.1

- **ISSUE #50050**: (terminalmage) Backport runtests.py's --from-filenames functionality to 2018.3 branch (refs: #50308, #50291)

- **PR #50308**: (rallytime) Fix matcher grain file @ 2018-10-30 15:27:47 UTC
  - PR #50182: (terminalmage) Backport runtests.py modifications from develop to 2018.3 (refs: #50308)
  - b805bab Merge pull request #50308 from rallytime/test-fixes
  - f238522 Fix matcher grain file

- **PR #50270**: (terrible-broom) apt: speedup installing packages with ‘>=’ or ‘<=’ and reduced memory... @ 2018-10-30 13:24:36 UTC
  - 57fe6cd Merge pull request #50270 from terrible-broom/feature/apt-cache-show-instead-of-dump
  - 6c1b05a Lint: add extra blank line
  - a4df706 fix review notes
  - d059edd apt: speedup installing packages with ‘>=’ or ‘<=’ and reduced memory consumption

- **PR #50293**: (gtmanfred) update jenkins version for 2018.3 @ 2018-10-29 23:39:34 UTC
- 6a65402 Merge pull request #50293 from saltstack/jenkins
- fe6bc4 update jenkins version for 2018.3
- PR saltstack/salt-jenkins#1182: (gtmanfred) clean up salt.utils for using 2018.3.3 (refs: #50289)

  - PR #50289: (gtmanfred) ignore empty line in localectl status output @ 2018-10-29 21:39:07 UTC
    - 935f181 Merge pull request #50289 from gtmanfred/2018.3
    - fb43061 fix test
    - 5eb0e37 add extra space to localemod
t    - e8dc8ba if line in output of localectl is empty, ignore it

  - PR #50276: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-10-29 19:05:15 UTC
    - 10ba8b4 Merge pull request #50276 from rallytime/merge-2018.3
    - f05abb0 Merge branch `2017.7` into `2018.3`
      * 6ae8a33 Merge pull request #50281 from dubb-b/add_subnet
        - 4fdef7c Lint: Add extra blank line
        - cebfd8a Fixing lint error
        - 0da6301 Merge branch `2017.7` of https://github.com/saltstack/salt into add_subnet
        - 2df6115 Adding subnetID so it knows the right VPC to build the node in.
    - a0cfbdc Merge branch `2017.7` into `2018.3`
      * b94a43b Merge pull request #50184 from ethanculler/fix-minion-return-exception-with-return
        - 283d41c Merge branch `2017.7` into fix-minion-return-exception-with-return
        - a4e54d7 Added handling for minion return exceptions containing the word "return"
      * 6b009b4 Merge pull request #50258 from dubb-b/fix_cloud_ec2
        - 6a1e9f0 Adding securitygroupname as the config instead of securitygroup
    - 3e1aac9 Merge pull request #50251 from gtmanfred/2017.7
      - 061e599 bump salt version to 2017.7.8
    - fe9bc81 Merge pull request #50233 from Ch3LL/bp-50232
      - f83460d change order of search engine ids
      - b3f2f17 Update search engine IDs for releases

  - PR #50282: (twangboy) Fix `unit/beacons.test_diskusage` on Windows @ 2018-10-29 18:37:13 UTC
    - 0f1dc08 Merge pull request #50282 from twangboy/fixed_test_diskusage
    - fd369dd Mock is_windows = False

  - PR #50182: (terminalmage) Backport runtests.py modifications from develop to 2018.3 (refs: #50308) @ 2018-10-29 16:25:07 UTC
    - f7c2f04 Merge pull request #50182 from terminalmage/issue50050
    - 113d76e Revert "Move jinja templating tests alongside salt/utils/jinja.py's tests"
    - 3057ca4 Lint fix: add extra blank line in core.py
    - 8968f9d Revert "Rename test_map_conf test file to respect naming convention"
- 85a9395 Remove saltclass pillar unit test for list expansion
- 3d95673 Use get_config_dir() instead of self.config_dir
- e8b3a62 Add init file back in for unit/client pkg
- d527dd2 Rename states/test_libvirt.py into states/test_virt.py
- ab4a670 Remove pgjsonb returner unit tests
- 68ab3ee Remove "test_custom" from grains section of filename_map
- 6814698 Remove test_error from scheduler tests
- c55def0 Add init file back in for integration/cloud/clouds pkg
- f485b4a enable testing only filemaps
- dfa05b9 Remove test files for beacons that don't exist in 2018.3

- **ISSUE #50132**: `(ManicoW)` XCP-ng packages and services management (refs: #50140)
  - **PR #50172**: `(rallytime)` Back-port #50140 to 2018.3 @ 2018-10-25 14:00:32 UTC

- **PR #50172**: `(rallytime)` Back-port #50140 to 2018.3 @ 2018-10-25 14:00:32 UTC
  - **PR #50140**: `(ManicoW)` Adding XCP-ng support (refs: #50172)
  - `82d4f43` Merge pull request #50172 from rallytime/bp-50140
  - `02e0ea0` lint fix
  - `819c46c` fix lint errors and code factorization
  - `8aa3598` Fix lint error
  - `9092e4e` Adding support for XCP-ng
  - `c516bc5` Adding XCP-ng to os family map

- **PR #50063**: `(twangboy)` Use long when setting REG_QWORD @ 2018-10-25 13:45:03 UTC
  - `9ad43f2` Merge pull request #50063 from twangboy/fix_50039
- 5fdba7d Disable lint error
- 84b8dd6 Add tests
- 4644bb6 Use long when setting REG_QWORD

• ISSUE #49965: (nkrishnakishor) Beacon: Usage in windows (refs: #50188)
• PR #50188: (garethgreenaway) [2018.3] fixes to diskusage beacon @ 2018-10-25 13:41:19 UTC
  - 01b083e Merge pull request #50188 from garethgreenaway/49965_beacon_diskusage_windows
  - 1f0ab27 Merge branch '2018.3' into 49965_beacon_diskusage_windows
  - 42b3203 Fixing lint
  - f65fa57 Fixing a bug in the diskusage beacon that prevented it from working on Windows. Adding a couple tests to test functionality on Windows.
• PR #50214: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-10-25 13:38:40 UTC
  - 9ea51c0 Merge pull request #50214 from rallytime/merge-2018.3
  - 897145c Merge branch '2017.7' into '2018.3'
    - 017d394 Merge pull request #50202 from Ch3LL/_2017.7.8
      - d520f9a Add tests with filename in token data
      - d45f6c7 Add empty token salt-api integration tests
      - 652dbf6 Ensure that tokens are hex to avoid hanging/errors in cherrypy
    - f28a4fa Merge pull request #50211 from channias/fix-spm-modules-install
      - 9b203d5 Fix broken install of additionnal modules in SPM packages
    - 6b4e07b Merge pull request #50212 from dwoz/test_no_fail
      - 7f613ac Do not fail if process already ended
    - 85e22d2 Merge pull request #50207 from Ch3LL/2update_version_doc_2017.7
      - 198d25c Add 2017.7.8 previous release
      - d4e26ac Update release versions for the 2017.7 branch
    - d035695 Merge pull request #50205 from Ch3LL/rm_2017.7.8
      - 71ee68b [2017.7.8] remove in progress and add security details
    - ce341f2 Merge pull request #50180 from max-arnold/2017.7
      - 881a521 Revert curly braces example for nested dictionaries
    - 622bb51 Merge pull request #50026 from damon-atkins/jenkins_pylint
      - aebce88 Merge branch '2017.7' into jenkins_pylint
      - 5f708fa use awk to create the other files, so git does not need to search again
      - 6b96a24 Adjust jenkins linting process, only run stage if required, use git diff to find files, instead of find, report on status, changed and deleted files, lint only changed files.
    - aa66d1b Merge pull request #50158 from vutny/doc/2017.7/fix-http-tutorial
      - fe2d70d [DOC] Fix JSON payload example in HTTP tutorial
• ISSUE #50162: (rbthomp) Scheduled job runs in endless loop when using when: and splay: together. (refs: #50216)
• PR #50216: (garethgreenaway) [2018.3] Fixes to scheduler, list of whens plus splay @ 2018-10-25 13:31:26 UTC
  - 51b3fa4 Merge pull request #50216 from garethgreenaway/garetgreenaway/50162_when_plus_splay@endless_loop
  - 685509f Fixing an issue when a combination of the when parameter as a list plus using the splay parameter would cause the schedule to continuously run jobs in an endless loop, regardless of if their scheduled time had been reached. Also fixing a related issue where scheduled jobs that rely on _next_fire_time were not being run as the corrected splayed time but rather running at the original scheduled time. Adding new tests.

• PR #50190: (dwoz) Fix test_managed_file_with_grains_data on Windows @ 2018-10-24 22:43:35 UTC
  - 43303fb Merge pull request #50190 from dwoz/grains_template_test
  - b77db48 Fix test_managed_file_with_grains_data on Windows

• PR #50187: (garethgreenaway) [2018.3] Adding fixes to scheduler tests to 2018.3 @ 2018-10-24 19:45:32 UTC
  - PR #49871: (garethgreenaway) [fluorine] Updating scheduler tests for OS X (refs: #50187)
  - 462314b Merge pull request #50187 from garethgreenaway/port_49871_to_2018_3
  - 25e7c6e Merge branch '2018.3' into port_49871_to_2018_3
  - d232df Update test_eval.py
  - d8d559 Fixing lint
  - 766e232 Removing unnecessary debugging lines
  - d2d06e22 Back porting #49871 to 2018.3. Adding some additional changes to ensure they are passing on OS X.

• PR #50201: (Ch3LL) [2018.3] Ensure that tokens are hex to avoid hanging/errors in cherrypy @ 2018-10-24 19:44:23 UTC
  - 8ad9a1b Merge pull request #50201 from Ch3LL/_2018.3.3

• PR #50208: (Ch3LL) Update release versions for the 2018.3 branch @ 2018-10-24 15:52:19 UTC
  - 88673ad Merge pull request #50208 from Ch3LL/2update_version_doc_2018.3
  - cdb49d Add 2017.7.8 previous release
  - 6f775e7 Update release versions for the 2018.3 branch

• PR #50206: (Ch3LL) [2018.3.3] remove in progress and add security details @ 2018-10-24 15:50:50 UTC
  - db0ef1e Merge pull request #50206 from Ch3LL/rn_2018.3.3
  - 896ca1a Add 2016.11.10 release notes to 2018.3 branch
  - 1e34158 [2018.3.3] remove in progress and add security details

• PR #50200: (rallytime) Back-port #50181 to 2018.3 @ 2018-10-24 15:49:59 UTC
  - PR #50181: (cro) Testinfra has a python packaging issue that is making version 1.17.0 fail to install some places (refs: #50200)
  - 3d3db79 Merge pull request #50200 from rallytime/bp-50181
  - f8e599f Ignore testinfra 1.17.0

• ISSUE #49523: (MTeknology) [salt-cloud] Non-ascii chars cause an exception in salt-cloud (refs: #50146, #50236)

• PR #50174: (rallytime) Back-port #50146 to 2018.3 (refs: #50236) @ 2018-10-23 18:16:45 UTC
- **PR #50146**: (MTecknology) Improve handling of non-ascii characters in terminal output. (Fixes: #49523)
  (refs: #50235, #saltstack/salt#50174,"_, #50174, #50231, #50236)
- 5f904dd Merge pull request #50174 from rallytime/bp-50146
- 601a5b8 Improve handling of non-ascii characters in terminal output. (Fixes: #49523)

- **ISSUE #50142**: (m03) stringutils.to_none AttributeError: 'module' object has no attribute 'tex_type' (refs: #50143)

- **PR #50173**: (rallytime) Back-port #50143 to 2018.3 @ 2018-10-23 17:13:55 UTC
  - **PR #50143**: (m03) Fix #50142, stringutils.to_none (refs: #50173)
  - **PR #45429**: (terminalmage) [PY3] Add unicode_literals to salt.utils modules (R-S) (refs: #50143)
  - 1cd0339 Merge pull request #50173 from rallytime/bp-50143
  - f5d6080 Add test_to_none
    - c0ce36b Fix #50142, stringutils.to_none

- **PR #50171**: (terminalmage) Fix invalid RST link in docker_network docs @ 2018-10-23 13:40:36 UTC
  - 9331f1e Merge pull request #50171 from terminalmage/docs
  - 7ea1d6c Fix invalid RST link in docker_network docs

- **PR #50161**: (rmarcinik) Add a missing result for task.info @ 2018-10-23 13:31:43 UTC
  - 16eece3 Merge pull request #50161 from rmarcinik/patch-1
  - 9848f06 Add a missing result for task.info

- **PR #50136**: (terminalmage) Add some debug logging before and after states gather pillar data @ 2018-10-22 14:40:38 UTC
  - 28bc5e3 Merge pull request #50136 from terminalmage/debug-logging
  - 8592a0b Add some debug logging before and after states gather pillar data

- **ISSUE #50129**: (kmatsoukas) Call to network.get_route fails when interface name contains a dash (refs: #50147)

- **PR #50147**: (garethgreenaway) [2018.3] Fix to modules/network.py @ 2018-10-22 14:31:03 UTC
  - 593c7ff Merge pull request #50147 from garethgreenaway/50129_network_get_route_fails_dash_in_name
  - 8fa87e3 Update test_network.py
  - 3117969 Fixing scenario where the interface for the default route has a dash in it, regular expression used in get_route currently doesn't not account for this. Adding some additional tests for network.get_route.

- **PR #50156**: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ 2018-10-22 14:24:39 UTC
  - 5c7a7d9 Merge pull request #50156 from rallytime/merge-2018.3
  - 87e20fd Merge branch '2017.7' into '2018.3'
  - 1a90c4f Merge pull request #50144 from dwoz/winrm_fs_release
    - 0951d85 Use newest winrm-fs release
  - e096560 Merge pull request #50113 from rallytime/bp-49989
    - 27c7ac9 Increase centos7-py2 kitchen pr timeout to 8 hours

- **PR #50148**: (MTecknology) Proxmox fixups @ 2018-10-22 11:55:10 UTC
  - ce375f4 Merge pull request #50148 from MTecknology/proxmox-fixups
PR #50085: (dwoz) Fix test_win_pkg yet again @ 2018-10-19 18:16:16 UTC
- 0ece06e Merge pull request #50085 from dwoz/win_pkg_redux
- f22630e Merge branch '2018.3' into win_pkg_redux
- 0b033a6 Do not allow age to be a negative number
- a24d8b8 Debug file list cache
- 9f5722a The test is not a flush problem
- 071f8a0 Add cache file name to list cache log
- 128c2e5 Flush and sync file contents
- 7d361d8 Add debug log when file list is returned from cache

PR #49980: (twangboy) Add support for AddPrinterDrivers @ 2018-10-19 13:19:41 UTC
- 0069247 Merge pull request #49980 from twangboy/lgpo_add_printer_drivers
- 76c9301 Add support for AddPrinterDrivers

PR #50114: (rallytime) Back-port #50061 to 2018.3 @ 2018-10-19 11:46:03 UTC
- PR #50061: (rongzeng54) pkg.install bugfix (refs: #50114)
- de23c83 Merge pull request #50114 from rallytime/bp-50061
- 1f09104 Add unit test for pkg.install with epoch
- a253c6 pkg.install bugfix

ISSUE #50074: (bigpick) Arista EOS Salt Minion - Debug Log Flooded with Repeated Message (refs: #50115)

PR #50115: (garethgreenaway) [2018.3] Apply scheduler fixes and tests from #49104 to 2018.3 @ 2018-10-19 11:45:31 UTC

  - 2e46a78 Expose docs for Ansible modules

- PR #50064: (rallytime) Back-port #50064 to 2018.3 @ 2018-10-16 09:07:10 UTC
  - PR #50064: (bluesliverx) Make test check_pillar more lenient (refs: #50064)
  - 40da3ce Merge pull request #50064 from rallytime/bp-50022
  - 6ef5ce4 Due to a previous PR the test_sdb_runner in sdb.test_vault was failing because of a exception that was being swallowed in the test_run_run function. The cause was that when vault related functions were being run, if they were being run on the master then they were being forced to run through the _get_token_and_url_from_master() function, which pull the id element out of the grains dictionary. When the call was taking place from a runner, the exception was popping up since there is no id when called from a runner. This fix checks to see if the id exists in the dictionary.
first, if it is there then \_get\_token\_and\_url\_from\_master() is called, otherwise \_use\_local\_config is called.

- PR \#49987: (terminalmage) Make Pillar no longer munge file_roots @ 2018-10-15 21:58:08 UTC
