  These can be set as such from the command line, or in the Salt config as *state_output_exclude* or *state_output_terse*, respectively.

The output modes have one modifier:

`full_id`, `terse_id`, `mixed_id`, `changes_id` and `filter_id` If `_id` is used, then the corresponding form will be used, but the value for `name` will be drawn from the state ID. This is useful for cases where the name value might be very long and hard to read.

state_tabular:
If *state_output* uses the terse output, set this to *True* for an aligned output format. If you wish to use a custom format, this can be set to a string.

state_output_pct:
Set *state_output_pct* to *True* in order to add "Success %" and "Failure %" to the "Summary" section at the end of the highstate output.

state_compress_ids:
Set *state_compress_ids* to *True* to aggregate information about states which have multiple "names" under the same state ID in the highstate output. This is useful in combination with the *terse_id* value set in the *state_output* option when states are using the *names* state parameter.

Example usage:

If `state_output: filter` is set in the configuration file:

```
salt '*' state.highstate exclude=None,True
```

means to exclude no states from the highstate and turn on terse output.

```
salt twd state.highstate exclude=problemstate1,problemstate2,False
```

means to exclude states `problemstate1` and `problemstate2` from the highstate, and use regular output.

Example output for the above highstate call when `top.sls` defines only one other state to apply to minion `twd`:

```
twd:

Summary for twd
------------
Succeeded: 1 (changed=1)
Failed:    0
------------
Total states run:     1
```

Example output with no special settings in configuration files:

```
myminion:
----------
```

(continues on next page)

(continued from previous page)

```
          ID: test.ping
    Function: module.run
      Result: True
     Comment: Module function test.ping executed
     Changes:
              ----------
              ret:
                  True

Summary for myminion
------------
Succeeded: 1
Failed:    0
------------
Total:     0
```

`salt.output.highstate.`**`output`**`(`*data*, ***kwargs*`)`

The HighState Outputter is only meant to be used with the state.highstate function, or a function that returns highstate return data.

26.11.2 salt.output.json_out

Display return data in JSON format

configuration

The output format can be configured in two ways: Using the `--out-indent` CLI flag and specifying a positive integer or a negative integer to group JSON from each minion to a single line.

Or setting the `output_indent` setting in the Master or Minion configuration file with one of the following values:

- `Null`: put each minion return on a single line.
- `pretty`: use four-space indents and sort the keys.
- An integer: specify the indentation level.

Salt's outputters operate on a per-minion basis. Each minion return will be output as a single JSON object once it comes in to the master.

Some JSON parsers can guess when an object ends and a new one begins but many can not. A good way to differentiate between each minion return is to use the single-line output format and to parse each line individually. Example output (truncated):

```
{"dave": {"en0": {"hwaddr": "02:b0:26:32:4c:69", ...}}}
{"jerry": {"en0": {"hwaddr": "02:26:ab:0d:b9:0d", ...}}}
{"kevin": {"en0": {"hwaddr": "02:6d:7f:ce:9f:ee", ...}}}
{"mike": {"en0": {"hwaddr": "02:48:a2:4b:70:a0", ...}}}
{"phill": {"en0": {"hwaddr": "02:1d:cc:a2:33:55", ...}}}
{"stuart": {"en0": {"hwaddr": "02:9a:e0:ea:9e:3c", ...}}}
```

CLI Example:

```
salt '*' foo.bar --out=json
```

`salt.output.json_out.`**`output`**(*data*, ***kwargs*)

Print the output data in JSON

26.11.3 salt.output.key

Display salt-key output

The `salt-key` command makes use of this outputter to format its output.

`salt.output.key.`**`output`**(*data*, ***kwargs*)

Read in the dict structure generated by the salt key API methods and print the structure.

26.11.4 salt.output.nested

Recursively display nested data

This is the default outputter for most execution functions.

Example output:

```
myminion:
    ----------
    foo:
        ----------
        bar:
            baz
        dictionary:
            ----------
            abc:
                123
            def:
                456
        list:
            - Hello
            - World
```

`class` `salt.output.nested.`**`NestDisplay`**(*retcode=0*)

Manage the nested display contents

`display`(*ret*, *indent*, *prefix*, *out*)

Recursively iterate down through data structures to determine output

`ustring`(*indent*, *color*, *msg*, *prefix=''*, *suffix=''*, *endc=None*)

`salt.output.nested.`**`output`**(*ret*, ***kwargs*)

Display ret data

26.11.5 salt.output.no_return

Display output for minions that did not return

This outputter is used to display notices about which minions failed to return when a salt function is run with `-v` or `--verbose`. It should not be called directly from the CLI.

Example output:

```
virtucentos:
    Minion did not return
```

class `salt.output.no_return.`**`NestDisplay`**

Create generator for nested output

`display`(*ret*, *indent*, *prefix*, *out*)

Recursively iterate down through data structures to determine output

`salt.output.no_return.`**`output`**(*ret*, ***kwargs*)

Display ret data

26.11.6 salt.output.pprint_out

Python pretty-print (pprint)

The python pretty-print system was once the default outputter. It simply passes the return data through to `pprint.pformat` and prints the results.

CLI Example:

```
salt '*' foo.bar --out=pprint
```

Example output:

```
{'saltmine': {'foo': {'bar': 'baz',
                      'dictionary': {'abc': 123, 'def': 456},
                      'list': ['Hello', 'World']}}}
```

`salt.output.pprint_out.`**`output`**(*data*, ***kwargs*)

Print out via pretty print

26.11.7 salt.output.progress

Display return data as a progress bar

`salt.output.progress.`**`output`**(*ret*, *bar*, ***kwargs*)

Update the progress bar

`salt.output.progress.`**`progress_iter`**(*progress*)

Initialize and return a progress bar iter

26.11.8 salt.output.raw

Display raw output data structure

This outputter simply displays the output as a python data structure, by printing a string representation of it. It is similar to the `pprint` outputter, only the data is not nicely formatted/indented.

This was the original outputter used by Salt before the outputter system was developed.

CLI Example:

```
salt '*' foo.bar --out=raw
```

Example output:

```
salt '*' foo.bar --out=raw
{'myminion': {'foo': {'list': ['Hello', 'World'], 'bar': 'baz', 'dictionary':
↪{'abc': 123, 'def': 456}}}}
```

`salt.output.raw.`**`output`**(*data*, ***kwargs*)

Rather basic....

26.11.9 salt.output.table_out

Display output in a table format

New in version 2017.7.0.

The `table` outputter displays a sequence of rows as table.

Example output:

```
edge01.bjm01:
----------
    comment:
    ----------
    out:
    ----------

        ----------------------------------------------------------------------
↪--------
        | Active | Interface | Last Move |        Mac        | Moves | Static⊠

↪| 222  |
        -----------------------------------------------------------------------
↪--------
    result:
    ----------
```

CLI Example:

```
salt '*' foo.bar --out=table
```

class `salt.output.table_out.`**`TableDisplay`**(*has_header=True, row_delimiter='-', delim=' | ', justify='center', separate_rows=True, prefix='| ', suffix=' |', width=50, wrapfunc=None*)

Manage the table display content.

`display`(*ret, indent, out, rows_key=None, labels_key=None*)

Display table(s).

`display_rows`(*rows, labels, indent*)

Prepares row content and displays.

`prepare_rows`(*rows, indent, has_header*)

Prepare rows content to be displayed.

`ustring`(*indent, color, msg, prefix='', suffix='', endc=None*)

Build the unicode string to be displayed.

`wrap_onspace`(*text*)

When the text inside the column is longer then the width, will split by space and continue on the next line.

`salt.output.table_out.`**`output`**(*ret, **kwargs*)

Display the output as table.

Parameters

- **`nested_indent`** (*) -- integer, specify the left alignment.
- **`has_header`** (*) -- boolean specifying if header should be displayed. Default: True.
- **`row_delimiter`** (*) -- character to separate rows. Default: _.
- **`delim`** (*) -- character to separate columns. Default: `" | "`.
- **`justify`** (*) -- text alignment. Default: `center`.
- **`separate_rows`** (*) -- boolean specifying if row separator will be displayed between consecutive rows. Default: True.
- **`prefix`** (*) -- character at the beginning of the row. Default: `"| "`.
- **`suffix`** (*) -- character at the end of the row. Default: `" |"`.

- **width** (*) -- column max width. Default: `50`.
- **rows_key** (*) -- display the rows under a specific key.
- **labels_key** (*) -- use the labels under a certain key. Otherwise will try to use the dictionary keys (if any).
- **title** (*) -- display title when only one table is selected (using the `rows_key` argument).

26.11.10 salt.output.txt

Simple text outputter

The `txt` outputter has been developed to make the output from shell commands on minions appear as they do when the command is executed on the minion.

CLI Example:

```
salt '*' foo.bar --out=txt
```

`salt.output.txt.`**`output`**`(`*data*, ***kwargs*`)`

Output the data in lines, very nice for running commands

26.11.11 salt.output.yaml_out

Display return data in YAML format

This outputter defaults to printing in YAML block mode for better readability.

CLI Example:

```
salt '*' foo.bar --out=yaml
```

Example output:

CLI Example:

```
saltmine:
  foo:
    bar: baz
    dictionary:
      abc: 123
      def: 456
    list:
      - Hello
      - World
```

`salt.output.yaml_out.`**`output`**`(`*data*, ***kwargs*`)`

Print out YAML using the block mode

26.12 pillar modules

cmd_json	Execute a command and read the output as JSON.
cmd_yaml	Execute a command and read the output as YAML.
extra_minion_data_in_pillar	Add all extra minion data to the pillar.
file_tree	The `file_tree` external pillar allows values from all files in a directory tree to be imported as Pillar data.
git_pillar	Use a git repository as a Pillar source
gpg	Decrypt pillar data through the builtin GPG renderer
nodegroups	Nodegroups Pillar
postgres	Retrieve Pillar data by doing a postgres query
sql_base	Retrieve Pillar data by doing a SQL query

26.12.1 salt.pillar.cmd_json

Execute a command and read the output as JSON. The JSON data is then directly overlaid onto the minion's Pillar data.

Configuring the CMD_JSON ext_pillar

Set the following Salt config to setup cmd json result as external pillar source:

```
ext_pillar:
  - cmd_json: 'echo {"arg":"value"}'
```

This will run the command `echo {arg: value}` on the master.

Module Documentation

`salt.pillar.cmd_json.`**`ext_pillar`**`(`*minion_id, pillar, command*`)`

Execute a command and read the output as JSON

26.12.2 salt.pillar.cmd_yaml

Execute a command and read the output as YAML. The YAML data is then directly overlaid onto the minion's Pillar data

`salt.pillar.cmd_yaml.`**`ext_pillar`**`(`*minion_id, pillar, command*`)`

Execute a command and read the output as YAML

26.12.3 salt.pillar.extra_minion_data_in_pillar

Add all extra minion data to the pillar.

codeauthor
Alexandru.Bleotu@morganstanley.ms.com

One can filter on the keys to include in the pillar by using the `include` parameter. For subkeys the ':' notation is supported (i.e. 'key:subkey') The keyword `<all>` includes all keys.

Complete example in etc/salt/master

```
ext_pillar:
  - extra_minion_data_in_pillar:
      include: *

ext_pillar:
  - extra_minion_data_in_pillar:
      include:
          - key1
          - key2:subkey2

ext_pillar:
  - extra_minion_data_in_pillar:
      include: <all>
```

`salt.pillar.extra_minion_data_in_pillar.`**`ext_pillar`**(*minion_id*, *pillar*, *include*, *extra_minion_data=None*)

26.12.4 salt.pillar.file_tree

The `file_tree` external pillar allows values from all files in a directory tree to be imported as Pillar data.

Note: This is an external pillar and is subject to the *rules and constraints* governing external pillars.

New in version 2015.5.0.

In this pillar, data is organized by either Minion ID or Nodegroup name. To setup pillar data for a specific Minion, place it in `<root_dir>/hosts/<minion_id>`. To setup pillar data for an entire Nodegroup, place it in `<root_dir>/nodegroups/<node_group>` where `<node_group>` is the Nodegroup's name.

Example `file_tree` Pillar

Master Configuration

```
ext_pillar:
  - file_tree:
      root_dir: /srv/ext_pillar
      follow_dir_links: False
      keep_newline: True
```

The `root_dir` parameter is required and points to the directory where files for each host are stored. The `follow_dir_links` parameter is optional and defaults to False. If `follow_dir_links` is set to True, this external pillar will follow symbolic links to other directories.

Warning: Be careful when using `follow_dir_links`, as a recursive symlink chain will result in unexpected results.

Changed in version 2018.3.0: If `root_dir` is a relative path, it will be treated as relative to the *`pillar_roots`* of the environment specified by *`pillarenv`*. If an environment specifies multiple roots, this module will search for files relative to all of them, in order, merging the results.

If `keep_newline` is set to `True`, then the pillar values for files ending in newlines will keep that newline. The default behavior is to remove the end-of-file newline. `keep_newline` should be turned on if the pillar data is intended to be used to deploy a file using `contents_pillar` with a *`file.managed`* state.

Changed in version 2015.8.4: The `raw_data` parameter has been renamed to `keep_newline`. In earlier releases, `raw_data` must be used. Also, this parameter can now be a list of globs, allowing for more granular control over which pillar values keep their end-of-file newline. The globs match paths relative to the directories named for minion IDs and nodegroups underneath the `root_dir` (see the layout examples in the below sections).

```yaml
ext_pillar:
  - file_tree:
      root_dir: /path/to/root/directory
      keep_newline:
        - files/testdir/*
```

Note: In earlier releases, this documentation incorrectly stated that binary files would not affected by the `keep_newline` configuration. However, this module does not actually distinguish between binary and text files.

Changed in version 2017.7.0: Templating/rendering has been added. You can now specify a default render pipeline and a black- and whitelist of (dis)allowed renderers.

`template` must be set to `True` for templating to happen.

```yaml
ext_pillar:
  - file_tree:
    root_dir: /path/to/root/directory
    render_default: jinja|yaml
    renderer_blacklist:
      - gpg
    renderer_whitelist:
      - jinja
      - yaml
    template: True
```

Assigning Pillar Data to Individual Hosts

To configure pillar data for each host, this external pillar will recursively iterate over `root_dir`/hosts/`id` (where `id` is a minion ID), and compile pillar data with each subdirectory as a dictionary key and each file as a value.

For example, the following `root_dir` tree:

```
./hosts/
./hosts/test-host/
./hosts/test-host/files/
./hosts/test-host/files/testdir/
./hosts/test-host/files/testdir/file1.txt
./hosts/test-host/files/testdir/file2.txt
./hosts/test-host/files/another-testdir/
./hosts/test-host/files/another-testdir/symlink-to-file1.txt
```

will result in the following pillar tree for minion with ID `test-host`:

```
test-host:
    ----------
    apache:
        ----------
        config.d:
            ----------
            00_important.conf:
                <important_config important_setting="yes" />
            20_bob_extra.conf:
                <bob_specific_cfg has_freeze_ray="yes" />
    corporate_app:
        ----------
        settings:
            ----------
            common_settings:
                // This is the main settings file for the corporate
                // internal web app
                main_setting: probably
            bob_settings:
                role: bob
```

Note: The leaf data in the example shown is the contents of the pillar files.

`salt.pillar.file_tree.`**`ext_pillar`**(*minion_id*, *pillar*, *root_dir=None*, *follow_dir_links=False*, *debug=False*, *keep_newline=False*, *render_default=None*, *renderer_blacklist=None*, *renderer_whitelist=None*, *template=False*)

Compile pillar data from the given `root_dir` specific to Nodegroup names and Minion IDs.

If a Minion's ID is not found at `<root_dir>/host/<minion_id>` or if it is not included in any Nodegroups named at `<root_dir>/nodegroups/<node_group>`, no pillar data provided by this pillar module will be available for that Minion.

Changed in version 2017.7.0: Templating/rendering has been added. You can now specify a default render pipeline and a black- and whitelist of (dis)allowed renderers.

`template` must be set to `True` for templating to happen.

```
ext_pillar:
  - file_tree:
    root_dir: /path/to/root/directory
    render_default: jinja|yaml
    renderer_blacklist:
      - gpg
    renderer_whitelist:
      - jinja
      - yaml
    template: True
```

Parameters

- **`minion_id`** -- The ID of the Minion whose pillar data is to be collected
- **`pillar`** -- Unused by the `file_tree` pillar module
- **`root_dir`** -- Filesystem directory used as the root for pillar data (e.g. `/srv/ext_pillar`)

  Changed in version 2018.3.0: If `root_dir` is a relative path, it will be treated as relative to the *`pillar_roots`* of the environment specified by *`pillarenv`*. If an environment specifies multiple roots, this module will search for files relative to all of them, in order, merging the results.
- **`follow_dir_links`** -- Follow symbolic links to directories while collecting pillar files. Defaults to `False`.

  > **Warning:** Care should be exercised when enabling this option as it will follow links that point outside of `root_dir`.

  > **Warning:** Symbolic links that lead to infinite recursion are not filtered.
- **`debug`** -- Enable debug information at log level `debug`. Defaults to `False`. This option may be useful to help debug errors when setting up the `file_tree` pillar module.
- **`keep_newline`** -- Preserve the end-of-file newline in files. Defaults to `False`. This option may either be a boolean or a list of file globs (as defined by the Python fnmatch package) for which end-of-file newlines are to be kept.

  `keep_newline` should be turned on if the pillar data is intended to be used to deploy a file using `contents_pillar` with a *`file.managed`* state.

  Changed in version 2015.8.4: The `raw_data` parameter has been renamed to `keep_newline`. In earlier releases, `raw_data` must be used. Also, this parameter can now be a list of globs, allowing for more granular control over which pillar values keep their end-of-file newline. The globs match paths relative to the directories named for Minion IDs and Nodegroup namess underneath the `root_dir`.

  ```
  ext_pillar:
    - file_tree:
        root_dir: /srv/ext_pillar
        keep_newline:
          - apache/config.d/*
          - corporate_app/settings/*
  ```

Note: In earlier releases, this documentation incorrectly stated that binary files would not affected by the `keep_newline`. However, this module does not actually distinguish between binary and text files.

- **`render_default`** -- Override Salt's *`default global renderer`* for the `file_tree` pillar.

```
render_default: jinja
```

- **`renderer_blacklist`** -- Disallow renderers for pillar files.

```
renderer_blacklist:
  - json
```

- **`renderer_whitelist`** -- Allow renderers for pillar files.

```
renderer_whitelist:
  - yaml
  - jinja
```

- **`template`** -- Enable templating of pillar files. Defaults to `False`.

26.12.5 salt.pillar.git_pillar

Use a git repository as a Pillar source

This external pillar allows for a Pillar top file and Pillar SLS files to be sourced from a git repository.

However, since git_pillar does not have an equivalent to the *`pillar_roots`* parameter, configuration is slightly different. A Pillar top file is required to be in the git repository and must still contain the relevant environment, like so:

```
base:
  '*':
    - foo
```

The branch/tag which maps to that environment must then be specified along with the repo's URL. Configuration details can be found below.

Important: Each branch/tag used for git_pillar must have its own top file. This is different from how the top file works when configuring *States*. The reason for this is that each git_pillar branch/tag is processed separately from the rest. Therefore, if the `qa` branch is to be used for git_pillar, it would need to have its own top file, with the `qa` environment defined within it, like this:

```
qa:
  'dev-*':
    - bar
```

Additionally, while git_pillar allows for the branch/tag to be overridden (see *here*), keep in mind that the top file must reference the actual environment name. It is common practice to make the environment in a git_pillar top file match the branch/tag name, but when remapping, the environment of course no longer matches the branch/tag, and the top file needs to be adjusted accordingly. When expected Pillar values configured in git_pillar are missing, this is a common misconfiguration that may be to blame, and is a good first step in troubleshooting.

Configuring git_pillar for Salt

Beginning with Salt version 2015.8.0, pygit2 is now supported in addition to GitPython. The requirements for GitPython and pygit2 are the same as for GitFS, as described *here*.

Important: git_pillar has its own set of global configuration parameters. While it may seem intuitive to use the global gitfs configuration parameters (`gitfs_base`, etc.) to manage git_pillar, this will not work. The main difference for this is the fact that the different components which use Salt's git backend code do not all function identically. For instance, in git_pillar it is necessary to specify which branch/tag to be used for git_pillar remotes. This is the reverse behavior from gitfs, where branches/tags make up your environments.

See *here* for documentation on the git_pillar configuration options and their usage.

Here is an example git_pillar configuration:

```
ext_pillar:
  - git:
    # Use 'prod' instead of the branch name 'production' as the environment
    - production https://gitserver/git-pillar.git:
      - env: prod
    # Use 'dev' instead of the branch name 'develop' as the environment
    - develop https://gitserver/git-pillar.git:
      - env: dev
    # No per-remote config parameters (and no trailing colon), 'qa' will
    # be used as the environment
    - qa https://gitserver/git-pillar.git
    # SSH key authentication
    - master git@other-git-server:pillardata-ssh.git:
      # Pillar SLS files will be read from the 'pillar' subdirectory in
      # this repository
      - root: pillar
      - privkey: /path/to/key
      - pubkey: /path/to/key.pub
      - passphrase: CorrectHorseBatteryStaple
    # HTTPS authentication
    - master https://other-git-server/pillardata-https.git:
      - user: git
      - password: CorrectHorseBatteryStaple
```

The main difference between this and the old way of configuring git_pillar is that multiple remotes can be configured under one `git` section under `ext_pillar`. More than one `git` section can be used, but it is not necessary. Remotes will be evaluated sequentially.

Per-remote configuration parameters are supported (similar to *gitfs*), and global versions of the git_pillar configuration parameters can also be set.

To remap a specific branch to a specific Pillar environment, use the `env` per-remote parameter:

```
ext_pillar:
  - git:
    - production https://gitserver/git-pillar.git:
      - env: prod
```

If `__env__` is specified as the branch name, then git_pillar will decide which branch to use based on the following criteria:

- If the minion has a *pillarenv* configured, it will use that pillar environment. (2016.11.2 and later)
- Otherwise, if the minion has an `environment` configured, it will use that environment.
- Otherwise, the master's *git_pillar_base* will be used.

Note: The use of *environment* to choose the pillar environment dates from a time before the *pillarenv* parameter was added. In a future release, it will be ignored and either the minion's *pillarenv* or the master's *git_pillar_base* will be used.

Here's an example of using `__env__` as the git_pillar environment:

```
ext_pillar:
  - git:
    - __env__ https://gitserver/git-pillar.git:
      - root: pillar
```

The corresponding Pillar top file would look like this:

```
"{{saltenv}}":
  '*':
    - bar
```

With the addition of pygit2 support, git_pillar can now interact with authenticated remotes. Authentication works just like in gitfs (as outlined in the *Git Fileserver Backend Walkthrough*), only with the global authentication parameter names prefixed with `git_pillar` instead of `gitfs` (e.g. *git_pillar_pubkey*, *git_pillar_privkey*, *git_pillar_passphrase*, etc.).

Note: The `name` parameter can be used to further differentiate between two remotes with the same URL and branch. When using two remotes with the same URL, the `name` option is required.

How Multiple Remotes Are Handled

As noted above, multiple remotes can be included in the same `git` ext_pillar configuration. Consider the following:

```
my_etcd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001

ext_pillar:
  - etcd: my_etcd_config
  - git:
    - master https://mydomain.tld/foo.git:
      - root: pillar
    - master https://mydomain.tld/bar.git
    - master https://mydomain.tld/baz.git
    - dev https://mydomain.tld/qux.git
  - git:
    - master https://mydomain.tld/abc.git
    - dev https://mydomain.tld/123.git
```

To understand how pillar data from these repos will be compiled, it's important to know how Salt will process them. The following points should be kept in mind:

1. Each ext_pillar is called separately from the others. So, in the above example, the `etcd` ext_pillar will be evaluated first, with the first group of git_pillar remotes evaluated next (and merged into the etcd pillar data). Lastly, the second group of git_pillar remotes will be evaluated, and then merged into the ext_pillar data evaluated before it.
2. Within a single group of git_pillar remotes, each remote will be evaluated in order, with results merged together as each remote is evaluated.

   Note: Prior to the 2017.7.0 release, remotes would be evaluated in a non-deterministic order.

   ---

3. By default, when a repo is evaluated, other remotes' which share its pillar environment will have their files made available to the remote being processed.

The first point should be straightforward enough, but the second and third could use some additional clarification.

First, point #2. In the first group of git_pillar remotes, the top file and pillar SLS files in the `foo` remote will be evaluated first. The `bar` remote will be evaluated next, and its results will be merged into the pillar data compiled when the `foo` remote was evaluated. As the subsequent remotes are evaluated, their data will be merged in the same fashion.

But wait, don't these repositories belong to more than one pillar environments? Well, yes. The default method of generating pillar data compiles pillar data from all environments. This behavior can be overridden using a `pillarenv`. Setting a *`pillarenv`* in the minion config file will make that minion tell the master to ignore any pillar data from environments which don't match that pillarenv. A pillarenv can also be specified for a given minion or set of minions when *`running states`*, by using the `pillarenv` argument. The CLI pillarenv will override one set in the minion config file. So, assuming that a pillarenv of `base` was set for a minion, it would not get any of the pillar variables configured in the `qux` remote, since that remote is assigned to the `dev` environment. The only way to get its pillar data would be to specify a pillarenv of `dev`, which would mean that it would then ignore any items from the `base` pillarenv. A more detailed explanation of pillar environments can be found *here*.

Moving on to point #3, and looking at the example ext_pillar configuration, as the `foo` remote is evaluated, it will also have access to the files from the `bar` and `baz` remotes, since all three are assigned to the `base` pillar environment. So, if an SLS file referenced by the `foo` remotes's top file does not exist in the `foo` remote, it will be searched for in the `bar` remote, followed by the `baz` remote. When it comes time to evaluate the `bar` remote, SLS files referenced by the `bar` remote's top file will first be looked for in the `bar` remote, followed by `foo`, and `baz`, and when the `baz` remote is processed, SLS files will be looked for in `baz`, followed by `foo` and `bar`. This "failover" logic is called a *directory overlay*, and it is also used by *`file_roots`* and :conf_minion`pillar_roots`. The ordering of which remote is checked for SLS files is determined by the order they are listed. First the remote being processed is checked, then the others that share the same environment are checked. However, before the 2017.7.0 release, since evaluation was unordered, the remote being processed would be checked, followed in no specific order by the other repos which share the same environment.

Beginning with the 2017.7.0 release, this behavior of git_pillar remotes having access to files in other repos which share the same environment can be disabled by setting *`git_pillar_includes`* to `False`. If this is done, then all git_pillar remotes will only have access to their own SLS files. Another way of ensuring that a git_pillar remote will not have access to SLS files from other git_pillar remotes which share the same pillar environment is to put them in a separate `git` section under `ext_pillar`. Look again at the example configuration above. In the second group of git_pillar remotes, the `abc` remote would not have access to the SLS files from the `foo`, `bar`, and `baz` remotes, and vice-versa.

Mountpoints

New in version 2017.7.0.

Assume the following pillar top file:

```
base:
  'web*':
    - common
    - web.server.nginx
    - web.server.appdata
```

Now, assume that you would like to configure the `web.server.nginx` and `web.server.appdata` SLS files in separate repos. This could be done using the following ext_pillar configuration (assuming that *`git_pillar_includes`* has not been set to `False`):

```
ext_pillar:
  - git:
    - master https://mydomain.tld/pillar-common.git
    - master https://mydomain.tld/pillar-nginx.git
    - master https://mydomain.tld/pillar-appdata.git
```

However, in order to get the files in the second and third git_pillar remotes to work, you would need to first create the directory structure underneath it (i.e. place them underneath `web/server/` in the repository). This also makes it tedious to reorganize the configuration, as changing `web.server.nginx` to `web.nginx` in the top file would require you to also move the SLS files in the `pillar-nginx` up a directory level.

For these reasons, much like gitfs, git_pillar now supports a "mountpoint" feature. Using the following ext_pillar configuration, the SLS files in the second and third git_pillar remotes can be placed in the root of the git repository:

```
ext_pillar:
  - git:
    - master https://mydomain.tld/pillar-common.git
    - master https://mydomain.tld/pillar-nginx.git:
      - mountpoint: web/server/
    - master https://mydomain.tld/pillar-appdata.git:
      - mountpoint: web/server/
```

Now, if the top file changed the SLS target from `web.server.nginx`, instead of reorganizing the git repository, you would just need to adjust the mountpoint to `web/` (and restart the `salt-master` daemon).

Note:

- Leading and trailing slashes on the mountpoints are optional.
- Use of the `mountpoint` feature requires that *`git_pillar_includes`* is not disabled.
- Content from mounted git_pillar repos can only be referenced by a top file in the same pillar environment.
- Salt versions prior to 2018.3.4 ignore the `root` parameter when `mountpoint` is set.

---

all_saltenvs

New in version 2018.3.4.

When `__env__` is specified as the branch name, `all_saltenvs` per-remote configuration parameter overrides the logic Salt uses to map branches/tags to pillar environments (i.e. pillarenvs). This allows a single branch/tag to appear in all saltenvs. Example:

```
ext_pillar:
  - git:
    - __env__ https://mydomain.tld/top.git
      - all_saltenvs: master
    - __env__ https://mydomain.tld/pillar-nginx.git:
      - mountpoint: web/server/
    - __env__ https://mydomain.tld/pillar-appdata.git:
      - mountpoint: web/server/
```

git_pillar_update_interval

New in version 3000.

This option defines the default update interval (in seconds) for git_pillar remotes. The update is handled within the global loop, hence `git_pillar_update_interval` should be a multiple of `loop_interval`.

```
git_pillar_update_interval: 120
```

fallback

New in version 3001.

Setting `fallback` per-remote or global configuration parameter will map non-existing environments to a default branch. Example:

```
ext_pillar:
  - git:
    - __env__ https://mydomain.tld/top.git
      - all_saltenvs: master
    - __env__ https://mydomain.tld/pillar-nginx.git:
      - mountpoint: web/server/
      - fallback: master
    - __env__ https://mydomain.tld/pillar-appdata.git:
      - mountpoint: web/server/
      - fallback: master
```

`salt.pillar.git_pillar.`**`ext_pillar`**`(`*minion_id, pillar, *repos*`)`

Checkout the ext_pillar sources and compile the resulting pillar SLS

26.12.6 salt.pillar.gpg

Decrypt pillar data through the builtin GPG renderer

In most cases, you'll want to make this the last external pillar used. For example, to pair with the builtin stack pillar you could do something like this:

```
ext_pillar:
  - stack: /path/to/stack.cfg
  - gpg: {}
```

Set `gpg_keydir` in your config to adjust the homedir the renderer uses.

`salt.pillar.gpg.`**`ext_pillar`**(*minion_id*, *pillar*, **args*, ***kwargs*)

26.12.7 salt.pillar.nodegroups

Nodegroups Pillar

Introspection: to which nodegroups does my minion belong? Provides a pillar with the default name of *nodegroups* which contains a list of nodegroups which match for a given minion.

New in version 2016.11.0.

Command Line

```
salt-call pillar.get nodegroups
local:
    - class_infra
    - colo_sj
    - state_active
    - country_US
    - type_saltmaster
```

Configuring Nodegroups Pillar

```
extension_modules: /srv/salt/ext
ext_pillar:
  - nodegroups:
      pillar_name: 'nodegroups'
```

`salt.pillar.nodegroups.`**`ext_pillar`**(*minion_id*, *pillar*, *pillar_name=None*)

A salt external pillar which provides the list of nodegroups of which the minion is a member.

Parameters

- **`minion_id`** -- used for compound matching nodegroups
- **`pillar`** -- provided by salt, but not used by nodegroups ext_pillar
- **`pillar_name`** -- optional name to use for the pillar, defaults to 'nodegroups'

Returns

a dictionary which is included by the salt master in the pillars returned to the minion

26.12.8 salt.pillar.postgres

Retrieve Pillar data by doing a postgres query

New in version 2017.7.0.

maturity
new

depends
psycopg2

platform
all

Complete Example

```
postgres:
  user: 'salt'
  pass: 'super_secret_password'
  db: 'salt_db'

ext_pillar:
  - postgres:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                  FROM some_random_table
                 WHERE minion_pattern LIKE %s'
        depth: 5
        as_list: True
        with_lists: [1,3]
```

class `salt.pillar.postgres.`**`POSTGRESExtPillar`**

This class receives and processes the database rows from POSTGRES.

`extract_queries`(*args, kwargs*)

This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

`salt.pillar.postgres.`**`ext_pillar`**(*minion_id, pillar, *args, **kwargs*)

Execute queries against POSTGRES, merge and return as a dict

26.12.9 salt.pillar.sql_base

Retrieve Pillar data by doing a SQL query

This module is not meant to be used directly as an ext_pillar. It is a place to put code common to PEP 249 compliant SQL database adapters. It exposes a python ABC that can be subclassed for new database providers.

maturity
new

platform
all

Theory of sql_base ext_pillar

Ok, here's the theory for how this works...

- First, any non-keyword args are processed in order.
- Then, remaining keywords are processed.

We do this so that it's backward compatible with older configs. Keyword arguments are sorted before being appended, so that they're predictable, but they will always be applied last so overall it's moot.

For each of those items we process, it depends on the object type:

- Strings are executed as is and the pillar depth is determined by the number of fields returned.
- A list has the first entry used as the query, the second as the pillar depth.
- A mapping uses the keys "query" and "depth" as the tuple

You can retrieve as many fields as you like, how they get used depends on the exact settings.

Configuring a sql_base ext_pillar

The sql_base ext_pillar cannot be used directly, but shares query configuration with its implementations. These examples use a fake 'sql_base' adapter, which should be replaced with the name of the adapter you are using.

A list of queries can be passed in

```
ext_pillar:
  - sql_base:
      - "SELECT pillar,value FROM pillars WHERE minion_id = %s"
      - "SELECT pillar,value FROM more_pillars WHERE minion_id = %s"
```

Or you can pass in a mapping

```
ext_pillar:
  - sql_base:
      main: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
      extras: "SELECT pillar,value FROM more_pillars WHERE minion_id = %s"
```

The query can be provided as a string as we have just shown, but they can be provided as lists

```
ext_pillar:
  - sql_base:
      - "SELECT pillar,value FROM pillars WHERE minion_id = %s"
        2
```

Or as a mapping

```
ext_pillar:
  - sql_base:
      - query: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
        depth: 2
```

The depth defines how the dicts are constructed. Essentially if you query for fields a,b,c,d for each row you'll get:

- With depth 1: {a: {"b": b, "c": c, "d": d}}
- With depth 2: {a: {b: {"c": c, "d": d}}}

- With depth 3: {a: {b: {c: d}}}

Depth greater than 3 wouldn't be different from 3 itself. Depth of 0 translates to the largest depth needed, so 3 in this case. (max depth == key count - 1)

Then they are merged in a similar way to plain pillar data, in the order returned by the SQL database.

Thus subsequent results overwrite previous ones when they collide.

The ignore_null option can be used to change the overwrite behavior so that only non-NULL values in subsequent results will overwrite. This can be used to selectively overwrite default values.

```
ext_pillar:
  - sql_base:
      - query: "SELECT pillar,value FROM pillars WHERE minion_id = 'default' and minion_id != %s"
        depth: 2
      - query: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
        depth: 2
        ignore_null: True
```

If you specify *as_list: True* in the mapping expression it will convert collisions to lists.

If you specify *with_lists: '...'* in the mapping expression it will convert the specified depths to list. The string provided is a sequence numbers that are comma separated. The string '1,3' will result in:

```
a,b,c,d,e,1  # field 1 same, field 3 differs
a,b,c,f,g,2  # ^^^^
a,z,h,y,j,3  # field 1 same, field 3 same
a,z,h,y,k,4  # ^^^^
  ^   ^
```

These columns define list grouping

```
{a: [
      {c: [
          {e: 1},
          {g: 2}
          ]
      },
      {h: [
          {j: 3, k: 4 }
          ]
      }
]}
```

The range for with_lists is 1 to number_of_fields, inclusive. Numbers outside this range are ignored.

If you specify *as_json: True* in the mapping expression and query only for single value, returned data are considered in JSON format and will be merged directly.

```
ext_pillar:
  - sql_base:
      - query: "SELECT json_pillar FROM pillars WHERE minion_id = %s"
        as_json: True
```

The processed JSON entries are recursively merged in a single dictionary. Additionnaly if *as_list* is set to *True* the lists will be merged in case of collision.

For instance the following rows:

> {"a": {"b": [1, 2]}, "c": 3} {"a": {"b": [1, 3]}, "d": 4}

will result in the following pillar with *as_list=False*

> {"a": {"b": [1, 3], "c": 3, "d": 4}

and in with *as_list=True*

> {"a": {"b": [1, 2, 3], "c": 3, "d": 4}

Finally, if you pass the queries in via a mapping, the key will be the first level name where as passing them in as a list will place them in the root. This isolates the query results into their own subtrees. This may be a help or hindrance to your aims and can be used as such.

You can basically use any SELECT query that gets you the information, you could even do joins or subqueries in case your minion_id is stored elsewhere. It is capable of handling single rows or multiple rows per minion.

Configuration of the connection depends on the adapter in use.

New in version 3005: The *as_json* parameter.

More complete example for MySQL (to also show configuration)

```
mysql:
  user: 'salt'
  pass: 'super_secret_password'
  db: 'salt_db'

ext_pillar:
  - mysql:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                   FROM some_random_table
                  WHERE minion_pattern LIKE %s'
        depth: 5
        as_list: True
        with_lists: [1,3]
```

class `salt.pillar.sql_base.`**`SqlBaseExtPillar`**

This class receives and processes the database rows in a database agnostic way.

`as_json = False`

`as_list = False`

`depth = 0`

`enter_root`(*root*)

Set self.focus for kwarg queries

`extract_queries`(*args, kwargs*)

This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

`fetch`(*minion_id, pillar, *args, **kwargs*)

Execute queries, merge and return as a dict.

field_names = None

focus = None

ignore_null = False

num_fields = 0

process_fields(*field_names*, *depth*)

The primary purpose of this function is to store the sql field list and the depth to which we process.

process_results(*rows*)

This function takes a list of database results and iterates over, merging them into a dict form.

result = None

with_lists = None

26.13 proxy modules

deltaproxy	This is the "master" deltaproxy minion, known better as the *control proxy* because it controls all the deltaproxies underneath it.
dummy	This is the a dummy proxy-minion designed for testing the proxy minion subsystem.

26.13.1 salt.proxy.deltaproxy

This is the "master" deltaproxy minion, known better as the *control proxy* because it controls all the deltaproxies underneath it.

salt.proxy.deltaproxy.**grains**()

Make up some grains

salt.proxy.deltaproxy.**grains_refresh**()

Refresh the grains

salt.proxy.deltaproxy.**init**(*opts*)

salt.proxy.deltaproxy.**initialized**()

Since grains are loaded in many different places and some of those ws places occur before the proxy can be initialized, return whether our init() function has been called

salt.proxy.deltaproxy.**ping**()

Degenerate ping

salt.proxy.deltaproxy.**shutdown**(*opts*)

For this proxy shutdown is a no-op

26.13.2 salt.proxy.dummy

This is the a dummy proxy-minion designed for testing the proxy minion subsystem.

`salt.proxy.dummy.`**`fns`**`()`

Method called by grains module.

`salt.proxy.dummy.`**`grains`**`()`

Make up some grains

`salt.proxy.dummy.`**`grains_refresh`**`()`

Refresh the grains

`salt.proxy.dummy.`**`init`**`(`*opts*`)`

Required. Can be used to initialize the server connection.

`salt.proxy.dummy.`**`initialized`**`()`

Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our init() function has been called

`salt.proxy.dummy.`**`package_install`**`(`*name*, ***kwargs*`)`

Install a ”package” on the REST server

`salt.proxy.dummy.`**`package_list`**`()`

List ”packages” installed on the REST server

`salt.proxy.dummy.`**`package_remove`**`(`*name*`)`

Remove a ”package” on the REST server

`salt.proxy.dummy.`**`package_status`**`(`*name*`)`

Check the installation status of a package on the REST server

`salt.proxy.dummy.`**`ping`**`()`

Degenerate ping

`salt.proxy.dummy.`**`service_list`**`()`

List ”services” on the REST server

`salt.proxy.dummy.`**`service_restart`**`(`*name*`)`

Restart a ”service” on the REST server

`salt.proxy.dummy.`**`service_start`**`(`*name*`)`

Start a ”service” on the dummy server

`salt.proxy.dummy.`**`service_status`**`(`*name*`)`

Check if a service is running on the REST server

`salt.proxy.dummy.`**`service_stop`**`(`*name*`)`

Stop a ”service” on the dummy server

`salt.proxy.dummy.`**`shutdown`**`(`*opts*`)`

For this proxy shutdown is a no-op

`salt.proxy.dummy.`**`test_from_state`**`()`

Test function so we have something to call from a state :return:

`salt.proxy.dummy.`**`upgrade`**`()`

”Upgrade” packages

`salt.proxy.dummy.`**`uptodate`**`()`

Call the REST endpoint to see if the packages on the "server" are up to date.

26.14 queue modules

26.15 roster modules

ansible	Read in an Ansible inventory file or script.
cache	The `cache` roster provides a flexible interface to the Salt Masters' minion cache to access regular minions over `salt-ssh`.
dir	Create a salt roster out of a flat directory of files.
flat	Read in the roster from a flat file using the renderer system
range	This roster resolves targets from a range server.
scan	Scan a netmask or ipaddr for open ssh ports
sshconfig	Parses roster entries out of Host directives from SSH config
sshknownhosts	Parses roster entries out of Host directives from SSH known_hosts

26.15.1 salt.roster.ansible

Read in an Ansible inventory file or script.

Flat inventory files should be in the regular ansible inventory format.

```
# /tmp/example_roster
[servers]
salt.gtmanfred.com ansible_ssh_user=gtmanfred ansible_ssh_host=127.0.0.1
↪ansible_ssh_port=22 ansible_ssh_pass='password' ansible_sudo_pass='password'

[desktop]
home ansible_ssh_user=gtmanfred ansible_ssh_host=12.34.56.78 ansible_ssh_
↪port=23 ansible_ssh_pass='password' ansible_sudo_pass='password'

[computers:children]
desktop
servers

[computers:vars]
http_port=80
```

then salt-ssh can be used to hit any of them

```
[~]# salt-ssh --roster=ansible --roster-file=/tmp/example_roster -N all test.
↪ping
salt.gtmanfred.com:
    True
home:
    True
[~]# salt-ssh --roster=ansible --roster-file=/tmp/example_roster -N desktop
↪test.ping
home:
    True
[~]# salt-ssh --roster=ansible --roster-file=/tmp/example_roster -N computers
↪test.ping
salt.gtmanfred.com:
    True
home:
    True
[~]# salt-ssh --roster=ansible --roster-file=/tmp/example_roster salt.
↪gtmanfred.com test.ping
salt.gtmanfred.com:
    True
```

There is also the option of specifying a dynamic inventory, and generating it on the fly

```
#!/bin/bash
# filename: /etc/salt/hosts
echo '{
    "servers": [
        "salt.gtmanfred.com"
    ],
    "desktop": [
        "home"
    ],
    "computers": {
        "hosts": [],
        "children": [
            "desktop",
            "servers"
        ],
        "vars": {
            "http_port": 80
        }
    },
    "_meta": {
        "hostvars": {
            "salt.gtmanfred.com": {
                "ansible_ssh_user": "gtmanfred",
                "ansible_ssh_host": "127.0.0.1",
                "ansible_sudo_pass": "password",
                "ansible_ssh_pass": "password",
                "ansible_ssh_port": 22
            },
            "home": {
                "ansible_ssh_user": "gtmanfred",
```

(continues on next page)

(continued from previous page)

```
                "ansible_ssh_host": "12.34.56.78",
                "ansible_sudo_pass": "password",
                "ansible_ssh_pass": "password",
                "ansible_ssh_port": 23
            }
        }
    }
}'
```

This is the format that an inventory script needs to output to work with ansible, and thus here.

```
[~]# salt-ssh --roster=ansible --roster-file /etc/salt/hosts salt.gtmanfred.
↪com test.ping
salt.gtmanfred.com:
        True
```

Note: A dynamic inventory script must have the executable bit set. In the above example, `chmod +x /etc/salt/hosts`.

Any of the [groups] or direct hostnames will return. The 'all' is special, and returns everything.

`salt.roster.ansible.`**`targets`**(*tgt*, *tgt_type='glob'*, ***kwargs*)

Return the targets from the ansible inventory_file Default: /etc/salt/roster

26.15.2 salt.roster.cache

The `cache` roster provides a flexible interface to the Salt Masters' minion cache to access regular minions over `salt-ssh`.

New in version 2017.7.0:

- grains, pillar, mine data matching
- SDB URLs
- IPv6 support
- roster_order per config key
- default order changed to industry-wide best practices
- CIDR range selection

Targeting

This roster supports all matching and targeting of the Salt Master. The matching will be done using only the Salt Master's cache.

The Roster Order

The roster's composition can be configured using `roster_order`. In the `roster_order` you can define *any* roster key and fill it with a parameter overriding the one in `roster_defaults`:

```
roster_order:
    host: id          # use the minion id as hostname
```

You can define lists of parameters as well, the first result from the list will become the value.

Selecting a host

```
# default
roster_order:
    host:
      - ipv6-private  # IPv6 addresses in private ranges
      - ipv6-global   # IPv6 addresses in global ranges
      - ipv4-private  # IPv4 addresses in private ranges
      - ipv4-public   # IPv4 addresses in public ranges
      - ipv4-local    # loopback addresses
```

This is the default `roster_order`. It prefers IPv6 over IPv4 addresses and private addresses over public ones. The relevant data will be fetched from the cache in-order, and the first match will fill the `host` key.

Other address selection parameters are also possible:

```
roster_order:
  host:
    - global|public|private|local    # Both IPv6 and IPv4 addresses in that
↪range
    - 2000::/3                       # CIDR networks, both IPv4 and IPv6 are
↪supported
```

Using cached data

Several cached libraries can be selected using the ```library: `` prefix, followed by the library key. This can be referenced using the same ``:``` syntax as e.g. *pillar.get*. Lists of references are also supported during the lookup, as are Salt SDB URLs.

This should be especially useful for the other roster keys:

```
roster_order:
  host:
    - grain: fqdn_ip4                # Lookup this grain
    - mine: network.ip_addrs         # Mine data lookup works the same

  password: sdb://vault/ssh_pass     # Salt SDB URLs are also supported

  user:
    - pillar: ssh:auth:user          # Lookup this pillar key
    - sdb://osenv/USER               # Lookup this env var through sdb

```

(continues on next page)

(continued from previous page)

```
priv:
  - pillar:                        # Lists are also supported
      - salt:ssh:private_key
      - ssh:auth:private_key
```

`salt.roster.cache.`**`targets`**(*tgt*, *tgt_type='glob'*, ***kwargs*)

Return the targets from the Salt Masters' minion cache. All targets and matchers are supported.

The resulting roster can be configured using `roster_order` and `roster_default`.

26.15.3 salt.roster.dir

Create a salt roster out of a flat directory of files.

Each filename in the directory is a minion id. The contents of each file is rendered using the salt renderer system.

Consider the following configuration for example:

config/master:

... roster: dir roster_dir: config/roster.d ...

Where the directory config/roster.d contains two files:

config/roster.d/minion-x:

host: minion-x.example.com port: 22 sudo: true user: ubuntu

config/roster.d/minion-y:

host: minion-y.example.com port: 22 sudo: true user: gentoo

The roster would find two minions: minion-x and minion-y, with the given host, port, sudo and user settings.

The directory roster also extends the concept of roster defaults by supporting a roster_domain value in config:

... roster_domain: example.org ...

If that option is set, then any roster without a 'host' setting will have an implicit host of its minion id + '.' + the roster_domain. (The default roster_domain is the empty string, so you can also name the files the fully qualified name of each host. However, if you do that, then the fully qualified name of each host is also the minion id.)

This makes it possible to avoid having to specify the hostnames when you always want them to match their minion id plus some domain.

`salt.roster.dir.`**`targets`**(*tgt*, *tgt_type='glob'*, ***kwargs*)

Return the targets from the directory of flat yaml files, checks opts for location.

26.15.4 salt.roster.flat

Read in the roster from a flat file using the renderer system

`salt.roster.flat.`**`targets`**(*tgt*, *tgt_type='glob'*, ***kwargs*)

Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

26.15.5 salt.roster.range

This roster resolves targets from a range server.

depends
seco.range, https://github.com/ytoolshed/range

When you want to use a range query for target matching, use `--roster range`. For example:

```
salt-ssh --roster range '%%%example.range.cluster' test.ping
```

`salt.roster.range.`**`target_glob`**(*tgt*, *hosts*)

`salt.roster.range.`**`target_range`**(*tgt*, *hosts*)

`salt.roster.range.`**`targets`**(*tgt*, *tgt_type='range'*, ***kwargs*)

Return the targets from a range query

26.15.6 salt.roster.scan

Scan a netmask or ipaddr for open ssh ports

`class` `salt.roster.scan.`**`RosterMatcher`**(*tgt*, *tgt_type*)

Matcher for the roster data structure

`targets`()

Return ip addrs based on netmask, sitting in the "glob" spot because it is the default

`salt.roster.scan.`**`targets`**(*tgt*, *tgt_type='glob'*, ***kwargs*)

Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

26.15.7 salt.roster.sshconfig

Parses roster entries out of Host directives from SSH config

```
salt-ssh --roster sshconfig '*' -r "echo hi"
```

`class` `salt.roster.sshconfig.`**`RosterMatcher`**(*raw*, *tgt*, *tgt_type*)

Matcher for the roster data structure

`get_data`(*minion*)

Return the configured ip

`ret_glob_minions`()

Return minions that match via glob

`targets`()

Execute the correct tgt_type routine and return

`salt.roster.sshconfig.`**`parse_ssh_config`**(*lines*)

Parses lines from the SSH config to create roster targets.

Parameters
`lines` -- Individual lines from the ssh config file

Returns
Dictionary of targets in similar style to the flat roster

`salt.roster.sshconfig.`**`targets`**(*tgt*, *tgt_type='glob'*, ***kwargs*)

Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

26.15.8 salt.roster.sshknownhosts

Parses roster entries out of Host directives from SSH known_hosts

New in version 3006.0.

Sample configuration:

Note: The `known_hosts` file only contains hostname/IP. To pass other parameters, use `roster_defaults`.

```
ssh_known_hosts_file: /Users/user1/.ssh/known_hosts
roster_defaults:
  user: user1
  sudo: True
```

Now you can use the module

```
salt-ssh --roster sshknownhosts '*' -r "echo hi"
```

Or with a Saltfile

```
salt-ssh:
  ssh_known_hosts_file: /Users/user1/.ssh/known_hosts
```

```
salt-ssh --roster sshknownhosts '*' -r "echo hi"
```

`salt.roster.sshknownhosts.`**`targets`**(*tgt*, *tgt_type='glob'*)

Return the targets from a known_hosts file

26.16 runner modules

auth	Authentication runner for creating, deleting, and managing eauth tokens.
cache	Return cached data from minions
config	This runner is designed to mirror the execution module config.py, but for master settings
doc	A runner module to collect and display the inline documentation from the various module types
error	Error generator to enable integration testing of salt runner error handling
event	Module for sending events using the runner system.
fileserver	Directly manage the Salt fileserver plugins
git_pillar	Runner module to directly manage the git external pillar
http	Module for making various web calls.
jobs	A convenience system to manage jobs, both active and already run
manage	General management functions for salt, tools like seeing what hosts are up and what hosts are down
match	Run matchers from the master context.
mine	A runner to access data from the salt mine
net	NET Finder
network	Network tools to run from the Master
pillar	Functions to interact with the pillar compiler on the master
queue	General management and processing of queues.
reactor	A convenience system to manage reactors
salt	This runner makes Salt's execution modules available on the salt master.
saltutil	The Saltutil runner is used to sync custom types to the Master.
sdb	Runner for setting and querying data via the sdb API on the master
ssh	A Runner module interface on top of the salt-ssh Python API.
state	Execute orchestration functions
survey	A general map/reduce style salt runner for aggregating results returned by several different minions.
test	This runner is used only for test purposes and serves no production purpose
winrepo	Runner to manage Windows software repo

26.16.1 salt.runners.auth

Authentication runner for creating, deleting, and managing eauth tokens.

New in version 2016.11.0.

`salt.runners.auth.`**`del_token`**(*token*)

Delete an eauth token by name

CLI Example:

```
salt-run auth.del_token 6556760736e4077daa601baec2b67c24
```

`salt.runners.auth.`**`mk_token`**(***load*)

Create an eauth token using provided credentials

Non-root users may specify an expiration date -- if allowed via the *`token_expire_user_override`* setting -- by passing an additional `token_expire` param. This overrides the *`token_expire`* setting of the same name in the Master config and is how long a token should live in seconds.

CLI Example:

```
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto

# Create a token valid for three years.
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto \
    token_expire=94670856

# Calculate the number of seconds using expr.
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto \
    token_expire=$(expr \( 365 \* 24 \* 60 \* 60 \) \* 3)
```

26.16.2 salt.runners.cache

Return cached data from minions

`salt.runners.cache.`**`clear_all`**(*tgt=None, tgt_type='glob'*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached pillar, grains, and mine data of the targeted minions

CLI Example:

```
salt-run cache.clear_all
```

`salt.runners.cache.`**`clear_git_lock`**(*role, remote=None, **kwargs*)

New in version 2015.8.2.

Remove the update locks for Salt components (gitfs, git_pillar, winrepo) which use gitfs backend code from salt.utils.gitfs.

> **Note:** Running *`cache.clear_all`* will not include this function as it does for pillar, grains, and mine.
>
> Additionally, executing this function with a `role` of `gitfs` is equivalent to running `salt-run fileserver.clear_lock backend=git`.

role
Which type of lock to remove (`gitfs`, `git_pillar`, or `winrepo`)

remote
If specified, then any remotes which contain the passed string will have their lock cleared. For example, a `remote` value of **github** will remove the lock from all github.com remotes.

type
[update,checkout,mountpoint] The types of lock to clear. Can be one or more of `update`, `checkout`, and `mountpoint`, and can be passed either as a comma-separated or Python list.

New in version 2015.8.8.

Changed in version 2018.3.0: `mountpoint` lock type added

CLI Examples:

```
salt-run cache.clear_git_lock gitfs
salt-run cache.clear_git_lock git_pillar
salt-run cache.clear_git_lock git_pillar type=update
salt-run cache.clear_git_lock git_pillar type=update,checkout
salt-run cache.clear_git_lock git_pillar type='["update", "mountpoint"]'
```

`salt.runners.cache.`**`clear_grains`**(*tgt=None*, *tgt_type='glob'*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached grains data of the targeted minions

CLI Example:

```
salt-run cache.clear_grains
```

`salt.runners.cache.`**`clear_mine`**(*tgt=None*, *tgt_type='glob'*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached mine data of the targeted minions

CLI Example:

```
salt-run cache.clear_mine
```

`salt.runners.cache.`**`clear_mine_func`**(*tgt=None*, *tgt_type='glob'*, *clear_mine_func_flag=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached mine function data of the targeted minions

CLI Example:

```
salt-run cache.clear_mine_func tgt='*' clear_mine_func_flag='network.
↪interfaces'
```

`salt.runners.cache.`**`clear_pillar`**(*tgt=None*, *tgt_type='glob'*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached pillar data of the targeted minions

CLI Example:

```
salt-run cache.clear_pillar
```

salt.runners.cache.**cloud**(*tgt*, *provider=None*)

Return cloud cache data for target.

Note: Only works with glob matching

tgt
Glob Target to match minion ids

provider
Cloud Provider

CLI Example:

```
salt-run cache.cloud 'salt*'
salt-run cache.cloud glance.example.org provider=openstack
```

salt.runners.cache.**fetch**(*bank*, *key*, *cachedir=None*)

Fetch data from a salt.cache bank.

CLI Example:

```
salt-run cache.fetch cloud/active/ec2/myec2 myminion cachedir=/var/cache/
↪salt/
```

salt.runners.cache.**flush**(*bank*, *key=None*, *cachedir=None*)

Remove the key from the cache bank with all the key content. If no key is specified remove the entire bank with all keys and sub-banks inside.

CLI Examples:

```
salt-run cache.flush cloud/active/ec2/myec2 cachedir=/var/cache/salt/
salt-run cache.flush cloud/active/ec2/myec2 myminion cachedir=/var/cache/
↪salt/
```

salt.runners.cache.**grains**(*tgt*, *tgt_type='glob'*, ***kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Return cached grains of the targeted minions.

tgt
Target to match minion ids.

Changed in version 2017.7.5,2018.3.0: The `tgt` argument is now required to display cached grains. If not used, the function will not return grains. This optional argument will become mandatory in the Salt `3001` release.

tgt_type
The type of targeting to use for matching, such as `glob`, `list`, etc.

CLI Example:

```
salt-run cache.grains '*'
```

salt.runners.cache.**list_**(*bank*, *cachedir=None*)

Lists entries stored in the specified bank.

CLI Example:

```
salt-run cache.list cloud/active/ec2/myec2 cachedir=/var/cache/salt/
```

`salt.runners.cache.`**`mine`**(*tgt=None*, *tgt_type='glob'*, ***kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Return cached mine data of the targeted minions

CLI Example:

```
salt-run cache.mine
```

`salt.runners.cache.`**`pillar`**(*tgt=None*, *tgt_type='glob'*, ***kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Return cached pillars of the targeted minions if tgt is set. If tgt is not set will return cached pillars for all minions.

CLI Example:

```
salt-run cache.pillar
```

`salt.runners.cache.`**`store`**(*bank*, *key*, *data*, *cachedir=None*)

Lists entries stored in the specified bank.

CLI Example:

```
salt-run cache.store mycache mykey 'The time has come the walrus said'
```

26.16.3 salt.runners.config

This runner is designed to mirror the execution module config.py, but for master settings

`salt.runners.config.`**`get`**(*key*, *default=''*, *delimiter=':'*)

Retrieve master config options, with optional nesting via the delimiter argument.

Arguments

default
: If the key is not found, the default will be returned instead

delimiter
: Override the delimiter used to separate nested levels of a data structure.

CLI Example:

```
salt-run config.get gitfs_remotes
salt-run config.get file_roots:base
salt-run config.get file_roots,base delimiter=','
```

26.16.4 salt.runners.doc

A runner module to collect and display the inline documentation from the various module types

`salt.runners.doc.`**`execution`**`()`

Collect all the sys.doc output from each minion and return the aggregate

CLI Example:

```
salt-run doc.execution
```

`salt.runners.doc.`**`runner`**`()`

Return all inline documentation for runner modules

CLI Example:

```
salt-run doc.runner
```

`salt.runners.doc.`**`wheel`**`()`

Return all inline documentation for wheel modules

CLI Example:

```
salt-run doc.wheel
```

26.16.5 salt.runners.error

Error generator to enable integration testing of salt runner error handling

`salt.runners.error.`**`error`**`(`*name=None*, *message=''*`)`

If name is None Then return empty dict

Otherwise raise an exception with __name__ from name, message from message

CLI Example:

```
salt-run error
salt-run error.error name="Exception" message="This is an error."
```

26.16.6 salt.runners.event

Module for sending events using the runner system.

New in version 2016.11.0.

`salt.runners.event.`**`send`**`(`*tag*, *data=None*`)`

Send an event with the given tag and data.

This is useful for sending events directly to the master from the shell with salt-run. It is also quite useful for sending events in orchestration states where the `fire_event` requisite isn't sufficient because it does not support sending custom data with the event.

Note that event tags will *not* be namespaced like events sent with the `fire_event` requisite! Whereas events produced from `fire_event` are prefixed with `salt/state_result/<jid>/<minion_id>/<name>`, events sent using this runner module will have no such prefix. Make sure your reactors don't expect a prefix!

Parameters

- **`tag`** -- the tag to send with the event
- **`data`** -- an optional dictionary of data to send with the event

CLI Example:

```
salt-run event.send my/custom/event '{"foo": "bar"}'
```

Orchestration Example:

```
# orch/command.sls

run_a_command:
  salt.function:
    - name: cmd.run
    - tgt: my_minion
    - arg:
      - exit {{ pillar['exit_code'] }}

send_success_event:
  salt.runner:
    - name: event.send
    - tag: my_event/success
    - data:
        foo: bar
    - require:
      - salt: run_a_command

send_failure_event:
  salt.runner:
    - name: event.send
    - tag: my_event/failure
    - data:
        baz: qux
    - onfail:
      - salt: run_a_command
```

```
salt-run state.orchestrate orch.command pillar='{"exit_code": 0}'
salt-run state.orchestrate orch.command pillar='{"exit_code": 1}'
```

26.16.7 salt.runners.fileserver

Directly manage the Salt fileserver plugins

`salt.runners.fileserver.`**`clear_cache`**`(`*backend=None*`)`

New in version 2015.5.0.

Clear the fileserver cache from VCS fileserver backends (*`git`*, `hg`, `svn`). Executing this runner with no arguments will clear the cache for all enabled VCS fileserver backends, but this can be narrowed using the `backend` argument.

backend

Only clear the update lock for the specified backend(s). If all passed backends start with a minus sign (`-`), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

CLI Example:

```
salt-run fileserver.clear_cache
salt-run fileserver.clear_cache backend=git,hg
salt-run fileserver.clear_cache hg
salt-run fileserver.clear_cache -roots
```

`salt.runners.fileserver.`**`clear_file_list_cache`**`(`*saltenv=None*, *backend=None*`)`

New in version 2016.11.0.

The Salt fileserver caches the files/directories/symlinks for each fileserver backend and environment as they are requested. This is done to help the fileserver scale better. Without this caching, when hundreds/thousands of minions simultaneously ask the master what files are available, this would cause the master's CPU load to spike as it obtains the same information separately for each minion.

saltenv

By default, this runner will clear the file list caches for all environments. This argument allows for a list of environments to be passed, to clear more selectively. This list can be passed either as a comma-separated string, or a Python list.

backend

Similar to the `saltenv` parameter, this argument will restrict the cache clearing to specific fileserver backends (the default behavior is to clear from all enabled fileserver backends). This list can be passed either as a comma-separated string, or a Python list.

Since the ability to clear these caches is often required by users writing custom runners which add/remove files, this runner can easily be called from within a custom runner using any of the following examples:

```
# Clear all file list caches
__salt__['fileserver.clear_file_list_cache']()
# Clear just the 'base' saltenv file list caches
__salt__['fileserver.clear_file_list_cache'](saltenv='base')
# Clear just the 'base' saltenv file list caches from just the 'roots'
# fileserver backend
__salt__['fileserver.clear_file_list_cache'](saltenv='base', backend=
↪'roots')
# Clear all file list caches from the 'roots' fileserver backend
__salt__['fileserver.clear_file_list_cache'](backend='roots')
```

Note: In runners, the `__salt__` dictionary will likely be renamed to `__runner__` in a future Salt release to distinguish runner functions from remote execution functions. See this GitHub issue for discussion/updates on this.

If using Salt's Python API (not a runner), the following examples are equivalent to the ones above:

```
import salt.config
import salt.runner

opts = salt.config.master_config('/etc/salt/master')
opts['fun'] = 'fileserver.clear_file_list_cache'

# Clear all file list_caches
opts['arg'] = []  # No arguments
runner = salt.runner.Runner(opts)
cleared = runner.run()

```

(continues on next page)

(continued from previous page)

```
# Clear just the 'base' saltenv file list caches
opts['arg'] = ['base', None]
runner = salt.runner.Runner(opts)
cleared = runner.run()

# Clear just the 'base' saltenv file list caches from just the 'roots'
# fileserver backend
opts['arg'] = ['base', 'roots']
runner = salt.runner.Runner(opts)
cleared = runner.run()

# Clear all file list caches from the 'roots' fileserver backend
opts['arg'] = [None, 'roots']
runner = salt.runner.Runner(opts)
cleared = runner.run()
```

This function will return a dictionary showing a list of environments which were cleared for each backend. An empty return dictionary means that no changes were made.

CLI Examples:

```
# Clear all file list caches
salt-run fileserver.clear_file_list_cache
# Clear just the 'base' saltenv file list caches
salt-run fileserver.clear_file_list_cache saltenv=base
# Clear just the 'base' saltenv file list caches from just the 'roots'
# fileserver backend
salt-run fileserver.clear_file_list_cache saltenv=base backend=roots
# Clear all file list caches from the 'roots' fileserver backend
salt-run fileserver.clear_file_list_cache backend=roots
```

`salt.runners.fileserver.`**`clear_lock`**`(`*backend=None, remote=None*`)`

New in version 2015.5.0.

Clear the fileserver update lock from VCS fileserver backends (*git*, `hg`, `svn`). This should only need to be done if a fileserver update was interrupted and a remote is not updating (generating a warning in the Master's log file). Executing this runner with no arguments will remove all update locks from all enabled VCS fileserver backends, but this can be narrowed by using the following arguments:

backend
Only clear the update lock for the specified backend(s).

remote
If specified, then any remotes which contain the passed string will have their lock cleared. For example, a `remote` value of **github** will remove the lock from all github.com remotes.

CLI Example:

```
salt-run fileserver.clear_lock
salt-run fileserver.clear_lock backend=git,hg
salt-run fileserver.clear_lock backend=git remote=github
salt-run fileserver.clear_lock remote=bitbucket
```

`salt.runners.fileserver.`**`dir_list`**`(`*saltenv='base', backend=None*`)`

Return a list of directories in the given environment

saltenv
[base] The salt fileserver environment to be listed

backend
Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (`-`), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Example:

```
salt-run fileserver.dir_list
salt-run fileserver.dir_list saltenv=prod
salt-run fileserver.dir_list saltenv=dev backend=git
salt-run fileserver.dir_list base hg,roots
salt-run fileserver.dir_list -git
```

`salt.runners.fileserver.`**`empty_dir_list`**(*saltenv='base'*, *backend=None*)

New in version 2015.5.0.

Return a list of empty directories in the given environment

saltenv
[base] The salt fileserver environment to be listed

backend
Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (`-`), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

Note: Some backends (such as *`git`* and `hg`) do not support empty directories. So, passing `backend=git` or `backend=hg` will result in an empty list being returned.

CLI Example:

```
salt-run fileserver.empty_dir_list
salt-run fileserver.empty_dir_list saltenv=prod
salt-run fileserver.empty_dir_list backend=roots
```

`salt.runners.fileserver.`**`envs`**(*backend=None*, *sources=False*)

Return the available fileserver environments. If no backend is provided, then the environments for all configured backends will be returned.

backend
Narrow fileserver backends to a subset of the enabled ones.

Changed in version 2015.5.0: If all passed backends start with a minus sign (`-`), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

Additionally, fileserver backends can now be passed as a comma-separated list. In earlier versions, they needed to be passed as a python list (ex: `backend="['roots', 'git']"`)

CLI Example:

```
salt-run fileserver.envs
salt-run fileserver.envs backend=roots,git
salt-run fileserver.envs git
```

`salt.runners.fileserver.`**`file_list`**(*saltenv='base'*, *backend=None*)

Return a list of files from the salt fileserver

saltenv
[base] The salt fileserver environment to be listed

backend
Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Examples:

```
salt-run fileserver.file_list
salt-run fileserver.file_list saltenv=prod
salt-run fileserver.file_list saltenv=dev backend=git
salt-run fileserver.file_list base hg,roots
salt-run fileserver.file_list -git
```

`salt.runners.fileserver.`**`lock`**(*backend=None*, *remote=None*)

New in version 2015.5.0.

Set a fileserver update lock for VCS fileserver backends (*`git`*, `hg`, `svn`).

Note: This will only operate on enabled backends (those configured in *`fileserver_backend`*).

---

backend
Only set the update lock for the specified backend(s).

remote
If not None, then any remotes which contain the passed string will have their lock cleared. For example, a `remote` value of `*github.com*` will remove the lock from all github.com remotes.

CLI Example:

```
salt-run fileserver.lock
salt-run fileserver.lock backend=git,hg
salt-run fileserver.lock backend=git remote='*github.com*'
salt-run fileserver.lock remote=bitbucket
```

`salt.runners.fileserver.`**`symlink_list`**(*saltenv='base'*, *backend=None*)

Return a list of symlinked files and dirs

saltenv
[base] The salt fileserver environment to be listed

backend
Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Example:

```
salt-run fileserver.symlink_list
salt-run fileserver.symlink_list saltenv=prod
salt-run fileserver.symlink_list saltenv=dev backend=git
salt-run fileserver.symlink_list base hg,roots
salt-run fileserver.symlink_list -git
```

salt.runners.fileserver.**update**(*backend=None*, ***kwargs*)

Update the fileserver cache. If no backend is provided, then the cache for all configured backends will be updated.

backend

Narrow fileserver backends to a subset of the enabled ones.

Changed in version 2015.5.0: If all passed backends start with a minus sign (`-`), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

Additionally, fileserver backends can now be passed as a comma-separated list. In earlier versions, they needed to be passed as a python list (ex: `backend="['roots', 'git']"`)

kwargs

Pass additional arguments to backend. See example below

CLI Example:

```
salt-run fileserver.update
salt-run fileserver.update backend=roots,git
salt-run fileserver.update backend=git remotes=myrepo,yourrepo
```

26.16.8 salt.runners.git_pillar

Runner module to directly manage the git external pillar

salt.runners.git_pillar.**update**(*branch=None*, *repo=None*)

New in version 2014.1.0.

Changed in version 2015.8.4: This runner function now supports the *git_pillar configuration schema* introduced in 2015.8.0. Additionally, the branch and repo can now be omitted to update all git_pillar remotes. The return data has also changed to a dictionary. The values will be `True` only if new commits were fetched, and `False` if there were errors or no new commits were fetched.

Changed in version 2018.3.0: The return for a given git_pillar remote will now be `None` when no changes were fetched. `False` now is reserved only for instances in which there were errors.

Changed in version 3001: The repo parameter also matches against the repo name.

Fetch one or all configured git_pillar remotes.

Note: This will *not* fast-forward the git_pillar cachedir on the master. All it does is perform a `git fetch`. If this runner is executed with `-l debug`, you may see a log message that says that the repo is up-to-date. Keep in mind that Salt automatically fetches git_pillar repos roughly every 60 seconds (or whatever `loop_interval` is set to). So, it is possible that the repo was fetched automatically in the time between when changes were pushed to the repo, and when this runner was executed. When in doubt, simply refresh pillar data using `saltutil.refresh_pillar` and then use `pillar.item` to check if the pillar data has changed as expected.

CLI Example:

```
# Update specific branch and repo
salt-run git_pillar.update branch='branch' repo='https://foo.com/bar.git'
# Update specific repo, by name
salt-run git_pillar.update repo=myrepo
# Update all repos
```

(continues on next page)

(continued from previous page)

```
salt-run git_pillar.update
# Run with debug logging
salt-run git_pillar.update -l debug
```

26.16.9 salt.runners.http

Module for making various web calls. Primarily designed for webhooks and the like, but also useful for basic http testing.

New in version 2015.5.0.

salt.runners.http.**query**(*url*, *output=True*, **kwargs)

Query a resource, and decode the return data

Passes through all the parameters described in the *utils.http.query function*:

CLI Example:

```
salt-run http.query http://somelink.com/
salt-run http.query http://somelink.com/ method=POST           params=
↪'key1=val1&key2=val2'
salt-run http.query http://somelink.com/ method=POST           data='
↪<xml>somecontent</xml>'
```

salt.runners.http.**update_ca_bundle**(*target=None*, *source=None*, *merge_files=None*)

Update the local CA bundle file from a URL

New in version 2015.5.0.

CLI Example:

```
salt-run http.update_ca_bundle
salt-run http.update_ca_bundle target=/path/to/cacerts.pem
salt-run http.update_ca_bundle source=https://example.com/cacerts.pem
```

If the `target` is not specified, it will be pulled from the `ca_cert` configuration variable available to the master. If it cannot be found there, it will be placed at `<<FILE_ROOTS>>/cacerts.pem`.

If the `source` is not specified, it will be pulled from the `ca_cert_url` configuration variable available to the master. If it cannot be found, it will be downloaded from the cURL website, using an http (not https) URL. USING THE DEFAULT URL SHOULD BE AVOIDED!

`merge_files` may also be specified, which includes a string or list of strings representing a file or files to be appended to the end of the CA bundle, once it is downloaded.

CLI Example:

```
salt-run http.update_ca_bundle merge_files=/path/to/mycert.pem
```

26.16.10 salt.runners.jobs

A convenience system to manage jobs, both active and already run

`salt.runners.jobs.`**`active`**(*display_progress=False*)

Return a report on all actively running jobs from a job id centric perspective

CLI Example:

```
salt-run jobs.active
```

`salt.runners.jobs.`**`exit_success`**(*jid*, *ext_source=None*)

Check if a job has been executed and exit successfully

jid
The jid to look up.

ext_source
The external job cache to use. Default: *None*.

CLI Example:

```
salt-run jobs.exit_success 20160520145827701627
```

`salt.runners.jobs.`**`last_run`**(*ext_source=None*, *outputter=None*, *metadata=None*, *function=None*, *target=None*, *display_progress=False*)

New in version 2015.8.0.

List all detectable jobs and associated functions

CLI Example:

```
salt-run jobs.last_run
salt-run jobs.last_run target=nodename
salt-run jobs.last_run function='cmd.run'
salt-run jobs.last_run metadata="{'foo': 'bar'}"
```

`salt.runners.jobs.`**`list_job`**(*jid*, *ext_source=None*, *display_progress=False*)

List a specific job given by its jid

ext_source
If provided, specifies which external job cache to use.

display_progress
[False] If `True`, fire progress events.

New in version 2015.8.8.

CLI Example:

```
salt-run jobs.list_job 20130916125524463507
salt-run jobs.list_job 20130916125524463507 --out=pprint
```

`salt.runners.jobs.`**`list_jobs`**(*ext_source=None*, *outputter=None*, *search_metadata=None*, *search_function=None*, *search_target=None*, *start_time=None*, *end_time=None*, *display_progress=False*)

List all detectable jobs and associated functions

ext_source
If provided, specifies which external job cache to use.

FILTER OPTIONS

Note: If more than one of the below options are used, only jobs which match *all* of the filters will be returned.

---

search_metadata
Specify a dictionary to match to the job's metadata. If any of the key-value pairs in this dictionary match, the job will be returned. Example:

```
salt-run jobs.list_jobs search_metadata='{"foo": "bar", "baz": "qux"}
↪'
```

search_function
Can be passed as a string or a list. Returns jobs which match the specified function. Globbing is allowed. Example:

```
salt-run jobs.list_jobs search_function='test.*'
salt-run jobs.list_jobs search_function='["test.*", "pkg.install"]'
```

Changed in version 2015.8.8: Multiple targets can now also be passed as a comma-separated list. For example:

```
salt-run jobs.list_jobs search_function='test.*,pkg.install'
```

search_target
Can be passed as a string or a list. Returns jobs which match the specified minion name. Globbing is allowed. Example:

```
salt-run jobs.list_jobs search_target='*.mydomain.tld'
salt-run jobs.list_jobs search_target='["db*", "myminion"]'
```

Changed in version 2015.8.8: Multiple targets can now also be passed as a comma-separated list. For example:

```
salt-run jobs.list_jobs search_target='db*,myminion'
```

start_time
Accepts any timestamp supported by the dateutil Python module (if this module is not installed, this argument will be ignored). Returns jobs which started after this timestamp.

end_time
Accepts any timestamp supported by the dateutil Python module (if this module is not installed, this argument will be ignored). Returns jobs which started before this timestamp.

CLI Example:

```
salt-run jobs.list_jobs
salt-run jobs.list_jobs search_function='test.*' search_target='localhost
↪' search_metadata='{"bar": "foo"}'
salt-run jobs.list_jobs start_time='2015, Mar 16 19:00' end_time='2015,
↪Mar 18 22:00'
```

`salt.runners.jobs.`**`list_jobs_filter`**(*count*, *filter_find_job=True*, *ext_source=None*, *outputter=None*, *display_progress=False*)

List all detectable jobs and associated functions

ext_source
The external job cache to use. Default: *None*.

CLI Example:

```
salt-run jobs.list_jobs_filter 50
salt-run jobs.list_jobs_filter 100 filter_find_job=False
```

`salt.runners.jobs.`**`lookup_jid`**(*jid*, *ext_source=None*, *returned=True*, *missing=False*, *display_progress=False*)

Return the printout from a previously executed job

jid
The jid to look up.

ext_source
The external job cache to use. Default: *None*.

returned
[True] If `True`, include the minions that did return from the command.

New in version 2015.8.0.

missing
[False] If `True`, include the minions that did *not* return from the command.

display_progress
[False] If `True`, fire progress events.

New in version 2015.5.0.

CLI Example:

```
salt-run jobs.lookup_jid 20130916125524463507
salt-run jobs.lookup_jid 20130916125524463507 --out=highstate
```

`salt.runners.jobs.`**`master`**()

Return the actively executing runners for the master

CLI Example:

```
salt-run jobs.master
```

`salt.runners.jobs.`**`print_job`**(*jid*, *ext_source=None*)

Print a specific job's detail given by its jid, including the return data.

CLI Example:

```
salt-run jobs.print_job 20130916125524463507
```

26.16.11 salt.runners.manage

General management functions for salt, tools like seeing what hosts are up and what hosts are down

`salt.runners.manage.`**`alived`**(*subset=None*, *show_ip=False*)

New in version 2015.8.0.

Changed in version 2019.2.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

subset
[None] Pass in a list of minion ids.

show_ip
[False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.alived
```

`salt.runners.manage.`**`allowed`**(*subset=None*, *show_ip=False*)

New in version 2015.8.0.

Changed in version 2019.2.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

subset
[None] Pass in a list of minion ids.

show_ip
[False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.allowed
```

`salt.runners.manage.`**`bootstrap`**(*version='develop'*, *script='https://github.com/saltstack/salt-bootstrap/releases/latest/download/bootstrap-salt.sh'*, *hosts=''*, *script_args=''*, *roster='flat'*, *ssh_user=None*, *ssh_password=None*, *ssh_priv_key=None*, *tmp_dir='/tmp/.bootstrap'*, *http_backend='tornado'*)

Bootstrap minions with salt-bootstrap

version
[develop] Git tag of version to install

script
[https://github.com/saltstack/salt-bootstrap/releases/latest/download/bootstrap-salt.sh] URL containing the script to execute

hosts
Comma-separated hosts [example: hosts='host1.local,host2.local']. These hosts need to exist in the specified roster.

script_args
Any additional arguments that you want to pass to the script.

New in version 2016.11.0.

roster
[flat] The roster to use for Salt SSH. More information about roster files can be found in *Salt's Roster Documentation*.

A full list of roster types, see the *builtin roster modules* documentation.

New in version 2016.11.0.

ssh_user
If `user` isn't found in the `roster`, a default SSH user can be set here. Keep in mind that `ssh_user` will not override the roster `user` value if it is already defined.

New in version 2016.11.0.

ssh_password
If `passwd` isn't found in the `roster`, a default SSH password can be set here. Keep in mind that `ssh_password` will not override the roster `passwd` value if it is already defined.

New in version 2016.11.0.

ssh_privkey
If `priv` isn't found in the `roster`, a default SSH private key can be set here. Keep in mind that `ssh_password` will not override the roster `passwd` value if it is already defined.

New in version 2016.11.0.

tmp_dir

[/tmp/.bootstrap] The temporary directory to download the bootstrap script in. This directory will have `-<uuid4>` appended to it. For example: `/tmp/.bootstrap-a19a728e-d40a-4801-aba9-d00655c143a7/`

New in version 2016.11.0.

http_backend

[tornado] The backend library to use to download the script. If you need to use a `file:///` URL, then you should set this to `urllib2`.

New in version 2016.11.0.

CLI Example:

```
salt-run manage.bootstrap hosts='host1,host2'
salt-run manage.bootstrap hosts='host1,host2' version='v3006.2'
salt-run manage.bootstrap hosts='host1,host2' version='v3006.2' script=
↪'https://github.com/saltstack/salt-bootstrap/develop'
```

`salt.runners.manage.`**`bootstrap_psexec`**(*hosts='', master=None, version=None, arch='win32', installer_url=None, username=None, password=None*)

Bootstrap Windows minions via PsExec.

hosts

Comma separated list of hosts to deploy the Windows Salt minion.

master

Address of the Salt master passed as an argument to the installer.

version

Point release of installer to download. Defaults to the most recent.

arch

Architecture of installer to download. Defaults to win32.

installer_url

URL of minion installer executable. Defaults to the latest version from https://packages.broadcom.com/artifactory/saltproject-generic/windows/

username

Optional user name for login on remote computer.

password

Password for optional username. If omitted, PsExec will prompt for one to be entered for each host.

CLI Example:

```
salt-run manage.bootstrap_psexec hosts='host1,host2'
salt-run manage.bootstrap_psexec hosts='host1,host2' version='0.17'⊠
↪username='DOMAIN\Administrator'
salt-run manage.bootstrap_psexec hosts='host1,host2' installer_url='http:/
↪/exampledomain/salt-installer.exe'
```

`salt.runners.manage.`**`down`**(*removekeys=False, tgt='*', tgt_type='glob', timeout=None, gather_job_timeout=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Print a list of all the down or unresponsive salt minions Optionally remove keys of down minions

CLI Example:

```
salt-run manage.down
salt-run manage.down removekeys=True
salt-run manage.down tgt="webservers" tgt_type="nodegroup"
```

`salt.runners.manage.`**`joined`**`(`*subset=None*, *show_ip=False*`)`

New in version 2015.8.0.

Changed in version 2019.2.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

subset
[None] Pass in a list of minion ids.

show_ip
[False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.joined
```

`salt.runners.manage.`**`key_regen`**`()`

This routine is used to regenerate all keys in an environment. This is invasive! ALL KEYS IN THE SALT ENVIRONMENT WILL BE REGENERATED!!

The key_regen routine sends a command out to minions to revoke the master key and remove all minion keys, it then removes all keys from the master and prompts the user to restart the master. The minions will all reconnect and keys will be placed in pending.

After the master is restarted and minion keys are in the pending directory execute a salt-key -A command to accept the regenerated minion keys.

The master *must* be restarted within 60 seconds of running this command or the minions will think there is something wrong with the keys and abort.

Only Execute this runner after upgrading minions and master to 0.15.1 or higher!

CLI Example:

```
salt-run manage.key_regen
```

`salt.runners.manage.`**`list_not_state`**`(`*subset=None*, *show_ip=False*`)`

New in version 2015.8.0.

Changed in version 2019.2.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent to minions)

subset
[None] Pass in a list of minion ids.

show_ip
[False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.list_not_state
```

`salt.runners.manage.`**`list_state`**`(`*subset=None*, *show_ip=False*`)`

New in version 2015.8.0.

Changed in version 2019.2.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

subset
[None] Pass in a list of minion ids.

show_ip
[False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.list_state
```

salt.runners.manage.**not_alived**(*subset=None*, *show_ip=False*)

New in version 2015.8.0.

Changed in version 2019.2.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

subset
[None] Pass in a list of minion ids.

show_ip
[False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_alived
```

salt.runners.manage.**not_allowed**(*subset=None*, *show_ip=False*)

New in version 2015.8.0.

Changed in version 2019.2.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

subset
[None] Pass in a list of minion ids.

show_ip
[False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_allowed
```

salt.runners.manage.**not_joined**(*subset=None*, *show_ip=False*)

New in version 2015.8.0.

Changed in version 2019.2.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

subset
[None] Pass in a list of minion ids.

show_ip
[False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_joined
```

salt.runners.manage.**not_present**(*subset=None*, *show_ip=False*)

New in version 2015.5.0.

Changed in version 2019.2.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

subset
[None] Pass in a list of minion ids.

show_ip
[False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_present
```

`salt.runners.manage.`**`not_reaped`**`(`*subset=None, show_ip=False*`)`

New in version 2015.8.0.

Changed in version 2019.2.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

subset
[None] Pass in a list of minion ids.

show_ip
[False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_reaped
```

`salt.runners.manage.`**`present`**`(`*subset=None, show_ip=False*`)`

Changed in version 2019.2.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

subset
[None] Pass in a list of minion ids.

show_ip
[False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.present
```

`salt.runners.manage.`**`reaped`**`(`*subset=None, show_ip=False*`)`

New in version 2015.8.0.

Changed in version 2019.2.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

subset
[None] Pass in a list of minion ids.

show_ip
[False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.reaped
```

`salt.runners.manage.`**`safe_accept`**`(`*target, tgt_type='glob'*`)`

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Accept a minion's public key after checking the fingerprint over salt-ssh

CLI Example:

```
salt-run manage.safe_accept my_minion
salt-run manage.safe_accept minion1,minion2 tgt_type=list
```

`salt.runners.manage.`**`status`**(*output=True, tgt='*', tgt_type='glob', timeout=None, gather_job_timeout=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Print the status of all known salt minions

CLI Example:

```
salt-run manage.status
salt-run manage.status tgt="webservers" tgt_type="nodegroup"
salt-run manage.status timeout=5 gather_job_timeout=10
```

`salt.runners.manage.`**`up`**(*tgt='*', tgt_type='glob', timeout=None, gather_job_timeout=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Print a list of all of the minions that are up

CLI Example:

```
salt-run manage.up
salt-run manage.up tgt="webservers" tgt_type="nodegroup"
salt-run manage.up timeout=5 gather_job_timeout=10
```

`salt.runners.manage.`**`versions`**()

Check the version of active minions

CLI Example:

```
salt-run manage.versions
```

26.16.12 salt.runners.match

Run matchers from the master context.

New in version 3007.0.

`salt.runners.match.`**`compound_matches`**(*expr, minion_id*)

Check whether a minion is matched by a given compound match expression. On success, this function will return the minion ID, otherwise False.

Note: Pillar values will be matched literally only since this function is intended for remote calling. This also applies to node groups defined on the master. Custom matchers are not respected.

Note: If a module calls this runner from a minion, you will need to explicitly allow the remote call. See *`peer_run`*.

CLI Example:

```
salt-run match.compound_matches 'I@foo:bar and G@os:Deb* and not db*' myminion
```

expr
The *Compound Matcher* expression to validate against.

minion_id
The minion ID of the minion to check the match for.

26.16.13 salt.runners.mine

A runner to access data from the salt mine

`salt.runners.mine.`**`get`**`(`*tgt, fun, tgt_type='glob'*`)`

Gathers the data from the specified minions' mine, pass in the target, function to look up and the target type

CLI Example:

```
salt-run mine.get '*' network.interfaces
```

`salt.runners.mine.`**`update`**`(`*tgt, tgt_type='glob', clear=False, mine_functions=None*`)`

New in version 2017.7.0.

Update the mine data on a certain group of minions.

tgt
Which minions to target for the execution.

tgt_type: **`glob`**
The type of `tgt`.

clear: **`False`**
Boolean flag specifying whether updating will clear the existing mines, or will update. Default: `False` (update).

mine_functions
Update the mine data on certain functions only. This feature can be used when updating the mine for functions that require refresh at different intervals than the rest of the functions specified under `mine_functions` in the minion/master config or pillar.

CLI Example:

```
salt-run mine.update '*'
salt-run mine.update 'juniper-edges' tgt_type='nodegroup'
```

26.16.14 salt.runners.net

NET Finder

New in version 2017.7.0.

A runner to find network details easily and fast. It's smart enough to know what you are looking for.

Configuration

- Minion (proxy) config

  To have the complete features, one needs to add the following mine configuration in the minion (proxy) config file:

  ```
  mine_functions:
    net.ipaddrs: []
    net.lldp: []
    net.mac: []
    net.arp: []
    net.interfaces: []
  ```

  Which instructs Salt to cache the data returned by the NAPALM-functions. While they are not mandatory, the less functions configured, the less details will be found by the runner.

  How often the mines are refreshed, can be specified using:

  ```
  mine_interval: <X minutes>
  ```

- Master config

  By default the following options can be configured on the master. They are not necessary, but available in case the user has different requirements.

  target: `*`
  From what minions will collect the mine data. Default: `*` (collect from all minions).

  expr_form: `glob`
  Minion matching expression form. Default: `glob`.

  ignore_interfaces
  A list of interfaces name to ignore. By default will consider all interfaces.

  display: `True`
  Display on the screen or return structured object? Default: `True` (return on the CLI).

  outputter: `table`
  Specify the outputter name when displaying on the CLI. Default: `table`.

  Configuration example:

  ```
  runners:
    net.find:
      target: 'edge*'
      expr_form: 'glob'
      ignore_interfaces:
        - lo0
        - em1
        - jsrv
        - fxp0
      outputter: yaml
  ```

`salt.runners.net.`**`find`**(*addr*, *best=True*, *display=True*)

Search in all possible entities (Interfaces, MAC tables, ARP tables, LLDP neighbors), using the following mine functions:

- net.mac

- net.arp
- net.lldp
- net.ipaddrs
- net.interfaces

This function has the advantage that it knows where to look, but the output might become quite long as returns all possible matches.

Optional arguments:

best: `True`
: Return only the best match with the interfaces IP networks when the saerching pattern is a valid IP Address or Network.

display: `True`
: Display on the screen or return structured object? Default: `True` (return on the CLI).

CLI Example:

```
$ sudo salt-run net.find 10.10.10.7
```

Output Example:

```
Details for all interfaces that include network 10.10.10.7/32 - only best⊠
↪match returned

--------------------------------------------------------------------------
↪----------------------------------------------
|    Device    | Interface | Interface Description |  UP  | Enabled |⊠

↪0 |
--------------------------------------------------------------------------
↪---
```

`salt.runners.net.`**`findarp`**(*device=None*, *interface=None*, *mac=None*, *ip=None*, *display=True*)

Search for entries in the ARP tables using the following mine functions:

- net.arp

Optional arguments:

device
: Return interface data from a certain device only.

interface
: Return data selecting by interface name.

mac
: Search using a specific MAC Address.

ip
Search using a specific IP Address.

display: True
Display on the screen or return structured object? Default: `True`, will return on the CLI.

CLI Example:

```
$ sudo salt-run net.findarp mac=8C:60:0F:78:EC:41
```

Output Example:

```
ARP Entries for MAC 8C:60:0F:78:EC:41
__________________________________________________________________________
↪______

__________________________________________________________________________
↪______
```

`salt.runners.net.`**`findmac`**(*device=None*, *mac=None*, *interface=None*, *vlan=None*, *display=True*)

Search in the MAC Address tables, using the following mine functions:

- net.mac

Optional arguments:

device
Return interface data from a certain device only.

interface
Return data selecting by interface name.

mac
Search using a specific MAC Address.

vlan
Search using a VLAN ID.

display: True
Display on the screen or return structured object? Default: `True`, will return on the CLI.

CLI Example:

```
$ sudo salt-run net.findmac mac=8C:60:0F:78:EC:41
```

Output Example:

```
MAC Address(es)
__________________________________________________________________________

__________________________________________________________________________
↪___________________
```

`salt.runners.net.`**`interfaces`**(*device=None, interface=None, title=None, pattern=None, ipnet=None, best=True, display=True*)

Search for interfaces details in the following mine functions:

- net.interfaces
- net.ipaddrs

Optional arguments:

device
Return interface data from a certain device only.

interface
Return data selecting by interface name.

pattern
Return interfaces that contain a certain pattern in their description.

ipnet
Return interfaces whose IP networks associated include this IP network.

best: **`True`**
When `ipnet` is specified, this argument says if the runner should return only the best match (the output will contain at most one row). Default: `True` (return only the best match).

display: True
Display on the screen or return structured object? Default: `True` (return on the CLI).

title
Display a custom title for the table.

CLI Example:

```
$ sudo salt-run net.interfaces interface=vt-0/0/10
```

Output Example:

```
Details for interface xe-0/0/0
--------------------------------------------------------------------------
↪---------------------------------------

```

`salt.runners.net.`**`lldp`**(*device=None, interface=None, title=None, pattern=None, chassis=None, display=True*)

Search in the LLDP neighbors, using the following mine functions:

- net.lldp

Optional arguments:

device

Return interface data from a certain device only.

interface

Return data selecting by interface name.

pattern

Return LLDP neighbors that have contain this pattern in one of the following fields:

- Remote Port ID
- Remote Port Description
- Remote System Name
- Remote System Description

chassis

Search using a specific Chassis ID.

display: **`True`**

Display on the screen or return structured object? Default: `True` (return on the CLI).

display: **`True`**

Display on the screen or return structured object? Default: `True` (return on the CLI).

title

Display a custom title for the table.

CLI Example:

```
$ sudo salt-run net.lldp pattern=Ethernet1/48
```

Output Example:

```
Pattern "Ethernet1/48" found in one of the following LLDP details
--------------------------------------------------------------------------

`salt.runners.net.`**`multi_find`**`(`**patterns, **kwargs*`)`

Execute multiple search tasks. This function is based on the *find* function. Depending on the search items, some information might overlap.

Optional arguments:

best: **`True`**

Return only the best match with the interfaces IP networks when the saerching pattern is a valid IP Address or Network.

display: **`True`**

Display on the screen or return structured object? Default: *True* (return on the CLI).

CLI Example:

```
$ sudo salt-run net.multi_find Ethernet1/49 xe-0/1/2
```

Output Example:

```
Pattern "Ethernet1/49" found in one of the following LLDP details

    ---------------------------------------------------------------------
↪------------------------------------------------------------------------
↪---------------------------------------
    |    Device    | Interface | Parent Interface | Remote Chassis ID |↩

26.16.15 salt.runners.network

Network tools to run from the Master

`salt.runners.network.`**`wol`**`(`*mac, bcast='255.255.255.255', destport=9*`)`

Send a "Magic Packet" to wake up a Minion

CLI Example:

```
salt-run network.wol 08-00-27-13-69-77
salt-run network.wol 080027136977 255.255.255.255 7
salt-run network.wol 08:00:27:13:69:77 255.255.255.255 7
```

`salt.runners.network.`**`wollist`**(*maclist*, *bcast='255.255.255.255'*, *destport=9*)

Send a "Magic Packet" to wake up a list of Minions. This list must contain one MAC hardware address per line

CLI Example:

```
salt-run network.wollist '/path/to/maclist'
salt-run network.wollist '/path/to/maclist' 255.255.255.255 7
salt-run network.wollist '/path/to/maclist' 255.255.255.255 7
```

`salt.runners.network.`**`wolmatch`**(*tgt*, *tgt_type='glob'*, *bcast='255.255.255.255'*, *destport=9*)

Send a "Magic Packet" to wake up Minions that are matched in the grains cache

CLI Example:

```
salt-run network.wolmatch minion_id
salt-run network.wolmatch 192.168.0.0/16 tgt_type='ipcidr' bcast=255.255.
↪255.255 destport=7
```

26.16.16 salt.runners.pillar

Functions to interact with the pillar compiler on the master

`salt.runners.pillar.`**`clear_pillar_cache`**(*minion='*'*, ***kwargs*)

Clears the cached values when using pillar_cache

New in version 3003.

CLI Example:

Clears the pillar cache for a specific minion:

```
salt-run pillar.clear_pillar_cache 'minion'
```

`salt.runners.pillar.`**`show_pillar`**(*minion='*'*, ***kwargs*)

Returns the compiled pillar either of a specific minion or just the global available pillars. This function assumes that no minion has the id `*`. Function also accepts pillarenv as attribute in order to limit to a specific pillar branch of git

CLI Example:

shows minion specific pillar:

```
salt-run pillar.show_pillar 'www.example.com'
```

shows global pillar:

```
salt-run pillar.show_pillar
```

shows global pillar for 'dev' pillar environment: (note that not specifying pillarenv will merge all pillar environments using the master config option pillar_source_merging_strategy.)

```
salt-run pillar.show_pillar 'pillarenv=dev'
```

shows global pillar for 'dev' pillar environment and specific pillarenv = dev:

```
salt-run pillar.show_pillar 'saltenv=dev' 'pillarenv=dev'
```

API Example:

```
import salt.config
import salt.runner
opts = salt.config.master_config('/etc/salt/master')
runner = salt.runner.RunnerClient(opts)
pillar = runner.cmd('pillar.show_pillar', [])
print(pillar)
```

`salt.runners.pillar.`**`show_pillar_cache`**(*minion='*', **kwargs*)

Shows the cached values in pillar_cache

New in version 3003.

CLI Example:

Shows the pillar cache for a specific minion:

```
salt-run pillar.show_pillar_cache 'minion'
```

`salt.runners.pillar.`**`show_top`**(*minion=None, saltenv='base'*)

Returns the compiled top data for pillar for a specific minion. If no minion is specified, we use the first minion we find.

CLI Example:

```
salt-run pillar.show_top
```

26.16.17 salt.runners.queue

General management and processing of queues.

This runner facilitates interacting with various queue backends such as the included sqlite3 queue or the planned AWS SQS and Redis queues

The queue functions such as *insert*, *delete*, and *pop* can be used for typical management of the queue.

The *process_queue* function pops the requested number of items from the queue and creates a Salt Event that can then be processed by a Reactor. The *process_queue* function can be called manually, or can be configured to run on a schedule with the Salt Scheduler or regular system cron. It is also possible to use the peer system to allow a minion to call the runner.

This runner, as well as the Queues system, is not api stable at this time.

There are many things that could potentially be done with queues within Salt. For the time being the focus will be on queueing infrastructure actions on specific minions. The queues generally will be populated with minion IDs. When the *process_queue* runner function is called events are created on the Salt Event bus that indicate the queue and a list of one or more minion IDs. The reactor is set up to match on event tags for a specific queue and then take infrastructure actions on those minion IDs. These actions might be to delete the minion's key from the master, use salt-cloud to destroy the vm, or some other custom action.

Queued runners

Using the Salt Queues, references to the commandline arguments of other runners can be saved to be processed later. The queue runners require a queue backend that can store json data (default: `pgjsonb`).

Once the queue is setup, the *runner_queue* will need to be configured.

```
runner_queue:
  queue: runners
  backend: pgjsonb
```

Note: only the queue is required, this defaults to using pgjsonb

Once this is set, then the following can be added to the scheduler on the master and it will run the specified amount of commands per time period.

```
schedule:
  runner queue:
    schedule:
      function: queue.process_runner
      minutes: 1
      kwargs:
        quantity: 2
```

The above configuration will pop 2 runner jobs off the runner queue, and then run them. And it will do this every minute, unless there are any jobs that are still running from the last time the process_runner task was executed.

`salt.runners.queue.`**`delete`**(*queue, items, backend='sqlite'*)

Delete an item or items from a queue

CLI Example:

```
salt-run queue.delete myqueue myitem
salt-run queue.delete myqueue myitem backend=sqlite
salt-run queue.delete myqueue "['item1', 'item2', 'item3']"
```

`salt.runners.queue.`**`insert`**(*queue, items, backend='sqlite'*)

Add an item or items to a queue

CLI Example:

```
salt-run queue.insert myqueue myitem
salt-run queue.insert myqueue "['item1', 'item2', 'item3']"
salt-run queue.insert myqueue myitem backend=sqlite
salt-run queue.insert myqueue "['item1', 'item2', 'item3']" backend=sqlite
```

`salt.runners.queue.`**`insert_runner`**(*fun, args=None, kwargs=None, queue=None, backend=None*)

Insert a reference to a runner into the queue so that it can be run later.

fun

The runner function that is going to be run

args

list or comma-separated string of args to send to fun

kwargs

dictionary of keyword arguments to send to fun

queue
queue to insert the runner reference into

backend
backend that to use for the queue

CLI Example:

```
salt-run queue.insert_runner test.stdout_print
salt-run queue.insert_runner event.send test_insert_runner kwargs='{"data
↪": {"foo": "bar"}}'
```

`salt.runners.queue.`**`list_items`**(*queue*, *backend='sqlite'*)

List contents of a queue

CLI Example:

```
salt-run queue.list_items myqueue
salt-run queue.list_items myqueue backend=sqlite
```

`salt.runners.queue.`**`list_length`**(*queue*, *backend='sqlite'*)

Provide the number of items in a queue

CLI Example:

```
salt-run queue.list_length myqueue
salt-run queue.list_length myqueue backend=sqlite
```

`salt.runners.queue.`**`list_queues`**(*backend='sqlite'*)

Return a list of Salt Queues on the backend

CLI Example:

```
salt-run queue.list_queues
salt-run queue.list_queues backend=sqlite
```

`salt.runners.queue.`**`pop`**(*queue*, *quantity=1*, *backend='sqlite'*, *is_runner=False*)

Pop one or more or all items from a queue

CLI Example:

```
salt-run queue.pop myqueue
salt-run queue.pop myqueue 6
salt-run queue.pop myqueue all
salt-run queue.pop myqueue 6 backend=sqlite
salt-run queue.pop myqueue all backend=sqlite
```

`salt.runners.queue.`**`process_queue`**(*queue*, *quantity=1*, *backend='sqlite'*, *is_runner=False*)

Pop items off a queue and create an event on the Salt event bus to be processed by a Reactor.

CLI Example:

```
salt-run queue.process_queue myqueue
salt-run queue.process_queue myqueue 6
salt-run queue.process_queue myqueue all backend=sqlite
```

`salt.runners.queue.`**`process_runner`**(*quantity=1*, *queue=None*, *backend=None*)

Process queued runners

quantity
number of runners to process

queue
queue to insert the runner reference into

backend
backend that to use for the queue

CLI Example:

```
salt-run queue.process_runner
salt-run queue.process_runner 5
```

26.16.18 salt.runners.reactor

A convenience system to manage reactors

Beginning in the 2017.7 release, the reactor runner requires that the reactor system is running. This is accomplished one of two ways, either by having reactors configured or by including `reactor` in the engine configuration for the Salt master.

```
```

engines:

- reactor

`salt.runners.reactor.`**`add`**`(`*event*, *reactors*, *saltenv='base'*, *test=None*`)`

Add a new reactor

CLI Example:

```
salt-run reactor.add 'salt/cloud/*/destroyed' reactors='/srv/reactor/
↪destroy/*.sls'
```

`salt.runners.reactor.`**`delete`**`(`*event*, *saltenv='base'*, *test=None*`)`

Delete a reactor

CLI Example:

```
salt-run reactor.delete 'salt/cloud/*/destroyed'
```

`salt.runners.reactor.`**`is_leader`**`()`

Return whether the running reactor is acting as a leader (responding to events).

CLI Example:

```
salt-run reactor.is_leader
```

`salt.runners.reactor.`**`list_`**`(`*saltenv='base'*, *test=None*`)`

List currently configured reactors

CLI Example:

```
salt-run reactor.list
```

`salt.runners.reactor.`**`set_leader`**`(`*value=True*`)`

Set the current reactor to act as a leader (responding to events). Defaults to True

CLI Example:

```
salt-run reactor.set_leader True
```

26.16.19 salt.runners.salt

This runner makes Salt's execution modules available on the salt master.

New in version 2016.11.0. Salt's execution modules are normally available on the salt minion. Use this runner to call execution modules on the salt master. Salt *execution modules* are the functions called by the `salt` command.

Execution modules can be called with `salt-run`:

```
salt-run salt.cmd test.ping
# call functions with arguments and keyword arguments
salt-run salt.cmd test.arg 1 2 3 key=value a=1
```

Execution modules are also available to salt runners:

```
__salt__['salt.cmd'](fun=fun, args=args, kwargs=kwargs)
```

`salt.runners.salt.`**`cmd`**`(`*fun, *args, **kwargs*`)`

Changed in version 2018.3.0: Added `with_pillar` argument

Execute `fun` with the given `args` and `kwargs`. Parameter `fun` should be the string *name* of the execution module to call.

Note: Execution modules will be loaded *every time* this function is called. Additionally, keep in mind that since runners execute on the master, custom execution modules will need to be synced to the master using `salt-run saltutil.sync_modules`, otherwise they will not be available.

with_pillar

[False] If `True`, pillar data will be compiled for the master

Note: To target the master in the pillar top file, keep in mind that the default `id` for the master is `<hostname>_master`. This can be overridden by setting an `id` configuration parameter in the master config file.

CLI Example:

```
salt-run salt.cmd test.ping
# call functions with arguments and keyword arguments
salt-run salt.cmd test.arg 1 2 3 a=1
salt-run salt.cmd mymod.myfunc with_pillar=True
```

`salt.runners.salt.`**`execute`**`(`*tgt, fun, arg=(), timeout=None, tgt_type='glob', ret='', jid='', kwarg=None, **kwargs*`)`

New in version 2017.7.0.

Execute `fun` on all minions matched by `tgt` and `tgt_type`. Parameter `fun` is the name of execution module function to call.

This function should mainly be used as a helper for runner modules, in order to avoid redundant code. For example, when inside a runner one needs to execute a certain function on arbitrary groups of minions, only has to:

```
ret1 = __salt__['salt.execute']('*', 'mod.fun')
ret2 = __salt__['salt.execute']('my_nodegroup', 'mod2.fun2', tgt_type=
↪'nodegroup')
```

It can also be used to schedule jobs directly on the master, for example:

```
schedule:
    collect_bgp_stats:
        function: salt.execute
        args:
            - edge-routers
            - bgp.neighbors
        kwargs:
            tgt_type: nodegroup
        days: 1
        returner: redis
```

26.16.20 salt.runners.saltutil

The Saltutil runner is used to sync custom types to the Master. See the *saltutil module* for documentation on managing updates to minions.

New in version 2016.3.0.

`salt.runners.saltutil.`**`sync_all`**(*saltenv='base', extmod_whitelist=None, extmod_blacklist=None*)

Sync all custom types

saltenv
[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist
[None] dictionary of modules to sync based on type

extmod_blacklist
[None] dictionary of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_all
salt-run saltutil.sync_all extmod_whitelist={'runners': ['custom_runner'],
↪ 'grains': []}
```

`salt.runners.saltutil.`**`sync_cache`**(*saltenv='base', extmod_whitelist=None, extmod_blacklist=None*)

New in version 2017.7.0.

Sync cache modules from `salt://_cache` to the master

saltenv
[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_cache
```

`salt.runners.saltutil.`**`sync_clouds`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2017.7.0.

Sync cloud modules from `salt://_clouds` to the master

saltenv
[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_clouds
```

`salt.runners.saltutil.`**`sync_eauth_tokens`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2018.3.0.

Sync eauth token modules from `salt://_tokens` to the master

saltenv
[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_eauth_tokens
```

`salt.runners.saltutil.`**`sync_engines`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

Sync engines from `salt://_engines` to the master

saltenv
[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_engines
```

`salt.runners.saltutil.`**`sync_executors`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 3000.

Sync executor modules from `salt://_executors` to the master

saltenv
[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist
[None] comma-seperated list of modules to sync

extmod_blacklist
[None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_executors
```

`salt.runners.saltutil.`**`sync_fileserver`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2018.3.0.

Sync fileserver modules from `salt://_fileserver` to the master

saltenv
[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_fileserver
```

`salt.runners.saltutil.`**`sync_grains`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

Sync grains modules from `salt://_grains` to the master

saltenv
[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_grains
```

`salt.runners.saltutil.`**`sync_modules`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

Sync execution modules from `salt://_modules` to the master

saltenv
[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_modules
```

`salt.runners.saltutil.`**`sync_output`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

Sync output modules from `salt://_output` to the master

saltenv
[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_output
```

`salt.runners.saltutil.`**`sync_pillar`**`(`*saltenv='base', extmod_whitelist=None, extmod_blacklist=None*`)`

Sync pillar modules from `salt://_pillar` to the master

saltenv
[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_pillar
```

`salt.runners.saltutil.`**`sync_proxymodules`**`(`*saltenv='base', extmod_whitelist=None, extmod_blacklist=None*`)`

Sync proxy modules from `salt://_proxy` to the master

saltenv
[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_proxymodules
```

`salt.runners.saltutil.`**`sync_queues`**`(`*saltenv='base', extmod_whitelist=None, extmod_blacklist=None*`)`

Sync queue modules from `salt://_queues` to the master

saltenv
[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_queues
```

`salt.runners.saltutil.`**`sync_renderers`**`(`*saltenv='base', extmod_whitelist=None, extmod_blacklist=None*`)`

Sync renderer modules from from `salt://_renderers` to the master

saltenv
[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_renderers
```

`salt.runners.saltutil.`**`sync_returners`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

Sync returner modules from `salt://_returners` to the master

saltenv
[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_returners
```

`salt.runners.saltutil.`**`sync_roster`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2017.7.0.

Sync roster modules from `salt://_roster` to the master

saltenv
[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_roster
```

`salt.runners.saltutil.`**`sync_runners`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

Sync runners from `salt://_runners` to the master

saltenv
[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_runners
```

`salt.runners.saltutil.`**`sync_sdb`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2017.7.0.

Sync sdb modules from `salt://_sdb` to the master

saltenv
[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_sdb
```

`salt.runners.saltutil.`**`sync_serializers`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2019.2.0.

Sync serializer modules from `salt://_serializers` to the master

saltenv
[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist
[None] comma-seperated list of modules to sync

extmod_blacklist
[None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_utils
```

`salt.runners.saltutil.`**`sync_states`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

Sync state modules from `salt://_states` to the master

saltenv
[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_states
```

`salt.runners.saltutil.`**`sync_thorium`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2018.3.0.

Sync Thorium from `salt://_thorium` to the master

saltenv: **`base`**
The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist
comma-separated list of modules to sync

extmod_blacklist
comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_thorium
```

`salt.runners.saltutil.`**`sync_tops`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2016.3.7,2016.11.4,2017.7.0.

Sync master_tops modules from `salt://_tops` to the master

saltenv
[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_tops
```

`salt.runners.saltutil.`**`sync_utils`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2016.11.0.

Sync utils modules from `salt://_utils` to the master

saltenv
[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_utils
```

`salt.runners.saltutil.`**`sync_wheel`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

Sync wheel modules from `salt://_wheel` to the master

saltenv
[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_wheel
```

`salt.runners.saltutil.`**`sync_wrapper`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 3007.0.

Sync salt-ssh wrapper modules from `salt://_wrapper` to the master.

saltenv
[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist
[None] comma-seperated list of modules to sync

extmod_blacklist
[None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_wrapper
```

26.16.21 salt.runners.sdb

Runner for setting and querying data via the sdb API on the master

`salt.runners.sdb.`**`delete`**`(`*uri*`)`

Delete a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully deleted, return `False`.

CLI Example:

```
salt-run sdb.delete sdb://mymemcached/foo
```

`salt.runners.sdb.`**`get`**`(`*uri*`)`

Get a value from a db, using a uri in the form of sdb://<profile>/<key>. If the uri provided does not start with sdb://, then it will be returned as-is.

CLI Example:

```
salt-run sdb.get sdb://mymemcached/foo
```

`salt.runners.sdb.`**`get_or_set_hash`**`(`*uri*, *length=8*, chars='abcdefghijklmnopqrstuvwxyz0123456789!@#$%^&*(-_=+)'`)`

Perform a one-time generation of a hash and write it to sdb. If that value has already been set return the value instead.

This is useful for generating passwords or keys that are specific to multiple minions that need to be stored somewhere centrally.

CLI Example:

```
salt-run sdb.get_or_set_hash 'SECRET_KEY' 50
```

> **Warning:** This function could return strings which may contain characters which are reserved as directives by the YAML parser, such as strings beginning with %. To avoid issues when using the output of this function in an SLS file containing YAML+Jinja, surround the call with single quotes.

`salt.runners.sdb.`**`set_`**`(`*uri*, *value*`)`

Set a value in a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully set, return `False`.

CLI Example:

```
salt-run sdb.set sdb://mymemcached/foo bar
```

26.16.22 salt.runners.ssh

A Runner module interface on top of the salt-ssh Python API.

This allows for programmatic use from salt-api, the Reactor, Orchestrate, etc.

`salt.runners.ssh.`**`cmd`**(*tgt, fun, arg=(), timeout=None, tgt_type='glob', kwarg=None*)

New in version 2015.5.0.

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Execute a single command via the salt-ssh subsystem and return all routines at once

A wrapper around the *`SSHClient.cmd`* method.

26.16.23 salt.runners.state

Execute orchestration functions

`salt.runners.state.`**`event`**(*tagmatch='*', count=-1, quiet=False, sock_dir=None, pretty=False, node='master'*)

Watch Salt's event bus and block until the given tag is matched

New in version 2014.7.0.

Changed in version 2019.2.0: `tagmatch` can now be either a glob or regular expression.

This is useful for utilizing Salt's event bus from shell scripts or for taking simple actions directly from the CLI.

Enable debug logging to see ignored events.

Parameters

- **`tagmatch`** -- the event is written to stdout for each tag that matches this glob or regular expression.
- **`count`** -- this number is decremented for each event that matches the `tagmatch` parameter; pass `-1` to listen forever.
- **`quiet`** -- do not print to stdout; just block
- **`sock_dir`** -- path to the Salt master's event socket file.
- **`pretty`** -- Output the JSON all on a single line if `False` (useful for shell tools); pretty-print the JSON output if `True`.
- **`node`** -- Watch the minion-side or master-side event bus. .. versionadded:: 2016.3.0

CLI Examples:

```
# Reboot a minion and run highstate when it comes back online
salt 'jerry' system.reboot && \\
    salt-run state.event 'salt/minion/jerry/start' count=1 quiet=True && \
↪\
    salt 'jerry' state.highstate

# Reboot multiple minions and run highstate when all are back online
salt -L 'kevin,stewart,dave' system.reboot && \\
    salt-run state.event 'salt/minion/*/start' count=3 quiet=True && \\
    salt -L 'kevin,stewart,dave' state.highstate

# Watch the event bus forever in a shell while-loop.
salt-run state.event | while read -r tag data; do
    echo $tag
```

(continues on next page)

(continued from previous page)

```
    echo $data | jq --color-output .
done
```

See also:

See tests/eventlisten.sh for an example of usage within a shell script.

`salt.runners.state.`**`orch`**`(`*mods, saltenv='base', test=None, exclude=None, pillar=None, pillarenv=None, pillar_enc=None, orchestration_jid=None*`)`

This function is an alias of `orchestrate`.

New in version 0.17.0.

Execute a state run from the master, used as a powerful orchestration system.

See also:

More Orchestrate documentation

- *Full Orchestrate Tutorial*
- *`Docs for the master-side state module`*

CLI Examples:

```
salt-run state.orchestrate webserver
salt-run state.orchestrate webserver saltenv=dev test=True
salt-run state.orchestrate webserver saltenv=dev pillarenv=aws
```

Changed in version 2014.1.1: Runner renamed from `state.sls` to `state.orchestrate`

Changed in version 2014.7.0: Runner uses the pillar variable

Changed in version 2017.5.0: Runner uses the pillar_enc variable that allows renderers to render the pillar. This is usable when supplying the contents of a file as pillar, and the file contains gpg-encrypted entries.

See also:

GPG renderer documentation

CLI Examples:

```
salt-run state.orchestrate webserver pillar_enc=gpg pillar="
↪$(cat somefile.json)"
```

`salt.runners.state.`**`orch_show_sls`**`(`*mods, saltenv='base', test=None, queue=False, pillar=None, pillarenv=None, pillar_enc=None*`)`

This function is an alias of `orchestrate_show_sls`.

Display the state data from a specific sls, or list of sls files, after being render using the master minion.

Note, the master minion adds a "_master" suffix to its minion id.

See also:

The state.show_sls module function

CLI Example:

```
salt-run state.orch_show_sls my-orch-formula.my-orch-state
↪'pillar={ nodegroup: ng1 }'
```

`salt.runners.state.`**`orchestrate`**(*mods, saltenv='base', test=None, exclude=None, pillar=None, pillarenv=None, pillar_enc=None, orchestration_jid=None*)

New in version 0.17.0.

Execute a state run from the master, used as a powerful orchestration system.

See also:

More Orchestrate documentation
- *Full Orchestrate Tutorial*
- `Docs for the master-side state module`

CLI Examples:

```
salt-run state.orchestrate webserver
salt-run state.orchestrate webserver saltenv=dev test=True
salt-run state.orchestrate webserver saltenv=dev pillarenv=aws
```

Changed in version 2014.1.1: Runner renamed from `state.sls` to `state.orchestrate`

Changed in version 2014.7.0: Runner uses the pillar variable

Changed in version 2017.5.0: Runner uses the pillar_enc variable that allows renderers to render the pillar. This is usable when supplying the contents of a file as pillar, and the file contains gpg-encrypted entries.

See also:

GPG renderer documentation

CLI Examples:

```
salt-run state.orchestrate webserver pillar_enc=gpg pillar="$(cat somefile.json)"
```

`salt.runners.state.`**`orchestrate_high`**(*data, test=None, queue=False, pillar=None, **kwargs*)

Execute a single state orchestration routine

New in version 2015.5.0.

CLI Example:

```
salt-run state.orchestrate_high '{
    stage_one:
        {salt.state: [{tgt: "db*"}, {sls: postgres_setup}]},
    stage_two:
        {salt.state: [{tgt: "web*"}, {sls: apache_setup}, {
            require: [{salt: stage_one}],
        }]},
    }'
```

`salt.runners.state.`**`orchestrate_show_sls`**(*mods, saltenv='base', test=None, queue=False, pillar=None, pillarenv=None, pillar_enc=None*)

Display the state data from a specific sls, or list of sls files, after being render using the master minion.

Note, the master minion adds a "_master" suffix to its minion id.

See also:

The state.show_sls module function

CLI Example:

```
salt-run state.orch_show_sls my-orch-formula.my-orch-state 'pillar={
↪nodegroup: ng1 }'
```

`salt.runners.state.`**`orchestrate_single`**(*fun, name, test=None, queue=False, pillar=None, **kwargs*)

Execute a single state orchestration routine

New in version 2015.5.0.

CLI Example:

```
salt-run state.orchestrate_single fun=salt.wheel name=key.list_all
```

`salt.runners.state.`**`pause`**(*jid, state_id=None, duration=None*)

Set up a state id pause, this instructs a running state to pause at a given state id. This needs to pass in the jid of the running state and can optionally pass in a duration in seconds.

`salt.runners.state.`**`resume`**(*jid, state_id=None*)

Remove a pause from a jid, allowing it to continue

`salt.runners.state.`**`rm_pause`**(*jid, state_id=None*)

This function is an alias of `resume`.

Remove a pause from a jid, allowing it to continue

`salt.runners.state.`**`set_pause`**(*jid, state_id=None, duration=None*)

This function is an alias of `pause`.

Set up a state id pause, this instructs a running state to pause at a given state id. This needs to pass in the jid of the running state and can optionally pass in a duration in seconds.

`salt.runners.state.`**`sls`**(*mods, saltenv='base', test=None, exclude=None, pillar=None, pillarenv=None, pillar_enc=None, orchestration_jid=None*)

This function is an alias of `orchestrate`.

New in version 0.17.0.

Execute a state run from the master, used as a powerful orchestration system.

See also:

More Orchestrate documentation

- *Full Orchestrate Tutorial*
- *`Docs for the master-side state module`*

CLI Examples:

```
salt-run state.orchestrate webserver
salt-run state.orchestrate webserver saltenv=dev test=True
salt-run state.orchestrate webserver saltenv=dev pillarenv=aws
```

Changed in version 2014.1.1: Runner renamed from `state.sls` to `state.orchestrate`

Changed in version 2014.7.0: Runner uses the pillar variable

Changed in version 2017.5.0: Runner uses the pillar_enc variable that allows renderers to render the pillar. This is usable when supplying the contents of a file as pillar, and the file contains gpg-encrypted entries.

See also:

GPG renderer documentation

CLI Examples:

```
salt-run state.orchestrate webserver pillar_enc=gpg pillar="
↪$(cat somefile.json)"
```

`salt.runners.state.`**`soft_kill`**`(`*jid*, *state_id=None*`)`

Set up a state run to die before executing the given state id, this instructs a running state to safely exit at a given state id. This needs to pass in the jid of the running state. If a state_id is not passed then the jid referenced will be safely exited at the beginning of the next state run.

26.16.24 salt.runners.survey

A general map/reduce style salt runner for aggregating results returned by several different minions.

New in version 2014.7.0.

Aggregated results are sorted by the size of the minion pools which returned matching results.

Useful for playing the game: *"some of these things are not like the others..."* when identifying discrepancies in a large infrastructure managed by salt.

`salt.runners.survey.`**`diff`**`(`**args*, ***kwargs*`)`

Return the DIFFERENCE of the result sets returned by each matching minion pool

New in version 2014.7.0.

These pools are determined from the aggregated and sorted results of a salt command.

This command displays the "diffs" as a series of 2-way differences -- namely the difference between the FIRST displayed minion pool (according to sort order) and EACH SUBSEQUENT minion pool result set.

Differences are displayed according to the Python `difflib.unified_diff()` as in the case of the salt execution module `file.get_diff`.

This command is submitted via a salt runner using the general form:

```
salt-run survey.diff [survey_sort=up/down] <target>
             <salt-execution-module> <salt-execution-module parameters>
```

Optionally accept a `survey_sort=` parameter. Default: `survey_sort=down`

CLI Example #1: (Example to display the "differences of files")

```
salt-run survey.diff survey_sort=up "*" cp.get_file_str file:///etc/hosts
```

`salt.runners.survey.`**`hash`**`(`**args*, ***kwargs*`)`

Return the MATCHING minion pools from the aggregated and sorted results of a salt command

New in version 2014.7.0.

This command is submitted via a salt runner using the general form:

```
salt-run survey.hash [survey_sort=up/down] <target>
          <salt-execution-module> <salt-execution-module parameters>
```

Optionally accept a `survey_sort=` parameter. Default: `survey_sort=down`

CLI Example #1: (functionally equivalent to `salt-run manage.up`)

```
salt-run survey.hash "*" test.ping
```

CLI Example #2: (find an "outlier" minion config file)

```
salt-run survey.hash "*" file.get_hash /etc/salt/minion survey_sort=up
```

26.16.25 salt.runners.test

This runner is used only for test purposes and serves no production purpose

`salt.runners.test.`**`arg`**`(`*`*args, **kwargs`*`)`

Output the given args and kwargs

Kwargs will be filtered for 'private' keynames.

CLI Example:

```
salt-run test.arg foo bar=baz
```

`salt.runners.test.`**`get_opts`**`()`

New in version 2018.3.0.

Return the configuration options of the master.

CLI Example:

```
salt-run test.get_opts
```

`salt.runners.test.`**`metasyntactic`**`(`*`locality='us'`*`)`

Return common metasyntactic variables for the given locality

CLI Example:

```
salt-run test.metasyntactic locality=uk
```

`salt.runners.test.`**`raw_arg`**`(`*`*args, **kwargs`*`)`

Output the given args and kwargs

CLI Example:

```
salt-run test.arg foo __bar=baz
```

`salt.runners.test.`**`sleep`**`(`*`s_time=10`*`)`

Sleep t seconds, then return True

CLI Example:

```
salt-run test.sleep s_time=5
```

`salt.runners.test.`**`stdout_print`**`()`

Print 'foo' and return 'bar'

CLI Example:

```
salt-run test.stdout_print
```

`salt.runners.test.`**`stream`**`()`

Fire a stream of 100 test events, then return True

CLI Example:

```
salt-run test.stream
```

26.16.26 salt.runners.winrepo

Runner to manage Windows software repo

`salt.runners.winrepo.`**`genrepo`**`(`*opts=None, fire_event=True*`)`

Generate winrepo_cachefile based on sls files in the winrepo_dir

opts

Specify an alternate opts dict. Should not be used unless this function is imported into an execution module.

fire_event

[True] Fire an event on failure. Only supported on the master.

CLI Example:

```
salt-run winrepo.genrepo
```

`salt.runners.winrepo.`**`update_git_repos`**`(`*opts=None, clean=False, masterless=False*`)`

Checkout git repos containing Windows Software Package Definitions

opts

Specify an alternate opts dict. Should not be used unless this function is imported into an execution module.

clean

[False] Clean repo cachedirs which are not configured under *`winrepo_remotes`*.

> **Warning:** This argument should not be set to `True` if a mix of git and non-git repo definitions are being used, as it will result in the non-git repo definitions being removed.

New in version 2015.8.0.

CLI Examples:

```
salt-run winrepo.update_git_repos
salt-run winrepo.update_git_repos clean=True
```

26.17 sdb modules

`env`	Environment sdb Module
`yaml`	Pull sdb values from a YAML file

26.17.1 salt.sdb.env

Environment sdb Module

maintainer
SaltStack

maturity
New

depends
None

platform
all

This module allows access to environment variables using an `sdb://` URI.

Example configuration for this module:

```
osenv:
  driver: env
```

WARNING:

OS environment variables will be available to read via SDB. Please make sure you don't have any sensitive data in your environment variables!!

Example usage of sdb env module:

```
set some env var:
  cmd.run:
    - name: echo {{ salt['sdb.set']('sdb://osenv/foo', 'bar') }}
    - order: 1

{% if salt['sdb.get']('sdb://osenv/foo') == 'bar' %}
always-changes-and-succeeds:
  test.succeed_with_changes:
    - name: foo
{% else %}
always-changes-and-fails:
  test.fail_with_changes:
    - name: foo
{% endif  %}
```

The above example will return success.

The `env` sdb module can also be used with salt cloud. Assuming you have exported the environment variable named `compute` (and have `osenv` defined). The example below will look for the salt cloud config key `compute_name` in the environment:

```
my-openstack-config:
  compute_name: sdb://osenv/compute
  ..snip
```

`salt.sdb.env.`**`get`**(*key*, *profile=None*)

Get a value

`salt.sdb.env.`**`set_`**(*key*, *value*, *profile=None*)

Set a key/value pair

26.17.2 salt.sdb.yaml

Pull sdb values from a YAML file

maintainer
SaltStack

maturity
New

platform
all

New in version 2017.7.0.

Configuration:

```
my-yaml-file:
  driver: yaml
  files:
    - /path/to/foo.yaml
    - /path/to/bar.yaml
```

The files are merged together and the result is searched using the same mechanism Salt uses for searching Grains and Pillar data structures.

Optional configuration:

```
my-yaml-file:
  driver: yaml
  files:
    - /path/to/foo.yaml
    - /path/to/bar.yaml
  merge:
    strategy: smart
    merge_list: false
  gpg: true
```

New in version 2018.3.0.

Setting the `gpg` option to `true` (default is `false`) will decrypt embedded GPG-encrypted data using the *GPG renderer*.

`salt.sdb.yaml.`**`get`**(*key*, *profile=None*)

Get a value from the dictionary

`salt.sdb.yaml.`**`set_`**(**args*, ***kwargs*)

Setting a value is not supported; edit the YAML files directly

26.18 serializer modules

26.18.1 salt.serializers

This module implements all the serializers needed by salt. Each serializer offers the same functions and attributes:

deserialize
function for deserializing string or stream

serialize
function for serializing a Python object

available
flag that tells if the serializer is available (all dependencies are met etc.)

exception `salt.serializers.`**`DeserializationError`**(*message, line_num=None, buf='', marker='<======================', trace=None*)

Raised when stream of string failed to be deserialized

exception `salt.serializers.`**`SerializationError`**(*message=''*)

Raised when stream of string failed to be serialized

`configparser`	salt.serializers.configparser
`json`	salt.serializers.json
`msgpack`	salt.serializers.msgpack
`tomlmod`	salt.serializers.tomlmod
`yaml`	salt.serializers.yaml
`yamlex`	salt.serializers.yamlex

26.18.2 salt.serializers.configparser

salt.serializers.configparser

New in version 2016.3.0.

Implements a configparser serializer.

exception `salt.serializers.configparser.`**`DeserializationError`**(*message, line_num=None, buf='', marker='<======================', trace=None*)

Raised when stream of string failed to be deserialized

exception `salt.serializers.configparser.`**`SerializationError`**(*message=''*)

Raised when stream of string failed to be serialized

`salt.serializers.configparser.`**`deserialize`**(*stream_or_string, **options*)

Deserialize any string or stream like object into a Python data structure.

Parameters

- **`stream_or_string`** -- stream or string to deserialize.
- **`options`** -- options given to lower configparser module.

`salt.serializers.configparser.serialize(obj, **options)`

Serialize Python data to a configparser formatted string or file.

Parameters

- **`obj`** -- the data structure to serialize
- **`options`** -- options given to lower configparser module.

26.18.3 salt.serializers.json

salt.serializers.json

Implements JSON serializer.

It's just a wrapper around json (or simplejson if available).

`exception salt.serializers.json.DeserializationError(message, line_num=None, buf='', marker='<======================', trace=None)`

Raised when stream of string failed to be deserialized

`exception salt.serializers.json.SerializationError(message='')`

Raised when stream of string failed to be serialized

`salt.serializers.json.deserialize(stream_or_string, **options)`

Deserialize any string or stream like object into a Python data structure.

Parameters

- **`stream_or_string`** -- stream or string to deserialize.
- **`options`** -- options given to lower json/simplejson module.

`salt.serializers.json.serialize(obj, **options)`

Serialize Python data to JSON.

Parameters

- **`obj`** -- the data structure to serialize
- **`options`** -- options given to lower json/simplejson module.

26.18.4 salt.serializers.msgpack

salt.serializers.msgpack

Implements MsgPack serializer.

`exception salt.serializers.msgpack.DeserializationError(message, line_num=None, buf='', marker='<======================', trace=None)`

Raised when stream of string failed to be deserialized

`exception salt.serializers.msgpack.SerializationError(message='')`

Raised when stream of string failed to be serialized

`salt.serializers.msgpack.deserialize(stream_or_string, **options)`

Deserialize any string of stream like object into a Python data structure.

Parameters

- **`stream_or_string`** -- stream or string to deserialize.

  - **options** -- options given to lower msgpack module.

salt.serializers.msgpack.**serialize**(*obj*, ***options*)

Serialize Python data to MsgPack.

Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to lower msgpack module.

26.18.5 salt.serializers.toml

salt.serializers.tomlmod

Implements TOML serializer.

It's just a wrapper around the python toml module.

exception salt.serializers.tomlmod.**DeserializationError**(*message, line_num=None, buf='', marker=' <======================', trace=None*)

Raised when stream of string failed to be deserialized

exception salt.serializers.tomlmod.**SerializationError**(*message=''*)

Raised when stream of string failed to be serialized

salt.serializers.tomlmod.**deserialize**(*stream_or_string*, ***options*)

Deserialize from TOML into Python data structure.

Parameters

- **stream_or_string** -- toml stream or string to deserialize.
- **options** -- options given to the python toml module.

salt.serializers.tomlmod.**serialize**(*obj*, ***options*)

Serialize Python data to TOML.

Parameters

- **obj** -- the data structure to serialize.
- **options** -- options given to the python toml module.

26.18.6 salt.serializers.yaml

salt.serializers.yaml

Implements YAML serializer.

Underneath, it is based on pyyaml and use the safe dumper and loader. It also use C bindings if they are available.

salt.serializers.yaml.**BaseDumper**

alias of `CSafeDumper`

salt.serializers.yaml.**BaseLoader**

alias of `CSafeLoader`

exception salt.serializers.yaml.**ConstructorError**(*context=None, context_mark=None, problem=None, problem_mark=None, note=None*)

exception salt.serializers.yaml.**DeserializationError**(*message*, *line_num=None*, *buf=''*, *marker=' <======================'*, *trace=None*)

Raised when stream of string failed to be deserialized

class salt.serializers.yaml.**Dumper**(*stream*, *default_style=None*, *default_flow_style=False*, *canonical=None*, *indent=None*, *width=None*, *allow_unicode=None*, *line_break=None*, *encoding=None*, *explicit_start=None*, *explicit_end=None*, *version=None*, *tags=None*, *sort_keys=True*)

Overwrites Dumper as not for pollute legacy Dumper

yaml_multi_representers = {<class 'salt.serializers.yaml.EncryptedString'>: <function EncryptedString.yaml_dumper>, <class 'NoneType'>: <function SafeRepresenter.represent_none>, <class 'str'>: <function SafeRepresenter.represent_str>, <class 'bool'>: <function SafeRepresenter.represent_bool>, <class 'int'>: <function SafeRepresenter.represent_int>, <class 'float'>: <function SafeRepresenter.represent_float>, <class 'list'>: <function SafeRepresenter.represent_list>, <class 'tuple'>: <function SafeRepresenter.represent_list>, <class 'dict'>: <function SafeRepresenter.represent_dict>, <class 'set'>: <function SafeRepresenter.represent_set>, <class 'datetime.date'>: <function SafeRepresenter.represent_date>, <class 'datetime.datetime'>: <function SafeRepresenter.represent_datetime>, None: <function SafeRepresenter.represent_undefined>, <class 'collections.OrderedDict'>: <function SafeRepresenter.represent_dict>}

class salt.serializers.yaml.**EncryptedString**

static yaml_constructor(*loader*, *tag*, *node*)

static yaml_dumper(*dumper*, *data*)

yaml_tag = '!encrypted'

class salt.serializers.yaml.**Loader**(*stream*)

Overwrites Loader as not for pollute legacy Loader

yaml_multi_constructors = {'!encrypted': <function EncryptedString.yaml_constructor>, 'tag:yaml.org,2002:binary': <function SafeConstructor.construct_yaml_binary>, 'tag:yaml.org,2002:bool': <function SafeConstructor.construct_yaml_bool>, 'tag:yaml.org,2002:float': <function SafeConstructor.construct_yaml_float>, 'tag:yaml.org,2002:int': <function SafeConstructor.construct_yaml_int>, 'tag:yaml.org,2002:map': <function SafeConstructor.construct_yaml_map>, 'tag:yaml.org,2002:null': <function SafeConstructor.construct_yaml_null>, 'tag:yaml.org,2002:omap': <function SafeConstructor.construct_yaml_omap>, 'tag:yaml.org,2002:pairs': <function SafeConstructor.construct_yaml_pairs>, 'tag:yaml.org,2002:seq': <function SafeConstructor.construct_yaml_seq>, 'tag:yaml.org,2002:set': <function SafeConstructor.construct_yaml_set>, 'tag:yaml.org,2002:str': <function SafeConstructor.construct_yaml_str>, 'tag:yaml.org,2002:timestamp': <function SafeConstructor.construct_yaml_timestamp>}

class `salt.serializers.yaml.`**`OrderedDict`**

Dictionary that remembers insertion order

`clear``()` → None. Remove all items from od.

`copy``()` → a shallow copy of od

`fromkeys``(`*value=None*`)`

Create a new ordered dictionary with keys from iterable and values set to value.

`items``()` → a set-like object providing a view on D's items

`keys``()` → a set-like object providing a view on D's keys

`move_to_end``(`*key*, *last=True*`)`

Move an existing element to the end (or beginning if last is false).

Raise KeyError if the element does not exist.

`pop``(`*key*[, *default*]`)` → v, remove specified key and return the corresponding value.

If the key is not found, return the default if given; otherwise, raise a KeyError.

`popitem``(`*last=True*`)`

Remove and return a (key, value) pair from the dictionary.

Pairs are returned in LIFO order if last is true or FIFO order if false.

`setdefault``(`*key*, *default=None*`)`

Insert key with a value of default if key is not in the dictionary.

Return the value for key if key is in the dictionary, else default.

`update``(`[*E*], ***F*`)` → None. Update D from dict/iterable E and F.

If E is present and has a .keys() method, then does: for k in E: D[k] = E[k] If E is present and lacks a .keys() method, then does: for k, v in E: D[k] = v In either case, this is followed by: for k in F: D[k] = F[k]

`values``()` → an object providing a view on D's values

exception `salt.serializers.yaml.`**`ScannerError`**`(`*context=None*, *context_mark=None*, *problem=None*, *problem_mark=None*, *note=None*`)`

exception `salt.serializers.yaml.`**`SerializationError`**`(`*message=''*`)`

Raised when stream of string failed to be serialized

`salt.serializers.yaml.`**`deserialize`**`(`*stream_or_string*, ***options*`)`

Deserialize any string of stream like object into a Python data structure.

Parameters

- **`stream_or_string`** -- stream or string to deserialize.
- **`options`** -- options given to lower yaml module.

`salt.serializers.yaml.`**`serialize`**`(`*obj*, ***options*`)`

Serialize Python data to YAML.

Parameters

- **`obj`** -- the data structure to serialize
- **`options`** -- options given to lower yaml module.

26.18.7 salt.serializers.yamlex

salt.serializers.yamlex

YAMLEX is a format that allows for things like sls files to be more intuitive.

It's an extension of YAML that implements all the salt magic: - it implies omap for any dict like. - it implies that string like data are str, not unicode - ...

For example, the file *states.sls* has this contents:

```
foo:
  bar: 42
  baz: [1, 2, 3]
```

The file can be parsed into Python like this

```
from salt.serializers import yamlex

with open('state.sls', 'r') as stream:
    obj = yamlex.deserialize(stream)
```

Check that `obj` is an OrderedDict

```
from salt.utils.odict import OrderedDict

assert isinstance(obj, dict)
assert isinstance(obj, OrderedDict)
```

yamlex *__repr__* and *__str__* objects' methods render YAML understandable string. It means that they are template friendly.

```
print '{0}'.format(obj)
```

returns:

```
{foo: {bar: 42, baz: [1, 2, 3]}}
```

and they are still valid YAML:

```
from salt.serializers import yaml
yml_obj = yaml.deserialize(str(obj))
assert yml_obj == obj
```

yamlex implements also custom tags:

!aggregate

this tag allows structures aggregation.

For example:

```
placeholder: !aggregate foo
placeholder: !aggregate bar
placeholder: !aggregate baz
```

is rendered as

```
placeholder: [foo, bar, baz]
```

!reset

this tag flushes the computing value.

```
placeholder: {!aggregate foo: {foo: 42}}
placeholder: {!aggregate foo: {bar: null}}
!reset placeholder: {!aggregate foo: {baz: inga}}
```

is roughly equivalent to

```
placeholder: {!aggregate foo: {baz: inga}}
```

Document is defacto an aggregate mapping.

class `salt.serializers.yamlex.`**`AggregatedMap`**

class `salt.serializers.yamlex.`**`AggregatedSequence`**(*iterable=(), /*)

`salt.serializers.yamlex.`**`BaseDumper`**

alias of `SafeDumper`

`salt.serializers.yamlex.`**`BaseLoader`**

alias of `CSafeLoader`

exception `salt.serializers.yamlex.`**`ConstructorError`**(*context=None, context_mark=None, problem=None, problem_mark=None, note=None*)

exception `salt.serializers.yamlex.`**`DeserializationError`**(*message, line_num=None, buf='', marker=' <======================', trace=None*)

Raised when stream of string failed to be deserialized

class `salt.serializers.yamlex.`**`Dumper`**(*stream, default_style=None, default_flow_style=False, canonical=None, indent=None, width=None, allow_unicode=None, line_break=None, encoding=None, explicit_start=None, explicit_end=None, version=None, tags=None, sort_keys=True*)

sls dumper.

`represent_odict`(*data*)

yaml_multi_representers = {<class 'NoneType'>: <function SafeRepresenter.represent_none>, <class 'bytes'>: <function SafeRepresenter.represent_binary>, <class 'str'>: <function SafeRepresenter.represent_str>, <class 'bool'>: <function SafeRepresenter.represent_bool>, <class 'int'>: <function SafeRepresenter.represent_int>, <class 'float'>: <function SafeRepresenter.represent_float>, <class 'list'>: <function SafeRepresenter.represent_list>, <class 'tuple'>: <function SafeRepresenter.represent_list>, <class 'dict'>: <function Dumper.represent_odict>, <class 'set'>: <function SafeRepresenter.represent_set>, <class 'datetime.date'>: <function SafeRepresenter.represent_date>, <class 'datetime.datetime'>: <function SafeRepresenter.represent_datetime>, None: <function SafeRepresenter.represent_undefined>}

class salt.serializers.yamlex.**Loader**(*stream*)

Create a custom YAML loader that uses the custom constructor. This allows for the YAML loading defaults to be manipulated based on needs within salt to make things like sls file more intuitive.

DEFAULT_MAPPING_TAG = 'tag:yaml.org,2002:omap'

DEFAULT_SCALAR_TAG = 'tag:yaml.org,2002:str'

DEFAULT_SEQUENCE_TAG = 'tag:yaml.org,2002:seq'

compose_document()

construct_sls_aggregate(*node*)

construct_sls_int(*node*)

Verify integers and pass them in correctly is they are declared as octal

construct_sls_reset(*node*)

construct_sls_str(*node*)

Build the SLSString.

construct_yaml_omap(*node*)

Build the SLSMap

resolve_sls_tag(*node*)

class salt.serializers.yamlex.**Map**

Map aggregation.

class salt.serializers.yamlex.**MappingNode**(*tag*, *value*, *start_mark=None*, *end_mark=None*, *flow_style=None*)

id = 'mapping'

class salt.serializers.yamlex.**OrderedDict**

Dictionary that remembers insertion order

clear() → None. Remove all items from od.

copy() → a shallow copy of od

fromkeys(*value=None*)

Create a new ordered dictionary with keys from iterable and values set to value.

items() → a set-like object providing a view on D's items

keys() → a set-like object providing a view on D's keys

move_to_end(*key*, *last=True*)

Move an existing element to the end (or beginning if last is false).

Raise KeyError if the element does not exist.

pop(*key*[, *default*]) → v, remove specified key and return the corresponding value.

If the key is not found, return the default if given; otherwise, raise a KeyError.

popitem(*last=True*)

Remove and return a (key, value) pair from the dictionary.

Pairs are returned in LIFO order if last is true or FIFO order if false.

setdefault(*key*, *default=None*)

Insert key with a value of default if key is not in the dictionary.

Return the value for key if key is in the dictionary, else default.

update([*E*], ***F*) → None. Update D from dict/iterable E and F.

If E is present and has a .keys() method, then does: for k in E: D[k] = E[k] If E is present and lacks a .keys() method, then does: for k, v in E: D[k] = v In either case, this is followed by: for k in F: D[k] = F[k]

values() → an object providing a view on D's values

class salt.serializers.yamlex.**SLSMap**

Ensures that dict str() and repr() are YAML friendly.

```
>>> mapping = OrderedDict([('a', 'b'), ('c', None)])
>>> print mapping
OrderedDict([('a', 'b'), ('c', None)])

>>> sls_map = SLSMap(mapping)
>>> print sls_map.__str__()
{a: b, c: null}
```

class salt.serializers.yamlex.**SLSString**

Ensures that str str() and repr() are YAML friendly.

```
>>> scalar = str('foo')
>>> print 'foo'
foo

>>> sls_scalar = SLSString(scalar)
>>> print sls_scalar
"foo"
```

exception salt.serializers.yamlex.**ScannerError**(*context=None*, *context_mark=None*, *problem=None*, *problem_mark=None*, *note=None*)

class salt.serializers.yamlex.**Sequence**(*iterable=()*, */*)

Sequence aggregation.

exception salt.serializers.yamlex.**SerializationError**(*message=''*)

Raised when stream of string failed to be serialized

salt.serializers.yamlex.**aggregate**(*obj_a*, *obj_b*, *level=False*, *map_class=<class 'salt.utils.aggregation.Map'>*, *sequence_class=<class 'salt.utils.aggregation.Sequence'>*)

Merge obj_b into obj_a.

```
>>> aggregate('first', 'second', True) == ['first', 'second']
True
```

`salt.serializers.yamlex.`**`deserialize`**(*stream_or_string*, ***options*)

Deserialize any string of stream like object into a Python data structure.

Parameters

- **`stream_or_string`** -- stream or string to deserialize.
- **`options`** -- options given to lower yaml module.

`salt.serializers.yamlex.`**`merge_recursive`**(*obj_a*, *obj_b*, *level=False*)

Merge obj_b into obj_a.

`salt.serializers.yamlex.`**`serialize`**(*obj*, ***options*)

Serialize Python data to YAML.

Parameters

- **`obj`** -- the data structure to serialize
- **`options`** -- options given to lower yaml module.

26.19 state modules

ansiblegate	Execution of Ansible modules from within states
apache	
apache_conf	
apache_module	
apache_site	
archive	Extract an archive
at	Configuration disposable regularly scheduled tasks for at.
beacon	Management of the Salt beacons
chocolatey	Manage Windows Packages using Chocolatey .
cloud	Using states instead of maps to deploy clouds
cmd	Execution of arbitrary commands
cron	Management of cron, the Unix command scheduler
disk	Disk monitoring state
environ	Support for getting and setting the environment variables of the current salt process.
etcd_mod	Manage etcd Keys
event	Send events through Salt's event system during state runs
file	This reference page explains how to use the state file module.
firewall	State to check firewall configurations
firewalld	Management of firewalld
git	States to manage git repositories and git configuration
gpg	Manage GPG keychains
grains	Manage grains on the minion

continues on next page

Table 3 – continued from previous page

group	Management of user groups
highstate_doc	To be used with processors in module *highstate_doc*.
host	Management of addresses and names in hosts file
http	HTTP monitoring states
idem	Idem Support
ini_manage	Manage ini files
ipset	Management of ipsets
iptables	Management of iptables
keyboard	Management of keyboard layouts
kmod	Loading and unloading of kernel modules
linux_acl	Linux File Access Control Lists
locale	Management of languages/locales
logrotate	Module for managing logrotate.
loop	Loop state
lvm	Management of Linux logical volumes
mac_assistive	Allows you to manage assistive access on macOS minions with 10.9+
mac_keychain	Installing of certificates to the keychain
mac_xattr	Allows you to manage extended attributes on files or directories
macdefaults	Writing/reading defaults from a macOS minion
macpackage	Installing of mac pkg files
makeconf	Management of Gentoo make.conf
mdadm_raid	Managing software RAID with mdadm
module	Execution of Salt modules from within states
mount	Mounting of filesystems
netacl	Network ACL
netconfig	Network Config
netntp	Network NTP
netsnmp	Network SNMP
netusers	Network Users
network	Configuration of network interfaces
nftables	Management of nftables
ntp	Management of NTP servers
pip_state	Installation of Python Packages Using pip
pkg	Installation of packages using OS package managers such as yum or apt-get
pkgbuild	The pkgbuild state is the front of Salt package building backend.
pkgng	Manage package remote repo using FreeBSD pkgng
pkgrepo	Management of APT/DNF/YUM/Zypper package repos
postgres_cluster	Management of PostgreSQL clusters
postgres_database	Management of PostgreSQL databases
postgres_extension	Management of PostgreSQL extensions
postgres_group	Management of PostgreSQL groups (roles)
postgres_initdb	Initialization of PostgreSQL data directory
postgres_language	Management of PostgreSQL languages
postgres_privileges	Management of PostgreSQL Privileges
postgres_schema	Management of PostgreSQL schemas
postgres_tablespace	Management of PostgreSQL tablespace
postgres_user	Management of PostgreSQL users (roles)
process	Process Management

continues on next page

Table 3 – continued from previous page

`proxy`	Allows you to manage proxy settings on minions
`pyenv`	Managing python installations with pyenv
`quota`	Management of POSIX Quotas
`rabbitmq_cluster`	Manage RabbitMQ Clusters
`rabbitmq_plugin`	Manage RabbitMQ Plugins
`rabbitmq_policy`	Manage RabbitMQ Policies
`rabbitmq_upstream`	Manage RabbitMQ Upstreams
`rabbitmq_user`	Manage RabbitMQ Users
`rabbitmq_vhost`	Manage RabbitMQ Virtual Hosts
`reg`	Manage the Windows registry
`salt_proxy`	Salt proxy state
`saltmod`	Control the Salt command interface
`saltutil`	Saltutil State
`schedule`	Management of the Salt scheduler
`selinux`	Management of SELinux rules
`service`	Starting or restarting of services and daemons
`ssh_auth`	Control of entries in SSH authorized_key files
`ssh_known_hosts`	Control of SSH known_hosts entries
`stateconf`	Stateconf System
`status`	Minion status monitoring
`sysctl`	Configuration of the kernel using sysctl
`sysfs`	Configuration of the kernel using sysfs
`syslog_ng`	State module for syslog_ng
`test`	Test States
`timezone`	Management of timezones
`tls`	Enforce state for SSL/TLS
`uptime`	Monitor Web Server with Uptime
`user`	Management of user accounts.
`virtualenv_mod`	Setup of Python virtualenv sandboxes.
`win_appx`	Manage Microsoft Store apps on Windows.
`win_certutil`	Installing of certificates to the Windows Certificate Manager
`win_dacl`	Windows Object Access Control Lists
`win_dism`	Installing of Windows features using DISM
`win_dns_client`	Module for configuring DNS Client on Windows systems
`win_firewall`	State for configuring Windows Firewall
`win_iis`	Microsoft IIS site management
`win_lgpo`	Manage Windows Local Group Policy
`win_lgpo_reg`	LGPO - Registry.pol
`win_license`	Installation and activation of windows licenses
`win_network`	Configuration of network interfaces on Windows hosts
`win_path`	Manage the Windows System PATH
`win_pki`	Microsoft certificate management via the Pki PowerShell module.
`win_powercfg`	This module allows you to control the power settings of a windows minion via powercfg.
`win_servermanager`	Manage Windows features via the ServerManager powershell module.
`win_shortcut`	State module for creating shortcuts on Windows.
`win_smtp_server`	Module for managing IIS SMTP server configuration on Windows servers.

continues on next page

Table 3 – continued from previous page

win_snmp	Module for managing SNMP service settings on Windows servers.
win_system	Management of Windows system information
win_task	State module for adding and removing scheduled tasks using the Windows Task Scheduler.
win_wua	Installation of Windows Updates using the Windows Update Agent
win_wusa	Microsoft Updates (KB) Management
winrepo	Manage Windows Package Repository
x509	Manage X509 Certificates
x509_v2	Manage X.509 certificates

26.19.1 salt.states.ansiblegate

Execution of Ansible modules from within states

With *ansible.call* these states allow individual Ansible module calls to be made via states. To call an Ansible module function use a `module.run` state:

```
some_set_of_tasks:
  ansible:
    - system.ping
    - packaging.os.zypper
      - name: emacs
      - state: installed
```

class salt.states.ansiblegate.**AnsibleState**

Ansible state caller.

get_args(*argset*)

Get args and kwargs from the argset.

Parameters

argset --

Returns

salt.states.ansiblegate.**playbooks**(*name*, *rundir=None*, *git_repo=None*, *git_kwargs=None*, *ansible_kwargs=None*)

Run Ansible Playbooks

Parameters

- **name** -- path to playbook. This can be relative to rundir or the git repo
- **rundir** -- location to run ansible-playbook from.
- **git_repo** -- git repository to clone for ansible playbooks. This is cloned using the *git.latest* state, and is cloned to the *rundir* if specified, otherwise it is clone to the *cache_dir*
- **git_kwargs** -- extra kwargs to pass to *git.latest* state module besides the *name* and *target*
- **ansible_kwargs** -- extra kwargs to pass to *ansible.playbooks* execution module besides the *name* and *target*

Returns

Ansible playbook output.

```
run nginx install:
  ansible.playbooks:
    - name: install.yml
    - git_repo: git://github.com/gituser/playbook.git
    - git_kwargs:
        rev: master
```

26.19.2 salt.states.apache

Warning: This module will be removed from Salt in version 3009 in favor of the apache Salt Extension.

Apache state

New in version 2014.7.0.

Allows for inputting a yaml dictionary into a file for apache configuration files.

The variable `this` is special and signifies what should be included with the above word between angle brackets (<>).

```
/etc/httpd/conf.d/website.com.conf:
  apache.configfile:
    - config:
      - VirtualHost:
          this: '*:80'
          ServerName:
            - website.com
          ServerAlias:
            - www.website.com
            - dev.website.com
          ErrorLog: logs/website.com-error_log
          CustomLog: logs/website.com-access_log combined
          DocumentRoot: /var/www/vhosts/website.com
          Directory:
            this: /var/www/vhosts/website.com
            Order: Deny,Allow
            Deny from: all
            Allow from:
              - 127.0.0.1
              - 192.168.100.0/24
            Options:
              - Indexes
              - FollowSymlinks
            AllowOverride: All
```

Changed in version 2018.3.0.

Allows having the same section container multiple times (e.g. <Directory /path/to/dir>).

YAML structure stays the same only replace dictionary with a list.

When a section container does not have mandatory attribute, such as <Else>, it still needs keyword `this` with empty string (or "" if nicer output is required - without space).

```
/etc/httpd/conf.d/website.com.conf:
  apache.configfile:
    - config:
      - VirtualHost:
          - this: '*:80'
          - ServerName:
            - website.com
          - DocumentRoot: /var/www/vhosts/website.com
          - Directory:
              this: /var/www/vhosts/website.com
              Order: Deny,Allow
              Deny from: all
              Allow from:
                - 127.0.0.1
                - 192.168.100.0/24
              Options:
                - Indexes
                - FollowSymlinks
              AllowOverride: All
          - Directory:
            - this: /var/www/vhosts/website.com/private
            - Order: Deny,Allow
            - Deny from: all
            - Allow from:
              - 127.0.0.1
              - 192.168.100.0/24
            - If:
                this: some condition
                do: something
            - Else:
                this:
                do: something else
            - Else:
                this: ""
                do: another thing
```

`salt.states.apache.`**`configfile`**`(`*name*, *config*`)`

26.19.3 salt.states.apache_conf

Warning: This module will be removed from Salt in version 3009 in favor of the apache Salt Extension.

Manage Apache Confs

New in version 2016.3.0.

Enable and disable apache confs.

```
Enable security conf:
  apache_conf.enabled:
    - name: security
```

(continues on next page)

(continued from previous page)

```
Disable security conf:
  apache_conf.disabled:
    - name: security
```

`salt.states.apache_conf.`**`disabled`**`(`*name*`)`

Ensure an Apache conf is disabled.

name
Name of the Apache conf

`salt.states.apache_conf.`**`enabled`**`(`*name*`)`

Ensure an Apache conf is enabled.

name
Name of the Apache conf

26.19.4 salt.states.apache_module

Warning: This module will be removed from Salt in version 3009 in favor of the apache Salt Extension.

Manage Apache Modules

New in version 2014.7.0.

Enable and disable apache modules.

```
Enable cgi module:
  apache_module.enabled:
    - name: cgi

Disable cgi module:
  apache_module.disabled:
    - name: cgi
```

`salt.states.apache_module.`**`disabled`**`(`*name*`)`

Ensure an Apache module is disabled.

New in version 2016.3.0.

name
Name of the Apache module

`salt.states.apache_module.`**`enabled`**`(`*name*`)`

Ensure an Apache module is enabled.

New in version 2016.3.0.

name
Name of the Apache module

26.19.5 salt.states.apache_site

> **Warning:** This module will be removed from Salt in version 3009 in favor of the apache Salt Extension.

Manage Apache Sites

New in version 2016.3.0.

Enable and disable apache sites.

```
Enable default site:
  apache_site.enabled:
    - name: default

Disable default site:
  apache_site.disabled:
    - name: default
```

`salt.states.apache_site.`**`disabled`**`(`*name*`)`

Ensure an Apache site is disabled.

name

Name of the Apache site

`salt.states.apache_site.`**`enabled`**`(`*name*`)`

Ensure an Apache site is enabled.

name

Name of the Apache site

26.19.6 salt.states.archive

Extract an archive

New in version 2014.1.0.

`salt.states.archive.`**`extracted`**`(`*name, source, source_hash=None, source_hash_name=None, source_hash_update=False, skip_files_list_verify=False, skip_verify=False, password=None, options=None, list_options=None, force=False, overwrite=False, clean=False, clean_parent=False, user=None, group=None, if_missing=None, trim_output=False, use_cmd_unzip=None, extract_perms=True, enforce_toplevel=True, enforce_ownership_on=None, archive_format=None, use_etag=False, signature=None, source_hash_sig=None, signed_by_any=None, signed_by_all=None, keyring=None, gnupghome=None, sig_backend='gpg', **kwargs*`)`

New in version 2014.1.0.

Changed in version 2016.11.0,3005: This state has been rewritten. Some arguments are new to this release and will not be available in the 2016.3 release cycle (and earlier). Additionally, the **ZIP Archive Handling** section below applies specifically to the 2016.11.0 release (and newer).

Ensure that an archive is extracted to a specific directory.

Important: **Changes for 2016.11.0**

In earlier releases, this state would rely on the `if_missing` argument to determine whether or not the archive needed to be extracted. When this argument was not passed, then the state would just assume `if_missing` is the same as the `name` argument (i.e. the parent directory into which the archive would be extracted).

This caused a number of annoyances. One such annoyance was the need to know beforehand a path that would result from the extraction of the archive, and setting `if_missing` to that directory, like so:

```
extract_myapp:
  archive.extracted:
    - name: /var/www
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
    - if_missing: /var/www/myapp-16.2.4
```

If `/var/www` already existed, this would effectively make `if_missing` a required argument, just to get Salt to extract the archive.

Some users worked around this by adding the top-level directory of the archive to the end of the `name` argument, and then used `--strip` or `--strip-components` to remove that top-level dir when extracting:

```
extract_myapp:
  archive.extracted:
    - name: /var/www/myapp-16.2.4
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
```

With the rewrite for 2016.11.0, these workarounds are no longer necessary. `if_missing` is still a supported argument, but it is no longer required. The equivalent SLS in 2016.11.0 would be:

```
extract_myapp:
  archive.extracted:
    - name: /var/www
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
```

Salt now uses a function called `archive.list` to get a list of files/directories in the archive. Using this information, the state can now check the minion to see if any paths are missing, and know whether or not the archive needs to be extracted. This makes the `if_missing` argument unnecessary in most use cases.

Important: ZIP Archive Handling

Note: this information applies to 2016.11.0 and later.

Salt has two different functions for extracting ZIP archives:

1. *`archive.unzip`*, which uses Python's zipfile module to extract ZIP files.
2. *`archive.cmd_unzip`*, which uses the `unzip` CLI command to extract ZIP files.

Salt will prefer the use of *`archive.cmd_unzip`* when CLI options are specified (via the `options` argument), and will otherwise prefer the *`archive.unzip`* function. Use of *`archive.cmd_unzip`* can be forced however by setting the `use_cmd_unzip` argument to `True`. By contrast, setting this argument to `False` will force usage of *`archive.unzip`*. For example:

```
/var/www:
  archive.extracted:
    - source: salt://foo/bar/myapp.zip
    - use_cmd_unzip: True
```

When `use_cmd_unzip` is omitted, Salt will choose which extraction function to use based on the source archive and the arguments passed to the state. When in doubt, simply do not set this argument; it is provided as a means of overriding the logic Salt uses to decide which function to use.

There are differences in the features available in both extraction functions. These are detailed below.

- *Command-line options* (only supported by `archive.cmd_unzip`) - When the `options` argument is used, `archive.cmd_unzip` is the only function that can be used to extract the archive. Therefore, if `use_cmd_unzip` is specified and set to `False`, and `options` is also set, the state will not proceed.
- *Permissions* - Due to an upstream bug in Python, permissions are not preserved when the zipfile module is used to extract an archive. As of the 2016.11.0 release, `archive.unzip` (as well as this state) has an `extract_perms` argument which, when set to `True` (the default), will attempt to match the permissions of the extracted files/directories to those defined within the archive. To disable this functionality and have the state not attempt to preserve the permissions from the ZIP archive, set `extract_perms` to `False`:

  ```
  /var/www:
    archive.extracted:
      - source: salt://foo/bar/myapp.zip
      - extract_perms: False
  ```

---

name
Directory into which the archive should be extracted

source
Archive to be extracted

Note: This argument uses the same syntax as its counterpart in the `file.managed` state.

source_hash
Hash of source file, or file with list of hash-to-file mappings

Note: This argument uses the same syntax as its counterpart in the `file.managed` state.

Changed in version 2016.11.0: If this argument specifies the hash itself, instead of a URI to a file containing hashes, the hash type can now be omitted and Salt will determine the hash type based on the length of the hash. For example, both of the below states are now valid, while before only the second one would be:

```
foo_app:
  archive.extracted:
    - name: /var/www
    - source: https://mydomain.tld/foo.tar.gz
    - source_hash: 3360db35e682f1c5f9c58aa307de16d41361618c

bar_app:
  archive.extracted:
    - name: /var/www
```

(continues on next page)

(continued from previous page)

```
    - source: https://mydomain.tld/bar.tar.gz
    - source_hash: sha1=5edb7d584b82ddcbf76e311601f5d4442974aaa5
```

source_hash_name

When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename part of the `source` URI. When managing a file with a `source` of `salt://files/foo.tar.gz`, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8    foo.tar.gz
```

This line would also match:

```
acbd18db4cc2f85cedef654fccc4a4d8    ./dir1/foo.tar.gz
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2    ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8    ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88    ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```
/var/www:
  archive.extracted:
    - source: https://mydomain.tld/dir2/foo.tar.gz
    - source_hash: https://mydomain.tld/hashes
    - source_hash_name: ./dir2/foo.tar.gz
```

Note: This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

New in version 2016.11.0.

source_hash_update

[False] Set this to `True` if archive should be extracted if source_hash has changed and there is a difference between the archive and the local files. This would extract regardless of the `if_missing` parameter.

Note that this is only checked if the `source` value has not changed. If it has (e.g. to increment a version number in the path) then the archive will not be extracted even if the hash has changed.

Note: Setting this to `True` along with `keep_source` set to `False` will result the `source` re-download to do a archive file list check. If it's not desirable please consider the `skip_files_list_verify` argument.

New in version 2016.3.0.

skip_files_list_verify

[False] Set this to `True` if archive should be extracted if `source_hash` has changed but only checksums of the archive will be checked to determine if the extraction is required.

It will try to find a local cache of the `source` and check its hash against the `source_hash`. If there is no local cache available, for example if you set the `keep_source` to `False`, it will try to find a cached source hash file in the Minion archives cache directory.

Note: The current limitation of this logic is that you have to set minions `hash_type` config option to the same one that you're going to pass via `source_hash` argument.

Warning: With this argument set to `True` Salt will only check for the `source_hash` against the local hash of the `sourse`. So if you, for example, remove extracted files without clearing the Salt Minion cache next time you execute the state Salt will not notice that extraction is required if the hashes are still match.

New in version 3000.

skip_verify
[False] If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.4.

keep_source
[True] For `source` archives not local to the minion (i.e. from the Salt fileserver or a remote source such as `http(s)` or `ftp`), Salt will need to download the archive to the minion cache before they can be extracted. To remove the downloaded archive after extraction, set this argument to `False`.

New in version 2017.7.3.

keep
[True] Same as `keep_source`, kept for backward-compatibility.

Note: If both `keep_source` and `keep` are used, `keep` will be ignored.

---

password
For ZIP archives only. Password used for extraction.

New in version 2016.3.0.

Changed in version 2016.11.0: The newly-added *`archive.is_encrypted`* function will be used to determine if the archive is password-protected. If it is, then the `password` argument will be required for the state to proceed.

options
For tar and zip archives only. This option can be used to specify a string of additional arguments to pass to the tar/zip command.

If this argument is not used, then the minion will attempt to use Python's native tarfile/zipfile support to extract it. For zip archives, this argument is mostly used to overwrite existing files with `o`.

Using this argument means that the `tar` or `unzip` command will be used, which is less platform-independent, so keep this in mind when using this option; the CLI options must be valid options for the `tar`/`unzip` implementation on the minion's OS.

New in version 2016.11.0.

Changed in version 2015.8.11,2016.3.2: XZ-compressed tar archives no longer require `J` to manually be set in the `options`, they are now detected automatically and decompressed using the xz CLI command and extracted using `tar xvf`. This is a more platform-independent solution, as not all tar implementations support the `J` argument for extracting archives.

Note: For tar archives, main operators like `-x`, `--extract`, `--get`, `-c` and `-f`/`--file` should *not* be used here.

---

list_options

For tar archives only. This state uses `archive.list` to discover the contents of the source archive so that it knows which file paths should exist on the minion if the archive has already been extracted. For the vast majority of tar archives, `archive.list` ”just works”. Archives compressed using gzip, bzip2, and xz/lzma (with the help of the xz CLI command) are supported automatically. However, for archives compressed using other compression types, CLI options must be passed to `archive.list`.

This argument will be passed through to `archive.list` as its `options` argument, to allow it to successfully list the archive's contents. For the vast majority of archives, this argument should not need to be used, it should only be needed in cases where the state fails with an error stating that the archive's contents could not be listed.

New in version 2016.11.0.

force

[False] If a path that should be occupied by a file in the extracted result is instead a directory (or vice-versa), the state will fail. Set this argument to `True` to force these paths to be removed in order to allow the archive to be extracted.

Warning: Use this option *very* carefully.

New in version 2016.11.0.

overwrite

[False] Set this to `True` to force the archive to be extracted. This is useful for cases where the filenames/directories have not changed, but the content of the files have.

New in version 2016.11.1.

clean

[False] Set this to `True` to remove any top-level files and recursively remove any top-level directory paths before extracting.

Note: Files will only be cleaned first if extracting the archive is deemed necessary, either by paths missing on the minion, or if `overwrite` is set to `True`.

New in version 2016.11.1.

clean_parent

[False] If `True`, and the archive is extracted, delete the parent directory (i.e. the directory into which the archive is extracted), and then re-create that directory before extracting. Note that `clean` and `clean_parent` are mutually exclusive.

New in version 3000.

user

The user to own each extracted file. Not available on Windows.

New in version 2015.8.0.

Changed in version 2016.3.0: When used in combination with `if_missing`, ownership will only be enforced if `if_missing` is a directory.

Changed in version 2016.11.0: Ownership will be enforced only on the file/directory paths found by running `archive.list` on the source archive. An alternative root directory on which to enforce ownership can be specified using the `enforce_ownership_on` argument.

group

The group to own each extracted file. Not available on Windows.

New in version 2015.8.0.

Changed in version 2016.3.0: When used in combination with `if_missing`, ownership will only be enforced if `if_missing` is a directory.

Changed in version 2016.11.0: Ownership will be enforced only on the file/directory paths found by running *archive.list* on the source archive. An alternative root directory on which to enforce ownership can be specified using the `enforce_ownership_on` argument.

if_missing

If specified, this path will be checked, and if it exists then the archive will not be extracted. This path can be either a directory or a file, so this option can also be used to check for a semaphore file and conditionally skip extraction.

Changed in version 2016.3.0: When used in combination with either `user` or `group`, ownership will only be enforced when `if_missing` is a directory.

Changed in version 2016.11.0: Ownership enforcement is no longer tied to this argument, it is simply checked for existence and extraction will be skipped if if is present.

trim_output

[False] Useful for archives with many files in them. This can either be set to `True` (in which case only the first 100 files extracted will be in the state results), or it can be set to an integer for more exact control over the max number of files to include in the state results.

New in version 2016.3.0.

use_cmd_unzip

[False] Set to `True` for zip files to force usage of the *archive.cmd_unzip* function to extract.

New in version 2016.11.0.

extract_perms

[True] **For ZIP archives only.** When using *archive.unzip* to extract ZIP archives, Salt works around an upstream bug in Python to set the permissions on extracted files/directories to match those encoded into the ZIP archive. Set this argument to `False` to skip this workaround.

New in version 2016.11.0.

enforce_toplevel

[True] This option will enforce a single directory at the top level of the source archive, to prevent extracting a 'tar-bomb'. Set this argument to `False` to allow archives with files (or multiple directories) at the top level to be extracted.

New in version 2016.11.0.

enforce_ownership_on

When `user` or `group` is specified, Salt will default to enforcing permissions on the file/directory paths detected by running *archive.list* on the source archive. Use this argument to specify an alternate directory on which ownership should be enforced.

Note: This path must be within the path specified by the `name` argument.

New in version 2016.11.0.

archive_format

One of `tar`, `zip`, or `rar`.

Changed in version 2016.11.0: If omitted, the archive format will be guessed based on the value of the `source` argument. If the minion is running a release older than 2016.11.0, this option is required.

use_etag

If `True`, remote http/https file sources will attempt to use the ETag header to determine if the remote file needs to be downloaded. This provides a lightweight mechanism for promptly refreshing files changed on a web server without requiring a full hash comparison via the `source_hash` parameter.

New in version 3005.

signature

Ensure a valid GPG signature exists on the selected `source` file. This needs to be a file URI retrievable by *:py:func:`cp.cache_file <salt.modules.cp.cache_file>* which identifies a detached signature.

Note: A signature is only enforced directly after caching the file, before it is extracted to its final destination. Existing files at the target will never be modified.

It will be enforced regardless of source type.

New in version 3007.0.

source_hash_sig

When `source` is a remote file source, `source_hash` is a file, `skip_verify` is not true and `use_etag` is not true, ensure a valid GPG signature exists on the source hash file. Set this to `true` for an inline (clearsigned) signature, or to a file URI retrievable by *:py:func:`cp.cache_file <salt.modules.cp.cache_file>* for a detached one.

Note: A signature on the `source_hash` file is enforced regardless of changes since its contents are used to check if an existing file is in the correct state - but only for remote sources! As for `signature`, existing target files will not be modified, only the cached source_hash and source_hash_sig files will be removed.

New in version 3007.0.

signed_by_any

When verifying signatures either on the managed file or its source hash file, require at least one valid signature from one of a list of key fingerprints. This is passed to `gpg.verify`.

New in version 3007.0.

signed_by_all

When verifying signatures either on the managed file or its source hash file, require a valid signature from each of the key fingerprints in this list. This is passed to `gpg.verify`.

New in version 3007.0.

keyring

When verifying signatures, use this keyring.

New in version 3007.0.

gnupghome

When verifying signatures, use this GnuPG home.

New in version 3007.0.

sig_backend

When verifying signatures, use this execution module as a backend. It must be compatible with the `gpg.verify` API. Defaults to `gpg`. All signature-related parameters are passed through.

New in version 3008.0.

Examples

1. tar with lmza (i.e. xz) compression:

```
graylog2-server:
  archive.extracted:
    - name: /opt/
    - source: https://github.com/downloads/Graylog2/graylog2-server/
```

(continues on next page)

(continued from previous page)

```
↪graylog2-server-0.9.6p1.tar.lzma
    - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
```

2. tar archive with flag for verbose output, and enforcement of user/group ownership:

```
graylog2-server:
  archive.extracted:
    - name: /opt/
    - source: https://github.com/downloads/Graylog2/graylog2-server/
↪graylog2-server-0.9.6p1.tar.gz
    - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
    - options: v
    - user: foo
    - group: foo
```

3. tar archive, with `source_hash_update` set to `True` to prevent state from attempting extraction unless the `source_hash` differs from the previous time the archive was extracted:

```
graylog2-server:
  archive.extracted:
    - name: /opt/
    - source: https://github.com/downloads/Graylog2/graylog2-server/
↪graylog2-server-0.9.6p1.tar.lzma
    - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
    - source_hash_update: True
```

26.19.7 salt.states.at

Configuration disposable regularly scheduled tasks for at.

The at state can be add disposable regularly scheduled tasks for your system.

`salt.states.at.`**`absent`**`(`*name*, *jobid=None*, ***kwargs*`)`

Changed in version 2017.7.0.

Remove a job from queue

jobid: **string|int**
Specific jobid to remove

tag
[string] Job's tag

runas
[string] Runs user-specified jobs

kwargs
Addition kwargs can be provided to filter jobs. See output of *at.jobcheck* for more.

```
example1:
  at.absent:
```

Warning: this will remove all jobs!

```
example2:
  at.absent:
    - year: 13
```

```
example3:
  at.absent:
    - tag: rose
```

```
example4:
  at.absent:
    - tag: rose
    - day: 13
    - hour: 16
```

```
example5:
  at.absent:
    - jobid: 4
```

`salt.states.at.`**`mod_watch`**`(`*name*, ***kwargs*`)`

The at watcher, called to invoke the watch command.

Note: This state exists to support special handling of the `watch` *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

---

name
The name of the atjob

`salt.states.at.`**`present`**`(`*name*, *timespec*, *tag=None*, *user=None*, *job=None*, *unique_tag=False*`)`

Changed in version 2017.7.0.

Add a job to queue.

job
[string] Command to run.

timespec
[string] The 'timespec' follows the format documented in the at(1) manpage.

tag
[string] Make a tag for the job.

user
[string] The user to run the at job .. versionadded:: 2014.1.4

unique_tag
[boolean] If set to True job will not be added if a job with the tag exists. .. versionadded:: 2017.7.0

```
rose:
  at.present:
    - job: 'echo "I love saltstack" > love'
    - timespec: '9:09 11/09/13'
    - tag: love
    - user: jam
```

`salt.states.at.`**`watch`**`(`*name*, *timespec*, *tag=None*, *user=None*, *job=None*, *unique_tag=False*`)`

New in version 2017.7.0.

Add an at job if trigger by watch

job
[string] Command to run.

timespec
[string] The 'timespec' follows the format documented in the at(1) manpage.

tag
[string] Make a tag for the job.

user
[string] The user to run the at job .. versionadded:: 2014.1.4

unique_tag
[boolean] If set to True job will not be added if a job with the tag exists. .. versionadded:: 2017.7.0

```
minion_restart:
  at.watch:
    - job: 'salt-call --local service.restart salt-minion'
    - timespec: 'now +1 min'
    - tag: minion_restart
    - unique_tag: trye
    - watch:
        - file: /etc/salt/minion
```

26.19.8 salt.states.beacon

Management of the Salt beacons

New in version 2015.8.0.

```
ps:
  beacon.present:
    - save: True
    - enable: False
    - services:
        salt-master: running
        apache2: stopped

sh:
  beacon.present: []

load:
  beacon.present:
    - averages:
        1m:
          - 0.0
          - 2.0
        5m:
          - 0.0
          - 1.5
        15m:
          - 0.1
          - 1.0

.. versionadded:: 3000
```

(continues on next page)

(continued from previous page)

```
Beginning in the 3000 release, multiple copies of a beacon can be configured
using the ``beacon_module`` parameter.

inotify_infs:
  beacon.present:
    - save: True
    - enable: True
    - files:
       /etc/infs.conf:
         mask:
           - create
           - delete
           - modify
         recurse: True
         auto_add: True
    - interval: 10
    - beacon_module: inotify
    - disable_during_state_run: True

inotify_ntp:
  beacon.present:
    - save: True
    - enable: True
    - files:
       /etc/ntp.conf:
         mask:
           - create
           - delete
           - modify
         recurse: True
         auto_add: True
    - interval: 10
    - beacon_module: inotify
    - disable_during_state_run: True
```

`salt.states.beacon.`**`absent`**`(`*name*, *save=False*, ***kwargs*`)`

Ensure beacon is absent.

name
The name of the beacon that is ensured absent.

save
True/False, if True the beacons.conf file be updated too. Default is False.

Example:

```
remove_beacon:
  beacon.absent:
    - name: ps
    - save: True
```

`salt.states.beacon.`**`disabled`**`(`*name*, ***kwargs*`)`

Disable a beacon.

name
The name of the beacon to disable.

Example:

```
disable_beacon:
  beacon.disabled:
    - name: psp
```

`salt.states.beacon.`**`enabled`**`(`*name*, ***kwargs*`)`

Enable a beacon.

name

The name of the beacon to enable.

Example:

```
enable_beacon:
  beacon.enabled:
    - name: ps
```

`salt.states.beacon.`**`present`**`(`*name*, *save=False*, ***kwargs*`)`

Ensure beacon is configured with the included beacon data.

name

The name of the beacon to ensure is configured.

save

True/False, if True the beacons.conf file be updated too. Default is False.

Example:

```
ps_beacon:
  beacon.present:
    - name: ps
    - save: True
    - enable: False
    - services:
        salt-master: running
        apache2: stopped
```

26.19.9 salt.states.chocolatey

Manage Windows Packages using Chocolatey .. versionadded:: 2016.3.0

Note: Chocolatey pulls data from the Chocolatey internet database to determine current versions, find available versions, etc. This is normally a slow operation and may be optimized by specifying a local, smaller chocolatey repo.

`salt.states.chocolatey.`**`bootstrapped`**`(`*name*, *force=False*, *source=None*, *version=None*`)`

New in version 3007.1.

Ensure chocolatey is installed on the system.

You can't upgrade an existing installation with this state. You must use chocolatey to upgrade chocolatey.

For example:

```
choco upgrade chocolatey --version 2.2.0
```

Parameters

- **name** (*str*) -- The name of the state that installs chocolatey. Required for all states. This is ignored.
- **force** (*bool*) -- Run the bootstrap process even if Chocolatey is found in the path.

Note: If chocolatey is already installed this will just re-run the install script over the existing version. The `version` parameter is ignored.

- **source** (*str*) -- The location of the `.nupkg` file or `.ps1` file to run from an alternate location. This can be one of the following types of URLs:
  - salt://
  - http(s)://
  - ftp://
  - file:// - A local file on the system
- **version** (*str*) -- The version of chocolatey to install. The latest version is installed if this value is `None`. Default is `None`

Example:

```
# Bootstrap the latest version of chocolatey
bootstrap_chocolatey:
  chocolatey.bootstrapped

# Bootstrap the latest version of chocolatey
# If chocolatey is already present, re-run the install script
bootstrap_chocolatey:
  chocolatey.bootstrapped:
    - force: True

# Bootstrap Chocolatey version 1.4.0
bootstrap_chocolatey:
  chocolatey.bootstrapped:
    - version: 1.4.0

# Bootstrap Chocolatey from a local file
bootstrap_chocolatey:
  chocolatey.bootstrapped:
    - source: C:\Temp\chocolatey.nupkg

# Bootstrap Chocolatey from a file on the salt master
bootstrap_chocolatey:
  chocolatey.bootstrapped:
    - source: salt://Temp/chocolatey.nupkg
```

`salt.states.chocolatey.`**`installed`**(*name, version=None, source=None, force=False, pre_versions=False, install_args=None, override_args=False, force_x86=False, package_args=None, allow_multiple=False, execution_timeout=None*)

Installs a package if not already installed

Parameters

- **name** (*str*) -- The name of the package to be installed. Required.
- **version** (*str*) -- Install a specific version of the package. Defaults to the latest version. If the version is different to the one installed, then the specified version will be installed. Default is `None`.
- **source** (*str*) -- Chocolatey repository (directory, share or remote URL, feed). `None`

defaults to the official Chocolatey feed. Default is `None`.

- **force** (*bool*) -- Reinstall the current version of an existing package. Do not use with `allow_multiple`. Default is `False`.
- **pre_versions** (*bool*) -- Include pre-release packages. Default is `False`.
- **install_args** (*str*) -- Install arguments you want to pass to the installation process, i.e. product key or feature list. Default is `None`.
- **override_args** (*bool*) -- Set to `True` to override the original install arguments (for the native installer) in the package and use your own. When this is set to `False`, install_args will be appended to the end of the default arguments. Default is `False`.
- **force_x86** (*bool*) -- Force x86 (32bit) installation on 64bit systems. Default is `False`.
- **package_args** (*str*) -- Arguments you want to pass to the package. Default is `None`.
- **allow_multiple** (*bool*) -- Allow multiple versions of the package to be installed. Do not use with `force`. Does not work with all packages. Default is `False`.

  New in version 2017.7.0.
- **execution_timeout** (*str*) -- Chocolatey execution timeout value you want to pass to the installation process. Default is `None`.

Example:

```yaml
install_some_package:
  chocolatey.installed:
    - name: packagename
    - version: '12.04'
    - source: 'mychocolatey/source'
    - force: True
```

`salt.states.chocolatey.`**`source_present`**(*name, source_location, username=None, password=None, force=False, priority=None*)

Adds a Chocolatey source if not already present.

Parameters

- **name** (*str*) -- The name of the source to be added as a chocolatey repository.
- **source** (*str*) -- Location of the source you want to work with.
- **username** (*str*) -- The username for a chocolatey source that needs authentication credentials.
- **password** (*str*) -- The password for a chocolatey source that needx authentication credentials.
- **force** (*bool*) -- Salt will not modify an existing repository with the same name. Set this option to `True` to update an existing repository.
- **priority** (*int*) -- The priority order of this source as compared to other sources. Lower is better. Defaults to 0 (no priority). All priorities above 0 will be evaluated first, then zero-based values will be evaluated in config file order.

Example:

```yaml
add_some_source:
  chocolatey.source_present:
    - name: reponame
    - source: https://repo.exemple.com
    - username: myuser
    - password: mypassword
    - priority: 100
```

`salt.states.chocolatey.`**`unbootstrapped`**(*name*)

New in version 3007.1.

Ensure chocolatey is removed from the system.

Parameters

`name` (*str*) -- The name of the state that uninstalls chocolatey. Required for all states. This is ignored.

Example:

```
# Uninstall chocolatey
uninstall_chocolatey:
  chocolatey.unbootstrapped
```

`salt.states.chocolatey.`**`uninstalled`**(*name*, *version=None*, *uninstall_args=None*, *override_args=False*)

Uninstalls a chocolatey package

Parameters

- **`name`** (*str*) -- The name of the package to be uninstalled. Required.
- **`version`** (*str*) -- Uninstalls a specific version of the package. Defaults to the latest version installed.
- **`uninstall_args`** (*str*) -- A list of uninstall arguments you want to pass to the uninstallation process, i.e. product key or feature list
- **`override_args`** (*str*) -- Set to `True` if you want to override the original uninstall arguments (for the native uninstaller) in the package and use your own. When this is set to `False`, uninstall_args will be appended to the end of the default arguments

Example:

```
remove_my_package:
  chocolatey.uninstalled:
    - name: mypackage
    - version: '21.5'
```

`salt.states.chocolatey.`**`upgraded`**(*name*, *version=None*, *source=None*, *force=False*, *pre_versions=False*, *install_args=None*, *override_args=False*, *force_x86=False*, *package_args=None*)

Upgrades a chocolatey package. Will install the package if not installed.

New in version 2018.3.0.

Parameters

- **`name`** (*str*) -- The name of the package to be installed. Required.
- **`version`** (*str*) -- Install a specific version of the package. Defaults to latest version. If the version is greater than the one installed then the specified version will be installed. Default is `None`.
- **`source`** (*str*) -- Chocolatey repository (directory, share or remote URL, feed). Defaults to the official Chocolatey feed. Default is `None`.
- **`force`** (*bool*) -- `True` will reinstall an existing package with the same version. Default is `False`.
- **`pre_versions`** (*bool*) -- `True` will include pre-release packages. Default is `False`.
- **`install_args`** (*str*) -- Install arguments you want to pass to the installation process, i.e product key or feature list. Default is `None`.
- **`override_args`** (*bool*) -- `True` will override the original install arguments (for the native installer) in the package and use those specified in `install_args`. `False` will append install_args to the end of the default arguments. Default is `False`.
- **`force_x86`** (*bool*) -- `True` forces 32bit installation on 64bit systems. Default is `False`.

- **package_args** (*str*) -- Arguments you want to pass to the package. Default is `None`.

Example:

```
upgrade_some_package:
  chocolatey.upgraded:
    - name: packagename
    - version: '12.04'
    - source: 'mychocolatey/source'
```

26.19.10 salt.states.cloud

Using states instead of maps to deploy clouds

New in version 2014.1.0.

Use this minion to spin up a cloud instance:

```
my-ec2-instance:
  cloud.profile:
    my-ec2-config
```

`salt.states.cloud.`**`absent`**(*name*, *onlyif=None*, *unless=None*)

Ensure that no instances with the specified names exist.

CAUTION: This is a destructive state, which will search all configured cloud providers for the named instance, and destroy it.

name
The name of the instance to destroy

onlyif
Do run the state only if is unless succeed

unless
Do not run the state at least unless succeed

`salt.states.cloud.`**`present`**(*name*, *cloud_provider*, *onlyif=None*, *unless=None*, *opts=None*, ***kwargs*)

Spin up a single instance on a cloud provider, using salt-cloud. This state does not take a profile argument; rather, it takes the arguments that would normally be configured as part of the state.

Note that while this function does take any configuration argument that would normally be used to create an instance, it will not verify the state of any of those arguments on an existing instance. Stateful properties of an instance should be configured using their own individual state (i.e., cloud.tagged, cloud.untagged, etc).

name
The name of the instance to create

cloud_provider
The name of the cloud provider to use

onlyif
Do run the state only if is unless succeed

unless
Do not run the state at least unless succeed

opts
Any extra opts that need to be used

`salt.states.cloud.`**`profile`**(*name*, *profile*, *onlyif=None*, *unless=None*, *opts=None*, ***kwargs*)

Create a single instance on a cloud provider, using a salt-cloud profile.

Note that while profiles used this function do take any configuration argument that would normally be used to create an instance using a profile, this state will not verify the state of any of those arguments on an existing instance. Stateful properties of an instance should be configured using their own individual state (i.e., cloud.tagged, cloud.untagged, etc).

name
The name of the instance to create

profile
The name of the cloud profile to use

onlyif
Do run the state only if is unless succeed

unless
Do not run the state at least unless succeed

kwargs
Any profile override or addition

opts
Any extra opts that need to be used

`salt.states.cloud.`**`volume_absent`**`(`*name*, *provider=None*, ***kwargs*`)`

Check that a block volume exists.

`salt.states.cloud.`**`volume_attached`**`(`*name*, *server_name*, *provider=None*, ***kwargs*`)`

Check if a block volume is attached.

`salt.states.cloud.`**`volume_detached`**`(`*name*, *server_name=None*, *provider=None*, ***kwargs*`)`

Check if a block volume is attached.

Returns True if server or Volume do not exist.

`salt.states.cloud.`**`volume_present`**`(`*name*, *provider=None*, ***kwargs*`)`

Check that a block volume exists.

26.19.11 salt.states.cmd

Execution of arbitrary commands

The cmd state module manages the enforcement of executed commands, this state can tell a command to run under certain circumstances.

A simple example to execute a command:

```
# Store the current date in a file
'date > /tmp/salt-run':
  cmd.run
```

Only run if another execution failed, in this case truncate syslog if there is no disk space:

```
'> /var/log/messages/':
  cmd.run:
    - unless: echo 'foo' > /tmp/.test && rm -f /tmp/.test
```

Only run if the file specified by `creates` does not exist, in this case touch /tmp/foo if it does not exist:

```
touch /tmp/foo:
  cmd.run:
    - creates: /tmp/foo
```

`creates` also accepts a list of files, in which case this state will run if **any** of the files do not exist:

```
"echo 'foo' | tee /tmp/bar > /tmp/baz":
  cmd.run:
    - creates:
      - /tmp/bar
      - /tmp/baz
```

Note: The `creates` option was added to the cmd state in version 2014.7.0, and made a global requisite in 3001.

Sometimes when running a command that starts up a daemon, the init script doesn't return properly which causes Salt to wait indefinitely for a response. In situations like this try the following:

```
run_installer:
  cmd.run:
    - name: /tmp/installer.bin > /dev/null 2>&1
```

Salt determines whether the `cmd` state is successfully enforced based on the exit code returned by the command. If the command returns a zero exit code, then salt determines that the state was successfully enforced. If the script returns a non-zero exit code, then salt determines that it failed to successfully enforce the state. If a command returns a non-zero exit code but you wish to treat this as a success, then you must place the command in a script and explicitly set the exit code of the script to zero.

Please note that the success or failure of the state is not affected by whether a state change occurred nor the stateful argument.

When executing a command or script, the state (i.e., changed or not) of the command is unknown to Salt's state system. Therefore, by default, the `cmd` state assumes that any command execution results in a changed state.

This means that if a `cmd` state is watched by another state then the state that's watching will always be executed due to the *changed* state in the `cmd` state.

Using the "Stateful" Argument

Many state functions in this module now also accept a `stateful` argument. If `stateful` is specified to be true then it is assumed that the command or script will determine its own state and communicate it back by following a simple protocol described below:

1. **If there's nothing in the stdout of the command, then assume no changes**. Otherwise, the stdout must be either in JSON or its *last* non-empty line must be a string of key=value pairs delimited by spaces (no spaces on either side of =).

2. **If it's JSON then it must be a JSON object (e.g., {})**. If it's key=value pairs then quoting may be used to include spaces. (Python's shlex module is used to parse the key=value string)

   Two special keys or attributes are recognized in the output:

   ```
   changed: bool (i.e., 'yes', 'no', 'true', 'false', case-insensitive)
   comment: str  (i.e., any string)
   ```

   So, only if `changed` is `True` then assume the command execution has changed the state, and any other key values or attributes in the output will be set as part of the changes.

3. **If there's a comment then it will be used as the comment of the state**.

   Here's an example of how one might write a shell script for use with a stateful command:

```
#!/bin/bash
#
echo "Working hard..."

# writing the state line
echo  # an empty line here so the next line will be the last.
echo "changed=yes comment='something has changed' whatever=123"
```

And an example SLS file using this module:

```
Run myscript:
  cmd.run:
    - name: /path/to/myscript
    - cwd: /
    - stateful: True

Run only if myscript changed something:
  cmd.run:
    - name: echo hello
    - cwd: /
    - onchanges:
        - cmd: Run myscript
```

Note that if the second `cmd.run` state also specifies `stateful: True` it can then be watched by some other states as well.

4. **The stateful argument can optionally include a test_name parameter.**

   This is used to specify a command to run in test mode. This command should return stateful data for changes that would be made by the command in the name parameter.

   New in version 2015.2.0.

```
Run myscript:
  cmd.run:
    - name: /path/to/myscript
    - cwd: /
    - stateful:
      - test_name: /path/to/myscript test

Run masterscript:
  cmd.script:
    - name: masterscript
    - source: salt://path/to/masterscript
    - cwd: /
    - stateful:
      - test_name: masterscript test
```

Should I use `cmd.run` or `cmd.wait`?

Note: Use *cmd.run* together with *onchanges* instead of *cmd.wait*.

These two states are often confused. The important thing to remember about them is that *cmd.run* states are run each time the SLS file that contains them is applied. If it is more desirable to have a command that only runs after some other state changes, then *cmd.wait* does just that. *cmd.wait* is designed to *watch* other states, and is executed when the state it is watching changes. Example:

```
/usr/local/bin/postinstall.sh:
  cmd.wait:
    - watch:
      - pkg: mycustompkg
  file.managed:
    - source: salt://utils/scripts/postinstall.sh

mycustompkg:
  pkg.installed:
    - require:
      - file: /usr/local/bin/postinstall.sh
```

`cmd.wait` itself do not do anything; all functionality is inside its `mod_watch` function, which is called by `watch` on changes.

The preferred format is using the *onchanges Requisite*, which works on `cmd.run` as well as on any other state. The example would then look as follows:

```
/usr/local/bin/postinstall.sh:
  cmd.run:
    - onchanges:
      - pkg: mycustompkg
  file.managed:
    - source: salt://utils/scripts/postinstall.sh

mycustompkg:
  pkg.installed:
    - require:
      - file: /usr/local/bin/postinstall.sh
```

How do I create an environment from a pillar map?

The map that comes from a pillar can be directly consumed by the env option! To use it, one may pass it like this. Example:

```
printenv:
  cmd.run:
    - env: {{ salt['pillar.get']('example:key', {}) }}
```

Better yet, use the slots feature to insert the data at runtime and minimize pillar data exposure:

```
printenv:
  cmd.run:
    - env: __slot__:salt:pillar.get(example:key)
```

How do I pass sensitive data to a command?

Passing sensitive data to commands using command line arguments or environment variables is a well-known security loophole and is not recommended.

If your command can read from stdin, use the stdin option in combination with the slots feature. Example:

```
my-command --read-secret-from-stdin:
  cmd.run:
    - stdin: __slot__:salt:pillar.get(example:secret)
```

Some commands read from stdin when "-" is passed as an input file:

```
gcc - -x c -o ./myprogram:
  cmd.run:
    - stdin: __slot__:salt:pillar.get(example:my_super_secret_c_code)
```

If your command can read from a file and is running on a Unix-ish system, pass /dev/stdin as the file and feed the data to stdin. Example:

```
step ca certificate server.example.com cert.pem key.pem --provisioner JWK --
↪provisioner-password-file /dev/stdin:
  cmd.run:
    - stdin: __slot__:salt:pillar.get(server:provisioner_password)
    - unless: step certificate needs-renewal cert.pem 2>&1 | grep
↪"certificate does not need renewal"
```

Note: The use of the runas option or sudo will cause permission errors when reading /dev/stdin. If you need to run as a specific user the command will have to read from the usual internal stdin file descriptor.

The use of the slots feature keeps minions who can render the state file from stealing the password.

`salt.states.cmd.call`(*name, func, args=(), kws=None, output_loglevel='debug', hide_output=False, use_vt=False, **kwargs*)

Invoke a pre-defined Python function with arguments specified in the state declaration. This function is mainly used by the `salt.renderers.pydsl` renderer.

In addition, the `stateful` argument has no effects here.

The return value of the invoked function will be interpreted as follows.

If it's a dictionary then it will be passed through to the state system, which expects it to have the usual structure returned by any salt state function.

Otherwise, the return value (denoted as `result` in the code below) is expected to be a JSON serializable object, and this dictionary is returned:

```
{
    'name': name
    'changes': {'retval': result},
    'result': True if result is None else bool(result),
```

(continues on next page)

(continued from previous page)

```
    'comment': result if isinstance(result, str) else ''
}
```

`salt.states.cmd.`**`mod_watch`**`(`*name*, ***kwargs*`)`

Execute a cmd function based on a watch call

Note: This state exists to support special handling of the `watch` *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

`salt.states.cmd.`**`run`**`(`*name*, *cwd=None*, *root=None*, *runas=None*, *shell=None*, *env=None*, *prepend_path=None*, *stateful=False*, *output_loglevel='debug'*, *hide_output=False*, *timeout=None*, *ignore_timeout=False*, *use_vt=False*, *success_retcodes=None*, *success_stdout=None*, *success_stderr=None*, ***kwargs*`)`

Run a command if certain circumstances are met. Use `cmd.wait` if you want to use the `watch` requisite.

Note: The `**kwargs` of `cmd.run` are passed down to one of the following exec modules:

- `cmdmod.run_all`: If used with default `runas`
- `cmdmod.run_chroot`: If used with non-`root` value for `runas`

For more information on what args are available for either of these, refer to the *cmdmod documentation*.

---

name

The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

cwd

The current working directory to execute the command in, defaults to /root

root

Path to the root of the jail to use. If this parameter is set, the command will run inside a chroot

runas

The user name (or uid) to run the command as

shell

The shell to use for execution, defaults to the shell grain

env

A list of environment variables to be set prior to execution. Example:

```
script-foo:
  cmd.run:
    - env:
      - BATCH: 'yes'
```

Warning: The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.

Variables as values are not evaluated. So $PATH in the following example is a literal '$PATH':

```
script-bar:
  cmd.run:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing $PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

Note: When using environment variables on Windows, case-sensitivity matters, i.e. Windows uses *Path* as opposed to *PATH* for other systems.

---

prepend_path

$PATH segment to prepend (trailing ':' not necessary) to $PATH. This is an easier alternative to the Jinja workaround.

New in version 2018.3.0.

stateful

The command being executed is expected to return data about executing a state. For more information, see the *Using the "Stateful" Argument* section.

output_loglevel

[debug] Control the loglevel at which the output from the command is logged to the minion log.

Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

---

hide_output

[False] Suppress stdout and stderr in the state's results.

Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

timeout

If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill

ignore_timeout

Ignore the timeout of commands, which is useful for running nohup processes.

New in version 2015.8.0.

creates

Only run if the file specified by `creates` do not exist. If you specify a list of files then this state will only run if **any** of the files do not exist.

New in version 2014.7.0.

use_vt

[False] Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

bg

[False] If `True`, run command in background and do not await or deliver its results.

New in version 2016.3.6.

success_retcodes

This parameter allows you to specify a list of non-zero return codes that should be considered as successful. If the return code from the command matches any in the list, the state will have a `True` result instead of `False`.

New in version 2019.2.0.

success_stdout: This parameter will allow a list of
strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

success_stderr: This parameter will allow a list of
strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

Note: cmd.run supports the usage of `reload_modules`. This functionality allows you to force Salt to reload all modules. You should only use `reload_modules` if your cmd.run does some sort of installation (such as `pip`), if you do not reload the modules future items in your state which rely on the software being installed will fail.

```yaml
getpip:
  cmd.run:
    - name: /usr/bin/python /usr/local/sbin/get-pip.py
    - unless: which pip
    - require:
      - pkg: python
      - file: /usr/local/sbin/get-pip.py
    - reload_modules: True
```

`salt.states.cmd.`**`script`**(*name, source=None, template=None, cwd=None, runas=None, password=None, shell=None, env=None, stateful=False, timeout=None, use_vt=False, output_loglevel='debug', hide_output=False, defaults=None, context=None, success_retcodes=None, success_stdout=None, success_stderr=None, **kwargs*)

Download a script and execute it with specified arguments.

source
The location of the script to download. If the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs

template
If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported

name
Either "cmd arg1 arg2 arg3..." (cmd is not used) or a source "salt://...".

cwd
The current working directory to execute the command in, defaults to /root

runas
Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

Note: For Windows users, specifically Server users, it may be necessary to specify your runas user using the User Logon Name instead of the legacy logon name. Traditionally, logons would be in the following format.

`Domain/user`

In the event this causes issues when executing scripts, use the UPN format which looks like the following.

```
user@domain.local
```

More information <https://github.com/saltstack/salt/issues/55080>

---

password

New in version 3000: Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

shell
The shell to use for execution. The default is set in grains['shell']

env
A list of environment variables to be set prior to execution. Example:

```
salt://scripts/foo.sh:
  cmd.script:
    - env:
      - BATCH: 'yes'
```

Warning: The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.

Variables as values are not evaluated. So $PATH in the following example is a literal '$PATH':

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing $PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

Note: When using environment variables on Windows, case-sensitivity matters, i.e. Windows uses *Path* as opposed to *PATH* for other systems.

saltenv
`[base]` The Salt environment to use

stateful
The command being executed is expected to return data about executing a state. For more information, see the *Using the "Stateful" Argument* section.

timeout
If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill

args
String of command line args to pass to the script. Only used if no args are specified as part of the *name* argument. To pass a string containing spaces in YAML, you will need to doubly-quote it: "arg1 'arg two' arg3"

creates
Only run if the file specified by `creates` do not exist. If you specify a list of files then this state will only run if **any** of the files do not exist.

New in version 2014.7.0.

use_vt
Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

context
New in version 2016.3.0.

Overrides default context variables passed to the template.

defaults
New in version 2016.3.0.

Default context passed to the template.

output_loglevel
[debug] Control the loglevel at which the output from the command is logged to the minion log.

Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

---

hide_output
[False] Suppress stdout and stderr in the state's results.

Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

success_retcodes
This parameter allows you to specify a list of non-zero return codes that should be considered as successful. If the return code from the command matches any in the list, the state will have a `True` result instead of `False`.

New in version 2019.2.0.

success_stdout: **This parameter will allow a list of**
strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

success_stderr: **This parameter will allow a list of**
strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

`salt.states.cmd.`**`wait`**`(`*name, cwd=None, root=None, runas=None, shell=None, env=(), stateful=False, output_loglevel='debug', hide_output=False, use_vt=False, success_retcodes=None, success_stdout=None, success_stderr=None, **kwargs*`)`

Run the given command only if the watch statement calls it.

Note: Use *`cmd.run`* together with `onchanges` instead of *`cmd.wait`*.

---

name
The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

cwd
The current working directory to execute the command in, defaults to /root

root
Path to the root of the jail to use. If this parameter is set, the command will run inside a chroot

runas
The user name to run the command as

shell
The shell to use for execution, defaults to /bin/sh

env
A list of environment variables to be set prior to execution. Example:

```
script-foo:
  cmd.wait:
    - env:
      - BATCH: 'yes'
```

> **Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.

Variables as values are not evaluated. So $PATH in the following example is a literal '$PATH':

```
script-bar:
  cmd.wait:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing $PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

> **Note:** When using environment variables on Windows, case-sensitivity matters, i.e. Windows uses *Path* as opposed to *PATH* for other systems.

stateful
The command being executed is expected to return data about executing a state. For more information, see the *Using the "Stateful" Argument* section.

creates
Only run if the file specified by `creates` do not exist. If you specify a list of files then this state will only run if **any** of the files do not exist.

New in version 2014.7.0.

output_loglevel
[debug] Control the loglevel at which the output from the command is logged to the minion log.

> **Note:** The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is

used for this value.

---

hide_output
[False] Suppress stdout and stderr in the state's results.

Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

use_vt
Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

success_retcodes
This parameter allows you to specify a list of non-zero return codes that should be considered as successful. If the return code from the command matches any in the list, the state will have a `True` result instead of `False`.

New in version 2019.2.0.

success_stdout: **This parameter will allow a list of**
strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

success_stderr: **This parameter will allow a list of**
strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

`salt.states.cmd.`**`wait_call`**(*name*, *func*, *args=()*, *kws=None*, *stateful=False*, *use_vt=False*, *output_loglevel='debug'*, *hide_output=False*, ***kwargs*)

`salt.states.cmd.`**`wait_script`**(*name*, *source=None*, *template=None*, *cwd=None*, *runas=None*, *shell=None*, *env=None*, *stateful=False*, *use_vt=False*, *output_loglevel='debug'*, *hide_output=False*, *success_retcodes=None*, *success_stdout=None*, *success_stderr=None*, ***kwargs*)

Download a script from a remote source and execute it only if a watch statement calls it.

source
The source script being downloaded to the minion, this source script is hosted on the salt master server. If the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs

template
If this setting is applied then the named templating engine will be used to render the downloaded file, currently jinja, mako, and wempy are supported

name
The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

cwd
The current working directory to execute the command in, defaults to /root

runas
The user name to run the command as

shell
The shell to use for execution, defaults to the shell grain

env
A list of environment variables to be set prior to execution. Example:

```
salt://scripts/foo.sh:
  cmd.wait_script:
    - env:
      - BATCH: 'yes'
```

Warning: The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.

Variables as values are not evaluated. So $PATH in the following example is a literal '$PATH':

```
salt://scripts/bar.sh:
  cmd.wait_script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing $PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

Note: When using environment variables on Windows, case-sensitivity matters, i.e. Windows uses *Path* as opposed to *PATH* for other systems.

stateful
The command being executed is expected to return data about executing a state. For more information, see the *Using the "Stateful" Argument* section.

use_vt
Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

output_loglevel
[debug] Control the loglevel at which the output from the command is logged to the minion log.

Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

hide_output
[False] Suppress stdout and stderr in the state's results.

Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

success_retcodes
This parameter allows you to specify a list of non-zero return codes that should be considered as successful. If the return code from the command matches any in the list, the state

will have a `True` result instead of `False`.

New in version 2019.2.0.

success_stdout: This parameter will allow a list of
strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

success_stderr: This parameter will allow a list of
strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

`salt.states.cmd.`**`watch`**(*name*, *cwd=None*, *root=None*, *runas=None*, *shell=None*, *env=()*, *stateful=False*, *output_loglevel='debug'*, *hide_output=False*, *use_vt=False*, *success_retcodes=None*, *success_stdout=None*, *success_stderr=None*, ***kwargs*)

This function is an alias of `wait`.

Run the given command only if the watch statement calls it.

Note: Use *`cmd.run`* together with `onchanges` instead of *`cmd.wait`*.

name
The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

cwd
The current working directory to execute the command in, defaults to /root

root
Path to the root of the jail to use. If this parameter is set, the command will run inside a chroot

runas
The user name to run the command as

shell
The shell to use for execution, defaults to /bin/sh

env
A list of environment variables to be set prior to execution. Example:

```
script-foo:
  cmd.wait:
    - env:
      - BATCH: 'yes'
```

Warning: The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.

Variables as values are not evaluated. So $PATH in the following example is a literal '$PATH':

```
script-bar:
  cmd.wait:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing $PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/
↪bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':')
↪}}
```

Note: When using environment variables on Windows, case-sensitivity matters, i.e. Windows uses *Path* as opposed to *PATH* for other systems.

stateful

The command being executed is expected to return data about executing a state. For more information, see the *Using the "Stateful" Argument* section.

creates

Only run if the file specified by `creates` do not exist. If you specify a list of files then this state will only run if **any** of the files do not exist.

New in version 2014.7.0.

output_loglevel

[debug] Control the loglevel at which the output from the command is logged to the minion log.

Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

hide_output

[False] Suppress stdout and stderr in the state's results.

Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

use_vt

Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

success_retcodes

This parameter allows you to specify a list of non-zero return codes that should be considered as successful. If the return code from the command matches any in the list, the state will have a `True` result instead of `False`.

New in version 2019.2.0.

success_stdout: This parameter will allow a list of

strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

success_stderr: This parameter will allow a list of

strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

26.19.12 salt.states.cron

Management of cron, the Unix command scheduler

Cron declarations require a number of parameters. The following are the parameters used by Salt to define the various timing values for a cron job:

- `minute`
- `hour`
- `daymonth`
- `month`
- `dayweek` (0 to 6 are Sunday through Saturday, 7 can also be used for Sunday)

Warning: Any timing arguments not specified take a value of `*`. This means that setting `hour` to `5`, while not defining the `minute` param, will result in Salt adding a job that will execute every minute between 5 and 6 A.M.!

Additionally, the default user for these states is `root`. Therefore, if the cron job is for another user, it is necessary to specify that user with the `user` parameter.

A long time ago (before 2014.2), when making changes to an existing cron job, the name declaration is the parameter used to uniquely identify the job, so if an existing cron that looks like this:

```
date > /tmp/crontest:
  cron.present:
    - user: root
    - minute: 5
```

Is changed to this:

```
date > /tmp/crontest:
  cron.present:
    - user: root
    - minute: 7
    - hour: 2
```

Then the existing cron will be updated, but if the cron command is changed, then a new cron job will be added to the user's crontab.

The current behavior is still relying on that mechanism, but you can also specify an identifier to identify your crontabs:

```
date > /tmp/crontest:
  cron.present:
    - identifier: SUPERCRON
    - user: root
    - minute: 7
    - hour: 2
```

New in version 2014.1.2.

And, some months later, you modify it:

```
superscript > /tmp/crontest:
  cron.present:
    - identifier: SUPERCRON
    - user: root
    - minute: 3
    - hour: 4
```

New in version 2014.1.2.

The old **date > /tmp/crontest** will be replaced by **superscript > /tmp/crontest**.

Additionally, Salt also supports running a cron every `x minutes` very similarly to the Unix convention of using `*/5` to have a job run every five minutes. In Salt, this looks like:

```
date > /tmp/crontest:
  cron.present:
    - user: root
    - minute: '*/5'
```

The job will now run every 5 minutes.

Additionally, the temporal parameters (minute, hour, etc.) can be randomized by using `random` instead of using a specific value. For example, by using the `random` keyword in the `minute` parameter of a cron state, the same cron job can be pushed to hundreds or thousands of hosts, and they would each use a randomly-generated minute. This can be helpful when the cron job accesses a network resource, and it is not desirable for all hosts to run the job concurrently.

```
/path/to/cron/script:
  cron.present:
    - user: root
    - minute: random
    - hour: 2
```

New in version 0.16.0.

Since Salt assumes a value of `*` for unspecified temporal parameters, adding a parameter to the state and setting it to `random` will change that value from `*` to a randomized numeric value. However, if that field in the cron entry on the minion already contains a numeric value, then using the `random` keyword will not modify it.

Added the opportunity to set a job with a special keyword like '@reboot' or '@hourly'. Quotes must be used, otherwise PyYAML will strip the '@' sign.

```
/path/to/cron/script:
  cron.present:
    - user: root
    - special: '@hourly'
```

The script will be executed every reboot if cron daemon support this option.

```
/path/to/cron/otherscript:
  cron.absent:
    - user: root
    - special: '@daily'
```

This counter part definition will ensure than a job with a special keyword is not set.

`salt.states.cron.`**`absent`**`(`*name*, *user='root'*, *identifier=False*, *special=None*, ***kwargs*`)`

Verifies that the specified cron job is absent for the specified user.

If an `identifier` is not passed then the `name` is used to identify the cron job for removal.

name
The command that should be absent in the user crontab.

user
The name of the user whose crontab needs to be modified, defaults to the root user

identifier
Custom-defined identifier for tracking the cron line for future crontab edits. This defaults to the state name

special
The special keyword used in the job (eg. @reboot, @hourly...). Quotes must be used, otherwise PyYAML will strip the '@' sign.

`salt.states.cron.`**`env_absent`**`(`*name*, *user='root'*`)`

Verifies that the specified environment variable is absent from the crontab for the specified user

name
The name of the environment variable to remove from the user crontab

user
The name of the user whose crontab needs to be modified, defaults to the root user

`salt.states.cron.`**`env_present`**`(`*name*, *value=None*, *user='root'*`)`

Verifies that the specified environment variable is present in the crontab for the specified user.

name
The name of the environment variable to set in the user crontab

user
The name of the user whose crontab needs to be modified, defaults to the root user

value
The value to set for the given environment variable

`salt.states.cron.`**`file`**`(`*name*, *source_hash=''*, *source_hash_name=None*, *user='root'*, *template=None*, *context=None*, *replace=True*, *defaults=None*, *backup=''*, ***kwargs*`)`

Provides file.managed-like functionality (templating, etc.) for a pre-made crontab file, to be assigned to a given user.

name
The source file to be used as the crontab. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is `salt://spam/eggs`

If the file is hosted on a HTTP or FTP server then the source_hash argument is also required

source_hash
This can be either a file which contains a source hash string for the source, or a source hash string. The source hash string is the hash algorithm followed by the hash of the file: `md5=e138491e9d5b97023cea823fe17bac22`

source_hash_name
When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename/URI associated with that hash. By default, Salt will look for the filename being managed. When managing a file at path `/tmp/foo.txt`, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8    foo.txt
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2    ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8    ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88    ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```
foo_crontab:
  cron.file:
    - name: https://mydomain.tld/dir2/foo.txt
    - source_hash: https://mydomain.tld/hashes
    - source_hash_name: ./dir2/foo.txt
```

Note: This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

New in version 2016.3.5.

user
The user to whom the crontab should be assigned. This defaults to root.

template
If this setting is applied then the named templating engine will be used to render the downloaded file. Currently, jinja and mako are supported.

context
Overrides default context variables passed to the template.

replace
If the crontab should be replaced, if False then this command will be ignored if a crontab exists for the specified user. Default is True.

defaults
Default context passed to the template.

backup
Overrides the default backup mode for the user's crontab.

`salt.states.cron.`**`present`**(*name*, *user='root'*, *minute='*'*, *hour='*'*, *daymonth='*'*, *month='*'*, *dayweek='*'*, *comment=None*, *commented=False*, *identifier=False*, *special=None*)

Verifies that the specified cron job is present for the specified user. It is recommended to use *identifier*. Otherwise the cron job is installed twice if you change the name. For more advanced information about what exactly can be set in the cron timing parameters, check your cron system's documentation. Most Unix-like systems' cron documentation can be found via the crontab man page: `man 5 crontab`.

name
The command that should be executed by the cron job.

user
The name of the user whose crontab needs to be modified, defaults to the root user

minute
The information to be set into the minute section, this can be any string supported by your cron system's the minute field. Default is `*`

hour
The information to be set in the hour section. Default is `*`

daymonth
The information to be set in the day of month section. Default is `*`

month
The information to be set in the month section. Default is `*`

dayweek
The information to be set in the day of week section. Default is `*`

comment
User comment to be added on line previous the cron job

commented
The cron job is set commented (prefixed with `#DISABLED#`). Defaults to False.

New in version 2016.3.0.

identifier
Custom-defined identifier for tracking the cron line for future crontab edits. This defaults to the state name

special
A special keyword to specify periodicity (eg. @reboot, @hourly...). Quotes must be used, otherwise PyYAML will strip the '@' sign.

New in version 2016.3.0.

26.19.13 salt.states.disk

Disk monitoring state

Monitor the state of disk resources.

The `disk.status` function can be used to report that the used space of a filesystem is within the specified limits.

```
used_space:
  disk.status:
    - name: /dev/xda1
    - maximum: 79%
    - minimum: 11%
```

It can be used with an `onfail` requisite, for example, to take additional action in response to or in preparation for other states.

```
storage_threshold:
  disk.status:
    - name: /dev/xda1
    - maximum: 97%

clear_cache:
  cmd.run:
    - name: rm -r /var/cache/app
    - onfail:
      - disk: storage_threshold
```

To use kilobytes (KB) for `minimum` and `maximum` rather than percents, specify the `absolute` flag:

```
used_space:
  disk.status:
    - name: /dev/xda1
    - minimum: 1024 KB
    - maximum: 1048576 KB
    - absolute: True
```

`salt.states.disk.`**`status`**`(`*name*, *maximum=None*, *minimum=None*, *absolute=False*, *free=False*`)`
Return the current disk usage stats for the named mount point

name
Disk mount or directory for which to check used space

maximum
The maximum disk utilization

minimum
The minimum disk utilization

absolute
By default, the utilization is measured in percentage. Set the *absolute* flag to use kilobytes.

New in version 2016.11.0.

free
By default, *minimum* & *maximum* refer to the amount of used space. Set to *True* to evaluate the free space instead.

26.19.14 salt.states.environ

Support for getting and setting the environment variables of the current salt process.

`salt.states.environ.`**`setenv`**`(`*name, value, false_unsets=False, clear_all=False, update_minion=False, permanent=False*`)`

Set the salt process environment variables.

name
The environment key to set. Must be a string.

value
Either a string or dict. When string, it will be the value set for the environment key of 'name' above. When a dict, each key/value pair represents an environment variable to set.

false_unsets
If a key's value is False and false_unsets is True, then the key will be removed from the salt processes environment dict entirely. If a key's value is False and false_unsets is not True, then the key's value will be set to an empty string. Default: False

clear_all
USE WITH CAUTION! This option can unset environment variables needed for salt to function properly. If clear_all is True, then any environment variables not defined in the environ dict will be deleted. Default: False

update_minion
If True, apply these environ changes to the main salt-minion process. If False, the environ changes will only affect the current salt subprocess. Default: False

permanent
On Windows minions this will set the environment variable in the registry so that it is always added as a environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in "HKLM" for this parameter. On all other minion types this will be ignored. Note: This will only take affect on applications opened after this has been set.

Example:

```yaml
a_string_env:
   environ.setenv:
     - name: foo
     - value: bar
     - update_minion: True

a_dict_env:
   environ.setenv:
     - name: does_not_matter
```

(continues on next page)

(continued from previous page)

```
    - value:
        foo: bar
        baz: quux
```

26.19.15 salt.states.etcd_mod

Manage etcd Keys

New in version 2015.8.0.

depends

- python-etcd or etcd3-py

This state module supports setting and removing keys from etcd.

Configuration

To work with an etcd server you must configure an etcd profile. The etcd config can be set in either the Salt Minion configuration file or in pillar:

```
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

It is technically possible to configure etcd without using a profile, but this is not considered to be a best practice, especially when multiple etcd servers or clusters are available.

```
etcd.host: 127.0.0.1
etcd.port: 4001
```

In order to choose whether to use etcd API v2 or v3, you can put the following configuration option in the same place as your etcd configuration. This option defaults to true, meaning you will use v2 unless you specify otherwise.

```
etcd.require_v2: True
```

When using API v3, there are some specific options available to be configured within your etcd profile. They are defaulted to the following...

```
etcd.encode_keys: False
etcd.encode_values: True
etcd.raw_keys: False
etcd.raw_values: False
etcd.unicode_errors: "surrogateescape"
```

`etcd.encode_keys` indicates whether you want to pre-encode keys using msgpack before adding them to etcd.

Note: If you set `etcd.encode_keys` to `True`, all recursive functionality will no longer work. This includes `tree` and `ls` and all other methods if you set `recurse`/`recursive` to `True`. This is due to the fact that when encoding with msgpack, keys like `/salt` and `/salt/stack` will have differing byte prefixes, and etcd v3 searches recursively using prefixes.

`etcd.encode_values` indicates whether you want to pre-encode values using msgpack before adding them to etcd. This defaults to `True` to avoid data loss on non-string values wherever possible.

`etcd.raw_keys` determines whether you want the raw key or a string returned.

`etcd.raw_values` determines whether you want the raw value or a string returned.

`etcd.unicode_errors` determines what you policy to follow when there are encoding/decoding errors.

Note: The etcd configuration can also be set in the Salt Master config file, but in order to use any etcd configurations defined in the Salt Master config, the *`pillar_opts`* must be set to `True`.

Be aware that setting `pillar_opts` to `True` has security implications as this makes all master configuration settings available in all minion's pillars.

Etcd profile configuration can be overridden using following arguments: `host`, `port`, `username`, `password`, `ca`, `client_key` and `client_cert`. The v3 specific arguments can also be used for overriding if you are using v3.

```yaml
my-value:
  etcd.set:
    - name: /path/to/key
    - value: value
    - host: 127.0.0.1
    - port: 2379
    - username: user
    - password: pass
```

Available Functions

- `set`

  This will set a value to a key in etcd. Changes will be returned if the key has been created or the value of the key has been updated. This means you can watch these states for changes.

  ```yaml
  /foo/bar/baz:
    etcd.set:
      - value: foo
      - profile: my_etcd_config
  ```

- `wait_set`

  Performs the same functionality as `set` but only if a watch requisite is `True`.

  ```yaml
  /some/file.txt:
    file.managed:
      - source: salt://file.txt

  /foo/bar/baz:
    etcd.wait_set:
      - value: foo
      - profile: my_etcd_config
      - watch:
        - file: /some/file.txt
  ```

- `rm`

  This will delete a key from etcd. If the key exists then changes will be returned and thus you can watch for changes on the state, if the key does not exist then no changes will occur.

  ```
  /foo/bar/baz:
    etcd.rm:
      - profile: my_etcd_config
  ```

- `wait_rm`

  Performs the same functionality as `rm` but only if a watch requisite is `True`.

  ```
  /some/file.txt:
    file.managed:
      - source: salt://file.txt

  /foo/bar/baz:
    etcd.wait_rm:
      - profile: my_etcd_config
      - watch:
        - file: /some/file.txt
  ```

`salt.states.etcd_mod.`**`directory`**(*name*, *profile=None*, ***kwargs*)

Create a directory in etcd.

name

The etcd directory name, for example: `/foo/bar/baz`.

profile

Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

```
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

`salt.states.etcd_mod.`**`mod_watch`**(*name*, ***kwargs*)

The etcd watcher, called to invoke the watch command. When called, execute a etcd function based on a watch call requisite.

Note: This state exists to support special handling of the `watch` *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

`salt.states.etcd_mod.`**`rm`**(*name*, *recurse=False*, *profile=None*, ***kwargs*)

Deletes a key from etcd

name

The etcd key name to remove, for example `/foo/bar/baz`.

recurse

Optional, defaults to `False`. If `True` performs a recursive delete.

profile

Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

```
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

`salt.states.etcd_mod.`**`set_`**(*name*, *value*, *profile=None*, ***kwargs*)

Set a key in etcd

name

The etcd key name, for example: `/foo/bar/baz`.

value

The value the key should contain.

profile

Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

```
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

`salt.states.etcd_mod.`**`wait_rm`**(*name*, *recurse=False*, *profile=None*, ***kwargs*)

Deletes a key from etcd only if the watch statement calls it. This function is also aliased as `wait_rm`.

name

The etcd key name to remove, for example `/foo/bar/baz`.

recurse

Optional, defaults to `False`. If `True` performs a recursive delete, see: https://python-etcd.readthedocs.io/en/latest/#delete-a-key.

profile

Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

```
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

`salt.states.etcd_mod.`**`wait_set`**(*name*, *value*, *profile=None*, ***kwargs*)

Set a key in etcd only if the watch statement calls it. This function is also aliased as `wait_set`.

name

The etcd key name, for example: `/foo/bar/baz`.

value

The value the key should contain.

profile

The etcd profile to use that has been configured on the Salt Master, this is optional and defaults to `None`.

```
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

26.19.16 salt.states.event

Send events through Salt's event system during state runs

`salt.states.event.`**`fire_master`**(*name*, *data=None*, *preload=None*, *with_env=False*, *with_grains=False*, *with_pillar=False*, *show_changed=True*, ***kwargs*)

This function is an alias of `send`.

Send an event to the Salt Master

New in version 2014.7.0.

Accepts the same arguments as the *`event.send`* execution module of the same name, with the additional argument:

param show_changed
If `True`, state will show as changed with the data argument as the change value. If `False`, shows as unchanged.

Example:

```
# ...snip bunch of states above

mycompany/mystaterun/status/update:
  event.send:
    - data:
        status: "Half-way through the state run!"

# ...snip bunch of states below
```

`salt.states.event.`**`mod_watch`**(*name*, *data=None*, *preload=None*, *with_env=False*, *with_grains=False*, *with_pillar=False*, *show_changed=True*, ***kwargs*)

This function is an alias of `send`.

Send an event to the Salt Master

New in version 2014.7.0.

Accepts the same arguments as the *`event.send`* execution module of the same name, with the additional argument:

param show_changed
If `True`, state will show as changed with the data argument as the change value. If `False`, shows as unchanged.

Example:

```
# ...snip bunch of states above

mycompany/mystaterun/status/update:
  event.send:
    - data:
        status: "Half-way through the state run!"

# ...snip bunch of states below
```

`salt.states.event.`**`send`**(*name*, *data=None*, *preload=None*, *with_env=False*, *with_grains=False*, *with_pillar=False*, *show_changed=True*, ***kwargs*)

Send an event to the Salt Master

New in version 2014.7.0.

Accepts the same arguments as the *`event.send`* execution module of the same name, with the additional argument:

Parameters
`show_changed` -- If `True`, state will show as changed with the data argument as the change value. If `False`, shows as unchanged.

Example:

```
# ...snip bunch of states above

mycompany/mystaterun/status/update:
  event.send:
    - data:
```

(continues on next page)

(continued from previous page)

```
        status: "Half-way through the state run!"

# ...snip bunch of states below
```

salt.states.event.**wait**(*name*, *sfun=None*, *data=None*)

Fire an event on the Salt master event bus if called from a watch statement

New in version 2014.7.0.

Example:

```
# Stand up a new web server.
apache:
  pkg:
    - installed
    - name: httpd
  service:
    - running
    - enable: True
    - name: httpd

# Notify the load balancer to update the pool once Apache is running.
refresh_pool:
  event:
    - wait
    - name: mycompany/loadbalancer/pool/update
    - data:
        new_web_server_ip: {{ grains['ipv4'] | first() }}
    - watch:
      - pkg: apache
```

26.19.17 salt.states.file

This reference page explains how to use the state file module.

For the module functions reference documentation, see *File module functions*.

Example operations on regular files, special files, directories, and symlinks

The states.file module enables you to alter configuration files to complete tasks such as upgrading operating systems, changing permissions, security settings, and adding and configuring nodes.

For further information about states, see Configuration management and states tutorials and Writing Salt states.

Here is a quick guide to common salt.states.file examples. For more examples, see the functions reference below.

- *Manage regular files with the file.managed state*
- *Use py renderer as a templating option*
- *Specify a file with the source parameter*
- *Use the names parameter to expand the contents of a single state*
- *Manage special files with the mknod function*

- *Manage directories with the directory function*
- *Use the symlinks function*
- *Manage directories recursively with the recurse function*
- *Manage backup directories with the retention schedule function*

Manage regular files with the file.managed state

Regular files can be enforced with the *`file.managed`* state. This state downloads files from the salt master and places them on the target system. Managed files can be rendered as a jinja, mako, or wempy template, adding a dynamic component to file management. For example, here *`file.managed`* uses the jinja templating system:

```
/etc/http/conf/http.conf:
  file.managed:
    - source: salt://apache/http.conf
    - user: root
    - group: root
    - mode: 644
    - attrs: ai
    - template: jinja
    - defaults:
        custom_var: "default value"
        other_var: 123
{% if grains['os'] == 'Ubuntu' %}
    - context:
        custom_var: "override"
{% endif %}
```

Use py renderer as a templating option

It is also possible to use any renderer as a templating option. The template would be a Python script which would need to contain a function called `run()`, which returns a string. All arguments to the state will be made available to the Python script as globals. The returned string will be the contents of the managed file. For example:

```
def run():
    lines = ['foo', 'bar', 'baz']
    lines.extend([source, name, user, context])  # Arguments as globals
    return '\n\n'.join(lines)
```

Note: The `defaults` and `context` arguments require extra indentation (four spaces instead of the normal two) in order to create a nested dictionary. *More information*.

If using a template, any user-defined template variables in the file defined in `source` must be passed in using the `defaults` and/or `context` arguments. The general best practice is to place default values in `defaults`, with conditional overrides going into `context`, as seen above.

The template will receive a variable `custom_var`, which would be accessed in the template using `{{ custom_var }}`. If the operating system is Ubuntu, the value of the variable `custom_var` would be *override*, otherwise it is the default *default value*

Specify a file with the source parameter

The `source` parameter can be specified as a list. If this is done, then the first file to be matched will be the one that is used. This allows you to have a default file on which to fall back if the desired file does not exist on the salt fileserver. Here's an example:

```
/etc/foo.conf:
  file.managed:
    - source:
      - salt://foo.conf.{{ grains['fqdn'] }}
      - salt://foo.conf.fallback
    - user: foo
    - group: users
    - mode: 644
    - attrs: i
    - backup: minion
```

Note: Salt supports backing up managed files via the backup option. For more details on this functionality please review the *backup_mode documentation*.

The `source` parameter can also specify a file in another Salt environment. In this example `foo.conf` in the `dev` environment will be used instead.

```
/etc/foo.conf:
  file.managed:
    - source:
      - 'salt://foo.conf?saltenv=dev'
    - user: foo
    - group: users
    - mode: '0644'
    - attrs: i
```

Warning: When using a mode that includes a leading zero you must wrap the value in single quotes. If the value is not wrapped in quotes it will be read by YAML as an integer and evaluated as an octal.

Use the names parameter to expand the contents of a single state

---

Note: Salt only supports numeric mode specifications (like `644`) and does not support symbolic modes (like `u+rw`) that are commonly used with commands like `chmod`.

The `names` parameter, which is part of the state compiler, can be used to expand the contents of a single state declaration into multiple, single state declarations. Each item in the `names` list receives its own individual state `name` and is converted into its own low-data structure. This is a convenient way to manage several files with similar attributes.

```
salt_master_conf:
  file.managed:
```

(continues on next page)

(continued from previous page)

```
    - user: root
    - group: root
    - mode: '0644'
    - names:
      - /etc/salt/master.d/master.conf:
        - source: salt://saltmaster/master.conf
      - /etc/salt/minion.d/minion-99.conf:
        - source: salt://saltmaster/minion.conf
```

Note: There is more documentation about this feature in the *Names declaration* section of the *Highstate docs*.

Manage special files with the mknod function

Special files can be managed via the `mknod` function. This function will create and enforce the permissions on a special file. The function supports the creation of character devices, block devices, and FIFO pipes. The function will create the directory structure up to the special file if it is needed on the minion. The function will not overwrite or operate on (change major/minor numbers) existing special files with the exception of user, group, and permissions. In most cases the creation of some special files require root permissions on the minion. This would require that the minion to be run as the root user. Here is an example of a character device:

```
/var/named/chroot/dev/random:
  file.mknod:
    - ntype: c
    - major: 1
    - minor: 8
    - user: named
    - group: named
    - mode: 660
```

Here is an example of a block device:

```
/var/named/chroot/dev/loop0:
  file.mknod:
    - ntype: b
    - major: 7
    - minor: 0
    - user: named
    - group: named
    - mode: 660
```

Here is an example of a fifo pipe:

```
/var/named/chroot/var/log/logfifo:
  file.mknod:
    - ntype: p
    - user: named
    - group: named
    - mode: 660
```

Manage directories with the directory function

Directories can be managed via the `directory` function. This function can create and enforce the permissions on a directory. A directory statement will look like this:

```
/srv/stuff/substuf:
  file.directory:
    - user: fred
    - group: users
    - mode: 755
    - makedirs: True
```

To enforce user and/or group ownership or permissions recursively on the directory's contents, add a `recurse` directive:

```
/srv/stuff/substuf:
  file.directory:
    - user: fred
    - group: users
    - mode: 755
    - makedirs: True
    - recurse:
      - user
      - group
      - mode
```

As a default, `mode` will resolve to `dir_mode` and `file_mode`. To specify both directory and file permissions, use this form:

```
/srv/stuff/substuf:
  file.directory:
    - user: fred
    - group: users
    - file_mode: 744
    - dir_mode: 755
    - makedirs: True
    - recurse:
      - user
      - group
      - mode
```

Use the symlinks function

The symlink function only takes a few arguments:

```
/etc/grub.conf:
  file.symlink:
    - target: /boot/grub/grub.conf
```

Manage directories recursively with the recurse function

Recursive directory management can also be set via the `recurse` function. Recursive directory management allows for a directory on the salt master to be recursively copied down to the minion. This is a great tool for deploying large code and configuration systems. Here is an example of a state using `recurse`:

```
/opt/code/flask:
  file.recurse:
    - source: salt://code/flask
    - include_empty: True
```

A more complex `recurse` example:

```
{% set site_user = 'testuser' %}
{% set site_name = 'test_site' %}
{% set project_name = 'test_proj' %}
{% set sites_dir = 'test_dir' %}

django-project:
  file.recurse:
    - name: {{ sites_dir }}/{{ site_name }}/{{ project_name }}
    - user: {{ site_user }}
    - dir_mode: 2775
    - file_mode: '0644'
    - template: jinja
    - source: salt://project/templates_dir
    - include_empty: True
```

Manage backup directories with the retention schedule function

Retention scheduling can be applied to manage contents of backup directories. For example:

```
/var/backups/example_directory:
  file.retention_schedule:
    - strptime_format: example_name_%Y%m%dT%H%M%S.tar.bz2
    - retain:
        most_recent: 5
        first_of_hour: 4
        first_of_day: 14
        first_of_week: 6
        first_of_month: 6
        first_of_year: all
```

File module functions

`salt.states.file.`**`absent`**`(`*name*, ***kwargs*`)`

Make sure that the named file or directory is absent. If it exists, it will be deleted. This will work to reverse any of the functions in the file state module. If a directory is supplied, it will be recursively deleted.

If only the contents of the directory need to be deleted but not the directory itself, use *`file.directory`* with `clean=True`

name

The path which should be deleted

```
remove:
  file.absent:
    - name: /tmp/file_to_remove
```

`salt.states.file.`**`accumulated`**`(`*name*, *filename*, *text*, ***kwargs*`)`

Prepare accumulator which can be used in template in file.managed state. Accumulator dictionary becomes available in template. It can also be used in file.blockreplace.

name

Accumulator name

filename

Filename which would receive this accumulator (see file.managed state documentation about `name`)

text

String or list for adding in accumulator

require_in / watch_in

One of them required for sure we fill up accumulator before we manage the file. Probably the same as filename

Example:

Given the following:

```
animals_doing_things:
  file.accumulated:
    - filename: /tmp/animal_file.txt
    - text: ' jumps over the lazy dog.'
    - require_in:
      - file: animal_file

animal_file:
  file.managed:
    - name: /tmp/animal_file.txt
    - source: salt://animal_file.txt
    - template: jinja
```

One might write a template for `animal_file.txt` like the following:

```
The quick brown fox{% for animal in accumulator['animals_doing_things'] %}
↪{{ animal }}{% endfor %}
```

Collectively, the above states and template file will produce:

```
The quick brown fox jumps over the lazy dog.
```

Multiple accumulators can be "chained" together.

Note: The 'accumulator' data structure is a Python dictionary. Do not expect any loop over the keys in a deterministic order!

`salt.states.file.`**`append`**`(`*name, text=None, makedirs=False, source=None, source_hash=None, template='jinja', sources=None, source_hashes=None, defaults=None, context=None, ignore_whitespace=True*`)`

Ensure that some text appears at the end of a file.

The text will not be appended if it already exists in the file. A single string of text or a list of strings may be appended.

name
The location of the file to append to.

text
The text to be appended, which can be a single string or a list of strings.

makedirs
If the file is located in a path without a parent directory, then the state will fail. If makedirs is set to True, then the parent directories will be created to facilitate the creation of the named file. Defaults to False.

source
A single source file to append. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials (see s3.get state documentation). File retrieval from Openstack Swift object storage is supported via swift://container/object_path URLs (see swift.get documentation).

For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs.

If the file is hosted on an HTTP or FTP server, the source_hash argument is also required.

source_hash

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

```
Type    Length
======  ======
sha512     128
sha384      96
sha256      64
sha224      56
sha1        40
md5         32
```

See the `source_hash` parameter description for *`file.managed`* function for more details and examples.

template
The named templating engine will be used to render the appended-to file. Defaults to `jinja`. The following templates are supported:

- `cheetah`
- `genshi`
- *`jinja`*
- *`mako`*

  - *py*
  - wempy

sources
A list of source files to append. If the files are hosted on an HTTP or FTP server, the source_hashes argument is also required.

source_hashes
A list of source_hashes corresponding to the sources list specified in the sources argument.

defaults
Default context passed to the template.

context
Overrides default context variables passed to the template.

ignore_whitespace
New in version 2015.8.4.

Spaces and Tabs in text are ignored by default, when searching for the appending content, one space or multiple tabs are the same for salt. Set this option to `False` if you want to change this behavior.

Multi-line example:

```yaml
/etc/motd:
  file.append:
    - text: |
        Thou hadst better eat salt with the Philosophers of Greece,
        than sugar with the Courtiers of Italy.
        - Benjamin Franklin
```

Multiple lines of text:

```yaml
/etc/motd:
  file.append:
    - text:
      - Trust no one unless you have eaten much salt with him.
      - "Salt is born of the purest of parents: the sun and the sea."
```

Gather text from multiple template files:

```yaml
/etc/motd:
  file:
    - append
    - template: jinja
    - sources:
      - salt://motd/devops-messages.tmpl
      - salt://motd/hr-messages.tmpl
      - salt://motd/general-messages.tmpl
```

New in version 0.9.5.

`salt.states.file.`**`blockreplace`**(*name, marker_start='#-- start managed zone --', marker_end='#-- end managed zone --', source=None, source_hash=None, template='jinja', sources=None, source_hashes=None, defaults=None, context=None, content='', append_if_not_found=False, prepend_if_not_found=False, backup='.bak', show_changes=True, append_newline=None, insert_before_match=None, insert_after_match=None*)

Maintain an edit in a file in a zone delimited by two line markers

New in version 2014.1.0.

Changed in version 2017.7.5,2018.3.1: `append_newline` argument added. Additionally, to improve idempotence, if the string represented by `marker_end` is found in the middle of the line, the content preceding the marker will be removed when the block is replaced. This allows one to remove `append_newline: False` from the SLS and have the block properly replaced if the end of the content block is immediately followed by the `marker_end` (i.e. no newline before the marker).

A block of content delimited by comments can help you manage several lines entries without worrying about old entries removal. This can help you maintaining an un-managed file containing manual edits.

Note: This function will store two copies of the file in-memory (the original version and the edited version) in order to detect changes and only edit the targeted file if necessary.

Additionally, you can use *`file.accumulated`* and target this state. All accumulated data dictionaries' content will be added in the content block.

---

name
Filesystem path to the file to be edited

marker_start
The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output

marker_end
The line content identifying the end of the content block. As of versions 2017.7.5 and 2018.3.1, everything up to the text matching the marker will be replaced, so it's important to ensure that your marker includes the beginning of the text you wish to replace.

content
The content to be used between the two lines identified by `marker_start` and `marker_end`

source
The source file to download to the minion, this source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials. (see s3.get state documentation) File retrieval from Openstack Swift object storage is supported via swift://container/object_path URLs, see swift.get documentation. For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs. If source is left blank or None (use ~ in YAML), the file will be created as an empty file and the content will not be managed. This is also the case when a file already exists and the source is undefined; the contents of the file will not be changed or managed.

If the file is hosted on a HTTP or FTP server then the source_hash argument is also required.

A list of sources can also be passed in to provide a default source and a set of fallbacks. The first source in the list that is found to exist will be used and subsequent entries in the list will be ignored.

```yaml
file_override_example:
  file.blockreplace:
    - name: /etc/example.conf
    - source:
      - salt://file_that_does_not_exist
      - salt://file_that_exists
```

source_hash
This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

```
Type    Length
======  ======
sha512     128
sha384      96
sha256      64
sha224      56
sha1        40
md5         32
```

See the `source_hash` parameter description for *`file.managed`* function for more details and examples.

template
Templating engine to be used to render the downloaded file. The following engines are supported:

- `cheetah`
- `genshi`
- *`jinja`*
- *`mako`*
- *`py`*
- `wempy`

context
Overrides default context variables passed to the template

defaults
Default context passed to the template

append_if_not_found
If markers are not found and this option is set to `True`, the content block will be appended to the file.

prepend_if_not_found
If markers are not found and this option is set to `True`, the content block will be prepended to the file.

insert_before_match
If markers are not found, this parameter can be set to a regex which will insert the block before the first found occurrence in the file.

New in version 3001.

insert_after_match
If markers are not found, this parameter can be set to a regex which will insert the block after the first found occurrence in the file.

New in version 3001.

backup
The file extension to use for a backup of the file if any edit is made. Set this to `False` to skip making a backup.

show_changes
Controls how changes are presented. If `True`, the `Changes` section of the state return will contain a unified diff of the changes made. If False, then it will contain a boolean (`True` if any changes were made, otherwise `False`).

append_newline
Controls whether or not a newline is appended to the content block. If the value of this argument is `True` then a newline will be added to the content block. If it is `False`, then a newline will *not* be added to the content block. If it is unspecified, then a newline will only be added to the content block if it does not already end in a newline.

New in version 2017.7.5,2018.3.1.

Example of usage with an accumulator and with a variable:

```
{% set myvar = 42 %}
hosts-config-block-{{ myvar }}:
  file.blockreplace:
    - name: /etc/hosts
    - marker_start: "# START managed zone {{ myvar }} -DO-NOT-EDIT-"
    - marker_end: "# END managed zone {{ myvar }} --"
    - content: 'First line of content'
    - append_if_not_found: True
    - backup: '.bak'
    - show_changes: True

hosts-config-block-{{ myvar }}-accumulated1:
  file.accumulated:
    - filename: /etc/hosts
    - name: my-accumulator-{{ myvar }}
    - text: "text 2"
    - require_in:
      - file: hosts-config-block-{{ myvar }}

hosts-config-block-{{ myvar }}-accumulated2:
  file.accumulated:
    - filename: /etc/hosts
    - name: my-accumulator-{{ myvar }}
    - text: |
         text 3
         text 4
    - require_in:
      - file: hosts-config-block-{{ myvar }}
```

will generate and maintain a block of content in `/etc/hosts`:

```
# START managed zone 42 -DO-NOT-EDIT-
First line of content
text 2
text 3
text 4
# END managed zone 42 --
```

`salt.states.file.`**`cached`**`(`*name, source_hash='', source_hash_name=None, skip_verify=False, saltenv='base', use_etag=False, source_hash_sig=None, signed_by_any=None, signed_by_all=None, keyring=None, gnupghome=None, sig_backend='gpg'*`)`

New in version 2017.7.3.

Changed in version 3005.

Ensures that a file is saved to the minion's cache. This state is primarily invoked by other states to ensure that we do not re-download a source file if we do not need to.

name

The URL of the file to be cached. To cache a file from an environment other than `base`, either use the `saltenv` argument or include the saltenv in the URL (e.g. `salt://path/to/file.conf?saltenv=dev`).

Note: A list of URLs is not supported, this must be a single URL. If a local file is passed here, then the state will obviously not try to download anything, but it will compare a hash if one is specified.

---

source_hash
See the documentation for this same argument in the *file.managed* state.

Note: For remote files not originating from the `salt://` fileserver, such as http(s) or ftp servers, this state will not re-download the file if the locally-cached copy matches this hash. This is done to prevent unnecessary downloading on repeated runs of this state. To update the cached copy of a file, it is necessary to update this hash.

---

source_hash_name
See the documentation for this same argument in the *file.managed* state.

skip_verify
See the documentation for this same argument in the *file.managed* state.

Note: Setting this to `True` will result in a copy of the file being downloaded from a remote (http(s), ftp, etc.) source each time the state is run.

---

saltenv
Used to specify the environment from which to download a file from the Salt fileserver (i.e. those with `salt://` URL).

use_etag
If `True`, remote http/https file sources will attempt to use the ETag header to determine if the remote file needs to be downloaded. This provides a lightweight mechanism for promptly refreshing files changed on a web server without requiring a full hash comparison via the `source_hash` parameter.

New in version 3005.

source_hash_sig
When `name` is a remote file source, `source_hash` is a file, `skip_verify` is not true and `use_etag` is not true, ensure a valid signature exists on the source hash file. Set this to `true` for an inline (clear-signed) signature, or to a file URI retrievable by *:py:func:`cp.cache_file <salt.modules.cp.cache_file>* for a detached one.

Note: A signature on the `source_hash` file is enforced regardless of changes since its contents are used to check if an existing file is in the correct state - but only for remote sources!

New in version 3007.0.

signed_by_any
When verifying `source_hash_sig`, require at least one valid signature from one of a list of keys. By default, this is passed to *gpg.verify*, meaning a key is identified by its fingerprint.

New in version 3007.0.

signed_by_all
When verifying `source_hash_sig`, require a valid signature from each of the keys in this list. By default, this is passed to *gpg.verify*, meaning a key is identified by its fingerprint.

New in version 3007.0.

keyring
When verifying signatures, use this keyring.

New in version 3007.0.

gnupghome
When verifying signatures, use this GnuPG home.

New in version 3007.0.

sig_backend

When verifying signatures, use this execution module as a backend. It must be compatible with the `gpg.verify` API. Defaults to `gpg`. All signature-related parameters are passed through.

New in version 3008.0.

This state will in most cases not be useful in SLS files, but it is useful when writing a state or remote-execution module that needs to make sure that a file at a given URL has been downloaded to the cachedir. One example of this is in the `archive.extracted` state:

```
result = __states__['file.cached'](source_match,
                                   source_hash=source_hash,
                                   source_hash_name=source_hash_name,
                                   skip_verify=skip_verify,
                                   saltenv=__env__)
```

This will return a dictionary containing the state's return data, including a `result` key which will state whether or not the state was successful. Note that this will not catch exceptions, so it is best used within a try/except.

Once this state has been run from within another state or remote-execution module, the actual location of the cached file can be obtained using `cp.is_cached`:

```
cached = __salt__['cp.is_cached'](source_match, saltenv=__env__)
```

This function will return the cached path of the file, or an empty string if the file is not present in the minion cache.

`salt.states.file.`**`comment`**(*name*, *regex*, *char='#'*, *backup='.bak'*, *ignore_missing=False*)

New in version 0.9.5.

Changed in version 3005.

Comment out specified lines in a file.

name

The full path to the file to be edited

regex

A regular expression used to find the lines that are to be commented; this pattern will be wrapped in parenthesis and will move any preceding/trailing `^` or `$` characters outside the parenthesis (e.g., the pattern `^foo$` will be rewritten as `^(foo)$`) Note that you _need_ the leading ^, otherwise each time you run highstate, another comment char will be inserted.

char

The character to be inserted at the beginning of a line in order to comment it out

backup

The file will be backed up before edit with this file extension

> **Warning:** This backup will be overwritten each time `sed` / `comment` / `uncomment` is called. Meaning the backup will only be useful after the first invocation.

Set to False/None to not keep a backup.

ignore_missing

Ignore a failure to find the regex in the file. This is useful for scenarios where a line must only be commented if it is found in the file.

New in version 3005.

Usage:

```
/etc/fstab:
  file.comment:
    - regex: ^bind 127.0.0.1
```

`salt.states.file.`**`copy_`**(*name*, *source*, *force=False*, *makedirs=False*, *preserve=False*, *user=None*, *group=None*, *mode=None*, *dir_mode=None*, *subdir=False*, ***kwargs*)

If the file defined by the `source` option exists on the minion, copy it to the named path. The file will not be overwritten if it already exists, unless the `force` option is set to `True`.

Note: This state only copies files from one location on a minion to another location on the same minion. For copying files from the master, use a *`file.managed`* state.

---

name
The location of the file to copy to

source
The location of the file to copy to the location specified with name

force
If the target location is present then the file will not be moved, specify ”force: True” to overwrite the target file

makedirs
If the target subdirectories don't exist create them

preserve
New in version 2015.5.0.

Set `preserve: True` to preserve user/group ownership and mode after copying. Default is `False`. If `preserve` is set to `True`, then user/group/mode attributes will be ignored.

user
New in version 2015.5.0.

The user to own the copied file, this defaults to the user salt is running as on the minion. If `preserve` is set to `True`, then this will be ignored

group
New in version 2015.5.0.

The group to own the copied file, this defaults to the group salt is running as on the minion. If `preserve` is set to `True` or on Windows this will be ignored

mode
New in version 2015.5.0.

The permissions to set on the copied file, aka 644, '0775', '4664'. If `preserve` is set to `True`, then this will be ignored. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

dir_mode
New in version 3006.0.

If directories are to be created, passing this option specifies the permissions for those directories. If this is not set, directories will be assigned permissions by adding the execute bit to the mode of the files.

The default mode for new files and directories corresponds to the umask of the salt process. Not enforced for existing files and directories.

subdir
New in version 2015.5.0.

If the name is a directory then place the file inside the named directory

---

Note: The copy function accepts paths that are local to the Salt minion. This function does not support salt://, http://, or the other additional file paths that are supported by *states.file.managed* and *states.file.recurse*.

Usage:

```
# Use 'copy', not 'copy_'
/etc/example.conf:
  file.copy:
    - source: /tmp/example.conf
```

`salt.states.file.`**`decode`**(*name*, *encoded_data=None*, *contents_pillar=None*, *encoding_type='base64'*, *checksum='md5'*)

Decode an encoded file and write it to disk

New in version 2016.3.0.

name
Path of the file to be written.

encoded_data
The encoded file. Either this option or `contents_pillar` must be specified.

contents_pillar
A Pillar path to the encoded file. Uses the same path syntax as *pillar.get*. The *hashutil.base64_encodefile* function can load encoded content into Pillar. Either this option or `encoded_data` must be specified.

encoding_type
The type of encoding.

checksum
The hashing algorithm to use to generate checksums. Wraps the *hashutil.digest* execution function.

Usage:

```
write_base64_encoded_string_to_a_file:
  file.decode:
    - name: /tmp/new_file
    - encoding_type: base64
    - contents_pillar: mypillar:thefile

# or

write_base64_encoded_string_to_a_file:
  file.decode:
    - name: /tmp/new_file
    - encoding_type: base64
    - encoded_data: |
        Z2V0IHNhbHRlZAo=
```

Be careful with multi-line strings that the YAML indentation is correct. E.g.,

```
write_base64_encoded_string_to_a_file:
  file.decode:
    - name: /tmp/new_file
    - encoding_type: base64
```

(continues on next page)

(continued from previous page)

```
    - encoded_data: |
        {{ salt['pillar.get']('path:to:data') | indent(8) }}
```

`salt.states.file.`**`directory`**`(`*name, user=None, group=None, recurse=None, max_depth=None, dir_mode=None, file_mode=None, makedirs=False, clean=False, require=None, exclude_pat=None, follow_symlinks=False, force=False, backupname=None, allow_symlink=True, children_only=False, win_owner=None, win_perms=None, win_deny_perms=None, win_inheritance=True, win_perms_reset=False, **kwargs*`)`

Ensure that a named directory is present and has the right perms

name

The location to create or manage a directory, as an absolute path

user

The user to own the directory; this defaults to the user salt is running as on the minion

group

The group ownership set for the directory; this defaults to the group salt is running as on the minion. On Windows, this is ignored

recurse

Enforce user/group ownership and mode of directory recursively. Accepts a list of strings representing what you would like to recurse. If `mode` is defined, will recurse on both `file_mode` and `dir_mode` if they are defined. If `ignore_files` or `ignore_dirs` is included, files or directories will be left unchanged respectively. directories will be left unchanged respectively. If `silent` is defined, individual file/directory change notifications will be suppressed.

Example:

```
/var/log/httpd:
  file.directory:
    - user: root
    - group: root
    - dir_mode: 755
    - file_mode: 644
    - recurse:
      - user
      - group
      - mode
```

Leave files or directories unchanged:

```
/var/log/httpd:
  file.directory:
    - user: root
    - group: root
    - dir_mode: 755
    - file_mode: 644
    - recurse:
      - user
      - group
      - mode
      - ignore_dirs
```

New in version 2015.5.0.

max_depth

Limit the recursion depth. The default is no limit=None. 'max_depth' and 'clean' are mutually exclusive.

New in version 2016.11.0.

dir_mode / mode

The permissions mode to set any directories created. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

file_mode

The permissions mode to set any files created if 'mode' is run in 'recurse'. This defaults to dir_mode. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

The file module only supports numeric mode specifications (like `644`) and does not support symbolic modes like `u+rw`) that are commonly used with commands like `chmod`.

makedirs

If the directory is located in a path without a parent directory, then the state will fail. If makedirs is set to True, then the parent directories will be created to facilitate the creation of the named file.

clean

Remove any files that are not referenced by a required `file` state. See examples below for more info. If this option is set then everything in this directory will be deleted unless it is required. 'clean' and 'max_depth' are mutually exclusive.

require

Require other resources such as packages or files.

exclude_pat

When 'clean' is set to True, exclude this pattern from removal list and preserve in the destination.

follow_symlinks

If the desired path is a symlink (or `recurse` is defined and a symlink is encountered while recursing), follow it and check the permissions of the directory/file to which the symlink points.

New in version 2014.1.4.

Changed in version 3001.1: If set to False symlinks permissions are ignored on Linux systems because it does not support permissions modification. Symlinks permissions are always 0o777 on Linux.

force

If the name of the directory exists and is not a directory and force is set to False, the state will fail. If force is set to True, the file in the way of the directory will be deleted to make room for the directory, unless backupname is set, then it will be renamed.

New in version 2014.7.0.

backupname

If the name of the directory exists and is not a directory, it will be renamed to the backupname. If the backupname already exists and force is False, the state will fail. Otherwise, the backupname will be removed first.

New in version 2014.7.0.

allow_symlink

If allow_symlink is True and the specified path is a symlink, it will be allowed to remain if it points to a directory. If allow_symlink is False then the state will fail, unless force is also set to True, in which case it will be removed or renamed, depending on the value of the backupname argument.

New in version 2014.7.0.

children_only

If children_only is True the base of a path is excluded when performing a recursive operation. In case of /path/to/base, base will be ignored while all of /path/to/base/* are still operated on.

win_owner
The owner of the directory. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

New in version 2017.7.0.

win_perms
A dictionary containing permissions to grant and their propagation. For example: `{'Administrators': {'perms': 'full_control', 'applies_to': 'this_folder_only'}}` Can be a single basic perm or a list of advanced perms. `perms` must be specified. `applies_to` is optional and defaults to `this_folder_subfolder_files`.

New in version 2017.7.0.

win_deny_perms
A dictionary containing permissions to deny and their propagation. For example: `{'Administrators': {'perms': 'full_control', 'applies_to': 'this_folder_only'}}` Can be a single basic perm or a list of advanced perms.

New in version 2017.7.0.

win_inheritance
True to inherit permissions from the parent directory, False not to inherit permission.

New in version 2017.7.0.

win_perms_reset
If `True` the existing DACL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

New in version 2018.3.0.

Here's an example using the above `win_*` parameters:

```yaml
create_config_dir:
  file.directory:
    - name: 'C:\config\'
    - win_owner: Administrators
    - win_perms:
        # Basic Permissions
        dev_ops:
          perms: full_control
        # List of advanced permissions
        appuser:
          perms:
            - read_attributes
            - read_ea
            - create_folders
            - read_permissions
          applies_to: this_folder_only
        joe_snuffy:
          perms: read
          applies_to: this_folder_files
    - win_deny_perms:
        fred_snuffy:
          perms: full_control
    - win_inheritance: False
```

For `clean: True` there is no mechanism that allows all states and modules to enumerate the files that they manage, so for file.directory to know what files are managed by Salt, a `file` state targeting managed files is required. To use a contrived example, the following states will always have changes, despite the file named `okay` being created by a Salt state:

```
silly_way_of_creating_a_file:
  cmd.run:
     - name: mkdir -p /tmp/dont/do/this && echo "seriously" > /tmp/dont/
↪do/this/okay
     - unless: grep seriously /tmp/dont/do/this/okay

will_always_clean:
  file.directory:
    - name: /tmp/dont/do/this
    - clean: True
```

Because `cmd.run` has no way of communicating that it's creating a file, `will_always_clean` will remove the newly created file. Of course, every time the states run the same thing will happen - the `silly_way_of_creating_a_file` will crete the file and `will_always_clean` will always remove it. Over and over again, no matter how many times you run it.

To make this example work correctly, we need to add a `file` state that targets the file, and a `require` between the file states.

```
silly_way_of_creating_a_file:
  cmd.run:
     - name: mkdir -p /tmp/dont/do/this && echo "seriously" > /tmp/dont/
↪do/this/okay
     - unless: grep seriously /tmp/dont/do/this/okay
  file.managed:
     - name: /tmp/dont/do/this/okay
     - create: False
     - replace: False
     - require_in:
       - file: will_always_clean
```

Now there is a `file` state that `clean` can check, so running those states will work as expected. The file will be created with the specific contents, and `clean` will ignore the file because it is being managed by a salt `file` state. Note that if `require_in` was placed under `cmd.run`, it would **not** work, because the requisite is for the cmd, not the file.

```
silly_way_of_creating_a_file:
  cmd.run:
     - name: mkdir -p /tmp/dont/do/this && echo "seriously" > /tmp/dont/
↪do/this/okay
     - unless: grep seriously /tmp/dont/do/this/okay
     # This part should be under file.managed
     - require_in:
       - file: will_always_clean
  file.managed:
     - name: /tmp/dont/do/this/okay
     - create: False
     - replace: False
```

Any other state that creates a file as a result, for example `pkgrepo`, must have the resulting files referenced in a file state in order for `clean: True` to ignore them. Also note that the requisite (`require_in` vs `require`) works in both directions:

```
clean_dir:
  file.directory:
    - name: /tmp/a/better/way
    - require:
      - file: a_better_way

a_better_way:
  file.managed:
    - name: /tmp/a/better/way/truely
    - makedirs: True
    - contents: a much better way
```

Works the same as this:

```
clean_dir:
  file.directory:
    - name: /tmp/a/better/way
    - clean: True

a_better_way:
  file.managed:
    - name: /tmp/a/better/way/truely
    - makedirs: True
    - contents: a much better way
    - require_in:
      - file: clean_dir
```

A common mistake here is to forget the state name and id are both required for requisites:

```
# Correct:
/path/to/some/file:
  file.managed:
    - contents: Cool
    - require_in:
      - file: clean_dir

# Incorrect
/path/to/some/file:
  file.managed:
    - contents: Cool
    - require_in:
      # should be `- file: clean_dir`
      - clean_dir

# Also incorrect
/path/to/some/file:
  file.managed:
    - contents: Cool
    - require_in:
      # should be `- file: clean_dir`
      - file
```

`salt.states.file.`**`exists`**(*name*, ***kwargs*)

Verify that the named file or directory is present or exists. Ensures pre-requisites outside of Salt's purview (e.g., keytabs, private keys, etc.) have been previously satisfied before deployment.

This function does not create the file if it doesn't exist, it will return an error.

name
: Absolute path which must exist

```
exists_/tmp/saltyfile:
  file.exists:
    - name: /tmp/saltyfile
```

`salt.states.file.`**`hardlink`**`(`*name*, *target*, *force=False*, *makedirs=False*, *user=None*, *group=None*, *dir_mode=None*, ***kwargs*`)`

Create a hard link If the file already exists and is a hard link pointing to any location other than the specified target, the hard link will be replaced. If the hard link is a regular file or directory then the state will return False. If the regular file is desired to be replaced with a hard link pass force: True

name
: The location of the hard link to create

target
: The location that the hard link points to

force
: If the name of the hard link exists and force is set to False, the state will fail. If force is set to True, the file or directory in the way of the hard link file will be deleted to make room for the hard link, unless backupname is set, when it will be renamed

makedirs
: If the location of the hard link does not already have a parent directory then the state will fail, setting makedirs to True will allow Salt to create the parent directory

user
: The user to own any directories made if makedirs is set to true. This defaults to the user salt is running as on the minion

group
: The group ownership set on any directories made if makedirs is set to true. This defaults to the group salt is running as on the minion. On Windows, this is ignored

dir_mode
: If directories are to be created, passing this option specifies the permissions for those directories.

```
symlink_/tmp/saltylink:
  file.hardlink:
    - name: /tmp/saltylink
    - target: /tmp/saltyfile
```

`salt.states.file.`**`keyvalue`**`(`*name*, *key=None*, *value=None*, *key_values=None*, *separator='='*, *append_if_not_found=False*, *prepend_if_not_found=False*, *search_only=False*, *show_changes=True*, *ignore_if_missing=False*, *count=1*, *uncomment=None*, *key_ignore_case=False*, *value_ignore_case=False*, *create_if_missing=False*`)`

Key/Value based editing of a file.

New in version 3001.

This function differs from `file.replace` in that it is able to search for keys, followed by a customizable separator, and replace the value with the given value. Should the value be the same as the one already in the file, no changes will be made.

Either supply both `key` and `value` parameters, or supply a dictionary with key / value pairs. It is an error to supply both.

name
: Name of the file to search/replace in.

key
Key to search for when ensuring a value. Use in combination with a `value` parameter.

value
Value to set for a given key. Use in combination with a `key` parameter.

key_values
Dictionary of key / value pairs to search for and ensure values for. Used to specify multiple key / values at once.

separator
Separator which separates key from value.

append_if_not_found
Append the key/value to the end of the file if not found. Note that this takes precedence over `prepend_if_not_found`.

prepend_if_not_found
Prepend the key/value to the beginning of the file if not found. Note that `append_if_not_found` takes precedence.

show_changes
Show a diff of the resulting removals and inserts.

ignore_if_missing
Return with success even if the file is not found (or not readable).

count
Number of occurrences to allow (and correct), default is 1. Set to -1 to replace all, or set to 0 to remove all lines with this key regardsless of its value.

Note: Any additional occurrences after `count` are removed. A count of -1 will only replace all occurrences that are currently uncommented already. Lines commented out will be left alone.

---

uncomment
Disregard and remove supplied leading characters when finding keys. When set to None, lines that are commented out are left for what they are.

Note: The argument to `uncomment` is not a prefix string. Rather; it is a set of characters, each of which are stripped.

---

key_ignore_case
Keys are matched case insensitively. When a value is changed the matched key is kept as-is.

value_ignore_case
Values are checked case insensitively, trying to set e.g. 'Yes' while the current value is 'yes', will not result in changes when `value_ignore_case` is set to True.

create_if_missing
Create the file if the destination file is not found.

New in version 3007.0.

An example of using `file.keyvalue` to ensure sshd does not allow for root to login with a password and at the same time setting the login-gracetime to 1 minute and disabling all forwarding:

```
sshd_config_harden:
    file.keyvalue:
      - name: /etc/ssh/sshd_config
      - key_values:
          permitrootlogin: 'without-password'
          LoginGraceTime: '1m'
          DisableForwarding: 'yes'
```

(continues on next page)

(continued from previous page)

```
      - separator: ' '
      - uncomment: '# '
      - key_ignore_case: True
      - append_if_not_found: True
```

The same example, except for only ensuring PermitRootLogin is set correctly. Thus being able to use the shorthand `key` and `value` parameters instead of `key_values`.

```
sshd_config_harden:
    file.keyvalue:
      - name: /etc/ssh/sshd_config
      - key: PermitRootLogin
      - value: without-password
      - separator: ' '
      - uncomment: '# '
      - key_ignore_case: True
      - append_if_not_found: True
```

Note: Notice how the key is not matched case-sensitively, this way it will correctly identify both 'PermitRootLogin' as well as 'permitrootlogin'.

`salt.states.file.`**`line`**`(`*name, content=None, match=None, mode=None, location=None, before=None, after=None, show_changes=True, backup=False, quiet=False, indent=True, create=False, user=None, group=None, file_mode=None*`)`

Line-focused editing of a file.

New in version 2015.8.0.

Note: `file.line` exists for historic reasons, and is not generally recommended. It has a lot of quirks. You may find `file.replace` to be more suitable.

`file.line` is most useful if you have single lines in a file, potentially a config file, that you would like to manage. It can remove, add, and replace lines.

name

Filesystem path to the file to be edited.

content

Content of the line. Allowed to be empty if mode=delete.

match

Match the target line for an action by a fragment of a string or regular expression.

If neither `before` nor `after` are provided, and `match` is also `None`, match falls back to the `content` value.

mode

Defines how to edit a line. One of the following options is required:

- **ensure**

  If line does not exist, it will be added. If `before` and `after` are specified either zero lines, or lines that contain the `content` line are allowed to be in between `before` and `after`. If there are lines, and none of them match then it will produce an error.
- **replace**

  If line already exists, it will be replaced.

- **delete**
  Delete the line, if found.
- **insert**
  Nearly identical to `ensure`. If a line does not exist, it will be added.

  The differences are that multiple (and non-matching) lines are alloweed between `before` and `after`, if they are specified. The line will always be inserted right before `before`. `insert` also allows the use of `location` to specify that the line should be added at the beginning or end of the file.

Note: If `mode=insert` is used, at least one of the following options must also be defined: `location`, `before`, or `after`. If `location` is used, it takes precedence over the other two options.

---

location
In `mode=insert` only, whether to place the `content` at the beginning or end of a the file. If `location` is provided, `before` and `after` are ignored. Valid locations:

- **start**
  Place the content at the beginning of the file.
- **end**
  Place the content at the end of the file.

before
Regular expression or an exact case-sensitive fragment of the string. Will be tried as **both** a regex **and** a part of the line. Must match **exactly** one line in the file. This value is only used in `ensure` and `insert` modes. The `content` will be inserted just before this line, matching its `indent` unless `indent=False`.

after
Regular expression or an exact case-sensitive fragment of the string. Will be tried as **both** a regex **and** a part of the line. Must match **exactly** one line in the file. This value is only used in `ensure` and `insert` modes. The `content` will be inserted directly after this line, unless `before` is also provided. If `before` is not matched, indentation will match this line, unless `indent=False`.

show_changes
Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made. Default is `True`

Note: Using this option will store two copies of the file in-memory (the original version and the edited version) in order to generate the diff.

---

backup
Create a backup of the original file with the extension: "Year-Month-Day-Hour-Minutes-Seconds".

quiet
Do not raise any exceptions. E.g. ignore the fact that the file that is tried to be edited does not exist and nothing really happened.

indent
Keep indentation with the previous line. This option is not considered when the `delete` mode is specified. Default is `True`.

create
Create an empty file if doesn't exist.

New in version 2016.11.0.

user
The user to own the file, this defaults to the user salt is running as on the minion.

New in version 2016.11.0.

group
The group ownership set for the file, this defaults to the group salt is running as on the minion On

Windows, this is ignored.

New in version 2016.11.0.

file_mode

The permissions to set on this file, aka 644, 0775, 4664. Not supported on Windows.

New in version 2016.11.0.

If an equal sign (=) appears in an argument to a Salt command, it is interpreted as a keyword argument in the format of `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
update_config:
  file.line:
    - name: /etc/myconfig.conf
    - mode: ensure
    - content: my key = my value
    - before: somekey.*?
```

Examples:

Here's a simple config file.

```
[some_config]
# Some config file
# this line will go away

here=False
away=True
goodybe=away
```

And an sls file:

```
remove_lines:
  file.line:
    - name: /some/file.conf
    - mode: delete
    - match: away
```

This will produce:

```
[some_config]
# Some config file

here=False
away=True
goodbye=away
```

If that state is executed 2 more times, this will be the result:

```
[some_config]
# Some config file

here=False
```

Given that original file with this state:

```
replace_things:
  file.line:
    - name: /some/file.conf
    - mode: replace
    - match: away
    - content: here
```

Three passes will this state will result in this file:

```
[some_config]
# Some config file
here

here=False
here
here
```

Each pass replacing the first line found.

Given this file:

```
insert after me
something
insert before me
```

The following state:

```
insert_a_line:
  file.line:
    - name: /some/file.txt
    - mode: insert
    - after: insert after me
    - before: insert before me
    - content: thrice
```

If this state is executed 3 times, the result will be:

```
insert after me
something
thrice
thrice
thrice
insert before me
```

If the mode is ensure instead, it will fail each time. To succeed, we need to remove the incorrect line between before and after:

```
insert after me
insert before me
```

With an ensure mode, this will insert `thrice` the first time and make no changes for subsequent calls. For something simple this is fine, but if you have instead blocks like this:

```
Begin SomeBlock
    foo = bar
End

Begin AnotherBlock
    another = value
End
```

And given this state:

```yaml
ensure_someblock:
  file.line:
    - name: /some/file.conf
    - mode: ensure
    - after: Begin SomeBlock
    - content: this = should be my content
    - before: End
```

This will fail because there are multiple `End` lines. Without that problem, it still would fail because there is a non-matching line, `foo = bar`. Ensure **only** allows either zero, or the matching line present to be present in between `before` and `after`.

`salt.states.file.`**`managed`**(*name, source=None, source_hash='', source_hash_name=None, keep_source=True, user=None, group=None, mode=None, attrs=None, template=None, makedirs=False, dir_mode=None, context=None, replace=True, defaults=None, backup='', show_changes=True, create=True, contents=None, tmp_dir=None, tmp_ext='', contents_pillar=None, contents_grains=None, contents_newline=True, contents_delimiter=':', encoding=None, encoding_errors='strict', allow_empty=True, follow_symlinks=True, check_cmd=None, skip_verify=False, selinux=None, win_owner=None, win_perms=None, win_deny_perms=None, win_inheritance=True, win_perms_reset=False, verify_ssl=True, use_etag=False, signature=None, source_hash_sig=None, signed_by_any=None, signed_by_all=None, keyring=None, gnupghome=None, ignore_ordering=False, ignore_whitespace=False, ignore_comment_characters=None, new_file_diff=False, sig_backend='gpg', **kwargs*)

Manage a given file, this function allows for a file to be downloaded from the salt master and potentially run through a templating system.

name
The location of the file to manage, as an absolute path.

source
The source file to download to the minion, this source file can be hosted on either the salt master server (`salt://`), the salt minion local file system (`/`), or on an HTTP or FTP server (`http(s)://`, `ftp://`).

Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials. (see s3.get state documentation) File retrieval from Openstack Swift object storage is supported via swift://container/object_path URLs, see swift.get documentation. For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs. If source is left blank or None (use ~ in YAML), the file will be created as an empty file and the content will not be managed. This is also the case when a file already exists and the source is undefined; the contents of the file will not be changed or managed. If source is left blank or None, please also set replaced to False to make your intention explicit.

If the file is hosted on a HTTP or FTP server then the source_hash argument is also required.

A list of sources can also be passed in to provide a default source and a set of fallbacks. The first source in the list that is found to exist will be used and subsequent entries in the list will be ignored. Source list functionality only supports local files and remote files hosted on the salt master server or retrievable via HTTP, HTTPS, or FTP.

```
file_override_example:
  file.managed:
    - source:
      - salt://file_that_does_not_exist
      - salt://file_that_exists
```

source_hash

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

```
Type    Length
======  ======
sha512     128
sha384      96
sha256      64
sha224      56
sha1        40
md5         32
```

Using a Source Hash File

The file can contain several checksums for several files. Each line must contain both the file name and the hash. If no file name is matched, the first hash encountered will be used, otherwise the most secure hash with the correct source file name will be used.

When using a source hash file the source_hash argument needs to be a url, the standard download urls are supported, ftp, http, salt etc:

Example:

```
tomdroid-src-0.7.3.tar.gz:
  file.managed:
    - name: /tmp/tomdroid-src-0.7.3.tar.gz
    - source: https://launchpad.net/tomdroid/beta/0.7.3/
↪+download/tomdroid-src-0.7.3.tar.gz
    - source_hash: https://launchpad.net/tomdroid/beta/0.7.3/
↪+download/tomdroid-src-0.7.3.hash
```

The following lines are all supported formats:

```
/etc/rc.conf ef6e82e4006dee563d98ada2a2a80a27
sha254c8525aee419eb649f0233be91c151178b30f0dff8ebbdcc8de71b1d5c8bcc06a
↪ /etc/resolv.conf
ead48423703509d37c4a90e6a0d53e143b6fc268
```

Debian file type `*.dsc` files are also supported.

Inserting the Source Hash in the SLS Data

The source_hash can be specified as a simple checksum, like so:

```
tomdroid-src-0.7.3.tar.gz:
  file.managed:
    - name: /tmp/tomdroid-src-0.7.3.tar.gz
    - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/
↪tomdroid-src-0.7.3.tar.gz
    - source_hash: 79eef25f9b0b2c642c62b7f737d4f53f
```

Note: Releases prior to 2016.11.0 must also include the hash type, like in the below example:

```
tomdroid-src-0.7.3.tar.gz:
  file.managed:
    - name: /tmp/tomdroid-src-0.7.3.tar.gz
    - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/
↪tomdroid-src-0.7.3.tar.gz
    - source_hash: md5=79eef25f9b0b2c642c62b7f737d4f53f
```

source_hash is ignored if the file hosted is not on a HTTP, HTTPS or FTP server.

Known issues:

If the remote server URL has the hash file as an apparent sub-directory of the source file, the module will discover that it has already cached a directory where a file should be cached. For example:

```
tomdroid-src-0.7.3.tar.gz:
  file.managed:
    - name: /tmp/tomdroid-src-0.7.3.tar.gz
    - source: https://launchpad.net/tomdroid/beta/0.7.3/
↪+download/tomdroid-src-0.7.3.tar.gz
    - source_hash: https://launchpad.net/tomdroid/beta/0.7.3/
↪+download/tomdroid-src-0.7.3.tar.gz/+md5
```

source_hash_name

When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename/URI associated with that hash. By default, Salt will look for the filename being managed. When managing a file at path `/tmp/foo.txt`, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8    foo.txt
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2    ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8    ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88    ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```
/tmp/foo.txt:
  file.managed:
    - source: https://mydomain.tld/dir2/foo.txt
    - source_hash: https://mydomain.tld/hashes
    - source_hash_name: ./dir2/foo.txt
```

Note: This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

New in version 2016.3.5.

keep_source

Set to `False` to discard the cached copy of the source file once the state completes. This can be useful for larger files to keep them from taking up space in minion cache. However, keep in mind that discarding the source file might result in the state needing to re-download the source file if the state is run again. If the source is not a local or `salt://` one, the source hash is known, `skip_verify` is not true and the managed file exists with the correct hash and is not templated, this is not the case (i.e. remote downloads are avoided if the local hash matches the expected one).

New in version 2017.7.3.

user

The user to own the file, this defaults to the user salt is running as on the minion

group

The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored

mode

The permissions to set on this file, e.g. `644`, `0775`, or `4664`.

The default mode for new files and directories corresponds to the umask of the salt process. The mode of existing files and directories will only be changed if `mode` is specified.

Note: This option is **not** supported on Windows.

Note: Salt's file module only supports numeric mode specifications (like `644`) and does not support symbolic modes (like `u+rw`) that are commonly used with commands like `chmod`.

Changed in version 2016.11.0: This option can be set to `keep`, and Salt will keep the mode from the Salt fileserver. This is only supported when the `source` URL begins with `salt://`, or for files local to the minion. Because the `source` option cannot be used with any of the `contents` options, setting the `mode` to `keep` is also incompatible with the `contents` options.

Note: keep does not work with salt-ssh.

As a consequence of how the files are transferred to the minion, and the inability to connect back to the master with salt-ssh, salt is unable to stat the file as it exists on the fileserver and thus cannot mirror the mode on the salt-ssh minion

attrs

The attributes to have on this file, e.g. `a`, `i`. The attributes can be any or a combination of the following characters: `aAcCdDeijPsStTu`.

Note: This option is **not** supported on Windows.

New in version 2018.3.0.

template

If this setting is applied, the named templating engine will be used to render the downloaded file. The following templates are supported:

- `cheetah`
- `genshi`
- *`jinja`*
- *`mako`*
- *`py`*
- `wempy`

makedirs

If set to `True`, then the parent directories will be created to facilitate the creation of the named file. If `False`, and the parent directory of the destination file doesn't exist, the state will fail.

dir_mode

If directories are to be created, passing this option specifies the permissions for those directories. If this is not set, directories will be assigned permissions by adding the execute bit to the mode of the files.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

replace

If set to `False` and the file already exists, the file will not be modified even if changes would otherwise be made. Permissions and ownership will still be enforced, however.

context

Overrides default context variables passed to the template.

defaults

Default context passed to the template.

backup

Overrides the default backup mode for this specific file. See *backup_mode documentation* for more details.

show_changes

Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made.

create

If set to `False`, then the file will only be managed if the file already exists on the system.

contents

Specify the contents of the file. Cannot be used in combination with `source`. Ignores hashes and does not use a templating engine.

This value can be either a single string, a multiline YAML string or a list of strings. If a list of strings, then the strings will be joined together with newlines in the resulting file. For example, the below two example states would result in identical file contents:

```
/path/to/file1:
  file.managed:
    - contents:
      - This is line 1
      - This is line 2

/path/to/file2:
  file.managed:
    - contents: |
        This is line 1
        This is line 2
```

contents_pillar

New in version 0.17.0.

Changed in version 2016.11.0: contents_pillar can also be a list, and the pillars will be concatenated together to form one file.

Operates like `contents`, but draws from a value stored in pillar, using the pillar path syntax used in *pillar.get*. This is useful when the pillar value contains newlines, as referencing a pillar variable using a jinja/mako template can result in YAML formatting issues due to the newlines causing indentation mismatches.

For example, the following could be used to deploy an SSH private key:

```
/home/deployer/.ssh/id_rsa:
  file.managed:
    - user: deployer
    - group: deployer
    - mode: 600
    - attrs: a
    - contents_pillar: userdata:deployer:id_rsa
```

This would populate `/home/deployer/.ssh/id_rsa` with the contents of `pillar['userdata']['deployer']['id_rsa']`. An example of this pillar setup would be like so:

```
userdata:
  deployer:
    id_rsa: |
        -----BEGIN RSA PRIVATE KEY-----
       ☒
↪MIIEowIBAAKCAQEAoQiwO3JhBquPAalQF9qP1lLZNXVjYMIswrMe2HcWUVBgh+vY
        U7sCwx/
↪dH6+VvNwmCoqmNnP+8gTPKGl1vgAObJAnMT623dMXjVKwnEagZPRJIxDy
        B/
↪HaAre9euNiY3LvIzBTWRSeMfT+rWvIKVBpvwlgGrfgz70m0pqxu+UyFbAGLin+
        GpxzZAMaFpZw4sSbIlRuissXZj/sHpQb8p9M5IeO4Z3rjkCP1cxI
        -----END RSA PRIVATE KEY-----
```

Note: The private key above is shortened to keep the example brief, but shows how to do multiline string in YAML. The key is followed by a pipe character, and the multiline string is indented two more spaces.

To avoid the hassle of creating an indented multiline YAML string, the *file_tree external pillar* can be used instead. However, this will not work for binary files in Salt releases before 2015.8.4.

Note: For information on using Salt Slots and how to incorporate execution module returns into file content or data, refer to the Salt Slots documentation.

---

contents_grains

New in version 2014.7.0.

Operates like `contents`, but draws from a value stored in grains, using the grains path syntax used in *grains.get*. This functionality works similarly to `contents_pillar`, but with grains.

For example, the following could be used to deploy a "message of the day" file:

```
write_motd:
  file.managed:
    - name: /etc/motd
    - contents_grains: motd
```

This would populate `/etc/motd` file with the contents of the `motd` grain. The `motd` grain is not a default grain, and would need to be set prior to running the state:

```
salt '*' grains.set motd 'Welcome! This system is managed by Salt.'
```

contents_newline

New in version 2014.7.0.

Changed in version 2015.8.4: This option is now ignored if the contents being deployed contain binary data.

If `True`, files managed using `contents`, `contents_pillar`, or `contents_grains` will have a newline added to the end of the file if one is not present. Setting this option to `False` will ensure the final line, or entry, does not contain a new line. If the last line, or entry in the file does contain a new line already, this option will not remove it.

contents_delimiter

New in version 2015.8.4.

Can be used to specify an alternate delimiter for `contents_pillar` or `contents_grains`. This delimiter will be passed through to *`pillar.get`* or *`grains.get`* when retrieving the contents.

encoding

If specified, then the specified encoding will be used. Otherwise, the file will be encoded using the system locale (usually UTF-8). See https://docs.python.org/3/library/codecs.html#standard-encodings for the list of available encodings.

New in version 2017.7.0.

encoding_errors

Error encoding scheme. Default is ```'strict'```. See https://docs.python.org/2/library/codecs.html#codec-base-classes for the list of available schemes.

New in version 2017.7.0.

allow_empty

New in version 2015.8.4.

If set to `False`, then the state will fail if the contents specified by `contents_pillar` or `contents_grains` are empty.

follow_symlinks

New in version 2014.7.0.

If the desired path is a symlink follow it and make changes to the file to which the symlink points.

check_cmd

New in version 2014.7.0.

The specified command will be run with an appended argument of a *temporary* file containing the new managed contents. If the command exits with a zero status the new managed contents will be written to the managed destination. If the command exits with a nonzero exit code, the state will fail and no changes will be made to the file.

For example, the following could be used to verify sudoers before making changes:

```
/etc/sudoers:
  file.managed:
    - user: root
    - group: root
    - mode: 0440
    - attrs: i
    - source: salt://sudoers/files/sudoers.jinja
    - template: jinja
    - check_cmd: /usr/sbin/visudo -c -f
```

NOTE: This `check_cmd` functions differently than the requisite `check_cmd`.

tmp_dir

Directory for temp file created by `check_cmd`. Useful for checkers dependent on config file location (e.g. daemons restricted to their own config directories by an apparmor profile).

```
/etc/dhcp/dhcpd.conf:
  file.managed:
    - user: root
    - group: root
    - mode: 0755
    - tmp_dir: '/etc/dhcp'
    - contents: "# Managed by Salt"
    - check_cmd: dhcpd -t -cf
```

tmp_ext

Suffix for temp file created by `check_cmd`. Useful for checkers dependent on config file extension (e.g. the init-checkconf upstart config checker).

```
/etc/init/test.conf:
  file.managed:
    - user: root
    - group: root
    - mode: 0440
    - tmp_ext: '.conf'
    - contents:
      - 'description "Salt Minion"'
      - 'start on started mountall'
      - 'stop on shutdown'
      - 'respawn'
      - 'exec salt-minion'
    - check_cmd: init-checkconf -f
```

skip_verify

If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.0.

selinux

Allows setting the selinux user, role, type, and range of a managed file

```
/tmp/selinux.test
  file.managed:
    - user: root
    - selinux:
        seuser: system_u
        serole: object_r
        setype: system_conf_t
        serange: s0
```

New in version 3000.

win_owner

The owner of the directory. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

New in version 2017.7.0.

win_perms

A dictionary containing permissions to grant and their propagation. For example:

`{'Administrators': {'perms': 'full_control'}}` Can be a single basic perm or a list of advanced perms. `perms` must be specified. `applies_to` does not apply to file objects.

New in version 2017.7.0.

win_deny_perms

A dictionary containing permissions to deny and their propagation. For example: `{'Administrators': {'perms': 'full_control'}}` Can be a single basic perm or a list of advanced perms. `perms` must be specified. `applies_to` does not apply to file objects.

New in version 2017.7.0.

win_inheritance

True to inherit permissions from the parent directory, False not to inherit permission.

New in version 2017.7.0.

win_perms_reset

If `True` the existing DACL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

New in version 2018.3.0.

Here's an example using the above `win_*` parameters:

```
create_config_file:
  file.managed:
    - name: C:\config\settings.cfg
    - source: salt://settings.cfg
    - win_owner: Administrators
    - win_perms:
        # Basic Permissions
        dev_ops:
          perms: full_control
        # List of advanced permissions
        appuser:
          perms:
            - read_attributes
            - read_ea
            - create_folders
            - read_permissions
        joe_snuffy:
          perms: read
    - win_deny_perms:
        fred_snuffy:
          perms: full_control
    - win_inheritance: False
```

verify_ssl

If `False`, remote https file sources (`https://`) and source_hash will not attempt to validate the servers certificate. Default is True.

New in version 3002.

use_etag

If `True`, remote http/https file sources will attempt to use the ETag header to determine if the remote file needs to be downloaded. This provides a lightweight mechanism for promptly refreshing files changed on a web server without requiring a full hash comparison via the `source_hash` parameter.

New in version 3005.

signature

Ensure a valid signature exists on the selected `source` file. Set this to true for inline signatures, or to a file URI retrievable by *:py:func:`cp.cache_file <salt.modules.cp.cache_file>* for a detached one.

Note: A signature is only enforced directly after caching the file, before it is moved to its final destination. Existing target files (with the correct checksum) will neither be checked nor deleted.

It will be enforced regardless of source type and will be required on the final output, therefore this does not lend itself well when templates are rendered. The file will not be modified, meaning inline signatures are not removed.

New in version 3007.0.

source_hash_sig
When `source` is a remote file source, `source_hash` is a file, `skip_verify` is not true and `use_etag` is not true, ensure a valid signature exists on the source hash file. Set this to `true` for an inline (clearsigned) signature, or to a file URI retrievable by *:py:func:`cp.cache_file <salt.modules.cp.cache_file>* for a detached one.

Note: A signature on the `source_hash` file is enforced regardless of changes since its contents are used to check if an existing file is in the correct state - but only for remote sources! As for `signature`, existing target files will not be modified, only the cached source_hash and source_hash_sig files will be removed.

New in version 3007.0.

signed_by_any
When verifying signatures either on the managed file or its source hash file, require at least one valid signature from one of a list of keys. By default, this is passed to *`gpg.verify`*, meaning a key is identified by its fingerprint.

New in version 3007.0.

signed_by_all
When verifying signatures either on the managed file or its source hash file, require a valid signature from each of the keys in this list. By default, this is passed to *`gpg.verify`*, meaning a key is identified by its fingerprint.

New in version 3007.0.

keyring
When verifying signatures, use this keyring.

New in version 3007.0.

gnupghome
When verifying signatures, use this GnuPG home.

New in version 3007.0.

ignore_ordering
If `True`, changes in line order will be ignored **ONLY** for the purposes of triggering watch/onchanges requisites. Changes will still be made to the file to bring it into alignment with requested state, and also reported during the state run. This behavior is useful for bringing existing application deployments under Salt configuration management without disrupting production applications with a service restart.

New in version 3007.0.

ignore_whitespace
If `True`, changes in whitespace will be ignored **ONLY** for the purposes of triggering watch/onchanges requisites. Changes will still be made to the file to bring it into alignment with requested state, and also reported during the state run. This behavior is useful for bringing existing application deployments under Salt configuration management without disrupting production applications with a service restart. Implies `ignore_ordering=True`

New in version 3007.0.

ignore_comment_characters

If set to a chacter string, the presence of changes *after* that string will be ignored in changes found in the file **ONLY** for the purposes of triggering watch/onchanges requisites. Changes will still be made to the file to bring it into alignment with requested state, and also reported during the state run. This behavior is useful for bringing existing application deployments under Salt configuration management without disrupting production applications with a service restart. Implies `ignore_ordering=True`

New in version 3007.0.

new_file_diff

If `True`, creation of new files will still show a diff in the changes return.

New in version 3008.0.

sig_backend

When verifying signatures, use this execution module as a backend. It must be compatible with the `gpg.verify` API. Defaults to `gpg`. All signature-related parameters are passed through.

New in version 3008.0.

`salt.states.file.`**`missing`**`(`*name*, ***kwargs*`)`

Verify that the named file or directory is missing, this returns True only if the named file is missing but does not remove the file if it is present.

name

Absolute path which must NOT exist

```
missing_/tmp/saltyfile:
  file.missing:
    - name: /tmp/saltyfile
```

`salt.states.file.`**`mknod`**`(`*name*, *ntype*, *major=0*, *minor=0*, *user=None*, *group=None*, *mode='0600'*`)`

Create a special file similar to the 'nix mknod command. The supported device types are `p` (fifo pipe), `c` (character device), and `b` (block device). Provide the major and minor numbers when specifying a character device or block device. A fifo pipe does not require this information. The command will create the necessary dirs if needed. If a file of the same name not of the same type/major/minor exists, it will not be overwritten or unlinked (deleted). This is logically in place as a safety measure because you can really shoot yourself in the foot here and it is the behavior of 'nix `mknod`. It is also important to note that not just anyone can create special devices. Usually this is only done as root. If the state is executed as none other than root on a minion, you may receive a permission error.

name

name of the file

ntype

node type 'p' (fifo pipe), 'c' (character device), or 'b' (block device)

major

major number of the device does not apply to a fifo pipe

minor

minor number of the device does not apply to a fifo pipe

user

owning user of the device/pipe

group

owning group of the device/pipe

mode

permissions on the device/pipe

Usage:

```
/dev/chr:
  file.mknod:
    - ntype: c
    - major: 180
    - minor: 31
    - user: root
    - group: root
    - mode: 660

/dev/blk:
  file.mknod:
    - ntype: b
    - major: 8
    - minor: 999
    - user: root
    - group: root
    - mode: 660

/dev/fifo:
  file.mknod:
    - ntype: p
    - user: root
    - group: root
    - mode: 660
```

New in version 0.17.0.

`salt.states.file.`**`mod_beacon`**`(`*name*, ***kwargs*`)`

Create a beacon to monitor a file based on a beacon state argument.

Note: This state exists to support special handling of the `beacon` state argument for supported state functions. It should not be called directly.

`salt.states.file.`**`mod_run_check_cmd`**`(`*cmd*, *filename*, ***check_cmd_opts*`)`

Execute the check_cmd logic.

Return True if `check_cmd` succeeds (check_cmd == 0) otherwise return a result dict

`salt.states.file.`**`not_cached`**`(`*name*, *saltenv='base'*`)`

New in version 2017.7.3.

Ensures that a file is not present in the minion's cache, deleting it if found. This state is primarily invoked by other states to ensure that a fresh copy is fetched.

name

The URL of the file to be removed from cache. To remove a file from cache in an environment other than `base`, either use the `saltenv` argument or include the saltenv in the URL (e.g. `salt://path/to/file.conf?saltenv=dev`).

Note: A list of URLs is not supported, this must be a single URL. If a local file is passed here, the state will take no action.

---

saltenv

Used to specify the environment from which to download a file from the Salt fileserver (i.e. those with `salt://` URL).

`salt.states.file.`**`patch`**(*name*, *source=None*, *source_hash=None*, *source_hash_name=None*, *skip_verify=False*, *template=None*, *context=None*, *defaults=None*, *options=''*, *reject_file=None*, *strip=None*, *saltenv=None*, ***kwargs*)

Ensure that a patch has been applied to the specified file or directory

Changed in version 2019.2.0: The `hash` and `dry_run_first` options are now ignored, as the logic which determines whether or not the patch has already been applied no longer requires them. Additionally, this state now supports patch files that modify more than one file. To use these sort of patches, specify a directory (and, if necessary, the `strip` option) instead of a file.

Note: A suitable `patch` executable must be available on the minion. Also, keep in mind that the pre-check this state does to determine whether or not changes need to be made will create a temp file and send all patch output to that file. This means that, in the event that the patch would not have applied cleanly, the comment included in the state results will reference a temp file that will no longer exist once the state finishes running.

name
The file or directory to which the patch should be applied

source
The patch file to apply

Changed in version 2019.2.0: The source can now be from any file source supported by Salt (`salt://`, `http://`, `https://`, `ftp://`, etc.). Templating is also now supported.

source_hash
Works the same way as in *`file.managed`*.

New in version 2019.2.0.

source_hash_name
Works the same way as in *`file.managed`*

New in version 2019.2.0.

skip_verify
Works the same way as in *`file.managed`*

New in version 2019.2.0.

template
Works the same way as in *`file.managed`*

New in version 2019.2.0.

context
Works the same way as in *`file.managed`*

New in version 2019.2.0.

defaults
Works the same way as in *`file.managed`*

New in version 2019.2.0.

options
Extra options to pass to patch. This should not be necessary in most cases.

Note: For best results, short opts should be separate from one another. The `-N` and `-r`, and `-o` options are used internally by this state and cannot be used here. Additionally, instead of using `-pN` or `--strip=N`, use the `strip` option documented below.

reject_file

If specified, any rejected hunks will be written to this file. If not specified, then they will be written to a temp file which will be deleted when the state finishes running.

Important: The parent directory must exist. Also, this will overwrite the file if it is already present.

New in version 2019.2.0.

strip

Number of directories to strip from paths in the patch file. For example, using the below SLS would instruct Salt to use `-p1` when applying the patch:

```
/etc/myfile.conf:
  file.patch:
    - source: salt://myfile.patch
    - strip: 1
```

New in version 2019.2.0: In previous versions, `-p1` would need to be passed as part of the `options` value.

saltenv

Specify the environment from which to retrieve the patch file indicated by the `source` parameter. If not provided, this defaults to the environment from which the state is being executed.

Note: Ignored when the patch file is from a non-`salt://` source.

Usage:

```
# Equivalent to ``patch --forward /opt/myfile.txt myfile.patch``
/opt/myfile.txt:
  file.patch:
    - source: salt://myfile.patch
```

`salt.states.file.`**`prepend`**`(`*name, text=None, makedirs=False, source=None, source_hash=None, template='jinja', sources=None, source_hashes=None, defaults=None, context=None, header=None*`)`

Ensure that some text appears at the beginning of a file

The text will not be prepended again if it already exists in the file. You may specify a single line of text or a list of lines to append.

name

The location of the file to prepend to.

text

The text to be prepended, which can be a single string or a list of strings.

makedirs

If the file is located in a path without a parent directory, then the state will fail. If makedirs is set to True, then the parent directories will be created to facilitate the creation of the named file. Defaults to False.

source

A single source file to prepend. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials (see s3.get state documentation). File retrieval from Openstack Swift object storage is supported via swift://container/object_path URLs (see swift.get documentation).

For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs.

If the file is hosted on an HTTP or FTP server, the source_hash argument is also required.

source_hash

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

```
Type    Length
======  ======
sha512     128
sha384      96
sha256      64
sha224      56
sha1        40
md5         32
```

See the `source_hash` parameter description for *`file.managed`* function for more details and examples.

template

The named templating engine will be used to render the source file(s). Defaults to `jinja`. The following templates are supported:

- `cheetah`
- `genshi`
- *`jinja`*
- *`mako`*
- *`py`*
- `wempy`

sources

A list of source files to prepend. If the files are hosted on an HTTP or FTP server, the source_hashes argument is also required.

source_hashes

A list of source_hashes corresponding to the sources list specified in the sources argument.

defaults

Default context passed to the template.

context

Overrides default context variables passed to the template.

ignore_whitespace

New in version 2015.8.4.

Spaces and Tabs in text are ignored by default, when searching for the appending content, one space or multiple tabs are the same for salt. Set this option to `False` if you want to change this behavior.

header

Forces the text to be prepended. If it exists in the file but not at the beginning, then it prepends a duplicate.

Multi-line example:

```
/etc/motd:
  file.prepend:
    - text: |
        Thou hadst better eat salt with the Philosophers of Greece,
        than sugar with the Courtiers of Italy.
```

(continues on next page)

(continued from previous page)

```
        - Benjamin Franklin
```

Multiple lines of text:

```
/etc/motd:
  file.prepend:
    - text:
      - Trust no one unless you have eaten much salt with him.
      - "Salt is born of the purest of parents: the sun and the sea."
```

Optionally, require the text to appear exactly as specified (order and position). Combine with multi-line or multiple lines of input.

```
/etc/motd:
  file.prepend:
    - header: True
    - text:
      - This will be the very first line in the file.
      - The 2nd line, regardless of duplicates elsewhere in the file.
      - These will be written anew if they do not appear verbatim.
```

Gather text from multiple template files:

```
/etc/motd:
  file:
    - prepend
    - template: jinja
    - sources:
      - salt://motd/devops-messages.tmpl
      - salt://motd/hr-messages.tmpl
      - salt://motd/general-messages.tmpl
```

New in version 2014.7.0.

`salt.states.file.`**`pruned`**`(`*name*, *recurse=False*, *ignore_errors=False*, *older_than=None*`)`

New in version 3006.0.

Ensure that the named directory is absent. If it exists and is empty, it will be deleted. An entire directory tree can be pruned of empty directories as well, by using the `recurse` option.

name
The directory which should be deleted if empty.

recurse
If set to `True`, this option will recursive deletion of empty directories. This is useful if nested paths are all empty, and would be the only items preventing removal of the named root directory.

ignore_errors
If set to `True`, any errors encountered while attempting to delete a directory are ignored. This **AUTOMATICALLY ENABLES** the `recurse` option since it's not terribly useful to ignore errors on the removal of a single directory. Useful for pruning only the empty directories in a tree which contains non-empty directories as well.

older_than
When `older_than` is set to a number, it is used to determine the **number of days** which must have passed since the last modification timestamp before a directory will be allowed to be removed. Setting the value to 0 is equivalent to leaving it at the default of `None`.

`salt.states.file.`**`recurse`**`(`*name*, *source*, *keep_source=True*, *clean=False*, *require=None*, *user=None*, *group=None*, *dir_mode=None*, *file_mode=None*, *sym_mode=None*, *template=None*, *context=None*, *replace=True*, *defaults=None*, *include_empty=False*, *backup=''*, *include_pat=None*, *exclude_pat=None*, *maxdepth=None*, *keep_symlinks=False*, *force_symlinks=False*, *win_owner=None*, *win_perms=None*, *win_deny_perms=None*, *win_inheritance=True*, *merge=False*, ***kwargs*`)`

Recurse through a subdirectory on the master and copy said subdirectory over to the specified path.

name
: The directory to set the recursion in

source
: The source directory, this directory is located on the salt master file server and is specified with the salt:// protocol. If the directory is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs

keep_source
: Set to `False` to discard the cached copy of the source file once the state completes. This can be useful for larger files to keep them from taking up space in minion cache. However, keep in mind that discarding the source file will result in the state needing to re-download the source file if the state is run again.

New in version 2017.7.3.

clean
: Make sure that only files that are set up by salt and required by this function are kept. If this option is set then everything in this directory will be deleted unless it is required.

require
: Require other resources such as packages or files

user
: The user to own the directory. This defaults to the user salt is running as on the minion

group
: The group ownership set for the directory. This defaults to the group salt is running as on the minion. On Windows, this is ignored

dir_mode
: The permissions mode to set on any directories created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

Note: This option is **not** supported on Windows.

file_mode
: The permissions mode to set on any files created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

Note: This option is **not** supported on Windows.

Changed in version 2016.11.0: This option can be set to `keep`, and Salt will keep the mode from the Salt fileserver. This is only supported when the `source` URL begins with `salt://`, or for files local to the minion. Because the `source` option cannot be used with any of the `contents` options, setting the `mode` to `keep` is also incompatible with the `contents` options.

sym_mode
: The permissions mode to set on any symlink created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

Note: This option is **not** supported on Windows.

---

template

If this setting is applied, the named templating engine will be used to render the downloaded file. The following templates are supported:

- `cheetah`
- `genshi`
- *`jinja`*
- *`mako`*
- *`py`*
- `wempy`

Note: The template option is required when recursively applying templates.

---

replace

If set to `False` and the file already exists, the file will not be modified even if changes would otherwise be made. Permissions and ownership will still be enforced, however.

context

Overrides default context variables passed to the template.

defaults

Default context passed to the template.

include_empty

Set this to True if empty directories should also be created (default is False)

backup

Overrides the default backup mode for all replaced files. See *backup_mode documentation* for more details.

include_pat

When copying, include only this pattern, or list of patterns, from the source. Default is glob match; if prefixed with 'E@', then regexp match. Example:

```
- include_pat: hello*       :: glob matches 'hello01', 'hello02'
                               ... but not 'otherhello'
- include_pat: E@hello      :: regexp matches 'otherhello',
                               'hello01' ...
```

Changed in version 3001: List patterns are now supported

```
- include_pat:
    - hello01
    - hello02
```

exclude_pat

Exclude this pattern, or list of patterns, from the source when copying. If both *include_pat* and *exclude_pat* are supplied, then it will apply conditions cumulatively. i.e. first select based on include_pat, and then within that result apply exclude_pat.

Also, when 'clean=True', exclude this pattern from the removal list and preserve in the destination. Example:

```
- exclude_pat: APPDATA*               :: glob matches APPDATA.01,
                                         APPDATA.02,.. for exclusion
- exclude_pat: E@(APPDATA)|(TEMPDATA) :: regexp matches APPDATA
                                         or TEMPDATA for exclusion
```

Changed in version 3001: List patterns are now supported

```
- exclude_pat:
    - APPDATA.01
    - APPDATA.02
```

maxdepth

When copying, only copy paths which are of depth *maxdepth* from the source path. Example:

```
- maxdepth: 0      :: Only include files located in the source
                      directory
- maxdepth: 1      :: Only include files located in the source
                      or immediate subdirectories
```

keep_symlinks

Determines how symbolic links (symlinks) are handled during the copying process. When set to `True`, the copy operation will copy the symlink itself, rather than the file or directory it points to. When set to `False`, the operation will follow the symlink and copy the target file or directory. If you want behavior similar to rsync, set this option to `True`.

However, if the `fileserver_followsymlinks` option is set to `False`, the `keep_symlinks` setting will be ignored, and symlinks will not be copied at all.

force_symlinks

Controls the creation of symlinks when using `keep_symlinks`. When set to `True`, it forces the creation of symlinks by removing any existing files or directories that might be obstructing their creation. This removal is done recursively if a directory is blocking the symlink. This option is only used when `keep_symlinks` is passed and is ignored if `fileserver_followsymlinks` is set to `False`.

win_owner

The owner of the symlink and directories if `makedirs` is True. If this is not passed, `user` will be used. If `user` is not passed, the account under which Salt is running will be used.

New in version 2017.7.7.

win_perms

A dictionary containing permissions to grant

New in version 2017.7.7.

win_deny_perms

A dictionary containing permissions to deny

New in version 2017.7.7.

win_inheritance

True to inherit permissions from parent, otherwise False

New in version 2017.7.7.

merge

When `source` is a list, instead of choosing the first existing source as the single source directory, merge paths in all existing sources. When the same path exists in several sources, the earliest source has priority. Defaults to false.

New in version 3008.0.

Note: When `keep_symlinks` is true, symlinks are treated like files, i.e. override lower priority files, directories and symlinks completely. When a higher priority source overrides the symlink target with the same type (file -> file/dir -> dir), they are kept as expected. Special handling is given to symlinks whose target type changes because of the override (file -> dir/dir -> file), where the (lower priority) symlink is dropped, even if it is not overridden by a higher priority source.

`salt.states.file.`**`rename`**`(`*name, source, force=False, makedirs=False, **kwargs*`)`

If the source file exists on the system, rename it to the named file. The named file will not be overwritten if it already exists unless the force option is set to True.

name
The location of the file to rename to

source
The location of the file to move to the location specified with name

force
If the target location is present then the file will not be moved, specify "force: True" to overwrite the target file

makedirs
If the target subdirectories don't exist create them

`salt.states.file.`**`replace`**`(`*name, pattern, repl, count=0, flags=8, bufsize=1, append_if_not_found=False, prepend_if_not_found=False, not_found_content=None, backup='.bak', show_changes=True, ignore_if_missing=False, backslash_literal=False*`)`

Maintain an edit in a file.

New in version 0.17.0.

name
Filesystem path to the file to be edited. If a symlink is specified, it will be resolved to its target.

pattern
A regular expression, to be matched using Python's `re.search()`.

Note: If you need to match a literal string that contains regex special characters, you may want to use salt's custom Jinja filter, `regex_escape`.

```
{{ 'http://example.com?foo=bar%20baz' | regex_escape }}
```

---

repl
The replacement text

count
Maximum number of pattern occurrences to be replaced. Defaults to 0. If count is a positive integer n, no more than n occurrences will be replaced, otherwise all occurrences will be replaced.

flags
A list of flags defined in the `re` module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., `['IGNORECASE', 'MULTILINE']`. Optionally, `flags` may be an int, with a value corresponding to the XOR (|) of all the desired flags. Defaults to 8 (which equates to `['MULTILINE']`).

Note: `file.replace` reads the entire file as a string to support multiline regex patterns. Therefore, when using anchors such as ^ or $ in the pattern, those anchors may be relative to the line OR relative to the file. The default for `file.replace` is to treat anchors as relative to the line, which is implemented by setting the default value of `flags` to `['MULTILINE']`. When overriding the default value for `flags`, if `'MULTILINE'` is not present then anchors will be relative to the file. If the desired behavior is for anchors to be relative to the line, then simply add `'MULTILINE'` to the list of flags.

---

bufsize
How much of the file to buffer into memory at once. The default value `1` processes one line at a time. The special value `file` may be specified which will read the entire file into memory before processing.

append_if_not_found
If set to `True`, and pattern is not found, then the content will be appended to the file.

New in version 2014.7.0.

prepend_if_not_found
If set to `True` and pattern is not found, then the content will be prepended to the file.

New in version 2014.7.0.

not_found_content
Content to use for append/prepend if not found. If `None` (default), uses `repl`. Useful when `repl` uses references to group in pattern.

New in version 2014.7.0.

backup
The file extension to use for a backup of the file before editing. Set to `False` to skip making a backup.

show_changes
Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made. Returns a boolean or a string.

ignore_if_missing
New in version 2016.3.4.

Controls what to do if the file is missing. If set to `False`, the state will display an error raised by the execution module. If set to `True`, the state will simply report no changes.

backslash_literal
New in version 2016.11.7.

Interpret backslashes as literal backslashes for the repl and not escape characters. This will help when using append/prepend so that the backslashes are not interpreted for the repl on the second run of the state.

For complex regex patterns, it can be useful to avoid the need for complex quoting and escape sequences by making use of YAML's multiline string syntax.

```
complex_search_and_replace:
  file.replace:
    # <...snip...>
    - pattern: |
        CentOS \(2.6.32[^\\n]+\\n\s+root[^\\n]+\\n\)+
```

Note: When using YAML multiline string syntax in `pattern:`, make sure to also use that syntax in the `repl:` part, or you might loose line feeds.

When regex capture groups are used in `pattern:`, their captured value is available for reuse in the `repl:` part as a backreference (ex. `\1`).

```
add_login_group_to_winbind_ssh_access_list:
  file.replace:
    - name: '/etc/security/pam_winbind.conf'
    - pattern: '^(require_membership_of = )(.*)$'
    - repl: '\1\2,append-new-group-to-line'
```

Note: The `file.replace` state uses Python's `re` module. For more advanced options, see https://docs.python.org/2/library/re.html `salt.states.file.`**`retention_schedule`**(*name*, *retain*, *strptime_format=None*, *timezone=None*)

Apply retention scheduling to backup storage directory.

New in version 2016.11.0.

Changed in version 3006.0.

Parameters

- **`name`** -- The filesystem path to the directory containing backups to be managed.
- **`retain`** -- Delete the backups, except for the ones we want to keep. The N below should be an integer but may also be the special value of `all`, which keeps all files matching the criteria. All of the retain options default to None, which means to not keep files based on this criteria.

  most_recent N
  Keep the most recent N files.

  first_of_hour N
  For the last N hours from now, keep the first file after the hour.

  first_of_day N
  For the last N days from now, keep the first file after midnight. See also `timezone`.

  first_of_week N
  For the last N weeks from now, keep the first file after Sunday midnight.

  first_of_month N
  For the last N months from now, keep the first file after the start of the month.

  first_of_year N
  For the last N years from now, keep the first file after the start of the year.
- **`strptime_format`** -- A python strptime format string used to first match the filenames of backups and then parse the filename to determine the datetime of the file. https://docs.python.org/2/library/datetime.html#datetime.datetime.strptime Defaults to None, which considers all files in the directory to be backups eligible for deletion and uses `os.path.getmtime()` to determine the datetime.
- **`timezone`** -- The timezone to use when determining midnight. This is only used when datetime is pulled from `os.path.getmtime()`. Defaults to `None` which uses the timezone from the locale.

Usage example:

```
/var/backups/example_directory:
  file.retention_schedule:
    - retain:
        most_recent: 5
        first_of_hour: 4
        first_of_day: 7
        first_of_week: 6    # NotImplemented yet.
        first_of_month: 6
        first_of_year: all
    - strptime_format: example_name_%Y%m%dT%H%M%S.tar.bz2
    - timezone: None
```

`salt.states.file.`**`serialize`**(*name*, *dataset=None*, *dataset_pillar=None*, *user=None*, *group=None*, *mode=None*, *backup=''*, *makedirs=False*, *show_changes=True*, *create=True*, *merge_if_exists=False*, *encoding=None*, *encoding_errors='strict'*, *serializer=None*, *serializer_opts=None*, *deserializer_opts=None*, *check_cmd=None*, *tmp_dir=None*, *tmp_ext=''*, ***kwargs*)

Serializes dataset and store it into managed file. Useful for sharing simple configuration files.

name
The location of the file to create

dataset
The dataset that will be serialized

dataset_pillar
Operates like `dataset`, but draws from a value stored in pillar, using the pillar path syntax used in *`pillar.get`*. This is useful when the pillar value contains newlines, as referencing a pillar variable using a jinja/mako template can result in YAML formatting issues due to the newlines causing indentation mismatches.

New in version 2015.8.0.

Note: For information on using Salt Slots and how to incorporate execution module returns into file content or data, refer to the Salt Slots documentation.

---

serializer (or formatter)
Write the data as this format. See the list of *serializer modules* for supported output formats.

Changed in version 3002: `serializer` argument added as an alternative to `formatter`. Both are accepted, but using both will result in an error.

encoding
If specified, then the specified encoding will be used. Otherwise, the file will be encoded using the system locale (usually UTF-8). See https://docs.python.org/3/library/codecs.html#standard-encodings for the list of available encodings.

New in version 2017.7.0.

encoding_errors
Error encoding scheme. Default is ```'strict'```. See https://docs.python.org/2/library/codecs.html#codec-base-classes for the list of available schemes.

New in version 2017.7.0.

user
The user to own the directory, this defaults to the user salt is running as on the minion

group
The group ownership set for the directory, this defaults to the group salt is running as on the minion

mode
The permissions to set on this file, e.g. `644`, `0775`, or `4664`.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

Note: This option is **not** supported on Windows.

---

backup
Overrides the default backup mode for this specific file.

makedirs
Create parent directories for destination file.

New in version 2014.1.3.

show_changes
Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made.

create
Default is True, if create is set to False then the file will only be managed if the file already exists on the

system.

merge_if_exists

Default is False, if merge_if_exists is True then the existing file will be parsed and the dataset passed in will be merged with the existing content

New in version 2014.7.0.

serializer_opts

Pass through options to serializer. For example:

```
/etc/dummy/package.yaml:
  file.serialize:
    - serializer: yaml
    - serializer_opts:
      - explicit_start: True
      - default_flow_style: True
      - indent: 4
```

The valid opts are the additional opts (i.e. not the data being serialized) for the function used to serialize the data. Documentation for the these functions can be found in the list below:

- For **yaml**: yaml.dump()
- For **json**: json.dumps()
- For **python**: pprint.pformat()
- For **msgpack**: Run `python -c 'import msgpack; help(msgpack.Packer)'` to see the available options (`encoding`, `unicode_errors`, etc.)

deserializer_opts

Like `serializer_opts` above, but only used when merging with an existing file (i.e. when `merge_if_exists` is set to `True`).

The options specified here will be passed to the deserializer to load the existing data, before merging with the specified data and re-serializing.

```
/etc/dummy/package.yaml:
  file.serialize:
    - serializer: yaml
    - serializer_opts:
      - explicit_start: True
      - default_flow_style: True
      - indent: 4
    - deserializer_opts:
      - encoding: latin-1
    - merge_if_exists: True
```

The valid opts are the additional opts (i.e. not the data being deserialized) for the function used to deserialize the data. Documentation for the these functions can be found in the list below:

- For **yaml**: yaml.load()
- For **json**: json.loads()

However, note that not all arguments are supported. For example, when deserializing JSON, arguments like `parse_float` and `parse_int` which accept a callable object cannot be handled in an SLS file.

New in version 2019.2.0.

check_cmd

The specified command will be run with an appended argument of a *temporary* file containing the new file contents. If the command exits with a zero status the new file contents will be written to the state output destination. If the command exits with a nonzero exit code, the state will fail and no changes will be made to the file.

For example, the following could be used to verify sudoers before making changes:

```
/etc/consul.d/my_config.json:
  file.serialize:
    - dataset:
        datacenter: "east-aws"
        data_dir: "/opt/consul"
        log_level: "INFO"
        node_name: "foobar"
        server: true
        watches:
          - type: checks
            handler: "/usr/bin/health-check-handler.sh"
        telemetry:
          statsite_address: "127.0.0.1:2180"
    - serializer: json
    - check_cmd: consul validate
```

NOTE: This `check_cmd` functions differently than the requisite `check_cmd`.

New in version 3007.0.

tmp_dir
Directory for temp file created by `check_cmd`. Useful for checkers dependent on config file location (e.g. daemons restricted to their own config directories by an apparmor profile).

New in version 3007.0.

tmp_ext
Suffix for temp file created by `check_cmd`. Useful for checkers dependent on config file extension.

New in version 3007.0.

For example, this state:

```
/etc/dummy/package.json:
  file.serialize:
    - dataset:
        name: naive
        description: A package using naive versioning
        author: A confused individual <iam@confused.com>
        dependencies:
          express: '>= 1.2.0'
          optimist: '>= 0.1.0'
        engine: node 0.4.1
    - serializer: json
```

will manage the file `/etc/dummy/package.json`:

```
{
  "author": "A confused individual <iam@confused.com>",
  "dependencies": {
    "express": ">= 1.2.0",
    "optimist": ">= 0.1.0"
  },
  "description": "A package using naive versioning",
  "engine": "node 0.4.1",
```

(continues on next page)

(continued from previous page)

```
  "name": "naive"
}
```

salt.states.file.**shortcut**(*name*, *target*, *arguments=None*, *working_dir=None*, *description=None*, *icon_location=None*, *force=False*, *backupname=None*, *makedirs=False*, *user=None*, ***kwargs*)

Create a Windows shortcut

If the file already exists and is a shortcut pointing to any location other than the specified target, the shortcut will be replaced. If it is a regular file or directory then the state will return False. If the regular file or directory is desired to be replaced with a shortcut pass force: True, if it is to be renamed, pass a backupname.

name
The location of the shortcut to create. Must end with either ".lnk" or ".url"

target
The location that the shortcut points to

arguments
Any arguments to pass in the shortcut

working_dir
Working directory in which to execute target

description
Description to set on shortcut

icon_location
Location of shortcut's icon

force
If the name of the shortcut exists and is not a file and force is set to False, the state will fail. If force is set to True, the link or directory in the way of the shortcut file will be deleted to make room for the shortcut, unless backupname is set, when it will be renamed

backupname
If the name of the shortcut exists and is not a file, it will be renamed to the backupname. If the backupname already exists and force is False, the state will fail. Otherwise, the backupname will be removed first.

makedirs
If the location of the shortcut does not already have a parent directory then the state will fail, setting makedirs to True will allow Salt to create the parent directory. Setting this to True will also create the parent for backupname if necessary.

user
The user to own the file, this defaults to the user salt is running as on the minion

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

salt.states.file.**symlink**(*name*, *target*, *force=False*, *backupname=None*, *makedirs=False*, *user=None*, *group=None*, *mode=None*, *win_owner=None*, *win_perms=None*, *win_deny_perms=None*, *win_inheritance=None*, *atomic=False*, *disallow_copy_and_unlink=False*, *inherit_user_and_group=False*, *follow_symlinks=True*, ***kwargs*)

Create a symbolic link (symlink, soft link)

If the file already exists and is a symlink pointing to any location other than the specified target, the symlink will be replaced. If an entry with the same name exists then the state will return False. If the existing entry is desired to be replaced with a symlink pass force: True, if it is to be renamed, pass a backupname.

name
The location of the symlink to create

target
The location that the symlink points to

force
If the name of the symlink exists and is not a symlink and force is set to False, the state will fail. If force is set to True, the existing entry in the way of the symlink file will be deleted to make room for the symlink, unless backupname is set, when it will be renamed

Changed in version 3000: Force will now remove all types of existing file system entries, not just files, directories and symlinks.

backupname
If the name of the symlink exists and is not a symlink, it will be renamed to the backupname. If the backupname already exists and force is False, the state will fail. Otherwise, the backupname will be removed first. An absolute path OR a basename file/directory name must be provided. The latter will be placed relative to the symlink destination's parent directory.

makedirs
If the location of the symlink does not already have a parent directory then the state will fail, setting makedirs to True will allow Salt to create the parent directory

user
The user to own the file, this defaults to the user salt is running as on the minion unless the link already exists and `inherit_user_and_group` is set

group
The group ownership set for the file, this defaults to the group salt is running as on the minion unless the link already exists and `inherit_user_and_group` is set. On Windows, this is ignored

mode
The permissions to set on this file, aka 644, 0775, 4664. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

win_owner
The owner of the symlink and directories if `makedirs` is True. If this is not passed, `user` will be used. If `user` is not passed, the account under which Salt is running will be used.

New in version 2017.7.7.

win_perms
A dictionary containing permissions to grant

New in version 2017.7.7.

win_deny_perms
A dictionary containing permissions to deny

New in version 2017.7.7.

win_inheritance
True to inherit permissions from parent, otherwise False

New in version 2017.7.7.

atomic
Use atomic file operation to create the symlink.

New in version 3006.0.

disallow_copy_and_unlink
Only used if `backupname` is used and the name of the symlink exists and is not a symlink. If set to `True`, the operation is offloaded to the `file.rename` execution module function. This will use `os.rename` underneath, which will fail in the event that `src` and `dst` are on different filesystems. If `False` (the default), `shutil.move` will be used in order to fall back on a "copy then unlink" approach, which is required for moving across filesystems.

New in version 3006.0.

inherit_user_and_group
If set to `True`, the link already exists, and either `user` or `group` are not set, this parameter will inform Salt to pull the user and group information from the existing link and use it where `user` or `group` is not set. The `user` and `group` parameters will override this behavior.

New in version 3006.0.

follow_symlinks (bool):
If set to `False`, the underlying `file.symlink` execution module and any checks in this state will use `os.path.lexists()` for existence checks instead of `os.path.exists()`.

New in version 3007.0.

```
symlink_/tmp/saltylink:
  file.symlink:
    - name: /tmp/saltylink
    - target: /tmp/saltyfile
```

`salt.states.file.`**`tidied`**(*name*, *age=0*, *matches=None*, *rmdirs=False*, *size=0*, *exclude=None*, *full_path_match=False*, *followlinks=False*, *time_comparison='atime'*, *age_size_logical_operator='OR'*, *age_size_only=None*, *rmlinks=True*, ***kwargs*)

Changed in version 3005,3006.0.

Remove unwanted files based on specific criteria.

The default operation uses an OR operation to evaluate age and size, so a file that is too large but is not old enough will still get tidied. If neither age nor size is given all files which match a pattern in matches will be removed.

NOTE: The regex patterns in this function are used in `re.match()`, so there is an implicit "beginning of string" anchor (`^`) in the regex and it is unanchored at the other end unless explicitly entered (`$`).

name
The directory tree that should be tidied

age
Maximum age in days after which files are considered for removal

matches
List of regular expressions to restrict what gets removed. Default: ['.*']

rmdirs
Whether or not it's allowed to remove directories

size
Maximum allowed file size. Files greater or equal to this size are removed. Doesn't apply to directories or symbolic links

exclude
List of regular expressions to filter the `matches` parameter and better control what gets removed.

New in version 3005.

full_path_match
Match the `matches` and `exclude` regex patterns against the entire file path instead of just the file or directory name. Default: `False`

New in version 3005.

followlinks
This module will not descend into subdirectories which are pointed to by symbolic links. If you wish to force it to do so, you may give this option the value `True`. Default: `False`

New in version 3005.

time_comparison
Default: `atime`. Options: `atime`/`mtime`/`ctime`. This value is used to set the type of time comparison made using `age`. The default is to compare access times (atime) or the last time the file was read. A

comparison by modification time (mtime) uses the last time the contents of the file was changed. The ctime parameter is the last time the contents, owner, or permissions of the file were changed.

New in version 3005.

age_size_logical_operator

This parameter can change the default operation (OR) to an AND operation to evaluate age and size. In that scenario, a file that is too large but is not old enough will NOT get tidied. A file will need to fulfill BOTH conditions in order to be tidied. Accepts `OR` or `AND`.

New in version 3006.0.

age_size_only

This parameter can trigger the reduction of age and size conditions which need to be satisfied down to ONLY age or ONLY size. By default, this parameter is `None` and both conditions will be evaluated using the logical operator defined in `age_size_logical_operator`. The parameter can be set to `age` or `size` in order to restrict evaluation down to that specific condition. Path matching and exclusions still apply.

New in version 3006.0.

rmlinks

Whether or not it's allowed to remove symbolic links

New in version 3006.0.

```
cleanup:
  file.tidied:
    - name: /tmp/salt_test
    - rmdirs: True
    - matches:
      - foo
      - b.*r
```

`salt.states.file.`**`touch`**`(`*name, atime=None, mtime=None, makedirs=False*`)`

Replicate the 'nix "touch" command to create a new empty file or update the atime and mtime of an existing file.

Note that if you just want to create a file and don't care about atime or mtime, you should use `file.managed` instead, as it is more feature-complete. (Just leave out the `source`/`template`/`contents` arguments, and it will just create the file and/or check its permissions, without messing with contents)

name

name of the file

atime

atime of the file

mtime

mtime of the file

makedirs

whether we should create the parent directory/directories in order to touch the file

Usage:

```
/var/log/httpd/logrotate.empty:
  file.touch
```

New in version 0.9.5.

`salt.states.file.`**`uncomment`**`(`*name, regex, char='#', backup='.bak'*`)`

Uncomment specified commented lines in a file

name

The full path to the file to be edited

regex
A regular expression used to find the lines that are to be uncommented. This regex should not include the comment character. A leading `^` character will be stripped for convenience (for easily switching between comment() and uncomment()). The regex will be searched for from the beginning of the line, ignoring leading spaces (we prepend '^[t]*')

char
The character to remove in order to uncomment a line

backup
The file will be backed up before edit with this file extension;

> **Warning:** This backup will be overwritten each time `sed` / `comment` / `uncomment` is called. Meaning the backup will only be useful after the first invocation.

Set to False/None to not keep a backup.

Usage:

```
/etc/adduser.conf:
  file.uncomment:
    - regex: EXTRA_GROUPS
```

New in version 0.9.5.

26.19.18 salt.states.firewall

State to check firewall configurations

New in version 2016.3.0.

`salt.states.firewall.`**`check`**(*name*, *port=None*, ***kwargs*)

Checks if there is an open connection from the minion to the defined host on a specific port.

name
host name or ip address to test connection to

port
The port to test the connection on

kwargs
Additional parameters, parameters allowed are:
proto (tcp or udp) family (ipv4 or ipv6) timeout

```
testgoogle:
  firewall.check:
    - name: 'google.com'
    - port: 80
    - proto: 'tcp'
```

26.19.19 salt.states.firewalld

Management of firewalld

New in version 2015.8.0.

The following example applies changes to the public zone, blocks echo-reply and echo-request packets, does not set the zone to be the default, enables masquerading, and allows ports 22/tcp and 25/tcp. It will be applied permanently and directly before restart/reload.

```
public:
  firewalld.present:
    - name: public
    - block_icmp:
      - echo-reply
      - echo-request
    - default: False
    - masquerade: True
    - ports:
      - 22/tcp
      - 25/tcp
```

The following example applies changes to the public zone, enables masquerading and configures port forwarding TCP traffic from port 22 to 2222, and forwards TCP traffic from port 80 to 443 at 192.168.0.1.

```
my_zone:
  firewalld.present:
    - name: public
    - masquerade: True
    - port_fwd:
      - 22:2222:tcp
      - 80:443:tcp:192.168.0.1
```

The following example binds the public zone to interface eth0 and to all packets coming from the 192.168.1.0/24 subnet. It also removes the zone from all other interfaces or sources.

```
public:
  firewalld.present:
    - name: public
    - interfaces:
      - eth0
    - sources:
      - 192.168.1.0/24
```

Here, we define a new service that encompasses TCP ports 4505 4506:

```
saltmaster:
  firewalld.service:
    - name: saltmaster
    - ports:
      - 4505/tcp
      - 4506/tcp
```

To make this new service available in a zone, the following can be used, which would allow access to the salt master from the 10.0.0.0/8 subnet:

```
saltzone:
  firewalld.present:
    - name: saltzone
    - services:
      - saltmaster
    - sources:
      - 10.0.0.0/8
```

Another way of implementing the same rule above using rich rules is demonstrated here:

```
saltzone:
  firewalld.present:
    - name: saltzone
    - rich_rules:
      - rule service name="saltmaster" accept
    - sources:
      - 10.0.0.0/8
```

The format of rich rules is the same as:

```
firewall-cmd --list-rich-rules
```

with an example output of:

```
rule protocol value="icmp" accept
rule protocol value="ipv6-icmp" accept
rule service name="snmp" accept
```

class `salt.states.firewalld.`**ForwardingMapping**(*srcport, destport, protocol, destaddr*)

Represents a port forwarding statement mapping a local port to a remote port for a specific protocol (TCP or UDP)

todict()

Returns a pretty dictionary meant for command line output.

`salt.states.firewalld.`**present**(*name, block_icmp=None, prune_block_icmp=False, default=None, masquerade=None, ports=None, prune_ports=False, port_fwd=None, prune_port_fwd=False, services=None, prune_services=False, interfaces=None, prune_interfaces=False, sources=None, prune_sources=False, rich_rules=None, prune_rich_rules=False*)

Ensure a zone has specific attributes.

name
The zone to modify.

default
[None] Set this zone as the default zone if `True`.

masquerade
[None] Enable or disable masquerade for a zone. By default it will not change it.

block_icmp
[None] List of ICMP types to block in the zone.

prune_block_icmp
[False] If `True`, remove all but the specified block_icmp from the zone.

ports
[None] List of ports to add to the zone.

prune_ports
[False] If `True`, remove all but the specified ports from the zone.

port_fwd
[None] List of port forwards to add to the zone.

prune_port_fwd
[False] If `True`, remove all but the specified port_fwd from the zone.

services
[None] List of services to add to the zone.

prune_services
[False] If `True`, remove all but the specified services from the zone. .. note:: Currently defaults to True for compatibility, but will be changed to False in a future release.

interfaces
[None] List of interfaces to add to the zone.

prune_interfaces
[False] If `True`, remove all but the specified interfaces from the zone.

sources
[None] List of sources to add to the zone.

prune_sources
[False] If `True`, remove all but the specified sources from the zone.

rich_rules
[None] List of rich rules to add to the zone.

prune_rich_rules
[False] If `True`, remove all but the specified rich rules from the zone.

`salt.states.firewalld.`**`service`**`(`*name*, *ports=None*, *protocols=None*`)`

Ensure the service exists and encompasses the specified ports and protocols.

New in version 2016.11.0.

26.19.20 salt.states.git

States to manage git repositories and git configuration

Important: Before using git over ssh, make sure your remote host fingerprint exists in your `~/.ssh/known_hosts` file.

Changed in version 2015.8.8: This state module now requires git 1.6.5 (released 10 October 2009) or newer.

`salt.states.git.`**`cloned`**`(`*name*, *target*, *branch=None*, *user=None*, *password=None*, *identity=None*, *https_user=None*, *https_pass=None*, *output_encoding=None*`)`

New in version 2018.3.3,2019.2.0.

Ensure that a repository has been cloned to the specified target directory. If not, clone that repository. No fetches will be performed once cloned.

name
Address of the remote repository

target
Name of the target directory where repository should be cloned

branch
Remote branch to check out. If unspecified, the default branch (i.e. the one to the remote HEAD points) will be checked out.

Note: The local branch name will match the remote branch name. If the branch name is changed, then that branch will be checked out locally, but keep in mind that remote repository will not be fetched.

If your use case requires that you keep the clone up to date with the remote repository, then consider using `git.latest`.

---

user
User under which to run git commands. By default, commands are run by the user under which the minion is running.

password
Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

identity
Path to a private key to use for ssh URLs. Works the same way as in `git.latest`, see that state's documentation for more information.

https_user
HTTP Basic Auth username for HTTPS (only) clones

https_pass
HTTP Basic Auth password for HTTPS (only) clones

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

`salt.states.git.`**`config_set`**`(`*name*, *value=None*, *multivar=None*, *repo=None*, *user=None*, *password=None*, *output_encoding=None*, ***kwargs*`)`

New in version 2014.7.0.

Changed in version 2015.8.0: Renamed from `git.config` to `git.config_set`. For earlier versions, use `git.config`.

Ensure that a config value is set to the desired value(s)

name
Name of the git config value to set

value
Set a single value for the config item

multivar
Set multiple values for the config item

Note: The order matters here, if the same parameters are set but in a different order, they will be removed and replaced in the order specified.

New in version 2015.8.0.

repo
Location of the git repository for which the config value should be set. Required unless `global` is set to `True`.

user
User under which to run git commands. By default, the commands are run by the user under which the minion is running.

password
Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

global
[False] If `True`, this will set a global git config option

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

> **Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

Local Config Example:

```
# Single value
mylocalrepo:
  git.config_set:
    - name: user.email
    - value: foo@bar.net
    - repo: /path/to/repo

# Multiple values
mylocalrepo:
  git.config_set:
    - name: mysection.myattribute
    - multivar:
      - foo
      - bar
      - baz
    - repo: /path/to/repo
```

Global Config Example (User ``foo``):

```
mylocalrepo:
  git.config_set:
    - name: user.name
    - value: Foo Bar
    - user: foo
    - global: True
```

`salt.states.git.`**`config_unset`**(*name*, *value_regex=None*, *repo=None*, *user=None*, *password=None*, *output_encoding=None*, ***kwargs*)

New in version 2015.8.0.

Ensure that the named config key is not present

name
The name of the configuration key to unset. This value can be a regex, but the regex must match the entire key name. For example, `foo\.` would not match all keys in the `foo` section, it would be necessary to use `foo\..+` to do so.

value_regex
Regex indicating the values to unset for the matching key(s)

> **Note:** This option behaves differently depending on whether or not `all` is set to `True`. If it is, then all values matching the regex will be deleted (this is the only way to delete multiple values from a multivar).

If `all` is set to `False`, then this state will fail if the regex matches more than one value in a multivar.

---

all
[False] If `True`, unset all matches

repo
Location of the git repository for which the config value should be set. Required unless `global` is set to `True`.

user
User under which to run git commands. By default, commands are run by the user under which the minion is running.

password
Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

global
[False] If `True`, this will set a global git config option

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

Examples:

```yaml
# Value matching 'baz'
mylocalrepo:
  git.config_unset:
    - name: foo.bar
    - value_regex: 'baz'
    - repo: /path/to/repo

# Ensure entire multivar is unset
mylocalrepo:
  git.config_unset:
    - name: foo.bar
    - all: True

# Ensure all variables in 'foo' section are unset, including multivars
mylocalrepo:
  git.config_unset:
    - name: 'foo\..+'
    - all: True

# Ensure that global config value is unset
mylocalrepo:
  git.config_unset:
    - name: foo.bar
    - global: True
```

`salt.states.git.`**`detached`**(*name*, *rev*, *target*, *remote='origin'*, *user=None*, *password=None*, *force_clone=False*, *force_checkout=False*, *fetch_remote=True*, *hard_reset=False*, *submodules=False*, *identity=None*, *https_user=None*, *https_pass=None*, *output_encoding=None*, ***kwargs*)

New in version 2016.3.0.

Make sure a repository is cloned to the given target directory and is a detached HEAD checkout of the commit ID resolved from `rev`.

name
Address of the remote repository.

rev
The branch, tag, or commit ID to checkout after clone. If a branch or tag is specified it will be resolved to a commit ID and checked out.

target
Name of the target directory where repository is about to be cloned.

remote
[origin] Git remote to use. If this state needs to clone the repo, it will clone it using this value as the initial remote name. If the repository already exists, and a remote by this name is not present, one will be added.

user
User under which to run git commands. By default, commands are run by the user under which the minion is running.

password
> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

force_clone
[False] If the `target` directory exists and is not a git repository, then this state will fail. Set this argument to `True` to remove the contents of the target directory and clone the repo into it.

force_checkout
[False] When checking out the revision ID, the state will fail if there are unwritten changes. Set this argument to `True` to discard unwritten changes when checking out.

fetch_remote
[True] If `False` a fetch will not be performed and only local refs will be reachable.

hard_reset
[False] If `True` a hard reset will be performed before the checkout and any uncommitted modifications to the working directory will be discarded. Untracked files will remain in place.

Note: Changes resulting from a hard reset will not trigger requisites.

submodules
[False] Update submodules

identity
A path on the minion (or a SaltStack fileserver URL, e.g. `salt://path/to/identity_file`) to a private key to use for SSH authentication.

https_user
HTTP Basic Auth username for HTTPS (only) clones

https_pass
HTTP Basic Auth password for HTTPS (only) clones

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

`salt.states.git.`**`latest`**(*name*, *target*, *rev='HEAD'*, *branch=None*, *user=None*, *password=None*, *update_head=True*, *force_checkout=False*, *force_clone=False*, *force_fetch=False*, *force_reset=False*, *submodules=False*, *bare=False*, *mirror=False*, *remote='origin'*, *fetch_tags=True*, *sync_tags=True*, *depth=None*, *identity=None*, *https_user=None*, *https_pass=None*, *refspec_branch='*'*, *refspec_tag='*'*, *output_encoding=None*, ***kwargs*)

Make sure the repository is cloned to the given directory and is up-to-date.

name

Address of the remote repository, as passed to `git clone`

Note: From the Git documentation, there are two URL formats supported for SSH authentication. The below two examples are equivalent:

```
# ssh:// URL
ssh://user@server/project.git

# SCP-like syntax
user@server:project.git
```

A common mistake is to use an `ssh://` URL, but with a colon after the domain instead of a slash. This is invalid syntax in Git, and will therefore not work in Salt. When in doubt, confirm that a `git clone` works for the URL before using it in Salt.

It has been reported by some users that SCP-like syntax is incompatible with git repos hosted on Atlassian Stash/BitBucket Server. In these cases, it may be necessary to use `ssh://` URLs for SSH authentication.

---

rev

[HEAD] The remote branch, tag, or revision ID to checkout after clone / before update. If specified, then Salt will also ensure that the tracking branch is set to `<remote>/<rev>`, unless `rev` refers to a tag or SHA1, in which case Salt will ensure that the tracking branch is unset.

If `rev` is not specified, it will be assumed to be `HEAD`, and Salt will not manage the tracking branch at all.

Changed in version 2015.8.0: If not specified, `rev` now defaults to the remote repository's HEAD.

target

Name of the target directory where repository is about to be cloned

branch

Name of the local branch into which to checkout the specified rev. If not specified, then Salt will not care what branch is being used locally and will just use whatever branch is currently there.

New in version 2015.8.0.

Note: If this argument is not specified, this means that Salt will not change the local branch if the repository is reset to another branch/tag/SHA1. For example, assume that the following state was run initially:

```
foo_app:
  git.latest:
    - name: https://mydomain.tld/apps/foo.git
    - target: /var/www/foo
    - user: www
```

This would have cloned the HEAD of that repo (since a `rev` wasn't specified), and because `branch` is not specified, the branch in the local clone at `/var/www/foo` would be whatever the default branch is on the remote repository (usually `master`, but not always). Now, assume that it becomes necessary to switch this checkout to the `dev` branch. This would require `rev` to be set, and probably would also require `force_reset` to be enabled:

```
foo_app:
  git.latest:
    - name: https://mydomain.tld/apps/foo.git
    - target: /var/www/foo
    - user: www
    - rev: dev
    - force_reset: True
```

The result of this state would be to perform a hard-reset to `origin/dev`. Since `branch` was not specified though, while `/var/www/foo` would reflect the contents of the remote repo's `dev` branch, the local branch would still remain whatever it was when it was cloned. To make the local branch match the remote one, set `branch` as well, like so:

```
foo_app:
  git.latest:
    - name: https://mydomain.tld/apps/foo.git
    - target: /var/www/foo
    - user: www
    - rev: dev
    - branch: dev
    - force_reset: True
```

This may seem redundant, but Salt tries to support a wide variety of use cases, and doing it this way allows for the use case where the local branch doesn't need to be strictly managed.

user

Local system user under which to run git commands. By default, commands are run by the user under which the minion is running.

Note: This is not to be confused with the username for http(s)/SSH authentication.

New in version 0.17.0.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

update_head

[True] If set to `False`, then the remote repository will be fetched (if necessary) to ensure that the commit to which `rev` points exists in the local checkout, but no changes will be made to the local HEAD.

New in version 2015.8.3.

force_checkout
: [False] When checking out the local branch, the state will fail if there are unwritten changes. Set this argument to `True` to discard unwritten changes when checking out.

force_clone
: [False] If the `target` directory exists and is not a git repository, then this state will fail. Set this argument to `True` to remove the contents of the target directory and clone the repo into it.

force_fetch
: [False] If a fetch needs to be performed, non-fast-forward fetches will cause this state to fail. Set this argument to `True` to force the fetch even if it is a non-fast-forward update.

  New in version 2015.8.0.

force_reset
: [False] If the update is not a fast-forward, this state will fail. Set this argument to `True` to force a hard-reset to the remote revision in these cases.

  Changed in version 2019.2.0: This option can now be set to `remote-changes`, which will instruct Salt not to discard local changes if the repo is up-to-date with the remote repository.

submodules
: [False] Update submodules on clone or branch change

bare
: [False] Set to `True` if the repository is to be a bare clone of the remote repository.

mirror
: Set to `True` if the repository is to be a mirror of the remote repository. This implies that `bare` set to `True`, and thus is incompatible with `rev`.

remote
: [origin] Git remote to use. If this state needs to clone the repo, it will clone it using this value as the initial remote name. If the repository already exists, and a remote by this name is not present, one will be added.

fetch_tags
: [True] If `True`, then when a fetch is performed all tags will be fetched, even those which are not reachable by any branch on the remote.

sync_tags
: [True] If `True`, then Salt will delete tags which exist in the local clone but are not found on the remote repository.

  New in version 2018.3.4.

depth
: Defines depth in history when git a clone is needed in order to ensure latest. E.g. `depth: 1` is useful when deploying from a repository with a long history. Use rev to specify branch or tag. This is not compatible with revision IDs.

  Changed in version 2019.2.0: This option now supports tags as well as branches, on Git 1.8.0 and newer.

identity
: Path to a private key to use for ssh URLs. This can be either a single string, or a list of strings. For example:

```yaml
# Single key
git@github.com:user/repo.git:
  git.latest:
    - user: deployer
    - identity: /home/deployer/.ssh/id_rsa

# Two keys
git@github.com:user/repo.git:
  git.latest:
```

(continues on next page)

(continued from previous page)

```
    - user: deployer
    - identity:
      - /home/deployer/.ssh/id_rsa
      - /home/deployer/.ssh/id_rsa_alternate
```

If multiple keys are specified, they will be tried one-by-one in order for each git command which needs to authenticate.

Warning: Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Changed in version 2016.3.0: Key can now be specified as a SaltStack fileserver URL (e.g. `salt://path/to/identity_file`).

https_user
HTTP Basic Auth username for HTTPS (only) clones

New in version 2015.5.0.

https_pass
HTTP Basic Auth password for HTTPS (only) clones

New in version 2015.5.0.

refspec_branch
[*] A glob expression defining which branches to retrieve when fetching. See git-fetch(1) for more information on how refspecs work.

New in version 2017.7.0.

refspec_tag
[*] A glob expression defining which tags to retrieve when fetching. See git-fetch(1) for more information on how refspecs work.

New in version 2017.7.0.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

Note: Clashing ID declarations can be avoided when including different branches from the same git repository in the same SLS file by using the `name` argument. The example below checks out the `gh-pages` and `gh-pages-prod` branches from the same repository into separate directories. The example also sets up the `ssh_known_hosts` ssh key required to perform the git checkout.

```
gitlab.example.com:
  ssh_known_hosts:
    - present
```

(continues on next page)

(continued from previous page)

```
    - user: root
    - enc: ecdsa
    - fingerprint: 4e:94:b0:54:c1:5b:29:a2:70:0e:e1:a3:51:ee:ee:e3

git-website-staging:
  git.latest:
    - name: git@gitlab.example.com:user/website.git
    - rev: gh-pages
    - target: /usr/share/nginx/staging
    - identity: /root/.ssh/website_id_rsa
    - require:
      - pkg: git
      - ssh_known_hosts: gitlab.example.com

git-website-staging:
  git.latest:
    - name: git@gitlab.example.com:user/website.git
    - rev: gh-pages
    - target: /usr/share/nginx/staging
    - identity: salt://website/id_rsa
    - require:
      - pkg: git
      - ssh_known_hosts: gitlab.example.com

git-website-prod:
  git.latest:
    - name: git@gitlab.example.com:user/website.git
    - rev: gh-pages-prod
    - target: /usr/share/nginx/prod
    - identity: /root/.ssh/website_id_rsa
    - require:
      - pkg: git
      - ssh_known_hosts: gitlab.example.com
```

`salt.states.git.`**`present`**(*name*, *force=False*, *bare=True*, *template=None*, *separate_git_dir=None*, *shared=None*, *user=None*, *password=None*, *output_encoding=None*)

Ensure that a repository exists in the given directory

> **Warning:** If the minion has Git 2.5 or later installed, `name` points to a worktree, and `force` is set to `True`, then the worktree will be deleted. This has been corrected in Salt 2015.8.0.

name

Path to the directory

Changed in version 2015.8.0: This path must now be absolute

force

[False] If `True`, and if `name` points to an existing directory which does not contain a git repository, then the contents of that directory will be recursively removed and a new repository will be initialized in its place.

bare

[True] If `True`, and a repository must be initialized, then the repository will be a bare repository.

Note: This differs from the default behavior of `git.init`, make sure to set this value to `False` if a bare repo is not desired.

---

template
If a new repository is initialized, this argument will specify an alternate template directory.

New in version 2015.8.0.

separate_git_dir
If a new repository is initialized, this argument will specify an alternate `$GIT_DIR`

New in version 2015.8.0.

shared
Set sharing permissions on git repo. See git-init(1) for more details.

New in version 2015.5.0.

user
User under which to run git commands. By default, commands are run by the user under which the minion is running.

New in version 0.17.0.

password
Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

26.19.21 salt.states.gpg

Manage GPG keychains

New in version 2016.3.0.

exception `salt.states.gpg.`**`KeyNotContained`**(*message='', info=None*)

Raised when a data source does not contain a requested key

`salt.states.gpg.`**`absent`**(*name, keys=None, user=None, gnupghome=None, keyring=None, keyring_absent_if_empty=False, **kwargs*)

Ensure a GPG public key is absent from the keychain.

name
The key ID of the GPG public key.

keys
The key ID or key IDs to remove from the GPG keychain.

user
Remove GPG keys from the specified user's keychain.

gnupghome
Override GnuPG home directory.

keyring
Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

keyring_absent_if_empty
Make sure to not leave behind an empty keyring file if `keyring` was specified. Defaults to false.

New in version 3007.0.

`salt.states.gpg.`**`present`**(*name*, *keys=None*, *user=None*, *keyserver=None*, *gnupghome=None*, *trust=None*, *keyring=None*, *source=None*, *skip_keyserver=False*, *text=None*, ***kwargs*)

Ensure a GPG public key is present in the GPG keychain and that it is not expired.

name
The key ID of the GPG public key.

keys
The key ID or key IDs to add to the GPG keychain.

user
Add GPG keys to the specified user's keychain.

keyserver
The keyserver to retrieve the keys from.

gnupghome
Override GnuPG home directory.

trust
Trust level for the key in the keychain, ignored by default. Valid trust levels: expired, unknown, not_trusted, marginally, fully, ultimately

keyring
Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

source
A (list of) path(s)/URI to retrieve the key(s) from. By default, this works as a backup option in case retrieving a key from the keyserver fails.

Note: All listed sources will be iterated over in order until the first one found to contain the requested key. If multiple keys are managed in a single state, the effective sources are allowed to differ between keys.

Important: Internally, this uses *`gpg.read_key`* to list keys in the sources. If a source is not a keyring, on GnuPG <2.1, this can lead to unintentional decryption.

New in version 3008.0.

skip_keyserver
Do not attempt to retrieve the key from the keyserver, only use `source`. Irrelevant when `text` is passed. Defaults to false.

New in version 3008.0.

text
Instead of retrieving the key(s) to import from a keyserver/URI, import them from this (armored) string.

Note: `name` or `keys` must still specify the expected key ID(s), so this cannot be used to indiscriminately import a keyring. Requires python-gnupg v0.5.1.

New in version 3008.0.

26.19.22 salt.states.grains

Manage grains on the minion

This state allows for grains to be set.

Grains set or altered with this module are stored in the 'grains' file on the minions, By default, this file is located at: `/etc/salt/grains`

Note: This does **NOT** override any grains set in the minion config file.

`salt.states.grains.`**`absent`**(*name*, *destructive=False*, *delimiter=':'*, *force=False*)

New in version 2014.7.0.

Delete a grain from the grains config file

name
The grain name

destructive
If destructive is True, delete the entire grain. If destructive is False, set the grain's value to None. Defaults to False.

force
If force is True, the existing grain will be overwritten regardless of its existing or provided value type. Defaults to False

New in version 2015.8.2.

delimiter
A delimiter different from the default can be provided.

New in version 2015.8.2.

Changed in version 2015.8.2.

This state now support nested grains and complex values. It is also more conservative: if a grain has a value that is a list or a dict, it will not be removed unless the *force* parameter is True.

```
grain_name:
  grains.absent
```

`salt.states.grains.`**`append`**(*name*, *value*, *convert=False*, *delimiter=':'*)

New in version 2014.7.0.

Append a value to a list in the grains config file. The grain that is being appended to (name) must exist before the new value can be added.

name
The grain name

value
The value to append

convert
If convert is True, convert non-list contents into a list. If convert is False and the grain contains non-list contents, an error is given. Defaults to False.

delimiter
A delimiter different from the default can be provided.

New in version 2015.8.2.

```
grain_name:
  grains.append:
    - value: to_be_appended
```

`salt.states.grains.`**`exists`**`(`*name*, *delimiter=':'*`)`

Ensure that a grain is set

name

The grain name

delimiter

A delimiter different from the default can be provided.

Check whether a grain exists. Does not attempt to check or set the value.

`salt.states.grains.`**`list_absent`**`(`*name*, *value*, *delimiter=':'*`)`

Delete a value from a grain formed as a list.

New in version 2014.1.0.

name

The grain name.

value

The value to delete from the grain list.

delimiter

A delimiter different from the default **:** can be provided.

New in version 2015.8.2.

The grain should be list type

```
roles:
  grains.list_absent:
    - value: db
```

For multiple grains, the syntax looks like:

```
roles:
  grains.list_absent:
    - value:
      - web
      - dev
```

`salt.states.grains.`**`list_present`**`(`*name*, *value*, *delimiter=':'*`)`

New in version 2014.1.0.

Ensure the value is present in the list-type grain. Note: If the grain that is provided in `name` is not present on the system, this new grain will be created with the corresponding provided value.

name

The grain name.

value

The value is present in the list type grain.

delimiter

A delimiter different from the default **:** can be provided.

New in version 2015.8.2.

The grain should be list type

```
roles:
  grains.list_present:
    - value: web
```

For multiple grains, the syntax looks like:

```
roles:
  grains.list_present:
    - value:
      - web
      - dev
```

`salt.states.grains.`**`make_hashable`**`(`*list_grain*, *result=None*`)`

Ensure that a list grain is hashable.

list_grain
The list grain that should be hashable

result
This function is recursive, so it must be possible to use a sublist as parameter to the function. Should not be used by a caller outside of the function.

Make it possible to compare two list grains to each other if the list contains complex objects.

`salt.states.grains.`**`present`**`(`*name*, *value*, *delimiter=':'*, *force=False*`)`

Ensure that a grain is set

Changed in version 2015.8.2.

name
The grain name

value
The value to set on the grain

force
If force is True, the existing grain will be overwritten regardless of its existing or provided value type. Defaults to False

New in version 2015.8.2.

delimiter
A delimiter different from the default can be provided.

New in version 2015.8.2.

It is now capable to set a grain to a complex value (ie. lists and dicts) and supports nested grains as well.

If the grain does not yet exist, a new grain is set to the given value. For a nested grain, the necessary keys are created if they don't exist. If a given key is an existing value, it will be converted, but an existing value different from the given key will fail the state.

If the grain with the given name exists, its value is updated to the new value unless its existing or provided value is complex (list or dict). Use *force: True* to overwrite.

```
cheese:
  grains.present:
    - value: edam

nested_grain_with_complex_value:
  grains.present:
    - name: icinga:Apache SSL
    - value:
      - command: check_https
      - params: -H localhost -p 443 -S

with,a,custom,delimiter:
  grains.present:
```

(continues on next page)

(continued from previous page)

```
    - value: yay
    - delimiter: ','
```

26.19.23 salt.states.group

Management of user groups

The group module is used to create and manage group settings, groups can be either present or absent. User/Group names can be passed to the `adduser`, `deluser`, and `members` parameters. `adduser` and `deluser` can be used together but not with `members`.

In Windows, if no domain is specified in the user or group name (i.e. `DOMAIN\username`) the module will assume a local user or group.

```
cheese:
  group.present:
    - gid: 7648
    - system: True
    - addusers:
      - user1
      - users2
    - delusers:
      - foo

cheese:
  group.present:
    - gid: 7648
    - system: True
    - members:
      - foo
      - bar
      - user1
      - user2
```

`salt.states.group.`**`absent`**(*name*, *local=False*)

Ensure that the named group is absent

Parameters

- **name** (*str*) -- The name of the group to remove
- **local** (*Only on systems with lgroupdel available*) -- Ensure the group account is removed locally ignoring global account management (default is False).

  New in version 3007.0.

Example:

```
# Removes the local group `db_admin`
db_admin:
  group.absent
```

`salt.states.group.`**`present`**(*name*, *gid=None*, *system=False*, *addusers=None*, *delusers=None*, *members=None*, *non_unique=False*, *local=False*)

Changed in version 3006.0.

Ensure that a group is present

Parameters

- **name** (*str*) -- The name of the group to manage
- **gid** (*str*) -- The group id to assign to the named group; if left empty, then the next available group id will be assigned. Ignored on Windows
- **system** (*bool*) -- Whether or not the named group is a system group. This is essentially the '-r' option of 'groupadd'. Ignored on Windows
- **addusers** (*list*) -- List of additional users to be added as a group members. Cannot conflict with names in delusers. Cannot be used in conjunction with members.
- **delusers** (*list*) -- Ensure these user are removed from the group membership. Cannot conflict with names in addusers. Cannot be used in conjunction with members.
- **members** (*list*) -- Replace existing group members with a list of new members. Cannot be used in conjunction with addusers or delusers.
- **non_unique** (*bool*) -- Allow creating groups with duplicate (non-unique) GIDs

  New in version 3006.0.
- **local** (*Only on systems with lgroupadd available*) -- Create the group account locally ignoring global account management (default is False).

  New in version 3007.0.

Example:

```
# Adds DOMAIN\db_admins and Administrators to the local db_admin group
# Removes Users
db_admin:
  group.present:
    - addusers:
      - DOMAIN\db_admins
      - Administrators
    - delusers:
      - Users

# Ensures only DOMAIN\domain_admins and the local Administrator are
# members of the local Administrators group. All other users are
# removed
Administrators:
  group.present:
    - members:
      - DOMAIN\domain_admins
      - Administrator
```

26.19.24 salt.states.highstate_doc

To be used with processors in module *highstate_doc*.

`salt.states.highstate_doc.`**`note`**(*name*, *source=None*, *contents=None*, ***kwargs*)

Add content to a document generated using *highstate_doc.render*.

This state does not preform any tasks on the host. It only is used in highstate_doc lowstate processors to include extra documents.

```
{{sls}} example note:
    highstate_doc.note:
```

(continues on next page)

(continued from previous page)

```
        - name: example note
        - require_in:
          - pkg: somepackage
        - contents: |
          example `highstate_doc.note`
          ------------------
          This state does not do anything to the system! It is only
↪used by a `processor`
          you can use `requisites` and `order` to move your docs around
↪the rendered file.
          .. this message appare above the `pkg: somepackage` state.
        - source: salt://{{tpldir}}/also_include_a_file.md

{{sls}} extra help:
    highstate_doc.note:
        - name: example
        - order: 0
        - source: salt://{{tpldir}}/HELP.md
```

26.19.25 salt.states.host

Management of addresses and names in hosts file

The `/etc/hosts` file can be managed to contain definitions for specific hosts:

```
salt-master:
  host.present:
    - ip: 192.168.0.42
```

Or using the `names` directive, you can put several names for the same IP. (Do not try one name with space-separated values).

```
server1:
  host.present:
    - ip: 192.168.0.42
    - names:
      - server1
      - florida
```

Note: Changing the `names` in `host.present` does not cause an update to remove the old entry.

```
server1:
  host.present:
    - ip:
      - 192.168.0.42
      - 192.168.0.43
      - 192.168.0.44
    - names:
      - server1
```

You can replace all existing names for a particular IP address:

```
127.0.1.1:
  host.only:
    - hostnames:
      - foo.example.com
      - foo
```

Or delete all existing names for an address:

```
203.0.113.25:
    host.only:
      - hostnames: []
```

You can also include comments:

```
server1:
  host.present:
    - ip: 192.168.0.42
    - names:
      - server1
      - florida
    - comment: A very important comment
```

`salt.states.host.`**`absent`**`(`*name*, *ip*`)`

Ensure that the named host is absent

name

The host to remove

ip

The ip addr(s) of the host to remove

`salt.states.host.`**`only`**`(`*name*, *hostnames*`)`

Ensure that only the given hostnames are associated with the given IP address.

New in version 2016.3.0.

name

The IP address to associate with the given hostnames.

hostnames

Either a single hostname or a list of hostnames to associate with the given IP address in the given order. Any other hostname associated with the IP address is removed. If no hostnames are specified, all hostnames associated with the given IP address are removed.

`salt.states.host.`**`present`**`(`*name*, *ip*, *comment=''*, *clean=False*`)`

Ensures that the named host is present with the given ip

name

The host to assign an ip to

ip

The ip addr(s) to apply to the host. Can be a single IP or a list of IP addresses.

comment

A comment to include for the host entry

New in version 3001.

clean

Remove any entries which don't match those configured in the `ip` option. Default is `False`.

New in version 2018.3.4.

26.19.26 salt.states.http

HTTP monitoring states

Perform an HTTP query and statefully return the result

New in version 2015.5.0.

`salt.states.http.`**`query`**`(`*name, match=None, match_type='string', status=None, status_type='string', wait_for=None, **kwargs*`)`

Perform an HTTP query and statefully return the result

Passes through all the parameters described in the *`utils.http.query function`*:

name
The name of the query.

match
Specifies a pattern to look for in the return text. By default, this will perform a string comparison of looking for the value of match in the return text.

match_type
Specifies the type of pattern matching to use on match. Default is `string`, but can also be set to `pcre` to use regular expression matching if a more complex pattern matching is required.

> **Note:** Despite the name of `match_type` for this argument, this setting actually uses Python's `re.search()` function rather than Python's `re.match()` function.

status
The status code for a URL for which to be checked. Can be used instead of or in addition to the `match` setting. This can be passed as an individual status code or a list of status codes.

status_type
Specifies the type of pattern matching to use for status. Default is `string`, but can also be set to `pcre` to use regular expression matching if a more complex pattern matching is required. Additionally, if a list of strings representing statuses is given, the type `list` can be used.

New in version 3000.

> **Note:** Despite the name of `match_type` for this argument, this setting actually uses Python's `re.search()` function rather than Python's `re.match()` function.

If both `match` and `status` options are set, both settings will be checked. However, note that if only one option is `True` and the other is `False`, then `False` will be returned. If this case is reached, the comments in the return data will contain troubleshooting information.

For more information about the `http.query` state, refer to the *HTTP Tutorial*.

```
query_example:
  http.query:
    - name: 'http://example.com/'
    - status: 200

query_example2:
  http.query:
    - name: 'http://example.com/'
    - status:
        - 200
```

(continues on next page)

(continued from previous page)

```
        - 201
    - status_type: list
```

salt.states.http.**wait_for_successful_query**(*name*, *wait_for=300*, ***kwargs*)

Like query but, repeat and wait until match/match_type or status is fulfilled. State returns result from last query state in case of success or if no successful query was made within wait_for timeout.

name
    The name of the query.

wait_for
    Total time to wait for requests that succeed.

request_interval
    Optional interval to delay requests by N seconds to reduce the number of requests sent.

Note: All other arguments are passed to the http.query state.

26.19.27 salt.states.idem

Idem Support

This state provides access to idem states

New in version 3002.

salt.states.idem.**state**(*name*, *sls*, *acct_file=None*, *acct_key=None*, *acct_profile=None*, *cache_dir=None*, *render=None*, *runtime=None*, *source_dir=None*, *test=False*)

Execute an idem sls file through a salt state

sls
    A list of idem sls files or sources

acct_file
    Path to the acct file used in generating idem ctx parameters. Defaults to the value in the ACCT_FILE environment variable.

acct_key
    Key used to decrypt the acct file. Defaults to the value in the ACCT_KEY environment variable.

acct_profile
    Name of the profile to add to idem's ctx.acct parameter Defaults to the value in the ACCT_PROFILE environment variable.

cache_dir
    The location to use for the cache directory

render
    The render pipe to use, this allows for the language to be specified (jinja|yaml)

runtime
    Select which execution runtime to use (serial|parallel)

source_dir
    The directory containing sls files

```
cheese:
    idem.state:
        - runtime: parallel
        - sls:
            - idem_state.sls
            - sls_source
```

depends
re

platform
all

`salt.states.ini_manage.`**`options_absent`**(*name*, *sections=None*, *separator='='*, *encoding=None*)

Remove a key/value pair from an ini file. Key/value pairs present in the ini file and not specified in sections dict will be untouched.

Parameters

- **name** (*str*) -- The path to the ini file
- **sections** (*dict*) -- A dictionary of sections and key/value pairs that will be removed from the ini file. Other key/value pairs in the ini file will be untouched.
- **separator** (*str*) -- The character used to separate keys and values. Standard ini files use the "=" character. The default is =.
- **encoding** (*str*) -- A string value representing encoding of the target ini file. If `None` is passed, it uses the system default which is likely `utf-8`. Default is `None`

  New in version 3006.10.

Returns
A dictionary containing list of changes made

Return type
dict

Example:

```
/home/saltminion/api-paste.ini:
  ini.options_absent:
    - separator: '='
    - sections:
        test:
          - testkey
          - secondoption
        test1:
          - testkey1
```

`salt.states.ini_manage.`**`options_present`**(*name*, *sections=None*, *separator='='*, *strict=False*, *encoding=None*, *no_spaces=False*)

Set or create a key/value pair in an `ini` file. Options present in the ini file and not specified in the sections dict will be untouched, unless the `strict: True` flag is used.

Sections that do not exist will be created.

Parameters

- **name** (*str*) -- The path to the ini file
- **sections** (*dict*) -- A dictionary of sections and key/value pairs that will be used to update the ini file. Other sections and key/value pairs in the ini file will be untouched unless `strict: True` is passed.
- **separator** (*str*) -- The character used to separate keys and values. Standard ini files use the "=" character. The default is =.
- **strict** (*bool*) -- A boolean value that specifies that the `sections` dictionary contains all settings in the ini file. `True` will create an ini file with only the values specified in `sections`. `False` will append or update values in an existing ini file and leave the rest untouched.
- **encoding** (*str*) -- A string value representing encoding of the target ini file. If `None` is passed, it uses the system default which is likely `utf-8`. Default is `None`

  New in version 3006.10.
- **no_spaces** (*bool*) -- A bool value that specifies that the key/value separator will be wrapped with spaces. This parameter was added to have the ability to not wrap the separator with spaces. Default is `False`, which maintains backwards compatibility.

  Warning: This will affect all key/value pairs in the ini file, not just the specific value being set.

  New in version 3006.10.

Returns

A dictionary containing list of changes made

Return type

dict

Example:

```
/home/saltminion/api-paste.ini:
  ini.options_present:
    - separator: '='
    - strict: True
    - sections:
        test:
          testkey: 'testval'
          secondoption: 'secondvalue'
        test1:
          testkey1: 'testval121'
```

`salt.states.ini_manage.`**`sections_absent`**(*name*, *sections=None*, *separator='='*, *encoding=None*)

Remove sections from the ini file. All key/value pairs in the section will also be removed.

Parameters

- **name** (*str*) -- The path to the ini file
- **sections** (*dict*) -- A dictionary of sections and key/value pairs that will be used to update the ini file. Other sections and key/value pairs in the ini file will be untouched unless `strict: True` is passed.
- **separator** (*str*) -- The character used to separate keys and values. Standard ini files use the "=" character. The default is =.

- **encoding** (*str*) -- A string value representing encoding of the target ini file. If `None` is passed, it uses the system default which is likely `utf-8`. Default is `None`

  New in version 3006.6.

Returns
A dictionary containing list of changes made

Return type
dict

Example:

```
/home/saltminion/api-paste.ini:
  ini.sections_absent:
    - separator: '='
    - sections:
        - test
        - test1
```

`salt.states.ini_manage.`**`sections_present`**(*name*, *sections=None*, *separator='='*, *encoding=None*)

Add sections to an ini file. This will only create empty sections. To also create key/value pairs, use options_present state.

Parameters

- **name** (*str*) -- The path to the ini file
- **sections** (*dict*) -- A dictionary of sections and key/value pairs that will be used to update the ini file. Only the sections portion is used, key/value pairs are ignored. To also set key/value pairs, use the options_present state.
- **separator** (*str*) -- The character used to separate keys and values. Standard ini files use the "=" character. The default is =.
- **encoding** (*str*) -- A string value representing encoding of the target ini file. If `None` is passed, it uses the system default which is likely `utf-8`. Default is `None`

  New in version 3006.10.

Returns
A dictionary containing list of changes made

Return type
dict

Example:

```
/home/saltminion/api-paste.ini:
  ini.sections_present:
    - separator: '='
    - sections:
        - section_one
        - section_two
```

26.19.29 salt.states.ipset

Management of ipsets

This is an ipset-specific module designed to manage IPSets for use in IPTables Firewalls.

A user-defined name to call this entry by in another part of a state or formula.

name
A user-defined set name.

set_type
The type for the set.

family
Networking family, either ipv4 or ipv6

26.19.30 salt.states.iptables

Management of iptables

This is an iptables-specific module designed to manage Linux firewalls. It is expected that this state module, and other system-specific firewall states, may at some point be deprecated in favor of a more generic `firewall` state.

```yaml
httpd:
  iptables.append:
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - protocol: tcp
    - sport: 1025:65535
    - save: True

httpd:
  iptables.append:
    - table: filter
```

(continues on next page)

(continued from previous page)

```
    - chain: INPUT
    - jump: ACCEPT
    - match:
        - state
        - comment
    - comment: "Allow HTTP"
    - connstate: NEW
    - dport: 80
    - protocol: tcp
    - sport: 1025:65535
    - save: True

httpd:
  iptables.append:
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match:
        - state
        - comment
    - comment: "Allow HTTP"
    - connstate: NEW
    - source: '127.0.0.1'
    - dport: 80
    - protocol: tcp
    - sport: 1025:65535
    - save: True

.. Invert Rule
httpd:
  iptables.append:
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match:
        - state

    - save: True

httpd:
  iptables.delete:
    - table: filter
    - family: ipv6
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - protocol: tcp
    - sport: 1025:65535
    - save: True

default to accept:
  iptables.set_policy:
```

(continues on next page)

(continued from previous page)

```
    - chain: INPUT
    - policy: ACCEPT
```

Note: Whereas iptables will accept `-p`, `--proto[c[o[l]]]` as synonyms of `--protocol`, if `--proto` appears in an iptables command after the appearance of `-m policy`, it is interpreted as the `--proto` option of the policy extension (see the iptables-extensions(8) man page).

Example rules for IPSec policy:

```
accept_esp_in:
  iptables.append:
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - source: 10.20.0.0/24
    - destination: 10.10.0.0/24
    - in-interface: eth0
    - match: policy
    - dir: in
    - pol: ipsec
    - reqid: 1
    - proto: esp
accept_esp_forward_in:
  iptables.append:
    - use:
      - iptables: accept_esp_in
    - chain: FORWARD

accept_esp_out:
  iptables.append:
    - table: filter
    - chain: OUTPUT
    - jump: ACCEPT
    - source: 10.10.0.0/24
    - destination: 10.20.0.0/24
    - out-interface: eth0
    - match: policy
    - dir: out
    - pol: ipsec
    - reqid: 1
    - proto: esp
accept_esp_forward_out:
  iptables.append:
    - use:
      - iptables: accept_esp_out
    - chain: FORWARD
```

Note: `name` is reserved for the Salt state name. To pass `--name EXAMPLE` to iptables, provide it with `- name_: EXAMPLE`.

Note: Various functions of the `iptables` module use the `--check` option. If the version of `iptables` on the target system does not include this option, an alternate version of this check will be performed using the output of iptables-save. This may have unintended consequences on legacy releases of `iptables`.

`salt.states.iptables.`**`append`**(*name*, *table='filter'*, *family='ipv4'*, ***kwargs*)

New in version 0.17.0.

Add a rule to the end of the specified chain. If the rule is already present anywhere in the chain, its position is not changed.

name

A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

table

The table that owns the chain which should be modified

family

Network family, ipv4 or ipv6.

save

If set to a true value, the new iptables rules for the given family will be saved to a file.

If the value is True, rules are saved to an OS-dependent file that will be loaded during system startup, resulting in the firewall rule remaining active across reboots if possible.

Note that loading the iptables rules during system startup may require non-default packages to be installed. On Debian-derived systems, the iptables-persistent package is required.

If the value is a string, it is taken to be a filename to which the rules will be saved. Arranging for the rules to be loaded during system startup must be done separately.

All other arguments are passed in with the same name as the long option that would normally be used for iptables, with one exception: `--state` is specified as *connstate* instead of *state* (not to be confused with *ctstate*).

Jump options that doesn't take arguments should be passed in with an empty string.

`salt.states.iptables.`**`chain_absent`**(*name*, *table='filter'*, *family='ipv4'*)

New in version 2014.1.0.

Verify the chain is absent.

table

The table to remove the chain from

family

Networking family, either ipv4 or ipv6

`salt.states.iptables.`**`chain_present`**(*name*, *table='filter'*, *family='ipv4'*)

New in version 2014.1.0.

Verify the chain is exist.

name

A user-defined chain name.

table

The table to own the chain.

family

Networking family, either ipv4 or ipv6

`salt.states.iptables.`**`delete`**(*name*, *table='filter'*, *family='ipv4'*, ***kwargs*)

New in version 2014.1.0.

Delete a rule from a chain if present. If the rule is already absent, this is not an error and nothing is changed.

name
: A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

table
: The table that owns the chain that should be modified

family
: Networking family, either ipv4 or ipv6

save
: If set to a true value, the new iptables rules for the given family will be saved to a file. See the `append` state for more details.

All other arguments are passed in with the same name as the long option that would normally be used for iptables, with one exception: `--state` is specified as *connstate* instead of *state* (not to be confused with *ctstate*).

Jump options that doesn't take arguments should be passed in with an empty string.

`salt.states.iptables.`**`flush`**`(`*name*, *table='filter'*, *family='ipv4'*, ***kwargs*`)`

New in version 2014.1.0.

Flush current iptables state

table
: The table that owns the chain that should be modified

family
: Networking family, either ipv4 or ipv6

chain
: The chain to be flushed. All the chains in the table if none is given.

`salt.states.iptables.`**`insert`**`(`*name*, *table='filter'*, *family='ipv4'*, ***kwargs*`)`

New in version 2014.1.0.

Insert a rule into a chain. If the rule is already present anywhere in the chain, its position is not changed.

name
: A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

table
: The table that owns the chain that should be modified

family
: Networking family, either ipv4 or ipv6

position
: The numerical representation of where the rule should be inserted into the chain. Note that `-1` is not a supported position value.

save
: If set to a true value, the new iptables rules for the given family will be saved to a file. See the `append` state for more details.

All other arguments are passed in with the same name as the long option that would normally be used for iptables, with one exception: `--state` is specified as *connstate* instead of *state* (not to be confused with *ctstate*).

Jump options that doesn't take arguments should be passed in with an empty string.

`salt.states.iptables.`**`mod_aggregate`**`(`*low*, *chunks*, *running*`)`

The mod_aggregate function which looks up all rules in the available low chunks and merges them into a single rules ref in the present low data

`salt.states.iptables.`**`set_policy`**`(`*name*, *table='filter'*, *family='ipv4'*, ***kwargs*`)`

New in version 2014.1.0.

Sets the default policy for iptables firewall tables

table
The table that owns the chain that should be modified

family
Networking family, either ipv4 or ipv6

policy
The requested table policy

save
If set to a true value, the new iptables rules for the given family will be saved to a file. See the `append` state for more details.

26.19.31 salt.states.keyboard

Management of keyboard layouts

The keyboard layout can be managed for the system:

```
us:
  keyboard.system
```

Or it can be managed for XOrg:

```
us:
  keyboard.xorg
```

`salt.states.keyboard.`**`system`**`(`*name*`)`

Set the keyboard layout for the system

name
The keyboard layout to use

`salt.states.keyboard.`**`xorg`**`(`*name*`)`

Set the keyboard layout for XOrg

layout
The keyboard layout to use

26.19.32 salt.states.kmod

Loading and unloading of kernel modules

The Kernel modules on a system can be managed cleanly with the kmod state module:

```
add_kvm:
  kmod.present:
    - name: kvm_amd
remove_beep:
  kmod.absent:
    - name: pcspkr
```

Multiple modules can be specified for both kmod.present and kmod.absent.

```
add_sound:
  kmod.present:
    - mods:
```

(continues on next page)

(continued from previous page)

```
      - snd_hda_codec_hdmi
      - snd_hda_codec
      - snd_hwdep
      - snd_hda_core
      - snd_pcm
      - snd_timer
      - snd
```

`salt.states.kmod.`**`absent`**`(`*name*, *persist=False*, *comment=True*, *mods=None*`)`

Verify that the named kernel module is not loaded

name

The name of the kernel module to verify is not loaded

persist

Remove module from `/etc/modules` (or `/etc/modules-load.d/salt_managed.conf` if the `systemd` key is present in Grains.

comment

Comment out module in `/etc/modules` rather than remove it

mods

A list of modules to verify are unloaded. If this argument is used, the `name` argument, although still required, is not used, and becomes a placeholder

New in version 2016.3.0.

`salt.states.kmod.`**`present`**`(`*name*, *persist=False*, *mods=None*`)`

Ensure that the specified kernel module is loaded

name

The name of the kernel module to verify is loaded

persist

Also add module to `/etc/modules` (or `/etc/modules-load.d/salt_managed.conf` if the `systemd` key is present in Grains.

mods

A list of modules to verify are loaded. If this argument is used, the `name` argument, although still required, is not used, and becomes a placeholder

New in version 2016.3.0.

26.19.33 salt.states.linux_acl

Linux File Access Control Lists

The Linux ACL state module requires the *getfacl* and *setfacl* binaries.

Ensure a Linux ACL is present

```yaml
root:
  acl.present:
    - name: /root
    - acl_type: user
    - acl_name: damian
    - perms: rwx
```

Ensure a Linux ACL is present as a default for all new objects

```
root:
  acl.present:
    - name: /root
    - acl_type: "default:user"
    - acl_name: damian
    - perms: rwx
```

Ensure a Linux ACL does not exist

```
root:
  acl.absent:
    - name: /root
    - acl_type: user
    - acl_name: damian
    - perms: rwx
```

Ensure a Linux ACL list is present

```
root:
  acl.list_present:
    - name: /root
    - acl_type: user
    - acl_names:
      - damian
      - homer
    - perms: rwx
```

Ensure a Linux ACL list does not exist

```
root:
  acl.list_absent:
    - name: /root
    - acl_type: user
    - acl_names:
      - damian
      - homer
    - perms: rwx
```

Warning: The effective permissions of Linux file access control lists (ACLs) are governed by the ”effective rights mask” (the *mask* line in the output of the *getfacl* command) combined with the *perms* set by this module: any permission bits (for example, r=read) present in an ACL but not in the mask are ignored. The mask is automatically recomputed when setting an ACL, so normally this isn't important. However, if the file permissions are changed (with *chmod* or *file.managed*, for example), the mask will generally be set based on just the group bits of the file permissions.

As a result, when using *file.managed* or similar to control file permissions as well as this module, you should set your group permissions to be at least as broad as any permissions in your ACL. Otherwise, the two state declarations will each register changes each run, and if the *file* declaration runs later, your ACL will be ineffective.

`salt.states.linux_acl.`**`absent`**`(`*name, acl_type, acl_name='', perms='', recurse=False*`)`

Ensure a Linux ACL does not exist

name

The acl path

acl_type
The type of the acl is used for, it can be 'user' or 'group'

acl_name
The user or group

perms
Remove the permissions eg.: rwx

recurse
Set the permissions recursive in the path

salt.states.linux_acl.**list_absent**(*name*, *acl_type*, *acl_names=None*, *recurse=False*)

Ensure a Linux ACL list does not exist

Takes a list of acl names and remove them from the given path

name
The acl path

acl_type
The type of the acl is used for, it can be 'user' or 'group'

acl_names
The list of users or groups

recurse
Set the permissions recursive in the path

salt.states.linux_acl.**list_present**(*name*, *acl_type*, *acl_names=None*, *perms=''*, *recurse=False*, *force=False*)

Ensure a Linux ACL list is present

Takes a list of acl names and add them to the given path

name
The acl path

acl_type
The type of the acl is used for it can be 'user' or 'group'

acl_names
The list of users or groups

perms
Set the permissions eg.: rwx

recurse
Set the permissions recursive in the path

force
Wipe out old permissions and ensure only the new permissions are set

salt.states.linux_acl.**present**(*name*, *acl_type*, *acl_name=''*, *perms=''*, *recurse=False*, *force=False*)

Ensure a Linux ACL is present

name
The acl path

acl_type
The type of the acl is used for it can be 'user' or 'group'

acl_name
The user or group

perms
Set the permissions eg.: rwx

recurse
Set the permissions recursive in the path

force
Wipe out old permissions and ensure only the new permissions are set

26.19.34 salt.states.locale

Management of languages/locales

Manage the available locales and the system default:

```
us_locale:
  locale.present:
    - name: en_US.UTF-8

default_locale:
  locale.system:
    - name: en_US.UTF-8
    - require:
      - locale: us_locale
```

`salt.states.locale.`**`present`**`(`*name*`)`

Generate a locale if it is not present

New in version 2014.7.0.

name

The name of the locale to be present. Some distributions require the charmap to be specified as part of the locale at this point.

`salt.states.locale.`**`system`**`(`*name*`)`

Set the locale for the system

name

The name of the locale to use

26.19.35 salt.states.logrotate

Module for managing logrotate.

New in version 2017.7.0.

`salt.states.logrotate.`**`set_`**`(`*name*, *key*, *value*, *setting=None*, *conf_file='/etc/logrotate.conf'*`)`

Set a new value for a specific configuration line.

Parameters

- **key** (*str*) -- The command or block to configure.
- **value** (*str*) -- The command value or command of the block specified by the key parameter.
- **setting** (*str*) -- The command value for the command specified by the value parameter.
- **conf_file** (*str*) -- The logrotate configuration file.

Example of usage with only the required arguments:

```
logrotate-rotate:
  logrotate.set:
    - key: rotate
    - value: 2
```

Example of usage specifying all available arguments:

```
logrotate-wtmp-rotate:
  logrotate.set:
    - key: /var/log/wtmp
    - value: rotate
    - setting: 2
    - conf_file: /etc/logrotate.conf
```

26.19.36 salt.states.loop

Loop state

Allows for looping over execution modules.

New in version 2017.7.0.

In both examples below, the execution module function `boto_elb.get_instance_health` returns a list of dicts. The condition checks the `state`-key of the first dict in the returned list and compares its value to the string *InService*.

```
wait_for_service_to_be_healthy:
  loop.until:
    - name: boto_elb.get_instance_health
    - condition: m_ret[0]['state'] == 'InService'
    - period: 5
    - timeout: 20
    - m_args:
      - {{ elb }}
    - m_kwargs:
        keyid: {{ access_key }}
        key: {{ secret_key }}
        instances: "{{ instance }}"
```

> **Warning:** This state allows arbitrary python code to be executed through the condition parameter which is literally evaluated within the state. Please use caution.

Changed in version 3000.

A version that does not use eval is now available. It uses either the python `operator` to compare the result of the function called in `name`, which can be one of the following: lt, le, eq (default), ne, ge, gt. Alternatively, *compare_operator* can be filled with a function from an execution module in `__salt__` or `__utils__` like the example below. The function `data.subdict_match` checks if the `expected` expression matches the data returned by calling the `name` function (with passed `args` and `kwargs`).

```
Wait for service to be healthy:
  loop.until_no_eval:
    - name: boto_elb.get_instance_health
    - expected: '0:state:InService'
    - compare_operator: data.subdict_match
    - period: 5
    - timeout: 20
    - args:
      - {{ elb }}
```

(continues on next page)

(continued from previous page)

```
    - kwargs:
        keyid: {{ access_key }}
        key: {{ secret_key }}
        instances: "{{ instance }}"
```

`salt.states.loop.`**`until`**(*name*, *m_args=None*, *m_kwargs=None*, *condition=None*, *period=1*, *timeout=60*)

Loop over an execution module until a condition is met.

Parameters

- **name** (*str*) -- The name of the execution module
- **m_args** (*list*) -- The execution module's positional arguments
- **m_kwargs** (*dict*) -- The execution module's keyword arguments
- **condition** (*str*) -- The condition which must be met for the loop to break. This should contain `m_ret` which is the return from the execution module.
- **period** (*int or float*) -- The number of seconds to wait between executions
- **timeout** (*int or float*) -- The timeout in seconds

`salt.states.loop.`**`until_no_eval`**(*name*, *expected*, *compare_operator='eq'*, *timeout=60*, *period=1*, *init_wait=0*, *args=None*, *kwargs=None*)

Generic waiter state that waits for a specific salt function to produce an expected result. The state fails if the function does not exist or raises an exception, or does not produce the expected result within the allotted retries.

Parameters

- **name** (*str*) -- Name of the module.function to call
- **expected** -- Expected return value. This can be almost anything.
- **compare_operator** (*str*) -- Operator to use to compare the result of the module.function call with the expected value. This can be anything present in __salt__ or __utils__. Will be called with 2 args: result, expected.
- **timeout** (*int or float*) -- Abort after this amount of seconds (excluding init_wait).
- **period** (*int or float*) -- Time (in seconds) to wait between attempts.
- **init_wait** (*int or float*) -- Time (in seconds) to wait before trying anything.
- **args** (*list*) -- args to pass to the salt module.function.
- **kwargs** (*dict*) -- kwargs to pass to the salt module.function.

New in version 3000.

26.19.37 salt.states.lvm

Management of Linux logical volumes

A state module to manage LVMs

```
/dev/sda:
  lvm.pv_present

my_vg:
  lvm.vg_present:
    - devices: /dev/sda

lvroot:
  lvm.lv_present:
    - vgname: my_vg
```

(continues on next page)

(continued from previous page)

```
    - size: 10G
    - stripes: 5
    - stripesize: 8K
```

`salt.states.lvm.`**`lv_absent`**`(`*name*, *vgname=None*`)`

Remove a given existing Logical Volume from a named existing volume group

name
: The Logical Volume to remove

vgname
: The name of the Volume Group on which the Logical Volume resides

`salt.states.lvm.`**`lv_present`**`(`*name*, *vgname=None*, *size=None*, *extents=None*, *snapshot=None*, *pv=''*, *thinvolume=False*, *thinpool=False*, *force=False*, *resizefs=False*, ***kwargs*`)`

Ensure that a Logical Volume is present, creating it if absent.

name
: The name of the Logical Volume

vgname
: The name of the Volume Group on which the Logical Volume resides

size
: The size of the Logical Volume in megabytes, or use a suffix such as S, M, G, T, P for 512 byte sectors, megabytes, gigabytes or terabytes respectively. The suffix is case insensitive.

extents
: The number of logical extents allocated to the Logical Volume It can be a percentage allowed by lvcreate's syntax, in this case it will set the Logical Volume initial size and won't be resized.

snapshot
: The name of the snapshot

pv
: The Physical Volume to use

kwargs
: Any supported options to lvcreate. See `linux_lvm` for more details.

New in version 2016.11.0.

thinvolume
: Logical Volume is thinly provisioned

thinpool
: Logical Volume is a thin pool

New in version 2018.3.0.

force
: Assume yes to all prompts

New in version 3002.

resizefs
: Use fsadm to resize the logical volume filesystem if needed

`salt.states.lvm.`**`pv_absent`**`(`*name*`)`

Ensure that a Physical Device is not being used by lvm

name
: The device name to initialize.

`salt.states.lvm.`**`pv_present`**`(`*name*, ***kwargs*`)`

Set a Physical Device to be used as an LVM Physical Volume

name
: The device name to initialize.

kwargs
: Any supported options to pvcreate. See `linux_lvm` for more details.

`salt.states.lvm.`**`vg_absent`**`(`*name*`)`

Remove an LVM volume group

name
The volume group to remove

`salt.states.lvm.`**`vg_present`**`(`*name*, *devices=None*, ***kwargs*`)`

Create an LVM Volume Group

name
The Volume Group name to create

devices
A list of devices that will be added to the Volume Group

kwargs
Any supported options to vgcreate. See `linux_lvm` for more details.

26.19.38 salt.states.mac_assistive

Allows you to manage assistive access on macOS minions with 10.9+

Install, enable and disable assistive access on macOS minions

```
/usr/bin/osacript:
  assistive.installed:
    - enabled: True
```

`salt.states.mac_assistive.`**`installed`**`(`*name*, *enabled=True*`)`

Make sure that we have the given bundle ID or path to command installed in the assistive access panel.

name
The bundle ID or path to command

enable
Should assistive access be enabled on this application?

26.19.39 salt.states.mac_keychain

Installing of certificates to the keychain

Install certificats to the macOS keychain

```
/mnt/test.p12:
  keychain.installed:
    - password: test123
```

`salt.states.mac_keychain.`**`default_keychain`**`(`*name*, *domain='user'*, *user=None*`)`

Set the default keychain to use

name
The chain in which to use as the default

domain
The domain to use valid values are user|system|common|dynamic, the default is user

user
The user to run as

`salt.states.mac_keychain.`**`installed`**`(`*name*, *password*, *keychain='/Library/Keychains/System.keychain'*, ***kwargs*`)`

Install a p12 certificate file into the macOS keychain

name
The certificate to install

password
The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

keychain
The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain

allow_any
Allow any application to access the imported certificate without warning

keychain_password
If your keychain is likely to be locked pass the password and it will be unlocked before running the import

`salt.states.mac_keychain.`**`uninstalled`**`(`*name*, *password*, *keychain='/Library/Keychains/System.keychain'*, *keychain_password=None*`)`

Uninstall a p12 certificate file from the macOS keychain

name
The certificate to uninstall, this can be a path for a .p12 or the friendly name

password
The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

cert_name
The friendly name of the certificate, this can be used instead of giving a certificate

keychain
The keychain to remove the certificate from, this defaults to /Library/Keychains/System.keychain

keychain_password
If your keychain is likely to be locked pass the password and it will be unlocked before running the import

26.19.40 salt.states.mac_xattr

Allows you to manage extended attributes on files or directories

Install, enable and disable assistive access on macOS minions

```
/path/to/file:
  xattr.exists:
    - attributes:
        - com.file.attr=test
        - com.apple.quarantine=0x00001111
```

`salt.states.mac_xattr.`**`delete`**`(`*name*, *attributes*`)`

Make sure the given attributes are deleted from the file/directory

name
The path to the file/directory

attributes
The attributes that should be removed from the file/directory, this is accepted as an array.

`salt.states.mac_xattr.`**`exists`**`(`*name*, *attributes*`)`

Make sure the given attributes exist on the file/directory

name
The path to the file/directory

attributes
The attributes that should exist on the file/directory, this is accepted as an array, with key and value split with an equals sign, if you want to specify a hex value then add 0x to the beginning of the value.

26.19.41 salt.states.macdefaults

Writing/reading defaults from a macOS minion

`salt.states.macdefaults.`**`absent`**`(`*name*, *domain*, *user=None*, *name_separator=None*`)`

Make sure the defaults value is absent

name
The key of the given domain to remove. It can be a nested key/index separated by *name_separator*.

name_separator
The separator to use when splitting the name into a list of keys. If None, the name will not be split (Default).

New in version 3008.0.

domain
The name of the domain to remove from

user
The user to write the defaults to

`salt.states.macdefaults.`**`write`**`(`*name*, *domain*, *value*, *vtype=None*, *name_separator=None*, *user=None*`)`

Write a default to the system

name
The key of the given domain to write to. It can be a nested key/index separated by *name_separator*.

name_separator
The separator to use when splitting the name into a list of keys. If None, the name will not be split (Default).

New in version 3008.0.

domain
The name of the domain to write to

value
The value to write to the given key

vtype
The type of value to be written. Valid types are string, data, int[eger], float, bool[ean], date, array, array-add, dict, dict-add

user
The user to write the defaults to

26.19.42 salt.states.macpackage

Installing of mac pkg files

Install any kind of pkg, dmg or app file on macOS:

```
/mnt/test.pkg:
  macpackage.installed:
    - store: True
```

(continues on next page)

(continued from previous page)

```
/mnt/test.dmg:
  macpackage.installed:
    - dmg: True

/mnt/xcode.dmg:
  macpackage.installed:
    - dmg: True
    - app: True
    - target: /Applications/Xcode.app
    - version_check: xcodebuild -version=Xcode 7.1\n.*7B91b
```

`salt.states.macpackage.`**`installed`**`(`*name, target='LocalSystem', dmg=False, store=False, app=False, mpkg=False, force=False, allow_untrusted=False, version_check=None*`)`

Install a Mac OS Package from a pkg or dmg file, if given a dmg file it will first be mounted in a temporary location

name
The pkg or dmg file to install

target
The location in which to install the package. This can be a path or LocalSystem

dmg
Is the given file a dmg file?

store
Should the pkg be installed as if it was from the Mac OS Store?

app
Is the file a .app? If so then we'll just copy that to /Applications/ or the given target

mpkg
Is the file a .mpkg? If so then we'll check all of the .pkg files found are installed

force
Force the package to be installed even if its already been found installed

allow_untrusted
Allow the installation of untrusted packages

version_check
The command and version that we want to check against, the version number can use regex.

```
version_check: python --version_check=2.7.[0-9]
```

26.19.43 salt.states.makeconf

Management of Gentoo make.conf

A state module to manage Gentoo's `make.conf` file

```
makeopts:
  makeconf.present:
    - value: '-j3'
```

`salt.states.makeconf.`**`absent`**`(`*name*`)`

Verify that the variable is not in the `make.conf`.

name
The variable name. This will automatically be converted to upper case since variables in `make.conf` are in upper case

`salt.states.makeconf.`**`present`**`(`*name*, *value=None*, *contains=None*, *excludes=None*`)`

Verify that the variable is in the `make.conf` and has the provided settings. If value is set, contains and excludes will be ignored.

name
The variable name. This will automatically be converted to upper case since variables in `make.conf` are in upper case

value
Enforce that the value of the variable is set to the provided value

contains
Enforce that the value of the variable contains the provided value

excludes
Enforce that the value of the variable does not contain the provided value.

26.19.44 salt.states.mdadm_raid

Managing software RAID with mdadm

depends
mdadm

A state module for creating or destroying software RAID devices.

```
/dev/md0:
  raid.present:
    - level: 5
    - devices:
      - /dev/xvdd
      - /dev/xvde
      - /dev/xvdf
    - chunk: 256
    - run: True
```

`salt.states.mdadm_raid.`**`absent`**`(`*name*`)`

Verify that the raid is absent

name
The name of raid device to be destroyed

```
/dev/md0:
  raid:
    - absent
```

`salt.states.mdadm_raid.`**`present`**`(`*name*, *level*, *devices*, ***kwargs*`)`

Verify that the raid is present

Changed in version 2014.7.0.

name
The name of raid device to be created

level
The RAID level to use when creating the raid.

devices
A list of devices used to build the array.

kwargs
Optional arguments to be passed to mdadm.

Example:

```
/dev/md0:
  raid.present:
    - level: 5
    - devices:
      - /dev/xvdd
      - /dev/xvde
      - /dev/xvdf
    - chunk: 256
    - run: True
```

26.19.45 salt.states.module

Execution of Salt modules from within states

Note: As of the 3005 release, you no longer need to opt-in to the new style of calling `module.run`. The following config can be removed from `/etc/salt/minion`:

```
use_superseded:
  - module.run
```

Both 'new' and 'legacy' styles of calling `module.run` are supported.

With *module.run* these states allow individual execution module calls to be made via states. Here's a contrived example, to show you how it's done:

```
# New Style
test.random_hash:
  module.run:
    - test.random_hash:
      - size: 42
      - hash_type: sha256

# Legacy Style
test.random_hash:
  module.run:
    - size: 42
    - hash_type: sha256
```

In the new style, the state ID (`test.random_hash`, in this case) is irrelevant when using `module.run`. It could have very well been written:

```
Generate a random hash:
  module.run:
    - test.random_hash:
```

(continues on next page)

(continued from previous page)

```
      - size: 42
      - hash_type: sha256
```

For a simple state like that it's not a big deal, but if the module you're using has certain parameters, things can get cluttered, fast. Using the contrived custom module (stuck in `/srv/salt/_modules/foo.py`, or your configured file_roots):

```
def bar(name, names, fun, state, saltenv):
    return "Name: {name} Names: {names} Fun: {fun} State: {state} Saltenv:
↪{saltenv}".format(**locals())
```

Your legacy state has to look like this:

```
# Legacy style
Unfortunate example:
  module.run:
  - name: foo.bar
  - m_name: Some name
  - m_names:
    - Such names
    - very wow
  - m_state: Arkansas
  - m_fun: Such fun
  - m_saltenv: Salty
```

With the new style it's much cleaner:

```
# New style
Better:
  module.run:
  - foo.bar:
    - name: Some name
    - names:
      - Such names
      - very wow
    - state: Arkansas
    - fun: Such fun
    - saltenv: Salty
```

The new style also allows multiple modules in one state. For instance, you can do this:

```
Do many things:
  module.run:
    - test.random_hash:
      - size: 10
      - hash_type: md5
    # Note the `:` at the end
    - test.true:
    - test.arg:
      - this
      - has
      - args
      - and: kwargs
```

(continues on next page)

(continued from previous page)

```
      - isn't: that neat?
    # Note the `:` at the end, too
    - test.version:
    - test.fib:
      - 4
```

Where in the legacy style you would have had to split your states like this:

```
test.random_hash:
  module.run:
    - size: 10
    - hash_type: md5

test.nop:
  module.run

test.arg:
  module.run:
    - args:
      - this
      - has
      - args
    - kwargs:
        and: kwargs
        isn't: that neat?

test.version:
  module.run
```

Another difference is that in the legacy style, unconsumed arguments to the `module` state were simply passed into the module function being executed:

```
show off module.run with args:
  module.run:
    - name: test.random_hash
    - size: 42
    - hash_type: sha256
```

The new style is much more explicit, with the arguments and keyword arguments being nested under the name of the function:

```
show off module.run with args:
  module.run:
    # Note the lack of `name: `, and trailing `:`
    - test.random_hash:
      - size: 42
      - hash_type: sha256
```

If the function takes `*args`, they can be passed in as well:

```
args and kwargs:
  module.run:
    - test.arg:
```

(continues on next page)

(continued from previous page)

```
      - isn't
      - this
      - fun
      - this: that
      - salt: stack
```

Modern Examples

Here are some other examples using the modern `module.run`:

```
fetch_out_of_band:
  module.run:
    - git.fetch:
      - cwd: /path/to/my/repo
      - user: myuser
      - opts: '--all'
```

A more complex example:

```
eventsviewer:
  module.run:
    - task.create_task:
      - name: events-viewer
      - user_name: System
      - action_type: Execute
      - cmd: 'c:\netops\scripts\events_viewer.bat'
      - trigger_type: 'Daily'
      - start_date: '2017-1-20'
      - start_time: '11:59PM'
```

It is sometimes desirable to trigger a function call after a state is executed, for this the *`module.wait`* state can be used:

```
add example to hosts:
  file.append:
    - name: /etc/hosts
    - text: 203.0.113.13     example.com

# New Style
mine.send:
  module.wait:
    # Again, note the trailing `:`
    - hosts.list_hosts:
    - watch:
      - file: add example to hosts
```

Legacy (Default) Examples

If you're using the legacy `module.run`, due to how the state system works, if a module function accepts an argument called, `name`, then `m_name` must be used to specify that argument, to avoid a collision with the `name` argument.

Here is a list of keywords hidden by the state system, which must be prefixed with `m_`:

- fun
- name
- names
- state
- saltenv

For example:

```
disable_nfs:
  module.run:
    - name: service.disable
    - m_name: nfs
```

Note that some modules read all or some of the arguments from a list of keyword arguments. For example:

```
mine.send:
  module.run:
    - func: network.ip_addrs
    - kwargs:
        interface: eth0
```

```
cloud.create:
  module.run:
    - func: cloud.create
    - provider: test-provider
    - m_names:
      - test-vlad
    - kwargs: {
          ssh_username: 'ubuntu',
          image: 'ami-8d6d9daa',
          securitygroup: 'default',
          size: 'c3.large',
          location: 'ap-northeast-1',
          delvol_on_destroy: 'True'
      }
```

Other modules take the keyword arguments using this style:

```
mac_enable_ssh:
  module.run:
    - name: system.set_remote_login
    - enable: True
```

Another example that creates a recurring task that runs a batch file on a Windows system:

```
eventsviewer:
  module.run:
    - name: task.create_task
    - m_name: 'events-viewer'
    - user_name: System
    - kwargs: {
          action_type: 'Execute',
          cmd: 'c:\netops\scripts\events_viewer.bat',
          trigger_type: 'Daily',
          start_date: '2017-1-20',
          start_time: '11:59PM'
    }
```

salt.states.module.**mod_watch**(***kwargs*)

This function is an alias of `run`.

Run a single module function or a range of module functions in a batch. Supersedes `module.run` function, which requires `m_` prefix to function-specific parameters.

param returner

Specify a common returner for the whole batch to send the return data

param kwargs

Pass any arguments needed to execute the function(s)

```
some_id_of_state:
  module.run:
    - network.ip_addrs:
      - interface: eth0
    - cloud.create:
      - names:
        - test-isbm-1
        - test-isbm-2
      - ssh_username: sles
      - image: sles12sp2
      - securitygroup: default
      - size: 'c3.large'
      - location: ap-northeast-1
      - delvol_on_destroy: True
```

return

salt.states.module.**run**(***kwargs*)

Run a single module function or a range of module functions in a batch. Supersedes `module.run` function, which requires `m_` prefix to function-specific parameters.

Parameters

- **returner** -- Specify a common returner for the whole batch to send the return data
- **kwargs** -- Pass any arguments needed to execute the function(s)

```
some_id_of_state:
  module.run:
    - network.ip_addrs:
      - interface: eth0
    - cloud.create:
      - names:
        - test-isbm-1
```

(continues on next page)

(continued from previous page)

```
        - test-isbm-2
      - ssh_username: sles
      - image: sles12sp2
      - securitygroup: default
      - size: 'c3.large'
      - location: ap-northeast-1
      - delvol_on_destroy: True
```

Returns

`salt.states.module.`**`wait`**(*name*, ***kwargs*)

Run a single module function only if the watch statement calls it

`name`
The module function to execute

`**kwargs`
Pass any arguments needed to execute the function

Note: Like the *`cmd.run`* state, this state will return `True` but not actually execute, unless one of the following two things happens:

1. The state has a *watch requisite*, and the state which it is watching changes.
2. Another state has a *watch_in requisite* which references this state, and the state wth the `watch_in` changes.

`salt.states.module.`**`watch`**(*name*, ***kwargs*)

This function is an alias of `wait`.

Run a single module function only if the watch statement calls it

`name`
The module function to execute

`**kwargs`
Pass any arguments needed to execute the function

Note: Like the *`cmd.run`* state, this state will return `True` but not actually execute, unless one of the following two things happens:

1. The state has a *watch requisite*, and the state which it is watching changes.
2. Another state has a *watch_in requisite* which references this state, and the state wth the `watch_in` changes.

26.19.46 salt.states.mount

Mounting of filesystems

Mount any type of mountable filesystem with the mounted function:

```
/mnt/sdb:
  mount.mounted:
    - device: /dev/sdb1
    - fstype: ext4
    - mkmnt: True
    - opts:
      - defaults
```

(continues on next page)

(continued from previous page)

```
/srv/bigdata:
  mount.mounted:
    - device: UUID=066e0200-2867-4ebe-b9e6-f30026ca2314
    - fstype: xfs
    - opts: nobootwait,noatime,nodiratime,nobarrier,logbufs=8
    - dump: 0
    - pass_num: 2
    - persist: True
    - mkmnt: True

/var/lib/bigdata:
  mount.mounted:
    - device: /srv/bigdata
    - fstype: none
    - opts: bind
    - dump: 0
    - pass_num: 0
    - persist: True
    - mkmnt: True
```

`salt.states.mount.`**`fstab_absent`**(*name*, *fs_file*, *mount_by=None*, *config='/etc/fstab'*)

Makes sure that a fstab mount point is absent.

name
The name of block device. Can be any valid fs_spec value.

fs_file
Mount point (target) for the filesystem.

mount_by
Select the final value for fs_spec. Can be [`None`, `device`, `label`, `uuid`, `partlabel`, `partuuid`]. If `None`, the value for fs_spect will be the parameter `name`, in other case will search the correct value based on the device name. For example, for `uuid`, the value for fs_spec will be of type 'UUID=xxx' instead of the device name set in `name`.

config
Place where the fstab file lives

`salt.states.mount.`**`fstab_present`**(*name*, *fs_file*, *fs_vfstype*, *fs_mntops='defaults'*, *fs_freq=0*, *fs_passno=0*, *mount_by=None*, *config='/etc/fstab'*, *mount=True*, *match_on='auto'*, *not_change=False*, *fs_mount=True*)

Makes sure that a fstab mount point is present.

name
The name of block device. Can be any valid fs_spec value.

fs_file
Mount point (target) for the filesystem.

fs_vfstype
The type of the filesystem (e.g. ext4, xfs, btrfs, …)

fs_mntops
The mount options associated with the filesystem. Default is `defaults`.

fs_freq
Field is used by dump to determine which fs need to be dumped. Default is `0`

fs_passno
Field is used by fsck to determine the order in which filesystem checks are done at boot time. Default is `0`

fs_mount

Field is used only in AIX systems to determine if the filesystem will be mounted by `mount all`

mount_by
Select the final value for fs_spec. Can be [`None`, `device`, `label`, `uuid`, `partlabel`, `partuuid`]. If `None`, the value for fs_spect will be the parameter `name`, in other case will search the correct value based on the device name. For example, for `uuid`, the value for fs_spec will be of type 'UUID=xxx' instead of the device name set in `name`.

config
Place where the fstab file lives. Default is `/etc/fstab`

mount
Set if the mount should be mounted immediately. Default is `True`

match_on
A name or list of fstab properties on which this state should be applied. Default is `auto`, a special value indicating to guess based on fstype. In general, `auto` matches on name for recognized special devices and device otherwise.

not_change
By default, if the entry is found in the fstab file but is different from the expected content (like different options), the entry will be replaced with the correct content. If this parameter is set to `True` and the line is found, the original content will be preserved.

`salt.states.mount.`**`mod_watch`**`(`*name*, *user=None*, ***kwargs*`)`

The mounted watcher, called to invoke the watch command.

Note: This state exists to support special handling of the `watch` *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

---

name
The name of the mount point

`salt.states.mount.`**`mounted`**`(`*name*, *device*, *fstype*, *mkmnt=False*, *opts='defaults'*, *dump=0*, *pass_num=0*, *config='/etc/fstab'*, *persist=True*, *mount=True*, *user=None*, *match_on='auto'*, *device_name_regex=None*, *extra_mount_invisible_options=None*, *extra_mount_invisible_keys=None*, *extra_mount_ignore_fs_keys=None*, *extra_mount_translate_options=None*, *hidden_opts=None*, *bind_mount_copy_active_opts=True*, ***kwargs*`)`

Verify that a device is mounted

name
The path to the location where the device is to be mounted

device
The device name, typically the device node, such as `/dev/sdb1` or `UUID=066e0200-2867-4ebe-b9e6-f30026ca2314` or `LABEL=DATA`

fstype
The filesystem type, this will be `xfs`, `ext2/3/4` in the case of classic filesystems, `fuse` in the case of fuse mounts, and `nfs` in the case of nfs mounts

mkmnt
If the mount point is not present then the state will fail, set `mkmnt: True` to create the mount point if it is otherwise not present

opts
A list object of options or a comma delimited list

dump
The dump value to be passed into the fstab, Default is `0`

pass_num
The pass value to be passed into the fstab, Default is `0`

config
Set an alternative location for the fstab, Default is `/etc/fstab`

persist
Set if the mount should be saved in the fstab, Default is `True`

mount
Set if the mount should be mounted immediately, Default is `True`

user
The account used to execute the mount; this defaults to the user salt is running as on the minion

match_on
A name or list of fstab properties on which this state should be applied. Default is `auto`, a special value indicating to guess based on fstype. In general, `auto` matches on name for recognized special devices and device otherwise.

device_name_regex
A list of device exact names or regular expressions which should not force a remount. For example, glusterfs may be mounted with a comma-separated list of servers in fstab, but the /proc/self/mountinfo will show only the first available server.

```
{% set glusterfs_ip_list = ['10.0.0.1', '10.0.0.2', '10.0.0.3'] %}

mount glusterfs volume:
  mount.mounted:
    - name: /mnt/glusterfs_mount_point
    - device: {{ glusterfs_ip_list|join(',') }}:/volume_name
    - fstype: glusterfs
    - opts: _netdev,rw,defaults,direct-io-mode=disable
    - mkmnt: True
    - persist: True
    - dump: 0
    - pass_num: 0
    - device_name_regex:
      - ({{ glusterfs_ip_list|join('|') }}):/volume_name
```

New in version 2016.11.0.

extra_mount_invisible_options
A list of extra options that are not visible through the `/proc/self/mountinfo` interface.

If a option is not visible through this interface it will always remount the device. This option extends the builtin `mount_invisible_options` list.

extra_mount_invisible_keys
A list of extra key options that are not visible through the `/proc/self/mountinfo` interface.

If a key option is not visible through this interface it will always remount the device. This option extends the builtin `mount_invisible_keys` list.

A good example for a key option is the password option:

```
password=badsecret
```

extra_mount_ignore_fs_keys
A dict of filesystem options which should not force a remount. This will update the internal dictionary. The dict should look like this:

```
{
    'ramfs': ['size']
}
```

extra_mount_translate_options

A dict of mount options that gets translated when mounted. To prevent a remount add additional options to the default dictionary. This will update the internal dictionary. The dictionary should look like this:

```
{
    'tcp': 'proto=tcp',
    'udp': 'proto=udp'
}
```

hidden_opts
A list of mount options that will be ignored when considering a remount as part of the state application

New in version 2015.8.2.

bind_mount_copy_active_opts
If set to `False`, this option disables the default behavior of copying the options from the bind mount if it was found to be active.

New in version 3006.0.

`salt.states.mount.`**`swap`**(*name*, *persist=True*, *config='/etc/fstab'*)

Activates a swap device

```
/root/swapfile:
  mount.swap
```

Note: `swap` does not currently support LABEL

`salt.states.mount.`**`unmounted`**(*name*, *device=None*, *config='/etc/fstab'*, *persist=False*, *user=None*, ***kwargs*)

New in version 0.17.0.

Verify that a device is not mounted

name
The path to the location where the device is to be unmounted from

device
The device to be unmounted. This is optional because the device could be mounted in multiple places.

New in version 2015.5.0.

config
Set an alternative location for the fstab, Default is `/etc/fstab`

persist
Set if the mount should be purged from the fstab, Default is `False`

user
The user to own the mount; this defaults to the user salt is running as on the minion

26.19.47 salt.states.netacl

Network ACL

Manage the firewall configuration on the network device managed through NAPALM. The firewall configuration is generated by Capirca.

New in version 2017.7.0.

codeauthor
Mircea Ulinic <ping@mirceaulinic.net>

maturity
new

depends
capirca, napalm

platform
unix

Dependencies

Capirca

To install Capirca, execute: `pip install capirca`.

NAPALM

To be able to load configuration on network devices, it requires NAPALM library to be installed: `pip install napalm`. Please check Installation for complete details.

`salt.states.netacl.`**`filter`**`(`*name*, *filter_name*, *filter_options=None*, *terms=None*, *prepend=True*, *pillar_key='acl'*, *pillarenv=None*, *saltenv=None*, *merge_pillar=False*, *only_lower_merge=False*, *revision_id=None*, *revision_no=None*, *revision_date=True*, *revision_date_format='%Y/%m/%d'*, *test=False*, *commit=True*, *debug=False*`)`

Generate and load the configuration of a policy filter.

filter_name
The name of the policy filter.

filter_options
Additional filter options. These options are platform-specific. See the complete list of options.

terms
Dictionary of terms for this policy filter. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

prepend: **`True`**
When `merge_pillar` is set as `True`, the final list of terms generated by merging the terms from `terms` with those defined in the pillar (if any): new terms are prepended at the beginning, while existing ones will preserve the position. To add the new terms at the end of the list, set this argument to `False`.

pillar_key: **`acl`**
The key in the pillar containing the default attributes values. Default: `acl`.

pillarenv
Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv
Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

merge_pillar: **`False`**
Merge `terms` with the corresponding value from the pillar. Default: `False`.

Note: By default this state does not merge, to avoid any unexpected behaviours.

The merge logic depends on the `prepend` argument.

The terms specified through the `terms` argument have higher priority than the pillar.

only_lower_merge: **`False`**
Specify if it should merge only the terms fields. Otherwise it will try to merge also filters fields. Default: `False`. This option requires `merge_pillar`, otherwise it is ignored.

revision_id
Add a comment in the filter config having the description for the changes applied.

revision_no
The revision count.

revision_date: **`True`**
Boolean flag: display the date when the filter configuration was generated. Default: `True`.

revision_date_format: **`%Y/%m/%d`**
The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

test: **`False`**
Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: **`True`**
Commit? Default: `True`.

debug: **`False`**
Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

CLI Example:

```
salt 'edge01.flw01' state.sls router.acl test=True
```

Output Example:

```
edge01.flw01:
----------

Summary for edge01.flw01
------------
Succeeded: 1 (unchanged=1, changed=1)
Failed:    0
------------
Total states run:     1
Total run time:   2.437 s
```

Pillar example:

```
acl:
  - my-filter:
      options:
        - inet6
      terms:
        - my-term:
            source_port: [1234, 1235]
            protocol:
              - tcp
              - udp
            source_address: 1.2.3.4
            action: reject
        - my-other-term:
            source_port:
              - [5678, 5680]
            protocol: tcp
            action: accept
```

State SLS Example:

```
{%- set filter_name = 'my-filter' -%}
{%- set my_filter_cfg = salt.netacl.get_filter_pillar(filter_name, pillar_
↪key='firewall') -%}
my_first_filter_state:
  netacl.filter:
    - filter_name: {{ filter_name }}
    - options: {{ my_filter_cfg['options'] | json }}
    - terms: {{ my_filter_cfg['terms'] | json }}
    - revision_date: false
    - revision_no: 5
    - debug: true
```

Or:

```
my_first_filter_state:
  netacl.filter:
    - filter_name: my-filter
    - merge_pillar: true
```

(continues on next page)

(continued from previous page)

```
    - pillar_key: firewall
    - revision_date: false
    - revision_no: 5
    - debug: true
```

In the example above, as `inet6` has been specified in the `filter_options`, the configuration chunk referring to `my-term` has been ignored as it referred to IPv4 only (from `source_address` field).

Note: The first method allows the user to eventually apply complex manipulation and / or retrieve the data from external services before passing the data to the state. The second one is more straightforward, for less complex cases when loading the data directly from the pillar is sufficient.

Note: When passing retrieved pillar data into the state file, it is strongly recommended to use the json serializer explicitly (`` | json``), instead of relying on the default Python serializer.

`salt.states.netacl.`**`managed`**(*name, filters=None, prepend=True, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=False, only_lower_merge=False, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d', test=False, commit=True, debug=False*)

Manage the whole firewall configuration.

filters
Dictionary of filters for this policy. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

prepend: `True`
When `merge_pillar` is set as `True`, the final list of filters generated by merging the filters from `filters` with those defined in the pillar (if any): new filters are prepended at the beginning, while existing ones will preserve the position. To add the new filters at the end of the list, set this argument to `False`.

pillar_key: `acl`
The key in the pillar containing the default attributes values. Default: `acl`.

pillarenv
Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv
Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

merge_pillar: `False`
Merge the `filters` will the corresponding values from the pillar. Default: `False`.

Note: By default this state does not merge, to avoid any unexpected behaviours.

The merge logic depends on the `prepend` argument.

The filters specified through the `filters` argument have higher priority than the pillar.

only_lower_merge: `False`
Specify if it should merge only the filters and terms fields. Otherwise it will try to merge everything at the policy level. Default: `False`. This option requires `merge_pillar`, otherwise it is ignored.

test: `False`
Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

revision_id
Add a comment in the policy config having the description for the changes applied.

revision_no
The revision count.

revision_date: `True`
Boolean flag: display the date when the policy configuration was generated. Default: `True`.

revision_date_format: `%Y/%m/%d`
The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

commit: `True`
Commit? Default: `True`.

debug: `False`
Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

CLI Example:

```
salt 'edge01.bjm01' state.sls router.acl test=True
```

Output Example:

```
edge01.bjm01:
-------------
              ID: netacl_example
        Function: netacl.managed

                          }
                      }

    Summary for edge01.bjm01
    ------------
    Succeeded: 1 (unchanged=1, changed=1)
    Failed:    0
    ------------
    Total states run:     1
    Total run time:   5.569 s
```

The policy configuration has been loaded from the pillar, having the following structure:

```yaml
firewall:
  - my-filter:
      terms:
        - my-term:
            source_port: [1234, 1235]
            protocol:
              - tcp
              - udp
            source_address: 1.2.3.4
            action: reject
        - my-other-term:
            source_port:
```

(continues on next page)

(continued from previous page)

```
              - [5678, 5680]
            protocol: tcp
            action: accept
    - block-icmp:
        terms:
          - first-term:
            protocol:
              - icmp
            action: reject
```

Example SLS file:

```
{%- set fw_filters = pillar.get('firewall', {}) -%}
netacl_example:
  netacl.managed:
    - filters: {{ fw_filters | json }}
    - revision_no: 2
    - debug: true
```

Or:

```
netacl_example:
  netacl.managed:
    - pillar_key: firewall
    - merge_pillar: true
    - revision_no: 2
    - debug: true
```

Note: The first method allows the user to eventually apply complex manipulation and / or retrieve the data from external services before passing the data to the state. The second one is more straightforward, for less complex cases when loading the data directly from the pillar is sufficient.

Note: When passing retrieved pillar data into the state file, it is strongly recommended to use the json serializer explicitly (`` | json``), instead of relying on the default Python serializer.

`salt.states.netacl.`**`term`**(*name, filter_name, term_name, filter_options=None, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=False, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d', test=False, commit=True, debug=False, source_service=None, destination_service=None, **term_fields*)

Manage the configuration of a specific policy term.

filter_name
The name of the policy filter.

term_name
The name of the term.

filter_options
Additional filter options. These options are platform-specific. See the complete list of options.

pillar_key: **`acl`**
The key in the pillar containing the default attributes values. Default: `acl`.

pillarenv
Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv
Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

merge_pillar: `False`
Merge the CLI variables with the pillar. Default: `False`.

The properties specified through the state arguments have higher priority than the pillar.

revision_id
Add a comment in the term config having the description for the changes applied.

revision_no
The revision count.

revision_date: `True`
Boolean flag: display the date when the term configuration was generated. Default: `True`.

revision_date_format: `%Y/%m/%d`
The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

test: `False`
Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: `True`
Commit? Default: `True`.

debug: `False`
Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

source_service
A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a source_port and protocol.

As this module is available on Unix platforms only, it reads the IANA port assignment from /etc/services.

If the user requires additional shortcuts to be referenced, they can add entries under /etc/services, which can be managed using the *`file state`*.

destination_service
A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a destination_port and protocol. Allows the same options as `source_service`.

term_fields
Term attributes. To see what fields are supported, please consult the list of supported keywords. Some platforms have few other optional keywords.

Note: The following fields are accepted:

- action
- address
- address_exclude
- comment
- counter
- expiration
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging

- log_name
- loss_priority
- option
- policer
- port
- precedence
- principals
- protocol
- protocol_except
- qos
- pan_application
- routing_instance
- source_address
- source_address_exclude
- source_port
- source_prefix
- verbatim
- packet_length
- fragment_offset
- hop_limit
- icmp_type
- ether_type
- traffic_class_count
- traffic_type
- translated
- dscp_set
- dscp_match
- dscp_except
- next_ip
- flexible_match_range
- source_prefix_except
- destination_prefix_except
- vpn
- source_tag
- destination_tag
- source_interface
- destination_interface
- flattened
- flattened_addr
- flattened_saddr
- flattened_daddr
- priority

Note: The following fields can be also a single value and a list of values:

- action
- address
- address_exclude
- comment
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix

- forwarding_class
- forwarding_class_except
- logging
- option
- port
- precedence
- principals
- protocol
- protocol_except
- pan_application
- source_address
- source_address_exclude
- source_port
- source_prefix
- verbatim
- icmp_type
- ether_type
- traffic_type
- dscp_match
- dscp_except
- flexible_match_range
- source_prefix_except
- destination_prefix_except
- source_tag
- destination_tag
- source_service
- destination_service

Example: `destination_address` can be either defined as:

```
destination_address: 172.17.17.1/24
```

or as a list of destination IP addresses:

```
destination_address:
    - 172.17.17.1/24
    - 172.17.19.1/24
```

or a list of services to be matched:

```
source_service:
    - ntp
    - snmp
    - ldap
    - bgpd
```

Note: The port fields `source_port` and `destination_port` can be used as above to select either a single value, either a list of values, but also they can select port ranges. Example:

```
source_port:
    - [1000, 2000]
    - [3000, 4000]
```

With the configuration above, the user is able to select the 1000-2000 and 3000-4000 source port ranges.

CLI Example:

```
salt 'edge01.bjm01' state.sls router.acl
```

Output Example:

```
edge01.bjm01:

                  +            term first-term {
                  +                from {
                  +                    protocol icmp;
                  +                }
                  +                then {
                  +                    reject;
                  +                }
                  +            }
                  +        }
                  +    }

Summary for edge01.bjm01
------------
Succeeded: 1 (unchanged=1, changed=1)
Failed:    0
------------
Total states run:     1
Total run time:   5.752 s
```

Pillar example:

```
firewall:
  - block-icmp:
      terms:
        - first-term:
            protocol:
```

(continues on next page)

(continued from previous page)

```
            - icmp
          action: reject
```

State SLS example:

```
{%- set filter_name = 'block-icmp' -%}
{%- set term_name = 'first-term' -%}
{%- set my_term_cfg = salt.netacl.get_term_pillar(filter_name, term_name)
↪-%}

update_icmp_first_term:
  netacl.term:
    - filter_name: {{ filter_name }}
    - filter_options:
        - not-interface-specific
    - term_name: {{ term_name }}
    - {{ my_term_cfg | json }}
```

Or directly referencing the pillar keys:

```
update_icmp_first_term:
  netacl.term:
    - filter_name: block-icmp
    - filter_options:
        - not-interface-specific
    - term_name: first-term
    - merge_pillar: true
```

Note: The first method allows the user to eventually apply complex manipulation and / or retrieve the data from external services before passing the data to the state. The second one is more straightforward, for less complex cases when loading the data directly from the pillar is sufficient.

Note: When passing retrieved pillar data into the state file, it is strongly recommended to use the json serializer explicitly (`` | json``), instead of relying on the default Python serializer.

26.19.48 salt.states.netconfig

Network Config

Manage the configuration on a network device given a specific static config or template.

codeauthor
Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

maturity
new

depends
napalm

platform
unix

Dependencies

- `NAPALM proxy minion`
- *`Network-related basic features execution module`*

New in version 2017.7.0.

`salt.states.netconfig.`**`commit_cancelled`**`(`*name*`)`

New in version 2019.2.0.

Cancel a commit scheduled to be executed via the `commit_in` and `commit_at` arguments from the *`net.load_template`* or *`net.load_config`* execution functions. The commit ID is displayed when the commit is scheduled via the functions named above.

State SLS Example:

```
'20180726083540640360':
  netconfig.commit_cancelled
```

`salt.states.netconfig.`**`commit_confirmed`**`(`*name*`)`

New in version 2019.2.0.

Confirm a commit scheduled to be reverted via the `revert_in` and `revert_at` arguments from the *`net.load_template`* or *`net.load_config`* execution functions. The commit ID is displayed when the commit confirmed is scheduled via the functions named above.

State SLS Example:

```
'20180726083540640360':
  netconfig.commit_confirmed
```

`salt.states.netconfig.`**`managed`**`(`*name, template_name=None, template_source=None, template_hash=None, template_hash_name=None, saltenv='base', template_engine='jinja', skip_verify=False, context=None, defaults=None, test=False, commit=True, debug=False, replace=False, commit_in=None, commit_at=None, revert_in=None, revert_at=None, **template_vars*`)`

Manages the configuration on network devices.

By default this state will commit the changes on the device. If there are no changes required, it does not commit and the field `already_configured` from the output dictionary will be set as `True` to notify that.

To avoid committing the configuration, set the argument `test` to `True` (or via the CLI argument `test=True`) and will discard (dry run).

To preserve the changes, set `commit` to `False` (either as CLI argument, either as state parameter). However, this is recommended to be used only in exceptional cases when there are applied few consecutive states and/or configuration changes. Otherwise the user might forget that the config DB is locked and the candidate config buffer is not cleared/merged in the running config.

To replace the config, set `replace` to `True`. This option is recommended to be used with caution!

template_name
Identifies path to the template source. The template can be either stored on the local machine, either remotely. The recommended location is under the `file_roots` as specified in the master config file. For example, let's suppose the `file_roots` is configured as:

```
file_roots:
  base:
     - /etc/salt/states
```

Placing the template under `/etc/salt/states/templates/example.jinja`, it can be used as `salt://templates/example.jinja`. Alternatively, for local files, the user can specify the absolute path. If remotely, the source can be retrieved via `http`, `https` or `ftp`.

Examples:

- `salt://my_template.jinja`
- `/absolute/path/to/my_template.jinja`
- `http://example.com/template.cheetah`
- `https:/example.com/template.mako`
- `ftp://example.com/template.py`

Changed in version 2019.2.0: This argument can now support a list of templates to be rendered. The resulting configuration text is loaded at once, as a single configuration chunk.

template_source: None
Inline config template to be rendered and loaded on the device.

template_hash: None
Hash of the template file. Format: `{hash_type: 'md5', 'hsum': <md5sum>}`

template_hash_name: None
When `template_hash` refers to a remote file, this specifies the filename to look for in that file.

saltenv: base
Specifies the template environment. This will influence the relative imports inside the templates.

template_engine: jinja
The following templates engines are supported:

- `cheetah`
- `genshi`
- *`jinja`*
- *`mako`*
- *`py`*
- `wempy`

skip_verify: False
If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

Changed in version 2017.7.1.

test: False
Dry run? If set to `True`, will apply the config, discard and return the changes. Default: `False` (will commit the changes on the device).

commit: True
Commit? Default: `True`.

debug: False
Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw result after the template was rendered.

Note: This argument cannot be used directly on the command line. Instead, it can be passed through the `pillar` variable when executing either of the *`state.sls`* or `state.apply` (see below for an example).

---

commit_in: `None`
Commit the changes in a specific number of minutes / hours. Example of accepted formats: `5` (commit in 5 minutes), `2m` (commit in 2 minutes), `1h` (commit the changes in 1 hour)`, `5h30m` (commit the changes in 5 hours and 30 minutes).

Note: This feature works on any platforms, as it does not rely on the native features of the network operating system.

Note: After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the *`net.cancel_commit`* execution function, using the commit ID returned by this function.

Warning: Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

commit_at: **`None`**

Commit the changes at a specific time. Example of accepted formats: `1am` (will commit the changes at the next 1AM), `13:20` (will commit at 13:20), `1:20am`, etc.

Note: This feature works on any platforms, as it does not rely on the native features of the network operating system.

Note: After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the *`net.cancel_commit`* execution function, using the commit ID returned by this function.

Warning: Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

revert_in: **`None`**

Commit and revert the changes in a specific number of minutes / hours. Example of accepted formats: `5` (revert in 5 minutes), `2m` (revert in 2 minutes), `1h` (revert the changes in 1 hour)`, `5h30m` (revert the changes in 5 hours and 30 minutes).

Note: To confirm the commit, and prevent reverting the changes, you will have to execute the *`net.confirm_commit`* function, using the commit ID returned by this function.

Warning: This works on any platform, regardless if they have or don't have native capabilities to confirming a commit. However, please be *very* cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don't have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

revert_at: `None`
Commit and revert the changes at a specific time. Example of accepted formats: `1am` (will commit and revert the changes at the next 1AM), `13:20` (will commit and revert at 13:20), `1:20am`, etc.

Note: To confirm the commit, and prevent reverting the changes, you will have to execute the *`net.confirm_commit`* function, using the commit ID returned by this function.

Warning: This works on any platform, regardless if they have or don't have native capabilities to confirming a commit. However, please be *very* cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don't have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

replace: False
Load and replace the configuration. Default: `False` (will apply load merge).

context: None
Overrides default context variables passed to the template.

New in version 2019.2.0.

defaults: None
Default variables/context passed to the template.

template_vars
Dictionary with the arguments/context to be used when the template is rendered. Do not explicitly specify this argument. This represents any other variable that will be sent to the template rendering system. Please see an example below! In both `ntp_peers_example_using_pillar` and `ntp_peers_example`, `peers` is sent as template variable.

Note: It is more recommended to use the `context` argument instead, to avoid any conflicts with other arguments.

SLS Example (e.g.: under salt://router/config.sls) :

```
whole_config_example:
    netconfig.managed:
        - template_name: salt://path/to/complete_config.jinja
```

(continues on next page)

(continued from previous page)

```
        - debug: True
        - replace: True
bgp_config_example:
    netconfig.managed:
        - template_name: /absolute/path/to/bgp_neighbors.mako
        - template_engine: mako
prefix_lists_example:
    netconfig.managed:
        - template_name: prefix_lists.cheetah
        - debug: True
        - template_engine: cheetah
ntp_peers_example:
    netconfig.managed:
        - template_name: http://bit.ly/2gKOj20
        - skip_verify: False
        - debug: True
        - peers:
            - 192.168.0.1
            - 192.168.0.1
ntp_peers_example_using_pillar:
    netconfig.managed:
        - template_name: http://bit.ly/2gKOj20
        - peers: {{ pillar.get('ntp.peers', []) }}
```

Multi template example:

```
hostname_and_ntp:
  netconfig.managed:
    - template_name:
        - https://bit.ly/2OhSgqP
        - https://bit.ly/2M6C4Lx
        - https://bit.ly/2OIWVTs
    - debug: true
    - context:
        hostname: {{ opts.id }}
        servers:
          - 172.17.17.1
          - 172.17.17.2
        peers:
          - 192.168.0.1
          - 192.168.0.2
```

Usage examples:

```
$ sudo salt 'juniper.device' state.sls router.config test=True

$ sudo salt -N all-routers state.sls router.config pillar="{'debug': True}
↪"
```

`router.config` depends on the location of the SLS file (see above). Running this command, will be executed all five steps from above. These examples above are not meant to be used in a production environment, their sole purpose is to provide usage examples.

Output example:

```
$ sudo salt 'juniper.device' state.sls router.config test=True
juniper.device:
----------
          ID: ntp_peers_example_using_pillar
    Function: netconfig.managed
      Result: None
     Comment: Testing mode: Configuration discarded.
     Started: 12:01:40.744535
    Duration: 8755.788 ms
     Changes:
              ----------
              diff:
                  [edit system ntp]
                       peer 192.168.0.1 { ... }
                  +    peer 172.17.17.1;
                  +    peer 172.17.17.3;

Summary for juniper.device
------------
Succeeded: 1 (unchanged=1, changed=1)
Failed:    0
------------
Total states run:     1
Total run time:   8.756 s
```

Raw output example (useful when the output is reused in other states/execution modules):

```
$ sudo salt --out=pprint 'juniper.device' state.sls router.config⊠
↪test=True debug=True
```

```
{
    'juniper.device': {
        'netconfig_|-ntp_peers_example_using_pillar_|-ntp_peers_example_
↪using_pillar_|-managed': {
            '__id__': 'ntp_peers_example_using_pillar',
            '__run_num__': 0,
            'already_configured': False,
            'changes': {
                'diff': '[edit system ntp]   peer 192.168.0.1 { ... }+   ⊠
↪peer 172.17.17.1;+   peer 172.17.17.3;'
            },
            'comment': 'Testing mode: Configuration discarded.',
            'duration': 7400.759,

↪172.17.17.3; } }',
            'name': 'ntp_peers_example_using_pillar',
            'result': None,
            'start_time': '12:09:09.811445'
        }
    }
}
```

`salt.states.netconfig.`**`replace_pattern`**(*name*, *pattern*, *repl*, *count=0*, *flags=8*, *bufsize=1*, *append_if_not_found=False*, *prepend_if_not_found=False*, *not_found_content=None*, *search_only=False*, *show_changes=True*, *backslash_literal=False*, *source='running'*, *path=None*, *test=False*, *replace=True*, *debug=False*, *commit=True*)

New in version 2019.2.0.

Replace occurrences of a pattern in the configuration source. If `show_changes` is `True`, then a diff of what changed will be returned, otherwise a `True` will be returned when changes are made, and `False` when no changes are made. This is a pure Python implementation that wraps Python's `sub()`.

pattern
A regular expression, to be matched using Python's `search()`.

repl
The replacement text.

count: **`0`**
Maximum number of pattern occurrences to be replaced. If count is a positive integer `n`, only `n` occurrences will be replaced, otherwise all occurrences will be replaced.

flags (list or int): **`8`**
A list of flags defined in the `re` module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., `['IGNORECASE', 'MULTILINE']`. Optionally, `flags` may be an int, with a value corresponding to the XOR (`|`) of all the desired flags. Defaults to 8 (which supports 'MULTILINE').

bufsize (int or str): **`1`**
How much of the configuration to buffer into memory at once. The default value `1` processes one line at a time. The special value `file` may be specified which will read the entire file into memory before processing.

append_if_not_found: **`False`**
If set to `True`, and pattern is not found, then the content will be appended to the file.

prepend_if_not_found: **`False`**
If set to `True` and pattern is not found, then the content will be prepended to the file.

not_found_content
Content to use for append/prepend if not found. If None (default), uses `repl`. Useful when `repl` uses references to group in pattern.

search_only: **`False`**
If set to true, this no changes will be performed on the file, and this function will simply return `True` if the pattern was matched, and `False` if not.

show_changes: **`True`**
If `True`, return a diff of changes made. Otherwise, return `True` if changes were made, and `False` if not.

backslash_literal: **`False`**
Interpret backslashes as literal backslashes for the repl and not escape characters. This will help when using append/prepend so that the backslashes are not interpreted for the repl on the second run of the state.

source: **`running`**
The configuration source. Choose from: `running`, `candidate`, or `startup`. Default: `running`.

path
Save the temporary configuration to a specific path, then read from there.

test: **`False`**
Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: **`True`**
Commit the configuration changes? Default: `True`.

debug: **`False`**

Debug mode. Will insert a new key in the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

replace: **`True`**
Load and replace the configuration. Default: `True`.

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

State SLS Example:

```
update_policy_name:
  netconfig.replace_pattern:
    - pattern: OLD-POLICY-NAME
    - repl: new-policy-name
    - debug: true
```

`salt.states.netconfig.`**`saved`**(*name, source='running', user=None, group=None, mode=None, attrs=None, makedirs=False, dir_mode=None, replace=True, backup='', show_changes=True, create=True, tmp_dir='', tmp_ext='', encoding=None, encoding_errors='strict', allow_empty=False, follow_symlinks=True, check_cmd=None, win_owner=None, win_perms=None, win_deny_perms=None, win_inheritance=True, win_perms_reset=False, **kwargs*)

New in version 2019.2.0.

Save the configuration to a file on the local file system.

name
Absolute path to file where to save the configuration. To push the files to the Master, use *`cp.push`* Execution function.

source: **`running`**
The configuration source. Choose from: `running`, `candidate`, `startup`. Default: `running`.

user
The user to own the file, this defaults to the user salt is running as on the minion

group
The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored

mode
The permissions to set on this file, e.g. `644`, `0775`, or `4664`. The default mode for new files and directories corresponds to the umask of the salt process. The mode of existing files and directories will only be changed if `mode` is specified.

Note: This option is **not** supported on Windows.

attrs
The attributes to have on this file, e.g. `a`, `i`. The attributes can be any or a combination of the following characters: `aAcCdDeijPsStTu`.

Note: This option is **not** supported on Windows.

makedirs: **`False`**
If set to `True`, then the parent directories will be created to facilitate the creation of the named file. If `False`, and the parent directory of the destination file doesn't exist, the state will fail.

dir_mode
If directories are to be created, passing this option specifies the permissions for those directories. If this

is not set, directories will be assigned permissions by adding the execute bit to the mode of the files.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

replace: **`True`**
If set to `False` and the file already exists, the file will not be modified even if changes would otherwise be made. Permissions and ownership will still be enforced, however.

backup
Overrides the default backup mode for this specific file. See *backup_mode documentation* for more details.

show_changes: **`True`**
Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made.

create: **`True`**
If set to `False`, then the file will only be managed if the file already exists on the system.

encoding
If specified, then the specified encoding will be used. Otherwise, the file will be encoded using the system locale (usually UTF-8). See https://docs.python.org/3/library/codecs.html#standard-encodings for the list of available encodings.

encoding_errors: **`'strict'`**
Error encoding scheme. Default is ``` `'strict'` ```. See https://docs.python.org/2/library/codecs.html#codec-base-classes for the list of available schemes.

allow_empty: **`True`**
If set to `False`, then the state will fail if the contents specified by `contents_pillar` or `contents_grains` are empty.

follow_symlinks: **`True`**
If the desired path is a symlink follow it and make changes to the file to which the symlink points.

check_cmd
The specified command will be run with an appended argument of a *temporary* file containing the new managed contents. If the command exits with a zero status the new managed contents will be written to the managed destination. If the command exits with a nonzero exit code, the state will fail and no changes will be made to the file.

tmp_dir
Directory for temp file created by `check_cmd`. Useful for checkers dependent on config file location (e.g. daemons restricted to their own config directories by an apparmor profile).

tmp_ext
Suffix for temp file created by `check_cmd`. Useful for checkers dependent on config file extension (e.g. the init-checkconf upstart config checker).

win_owner: **`None`**
The owner of the directory. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

win_perms: **`None`**
A dictionary containing permissions to grant and their propagation. For example: `{'Administrators': {'perms': 'full_control'}}` Can be a single basic perm or a list of advanced perms. `perms` must be specified. `applies_to` does not apply to file objects.

win_deny_perms: **`None`**
A dictionary containing permissions to deny and their propagation. For example: `{'Administrators': {'perms': 'full_control'}}` Can be a single basic perm or a list of advanced perms. `perms` must be specified. `applies_to` does not apply to file objects.

win_inheritance: **`True`**
True to inherit permissions from the parent directory, False not to inherit permission.

win_perms_reset: **`False`**
If `True` the existing DACL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

State SLS Example:

```
/var/backups/{{ opts.id }}/{{ salt.status.time('%s') }}.cfg:
  netconfig.saved:
    - source: running
    - makedirs: true
```

The state SLS above would create a backup config grouping the files by the Minion ID, in chronological files. For example, if the state is executed at on the 3rd of August 2018, at 5:15PM, on the Minion `core1.lon01`, the configuration would saved in the file: `/var/backups/core01.lon01/1533316558.cfg`

26.19.49 salt.states.netntp

Network NTP

New in version 2016.11.0.

Manage the configuration of NTP peers and servers on the network devices through the NAPALM proxy.

codeauthor
Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

maturity
new

depends
napalm

platform
unix

Dependencies

- Requires netaddr to be installed: *pip install netaddr* to check if IP Addresses are correctly specified
- Requires dnspython to be installed: *pip install dnspython* to resolve the nameserver entities (in case the user does not configure the peers/servers using their IP addresses)
- `NAPALM proxy minion`
- *`NTP operational and configuration management module`*

`salt.states.netntp.`**`managed`**`(`*name*, *peers=None*, *servers=None*`)`

Manages the configuration of NTP peers and servers on the device, as specified in the state SLS file. NTP entities not specified in these lists will be removed whilst entities not configured on the device will be set.

SLS Example:

```
netntp_example:
    netntp.managed:
         - peers:
            - 192.168.0.1
            - 172.17.17.1
         - servers:
            - 24.124.0.251
            - 138.236.128.36
```

Output example:

```
{
    'edge01.nrt04': {
        'netntp_|-netntp_example_|-netntp_example_|-managed': {
            'comment': 'NTP servers already configured as needed.',
            'name': 'netntp_example',
            'start_time': '12:45:24.056659',
            'duration': 2938.857,
            'changes': {
                'peers': {
                    'removed': [
                        '192.168.0.2',
                        '192.168.0.3'
                    ],
                    'added': [
                        '192.168.0.1',
                        '172.17.17.1'
                    ]
                }
            },
            'result': None
        }
    }
}
```

26.19.50 salt.states.netsnmp

Network SNMP

Manage the SNMP configuration on network devices.

codeauthor
Mircea Ulinic <ping@mirceaulinic.net>

maturity
new

depends
napalm

platform
unix

Dependencies

- *napalm snmp management module (salt.modules.napalm_snmp)*

New in version 2016.11.0.

`salt.states.netsnmp.`**`managed`**(*name*, *config=None*, *defaults=None*)

Configures the SNMP on the device as specified in the SLS file.

SLS Example:

```
snmp_example:
    netsnmp.managed:
         - config:
           location: Honolulu, HI, US
         - defaults:
           contact: noc@cloudflare.com
```

Output example (for the SLS above, e.g. called snmp.sls under /router/):

```
$ sudo salt edge01.hnl01 state.sls router.snmp test=True
edge01.hnl01:
----------
          ID: snmp_example
    Function: snmp.managed
      Result: None
     Comment: Testing mode: configuration was not changed!
     Started: 13:29:06.872363
    Duration: 920.466 ms
     Changes:
              ----------
              added:
                  ----------
                  chassis_id:
                      None
                  contact:
                      noc@cloudflare.com
                  location:
                      Honolulu, HI, US

Summary for edge01.hnl01
------------
Succeeded: 1 (unchanged=1, changed=1)
Failed:    0
------------
Total states run:     1
Total run time: 920.466 ms
```

26.19.51 salt.states.netusers

Network Users

Manage the users configuration on network devices via the NAPALM proxy.

codeauthor
Mircea Ulinic <ping@mirceaulinic.net>

maturity
new

depends
napalm

platform
unix

Dependencies

- `NAPALM proxy minion`
- *`Users configuration management module`*

New in version 2016.11.0.

`salt.states.netusers.`**`managed`**(*name*, *users=None*, *defaults=None*)

Manages the configuration of the users on the device, as specified in the state SLS file. Users not defined in that file will be removed whilst users not configured on the device, will be added.

SLS Example:

```
netusers_example:
    netusers.managed:
         - users:
            admin:
                level: 15
                password: $1$knmhgPPv$g8745biu4rb.Zf.IT.F/U1
                sshkeys: []
            restricted:
                level: 1
                password: $1$j34j5k4b$4d5SVjTiz1l.Zf.IT.F/K7
            martin:
                level: 15
                password: ''
                sshkeys:

```

26.19.52 salt.states.network

Configuration of network interfaces

The network module is used to create and manage network settings, interfaces can be set as either managed or ignored. By default all interfaces are ignored unless specified.

Note: RedHat-based systems (RHEL, CentOS, Scientific, etc.) have been supported since version 2014.1.0.

Debian-based systems (Debian, Ubuntu, etc.) have been supported since version 2017.7.0. The following options are not supported: ipaddr_start, and ipaddr_end.

Other platforms are not yet supported.

Note: On Debian-based systems, networking configuration can be specified in */etc/network/interfaces* or via included files such as (by default) */etc/network/interfaces.d/**. This can be problematic for configuration management. It is recommended to use either *file.managed or network.managed*.

If using `network.managed`, it can be useful to ensure `interfaces.d/` is empty. This can be done using the following state

```
/etc/network/interfaces.d:
  file.directory:
    - clean: True
```

Configuring Global Network Settings

Use the `network.system` state to set global network settings:

```
system:
  network.system:
    - enabled: True
    - hostname: server1.example.com
    - gateway: 192.168.0.1
    - gatewaydev: eth0
    - nozeroconf: True
    - nisdomain: example.com
    - require_reboot: True
    - apply_hostname: True
```

Note: The use of `apply_hostname` above will apply changes to the hostname immediately.

Changed in version 2015.5.0: `apply_hostname` added

retain_settings

New in version 2016.11.0.

Use *retain_settings* to retain current network settings that are not otherwise specified in the state. Particularly useful if only setting the hostname. Default behavior is to delete unspecified network settings.

```
system:
  network.system:
    - hostname: server2.example.com
    - apply_hostname: True
    - retain_settings: True
```

Configuring Network Routes

Use the *network.routes* state to set network routes.

```
routes:
  network.routes:
    - name: eth0
    - routes:
      - name: secure_network
        ipaddr: 10.2.0.0
        netmask: 255.255.255.0
        gateway: 10.1.0.3
      - name: HQ_network
        ipaddr: 10.100.0.0
        netmask: 255.255.0.0
        gateway: 10.1.0.10
```

Managing Network Interfaces

The *network.managed* state is used to configure network interfaces. Here are several examples:

Ethernet Interface

```
eth0:
  network.managed:
    - enabled: True
    - type: eth
    - proto: static
    - ipaddr: 10.1.0.7
    - netmask: 255.255.255.0
    - gateway: 10.1.0.1
    - enable_ipv6: true
    - ipv6proto: static
    - ipv6addrs:
      - 2001:db8:dead:beef::3/64
      - 2001:db8:dead:beef::7/64
    - ipv6gateway: 2001:db8:dead:beef::1
    - ipv6netmask: 64
    - dns:
      - 8.8.8.8
      - 8.8.4.4
    - channels:
        rx: 4
        tx: 4
        other: 4
        combined: 4
```

Ranged Interfaces (RHEL/CentOS Only)

New in version 2015.8.0.

Ranged interfaces can be created by including the word `range` in the interface name.

Important: The interface type must be `eth`.

```
eth0-range0:
  network.managed:
    - type: eth
    - ipaddr_start: 192.168.1.1
    - ipaddr_end: 192.168.1.10
    - clonenum_start: 10
    - mtu: 9000

bond0-range0:
  network.managed:
    - type: eth
    - ipaddr_start: 192.168.1.1
    - ipaddr_end: 192.168.1.10
    - clonenum_start: 10
    - mtu: 9000

eth1.0-range0:
  network.managed:
    - type: eth
    - ipaddr_start: 192.168.1.1
    - ipaddr_end: 192.168.1.10
    - clonenum_start: 10
    - vlan: True
    - mtu: 9000

bond0.1-range0:
  network.managed:
    - type: eth
    - ipaddr_start: 192.168.1.1
    - ipaddr_end: 192.168.1.10
    - clonenum_start: 10
    - vlan: True
    - mtu: 9000
```

Bond Interfaces

To configure a bond, you must do the following:

- Configure the bond slaves with a `type` of `slave`, and a `master` option set to the name of the bond interface.
- Configure the bond interface with a `type` of `bond`, and a `slaves` option defining the bond slaves for the bond interface.

```
eth2:
  network.managed:
    - enabled: True
    - type: slave
    - master: bond0

eth3:
  network.managed:
    - enabled: True
    - type: slave
    - master: bond0

bond0:
  network.managed:
    - type: bond
    - ipaddr: 10.1.0.1
    - netmask: 255.255.255.0
    - mode: gre
    - proto: static
    - dns:
      - 8.8.8.8
      - 8.8.4.4
    - enabled: False
    - slaves: eth2 eth3
    - require:
      - network: eth2
      - network: eth3
    - miimon: 100
    - arp_interval: 250
    - downdelay: 200
    - lacp_rate: fast
    - max_bonds: 1
    - updelay: 0
    - use_carrier: on
    - hashing-algorithm: layer2
    - mtu: 9000
    - autoneg: on
    - speed: 1000
    - duplex: full
    - rx: on
    - tx: off
    - sg: on
    - tso: off
    - ufo: off
    - gso: off
```

(continues on next page)

(continued from previous page)

```
    - gro: off
    - lro: off
```

VLANs

Set `type` to `vlan` to configure a VLANs. These VLANs are configured on the bond interface defined above.

```
bond0.2:
  network.managed:
    - type: vlan
    - ipaddr: 10.1.0.2
    - use:
      - network: bond0
    - require:
      - network: bond0

bond0.3:
  network.managed:
    - type: vlan
    - ipaddr: 10.1.0.3
    - use:
      - network: bond0
    - require:
      - network: bond0

bond0.10:
  network.managed:
    - type: vlan
    - ipaddr: 10.1.0.4
    - use:
      - network: bond0
    - require:
      - network: bond0

bond0.12:
  network.managed:
    - type: vlan
    - ipaddr: 10.1.0.5
    - use:
      - network: bond0
    - require:
      - network: bond0
```

Bridge Interfaces

```
eth4:
  network.managed:
    - enabled: True
    - type: eth
    - proto: dhcp
    - bridge: br0

br0:
  network.managed:
    - enabled: True
    - type: bridge
    - proto: dhcp
    - bridge: br0
    - delay: 0
    - ports: eth4
    - bypassfirewall: True
    - use:
      - network: eth4
    - require:
      - network: eth4
```

Note: When managing bridged interfaces on a Debian/Ubuntu based system, the `ports` argument is required. RedHat-based systems will ignore the argument.

Network Teaming (RHEL/CentOS 7 and later)

New in version 3002.

- Configure the members of the team interface with a `type` of `teamport`, and a `team_master` option set to the name of the bond interface.
  - `master` also works, but will be ignored if both `team_master` and `master` are present.
  - If applicable, include a `team_port_config` option. This should be formatted as a dictionary. Keep in mind that due to a quirk of PyYAML, dictionaries nested under a list item must be double-indented (see example below for interface `eth5`).
- Configure the team interface with a `type` of `team`. The team configuration should be passed via the `team_config` option. As with `team_port_config`, the dictionary should be double-indented.

```
eth5:
  network.managed:
    - type: teamport
    - team_master: team0
    - team_port_config:
        prio: 100

eth6:
  network.managed:
    - type: teamport
```

(continues on next page)

(continued from previous page)

```
    - team_master: team0

team0:
  network.managed:
    - type: team
    - ipaddr: 172.24.90.42
    - netmask: 255.255.255.128
    - enable_ipv6: True
    - ipv6addr: 'fee1:dead:beef:af43::'
    - team_config:
        runner:
          hwaddr_policy: by_active
          name: activebackup
          link_watch:
            name: ethtool
```

Note: While `teamd` must be installed to manage a team interface, it is not required to configure a separate *pkg.installed* state for it, as it will be silently installed if needed.

Configuring the Loopback Interface

Use *network.managed* with a `type` of `eth` and a `proto` of `loopback`.

```
lo:
  network.managed:
    - name: lo
    - type: eth
    - proto: loopback
    - onboot: yes
    - userctl: no
    - ipv6_autoconf: no
    - enable_ipv6: true
```

Other Useful Options

noifupdown

The `noifupdown` option, if set to `True`, will keep Salt from restart the interface if changes are made, requiring them to be restarted manually. Here are a couple examples:

```
eth7:
  network.managed:
    - enabled: True
    - type: eth
    # Automatic IP/DNS
    - proto: dhcp
    - noifupdown: True
```

(continues on next page)

(continued from previous page)

```
eth8:
  network.managed:
    - type: eth
    - noifupdown: True

    # IPv4
    - proto: static
    - ipaddr: 192.168.4.9
    - netmask: 255.255.255.0
    - gateway: 192.168.4.1
    - enable_ipv6: True

    # IPv6
    - ipv6proto: static
    - ipv6addr: 2001:db8:dead:c0::3
    - ipv6netmask: 64
    - ipv6gateway: 2001:db8:dead:c0::1
    # override shared; makes those options v4-only
    - ipv6ttl: 15

    # Shared
    - mtu: 1480
    - ttl: 18
    - dns:
      - 8.8.8.8
      - 8.8.4.4
```

`salt.states.network.`**`managed`**`(`*name*, *enabled=True*, ***kwargs*`)`

Ensure that the named interface is configured properly.

name
The name of the interface to manage

type
[eth] Type of interface and configuration

Changed in version 3002.

enabled
Designates the state of this interface.

`salt.states.network.`**`routes`**`(`*name*, ***kwargs*`)`

Manage network interface static routes.

name
Interface name to apply the route to.

kwargs
Named routes

`salt.states.network.`**`system`**`(`*name*, ***kwargs*`)`

Ensure that global network settings are configured properly.

name
Custom name to represent this configuration change.

kwargs
The global parameters for the system.

26.19.53 salt.states.nftables

Management of nftables

This is an nftables-specific module designed to manage Linux firewalls. It is expected that this state module, and other system-specific firewall states, may at some point be deprecated in favor of a more generic *firewall* state.

```
httpd:
  nftables.append:
    - table: filter
    - chain: input
    - jump: accept
    - match: state
    - connstate: new
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True

httpd:
  nftables.append:
    - table: filter
    - family: ipv6
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True

httpd:
  nftables.insert:
    - position: 1
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True

httpd:
  nftables.insert:
    - position: 1
    - table: filter
    - family: ipv6
    - chain: INPUT
    - jump: ACCEPT
    - match: state
```

(continues on next page)

(continued from previous page)

```
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True

httpd:
  nftables.delete:
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True

httpd:
  nftables.delete:
    - position: 1
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True

httpd:
  nftables.delete:
    - table: filter
    - family: ipv6
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True

output:
  nftables.chain_present:
    - family: ip
    - table: filter

output:
  nftables.chain_absent:
    - family: ip
```

(continues on next page)

(continued from previous page)

```
    - table: filter
```

salt.states.nftables.**append**(*name*, *family='ipv4'*, ***kwargs*)

New in version 0.17.0.

Append a rule to a chain

name
A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

family
Network family, ipv4 or ipv6.

All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: *--state* is specified as *connstate* instead of *state* (not to be confused with *ctstate*).

salt.states.nftables.**chain_absent**(*name*, *table='filter'*, *family='ipv4'*)

New in version 2014.7.0.

Verify the chain is absent.

family
Networking family, either ipv4 or ipv6

salt.states.nftables.**chain_present**(*name*, *table='filter'*, *table_type=None*, *hook=None*, *priority=None*, *family='ipv4'*)

New in version 2014.7.0.

Changed in version 3002.

Verify a chain exists in a table.

name
A user-defined chain name.

table
The table to own the chain.

family
Networking family, either ipv4 or ipv6

salt.states.nftables.**delete**(*name*, *family='ipv4'*, ***kwargs*)

New in version 2014.7.0.

Delete a rule to a chain

name
A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

family
Networking family, either ipv4 or ipv6

All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: *--state* is specified as *connstate* instead of *state* (not to be confused with *ctstate*).

salt.states.nftables.**flush**(*name*, *family='ipv4'*, *ignore_absence=False*, ***kwargs*)

New in version 2014.7.0.

Changed in version 3002.

Flush current nftables state

family
Networking family, either ipv4 or ipv6

ignore_absence
If set to True, attempts to flush a non-existent table will not result in a failed state.

New in version 3002.

`salt.states.nftables.`**`insert`**`(`*name*, *family='ipv4'*, ***kwargs*`)`

New in version 2014.7.0.

Insert a rule into a chain

name
A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

family
Networking family, either ipv4 or ipv6

All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: *--state* is specified as *connstate* instead of *state* (not to be confused with *ctstate*).

`salt.states.nftables.`**`set_policy`**`(`*name*, *table='filter'*, *family='ipv4'*, ***kwargs*`)`

New in version 3002.

Sets the default policy for nftables chains

table
The table that owns the chain that should be modified

family
Networking family, either ipv4 or ipv6

policy
The requested table policy (accept or drop)

save
Boolean to save the in-memory nftables settings to a file.

save_filename
The filename to save the nftables settings (default: /etc/nftables or /etc/nftables/salt-all-in-one.nft if the former is a directory)

`salt.states.nftables.`**`table_absent`**`(`*name*, *family='ipv4'*, ***kwargs*`)`

New in version 3002.

Ensure an nftables table is absent

name
Name of the table to ensure is absent

family
Networking family, either ipv4 or ipv6

`salt.states.nftables.`**`table_present`**`(`*name*, *family='ipv4'*, ***kwargs*`)`

New in version 3002.

Ensure an nftables table is present

name
A user-defined table name.

family
Networking family, either ipv4 or ipv6

26.19.54 salt.states.ntp

Management of NTP servers

New in version 2014.1.0.

This state is used to manage NTP servers. Currently only Windows is supported.

```
win_ntp:
  ntp.managed:
    - servers:
      - pool.ntp.org
      - us.pool.ntp.org
```

`salt.states.ntp.`**`managed`**(*name*, *servers=None*)

Manage NTP servers

servers

A list of NTP servers

26.19.55 salt.states.pip_state

Installation of Python Packages Using pip

These states manage system installed python packages. Note that pip must be installed for these states to be available, so pip states should include a requisite to a pkg.installed state for the package which provides pip (`python-pip` in most cases). Example:

```
python-pip:
  pkg.installed

virtualenvwrapper:
  pip.installed:
    - require:
      - pkg: python-pip
```

`salt.states.pip_state.`**`installed`**(*name*, *pkgs=None*, *pip_bin=None*, *requirements=None*, *bin_env=None*, *use_wheel=False*, *no_use_wheel=False*, *log=None*, *proxy=None*, *timeout=None*, *repo=None*, *editable=None*, *find_links=None*, *index_url=None*, *extra_index_url=None*, *no_index=False*, *mirrors=None*, *build=None*, *target=None*, *download=None*, *download_cache=None*, *source=None*, *upgrade=False*, *force_reinstall=False*, *ignore_installed=False*, *exists_action=None*, *no_deps=False*, *no_install=False*, *no_download=False*, *install_options=None*, *global_options=None*, *user=None*, *cwd=None*, *pre_releases=False*, *cert=None*, *allow_all_external=False*, *allow_external=None*, *allow_unverified=None*, *process_dependency_links=False*, *env_vars=None*, *use_vt=False*, *trusted_host=None*, *no_cache_dir=False*, *cache_dir=None*, *no_binary=None*, *extra_args=None*, ***kwargs*)

Make sure the package is installed

name

The name of the python package to install. You can also specify version numbers here using the standard operators `==, >=, <=`. If `requirements` or `pkgs` is given, this parameter will be ignored.

Example:

```
django:
  pip.installed:
    - name: django >= 1.6, <= 1.7
    - require:
      - pkg: python-pip
```

Installs the latest Django version greater than 1.6 but less than 1.7.

pkgs

A list of python packages to install. This let you install multiple packages at the same time.

Example:

```
django-and-psycopg2:
  pip.installed:
    - pkgs:
      - django >= 1.6, <= 1.7
      - psycopg2 >= 2.8.4
    - require:
      - pkg: python-pip
```

Installs the latest Django version greater than 1.6 but less than 1.7 and the latest psycopg2 greater than 2.8.4 at the same time.

requirements

Path to a pip requirements file. If the path begins with salt:// the file will be transferred from the master file server.

user

The user under which to run pip

use_wheel

[False] Prefer wheel archives (requires pip>=1.4)

no_use_wheel

[False] Force to not use wheel archives (requires pip>=1.4)

no_binary

Force to not use binary packages (requires pip >= 7.0.0) Accepts either :all: to disable all binary packages, :none: to empty the set, or a list of one or more packages

Example:

```
django:
  pip.installed:
    - no_binary: ':all:'

flask:
  pip.installed:
    - no_binary:
      - itsdangerous
      - click
```

log

Log file where a complete (maximum verbosity) record will be kept

proxy

Specify a proxy in the form user:passwd@proxy.server:port. Note that the user:password@ is optional and required only if you are behind an authenticated proxy. If you provide user@proxy.server:port then you will be prompted for a password.

timeout

Set the socket timeout (default 15 seconds)

editable
install something editable (i.e. git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed)

find_links
URL to look for packages at

index_url
Base URL of Python Package Index

extra_index_url
Extra URLs of package indexes to use in addition to `index_url`

no_index
Ignore package index

mirrors
Specific mirror URL(s) to query (automatically adds --use-mirrors)

build
Unpack packages into `build` dir

target
Install packages into `target` dir

download
Download packages into `download` instead of installing them

download_cache
Cache downloaded packages in `download_cache` dir

source
Check out `editable` packages into `source` dir

upgrade
Upgrade all packages to the newest available version

force_reinstall
When upgrading, reinstall all packages even if they are already up-to-date.

ignore_installed
Ignore the installed packages (reinstalling instead)

exists_action
Default action when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup

no_deps
Ignore package dependencies

no_install
Download and unpack all packages, but don't actually install them

no_cache_dir:
Disable the cache.

cwd
Current working directory to run pip from

pre_releases
Include pre-releases in the available versions

cert
Provide a path to an alternate CA bundle

allow_all_external
Allow the installation of all externally hosted files

allow_external
Allow the installation of externally hosted files (comma separated list)

allow_unverified
Allow the installation of insecure and unverifiable files (comma separated list)

process_dependency_links
Enable the processing of dependency links

env_vars
Add or modify environment variables. Useful for tweaking build steps, such as specifying INCLUDE or LIBRARY paths in Makefiles, build scripts or compiler calls. This must be in the form of a dictionary or

a mapping.

Example:

```
django:
  pip.installed:
    - name: django_app
    - env_vars:
        CUSTOM_PATH: /opt/django_app
        VERBOSE: True
```

use_vt
Use VT terminal emulation (see output while installing)

trusted_host
Mark this host as trusted, even though it does not have valid or any HTTPS.

bin_env
[None] Absolute path to a virtual environment directory or absolute path to a pip executable. The example below assumes a virtual environment has been created at `/foo/.virtualenvs/bar`.

Example:

```
django:
pip.installed:
    - name: django >= 1.6, <= 1.7
    - bin_env: /foo/.virtualenvs/bar
    - require:
    - pkg: python-pip
```

Or

Example:

```
django:
pip.installed:
    - name: django >= 1.6, <= 1.7
    - bin_env: /foo/.virtualenvs/bar/bin/pip
    - require:
    - pkg: python-pip
```

Attention

The following arguments are deprecated, do not use.

---

pip_bin
[None] Deprecated, use `bin_env`

Changed in version 0.17.0: `use_wheel` option added.

install_options
Extra arguments to be supplied to the setup.py install command. If you are using an option with a directory path, be sure to use absolute path.

Example:

```
django:
  pip.installed:
```

(continues on next page)

(continued from previous page)

```
    - name: django
    - install_options:
      - --prefix=/blah
    - require:
      - pkg: python-pip
```

global_options
Extra global options to be supplied to the setup.py call before the install command.

New in version 2014.1.3.

Attention

As of Salt 0.17.0 the pip state **needs** an importable pip module. This usually means having the system's pip package installed or running Salt from an active virtualenv.

The reason for this requirement is because `pip` already does a pretty good job parsing its own requirements. It makes no sense for Salt to do `pip` requirements parsing and validation before passing them to the `pip` library. It's functionality duplication and it's more error prone.

Attention

Please set `reload_modules: True` to have the salt minion import this module after installation.

Example:

```
pyopenssl:
    pip.installed:
        - name: pyOpenSSL
        - reload_modules: True
        - exists_action: i
```

extra_args
pip keyword and positional arguments not yet implemented in salt

```
pandas:
  pip.installed:
    - name: pandas
    - extra_args:
      - --latest-pip-kwarg: param
      - --latest-pip-arg
```

Warning: If unsupported options are passed here that are not supported in a minion's version of pip, a *No such option error* will be thrown.

If you are using onedir packages and you need to install python packages into the system python environment, you must provide the pip_bin or bin_env to the pip state module.

```
lib-foo:
  pip.installed:
```

(continues on next page)

(continued from previous page)

```
    - pip_bin: /usr/bin/pip3
lib-bar:
  pip.installed:
    - bin_env: /usr/bin/python3
```

`salt.states.pip_state.`**`pip_has_exceptions_mod`**(*ver*)

True when the pip version has the *pip.exceptions* module

`salt.states.pip_state.`**`pip_has_internal_exceptions_mod`**(*ver*)

True when the pip version has the *pip._internal.exceptions* module

`salt.states.pip_state.`**`purge_pip`**()

Purge pip and its sub-modules

`salt.states.pip_state.`**`removed`**(*name*, *requirements=None*, *bin_env=None*, *log=None*, *proxy=None*, *timeout=None*, *user=None*, *cwd=None*, *use_vt=False*)

Make sure that a package is not installed.

name
The name of the package to uninstall

user
The user under which to run pip

bin_env
[None] the pip executable or virtualenenv to use

use_vt
Use VT terminal emulation (see output while installing)

`salt.states.pip_state.`**`uptodate`**(*name*, *bin_env=None*, *user=None*, *cwd=None*, *use_vt=False*)

New in version 2015.5.0.

Verify that the system is completely up to date.

name
The name has no functional value and is only used as a tracking reference

user
The user under which to run pip

bin_env
the pip executable or virtualenenv to use

use_vt
Use VT terminal emulation (see output while installing)

26.19.56 salt.states.pkg

Installation of packages using OS package managers such as yum or apt-get

Note: On minions running systemd>=205, as of version 2015.8.12, 2016.3.3, and 2016.11.0, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing the package manager commands spawned by Salt, when Salt updates itself (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Salt can manage software packages via the pkg state module, packages can be set up to be installed, latest, removed and purged. Package management declarations are typically rather simple:

```
vim:
  pkg.installed
```

A more involved example involves pulling from a custom repository.

```
base:
  pkgrepo.managed:
    - name: ppa:wolfnet/logstash
    - dist: precise
    - file: /etc/apt/sources.list.d/logstash.list
    - keyid: 28B04E4A
    - keyserver: keyserver.ubuntu.com

logstash:
  pkg.installed:
    - fromrepo: ppa:wolfnet/logstash
```

Multiple packages can also be installed with the use of the pkgs state module

```
dotdeb.repo:
  pkgrepo.managed:
    - name: deb http://packages.dotdeb.org wheezy-php55 all
    - dist: wheezy-php55
    - file: /etc/apt/sources.list.d/dotbeb.list
    - keyid: 89DF5277
    - keyserver: keys.gnupg.net
    - refresh_db: true

php.packages:
  pkg.installed:
    - fromrepo: wheezy-php55
    - pkgs:
      - php5-fpm
      - php5-cli
      - php5-curl
```

Warning: Make sure the package name has the correct case for package managers which are case-sensitive (such as *pkgng*).

`salt.states.pkg.`**`downloaded`**(*name, version=None, pkgs=None, fromrepo=None, ignore_epoch=None, **kwargs*)

New in version 2017.7.0.

Ensure that the package is downloaded, and that it is the correct version (if specified).

Note: Any argument which is either a) not explicitly defined for this state, or b) not a global state argument like `saltenv`, or `reload_modules`, will be passed through to the call to `pkg.install` to download the package(s). For example, you can include a `disablerepo` argument on platforms that use yum/dnf to disable that repo:

```
mypkg:
  pkg.downloaded:
    - disablerepo: base,updates
```

To see what is supported, check *this page* to find the documentation for your platform's `pkg` module, then look at the documentation for the `install` function.

Any argument that is passed through to the `install` function, which is not defined for that function, will be silently ignored.

Currently supported for the following pkg providers: *yum*, `zypper` and *apt*

Parameters

- **name** (*str*) -- The name of the package to be downloaded. This parameter is ignored if either "pkgs" is used. Additionally, please note that this option can only be used to download packages from a software repository.
- **version** (*str*) -- Download a specific version of a package.

  Important: As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon must have the epoch included when specifying the version number. For example:

  ```
  vim-enhanced:
    pkg.downloaded:
      - version: 2:7.4.160-1.el7
  ```

  An **ignore_epoch** argument has been added to which causes the epoch to be disregarded when the state checks to see if the desired version was installed.

  You can install a specific version when using the `pkgs` argument by including the version after the package:

  ```
  common_packages:
    pkg.downloaded:
      - pkgs:
        - unzip
        - dos2unix
        - salt-minion: 2015.8.5-1.el6
  ```

- **resolve_capabilities** (*bool*) -- Turn on resolving capabilities. This allow one to name "provides" or alias names for packages.

  New in version 2018.3.0.

CLI Example:

```
zsh:
  pkg.downloaded:
    - version: 5.0.5-4.63
    - fromrepo: "myrepository"
```

`salt.states.pkg.`**`group_installed`**(*name, skip=None, include=None, **kwargs*)

New in version 2015.8.0.

Changed in version 2016.11.0: Added support in `pacman`

Changed in version 3006.2: For RPM-based systems, support for `fromrepo`, `enablerepo`, and `disablerepo` (as used in *pkg.install*) has been added. This allows one to, for example, use `enablerepo` to perform a group install from a repo that is otherwise disabled.

Ensure that an entire package group is installed. This state is currently only supported for the *yum* and `pacman` package managers.

skip

Packages that would normally be installed by the package group ("default" packages), which should not be installed.

```
Load Balancer:
  pkg.group_installed:
    - skip:
      - piranha
```

include

Packages which are included in a group, which would not normally be installed by a `yum groupinstall` ("optional" packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed.

```
Load Balancer:
  pkg.group_installed:
    - include:
      - haproxy
```

Changed in version 2016.3.0: This option can no longer be passed as a comma-separated list, it must now be passed as a list (as shown in the above example).

Note: The below options are only supported on RPM-based systems

---

fromrepo

Restrict `yum groupinfo` to the specified repo(s). (e.g., `yum --disablerepo='*' --enablerepo='somerepo'`)

```
MyGroup:
  pkg.group_installed:
    - fromrepo: base,updates
```

New in version 3006.2.

enablerepo (ignored if `fromrepo` is specified)

Specify a disabled package repository (or repositories) to enable. (e.g., `yum --enablerepo='somerepo'`)

```
MyGroup:
  pkg.group_installed:
    - enablerepo: myrepo
```

New in version 3006.2.

disablerepo (ignored if `fromrepo` is specified)

Specify an enabled package repository (or repositories) to disable. (e.g., `yum --disablerepo='somerepo'`)

```
MyGroup:
  pkg.group_installed:
    - disablerepo: epel
```

New in version 3006.2.

Note: Because this is essentially a wrapper around *`pkg.install`*, any argument which can be passed to pkg.install may also be included here, and it will be passed on to the call to *`pkg.install`*.

`salt.states.pkg.`**`held`**(*name*, *version=None*, *pkgs=None*, *replace=False*, ***kwargs*)

New in version 3005.

Set package in 'hold' state, meaning it will not be changed.

Parameters

- **`name`** (*`str`*) -- The name of the package to be held. This parameter is ignored if `pkgs` is used.
- **`version`** (*`str`*) -- Hold a specific version of a package. Full description of this parameter is in *installed* function.

  Note: This parameter make sense for Zypper-based systems. Ignored for YUM/DNF and APT

- **`pkgs`** (*`list`*) -- A list of packages to be held. All packages listed under `pkgs` will be held.

```
mypkgs:
  pkg.held:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
```

  Note: For Zypper-based systems the package could be held for the version specified. YUM/DNF and APT ingore it.

- **`replace`** (*`bool`*) -- Force replacement of existings holds with specified. By default, this parameter is set to `False`.

`salt.states.pkg.`**`installed`**(*name*, *version=None*, *refresh=None*, *fromrepo=None*, *skip_verify=False*, *skip_suggestions=False*, *pkgs=None*, *sources=None*, *allow_updates=False*, *pkg_verify=False*, *normalize=True*, *ignore_epoch=None*, *reinstall=False*, *update_holds=False*, ***kwargs*)

Changed in version 3007.0.

Ensure that the package is installed, and that it is the correct version (if specified).

Note: Any argument which is either a) not explicitly defined for this state, or b) not a global state argument like `saltenv`, or `reload_modules`, will be passed through to the call to `pkg.install` to install the package(s). For example, you can include a `disablerepo` argument on platforms that use yum/dnf to disable that repo:

```
mypkg:
  pkg.installed:
    - disablerepo: base,updates
```

To see what is supported, check *this page* to find the documentation for your platform's `pkg` module, then look at the documentation for the `install` function.

Any argument that is passed through to the `install` function, which is not defined for that function, will be silently ignored.

Note: In Windows, some packages are installed using the task manager. The Salt minion installer does this. In that case, there is no way to know if the package installs correctly. All that can be reported is that the task that launches the installer started successfully.

Parameters

- **`name`** (*`str`*) -- The name of the package to be installed. This parameter is ignored if either "pkgs" or "sources" is used. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option detailed below.
- **`version`** (*`str`*) -- Install a specific version of a package. This option is ignored if "sources" is used. Currently, this option is supported for the following pkg providers: *`apt`*, `ebuild`, `pacman`, *`pkgin`*, *`win_pkg`*, *`yum`*, and `zypper`. The version number includes the release designation where applicable, to allow Salt to target a specific release of a given version. When in doubt, using the `pkg.latest_version` function for an uninstalled package will tell you the version available.

```
# salt myminion pkg.latest_version vim-enhanced
myminion:
    2:7.4.160-1.el7
```

Important: As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the `pkg.latest_version` output above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
  pkg.installed:
    - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an **ignore_epoch** argument has been added to *`pkg.installed`*, *`pkg.removed`*, and *`pkg.purged`* states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed.

Also, while this function is not yet implemented for all pkg frontends, *`pkg.list_repo_pkgs`* will show all versions available in the various repositories for a given package, irrespective of whether or not it is installed.

```
# salt myminion pkg.list_repo_pkgs bash
myminion:
----------
    bash:
        - 4.2.46-21.el7_3
        - 4.2.46-20.el7_2
```

This function was first added for *`pkg.list_repo_pkgs`* in 2014.1.0, and was expanded to *`Debian/Ubuntu`* and `Arch Linux`-based distros in the 2017.7.0 release.

The version strings returned by either of these functions can be used as version specifiers in pkg states.

You can install a specific version when using the `pkgs` argument by including the version after the package:

```
common_packages:
  pkg.installed:
    - pkgs:
      - unzip
      - dos2unix
      - salt-minion: 2015.8.5-1.el6
```

If the version given is the string `latest`, the latest available package version will be installed à la `pkg.latest`.

WILDCARD VERSIONS

As of the 2017.7.0 release, this state now supports wildcards in package versions for SUSE SLES/Leap/Tumbleweed, Debian/Ubuntu, RHEL/CentOS, Arch Linux, and their derivatives. Using wildcards can be useful for packages where the release name is built into the version in some way, such as for RHEL/CentOS which typically has version numbers like `1.2.34-5.el7`. An example of the usage for this would be:

```
mypkg:
  pkg.installed:
    - version: '1.2.34*'
```

Keep in mind that using wildcard versions will result in a slower state run since Salt must gather the available versions of the specified packages and figure out which of them match the specified wildcard expression.

- **refresh** (*bool*) -- This parameter controls whether or not the package repo database is updated prior to installing the requested package(s).

  If `True`, the package database will be refreshed (`apt-get update` or equivalent, depending on platform) before installing.

  If `False`, the package database will *not* be refreshed before installing.

  If unset, then Salt treats package database refreshes differently depending on whether or not a `pkg` state has been executed already during the current Salt run. Once a refresh has been performed in a `pkg` state, for the remainder of that Salt run no other refreshes will be performed for `pkg` states which do not explicitly set `refresh` to `True`. This prevents needless additional refreshes from slowing down the Salt run.
- **cache_valid_time** (*str*) -- New in version 2016.11.0.

  This parameter sets the value in seconds after which the cache is marked as invalid, and a cache update is necessary. This overwrites the `refresh` parameter's default behavior.

  Example:

```
httpd:
  pkg.installed:
    - fromrepo: mycustomrepo
    - skip_verify: True
    - skip_suggestions: True
    - version: 2.0.6~ubuntu3
```

(continues on next page)

(continued from previous page)

```
    - refresh: True
    - cache_valid_time: 300
    - allow_updates: True
    - hold: False
```

In this case, a refresh will not take place for 5 minutes since the last `apt-get update` was executed on the system.

Note: This parameter is available only on Debian based distributions and has no effect on the rest.

- **`fromrepo`** (*`str`*) -- Specify a repository from which to install

---

Note: Distros which use APT (Debian, Ubuntu, etc.) do not have a concept of repositories, in the same way as YUM-based distros do. When a source is added, it is assigned to a given release. Consider the following source configuration:

```
deb http://ppa.launchpad.net/saltstack/salt/ubuntu␣
↪precise main
```

The packages provided by this source would be made available via the `precise` release, therefore `fromrepo` would need to be set to `precise` for Salt to install the package from this source.

Having multiple sources in the same release may result in the default install candidate being newer than what is desired. If this is the case, the desired version must be specified using the `version` parameter.

If the `pkgs` parameter is being used to install multiple packages in the same state, then instead of using `version`, use the method of version specification described in the **Multiple Package Installation Options** section below.

Running the shell command `apt-cache policy pkgname` on a minion can help elucidate the APT configuration and aid in properly configuring states:

```
root@saltmaster:~# salt ubuntu01 cmd.run 'apt-cache␣
↪policy ffmpeg'
ubuntu01:
    ffmpeg:
    Installed: (none)
    Candidate: 7:0.10.11-1~precise1
    Version table:
        7:0.10.11-1~precise1 0
            500 http://ppa.launchpad.net/jon-severinsson/
↪ffmpeg/ubuntu/ precise/main amd64 Packages
        4:0.8.10-0ubuntu0.12.04.1 0
            500 http://us.archive.ubuntu.com/ubuntu/␣
↪precise-updates/main amd64 Packages
            500 http://security.ubuntu.com/ubuntu/␣
↪precise-security/main amd64 Packages
        4:0.8.1-0ubuntu1 0
            500 http://us.archive.ubuntu.com/ubuntu/␣
↪precise/main amd64 Packages
```

The release is located directly after the source's URL. The actual release name is the part before the slash, so to install version **4:0.8.10-0ubuntu0.12.04.1** either `precise-updates` or `precise-security` could be used for the `fromrepo` value.

- **skip_verify** (*bool*) -- Skip the GPG verification check for the package to be installed
- **skip_suggestions** (*bool*) -- Force strict package naming. Disables lookup of package alternatives.

  New in version 2014.1.1.
- **resolve_capabilities** (*bool*) -- Turn on resolving capabilities. This allow one to name "provides" or alias names for packages.

  New in version 2018.3.0.
- **allow_updates** (*bool*) -- Allow the package to be updated outside Salt's control (e.g. auto updates on Windows). This means a package on the Minion can have a newer version than the latest available in the repository without enforcing a re-installation of the package.

  New in version 2014.7.0.

  Example:

```
httpd:
  pkg.installed:
    - fromrepo: mycustomrepo
    - skip_verify: True
    - skip_suggestions: True
    - version: 2.0.6~ubuntu3
    - refresh: True
    - allow_updates: True
    - hold: False
```

- **pkg_verify** (*bool*) -- New in version 2014.7.0.

  Use pkg.verify to check if already installed packages require reinstallion. Requested packages that are already installed and not targeted for up- or downgrade are verified with pkg.verify to determine if any file installed by the package have been modified or if package dependencies are not fulfilled. `ignore_types` and `verify_options` can be passed to pkg.verify. See examples below. Currently, this option is supported for the following pkg providers: *yum*, `zypperpkg`.

  Examples:

```
httpd:
  pkg.installed:
    - version: 2.2.15-30.el6.centos
    - pkg_verify: True
```

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
    - pkg_verify:
```

(continues on next page)

(continued from previous page)

```
      - ignore_types:
        - config
        - doc
```

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
    - pkg_verify:
      - ignore_types:
        - config
        - doc
      - verify_options:
        - nodeps
        - nofiledigest
```

- **ignore_types** (*list*) -- List of types to ignore when verifying the package

  New in version 2014.7.0.
- **verify_options** (*list*) -- List of additional options to pass when verifying the package. These options will be added to the `rpm -V` command, prepended with `--` (for example, when `nodeps` is passed in this option, `rpm -V` will be run with `--nodeps`).

  New in version 2016.11.0.
- **normalize** (*bool*) -- Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

  New in version 2014.7.0.

  Example:

  ```
  gpfs.gplbin-2.6.32-279.31.1.el6.x86_64:
    pkg.installed:
      - normalize: False
  ```
- **ignore_epoch** (*bool*) -- If this option is not explicitly set, and there is no epoch in the desired package version, the epoch will be implicitly ignored. Set this argument to `True` to explicitly ignore the epoch, and `False` to strictly enforce it.

  New in version 2015.8.9.

  Changed in version 3001: In prior releases, the default behavior was to strictly enforce epochs unless this argument was set to `True`.

MULTIPLE PACKAGE INSTALLATION OPTIONS:

Parameters

- **pkgs** (*list*) -- A list of packages to install from a software repository. All packages listed under `pkgs` will be installed via a single command.

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar
      - baz
    - hold: True
```

`NOTE:` For *apt*, `ebuild`, `pacman`, *winrepo*, *yum*, and `zypper`, version numbers can be specified in the `pkgs` argument. For example:

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
```

Additionally, `ebuild`, `pacman`, `zypper`, *yum/dnf*, and *apt* support the `<`, `<=`, `>=`, and `>` operators for more control over what versions will be installed. For example:

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: '>=1.2.3-4'
      - baz
```

`NOTE:` When using comparison operators, the expression must be enclosed in quotes to avoid a YAML render error.

With `ebuild` is also possible to specify a use flag list and/or if the given packages should be in package.accept_keywords file and/or the overlay from which you want the package to be installed. For example:

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo: '~'
      - bar: '~>=1.2:slot::overlay[use,-otheruse]'
      - baz
```

- **sources** (*list*) -- A list of packages to install, along with the source URI or local path from which to install each package. In the example below, `foo`, `bar`, `baz`, etc. refer to the name of the package, as it would appear in the output of the `pkg.version` or `pkg.list_pkgs` salt CLI commands.

```
mypkgs:
  pkg.installed:
    - sources:
      - foo: salt://rpms/foo.rpm
```

(continues on next page)

(continued from previous page)

```
      - bar: http://somesite.org/bar.rpm
      - baz: ftp://someothersite.org/baz.rpm
      - qux: /minion/path/to/qux.rpm
```

PLATFORM-SPECIFIC ARGUMENTS

These are specific to each OS. If it does not apply to the execution module for your OS, it is ignored.

Parameters

- **`hold`** (*`bool`*) -- Force the package to be held at the current installed version.

  Supported on YUM/DNF & APT based systems.

  New in version 2014.7.0.

  Supported on Zypper-based systems.

  New in version 3003.
- **`update_holds`** (*`bool`*) -- If `True`, and this function would update the package version, any packages which are being held will be temporarily unheld so that they can be updated. Otherwise, if this function attempts to update a held package, the held package(s) will be skipped and the state will fail. By default, this parameter is set to `False`.

  Supported on YUM/DNF & APT based systems.

  New in version 2016.11.0.

  Supported on Zypper-based systems.

  New in version 3003.
- **`names`** (*`list`*) -- A list of packages to install from a software repository. Each package will be installed individually by the package manager.

  Warning: Unlike `pkgs`, the `names` parameter cannot specify a version. In addition, it makes a separate call to the package management frontend to install each package, whereas `pkgs` makes just a single call. It is therefore recommended to use `pkgs` instead of `names` to install multiple packages, both for the additional features and the performance improvement that it brings.

- **`install_recommends`** (*`bool`*) -- Whether to install the packages marked as recommended. Default is `True`. Currently only works with APT-based systems.

  New in version 2015.5.0.

  ```
  httpd:
    pkg.installed:
      - install_recommends: False
  ```
- **`only_upgrade`** (*`bool`*) -- Only upgrade the packages, if they are already installed. Default is `False`. Currently only works with APT-based systems.

  New in version 2015.5.0.

  ```
  httpd:
    pkg.installed:
      - only_upgrade: True
  ```

Note: If this parameter is set to True and the package is not already installed, the state will fail.

- **`report_reboot_exit_codes`** (*bool*) -- If the installer exits with a recognized exit code indicating that a reboot is required, the module function

  win_system.set_reboot_required_witnessed

  will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, `3010` is the only recognized exit code, but this is subject to future refinement. The value of this param defaults to `True`. This parameter has no effect on non-Windows systems.

  New in version 2016.11.0.

```
ms vcpp installed:
  pkg.installed:
    - name: ms-vcpp
    - version: 10.0.40219
    - report_reboot_exit_codes: False
```

Returns
A dictionary containing the state of the software installation

Rtype dict

Note: The `pkg.installed` state supports the usage of `reload_modules`. This functionality allows you to force Salt to reload all modules. In many cases, Salt is clever enough to transparently reload the modules. For example, if you install a package, Salt reloads modules because some other module or state might require the package which was installed. However, there are some edge cases where this may not be the case, which is what `reload_modules` is meant to resolve.

You should only use `reload_modules` if your `pkg.installed` does some sort of installation where if you do not reload the modules future items in your state which rely on the software being installed will fail. Please see the *Reloading Modules* documentation for more information.

See also:

unless and onlyif

If running pkg commands together with *aggregate* isn't an option, you can use the *creates*, *unless*, or *onlyif* syntax to skip a full package run. This can be helpful in large environments with multiple states that include requisites for packages to be installed.

```
# Using creates for a simple single-factor check
install_nginx:
  pkg.installed:
    - name: nginx
    - creates:
      - /etc/nginx/nginx.conf
```

```
# Using file.file_exists for a single-factor check
install_nginx:
  pkg.installed:
    - name: nginx
    - unless:
      - fun: file.file_exists
```

(continues on next page)

(continued from previous page)

```
        args:
          - /etc/nginx/nginx.conf

# Using unless with a shell test
install_nginx:
  pkg.installed:
    - name: nginx
    - unless: test -f /etc/nginx/nginx.conf
```

```
# Using file.search for a two-factor check
install_nginx:
  pkg.installed:
    - name: nginx
    - unless:
      - fun: file.search
        args:
          - /etc/nginx/nginx.conf
          - 'user www-data;'
```

The above examples use different methods to reasonably ensure that a package has already been installed. First, with checking for a file that would be created with the package. Second, by checking for specific text within a file that would be created or managed by salt. With these requisists satisfied, creates/unless will return `True` and the `pkg.installed` state will be skipped.

```
# Example of state run without unless used
salt 'saltdev' state.apply nginx
saltdev:
----------
          ID: install_nginx
          Function: pkg.installed
          Name: nginx
          Result: True
          Comment: All specified packages are already installed
          Started: 20:11:56.388331
          Duration: 4290.0 ms
          Changes:

# Example of state run using unless requisite
salt 'saltdev' state.apply nginx
saltdev:
----------
          ID: install_nginx
          Function: pkg.installed
          Name: nginx
          Result: True
          Comment: unless condition is true
          Started: 20:10:50.659215
          Duration: 1530.0 ms
          Changes:
```

The result is a reduction of almost 3 seconds. In larger environments, small reductions in waiting time can add up.

Unless Requisite

`salt.states.pkg.`**`latest`**(*name*, *refresh=None*, *fromrepo=None*, *skip_verify=False*, *pkgs=None*, *watch_flags=True*, ***kwargs*)

Changed in version 3007.0.

Ensure that the named package is installed and the latest available package. If the package can be updated, this state function will update the package. Generally it is better for the *`installed`* function to be used, as *`latest`* will update the package whenever a new package is available.

Note: Any argument which is either a) not explicitly defined for this state, or b) not a global state argument like `saltenv`, or `reload_modules`, will be passed through to the call to `pkg.install` to install the package(s). For example, you can include a `disablerepo` argument on platforms that use yum/dnf to disable that repo:

```
mypkg:
  pkg.latest:
    - disablerepo: base,updates
```

To see what is supported, check *this page* to find the documentation for your platform's `pkg` module, then look at the documentation for the `install` function.

Any argument that is passed through to the `install` function, which is not defined for that function, will be silently ignored.

---

name
The name of the package to maintain at the latest available version. This parameter is ignored if "pkgs" is used.

fromrepo
Specify a repository from which to install

skip_verify
Skip the GPG verification check for the package to be installed

refresh
This parameter controls whether or not the package repo database is updated prior to checking for the latest available version of the requested packages.

If `True`, the package database will be refreshed (`apt-get update` or equivalent, depending on platform) before checking for the latest available version of the requested packages.

If `False`, the package database will *not* be refreshed before checking.

If unset, then Salt treats package database refreshes differently depending on whether or not a `pkg` state has been executed already during the current Salt run. Once a refresh has been performed in a `pkg` state, for the remainder of that Salt run no other refreshes will be performed for `pkg` states which do not explicitly set `refresh` to `True`. This prevents needless additional refreshes from slowing down the Salt run.

Parameters

- **`cache_valid_time`** (*`str`*) -- New in version 2016.11.0.

  This parameter sets the value in seconds after which the cache is marked as invalid, and a cache update is necessary. This overwrites the `refresh` parameter's default behavior.

  Example:

```
httpd:
  pkg.latest:
    - refresh: True
    - cache_valid_time: 300
```

In this case, a refresh will not take place for 5 minutes since the last `apt-get update` was executed on the system.

Note: This parameter is available only on Debian based distributions and has no effect on the rest.

- **`resolve_capabilities`** (*bool*) -- Turn on resolving capabilities. This allow one to name "provides" or alias names for packages.

  New in version 2018.3.0.

Multiple Package Installation Options:

(Not yet supported for: FreeBSD, OpenBSD, MacOS, and Solaris pkgutil)

pkgs

A list of packages to maintain at the latest available version.

```
mypkgs:
  pkg.latest:
    - pkgs:
      - foo
      - bar
      - baz
```

install_recommends

Whether to install the packages marked as recommended. Default is `True`. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:
  pkg.latest:
    - install_recommends: False
```

only_upgrade

Only upgrade the packages, if they are already installed. Default is `False`. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:
  pkg.latest:
    - only_upgrade: True
```

Note: If this parameter is set to True and the package is not already installed, the state will fail.

---

report_reboot_exit_codes

If the installer exits with a recognized exit code indicating that a reboot is required, the module function

win_system.set_reboot_required_witnessed will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, `3010` is the only recognized exit code, but this is subject to future refinement. The value of this param defaults to `True`. This parameter has no effect on non-Windows systems.

New in version 2016.11.0.

```
ms vcpp installed:
  pkg.latest:
    - name: ms-vcpp
    - report_reboot_exit_codes: False
```

`salt.states.pkg.`**`mod_aggregate`**`(`*low*, *chunks*, *running*`)`

The mod_aggregate function which looks up all packages in the available low chunks and merges them into a single pkgs ref in the present low data

`salt.states.pkg.`**`mod_beacon`**`(`*name*, ***kwargs*`)`

Create a beacon to monitor a package or packages based on a beacon state argument.

Note: This state exists to support special handling of the `beacon` state argument for supported state functions. It should not be called directly.

`salt.states.pkg.`**`mod_watch`**`(`*name*, ***kwargs*`)`

Install/reinstall a package based on a watch requisite

Note: This state exists to support special handling of the `watch` *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

`salt.states.pkg.`**`patch_downloaded`**`(`*name*, *advisory_ids=None*, ***kwargs*`)`

New in version 2017.7.0.

Ensure that packages related to certain advisory ids are downloaded.

Currently supported for the following pkg providers: *`yum`* and `zypper`

CLI Example:

```
preparing-to-fix-issues:
  pkg.patch_downloaded:
    - advisory_ids:
      - SUSE-SLE-SERVER-12-SP2-2017-185
      - SUSE-SLE-SERVER-12-SP2-2017-150
      - SUSE-SLE-SERVER-12-SP2-2017-120
```

`salt.states.pkg.`**`patch_installed`**`(`*name*, *advisory_ids=None*, *downloadonly=None*, ***kwargs*`)`

New in version 2017.7.0.

Ensure that packages related to certain advisory ids are installed.

Note: Any argument which is either a) not explicitly defined for this state, or b) not a global state argument like `saltenv`, or `reload_modules`, will be passed through to the call to `pkg.install` to install the patch(es).

To see what is supported, check *this page* to find the documentation for your platform's `pkg` module, then look at the documentation for the `install` function.

Any argument that is passed through to the `install` function, which is not defined for that function, will be silently ignored.

Currently supported for the following pkg providers: *yum* and `zypper`

CLI Example:

```
issue-foo-fixed:
  pkg.patch_installed:
    - advisory_ids:
      - SUSE-SLE-SERVER-12-SP2-2017-185
      - SUSE-SLE-SERVER-12-SP2-2017-150
      - SUSE-SLE-SERVER-12-SP2-2017-120
```

`salt.states.pkg.`**`purged`**(*name*, *version=None*, *pkgs=None*, *normalize=True*, *ignore_epoch=None*, ***kwargs*)

Verify that a package is not installed, calling `pkg.purge` if necessary to purge the package. All configuration files are also removed.

name
The name of the package to be purged.

version
The version of the package that should be removed. Don't do anything if the package is installed with an unmatching version.

Important: As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the example above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
  pkg.purged:
    - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an **ignore_epoch** argument has been added to *`pkg.installed`*, *`pkg.removed`*, and *`pkg.purged`* states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed. If **ignore_epoch** was not set to `True`, and instead of `2:7.4.160-1.el7` a version of `7.4.160-1.el7` were used, this state would report success since the actual installed version includes the epoch, and the specified version would not match.

---

normalize
[True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

ignore_epoch
[None] If this option is not explicitly set, and there is no epoch in the desired package version, the epoch will be implicitly ignored. Set this argument to `True` to explicitly ignore the epoch, and `False` to strictly enforce it.

New in version 2015.8.9.

Changed in version 3001: In prior releases, the default behavior was to strictly enforce epochs unless this argument was set to `True`.

Multiple Package Options:

pkgs

A list of packages to purge. Must be passed as a python list. The `name` parameter will be ignored if this option is passed. It accepts version numbers as well.

New in version 0.16.0.

`salt.states.pkg.`**`removed`**`(`*name*, *version=None*, *pkgs=None*, *normalize=True*, *ignore_epoch=None*, ***kwargs*`)`

Verify that a package is not installed, calling `pkg.remove` if necessary to remove the package.

name

The name of the package to be removed.

version

The version of the package that should be removed. Don't do anything if the package is installed with an unmatching version.

Important: As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the example above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
  pkg.removed:
    - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an **ignore_epoch** argument has been added to *`pkg.installed`*, *`pkg.removed`*, and *`pkg.purged`* states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed. If **ignore_epoch** was not set to `True`, and instead of `2:7.4.160-1.el7` a version of `7.4.160-1.el7` were used, this state would report success since the actual installed version includes the epoch, and the specified version would not match.

normalize

[True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

ignore_epoch

[None] If this option is not explicitly set, and there is no epoch in the desired package version, the epoch will be implicitly ignored. Set this argument to `True` to explicitly ignore the epoch, and `False` to strictly enforce it.

New in version 2015.8.9.

Changed in version 3001: In prior releases, the default behavior was to strictly enforce epochs unless this argument was set to `True`.

Multiple Package Options:

pkgs

A list of packages to remove. Must be passed as a python list. The `name` parameter will be ignored if this option is passed. It accepts version numbers as well.

New in version 0.16.0.

`salt.states.pkg.`**`unheld`**`(`*name*, *version=None*, *pkgs=None*, *all=False*, ***kwargs*`)`

New in version 3005.

Unset package from 'hold' state, to allow operations with the package.

Parameters

- **name** (*str*) -- The name of the package to be unheld. This parameter is ignored if `pkgs` is used.
- **version** (*str*) -- Unhold a specific version of a package. Full description of this parameter is in *installed* function.

  Note: This parameter make sense for Zypper-based systems. Ignored for YUM/DNF and APT

- **pkgs** (*list*) -- A list of packages to be unheld. All packages listed under `pkgs` will be unheld.

```
mypkgs:
  pkg.unheld:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
```

  Note: For Zypper-based systems the package could be held for the version specified. YUM/DNF and APT ingore it. For `unheld` there is no need to specify the exact version to be unheld.

- **all** (*bool*) -- Force removing of all existings locks. By default, this parameter is set to `False`.

`salt.states.pkg.`**`uptodate`**(*name*, *refresh=False*, *pkgs=None*, ***kwargs*)

New in version 2014.7.0.

Changed in version 2018.3.0: Added support for the `pkgin` provider.

Verify that the system is completely up to date.

:param str name

The name has no functional value and is only used as a tracking reference

:param bool refresh

refresh the package database before checking for new upgrades

:param list pkgs

list of packages to upgrade

Parameters

resolve_capabilities (*bool*) -- Turn on resolving capabilities. This allow one to name ”provides” or alias names for packages.

New in version 2018.3.0.

:param kwargs

Any keyword arguments to pass through to the `pkg` module.

For example, for apt systems: *dist_upgrade*, *cache_valid_time*, *force_conf_new*

New in version 2015.5.0.

26.19.57 salt.states.pkgbuild

The pkgbuild state is the front of Salt package building backend. It automatically builds DEB and RPM packages from specified sources

New in version 2015.8.0.

```
salt_2015.5.2:
  pkgbuild.built:
    - runas: thatch
    - results:
      - salt-2015.5.2-2.el7.centos.noarch.rpm
      - salt-api-2015.5.2-2.el7.centos.noarch.rpm
      - salt-cloud-2015.5.2-2.el7.centos.noarch.rpm
      - salt-master-2015.5.2-2.el7.centos.noarch.rpm
      - salt-minion-2015.5.2-2.el7.centos.noarch.rpm
      - salt-ssh-2015.5.2-2.el7.centos.noarch.rpm
      - salt-syndic-2015.5.2-2.el7.centos.noarch.rpm
    - dest_dir: /tmp/pkg
    - spec: salt://pkg/salt/spec/salt.spec
    - template: jinja
    - deps:
      - salt://pkg/salt/sources/required_dependency.rpm
    - tgt: epel-7-x86_64
    - sources:
      - salt://pkg/salt/sources/logrotate.salt
      - salt://pkg/salt/sources/README.fedora
      - salt://pkg/salt/sources/salt-2015.5.2.tar.gz
      - salt://pkg/salt/sources/salt-2015.5.2-tests.patch
      - salt://pkg/salt/sources/salt-api
      - salt://pkg/salt/sources/salt-api.service
      - salt://pkg/salt/sources/salt-master
      - salt://pkg/salt/sources/salt-master.service
      - salt://pkg/salt/sources/salt-minion
      - salt://pkg/salt/sources/salt-minion.service
      - salt://pkg/salt/sources/saltpkg.sls
      - salt://pkg/salt/sources/salt-syndic
      - salt://pkg/salt/sources/salt-syndic.service
      - salt://pkg/salt/sources/SaltTesting-2015.5.8.tar.gz
/tmp/pkg:
  pkgbuild.repo
```

`salt.states.pkgbuild.`**`built`**(*name, runas, dest_dir, spec, sources, tgt, template=None, deps=None, env=None, results=None, force=False, saltenv='base', log_dir='/var/log/salt/pkgbuild'*)

Ensure that the named package is built and exists in the named directory

name
The name to track the build, the name value is otherwise unused

runas
The user to run the build process as

dest_dir
The directory on the minion to place the built package(s)

spec
The location of the spec file (used for rpms)

sources
The list of package sources

tgt
The target platform to run the build on

template
Run the spec file through a templating engine

Changed in version 2015.8.2: This argument is now optional, allowing for no templating engine to be used if none is desired.

deps
Packages required to ensure that the named package is built can be hosted on either the salt master server or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials

env
A dictionary of environment variables to be set prior to execution. Example:

```
- env:
    DEB_BUILD_OPTIONS: 'nocheck'
```

> **Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.

results
The names of the expected rpms that will be built

force
[False] If `True`, packages will be built even if they already exist in the `dest_dir`. This is useful when building a package for continuous or nightly package builds.

New in version 2015.8.2.

saltenv
The saltenv to use for files downloaded from the salt filesever

log_dir
[/var/log/salt/rpmbuild] Root directory for log files created from the build. Logs will be organized by package name, version, OS release, and CPU architecture under this directory.

New in version 2015.8.2.

`salt.states.pkgbuild.`**`repo`**(*name, keyid=None, env=None, use_passphrase=False, gnupghome='/etc/salt/gpgkeys', runas='builder', timeout=15.0*)

Make a package repository and optionally sign it and packages present

The name is directory to turn into a repo. This state is best used with onchanges linked to your package building states.

name
The directory to find packages that will be in the repository

keyid
Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with keyid which have been loaded into the minion's Pillar data.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```
gpg_pkg_priv_key: |
  -----BEGIN PGP PRIVATE KEY BLOCK-----
  Version: GnuPG v1

  lQO+BFciIfQBCADAPCtzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
  w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6VO4ysvVz28UbnhPxsIkOlf2cq8qc
  .
  .
  Ebe+8JCQTwqSXPRTzXmy/b5WXDeM79CkLWvuGpXFor76D+ECMRPv/rawukEcNptn
  R5OmgHqvydEnO4pWbn8JzQO9YX/Us0SMHBVzLC8eIi5ZIopzalvX
  =JvW8
  -----END PGP PRIVATE KEY BLOCK-----

gpg_pkg_priv_keyname: gpg_pkg_key.pem

gpg_pkg_pub_key: |
  -----BEGIN PGP PUBLIC KEY BLOCK-----
  Version: GnuPG v1

  mQENBFciIfQBCADAPCtzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
  w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6VO4ysvVz28UbnhPxsIkOlf2cq8qc
  .
  .
  bYP7t5iwJmQzRMyFInYRt77wkJBPCpJc9FPNebL9vlZcN4zv0KQta+4alcWivvoP
  4QIxE+/+trC6QRw2m2dHk6aAeq/J0Sc7ilZufwnNA71hf9SzRIwcFXMsLx4iLlki
  inNqW9c=
  =s1CX
  -----END PGP PUBLIC KEY BLOCK-----

gpg_pkg_pub_keyname: gpg_pkg_key.pub
```

env

Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository. Example:

```
- env:
    OPTIONS: 'ask-passphrase'
```

Warning: The above illustrates a common `PyYAML` pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) `PyYAML` idiosyncrasies can be found *here*.

Use of `OPTIONS` on some platforms, for example: `ask-passphrase`, will require `gpg-agent` or similar to cache passphrases.

Note: This parameter is not used for making `yum` repositories.

use_passphrase

[False] New in version 2016.3.0.

Use a passphrase with the signing key presented in `keyid`. Passphrase is received from Pillar data which could be passed on the command line with `pillar` parameter. For example:

```
pillar='{ "gpg_passphrase" : "my_passphrase" }'
```

gnupghome
[/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with 'keyid'

runas
[builder] New in version 2016.3.0.

User to create the repository as, and optionally sign packages.

Note: Ensure the user has correct permissions to any files and directories which are to be utilized.

---

timeout
[15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

26.19.58 salt.states.pkgng

Manage package remote repo using FreeBSD pkgng

Salt can manage the URL pkgng pulls packages from. ATM the state and module are small so use cases are typically rather simple:

```
pkgng_clients:
  pkgng.update_packaging_site:
    - name: "http://192.168.0.2"
```

`salt.states.pkgng.`**`update_packaging_site`**`(`*name*`)`

26.19.59 salt.states.pkgrepo

Management of APT/DNF/YUM/Zypper package repos

States for managing software package repositories on Linux distros. Supported package managers are APT, DNF, YUM and Zypper. Here is some example SLS:

```
base:
  pkgrepo.managed:
    - humanname: CentOS-$releasever - Base
    - mirrorlist: http://mirrorlist.centos.org/?release=$releasever&arch=
↪$basearch&repo=os
    - comments:
        - 'http://mirror.centos.org/centos/$releasever/os/$basearch/'
    - gpgcheck: 1
    - gpgkey: file:///etc/pki/rpm-gpg/RPM-GPG-KEY-CentOS-6
```

```
base:
  pkgrepo.managed:
    - name: deb http://ppa.launchpad.net/wolfnet/logstash/ubuntu precise main
    - file: /etc/apt/sources.list.d/logstash.list
```

(continues on next page)

(continued from previous page)

```
    - keyid: 28B04E4A
    - keyserver: keyserver.ubuntu.com
    - require_in:
      - pkg: logstash

  pkg.latest:
    - name: logstash
    - refresh: True
```

```
base:
  pkgrepo.managed:
    - name: deb http://www.deb-multimedia.org stable main
    - file: /etc/apt/sources.list.d/deb-multimedia.list
    - key_url: salt://deb-multimedia/files/marillat.pub
```

```
base:
  pkgrepo.managed:
    - name: deb http://dl.google.com/linux/chrome/deb/ stable main
    - file: /etc/apt/sources.list.d/chrome-browser.list
    - require_in:
      - pkg: google-chrome-stable
    - gpgcheck: 1
    - key_url: https://dl-ssl.google.com/linux/linux_signing_key.pub
```

```
base:
  pkgrepo.managed:
    - ppa: wolfnet/logstash
  pkg.latest:
    - name: logstash
    - refresh: True
```

Note: On Ubuntu systems, the `python-software-properties` package should be installed for better support of PPA repositories. To check if this package is installed, run `dpkg -l python-software-properties`.

On Ubuntu & Debian systems, the `python-apt` package is required to be installed. To check if this package is installed, run `dpkg -l python-apt`. `python-apt` will need to be manually installed if it is not present.

```
hello-copr:
    pkgrepo.managed:
        - copr: mymindstorm/hello
    pkg.installed:
        - name: hello
```

apt-key deprecated

`apt-key` is deprecated and will be last available in Debian 11 and Ubuntu 22.04. The recommended way to manage repo keys going forward is to download the keys into /etc/apt/keyrings and use `signed-by` in your repo file pointing to the key. This module was updated in version 3005 to implement the recommended approach. You need to add `- aptkey: False` to your state and set `signed-by` in your repo name, to use this recommended approach. If the cli command `apt-key` is not available it will automatically set `aptkey` to False.

Using `aptkey: False` with `key_url` example:

```
deb [signed-by=/etc/apt/keyrings/salt-archive-keyring.gpg arch=amd64] https://
↪packages.broadcom.com/artifactory/saltproject-deb/ bionic main:
  pkgrepo.managed:
    - file: /etc/apt/sources.list.d/salt.list
    - key_url: https://packages.broadcom.com/artifactory/api/security/keypair/
↪SaltProjectKey/public
    - aptkey: False
```

Using `aptkey: False` with `keyserver` and `keyid`:

```
deb [signed-by=/etc/apt/keyrings/salt-archive-keyring.gpg arch=amd64] https://
↪packages.broadcom.com/artifactory/saltproject-deb/ bionic main:
  pkgrepo.managed:
    - file: /etc/apt/sources.list.d/salt.list
    - keyserver: keyserver.ubuntu.com
    - keyid: 0E08A149DE57BFBE
    - aptkey: False
```

`salt.states.pkgrepo.`**`absent`**`(`*name*, ***kwargs*`)`

This function deletes the specified repo on the system, if it exists. It is essentially a wrapper around `pkg.del_repo`.

name

The name of the package repo, as it would be referred to when running the regular package manager commands.

Note: On apt-based systems this must be the complete source entry. For example, if you include `[arch=amd64]`, and a repo matching the specified URI, dist, etc. exists _without_ an architecture, then no changes will be made and the state will report a `True` result.

FEDORA/REDHAT-SPECIFIC OPTIONS

copr

Use community packages outside of the main package repository.

New in version 3002.

```
hello-copr:
    pkgrepo.absent:
      - copr: mymindstorm/hello
```

UBUNTU-SPECIFIC OPTIONS

ppa

On Ubuntu, you can take advantage of Personal Package Archives on Launchpad simply by specifying the user and archive name.

```
logstash-ppa:
  pkgrepo.absent:
    - ppa: wolfnet/logstash
```

ppa_auth
For Ubuntu PPAs there can be private PPAs that require authentication to access. For these PPAs the username/password can be specified. This is required for matching if the name format uses the `ppa:` specifier and is private (requires username/password to access, which is encoded in the URI).

```
logstash-ppa:
  pkgrepo.absent:
    - ppa: wolfnet/logstash
    - ppa_auth: username:password
```

keyid
If passed, then the GPG key corresponding to the passed KeyID will also be removed.

keyid_ppa
[False] If set to `True`, the GPG key's ID will be looked up from ppa.launchpad.net and removed, and the `keyid` argument will be ignored.

Note: This option will be disregarded unless the `ppa` argument is present.

`salt.states.pkgrepo.`**`managed`**`(`*name*, *ppa=None*, *copr=None*, *aptkey=True*, ***kwargs*`)`

This state manages software package repositories. Currently, *`yum`*, *`apt`*, and `zypper` repositories are supported.

YUM/DNF/ZYPPER-BASED SYSTEMS

Note: One of `baseurl`, `mirrorlist`, or `metalink` below is required. Additionally, note that this state is not presently capable of managing more than one repo in a single repo file, so each instance of this state will manage a single repo file containing the configuration for a single repo.

name
This value will be used in two ways: Firstly, it will be the repo ID, as seen in the entry in square brackets (e.g. `[foo]`) for a given repo. Secondly, it will be the name of the file as stored in /etc/yum.repos.d (e.g. `/etc/yum.repos.d/foo.conf`).

enabled
[True] Whether the repo is enabled or not. Can be specified as `True`/`False` or `1`/`0`.

disabled
[False] Included to reduce confusion due to APT's use of the `disabled` argument. If this is passed for a YUM/DNF/Zypper-based distro, then the reverse will be passed as `enabled`. For example passing `disabled=True` will assume `enabled=False`.

copr
Fedora and RedHat based distributions only. Use community packages outside of the main package repository.

New in version 3002.

humanname
This is used as the `name` value in the repo file in `/etc/yum.repos.d/` (or `/etc/zypp/repos.d` for SUSE distros).

baseurl
The URL to a yum repository

mirrorlist
A URL which points to a file containing a collection of baseurls

metalink
A URL for a curated list of non-stale mirrors only usable with yum/dnf

New in version 3008.0.

comments
Sometimes you want to supply additional information, but not as enabled configuration. Anything supplied for this list will be saved in the repo configuration with a comment marker (#) in front.

gpgautoimport
Only valid for Zypper package manager. If set to `True`, automatically trust and import the new repository signing key. The key should be specified with `gpgkey` parameter. See details below.

Additional configuration values seen in YUM/DNF/Zypper repo files, such as `gpgkey` or `gpgcheck`, will be used directly as key-value pairs. For example:

```
foo:
  pkgrepo.managed:
    - humanname: Personal repo for foo
    - baseurl: https://mydomain.tld/repo/foo/$releasever/$basearch
    - gpgkey: file:///etc/pki/rpm-gpg/foo-signing-key
    - gpgcheck: 1
```

APT-BASED SYSTEMS

ppa
On Ubuntu, you can take advantage of Personal Package Archives on Launchpad simply by specifying the user and archive name. The keyid will be queried from launchpad and everything else is set automatically. You can override any of the below settings by simply setting them as you would normally. For example:

```
logstash-ppa:
  pkgrepo.managed:
    - ppa: wolfnet/logstash
```

ppa_auth
For Ubuntu PPAs there can be private PPAs that require authentication to access. For these PPAs the username/password can be passed as an HTTP Basic style username/password combination.

```
logstash-ppa:
  pkgrepo.managed:
    - ppa: wolfnet/logstash
    - ppa_auth: username:password
```

name
On apt-based systems this must be the complete entry as it would be seen in the `sources.list` file. This can have a limited subset of components (e.g. `main`) which can be added/modified with the `comps` option.

```
precise-repo:
  pkgrepo.managed:
    - name: deb http://us.archive.ubuntu.com/ubuntu precise main
```

Note: The above example is intended as a more readable way of configuring the SLS, it is equivalent to the following:

```
'deb http://us.archive.ubuntu.com/ubuntu precise main':
  pkgrepo.managed
```

---

disabled
[False] Toggles whether or not the repo is used for resolving dependencies and/or installing packages.

enabled
[True] Included to reduce confusion due to YUM/DNF/Zypper's use of the `enabled` argument. If this is passed for an APT-based distro, then the reverse will be passed as `disabled`. For example, passing `enabled=False` will assume `disabled=False`.

architectures
On apt-based systems, `architectures` can restrict the available architectures that the repository provides (e.g. only `amd64`). `architectures` should be a comma-separated list.

comps
On apt-based systems, comps dictate the types of packages to be installed from the repository (e.g. `main`, `nonfree`, ...). For purposes of this, `comps` should be a comma-separated list.

file
The filename for the `*.list` that the repository is configured in. It is important to include the full-path AND make sure it is in a directory that APT will look in when handling packages

dist
This dictates the release of the distro the packages should be built for. (e.g. `unstable`). This option is rarely needed.

keyid
The KeyID or a list of KeyIDs of the GPG key to install. This option also requires the `keyserver` option to be set.

keyserver
This is the name of the keyserver to retrieve GPG keys from. The `keyid` option must also be set for this option to work.

key_url
URL to retrieve a GPG key from. Allows the usage of `https://` as well as `salt://`. If `allow_insecure_key` is True, this also allows `http://`.

Note: Use either `keyid`/`keyserver` or `key_url`, but not both.

key_text
The string representation of the GPG key to install.

New in version 2018.3.0.

Note: Use either `keyid`/`keyserver`, `key_url`, or `key_text` but not more than one method.

consolidate
[False] If set to `True`, this will consolidate all sources definitions to the `sources.list` file, cleanup the now unused files, consolidate components (e.g. `main`) for the same URI, type, and architecture to a single line, and finally remove comments from the `sources.list` file. The consolidation will run every time the state is processed. The option only needs to be set on one repo managed by Salt to take effect.

clean_file
[False] If set to `True`, empty the file before configuring the defined repository

Note: Use with care. This can be dangerous if multiple sources are configured in the same file.

New in version 2015.8.0.

refresh
[True] If set to `False` this will skip refreshing the apt package database on Debian based systems.

refresh_db
[True] Deprecated since version 2018.3.0: Use `refresh` instead.

require_in
Set this to a list of *`pkg.installed`* or *`pkg.latest`* to trigger the running of `apt-get update` prior to attempting to install these packages. Setting a require in the pkg state will not work for this.

aptkey:
Use the binary apt-key. If the command `apt-key` is not found in the path, aptkey will be False, regardless of what is passed into this argument.

allow_insecure_key
[True] Whether to allow an insecure (e.g. http vs. https) key_url.

New in version 3006.0.

26.19.60 salt.states.postgres_cluster

Management of PostgreSQL clusters

The postgres_cluster state module is used to manage PostgreSQL clusters. Clusters can be set as either absent or present

```
create cluster 9.3 main:
  postgres_cluster.present:
      - name: 'main'
      - version: '9.3'
```

`salt.states.postgres_cluster.`**`absent`**(*version*, *name*)

Ensure that the named cluster is absent

version
Version of the postgresql server of the cluster to remove

name
The name of the cluster to remove

New in version 2016.3.0.

`salt.states.postgres_cluster.`**`present`**(*version*, *name*, *port=None*, *encoding=None*, *locale=None*, *datadir=None*, *allow_group_access=None*, *data_checksums=None*, *wal_segsize=None*)

Ensure that the named cluster is present with the specified properties. For more information about all of these options see man pg_createcluster(1)

version
Version of the postgresql cluster

name
The name of the cluster

port
Cluster port

encoding
The character encoding scheme to be used in this database

locale
Locale with which to create cluster

datadir
Where the cluster is stored

allow_group_access
: Allows users in the same group as the cluster owner to read all cluster files created by initdb

data_checksums
: Use checksums on data pages

wal_segsize
: Set the WAL segment size, in megabytes

New in version 2016.3.0.

26.19.61 salt.states.postgres_database

Management of PostgreSQL databases

The postgres_database module is used to create and manage Postgres databases. Databases can be set as either absent or present

```
frank:
  postgres_database.present
```

salt.states.postgres_database.**absent**(*name*, *user=None*, *maintenance_db=None*, *db_password=None*, *db_host=None*, *db_port=None*, *db_user=None*)

Ensure that the named database is absent

name
: The name of the database to remove

db_user
: database username if different from config or default

db_password
: user password if any password for a specified user

db_host
: Database host if different from config or default

db_port
: Database port if different from config or default

user
: System user all operations should be performed on behalf of

New in version 0.17.0.

salt.states.postgres_database.**present**(*name*, *tablespace=None*, *encoding=None*, *lc_collate=None*, *lc_ctype=None*, *owner=None*, *owner_recurse=False*, *template=None*, *user=None*, *maintenance_db=None*, *db_password=None*, *db_host=None*, *db_port=None*, *db_user=None*)

Ensure that the named database is present with the specified properties. For more information about all of these options see man createdb(1)

name
: The name of the database to manage

tablespace
: Default tablespace for the database

encoding
: The character encoding scheme to be used in this database. The encoding has to be defined in the following format (without hyphen).

```
- encoding: UTF8
```

lc_collate
The LC_COLLATE setting to be used in this database

lc_ctype
The LC_CTYPE setting to be used in this database

owner
The username of the database owner

owner_recurse
Recurse owner change to all relations in the database

template
The template database from which to build this database

user
System user all operations should be performed on behalf of

db_user
database username if different from config or default

db_password
user password if any password for a specified user

db_host
Database host if different from config or default

db_port
Database port if different from config or default

New in version 0.17.0.

26.19.62 salt.states.postgres_extension

Management of PostgreSQL extensions

A module used to install and manage PostgreSQL extensions.

```
adminpack:
  postgres_extension.present
```

New in version 2014.7.0.

`salt.states.postgres_extension.`**`absent`**`(`*name, if_exists=None, restrict=None, cascade=None, user=None, maintenance_db=None, db_user=None, db_password=None, db_host=None, db_port=None*`)`

Ensure that the named extension is absent.

name
Extension name of the extension to remove

if_exists
Add if exist slug

restrict
Add restrict slug

cascade
Drop on cascade

user
System user all operations should be performed on behalf of

maintenance_db
Database to act on

db_user
Database username if different from config or default

db_password
User password if any password for a specified user

db_host
Database host if different from config or default

db_port
Database port if different from config or default

`salt.states.postgres_extension.`**`present`**`(`*name, if_not_exists=None, schema=None, ext_version=None, from_version=None, user=None, maintenance_db=None, db_user=None, db_password=None, db_host=None, db_port=None*`)`

Ensure that the named extension is present.

Note: Before you can use the state to load an extension into a database, the extension's supporting files must be already installed.

For more information about all of these options see `CREATE EXTENSION` SQL command reference in the PostgreSQL documentation.

name
The name of the extension to be installed

if_not_exists
Add an `IF NOT EXISTS` parameter to the DDL statement

schema
Schema to install the extension into

ext_version
Version to install

from_version
Old extension version if already installed

user
System user all operations should be performed on behalf of

maintenance_db
Database to act on

db_user
Database username if different from config or default

db_password
User password if any password for a specified user

db_host
Database host if different from config or default

db_port
Database port if different from config or default

26.19.63 salt.states.postgres_group

Management of PostgreSQL groups (roles)

The postgres_group module is used to create and manage Postgres groups.

```
frank:
  postgres_group.present
```

`salt.states.postgres_group.`**`absent`**`(`*name, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None, db_user=None*`)`

Ensure that the named group is absent

name
The groupname of the group to remove

user
System user all operations should be performed on behalf of

New in version 0.17.0.

db_user
database username if different from config or default

db_password
user password if any password for a specified user

db_host
Database host if different from config or default

db_port
Database port if different from config or default

`salt.states.postgres_group.`**`present`**`(`*name, createdb=None, createroles=None, encrypted=None, superuser=None, inherit=None, login=None, replication=None, password=None, refresh_password=None, groups=None, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None, db_user=None*`)`

Ensure that the named group is present with the specified privileges Please note that the user/group notion in postgresql is just abstract, we have roles, where users can be seen as roles with the `LOGIN` privilege and groups the others.

name
The name of the group to manage

createdb
Is the group allowed to create databases?

createroles
Is the group allowed to create other roles/users

encrypted
How the password should be stored.

If encrypted is `None`, `True`, or `md5`, it will use PostgreSQL's MD5 algorithm.

If encrypted is `False`, it will be stored in plaintext.

If encrypted is `scram-sha-256`, it will use the algorithm described in RFC 7677.

Changed in version 3003: Prior versions only supported `True` and `False`

login
Should the group have login perm

inherit
Should the group inherit permissions

superuser
Should the new group be a "superuser"

replication
Should the new group be allowed to initiate streaming replication

password
The group's password. It can be either a plain string or a pre-hashed password:

```
'md5{MD5OF({password}{role}}'
'SCRAM-SHA-256${iterations}:{salt}${stored_key}:{server_key}'
```

If encrypted is not `False`, then the password will be converted to the appropriate format above, if not already. As a consequence, passwords that start with "md5" or "SCRAM-SHA-256" cannot be used.

refresh_password
Password refresh flag

Boolean attribute to specify whether to password comparison check should be performed.

If refresh_password is `True`, the password will be automatically updated without extra password change check.

This behaviour makes it possible to execute in environments without superuser access available, e.g. Amazon RDS for PostgreSQL

groups
A string of comma separated groups the group should be in

user
System user all operations should be performed on behalf of

New in version 0.17.0.

db_user
database username if different from config or default

db_password
user password if any password for a specified user

db_host
Database host if different from config or default

db_port
Database port if different from config or default

26.19.64 salt.states.postgres_initdb

Initialization of PostgreSQL data directory

The postgres_initdb module is used to initialize the postgresql data directory.

New in version 2016.3.0.

```
pgsql-data-dir:
  postgres_initdb.present:
    - name: /var/lib/pgsql/data
    - auth: password
    - user: postgres
    - password: strong_password
    - encoding: UTF8
    - locale: C
    - runas: postgres
    - checksums: True
    - waldir: /var/postgresql/wal
```

`salt.states.postgres_initdb.`**`present`**`(`*name, user=None, password=None, auth='password', encoding='UTF8', locale=None, runas=None, waldir=None, checksums=False*`)`

Initialize the PostgreSQL data directory

name
The name of the directory to initialize

user
The database superuser name

password
The password to set for the postgres user

auth
The default authentication method for local connections

encoding
The default encoding for new databases

locale
The default locale for new databases

waldir
The transaction log (WAL) directory (default is to keep WAL inside the data directory)

New in version 2019.2.0.

checksums
If True, the cluster will be created with data page checksums.

Note: Data page checksums are supported since PostgreSQL 9.3.

New in version 2019.2.0.

runas
The system user the operation should be performed on behalf of

26.19.65 salt.states.postgres_language

Management of PostgreSQL languages

The postgres_language module is used to create and manage Postgres languages. Languages can be set as either absent or present

New in version 2016.3.0.

```
plpgsql:
  postgres_language.present:
    - maintenance_db: testdb
```

```
plpgsql:
  postgres_language.absent:
    - maintenance_db: testdb
```

`salt.states.postgres_language.`**`absent`**`(`*name, maintenance_db, user=None, db_password=None, db_host=None, db_port=None, db_user=None*`)`

Ensure that a named language is absent in the specified database.

name
The name of the language to remove

maintenance_db
The name of the database in which the language is to be installed

user
System user all operations should be performed on behalf of

db_user
database username if different from config or default

db_password
user password if any password for a specified user

db_host
Database host if different from config or default

db_port
Database port if different from config or default

`salt.states.postgres_language.`**`present`**(*name*, *maintenance_db*, *user=None*, *db_password=None*, *db_host=None*, *db_port=None*, *db_user=None*)

Ensure that a named language is present in the specified database.

name
The name of the language to install

maintenance_db
The name of the database in which the language is to be installed

user
System user all operations should be performed on behalf of

db_user
database username if different from config or default

db_password
user password if any password for a specified user

db_host
Database host if different from config or default

db_port
Database port if different from config or default

26.19.66 salt.states.postgres_privileges

Management of PostgreSQL Privileges

The postgres_privileges module is used to manage Postgres privileges. Privileges can be set as either absent or present.

Privileges can be set on the following database object types:

- database
- schema
- tablespace
- table
- sequence
- language
- group

Setting the grant option is supported as well.

New in version 2016.3.0.

```
baruwa:
  postgres_privileges.present:
    - object_name: awl
    - object_type: table
    - privileges:
      - SELECT
      - INSERT
      - DELETE
    - grant_option: False
    - prepend: public
    - maintenance_db: testdb
```

```
andrew:
  postgres_privileges.present:
    - object_name: admins
    - object_type: group
    - grant_option: False
    - maintenance_db: testdb
```

```
baruwa:
  postgres_privileges.absent:
    - object_name: awl
    - object_type: table
    - privileges:
      - SELECT
      - INSERT
      - DELETE
    - prepend: public
    - maintenance_db: testdb
```

```
andrew:
  postgres_privileges.absent:
    - object_name: admins
    - object_type: group
    - maintenance_db: testdb
```

`salt.states.postgres_privileges.`**`absent`**`(`*name, object_name, object_type, privileges=None, prepend='public', maintenance_db=None, user=None, db_password=None, db_host=None, db_port=None, db_user=None*`)`

Revoke the requested privilege(s) on the specificed object(s)

name
Name of the role whose privileges should be revoked

object_name
Name of the object on which the revoke is to be performed

object_type
The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

View permissions should specify *object_type: table.*

privileges
Comma separated list of privileges to revoke, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE

- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- MAINTAIN
- ALL

note
privileges should not be set when revoking group membership

prepend
Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

maintenance_db
The name of the database in which the language is to be installed

user
System user all operations should be performed on behalf of

db_user
database username if different from config or default

db_password
user password if any password for a specified user

db_host
Database host if different from config or default

db_port
Database port if different from config or default

`salt.states.postgres_privileges.`**`present`**`(`*name*, *object_name*, *object_type*, *privileges=None*, *grant_option=None*, *prepend='public'*, *maintenance_db=None*, *user=None*, *db_password=None*, *db_host=None*, *db_port=None*, *db_user=None*`)`

Grant the requested privilege(s) on the specified object to a role

name
Name of the role to which privileges should be granted

object_name
Name of the object on which the grant is to be performed. 'ALL' may be used for objects of type 'table' or 'sequence'.

object_type
The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

View permissions should specify *object_type: table*.

privileges
List of privileges to grant, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT

- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- MAINTAIN
- ALL

note
privileges should not be set when granting group membership

grant_option
If grant_option is set to True, the recipient of the privilege can in turn grant it to others

prepend
Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

maintenance_db
The name of the database in which the language is to be installed

user
System user all operations should be performed on behalf of

db_user
database username if different from config or default

db_password
user password if any password for a specified user

db_host
Database host if different from config or default

db_port
Database port if different from config or default

26.19.67 salt.states.postgres_schema

Management of PostgreSQL schemas

The postgres_schemas module is used to create and manage Postgres schemas.

```
public:
  postgres_schema.present 'dbname' 'name'
```

`salt.states.postgres_schema.`**`absent`**`(`*dbname*, *name*, *user=None*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*`)`

Ensure that the named schema is absent.

dbname
The database's name will work on

name
The name of the schema to remove

user
system user all operations should be performed on behalf of

db_user
database username if different from config or default

db_password
user password if any password for a specified user

db_host
Database host if different from config or default

db_port
Database port if different from config or default

`salt.states.postgres_schema.`**`present`**(*dbname, name, owner=None, user=None, db_user=None, db_password=None, db_host=None, db_port=None*)

Ensure that the named schema is present in the database.

dbname
The database's name will work on

name
The name of the schema to manage

user
system user all operations should be performed on behalf of

db_user
database username if different from config or default

db_password
user password if any password for a specified user

db_host
Database host if different from config or default

db_port
Database port if different from config or default

26.19.68 salt.states.postgres_tablespace

Management of PostgreSQL tablespace

A module used to create and manage PostgreSQL tablespaces.

```
ssd-tablespace:
  postgres_tablespace.present:
    - name: indexes
    - directory: /mnt/ssd-data
```

New in version 2015.8.0.

`salt.states.postgres_tablespace.`**`absent`**(*name, user=None, maintenance_db=None, db_user=None, db_password=None, db_host=None, db_port=None*)

Ensure that the named tablespace is absent.

name
The name of the tablespace to remove

user
System user all operations should be performed on behalf of

maintenance_db
Database to act on

db_user
Database username if different from config or default

db_password
User password if any password for a specified user

db_host
Database host if different from config or default

db_port
Database port if different from config or default

`salt.states.postgres_tablespace.`**`present`**(*name, directory, options=None, owner=None, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None, db_user=None*)

Ensure that the named tablespace is present with the specified properties. For more information about all of these options run `man 7 create_tablespace`.

name
The name of the tablespace to create/manage.

directory
The directory where the tablespace will be located, must already exist

options
A dictionary of options to specify for the tablespace. Currently, the only tablespace options supported are `seq_page_cost` and `random_page_cost`. Default values are shown in the example below:

```
my_space:
  postgres_tablespace.present:
    - directory: /srv/my_tablespace
    - options:
        seq_page_cost: 1.0
        random_page_cost: 4.0
```

owner
The database user that will be the owner of the tablespace. Defaults to the user executing the command (i.e. the *user* option)

user
System user all operations should be performed on behalf of

maintenance_db
Database to act on

db_user
Database username if different from config or default

db_password
User password if any password for a specified user

db_host
Database host if different from config or default

db_port
Database port if different from config or default

26.19.69 salt.states.postgres_user

Management of PostgreSQL users (roles)

The postgres_users module is used to create and manage Postgres users.

```
frank:
  postgres_user.present
```

`salt.states.postgres_user.`**`absent`**(*name*, *user=None*, *maintenance_db=None*, *db_password=None*, *db_host=None*, *db_port=None*, *db_user=None*)

Ensure that the named user is absent

name
The username of the user to remove

user
System user all operations should be performed on behalf of

New in version 0.17.0.

db_user
database username if different from config or default

db_password
user password if any password for a specified user

db_host
Database host if different from config or default

db_port
Database port if different from config or default

`salt.states.postgres_user.`**`present`**`(`*name, createdb=None, createroles=None, encrypted=None, superuser=None, replication=None, inherit=None, login=None, password=None, default_password=None, refresh_password=None, valid_until=None, groups=None, user=None, maintenance_db=None, db_password=None, db_host=None, db_port=None, db_user=None*`)`

Ensure that the named user is present with the specified privileges Please note that the user/group notion in postgresql is just abstract, we have roles, where users can be seen as roles with the LOGIN privilege and groups the others.

name
The name of the system user to manage.

createdb
Is the user allowed to create databases?

createroles
Is the user allowed to create other users?

encrypted
How the password should be stored.

If encrypted is `None`, `True`, or `md5`, it will use PostgreSQL's MD5 algorithm.

If encrypted is `False`, it will be stored in plaintext.

If encrypted is `scram-sha-256`, it will use the algorithm described in RFC 7677.

Changed in version 3003: Prior versions only supported `True` and `False`

login
Should the group have login perm

inherit
Should the group inherit permissions

superuser
Should the new user be a ”superuser”

replication
Should the new user be allowed to initiate streaming replication

password
The user's password. It can be either a plain string or a pre-hashed password:

```
'md5{MD5OF({password}{role}}'
'SCRAM-SHA-256${iterations}:{salt}${stored_key}:{server_key}'
```

If encrypted is not `False`, then the password will be converted to the appropriate format above, if not already. As a consequence, passwords that start with ”md5” or ”SCRAM-SHA-256” cannot be used.

default_password
The password used only when creating the user, unless password is set.

New in version 2016.3.0.

refresh_password
Password refresh flag

Boolean attribute to specify whether to password comparison check should be performed.

If refresh_password is `True`, the password will be automatically updated without extra password change check.

This behaviour makes it possible to execute in environments without superuser access available, e.g. Amazon RDS for PostgreSQL

valid_until
A date and time after which the role's password is no longer valid.

groups
A string of comma separated groups the user should be in

user
System user all operations should be performed on behalf of

New in version 0.17.0.

db_user
Postgres database username, if different from config or default.

db_password
Postgres user's password, if any password, for a specified db_user.

db_host
Postgres database host, if different from config or default.

db_port
Postgres database port, if different from config or default.

26.19.70 salt.states.process

Process Management

Ensure a process matching a given pattern is absent.

```
httpd-absent:
  process.absent:
    - name: apache2
```

`salt.states.process.`**`absent`**`(`*name*, *user=None*, *signal=None*`)`

Ensures that the named command is not running.

name
The pattern to match.

user
The user to which the process belongs

signal
Signal to send to the process(es).

26.19.71 salt.states.proxy

Allows you to manage proxy settings on minions

Setup proxy settings on minions

```
192.168.1.4:
  proxy.managed:
    - port: 3128
    - bypass_domains:
        - localhost
        - 127.0.0.1
```

`salt.states.proxy.`**`managed`**(*name*, *port*, *services=None*, *user=None*, *password=None*, *bypass_domains=None*, *network_service='Ethernet'*)

Manages proxy settings for this mininon

name
The proxy server to use

port
The port used by the proxy server

services
A list of the services that should use the given proxy settings, valid services include http, https and ftp. If no service is given all of the valid services will be used.

user
The username to use for the proxy server if required

password
The password to use for the proxy server if required

bypass_domains
An array of the domains that should bypass the proxy

network_service
The network service to apply the changes to, this only necessary on macOS

26.19.72 salt.states.pyenv

Managing python installations with pyenv

This module is used to install and manage python installations with pyenv. Different versions of python can be installed, and uninstalled. pyenv will be installed automatically the first time it is needed and can be updated later. This module will *not* automatically install packages which pyenv will need to compile the versions of python.

If pyenv is run as the root user then it will be installed to /usr/local/pyenv, otherwise it will be installed to the users ~/.pyenv directory. To make pyenv available in the shell you may need to add the pyenv/shims and pyenv/bin directories to the users PATH. If you are installing as root and want other users to be able to access pyenv then you will need to add pyenv_ROOT to their environment.

This is how a state configuration could look like:

```yaml
pyenv-deps:
  pkg.installed:
    - pkgs:
      - make
      - build-essential
      - libssl-dev
      - zlib1g-dev
      - libbz2-dev
      - libreadline-dev
      - libsqlite3-dev
      - wget
      - curl
      - llvm
python-2.6:
  pyenv.absent:
    - require:
      - pkg: pyenv-deps

python-2.7.6:
```

(continues on next page)

(continued from previous page)

```
  pyenv.installed:
    - default: True
    - require:
      - pkg: pyenv-deps
```

Note: Git needs to be installed and available via PATH if pyenv is to be installed automatically by the module.

`salt.states.pyenv.`**`absent`**`(`*name, user=None*`)`

Verify that the specified python is not installed with pyenv. pyenv is installed if necessary.

name
The version of python to uninstall

user: None
The user to run pyenv as.

New in version 0.17.0.

New in version 0.16.0.

`salt.states.pyenv.`**`install_pyenv`**`(`*name, user=None*`)`

Install pyenv if not installed. Allows you to require pyenv be installed prior to installing the plugins. Useful if you want to install pyenv plugins via the git or file modules and need them installed before installing any rubies.

Use the pyenv.root configuration option to set the path for pyenv if you want a system wide install that is not in a user home dir.

user: None
The user to run pyenv as.

`salt.states.pyenv.`**`installed`**`(`*name, default=False, user=None*`)`

Verify that the specified python is installed with pyenv. pyenv is installed if necessary.

name
The version of python to install

default
[False] Whether to make this python the default.

user: None
The user to run pyenv as.

New in version 0.17.0.

New in version 0.16.0.

26.19.73 salt.states.quota

Management of POSIX Quotas

The quota can be managed for the system:

```
/:
  quota.mode:
    mode: off
    quotatype: user
```

`salt.states.quota.`**`mode`**`(`*name, mode, quotatype*`)`

Set the quota for the system

name
The filesystem to set the quota mode on

mode
Whether the quota system is on or off

quotatype
Must be `user` or `group`

26.19.74 salt.states.rabbitmq_cluster

Manage RabbitMQ Clusters

Example:

```
rabbit@rabbit.example.com:
  rabbitmq_cluster.join:
    - user: rabbit
    - host: rabbit.example.com
```

`salt.states.rabbitmq_cluster.`**`join`**(*name, host, user='rabbit', ram_node=None, runas='root'*)

This function is an alias of `joined`.

Ensure the current node joined to a cluster with node user@host

name
Irrelevant, not used (recommended: user@host)

user
The user of node to join to (default: rabbit)

host
The host of node to join to

ram_node
Join node as a RAM node

runas
The user to run the rabbitmq command as

`salt.states.rabbitmq_cluster.`**`joined`**(*name, host, user='rabbit', ram_node=None, runas='root'*)

Ensure the current node joined to a cluster with node user@host

name
Irrelevant, not used (recommended: user@host)

user
The user of node to join to (default: rabbit)

host
The host of node to join to

ram_node
Join node as a RAM node

runas
The user to run the rabbitmq command as

26.19.75 salt.states.rabbitmq_plugin

Manage RabbitMQ Plugins

New in version 2014.1.0.

Example:

```
some_plugin:
  rabbitmq_plugin.enabled: []
```

`salt.states.rabbitmq_plugin.`**`disabled`**`(`*name, runas=None*`)`

Ensure the RabbitMQ plugin is disabled.

name
The name of the plugin

runas
The user to run the rabbitmq-plugin command as

`salt.states.rabbitmq_plugin.`**`enabled`**`(`*name, runas=None*`)`

Ensure the RabbitMQ plugin is enabled.

name
The name of the plugin

runas
The user to run the rabbitmq-plugin command as

26.19.76 salt.states.rabbitmq_policy

Manage RabbitMQ Policies

maintainer
Benn Eichhorn <benn@getlocalmeasure.com>

maturity
new

platform
all

Example:

```
rabbit_policy:
  rabbitmq_policy.present:
    - name: HA
    - pattern: '.*'
    - definition: '{"ha-mode": "all"}'
```

`salt.states.rabbitmq_policy.`**`absent`**`(`*name, vhost='/', runas=None*`)`

Ensure the named policy is absent

Reference: http://www.rabbitmq.com/ha.html

name
The name of the policy to remove

runas
Name of the user to run the command as

`salt.states.rabbitmq_policy.`**`present`**(*name, pattern, definition, priority=0, vhost='/', runas=None, apply_to=None*)

Ensure the RabbitMQ policy exists.

Reference: https://rabbitmq.com/parameters.html#policies

name
: Policy name

pattern
: A regex of queues to apply the policy to

definition
: A json dict describing the policy

priority
: Priority (defaults to 0)

vhost
: Virtual host to apply to (defaults to '/')

runas
: Name of the user to run the command as

apply_to
: Apply policy to 'queues', 'exchanges' or 'all' (default to 'all')

26.19.77 salt.states.rabbitmq_upstream

Manage RabbitMQ Upstreams

Example:

```
rabbit_upstream:
  rabbitmq_upstream.present:
  - name: upstream_1
  - uri: amqp://my_user:my_password@rabbitmq_host
  - trust_user_id: True
  - ack_mode: on-confirm
  - max_hops: 1
```

New in version 3000.

`salt.states.rabbitmq_upstream.`**`absent`**(*name, runas=None*)

Ensure the named upstream is absent.

Parameters

- **name** (*str*) -- The name of the upstream to remove
- **runas** (*str*) -- User to run the command

New in version 3000.

`salt.states.rabbitmq_upstream.`**`present`**(*name, uri, prefetch_count=None, reconnect_delay=None, ack_mode=None, trust_user_id=None, exchange=None, max_hops=None, expires=None, message_ttl=None, ha_policy=None, queue=None, runas=None*)

Ensure the RabbitMQ upstream exists.

Parameters

- **name** (*str*) -- The name of the upstream connection
- **uri** (*str*) -- The URI to connect to. If upstream is a cluster and can have several URIs, you can enter them here separated by spaces. Examples: - amqp://user:password@server_name - amqp://user:password@server_name/vhost

When connecting with SSL, several URI-parameters need also be specified: - cacertfile = /path/to/cacert.pem - certfile = /path/to/cert.pem - keyfile = /part/to/key.pem - verity = verify_peer - fail_if_no_peer_cert = true | false - auth_mechanism = external Example: - amqp://user:password@server_name?cacertfile=/path/to/cacert.pem&certfile=/path/to/cert.pem&keyfile=/path/to/key.pem&verify=verify_peer - amqp://server-name?cacertfile=/path/to/cacert.pem&certfile=/path/to/cert.pem&keyfile=/path/to/key.pem&verify=verify_peer&fail_if_no_peer_cert=true&auth_mechanism=external

- **prefetch_count** (*int*) -- Maximum number of unacknowledged messages that may be in flight over a federation link at one time. Default: 1000
- **reconnect_delay** (*int*) -- Time in seconds to wait after a network link goes down before attempting reconnection. Default: 5
- **ack_mode** (*str*) -- The following values are allowed: on-confirm: Messages are acknowledged to the upstream broker after they have been confirmed downstream. Handles network errors and broker failures without losing messages. The slowest option, and the default. on-publish: Messages are acknowledged to the upstream broker after they have been published downstream. Handles network errors without losing messages, but may lose messages in the event of broker failures. no-ack: Message acknowledgements are not used. The fastest option, but you may lose messages in the event of network or broker failures.
- **trust_user_id** (*bool*) -- Set `True` to preserve the "user-id" field across a federation link, even if the user-id does not match that used to republish the message. Set to `False` to clear the "user-id" field when messages are federated. Only set this to `True` if you trust the upstream broker not to forge user-ids.
- **exchange** (*str*) -- The name of the upstream exchange. Default is to use the same name as the federated exchange.
- **max_hops** (*int*) -- Maximum number of federation links that messages can traverse before being dropped. Defaults to 1 if not set.
- **expires** (*int*) -- Time in milliseconds that the upstream should remember about this node for. After this time all upstream state will be removed. Set to `None` (Default) to mean "forever".
- **message_ttl** (*int*) -- Time in milliseconds that undelivered messages should be held upstream when there is a network outage or backlog. Set to `None` (default) to mean "forever".
- **ha_policy** (*str*) -- Determines the "x-ha-policy"-argument for the upstream queue for a federated exchange. Default is "none" meaning the queue is not HA.
- **queue** (*str*) -- The name of the upstream queue. Default is to use the same name as the federated queue.

New in version 3000.

26.19.78 salt.states.rabbitmq_user

Manage RabbitMQ Users

Example:

```yaml
rabbit_user:
  rabbitmq_user.present:
    - password: password
    - force: True
    - tags:
      - monitoring
      - user
```

(continues on next page)

(continued from previous page)

```
    - perms:
      - '/':
        - '.*'
        - '.*'
        - '.*'
    - runas: rabbitmq
```

`salt.states.rabbitmq_user.`**`absent`**(*name*, *runas=None*)

Ensure the named user is absent

name
The name of the user to remove

runas
User to run the command

`salt.states.rabbitmq_user.`**`present`**(*name*, *password=None*, *force=False*, *tags=None*, *perms=()*, *runas=None*)

Ensure the RabbitMQ user exists.

name
User name

password
The user's password

force
If force is `True`, the password will be automatically updated without extra password change check.

tags
Optional list of tags for the user

perms
A list of dicts with vhost keys and 3-tuple values

runas
Name of the user to run the command

26.19.79 salt.states.rabbitmq_vhost

Manage RabbitMQ Virtual Hosts

Example:

```
virtual_host:
  rabbitmq_vhost.present:
    - user: rabbit_user
    - conf: .*
    - write: .*
    - read: .*
```

`salt.states.rabbitmq_vhost.`**`absent`**(*name*)

Ensure the RabbitMQ Virtual Host is absent

name
Name of the Virtual Host to remove

runas
User to run the command

Deprecated since version 2015.8.0.

`salt.states.rabbitmq_vhost.`**`present`**`(`*name*`)`

Ensure the RabbitMQ VHost exists.

name
VHost name

user
Initial user permission to set on the VHost, if present

Deprecated since version 2015.8.0.

owner
Initial owner permission to set on the VHost, if present

Deprecated since version 2015.8.0.

conf
Initial conf string to apply to the VHost and user. Defaults to .*

Deprecated since version 2015.8.0.

write
Initial write permissions to apply to the VHost and user. Defaults to .*

Deprecated since version 2015.8.0.

read
Initial read permissions to apply to the VHost and user. Defaults to .*

Deprecated since version 2015.8.0.

runas
Name of the user to run the command

Deprecated since version 2015.8.0.

26.19.80 salt.states.reg

Manage the Windows registry

Many python developers think of registry keys as if they were python keys in a dictionary which is not the case. The windows registry is broken down into the following components:

Hives

This is the top level of the registry. They all begin with HKEY.

- HKEY_CLASSES_ROOT (HKCR)
- HKEY_CURRENT_USER (HKCU)
- HKEY_LOCAL MACHINE (HKLM)
- HKEY_USER (HKU)
- HKEY_CURRENT_CONFIG

Keys

Hives contain keys. These are basically the folders beneath the hives. They can contain any number of subkeys.

When passing the hivekey values they must be quoted correctly depending on the backslashes being used (\ vs \\). The way backslashes are handled in the state file is different from the way they are handled when working on the CLI. The following are valid methods of passing the hivekey:

Using single backslashes:
HKLMSOFTWAREPython 'HKLMSOFTWAREPython'

Using double backslashes:
”HKLM\SOFTWARE\Python”

Values or Entries

Values or Entries are the name/data pairs beneath the keys and subkeys. All keys have a default name/data pair. The name is `(Default)` with a displayed value of `(value not set)`. The actual value is Null.

Example

The following example is taken from the windows startup portion of the registry:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Run]
"RTHDVCPL"="\"C:\\Program Files\\Realtek\\Audio\\HDA\\RtkNGUI64.exe\" -s"
"NvBackend"="\"C:\\Program Files (x86)\\NVIDIA Corporation\\Update Core\\
↪NvBackend.exe\""
"BTMTrayAgent"="rundll32.exe \"C:\\Program Files (x86)\\Intel\\Bluetooth\\
↪btmshellex.dll\",TrayApp"
```

In this example these are the values for each:

Hive:
`HKEY_LOCAL_MACHINE`

Key and subkeys:
`SOFTWARE\\Microsoft\\Windows\\CurrentVersion\\Run`

Value:

- There are 3 value names: `RTHDVCPL`, `NvBackend`, and `BTMTrayAgent`
- Each value name has a corresponding value

`salt.states.reg.`**`absent`**(*name*, *vname=None*, *use_32bit_registry=False*)

Ensure a registry value is removed. To remove a key use key_absent.

Parameters

- **name** (*str*) -- A string value representing the full path of the key to include the HIVE, Key, and all Subkeys. For example:

  `HKEY_LOCAL_MACHINE\SOFTWARE\Salt`

  Valid hive values include:
  - HKEY_CURRENT_USER or HKCU
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_USERS or HKU

- **vname** (*str*) -- The name of the value you'd like to create beneath the Key. If this parameter is not passed it will assume you want to set the `(Default)` value
- **use_32bit_registry** (*bool*) -- Use the 32bit portion of the registry. Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.

Returns
A dictionary showing the results of the registry operation.

Return type
dict

CLI Example:

```
'HKEY_CURRENT_USER\SOFTWARE\Salt':
  reg.absent
    - vname: version
```

In the above example the value named `version` will be removed from the SOFTWARE\Salt key in the HKEY_CURRENT_USER hive. If `vname` was not passed, the `(Default)` value would be deleted.

`salt.states.reg.`**`key_absent`**(*name*, *use_32bit_registry=False*)

New in version 2015.5.4.

Ensure a registry key is removed. This will remove the key, subkeys, and all value entries.

Parameters

- **name** (*str*) -- A string representing the full path to the key to be removed to include the hive and the keypath. The hive can be any of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
- **use_32bit_registry** (*bool*) -- Use the 32bit portion of the registry. Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.

Returns
A dictionary showing the results of the registry operation.

Return type
dict

CLI Example:
The following example will delete the `SOFTWARE\DeleteMe` key in the `HKEY_LOCAL_MACHINE` hive including all its subkeys and value pairs.

```
remove_key_demo:
  reg.key_absent:
    - name: HKEY_CURRENT_USER\SOFTWARE\DeleteMe
```

In the above example the path is interpreted as follows:

- `HKEY_CURRENT_USER` is the hive
- `SOFTWARE\DeleteMe` is the key

`salt.states.reg.`**`present`**(*name*, *vname=None*, *vdata=None*, *vtype='REG_SZ'*, *use_32bit_registry=False*, *win_owner=None*, *win_perms=None*, *win_deny_perms=None*, *win_inheritance=True*, *win_perms_reset=False*)

Ensure a registry key or value is present.

Parameters

- **name** (*str*) -- A string value representing the full path of the key to include the HIVE, Key, and all Subkeys. For example:

  `HKEY_LOCAL_MACHINE\SOFTWARE\Salt`

Valid hive values include:
  - HKEY_CURRENT_USER or HKCU
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_USERS or HKU
- **vname** (*str*) -- The name of the value you'd like to create beneath the Key. If this parameter is not passed it will assume you want to set the `(Default)` value
- **vdata** (*str, int, list, bytes*) -- The value you'd like to set. If a value name (`vname`) is passed, this will be the data for that value name. If not, this will be the `(Default)` value for the key.

  The type of data this parameter expects is determined by the value type specified in `vtype`. The correspondence is as follows:
    - REG_BINARY: Binary data (str in Py2, bytes in Py3)
    - REG_DWORD: int
    - REG_EXPAND_SZ: str
    - REG_MULTI_SZ: list of str
    - REG_QWORD: int
    - REG_SZ: str

  Note: When setting REG_BINARY, string data will be converted to binary automatically. To pass binary data, use the built-in yaml tag `!!binary` to denote the actual binary characters. For example, the following lines will both set the same data in the registry:
    - `vdata: Salty Test`
    - `vdata: !!binary U2FsdHkgVGVzdA==\n`

  For more information about the `!!binary` tag see here

  Note: The type for the `(Default)` value is always REG_SZ and cannot be changed. This parameter is optional. If not passed, the Key will be created with no associated item/value pairs.

- **vtype** (*str*) -- The value type for the data you wish to store in the registry. Valid values are:
  - REG_BINARY
  - REG_DWORD
  - REG_EXPAND_SZ
  - REG_MULTI_SZ
  - REG_QWORD
  - REG_SZ (Default)
- **use_32bit_registry** (*bool*) -- Use the 32bit portion of the registry. Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.
- **win_owner** (*str*) -- The owner of the registry key. If this is not passed, the account under which Salt is running will be used.

  Note: Owner is set for the key that contains the value/data pair. You cannot set ownership on value/data pairs themselves.

  New in version 2019.2.0.
- **win_perms** (*dict*) -- A dictionary containing permissions to grant and their propagation. If not passed the 'Grant` permissions will not be modified.

Note: Permissions are set for the key that contains the value/data pair. You cannot set permissions on value/data pairs themselves.

For each user specify the account name, with a sub dict for the permissions to grant and the 'Applies to' setting. For example: `{'Administrators': {'perms': 'full_control', 'applies_to': 'this_key_subkeys'}}`. `perms` must be specified.

Registry permissions are specified using the `perms` key. You can specify a single basic permission or a list of advanced perms. The following are valid perms:

Basic (passed as a string):

- full_control
- read
- write

Advanced (passed as a list):

- delete
- query_value
- set_value
- create_subkey
- enum_subkeys
- notify
- create_link
- read_control
- write_dac
- write_owner

The 'Applies to' setting is optional. It is specified using the `applies_to` key. If not specified `this_key_subkeys` is used. Valid options are:

Applies to settings:

- this_key_only
- this_key_subkeys
- subkeys_only

New in version 2019.2.0.

- **`win_deny_perms`** (*`dict`*) -- A dictionary containing permissions to deny and their propagation. If not passed the *Deny* permissions will not be modified.

Note: Permissions are set for the key that contains the value/data pair. You cannot set permissions on value/data pairs themselves.

Valid options are the same as those specified in `win_perms`

Note:

'Deny' permissions always take precedence over 'grant'

permissions.

New in version 2019.2.0.

- **`win_inheritance`** (*`bool`*) -- `True` to inherit permissions from the parent key. `False` to disable inheritance. Default is `True`.

Note: Inheritance is set for the key that contains the value/data pair. You cannot set inheritance on value/data pairs themselves.

New in version 2019.2.0.

- **win_perms_reset** (*bool*) -- If `True` the existing DACL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`

Note: Perms are reset for the key that contains the value/data pair. You cannot set permissions on value/data pairs themselves.

New in version 2019.2.0.

Returns
A dictionary showing the results of the registry operation.

Return type
dict

Example:

The following example will set the `(Default)` value for the `SOFTWARE\Salt` key in the `HKEY_CURRENT_USER` hive to `2016.3.1`:

```
HKEY_CURRENT_USER\SOFTWARE\Salt:
  reg.present:
    - vdata: 2016.3.1
```

Example:

The following example will set the value for the `version` entry under the `SOFTWARE\Salt` key in the `HKEY_CURRENT_USER` hive to `2016.3.1`. The value will be reflected in `Wow6432Node`:

```
HKEY_CURRENT_USER\SOFTWARE\Salt:
  reg.present:
    - vname: version
    - vdata: 2016.3.1
```

In the above example the path is interpreted as follows:

- `HKEY_CURRENT_USER` is the hive
- `SOFTWARE\Salt` is the key
- `vname` is the value name ('version') that will be created under the key
- `vdata` is the data that will be assigned to 'version'

Example:

Binary data can be set in two ways. The following two examples will set a binary value of `Salty Test`

```
no_conversion:
  reg.present:
    - name: HKLM\SOFTWARE\SaltTesting
    - vname: test_reg_binary_state
    - vdata: Salty Test
    - vtype: REG_BINARY

conversion:
  reg.present:
    - name: HKLM\SOFTWARE\SaltTesting
    - vname: test_reg_binary_state_with_tag
```

(continues on next page)

(continued from previous page)

```
    - vdata: !!binary U2FsdHkgVGVzdA==\n
    - vtype: REG_BINARY
```

Example:

To set a `REG_MULTI_SZ` value:

```
reg_multi_sz:
  reg.present:
    - name: HKLM\SOFTWARE\Salt
    - vname: reg_multi_sz
    - vdata:
      - list item 1
      - list item 2
```

Example:

To ensure a key is present and has permissions:

```
set_key_permissions:
  reg.present:
    - name: HKLM\SOFTWARE\Salt
    - vname: version
    - vdata: 2016.3.1
    - win_owner: Administrators
    - win_perms:
        jsnuffy:
          perms: full_control
        sjones:
          perms:
            - read_control
            - enum_subkeys
            - query_value
          applies_to:
            - this_key_only
    - win_deny_perms:
        bsimpson:
          perms: full_control
          applies_to: this_key_subkeys
    - win_inheritance: True
    - win_perms_reset: True
```

26.19.81 salt.states.salt_proxy

Salt proxy state

New in version 2015.8.2.

State to deploy and run salt-proxy processes on a minion.

Set up pillar data for your proxies per the documentation.

Run the state as below

```
salt-proxy-configure:
    salt_proxy.configure_proxy:
        - proxyname: p8000
        - start: True
```

This state will configure the salt proxy settings within /etc/salt/proxy (if /etc/salt/proxy doesn't exists) and start the salt-proxy process (default true), if it isn't already running.

`salt.states.salt_proxy.`**`configure_proxy`**`(`*name*, *proxyname='p8000'*, *start=True*`)`

Create the salt proxy file and start the proxy process if required

Parameters

- **`name`** -- The name of this state
- **`proxyname`** -- Name to be used for this proxy (should match entries in pillar)
- **`start`** -- Boolean indicating if the process should be started

Example:

```
salt-proxy-configure:
    salt_proxy.configure_proxy:
        - proxyname: p8000
        - start: True
```

26.19.82 salt.states.saltmod

Control the Salt command interface

This state is intended for use from the Salt Master. It provides access to sending commands down to minions as well as access to executing master-side modules. These state functions wrap Salt's *Python API*.

New in version 2016.11.0.

Support for masterless minions was added to the `salt.state` function, so they can run orchestration sls files. This is particularly useful when the rendering of a state is dependent on the execution of another state. Orchestration will render and execute each orchestration block independently, while honoring requisites to ensure the states are applied in the correct order.

See also:

More Orchestrate documentation

- *Full Orchestrate Tutorial*
- *`The Orchestrate runner`*

`salt.states.saltmod.`**`function`**`(`*name*, *tgt*, *ssh=False*, *tgt_type='glob'*, *ret=''*, *ret_config=None*, *ret_kwargs=None*, *expect_minions=False*, *fail_minions=None*, *fail_function=None*, *arg=None*, *kwarg=None*, *timeout=None*, *batch=None*, *subset=None*, *failhard=None*, ***kwargs*`)`

Execute a single module function on a remote minion via salt or salt-ssh

name

The name of the function to run, aka cmd.run or pkg.install

tgt

The target specification, aka '*' for all minions

tgt_type

The target type, defaults to `glob`

arg

The list of arguments to pass into the function

kwarg
The dict (not a list) of keyword arguments to pass into the function

ret
Optionally set a single or a list of returners to use

ret_config
Use an alternative returner configuration

ret_kwargs
Override individual returner configuration items

expect_minions
An optional boolean for failing if some minions do not respond

fail_minions
An optional list of targeted minions where failure is an option

fail_function
An optional string that points to a salt module that returns True or False based on the returned data dict for individual minions

ssh
Set to *True* to use the ssh client instead of the standard salt client

roster
In the event of using salt-ssh, a roster system can be set

New in version 3005.

batch
Execute the command *in batches*. E.g.: `10%`.

subset
Number of minions from the targeted set to randomly use

New in version 2017.7.0.

failhard
pass failhard down to the executing state

New in version 2019.2.2.

`salt.states.saltmod.`**`parallel_runners`**(*name*, *runners*, ***kwargs*)

Executes multiple runner modules on the master in parallel.

New in version 2018.3.0.

A separate thread is spawned for each runner. This state is intended to be used with the orchestrate runner in place of the `saltmod.runner` state when different tasks should be run in parallel. In general, Salt states are not safe when used concurrently, so ensure that they are used in a safe way (e.g. by only targeting separate minions in parallel tasks).

name:
name identifying this state. The name is provided as part of the output, but not used for anything else.

runners:
list of runners that should be run in parallel. Each element of the list has to be a dictionary. This dictionary's name entry stores the name of the runner function that shall be invoked. The optional kwarg entry stores a dictionary of named arguments that are passed to the runner function.

```
parallel-state:
   salt.parallel_runners:
     - runners:
         my_runner_1:
           - name: state.orchestrate
           - kwarg:
               mods: orchestrate_state_1
         my_runner_2:
```

(continues on next page)

(continued from previous page)

```
            - name: state.orchestrate
            - kwarg:
                mods: orchestrate_state_2
```

`salt.states.saltmod.`**`runner`**`(`*name*, ***kwargs*`)`

Execute a runner module on the master

New in version 2014.7.0.

name
The name of the function to run

kwargs
Any keyword arguments to pass to the runner function

```
run-manage-up:
 salt.runner:
   - name: manage.up
```

`salt.states.saltmod.`**`state`**`(`*name, tgt, ssh=False, tgt_type='glob', ret='', ret_config=None, ret_kwargs=None, highstate=None, sls=None, top=None, saltenv=None, test=None, pillar=None, pillarenv=None, expect_minions=True, exclude=None, fail_minions=None, allow_fail=0, concurrent=False, timeout=None, batch=None, queue=False, subset=None, orchestration_jid=None, failhard=None, **kwargs*`)`

Invoke a state run on a given target

name
An arbitrary name used to track the state execution

tgt
The target specification for the state run.

New in version 2016.11.0.

Masterless support: When running on a masterless minion, the `tgt` is ignored and will always be the local minion.

tgt_type
The target type to resolve, defaults to `glob`

ret
Optionally set a single or a list of returners to use

ret_config
Use an alternative returner configuration

ret_kwargs
Override individual returner configuration items

highstate
Defaults to None, if set to True the target systems will ignore any sls references specified in the sls option and call state.highstate on the targeted minions

top
Should be the name of a top file. If set state.top is called with this top file instead of state.sls.

sls
A group of sls files to execute. This can be defined as a single string containing a single sls file, or a list of sls files

test
Pass `test=true` or `test=false` through to the state function. This can be used to override a test mode set in the minion's config file. If left as the default of None and the 'test' mode is supplied on the command line, that value is passed instead.

pillar
Pass the `pillar` kwarg through to the state function

pillarenv
The pillar environment to grab pillars from

New in version 2017.7.0.

saltenv
The default salt environment to pull sls files from

ssh
Set to *True* to use the ssh client instead of the standard salt client

roster
In the event of using salt-ssh, a roster system can be set

expect_minions
An optional boolean for failing if some minions do not respond

fail_minions
An optional list of targeted minions where failure is an option

allow_fail
Pass in the number of minions to allow for failure before setting the result of the execution to False

exclude
Pass exclude kwarg to state

concurrent
Allow multiple state runs to occur at once.

WARNING: This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same Do not use this flag for performance optimization.

queue
Pass `queue=true` through to the state function

batch
Execute the command *in batches*. E.g.: `10%`.

New in version 2016.3.0.

subset
Number of minions from the targeted set to randomly use

New in version 2017.7.0.

failhard
pass failhard down to the executing state

New in version 2019.2.2.

Examples:

Run a list of sls files via `state.sls` on target minions:

```
webservers:
  salt.state:
    - tgt: 'web*'
    - sls:
      - apache
      - django
      - core
    - saltenv: prod
```

Run sls file via `state.sls` on target minions with exclude:

```
docker:
  salt.state:
    - tgt: 'docker*'
    - sls: docker
```

(continues on next page)

(continued from previous page)

```
    - exclude: docker.swarm
    - saltenv: prod
```

Run a full `state.highstate` on target mininons.

```
databases:
  salt.state:
    - tgt: role:database
    - tgt_type: grain
    - highstate: True
```

`salt.states.saltmod.`**`wait_for_event`**(*name*, *id_list*, *event_id='id'*, *timeout=300*, *node='master'*)

Watch Salt's event bus and block until a condition is met

New in version 2014.7.0.

name
An event tag to watch for; supports Reactor-style globbing.

id_list
A list of event identifiers to watch for -- usually the minion ID. Each time an event tag is matched the event data is inspected for `event_id`, if found it is removed from `id_list`. When `id_list` is empty this function returns success.

event_id
[id] The name of a key in the event data. Default is `id` for the minion ID, another common value is `name` for use with orchestrating salt-cloud events.

timeout
[300] The maximum time in seconds to wait before failing.

The following example blocks until all the listed minions complete a restart and reconnect to the Salt master:

```
reboot_all_minions:
  salt.function:
    - name: system.reboot
    - tgt: '*'

wait_for_reboots:
  salt.wait_for_event:
    - name: salt/minion/*/start
    - id_list:
      - jerry
      - stuart
      - dave
      - phil
      - kevin
      - mike
    - require:
      - salt: reboot_all_minions
```

`salt.states.saltmod.`**`wheel`**(*name*, ***kwargs*)

Execute a wheel module on the master

New in version 2014.7.0.

name
The name of the function to run

kwargs
Any keyword arguments to pass to the wheel function

```
accept_minion_key:
  salt.wheel:
    - name: key.accept
    - match: frank
```

26.19.83 salt.states.saltutil

Saltutil State

This state wraps the saltutil execution modules to make them easier to run from a states. Rather than needing to to use `module.run` this state allows for improved change detection.

New in version 3000.

`salt.states.saltutil.`**`sync_all`**`(`*name*, ***kwargs*`)`

Performs the same task as saltutil.sync_all module See *`saltutil module for full list of options`*

```
sync_everything:
  saltutil.sync_all:
    - refresh: True
```

`salt.states.saltutil.`**`sync_beacons`**`(`*name*, ***kwargs*`)`

Performs the same task as saltutil.sync_beacons module See *`saltutil module for full list of options`*

```
sync_everything:
  saltutil.sync_beacons:
    - refresh: True
```

`salt.states.saltutil.`**`sync_clouds`**`(`*name*, ***kwargs*`)`

Performs the same task as saltutil.sync_clouds module See *`saltutil module for full list of options`*

```
sync_everything:
  saltutil.sync_clouds:
    - refresh: True
```

`salt.states.saltutil.`**`sync_engines`**`(`*name*, ***kwargs*`)`

Performs the same task as saltutil.sync_engines module See *`saltutil module for full list of options`*

```
sync_everything:
  saltutil.sync_engines:
    - refresh: True
```

`salt.states.saltutil.`**`sync_executors`**`(`*name*, ***kwargs*`)`

Performs the same task as saltutil.sync_executors module See *`saltutil module for full list of options`*

```
sync_everything:
  saltutil.sync_executors:
    - refresh: True
```

salt.states.saltutil.**sync_grains**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_grains module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_grains:
    - refresh: True
```

salt.states.saltutil.**sync_log_handlers**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_log_handlers module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_log_handlers:
    - refresh: True
```

salt.states.saltutil.**sync_matchers**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_matchers module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_matchers:
    - refresh: True
```

salt.states.saltutil.**sync_modules**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_modules module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_modules:
    - refresh: True
```

salt.states.saltutil.**sync_output**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_output module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_output:
    - refresh: True
```

salt.states.saltutil.**sync_outputters**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_outputters module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_outputters:
    - refresh: True
```

salt.states.saltutil.**sync_pillar**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_pillar module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_pillar:
    - refresh: True
```

`salt.states.saltutil.`**`sync_proxymodules`**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_proxymodules module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_proxymodules:
    - refresh: True
```

`salt.states.saltutil.`**`sync_renderers`**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_renderers module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_renderers:
    - refresh: True
```

`salt.states.saltutil.`**`sync_returners`**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_returners module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_returners:
    - refresh: True
```

`salt.states.saltutil.`**`sync_sdb`**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_sdb module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_sdb:
    - refresh: True
```

`salt.states.saltutil.`**`sync_serializers`**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_serializers module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_serializers:
    - refresh: True
```

`salt.states.saltutil.`**`sync_states`**(*name*, ***kwargs*)

Performs the same task as saltutil.sync_states module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_states:
    - refresh: True
```

`salt.states.saltutil.`**`sync_thorium`**`(`*name*, ***kwargs*`)`

Performs the same task as saltutil.sync_thorium module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_thorium:
    - refresh: True
```

`salt.states.saltutil.`**`sync_tops`**`(`*name*, ***kwargs*`)`

Performs the same task as saltutil.sync_tops module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_tops:
    - refresh: True
```

`salt.states.saltutil.`**`sync_utils`**`(`*name*, ***kwargs*`)`

Performs the same task as saltutil.sync_utils module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_utils:
    - refresh: True
```

`salt.states.saltutil.`**`sync_wrapper`**`(`*name*, ***kwargs*`)`

New in version 3007.0.

Performs the same task as saltutil.sync_wrapper module See *saltutil module for full list of options*

```
sync_everything:
  saltutil.sync_wrapper:
    - refresh: True
```

26.19.84 salt.states.schedule

Management of the Salt scheduler

```
job3:
  schedule.present:
    - function: test.ping
    - seconds: 3600
    - splay: 10
```

This will schedule the command: test.ping every 3600 seconds (every hour) splaying the time between 0 and 10 seconds

```
job2:
  schedule.present:
    - function: test.ping
    - seconds: 15
    - splay:
```

(continues on next page)

(continued from previous page)

```
        start: 10
        end: 20
```

This will schedule the command: test.ping every 15 seconds splaying the time between 10 and 20 seconds

```
job1:
  schedule.present:
    - function: state.sls
    - job_args:
      - httpd
    - job_kwargs:
        test: True
    - when:
        - Monday 5:00pm
        - Tuesday 3:00pm
        - Wednesday 5:00pm
        - Thursday 3:00pm
        - Friday 5:00pm
```

This will schedule the command: state.sls httpd test=True at 5pm on Monday, Wednesday and Friday, and 3pm on Tuesday and Thursday. Requires that python-dateutil is installed on the minion.

```
job1:
  schedule.present:
    - function: state.sls
    - job_args:
      - httpd
    - job_kwargs:
        test: True
    - cron: '*/5 * * * *'
```

Scheduled jobs can also be specified using the format used by cron. This will schedule the command: state.sls httpd test=True to run every 5 minutes. Requires that python-croniter is installed on the minion.

```
job1:
  schedule.present:
    - function: state.sls
    - job_args:
      - httpd
    - job_kwargs:
        test: True
    - when:
        - Monday 5:00pm
        - Tuesday 3:00pm
        - Wednesday 5:00pm
        - Thursday 3:00pm
        - Friday 5:00pm
    - returner: xmpp
    - return_config: xmpp_state_run
    - return_kwargs:
        recipient: user@domain.com
```

This will schedule the command: state.sls httpd test=True at 5pm on Monday, Wednesday and Friday, and 3pm on

Tuesday and Thursday. Using the xmpp returner to return the results of the scheduled job, with the alternative configuration options found in the xmpp_state_run section.

```
job1:
  schedule.present:
    - function: state.sls
    - job_args:
      - httpd
    - job_kwargs:
        test: True
    - hours: 1
    - skip_during_range:
        start: 2pm
        end: 3pm
    - run_after_skip_range: True
```

This will schedule the command: state.sls httpd test=True at 5pm on Monday, Wednesday and Friday, and 3pm on Tuesday and Thursday. Requires that python-dateutil is installed on the minion.

`salt.states.schedule.`**`absent`**`(`*name*, ***kwargs*`)`

Ensure a job is absent from the schedule

name
The unique name that is given to the scheduled job.

persist
Whether changes to the scheduled job should be saved, defaults to True.

When used with absent this will decide whether the scheduled job will be removed from the saved scheduled jobs and not be available when the Salt minion is restarted.

`salt.states.schedule.`**`disabled`**`(`*name*, ***kwargs*`)`

Ensure a job is disabled in the schedule

name
The unique name that is given to the scheduled job.

persist
Whether changes to the scheduled job should be saved, defaults to True.

offline
Delete the scheduled job to the Salt minion when the Salt minion is not running.

`salt.states.schedule.`**`enabled`**`(`*name*, ***kwargs*`)`

Ensure a job is enabled in the schedule

name
The unique name that is given to the scheduled job.

persist
Whether changes to the scheduled job should be saved, defaults to True.

`salt.states.schedule.`**`present`**`(`*name*, ***kwargs*`)`

Ensure a job is present in the schedule

name
The unique name that is given to the scheduled job.

seconds
The scheduled job will be executed after the specified number of seconds have passed.

minutes
The scheduled job will be executed after the specified number of minutes have passed.

hours
The scheduled job will be executed after the specified number of hours have passed.

days
The scheduled job will be executed after the specified number of days have passed.

when
This will schedule the job at the specified time(s). The when parameter must be a single value or a dictionary with the date string(s) using the dateutil format. Requires python-dateutil.

cron
This will schedule the job at the specified time(s) using the crontab format. Requires python-croniter.

run_on_start
Whether the scheduled job will run when Salt minion starts, or the job will be skipped **once** and run at the next scheduled run. Value should be a boolean.

function
The function that should be executed by the scheduled job.

job_args
The arguments that will be used by the scheduled job.

job_kwargs
The keyword arguments that will be used by the scheduled job.

maxrunning
Ensure that there are no more than N copies of a particular job running.

jid_include
Include the job into the job cache.

splay
The amount of time in seconds to splay a scheduled job. Can be specified as a single value in seconds or as a dictionary range with 'start' and 'end' values.

range
This will schedule the command within the range specified. The range parameter must be a dictionary with the date strings using the dateutil format. Requires python-dateutil.

once
This will schedule a job to run once on the specified date.

once_fmt
The default date format is ISO 8601 but can be overridden by also specifying the `once_fmt` option.

enabled
Whether the scheduled job should be enabled or disabled. Value should be a boolean.

return_job
Whether to return information to the Salt master upon job completion.

metadata
Using the metadata parameter special values can be associated with a scheduled job. These values are not used in the execution of the job, but can be used to search for specific jobs later if combined with the return_job parameter. The metadata parameter must be specified as a dictionary, othewise it will be ignored.

returner
The returner to use to return the results of the scheduled job.

return_config
The alternative configuration to use for returner configuration options.

return_kwargs
Any individual returner configuration items to override. Should be passed as a dictionary.

persist
Whether changes to the scheduled job should be saved, defaults to True.

skip_during_range
This will ensure that the scheduled command does not run within the range specified. The range parameter must be a dictionary with the date strings using the dateutil format. Requires python-dateutil.

run_after_skip_range
Whether the scheduled job should run immediately after the skip_during_range time period ends.

offline
Add the scheduled job to the Salt minion when the Salt minion is not running.

New in version 3006.3.

26.19.85 salt.states.selinux

Management of SELinux rules

If SELinux is available for the running system, the mode can be managed and booleans can be set.

```
enforcing:
    selinux.mode

samba_create_home_dirs:
    selinux.boolean:
      - value: True
      - persist: True

nginx:
    selinux.module:
      - enabled: False
```

Note: Use of these states require that the `selinux` execution module is available.

`salt.states.selinux.`**`boolean`**`(`*name, value, persist=False*`)`

Set up an SELinux boolean

name
The name of the boolean to set

value
The value to set on the boolean

persist
Defaults to False, set persist to true to make the boolean apply on a reboot

`salt.states.selinux.`**`fcontext_policy_absent`**`(`*name, filetype='a', sel_type=None, sel_user=None, sel_level=None*`)`

New in version 2017.7.0.

Makes sure an SELinux file context policy for a given filespec (name), filetype and SELinux context type is absent.

name
filespec of the file or directory. Regex syntax is allowed.

filetype
The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also *man semanage-fcontext*. Defaults to 'a' (all files).

sel_type
The SELinux context type. There are many.

sel_user
The SELinux user.

sel_level
The SELinux MLS range.

`salt.states.selinux.`**`fcontext_policy_applied`**`(`*name, recursive=False*`)`

New in version 2017.7.0.

Checks and makes sure the SELinux policies for a given filespec are applied.

`salt.states.selinux.`**`fcontext_policy_present`**`(`*name*, *sel_type*, *filetype='a'*, *sel_user=None*, *sel_level=None*`)`

New in version 2017.7.0.

Makes sure a SELinux policy for a given filespec (name), filetype and SELinux context type is present.

name
filespec of the file or directory. Regex syntax is allowed.

sel_type
SELinux context type. There are many.

filetype
The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also *man semanage-fcontext*. Defaults to 'a' (all files).

sel_user
The SELinux user.

sel_level
The SELinux MLS range.

`salt.states.selinux.`**`mode`**`(`*name*`)`

Verifies the mode SELinux is running in, can be set to enforcing, permissive, or disabled

Note: A change to or from disabled mode requires a system reboot. You will need to perform this yourself.

name
The mode to run SELinux in, permissive, enforcing, or disabled.

`salt.states.selinux.`**`module`**`(`*name*, *module_state='Enabled'*, *version='any'*, ***opts*`)`

Enable/Disable and optionally force a specific version for an SELinux module

name
The name of the module to control

module_state
Should the module be enabled or disabled?

version
Defaults to no preference, set to a specified value if required. Currently can only alert if the version is incorrect.

install
Setting to True installs module

source
Points to module source file, used only when install is True

remove
Setting to True removes module

New in version 2016.3.0.

`salt.states.selinux.`**`module_install`**`(`*name*`)`

Installs custom SELinux module from given file

name
Path to file with module to install

New in version 2016.11.6.

`salt.states.selinux.`**`module_remove`**`(`*name*`)`

Removes SELinux module

name
The name of the module to remove

New in version 2016.11.6.

`salt.states.selinux.`**`port_policy_absent`**`(`*name*, *sel_type=None*, *protocol=None*, *port=None*`)`

New in version 2019.2.0.

Makes sure an SELinux port policy for a given port, protocol and SELinux context type is absent.

name
The protocol and port spec. Can be formatted as `(tcp|udp)/(port|port-range)`.

sel_type
The SELinux Type. Optional; can be used in determining if policy is present, ignored by `semanage port --delete`.

protocol
The protocol for the port, `tcp` or `udp`. Required if name is not formatted.

port
The port or port range. Required if name is not formatted.

`salt.states.selinux.`**`port_policy_present`**`(`*name*, *sel_type*, *protocol=None*, *port=None*, *sel_range=None*`)`

New in version 2019.2.0.

Makes sure an SELinux port policy for a given port, protocol and SELinux context type is present.

name
The protocol and port spec. Can be formatted as `(tcp|udp)/(port|port-range)`.

sel_type
The SELinux Type.

protocol
The protocol for the port, `tcp` or `udp`. Required if name is not formatted.

port
The port or port range. Required if name is not formatted.

sel_range
The SELinux MLS/MCS Security Range.

26.19.86 salt.states.service

Starting or restarting of services and daemons

Services are defined as system daemons and are typically launched using system init or rc scripts. This service state uses whichever service module is loaded on the minion with the virtualname of `service`. Services can be defined as either running or dead.

If you need to know if your init system is supported, see the list of supported `service modules` for your desired init system (systemd, sysvinit, launchctl, etc.).

Note that Salt's service execution module, and therefore this service state, uses OS grains to ascertain which service module should be loaded and used to execute service functions. As existing distributions change init systems or new distributions are created, OS detection can sometimes be incomplete. If your service states are running into trouble with init system detection, please see the *Overriding Virtual Module Providers* section of Salt's module documentation to work around possible errors.

For services managed by systemd, the systemd_service module includes a built-in feature to reload the daemon when unit files are changed or extended. This feature is used automatically by the service state and the systemd_service module when running on a systemd minion, so there is no need to set up your own methods of reloading the daemon. If you need to manually reload the daemon for some reason, you can use the *`systemd_service.systemctl_reload`* function provided by Salt.

Note: The current status of a service is determined by the return code of the init/rc script status command. A status return code of 0 it is considered running. Any other return code is considered dead.

```
httpd:
  service.running: []
```

The service can also be set to start at runtime via the enable option:

```
openvpn:
  service.running:
    - enable: True
```

By default if a service is triggered to refresh due to a watch statement the service is restarted. If the desired behavior is to reload the service, then set the reload value to True:

```
redis:
  service.running:
    - enable: True
    - reload: True
    - watch:
      - pkg: redis
```

Note: More details regarding `watch` can be found in the *Requisites* documentation.

`salt.states.service.`**`dead`**`(`*name*, *enable=None*, *sig=None*, *init_delay=None*, ***kwargs*`)`

Ensure that the named service is dead by stopping the service if it is running

name
The name of the init or rc script used to manage the service

enable
Set the service to be enabled at boot time, `True` sets the service to be enabled, `False` sets the named service to be disabled. The default is `None`, which does not enable or disable anything.

sig
The string to search for when looking for the service process with ps

init_delay
Add a sleep command (in seconds) before the check to make sure service is killed.

New in version 2017.7.0.

no_block
[False] **For systemd minions only**. Stops the service using `--no-block`.

New in version 2017.7.0.

timeout
For Windows minions only.

The time in seconds to wait for the service to stop before returning. Default is the default for *`win_service.stop`*.

New in version 2017.7.9,2018.3.4.

`salt.states.service.`**`disabled`**`(`*name*, ***kwargs*`)`

Ensure that the service is disabled on boot, only use this state if you don't want to manage the running process, remember that if you want to disable a service to use the enable: False option for the running or dead function.

name
The name of the init or rc script used to manage the service

`salt.states.service.`**`enabled`**`(`*name*, ***kwargs*`)`

Ensure that the service is enabled on boot, only use this state if you don't want to manage the running process, remember that if you want to enable a running service to use the enable: True option for the running or dead function.

name

The name of the init or rc script used to manage the service

`salt.states.service.`**`masked`**`(`*name*, *runtime=False*`)`

New in version 2017.7.0.

Note: This state is only available on minions which use systemd.

Ensures that the named service is masked (i.e. prevented from being started).

name

Name of the service to mask

runtime

[False] By default, this state will manage an indefinite mask for the named service. Set this argument to `True` to runtime mask the service.

Note: It is possible for a service to have both indefinite and runtime masks set for it. Therefore, this state will manage a runtime or indefinite mask independently of each other. This means that if the service is already indefinitely masked, running this state with `runtime` set to `True` will _not_ remove the indefinite mask before setting a runtime mask. In these cases, if it is desirable to ensure that the service is runtime masked and not indefinitely masked, pair this state with a *`service.unmasked`* state, like so:

```yaml
mask_runtime_foo:
  service.masked:
    - name: foo
    - runtime: True

unmask_indefinite_foo:
  service.unmasked:
    - name: foo
    - runtime: False
```

`salt.states.service.`**`mod_beacon`**`(`*name*, ***kwargs*`)`

Create a beacon to monitor a service based on a beacon state argument.

Note: This state exists to support special handling of the `beacon` state argument for supported state functions. It should not be called directly.

`salt.states.service.`**`mod_watch`**`(`*name*, *sfun=None*, *sig=None*, *reload=False*, *full_restart=False*, *init_delay=None*, *force=False*, ***kwargs*`)`

The service watcher, called to invoke the watch command. When called, it will restart or reload the named service.

Note: This state exists to support special handling of the `watch` *requisite*. It should not be called directly.

Parameters for this function should be set by the watching service (e.g. `service.running`).

---

name
The name of the service to control.

sfun
The original function which triggered the mod_watch call (*service.running*, for example).

sig
The string to search for when looking for the service process with ps.

reload
When set, reload the service instead of restarting it (e.g. `service nginx reload`).

full_restart
Perform a full stop/start of a service by passing `--full-restart`. This option is ignored if `reload` is set and is supported by only a few *`service modules`*.

force
Use service.force_reload instead of reload (needs reload to be set to True).

init_delay
Add a sleep command (in seconds) before the service is restarted/reloaded.

`salt.states.service.`**`running`**(*name*, *enable=None*, *sig=None*, *init_delay=None*, ***kwargs*)

Ensure that the service is running

name
The name of the init or rc script used to manage the service

enable
Set the service to be enabled at boot time, `True` sets the service to be enabled, `False` sets the named service to be disabled. The default is `None`, which does not enable or disable anything.

sig
The string to search for when looking for the service process with ps

init_delay
Some services may not be truly available for a short period after their startup script indicates to the system that they are. Provide an 'init_delay' to specify that this state should wait an additional given number of seconds after a service has started before returning. Useful for requisite states wherein a dependent state might assume a service has started but is not yet fully initialized.

no_block
[False] **For systemd minions only**. Starts the service using `--no-block`.

New in version 2017.7.0.

timeout
For Windows minions only.

The time in seconds to wait for the service to start before returning. Default is the default for *`win_service.start`*.

New in version 2017.7.9,2018.3.4.

unmask
[False] **For systemd minions only**. Set to `True` to remove an indefinite mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before making any changes. This behavior is no longer the default.

unmask_runtime
[False] **For systemd minions only**. Set to `True` to remove a runtime mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before making any changes. This behavior is no longer the default.

wait
[3] **For systemd minions only**. Passed through when using *`service.status`* to determine whether the service is running or not.

New in version 2019.2.3.

Note:
`watch` can be used with service.running to restart a service when
another state changes (example: a file.managed state that creates the service's config file). More details regarding `watch` can be found in the *Requisites* documentation.

`salt.states.service.`**`unmasked`**`(`*name*, *runtime=False*`)`

New in version 2017.7.0.

Note: This state is only available on minions which use systemd.

Ensures that the named service is unmasked

name
Name of the service to unmask

runtime
[False] By default, this state will manage an indefinite mask for the named service. Set this argument to `True` to ensure that the service is runtime masked.

Note: It is possible for a service to have both indefinite and runtime masks set for it. Therefore, this state will manage a runtime or indefinite mask independently of each other. This means that if the service is indefinitely masked, running this state with `runtime` set to `True` will _not_ remove the indefinite mask.

26.19.87 salt.states.ssh_auth

Control of entries in SSH authorized_key files

The information stored in a user's SSH authorized key file can be easily controlled via the ssh_auth state. Defaults can be set by the enc, options, and comment keys. These defaults can be overridden by including them in the name.

Since the YAML specification limits the length of simple keys to 1024 characters, and since SSH keys are often longer than that, you may have to use a YAML 'explicit key', as demonstrated in the second example below.

```
AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY==:
  ssh_auth.present:
    - user: root
    - enc: ssh-dss

? AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY==...
:
  ssh_auth.present:
    - user: root
    - enc: ssh-dss

thatch:
  ssh_auth.present:
    - user: root
    - source: salt://ssh_keys/thatch.id_rsa.pub
    - config: '%h/.ssh/authorized_keys'
```

(continues on next page)

(continued from previous page)

```
sshkeys:
  ssh_auth.present:
    - user: root
    - enc: ssh-rsa
    - options:
      - option1="value1"
      - option2="value2 flag2"
    - comment: myuser
    - names:
      - AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY==
      - ssh-dss AAAAB3NzaCL0sQ9fJ5bYTEyY== user@domain
      - option3="value3" ssh-dss AAAAB3NzaC1kcQ9J5bYTEyY== other@testdomain
      - AAAAB3NzaC1kcQ9fJFF435bYTEyY== newcomment

sshkeys:
  ssh_auth.manage:
    - user: root
    - enc: ssh-rsa
    - options:
      - option1="value1"
      - option2="value2 flag2"
    - comment: myuser
    - ssh_keys:
      - AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY==
      - ssh-dss AAAAB3NzaCL0sQ9fJ5bYTEyY== user@domain
      - option3="value3" ssh-dss AAAAB3NzaC1kcQ9J5bYTEyY== other@testdomain
      - AAAAB3NzaC1kcQ9fJFF435bYTEyY== newcomment
```

`salt.states.ssh_auth.`**`absent`**(*name, user, enc='ssh-rsa', comment='', source='', options=None, config='.ssh/authorized_keys', fingerprint_hash_type=None*)

Verifies that the specified SSH key is absent

name

The SSH key to manage

user

The user who owns the SSH authorized keys file to modify

enc

Defines what type of key is being used, can be ed25519, ecdsa, ssh-rsa, ssh-dss or any other type as of openssh server version 8.7.

comment

The comment to be placed with the SSH public key

options

The options passed to the key, pass a list object

source

The source file for the key(s). Can contain any number of public keys, in standard "authorized_keys" format. If this is set, comment, enc and options will be ignored.

New in version 2015.8.0.

config

The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/authorized_keys". Token expansion %u and %h for username and home path supported.

fingerprint_hash_type

The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to `sha256` if not specified.

New in version 2016.11.7.

`salt.states.ssh_auth.`**`manage`**(*name*, *ssh_keys*, *user*, *enc='ssh-rsa'*, *comment=''*, *source=''*, *options=None*, *config='.ssh/authorized_keys'*, *fingerprint_hash_type=None*, ***kwargs*)

New in version 3000.

Ensures that only the specified ssh_keys are present for the specified user

ssh_keys
The SSH key to manage

user
The user who owns the SSH authorized keys file to modify

enc
Defines what type of key is being used, can be ed25519, ecdsa, ssh-rsa, ssh-dss or any other type as of openssh server version 8.7.

comment
The comment to be placed with the SSH public key

source
The source file for the key(s). Can contain any number of public keys, in standard "authorized_keys" format. If this is set, comment and enc will be ignored.

Note: The source file must contain keys in the format `<enc> <key> <comment>`. If you have generated a keypair using PuTTYgen, then you will need to do the following to retrieve an OpenSSH-compatible public key.

1. In PuTTYgen, click `Load`, and select the *private* key file (not the public key), and click `Open`.
2. Copy the public key from the box labeled `Public key for pasting into OpenSSH authorized_keys file`.
3. Paste it into a new file.

---

options
The options passed to the keys, pass a list object

config
The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/authorized_keys". Token expansion %u and %h for username and home path supported.

fingerprint_hash_type
The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to `sha256` if not specified.

`salt.states.ssh_auth.`**`present`**(*name*, *user*, *enc='ssh-rsa'*, *comment=''*, *source=''*, *options=None*, *config='.ssh/authorized_keys'*, *fingerprint_hash_type=None*, ***kwargs*)

Verifies that the specified SSH key is present for the specified user

name
The SSH key to manage

user
The user who owns the SSH authorized keys file to modify

enc
Defines what type of key is being used, can be ed25519, ecdsa, ssh-rsa, ssh-dss or any other type as of openssh server version 8.7.

comment
The comment to be placed with the SSH public key

source
The source file for the key(s). Can contain any number of public keys, in standard "authorized_keys" format. If this is set, comment and enc will be ignored.

Note: The source file must contain keys in the format `<enc> <key> <comment>`. If you have generated a keypair using PuTTYgen, then you will need to do the following to retrieve an OpenSSH-compatible public key.

1. In PuTTYgen, click `Load`, and select the *private* key file (not the public key), and click `Open`.
2. Copy the public key from the box labeled `Public key for pasting into OpenSSH authorized_keys file`.
3. Paste it into a new file.

---

options
The options passed to the key, pass a list object

config
The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/authorized_keys". Token expansion %u and %h for username and home path supported.

fingerprint_hash_type
The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to `sha256` if not specified.

26.19.88 salt.states.ssh_known_hosts

Control of SSH known_hosts entries

Manage the information stored in the known_hosts files.

```
github.com:
  ssh_known_hosts:
    - present
    - user: root
    - fingerprint: 16:27:ac:a5:76:28:2d:36:63:1b:56:4d:eb:df:a6:48
    - fingerprint_hash_type: md5

example.com:
  ssh_known_hosts:
    - absent
    - user: root
```

`salt.states.ssh_known_hosts.`**`absent`**`(`*name*, *user=None*, *config=None*`)`

Verifies that the specified host is not known by the given user

name
The host name Note that only single host names are supported. If foo.example.com and bar.example.com are the same machine and you need to exclude both, you will need one Salt state for each.

user
The user who owns the ssh authorized keys file to modify

config
The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/known_hosts". If no user is specified, defaults to "/etc/ssh/ssh_known_hosts". If present, must be an absolute path when a user is not specified.

`salt.states.ssh_known_hosts.`**`present`**`(`*name*, *user=None*, *fingerprint=None*, *key=None*, *port=None*, *enc=None*, *config=None*, *hash_known_hosts=True*, *timeout=5*, *fingerprint_hash_type=None*`)`

Verifies that the specified host is known by the specified user

On many systems, specifically those running with openssh 4 or older, the `enc` option must be set, only openssh 5 and above can detect the key type.

name
The name of the remote host (e.g. "github.com") Note that only a single hostname is supported, if foo.example.com and bar.example.com have the same host you will need two separate Salt States to represent them.

user
The user who owns the ssh authorized keys file to modify

fingerprint
The fingerprint of the key which must be present in the known_hosts file (optional if key specified)

key
The public key which must be present in the known_hosts file (optional if fingerprint specified)

port
optional parameter, port which will be used to when requesting the public key from the remote host, defaults to port 22.

enc
Defines what type of key is being used, can be ed25519, ecdsa, ssh-rsa, ssh-dss or any other type as of openssh server version 8.7.

config
The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/known_hosts". If no user is specified, defaults to "/etc/ssh/ssh_known_hosts". If present, must be an absolute path when a user is not specified.

hash_known_hosts
[True] Hash all hostnames and addresses in the known hosts file.

timeout
[int] Set the timeout for connection attempts. If `timeout` seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

New in version 2016.3.0.

fingerprint_hash_type
The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to `sha256` if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0: default changed from `md5` to `sha256`

26.19.89 salt.states.stateconf

Stateconf System

The stateconf system is intended for use only with the stateconf renderer. This State module presents the set function. This function does not execute any functionality, but is used to interact with the stateconf renderer.

`salt.states.stateconf.`**`context`**`(`*name*, ***kwargs*`)`

No-op state to support state config via the stateconf renderer.

`salt.states.stateconf.`**`set`**`(`*name*, ***kwargs*`)`

No-op state to support state config via the stateconf renderer.

26.19.90 salt.states.status

Minion status monitoring

Maps to the *status* execution module.

`salt.states.status.`**`loadavg`**`(`*name*, *maximum=None*, *minimum=None*`)`

Return the current load average for the specified minion. Available values for name are *1-min*, *5-min* and *15-min*. *minimum* and *maximum* values should be passed in as strings.

`salt.states.status.`**`process`**`(`*name*`)`

Return whether the specified signature is found in the process tree. This differs slightly from the services states, in that it may refer to a process that is not managed via the init system.

26.19.91 salt.states.sysctl

Configuration of the kernel using sysctl

Control the kernel sysctl system.

```
vm.swappiness:
  sysctl.present:
    - value: 20
```

`salt.states.sysctl.`**`present`**`(`*name*, *value*, *config=None*`)`

Ensure that the named sysctl value is set in memory and persisted to the named configuration file. The default sysctl configuration file is /etc/sysctl.conf

name
The name of the sysctl value to edit

value
The sysctl value to apply. Make sure to set the value to the correct expected output for systctl or reading the respective /proc/sys file. For example, instead of adding the value *1,2,3* you might need to write *1-3*. If you do not set the correct value, Salt will continue to return with changes.

config
The location of the sysctl configuration file. If not specified, the proper location will be detected based on platform.

26.19.92 salt.states.sysfs

Configuration of the kernel using sysfs

Control the kernel object attributes exported by sysfs

```
kernel/mm/transparent_hugepage/enabled
  sysfs.present:
    - value: never
```

New in version 3006.0.

`salt.states.sysfs.`**`present`**`(`*name*, *value*, *config=None*`)`

Ensure that the named sysfs attribute is set with the defined value

name
The name of the sysfs attribute to edit

value
The sysfs value to apply

26.19.93 salt.states.syslog_ng

State module for syslog_ng

maintainer
Tibor Benke <btibi@sch.bme.hu>

maturity
new

depends
cmd, ps, syslog_ng

platform
all

Users can generate syslog-ng configuration files from YAML format or use
plain ones and reload, start, or stop their syslog-ng by using this module.

Details

The service module is not available on all system, so this module includes *`syslog_ng.reloaded`*, *`syslog_ng.stopped`*, and *`syslog_ng.started`* functions. If the service module is available on the computers, users should use that.

Users can generate syslog-ng configuration with *`syslog_ng.config`* function. For more information see *syslog-ng state usage*.

Syslog-ng configuration file format

The syntax of a configuration snippet in syslog-ng.conf:

> object_type object_id {<options>};

These constructions are also called statements. There are options inside of them:

> option(parameter1, parameter2); option2(parameter1, parameter2);

You can find more information about syslog-ng's configuration syntax in the Syslog-ng Admin guide: http://www.balabit.com/sites/default/files/documents/syslog-ng-ose-3.5-guides/en/syslog-ng-ose-v3.5-guide-admin/html-single/index.html#syslog-ng.conf.5

`salt.states.syslog_ng.`**`config`**`(`*name*, *config*, *write=True*`)`

Builds syslog-ng configuration.

name : the id of the Salt document config : the parsed YAML code write : if True, it writes the config into the configuration file, otherwise just returns it

`salt.states.syslog_ng.`**`reloaded`**`(`*name*`)`

Reloads syslog-ng.

`salt.states.syslog_ng.`**`started`**`(`*name=None, user=None, group=None, chroot=None, caps=None, no_caps=False, pidfile=None, enable_core=False, fd_limit=None, verbose=False, debug=False, trace=False, yydebug=False, persist_file=None, control=None, worker_threads=None, *args, **kwargs*`)`

Ensures, that syslog-ng is started via the given parameters.

Users shouldn't use this function, if the service module is available on their system.

`salt.states.syslog_ng.`**`stopped`**`(`*name=None*`)`

Kills syslog-ng.

26.19.94 salt.states.test

Test States

Provide test case states that enable easy testing of things to do with state calls, e.g. running, calling, logging, output filtering etc.

```
always-passes-with-any-kwarg:
  test.nop:
    - name: foo
    - something: else
    - foo: bar

always-passes:
  test.succeed_without_changes:
    - name: foo

always-fails:
  test.fail_without_changes:
    - name: foo

always-changes-and-succeeds:
  test.succeed_with_changes:
    - name: foo

always-changes-and-fails:
  test.fail_with_changes:
    - name: foo

my-custom-combo:
  test.configurable_test_state:
    - name: foo
    - changes: True
    - result: False
    - comment: bar.baz
    - warnings: A warning

is-pillar-foo-present-and-bar-is-int:
  test.check_pillar:
    - present:
        - foo
```

(continues on next page)

(continued from previous page)

```
    - integer:
      - bar
```

You may also use these states for controlled failure in state definitions, for example if certain conditions in pillar or grains do not apply. The following state definition will fail with a message "OS not supported!" when *grains['os']* is neither Ubuntu nor CentOS:

```
{% if grains['os'] in ['Ubuntu', 'CentOS'] %}

# Your state definitions go here

{% else %}
failure:
  test.fail_without_changes:
    - name: "OS not supported!"
    - failhard: True
{% endif %}
```

`salt.states.test.`**`check_pillar`**`(`*name, present=None, boolean=None, integer=None, string=None, listing=None, dictionary=None, verbose=False*`)`

Checks the presence and, optionally, the type of given keys in Pillar

Supported kwargs for types are: - boolean (bool) - integer (int) - string (str) - listing (list) - dictionary (dict)

Checking for None type pillars is not implemented yet.

```
is-pillar-foo-present-and-bar-is-int:
  test.check_pillar:
    - present:
      - foo
    - integer:
      - bar
```

`salt.states.test.`**`configurable_test_state`**`(`*name, changes=True, result=True, comment='', warnings=None, allow_test_mode_failure=False*`)`

New in version 2014.7.0.

A configurable test state which allows for more control over the return data

name

A unique string to serve as the state's ID

changes

[True] Controls whether or not the state reports that there were changes. There are three supported values for this argument:

- If `True`, the state will report changes
- If `False`, the state will report no changes
- If `"Random"`, the state will randomly report either changes or no changes.

result

[True] Controls the result for for the state. Like `changes`, there are three supported values for this argument:

- If `True`, the state will report a `True` result
- If `False`, the state will report a `False` result
- If `"Random"`, the state will randomly report either `True`

Note: The result will be reported as `None` if *all* of the following are true:

1. The state is being run in test mode (i.e. `test=True` on the CLI)
2. `result` is `True` (either explicitly, or via being set to `"Random"`)
3. `changes` is `True` (either explicitly, or via being set to `"Random"`)

---

comment
[""] Comment field field for the state. By default, this is an empty string.

warnings
A string (or a list of strings) to fill the warnings field with. Default is None

New in version 3000.

allow_test_mode_failure
When False, running this state in test mode can only return a True or None result. When set to True and result is set to False, the test mode result will be False. Default is False

New in version 3007.0.

`salt.states.test.fail_with_changes(name, **kwargs)`

New in version 2014.7.0.

Returns `False` with an non-empty `changes` dictionary. Useful for testing requisites.

name
A unique string to serve as the state's ID

`salt.states.test.fail_without_changes(name, **kwargs)`

New in version 2014.7.0.

Returns failure

name
A unique string to serve as the state's ID

`salt.states.test.mod_watch(name, sfun=None, **kwargs)`

Call this function via a watch statement

New in version 2014.7.0.

Any parameters in the state return dictionary can be customized by adding the keywords `result`, `comment`, and `changes`.

```yaml
this_state_will_return_changes:
  test.succeed_with_changes

this_state_will_NOT_return_changes:
  test.succeed_without_changes

this_state_is_watching_another_state:
  test.succeed_without_changes:
    - comment: 'This is a custom comment'
    - watch:
      - test: this_state_will_return_changes
      - test: this_state_will_NOT_return_changes

this_state_is_also_watching_another_state:
  test.succeed_without_changes:
    - watch:
      - test: this_state_will_NOT_return_changes
```

`salt.states.test.nop(name, **kwargs)`

New in version 2015.8.1.

A no-op state that does nothing. Useful in conjunction with the `use` requisite, or in templates which could otherwise be empty due to jinja rendering.

name
A unique string to serve as the state's ID

`salt.states.test.`**`show_notification`**`(`*name*, *text=None*, ***kwargs*`)`

New in version 2015.8.0.

Simple notification using text argument.

name
A unique string to serve as the state's ID

text
Text to return in the comment field

`salt.states.test.`**`succeed_with_changes`**`(`*name*, ***kwargs*`)`

New in version 2014.7.0.

Returns `True` with an non-empty `changes` dictionary. Useful for testing requisites.

name
A unique string to serve as the state's ID

`salt.states.test.`**`succeed_without_changes`**`(`*name*, ***kwargs*`)`

New in version 2014.7.0.

Returns successful

name
A unique string to serve as the state's ID

26.19.95 salt.states.timezone

Management of timezones

The timezone can be managed for the system:

```
America/Denver:
  timezone.system
```

The system and the hardware clock are not necessarily set to the same time. By default, the hardware clock is set to localtime, meaning it is set to the same time as the system clock. If *utc* is set to True, then the hardware clock will be set to UTC, and the system clock will be an offset of that.

```
America/Denver:
  timezone.system:
    - utc: True
```

The Ubuntu community documentation contains an explanation of this setting, as it applies to systems that dual-boot with Windows. This is explained in greater detail here.

`salt.states.timezone.`**`system`**`(`*name*, *utc=True*`)`

Set the timezone for the system.

name
The name of the timezone to use (e.g.: America/Denver)

utc
Whether or not to set the hardware clock to UTC (default is True)

26.19.96 salt.states.tls

Enforce state for SSL/TLS

salt.states.tls.**valid_certificate**(*name*, *weeks=0*, *days=0*, *hours=0*, *minutes=0*, *seconds=0*)

Verify that a TLS certificate is valid now and (optionally) will be valid for the time specified through weeks, days, hours, minutes, and seconds.

26.19.97 salt.states.uptime

Monitor Web Server with Uptime

Uptime is an open source remote monitoring application using Node.js, MongoDB, and Twitter Bootstrap.

Warning: This state module is beta. It might be changed later to include more or less automation.

Note: This state module requires a pillar to specify the location of your uptime install

```
uptime:
  application_url: "http://uptime-url.example.org"
```

Example:

```
url:
  uptime.monitored
url/sitemap.xml:
  uptime.monitored:
     - polling: 600 # every hour
```

salt.states.uptime.**monitored**(*name*, ***params*)

Makes sure an URL is monitored by uptime. Checks if URL is already monitored, and if not, adds it.

26.19.98 salt.states.user

Management of user accounts.

The user module is used to create and manage user settings, users can be set as either absent or present

```
fred:
  user.present:
    - fullname: Fred Jones
    - shell: /bin/zsh
    - home: /home/fred
    - uid: 4000
    - gid: 4000
    - groups:
      - wheel
      - storage
```

(continues on next page)

(continued from previous page)

```
      - games

testuser:
  user.absent
```

salt.states.user.**absent**(*name*, *purge=False*, *force=False*, *local=False*)

Ensure that the named user is absent

name
The name of the user to remove

purge
Set purge to True to delete all of the user's files as well as the user, Default is `False`.

force
If the user is logged in, the absent state will fail. Set the force option to True to remove the user even if they are logged in. Not supported in FreeBSD and Solaris, Default is `False`.

local (Only on systems with luserdel available):
Ensure the user account is removed locally ignoring global account management (default is False).

New in version 3007.0.

salt.states.user.**present**(*name*, *uid=None*, *gid=None*, *usergroup=None*, *groups=None*, *optional_groups=None*, *remove_groups=True*, *home=None*, *createhome=True*, *password=None*, *hash_password=False*, *enforce_password=True*, *empty_password=False*, *shell=None*, *unique=True*, *system=False*, *fullname=None*, *roomnumber=None*, *workphone=None*, *homephone=None*, *other=None*, *loginclass=None*, *date=None*, *mindays=None*, *maxdays=None*, *inactdays=None*, *warndays=None*, *expire=None*, *win_homedrive=None*, *win_profile=None*, *win_logonscript=None*, *win_description=None*, *nologinit=False*, *allow_uid_change=False*, *allow_gid_change=False*, *password_lock=None*, *local=False*)

Ensure that the named user is present with the specified properties

name
The name of the user to manage

uid
The user id to assign. If not specified, and the user does not exist, then the next available uid will be assigned.

gid
The id of the default group to assign to the user. Either a group name or gid can be used. If not specified, and the user does not exist, then the next available gid will be assigned.

allow_uid_change
[False] Set to `True` to allow the state to update the uid.

New in version 2018.3.1.

allow_gid_change
[False] Set to `True` to allow the state to update the gid.

New in version 2018.3.1.

usergroup
If True, a group with the same name as the user will be created. If False, a group with the same name as the user will not be created. The default is distribution-specific. See the USERGROUPS_ENAB section of the login.defs(5) man page.

Note: Only supported on GNU/Linux distributions

New in version 3001.

groups
A list of groups to assign the user to, pass a list object. If a group specified here does not exist on the minion, the state will fail. If set to the empty list, the user will be removed from all groups except the default group. If unset, salt will assume current groups are still wanted, and will make no changes to them.

optional_groups
A list of groups to assign the user to, pass a list object. If a group specified here does not exist on the minion, the state will silently ignore it.

NOTE: If the same group is specified in both ”groups” and ”optional_groups”, then it will be assumed to be required and not optional.

remove_groups
Remove groups that the user is a member of that weren't specified in the state, Default is `True`.

home
The custom login directory of user. Uses default value of underlying system if not set. Notice that this directory does not have to exist. This also the location of the home directory to create if createhome is set to True.

createhome
[True] If set to `False`, the home directory will not be created if it doesn't already exist.

Warning: Not supported on Windows or Mac OS.

Additionally, parent directories will *not* be created. The parent directory for `home` must already exist.

nologinit
[False] If set to `True`, it will not add the user to lastlog and faillog databases.

Note: Not supported on Windows.

password
A password hash to set for the user. Updating a password on an existing account is only supported on Linux, FreeBSD, NetBSD, OpenBSD, and Solaris. If the `empty_password` argument is set to `True` then `password` is ignored. For Windows this is the plain text password. For Linux, the hash can be generated with `mkpasswd -m sha-256`.

Changed in version 0.16.0: BSD support added.

hash_password
Set to True to hash the clear text password. Default is `False`.

enforce_password
Set to False to keep the password from being changed if it has already been set and the password hash differs from what is specified in the ”password” field. This option will be ignored if ”password” is not specified, Default is `True`.

empty_password
Set to True to enable password-less login for user, Default is `False`.

password_lock
Set to `False` to unlock a user's password (or Windows account). On non-Windows systems ONLY, this parameter can be set to `True` to lock a user's password. Default is `None`, which does not take action on the password (or Windows account).

New in version 3006.0.

shell
The login shell, defaults to the system default shell

unique
Require a unique UID, Default is `True`.

system
Choose UID in the range of FIRST_SYSTEM_UID and LAST_SYSTEM_UID, Default is `False`.

loginclass
The login class, defaults to empty (BSD only)

User comment field (GECOS) support (currently Linux, BSD, and MacOS only):

The below values should be specified as strings to avoid ambiguities when the values are loaded. (Especially the phone and room number fields which are likely to contain numeric data)

fullname
The user's full name

roomnumber
The user's room number (not supported in MacOS)

workphone
The user's work phone number (not supported in MacOS)

homephone
The user's home phone number (not supported in MacOS)

other
The user's other attribute (not supported in MacOS) If GECOS field contains more than 4 commas, this field will have the rest of 'em

Changed in version 2014.7.0: Shadow attribute support added.

Shadow attributes support (currently Linux only):

The below values should be specified as integers.

date
Date of last change of password, represented in days since epoch (January 1, 1970).

mindays
The minimum number of days between password changes.

maxdays
The maximum number of days between password changes.

inactdays
The number of days after a password expires before an account is locked.

warndays
Number of days prior to maxdays to warn users.

expire
Date that account expires, represented in days since epoch (January 1, 1970).

local (Only on systems with luseradd available):
Create the user account locally ignoring global account management (default is False).

New in version 3007.0.

The below parameters apply to windows only:

win_homedrive (Windows Only)
The drive letter to use for the home directory. If not specified the home directory will be a unc path. Otherwise the home directory will be mapped to the specified drive. Must be a letter followed by a colon. Because of the colon, the value must be surrounded by single quotes. ie: `- win_homedrive: 'U:'`

Changed in version 2015.8.0.

win_profile (Windows Only)
The custom profile directory of the user. Uses default value of underlying system if not set.

Changed in version 2015.8.0.

win_logonscript (Windows Only)
The full path to the logon script to run when the user logs in.

Changed in version 2015.8.0.

win_description (Windows Only)
A brief description of the purpose of the users account.

Changed in version 2015.8.0.

26.19.99 salt.states.virtualenv

Setup of Python virtualenv sandboxes.

New in version 0.17.0.

`salt.states.virtualenv_mod.`**`manage`**`(`*name*, *venv_bin=None*, *requirements=None*, *system_site_packages=False*, *distribute=False*, *use_wheel=False*, *clear=False*, *python=None*, *extra_search_dir=None*, *never_download=None*, *prompt=None*, *user=None*, *cwd=None*, *index_url=None*, *extra_index_url=None*, *pre_releases=False*, *no_deps=False*, *pip_download=None*, *pip_download_cache=None*, *pip_exists_action=None*, *pip_ignore_installed=False*, *proxy=None*, *use_vt=False*, *env_vars=None*, *no_use_wheel=False*, *pip_upgrade=False*, *pip_pkgs=None*, *pip_no_cache_dir=False*, *pip_cache_dir=None*, *process_dependency_links=False*, *no_binary=None*, ***kwargs*`)`

This function is an alias of `managed`.

Create a virtualenv and optionally manage it with pip

name
Path to the virtualenv.

venv_bin: virtualenv
The name (and optionally path) of the virtualenv command. This can also be set globally in the minion config file as `virtualenv.venv_bin`.

requirements: None
Path to a pip requirements file. If the path begins with `salt://` the file will be transferred from the master file server.

use_wheel: False
Prefer wheel archives (requires pip >= 1.4).

python: None
Python executable used to build the virtualenv. When Salt is installed from a onedir package. You will likely want to specify which python interperter should be used.

user: None
The user under which to run virtualenv and pip.

cwd: None
Path to the working directory where *pip install* is executed.

no_deps: False
Pass *--no-deps* to *pip install*.

pip_exists_action: None
Default action of pip when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup.

proxy: None
Proxy address which is passed to *pip install*.

env_vars: None
Set environment variables that some builds will depend on. For example, a Python C-module may have a Makefile that needs INCLUDE_PATH set to pick up a header file while compiling.

no_use_wheel: False
Force to not use wheel archives (requires pip>=1.4)

no_binary
Force to not use binary packages (requires pip >= 7.0.0) Accepts either :all: to disable all binary packages, :none: to empty the set, or a list of one or more packages

pip_upgrade: False
Pass *--upgrade* to *pip install*.

pip_pkgs: None
As an alternative to *requirements*, pass a list of pip packages that should be installed.

process_dependency_links: False
Run pip install with the --process_dependency_links flag.

New in version 2017.7.0.

Also accepts any kwargs that the virtualenv module will. However, some kwargs, such as the `pip` option, require `- distribute: True`.

```
/var/www/myvirtualenv.com:
  virtualenv.managed:
    - system_site_packages: False
    - requirements: salt://REQUIREMENTS.txt
    - env_vars:
        PATH_VAR: '/usr/local/bin/'
```

Current versions of Salt use onedir packages and will use onedir python interpreter by default. If you've installed Salt via out package repository. You will likely want to provide the path to the interpreter with which you would like to be used to create the virtual environment. The interpreter can be specified by providing the *python* option.

`salt.states.virtualenv_mod.`**`managed`**`(`*name, venv_bin=None, requirements=None, system_site_packages=False, distribute=False, use_wheel=False, clear=False, python=None, extra_search_dir=None, never_download=None, prompt=None, user=None, cwd=None, index_url=None, extra_index_url=None, pre_releases=False, no_deps=False, pip_download=None, pip_download_cache=None, pip_exists_action=None, pip_ignore_installed=False, proxy=None, use_vt=False, env_vars=None, no_use_wheel=False, pip_upgrade=False, pip_pkgs=None, pip_no_cache_dir=False, pip_cache_dir=None, process_dependency_links=False, no_binary=None, **kwargs*`)`

Create a virtualenv and optionally manage it with pip

name
Path to the virtualenv.

venv_bin: virtualenv
The name (and optionally path) of the virtualenv command. This can also be set globally in the minion config file as `virtualenv.venv_bin`.

requirements: None
Path to a pip requirements file. If the path begins with `salt://` the file will be transferred from the master file server.

use_wheel: False
Prefer wheel archives (requires pip >= 1.4).

python: None
Python executable used to build the virtualenv. When Salt is installed from a onedir package. You will likely want to specify which python interperter should be used.

user: None
The user under which to run virtualenv and pip.

cwd: None
Path to the working directory where *pip install* is executed.

no_deps: False
Pass *--no-deps* to *pip install*.

pip_exists_action: None

Default action of pip when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup.

proxy: None
Proxy address which is passed to *pip install*.

env_vars: None
Set environment variables that some builds will depend on. For example, a Python C-module may have a Makefile that needs INCLUDE_PATH set to pick up a header file while compiling.

no_use_wheel: False
Force to not use wheel archives (requires pip>=1.4)

no_binary
Force to not use binary packages (requires pip >= 7.0.0) Accepts either :all: to disable all binary packages, :none: to empty the set, or a list of one or more packages

pip_upgrade: False
Pass *--upgrade* to *pip install*.

pip_pkgs: None
As an alternative to *requirements*, pass a list of pip packages that should be installed.

process_dependency_links: False
Run pip install with the --process_dependency_links flag.

New in version 2017.7.0.

Also accepts any kwargs that the virtualenv module will. However, some kwargs, such as the `pip` option, require `- distribute: True`.

```
/var/www/myvirtualenv.com:
  virtualenv.managed:
    - system_site_packages: False
    - requirements: salt://REQUIREMENTS.txt
    - env_vars:
        PATH_VAR: '/usr/local/bin/'
```

Current versions of Salt use onedir packages and will use onedir python interpreter by default. If you've installed Salt via out package repository. You will likely want to provide the path to the interpreter with which you would like to be used to create the virtual environment. The interpreter can be specified by providing the *python* option.

26.19.100 salt.states.win_appx

Manage Microsoft Store apps on Windows. Removing an app with this modules will deprovision the app from the online Windows image.

New in version 3007.0.

`salt.states.win_appx.`**`absent`**(*name*, *query*, *include_store=False*, *frameworks=False*, *deprovision_only=False*)

Removes Microsoft Store packages from the system. If the package is part of a bundle, the entire bundle will be removed.

This function removes the package for all users on the system. It also deprovisions the package so that it isn't re-installed by later system updates. To only deprovision a package and not remove it for all users, set `deprovision_only=True`.

Parameters

- **query** (*str*) -- The query string to use to select the packages to be removed. If the string matches multiple packages, they will all be removed. Here are some example strings:

string	description
`*teams*`	Remove Microsoft Teams
`*zune*`	Remove Windows Media Player and Zune Video
`*zuneMusic*`	Only remove Windows Media Player
`*xbox*`	Remove all xBox packages, there are 5 by default
`*`	Remove everything but the Microsoft Store, unless `include_store=True`

> **Note:** Use the `appx.list` function to make sure your query is returning what you expect. Then use the same query to remove those packages

- **`include_store`** (*bool*) -- Include the Microsoft Store in the results of the query to be removed. Use this with caution. It is difficult to reinstall the Microsoft Store once it has been removed with this function. Default is `False`
- **`frameworks`** (*bool*) -- Include frameworks in the results of the query to be removed. Default is `False`
- **`deprovision_only`** (*bool*) -- Only deprovision the package. The package will be removed from the current user and added to the list of deprovisioned packages. The package will not be re-installed in future system updates. New users of the system will not have the package installed. However, the package will still be installed for existing users. Default is `False`

Returns
`True` if successful, `None` if no packages found

Return type
bool

Raises
`CommandExecutionError` -- On errors encountered removing the package

CLI Example:

```
remove_candy_crush:
  appx.absent:
    - query: "*candy*"
```

26.19.101 salt.states.win_certutil

Installing of certificates to the Windows Certificate Manager

Install certificates to the Windows Certificate Manager

```
salt://certs/cert.cer:
  certutil.add_store:
    - store: TrustedPublisher
```

`salt.states.win_certutil.`**`add_store`**(*name, store, saltenv='base'*)

Store a certificate to the given certificate store

Parameters

- **`name`** (*str*) -- The path to the certificate to add to the store. This is either the path to a local file or a file from the file server in the form of `salt://path/to/file`
- **`store`** (*str*) -- The certificate store to add the certificate to
- **`saltenv`** (*str*) -- The salt environment to use. This is ignored if the path is local

Returns
A dictionary containing the results

Return type
dict

CLI Example:

```
add_certificate:
  certutil.add_store:
    name: salt://web_cert.cer
    store: TrustedPublisher
```

salt.states.win_certutil.**del_store**(*name*, *store*, *saltenv='base'*)

Remove a certificate from the given certificate store

Parameters

- **name** (*str*) -- The path to the certificate to remove from the store. This is either the path to a local file or a file from the file server in the form of `salt://path/to/file`
- **store** (*str*) -- The certificate store to remove the certificate from
- **saltenv** (*str*) -- The salt environment to use. This is ignored if the path is local

Returns
A dictionary containing the results

Return type
dict

CLI Example:

```
remove_certificate:
  certutil.del_store:
    name: salt://web_cert.cer
    store: TrustedPublisher
```

26.19.102 salt.states.win_dacl

Windows Object Access Control Lists

Ensure an ACL is present

parameters:
name - the path of the object objectType - Registry/File/Directory user - user account or SID for the ace permission - permission for the ace (see module win_acl for available permissions for each objectType) acetype - Allow/Deny propagation - how the ACL should apply to child objects (see module win_acl for available propagation types)

```
addAcl:
  win_dacl.present:
    - name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
    - objectType: Registry
    - user: FakeUser
    - permission: FullControl
    - acetype: ALLOW
    - propagation: KEY&SUBKEYS
```

Ensure an ACL does not exist

parameters:
name - the path of the object objectType - Registry/File/Directory user - user account or SID for the ace

permission - permission for the ace (see module win_acl for available permissions for each objectType) acetype - Allow/Deny propagation - how the ACL should apply to child objects (see module win_acl for available propagation types)

```
removeAcl:
  win_dacl.absent:
    - name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
    - objectType: Registry
    - user: FakeUser
    - permission: FullControl
    - acetype: ALLOW
    - propagation: KEY&SUBKEYS
```

Ensure an object is inheriting permissions

parameters:

name - the path of the object objectType - Registry/File/Directory clear_existing_acl - True/False - when inheritance is enabled, should the existing ACL be kept or cleared out

```
eInherit:
  win_dacl.enableinheritance:
    - name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
    - objectType: Registry
    - clear_existing_acl: True
```

Ensure an object is not inheriting permissions

parameters:

name - the path of the object objectType - Registry/File/Directory copy_inherited_acl - True/False - if inheritance is enabled, should the inherited permissions be copied to the ACL when inheritance is disabled

```
dInherit:
  win_dacl.disableinheritance:
    - name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
    - objectType: Registry
    - copy_inherited_acl: False
```

`salt.states.win_dacl.`**`absent`**(*name*, *objectType*, *user*, *permission*, *acetype*, *propagation*)

Ensure an ACL does not exist

`salt.states.win_dacl.`**`disinherit`**(*name*, *objectType*, *copy_inherited_acl=True*)

Ensure an object is not inheriting ACLs from its parent

`salt.states.win_dacl.`**`inherit`**(*name*, *objectType*, *clear_existing_acl=False*)

Ensure an object is inheriting ACLs from its parent

`salt.states.win_dacl.`**`present`**(*name*, *objectType*, *user*, *permission*, *acetype*, *propagation*)

Ensure an ACE is present

26.19.103 salt.states.win_dism

Installing of Windows features using DISM

Install Windows features, capabilities, and packages with DISM

```
Language.Basic~~~en-US~0.0.1.0:
  dism.capability_installed

NetFx3:
  dism.feature_installed
```

`salt.states.win_dism.`**`capability_installed`**(*name*, *source=None*, *limit_access=False*, *image=None*, *restart=False*)

Install a DISM capability

Parameters

- **name** (*str*) -- The capability to install
- **source** (*str*) -- The optional source of the capability
- **limit_access** (*bool*) -- Prevent DISM from contacting Windows Update for online images
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is `None`
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

Example

Run `dism.available_capabilities` to get a list of available capabilities. This will help you get the proper name to use

```
install_dotnet35:
  dism.capability_installed:
    - name: NetFX3~~~~
```

`salt.states.win_dism.`**`capability_removed`**(*name*, *image=None*, *restart=False*)

Uninstall a DISM capability

Parameters

- **name** (*str*) -- The capability to uninstall
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is `None`
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the uninstall

Example

Run `dism.installed_capabilities` to get a list of installed capabilities. This will help you get the proper name to use

```
remove_dotnet35:
  dism.capability_removed:
    - name: NetFX3~~~~
```

`salt.states.win_dism.`**`feature_installed`**(*name*, *package=None*, *source=None*, *limit_access=False*, *enable_parent=False*, *image=None*, *restart=False*)

Install a DISM feature

Parameters

- **name** (*str*) -- The feature in which to install
- **package** (*Optional[str]*) -- The parent package for the feature. You do not have to specify the package if it is the Windows Foundation Package. Otherwise, use package to specify the parent package of the feature
- **source** (*str*) -- The optional source of the feature
- **limit_access** (*bool*) -- Prevent DISM from contacting Windows Update for online images
- **enable_parent** (*Optional[bool]*) -- `True` will enable all parent features of the specified feature
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is `None`
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

Example

Run `dism.available_features` to get a list of available features. This will help you get the proper name to use

```
install_telnet_client:
  dism.feature_installed:
    - name: TelnetClient
```

`salt.states.win_dism.`**`feature_removed`**`(`*name*, *remove_payload=False*, *image=None*, *restart=False*`)`

Disables a feature.

Parameters

- **name** (*str*) -- The feature to disable
- **remove_payload** (*Optional[bool]*) -- Remove the feature's payload. Must supply source when enabling in the future.
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is `None`
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the uninstall

Example

Run `dism.installed_features` to get a list of installed features. This will help you get the proper name to use

```
remove_telnet_client:
  dism.feature_removed:
    - name: TelnetClient
    - remove_payload: True
```

`salt.states.win_dism.`**`kb_removed`**`(`*name*, *image=None*, *restart=False*`)`

Uninstall a KB package

New in version 3006.0.

Parameters

- **name** (*str*) -- The name of the KB. Can be with or without the KB at the beginning
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is `None`

- **restart** (*Optional[bool]*) -- Reboot the machine if required by the uninstall

Example

```
# Example using full KB name
remove_KB1231231:
  dism.package_installed:
    - name: KB1231231

# Example using just he KB number
remove_KB1231231:
  dism.package_installed:
    - name: 1231231
```

`salt.states.win_dism.`**`package_installed`**(*name*, *ignore_check=False*, *prevent_pending=False*, *image=None*, *restart=False*)

Install a package.

Parameters

- **name** (*str*) -- The package to install. Can be a .cab file, a .msu file, or a folder
- **ignore_check** (*Optional[bool]*) -- Skip installation of the package if the applicability checks fail
- **prevent_pending** (*Optional[bool]*) -- Skip the installation of the package if there are pending online actions
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is `None`
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

Example

```
install_KB123123123:
  dism.package_installed:
    - name: C:\Packages\KB123123123.cab
```

`salt.states.win_dism.`**`package_removed`**(*name*, *image=None*, *restart=False*)

Uninstall a package

Parameters

- **name** (*str*) -- The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. This can also be the name of a package as listed in `dism.installed_packages`
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is `None`
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the uninstall

Example

```
# Example using source
remove_KB1231231:
  dism.package_installed:
    - name: C:\Packages\KB1231231.cab

# Example using name from ``dism.installed_packages``
remove_KB1231231:
  dism.package_installed:
    - name: Package_for_KB1231231~31bf3856ad364e35~amd64~~10.0.1.3
```

`salt.states.win_dism.`**`provisioned_package_installed`**`(`*name*, *image=None*, *restart=False*`)`

Provision a package on a Windows image.

New in version 3007.0.

Parameters

- **name** (*str*) -- The package to install. Can be one of the following:
  - `.appx` or `.appxbundle`
  - `.msix` or `.msixbundle`
  - `.ppkg`

  The name of the file before the file extension must match the name of the package after it is installed. This name can be found by running `dism.provisioned_packages`
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is `None`
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the installation. Default is `False`

Example

```
install_windows_media_player:
  dism.provisioned_package_installed:
    - name: C:\Packages\Microsoft.ZuneVideo_2019.22091.10036.0_neutral_~_
↪8wekyb3d8bbwe.Msixbundle
```

26.19.104 salt.states.win_dns_client

Module for configuring DNS Client on Windows systems

`salt.states.win_dns_client.`**`dns_dhcp`**`(`*name*, *interface='Local Area Connection'*`)`

Configure the DNS server list from DHCP Server

`salt.states.win_dns_client.`**`dns_exists`**`(`*name*, *servers=None*, *interface='Local Area Connection'*, *replace=False*`)`

Configure the DNS server list in the specified interface

Example:

```
config_dns_servers:
  win_dns_client.dns_exists:
    - replace: True #remove any servers not in the "servers" list,
```

(continues on next page)

(continued from previous page)

```
↪default is False
    - servers:
      - 8.8.8.8
      - 8.8.8.9
```

`salt.states.win_dns_client.`**`primary_suffix`**(*name*, *suffix=None*, *updates=False*)

New in version 2014.7.0.

Configure the global primary DNS suffix of a DHCP client.

suffix
: [None] The suffix which is advertised for this client when acquiring a DHCP lease When none is set, the explicitly configured DNS suffix will be removed.

updates
: [False] Allow syncing the DNS suffix with the AD domain when the client's AD domain membership changes

```
primary_dns_suffix:
    win_dns_client.primary_suffix:
        - suffix: sub.domain.tld
        - updates: True
```

26.19.105 salt.states.win_firewall

State for configuring Windows Firewall

`salt.states.win_firewall.`**`add_rule`**(*name*, *localport*, *protocol='tcp'*, *action='allow'*, *dir='in'*, *remoteip='any'*)

Add a new inbound or outbound rule to the firewall policy

Parameters

- **name** (*str*) -- The name of the rule. Must be unique and cannot be "all". Required.
- **localport** (*int*) -- The port the rule applies to. Must be a number between 0 and 65535. Can be a range. Can specify multiple ports separated by commas. Required.
- **protocol** (*Optional[str]*) -- The protocol. Can be any of the following:
  - A number between 0 and 255
  - icmpv4
  - icmpv6
  - tcp
  - udp
  - any
- **action** (*Optional[str]*) -- The action the rule performs. Can be any of the following:
  - allow
  - block
  - bypass
- **dir** (*Optional[str]*) -- The direction. Can be `in` or `out`.
- **remoteip** (*Optional [str]*) -- The remote IP. Can be any of the following:
  - any
  - localsubnet
  - dns
  - dhcp
  - wins
  - defaultgateway

- Any valid IPv4 address (192.168.0.12)
- Any valid IPv6 address (2002:9b3b:1a31:4:208:74ff:fe39:6c43)
- Any valid subnet (192.168.1.0/24)
- Any valid range of IP addresses (192.168.0.1-192.168.0.12)
- A list of valid IP addresses

Can be combinations of the above separated by commas.

New in version 2016.11.6.

Example:

```
open_smb_port:
  win_firewall.add_rule:
    - name: SMB (445)
    - localport: 445
    - protocol: tcp
    - action: allow
```

`salt.states.win_firewall.`**`disabled`**(*name='allprofiles'*)

Disable all the firewall profiles (Windows only)

Parameters

profile (*Optional[str]*) -- The name of the profile to disable. Default is `allprofiles`. Valid options are:

- allprofiles
- domainprofile
- privateprofile
- publicprofile

Example:

```
# To disable the domain profile
disable_domain:
  win_firewall.disabled:
    - name: domainprofile

# To disable all profiles
disable_all:
  win_firewall.disabled:
    - name: allprofiles
```

`salt.states.win_firewall.`**`enabled`**(*name='allprofiles'*)

Enable all the firewall profiles (Windows only)

Parameters

profile (*Optional[str]*) -- The name of the profile to enable. Default is `allprofiles`. Valid options are:

- allprofiles
- domainprofile
- privateprofile
- publicprofile

Example:

```
# To enable the domain profile
enable_domain:
  win_firewall.enabled:
    - name: domainprofile

```

(continues on next page)

(continued from previous page)

```
# To enable all profiles
enable_all:
  win_firewall.enabled:
    - name: allprofiles
```

26.19.106 salt.states.win_iis

Microsoft IIS site management

This module provides the ability to add/remove websites and application pools from Microsoft IIS.

New in version 2016.3.0.

salt.states.win_iis.**container_setting**(*name*, *container*, *settings=None*)

Set the value of the setting for an IIS container.

Parameters

- **name** (*str*) -- The name of the IIS container.
- **container** (*str*) -- The type of IIS container. The container types are: AppPools, Sites, SslBindings
- **settings** (*str*) -- A dictionary of the setting names and their values. Example of usage for the `AppPools` container:

```
site0-apppool-setting:
    win_iis.container_setting:
        - name: site0
        - container: AppPools
        - settings:
            managedPipelineMode: Integrated
            processModel.maxProcesses: 1
            processModel.userName: TestUser
            processModel.password: TestPassword
            processModel.identityType: SpecificUser
```

Example of usage for the `Sites` container:

```
site0-site-setting:
    win_iis.container_setting:
        - name: site0
        - container: Sites
        - settings:
            logFile.logFormat: W3C
            logFile.period: Daily
            limits.maxUrlSegments: 32
```

salt.states.win_iis.**create_app**(*name*, *site*, *sourcepath*, *apppool=None*)

Create an IIS application.

Parameters

- **name** (*str*) -- The IIS application.
- **site** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path.
- **apppool** (*str*) -- The name of the IIS application pool.

Example of usage with only the required arguments:

```
site0-v1-app:
    win_iis.create_app:
        - name: v1
        - site: site0
        - sourcepath: C:\inetpub\site0\v1
```

Example of usage specifying all available arguments:

```
site0-v1-app:
    win_iis.create_app:
        - name: v1
        - site: site0
        - sourcepath: C:\inetpub\site0\v1
        - apppool: site0
```

`salt.states.win_iis.`**`create_apppool`**`(`*name*`)`

Create an IIS application pool.

Parameters

name (*str*) -- The name of the IIS application pool.

Usage:

```
site0-apppool:
    win_iis.create_apppool:
        - name: site0
```

`salt.states.win_iis.`**`create_binding`**`(`*name, site, hostheader='', ipaddress='*', port=80, protocol='http', sslflags=0*`)`

Create an IIS binding.

Parameters

- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*str*) -- The TCP port of the binding.
- **protocol** (*str*) -- The application protocol of the binding.
- **sslflags** (*str*) -- The flags representing certificate type and storage of the binding.

Example of usage with only the required arguments:

```
site0-https-binding:
    win_iis.create_binding:
        - site: site0
```

Example of usage specifying all available arguments:

```
site0-https-binding:
    win_iis.create_binding:
        - site: site0
        - hostheader: site0.local
        - ipaddress: '*'
        - port: 443
        - protocol: https
        - sslflags: 0
```

`salt.states.win_iis.`**`create_cert_binding`**`(`*name, site, hostheader='', ipaddress='*', port=443, sslflags=0*`)`

Assign a certificate to an IIS binding.

Parameters

- **name** (*str*) -- The thumbprint of the certificate.
- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*str*) -- The TCP port of the binding.
- **sslflags** (*str*) -- Flags representing certificate type and certificate storage of the binding.

Example of usage with only the required arguments:

```
site0-cert-binding:
    win_iis.create_cert_binding:
        - name: 9988776655443322111000AAABBBCCCDDDEEEFFF
        - site: site0
```

Example of usage specifying all available arguments:

```
site0-cert-binding:
    win_iis.create_cert_binding:
        - name: 9988776655443322111000AAABBBCCCDDDEEEFFF
        - site: site0
        - hostheader: site0.local
        - ipaddress: 192.168.1.199
        - port: 443
        - sslflags: 1
```

New in version 2016.11.0.

`salt.states.win_iis.`**`create_vdir`**(*name*, *site*, *sourcepath*, *app='/'*)

Create an IIS virtual directory.

Parameters

- **name** (*str*) -- The virtual directory name.
- **site** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path.
- **app** (*str*) -- The IIS application.

Example of usage with only the required arguments:

```
site0-foo-vdir:
    win_iis.create_vdir:
        - name: foo
        - site: site0
        - sourcepath: C:\inetpub\vdirs\foo
```

Example of usage specifying all available arguments:

```
site0-foo-vdir:
    win_iis.create_vdir:
        - name: foo
        - site: site0
        - sourcepath: C:\inetpub\vdirs\foo
        - app: v1
```

`salt.states.win_iis.`**`deployed`**(*name*, *sourcepath*, *apppool=''*, *hostheader=''*, *ipaddress='*'*, *port=80*, *protocol='http'*)

Ensure the website has been deployed.

Parameters

- **name** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path of the IIS site.
- **apppool** (*str*) -- The name of the IIS application pool.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*str*) -- The TCP port of the binding.
- **protocol** (*str*) -- The application protocol of the binding.

Example of usage with only the required arguments. This will default to using the default application pool assigned by IIS:

```
site0-deployed:
    win_iis.deployed:
        - name: site0
        - sourcepath: C:\inetpub\site0
```

Example of usage specifying all available arguments:

```
site0-deployed:
    win_iis.deployed:
        - name: site0
        - sourcepath: C:\inetpub\site0
        - apppool: site0
        - hostheader: site0.local
        - ipaddress: '*'
        - port: 443
        - protocol: https
```

`salt.states.win_iis.`**`remove_app`**(*name, site*)

Remove an IIS application.

Parameters

- **name** (*str*) -- The application name.
- **site** (*str*) -- The IIS site name.

Usage:

```
site0-v1-app-remove:
    win_iis.remove_app:
        - name: v1
        - site: site0
```

`salt.states.win_iis.`**`remove_apppool`**(*name*)

Remove an IIS application pool.

Parameters

name (*str*) -- The name of the IIS application pool.

Usage:

```
defaultapppool-remove:
    win_iis.remove_apppool:
        - name: DefaultAppPool
```

`salt.states.win_iis.`**`remove_binding`**(*name, site, hostheader='', ipaddress='*', port=80*)

Remove an IIS binding.

Parameters

- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*str*) -- The TCP port of the binding.

Example of usage with only the required arguments:

```
site0-https-binding-remove:
    win_iis.remove_binding:
        - site: site0
```

Example of usage specifying all available arguments:

```
site0-https-binding-remove:
    win_iis.remove_binding:
        - site: site0
        - hostheader: site0.local
        - ipaddress: '*'
        - port: 443
```

`salt.states.win_iis.`**`remove_cert_binding`**(*name, site, hostheader='', ipaddress='*', port=443*)

Remove a certificate from an IIS binding.

Parameters

- **name** (*str*) -- The thumbprint of the certificate.
- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*str*) -- The TCP port of the binding.

Example of usage with only the required arguments:

```
site0-cert-binding-remove:
    win_iis.remove_cert_binding:
        - name: 9988776655443322111000AAABBBCCCDDDEEEFFF
        - site: site0
```

Example of usage specifying all available arguments:

```
site0-cert-binding-remove:
    win_iis.remove_cert_binding:
        - name: 9988776655443322111000AAABBBCCCDDDEEEFFF
        - site: site0
        - hostheader: site0.local
        - ipaddress: 192.168.1.199
        - port: 443
```

New in version 2016.11.0.

`salt.states.win_iis.`**`remove_site`**(*name*)

Delete a website from IIS.

Parameters

name (*str*) -- The IIS site name.

Usage:

```
defaultwebsite-remove:
    win_iis.remove_site:
        - name: Default Web Site
```

`salt.states.win_iis.`**`remove_vdir`**(*name*, *site*, *app='/'*)

Remove an IIS virtual directory.

Parameters

- **name** (*str*) -- The virtual directory name.
- **site** (*str*) -- The IIS site name.
- **app** (*str*) -- The IIS application.

Example of usage with only the required arguments:

```
site0-foo-vdir-remove:
    win_iis.remove_vdir:
        - name: foo
        - site: site0
```

Example of usage specifying all available arguments:

```
site0-foo-vdir-remove:
    win_iis.remove_vdir:
        - name: foo
        - site: site0
        - app: v1
```

`salt.states.win_iis.`**`set_app`**(*name*, *site*, *settings=None*)

New in version 2017.7.0.

Set the value of the setting for an IIS web application.

Note: This function only configures existing app. Params are case sensitive.

Parameters

- **name** (*str*) -- The IIS application.
- **site** (*str*) -- The IIS site name.
- **settings** (*str*) -- A dictionary of the setting names and their values.

Available settings:

- `physicalPath` - The physical path of the webapp
- `applicationPool` - The application pool for the webapp
- `userName` "connectAs" user
- `password` "connectAs" password for user

Return type

bool

Example of usage:

```
site0-webapp-setting:
    win_iis.set_app:
        - name: app0
        - site: Default Web Site
        - settings:
            userName: domain\\user
```

(continues on next page)

(continued from previous page)

```
            password: pass
            physicalPath: c:\inetpub\wwwroot
            applicationPool: appPool0
```

salt.states.win_iis.**webconfiguration_settings**(*name*, *settings=None*)

Set the value of webconfiguration settings.

Parameters

- **name** (*str*) -- The name of the IIS PSPath containing the settings. Possible PSPaths are : MACHINE, MACHINE/WEBROOT, IIS:, IIS:Sitessitename, ...
- **settings** (*dict*) -- Dictionaries of dictionaries. You can match a specific item in a collection with this syntax inside a key: 'Collection[{name: site0}].logFile.directory'

Example of usage for the `MACHINE/WEBROOT` PSPath:

```
MACHINE-WEBROOT-level-security:
  win_iis.webconfiguration_settings:
    - name: 'MACHINE/WEBROOT'
    - settings:
        system.web/authentication/forms:
          requireSSL: True
          protection: "All"
          credentials.passwordFormat: "SHA1"
        system.web/httpCookies:
          httpOnlyCookies: True
```

Example of usage for the `IIS:\Sites\site0` PSPath:

```
site0-IIS-Sites-level-security:
  win_iis.webconfiguration_settings:
    - name: 'IIS:\Sites\site0'
    - settings:
        system.webServer/httpErrors:
          errorMode: "DetailedLocalOnly"
        system.webServer/security/requestFiltering:
          allowDoubleEscaping: False
          verbs.Collection:
            - verb: TRACE
              allowed: False
          fileExtensions.allowUnlisted: False
```

Example of usage for the `IIS:\` PSPath with a collection matching:

```
site0-IIS-level-security:
  win_iis.webconfiguration_settings:
    - name: 'IIS:\'
    - settings:
        system.applicationHost/sites:
          'Collection[{name: site0}].logFile.directory': 'C:\logs\iis\
↪site0'
```

26.19.107 salt.states.win_lgpo

Manage Windows Local Group Policy

New in version 2016.11.0.

This state module allows you to configure local Group Policy on Windows. You can ensure the setting of a single policy or multiple policies in one pass.

Single policies must specify the policy name, the setting, and the policy class (Machine/User/Both). Here are some examples for setting a single policy setting.

Example single policy configuration:

```
Ensure Account Lockout Duration:
  lgpo.set:
    - name: Account lockout duration
    - setting: 90
    - policy_class: Machine
```

Example using abbreviated form:

```
Account lockout duration:
  lgpo.set:
    - setting: 120
    - policy_class: Machine
```

It is also possible to set multiple policies in a single state. This is done by setting the settings under either *computer_policy* or *user_policy*. Here are some examples for setting multiple policy settings in a single state.

Multiple policy configuration

```
Company Local Group Policy:
    lgpo.set:
        - computer_policy:
            Deny log on locally:
              - Guest
            Account lockout duration: 120
            Account lockout threshold: 10
            Reset account lockout counter after: 120
            Enforce password history: 24
            Maximum password age: 60
            Minimum password age: 1
            Minimum password length: 14
            Password must meet complexity requirements: Enabled
            Store passwords using reversible encryption: Disabled
            Configure Automatic Updates:
                Configure automatic updating: 4 - Auto download and schedule
↪the intsall
                Scheduled install day: 7 - Every Saturday
                Scheduled install time: 17:00
            Specify intranet Microsoft update service location:
                Set the intranet update service for detecting updates: http://
↪mywsus
                Set the intranet statistics server: http://mywsus
```

(continues on next page)

(continued from previous page)

```
        - user_policy:
            Do not process the legacy run list: Enabled
```

```
server_policy:
  lgpo.set:
    - computer_policy:
        Maximum password age: 60
        Minimum password age: 1
        Minimum password length: 14
        Account lockout duration: 120
        Account lockout threshold: 10
        Reset account lockout counter after: 120
        Manage auditing and security log:
          - "BUILTIN\\Administrators"
        Replace a process level token:
          - "NT AUTHORITY\\NETWORK SERVICE"
          - "NT AUTHORITY\\LOCAL SERVICE"
        "Accounts: Guest account status": Disabled
        "Accounts: Rename guest account": Not_4_U
        "Audit: Audit the use of Backup and Restore privilege": Enabled
        "Interactive logon: Do not display last user name": Enabled
        "Network\\DNS Client\\Dynamic update": Disabled
        "System\\Logon\\Do not display the Getting Started welcome screen at
↪logon": Enabled
        "Windows Components\\Remote Desktop Services\\Remote Desktop Session

↪mywsus
            "Set the intranet statistics server": http://mywsus
    - cumulative_rights_assignments: True

Some policy settings can't be set on their own an require that other policy
settings are set at the same time. It can be difficult to figure out what
additional settings need to be applied. The easiest way to do this is to
modify the setting manually using the Group Policy Editor (`gpedit.msc`) on
the machine. Then `get` the policy settings configured on that machine. Use
the following command:

.. code-block:: bash

    salt-call --local lgpo.get machine

For example, if I want to set the Windows Update settings for a Windows
Server 2016 machine I would go into the Group Policy Editor (`gpedit.msc`)
and configure the group policy. That policy can be found at: Computer
Configuration -> Administrative Templates -> Windows Components -> Windows
Update -> Configure Automatic Updates. You have the option to "Enable" the
policy and set some configuration options. In this example, just click
"Enable" and accept the default configuration options. Click "OK" to apply
the setting.

Now run the `get` command as shown above. You will find the following in
the minion return:

.. code-block:: bash

    Windows Components\Windows Update\Configure Automatic Updates:
        ----------
        Configure automatic updating:
            3 - Auto download and notify for install
        Install during automatic maintenance:
            False
        Install updates for other Microsoft products:
            False
        Scheduled install day:
            0 - Every day
        Scheduled install time:
            03:00

This shows you that to enable the "Configure Automatic Updates" policy you
also have to configure the following settings:
```

(continues on next page)

(continued from previous page)

```
- Configure automatic updating
- Install during automatic maintenance
- Install updates for other Microsoft products
- Scheduled install day
- Scheduled install time

So, if you were writing a state for the above policy, it would look like
this:

.. code-block:: bash

    configure_windows_update_settings:
      lgpo.set:
        - computer_policy:
            Configure Automatic Updates:
              Configure automatic updating: 3 - Auto download and notify for␣
↪install
              Install during automatic maintenance: False
              Install updates for other Microsoft products: False
              Scheduled install day: 0 - Every day
              Scheduled install time: 03:00

.. note::

    It is important that you put names of policies and settings exactly as
    they are displayed in the return. That includes capitalization and
    punctuation such as periods, dashes, etc. This rule applies to both
    the setting name and the setting value.

.. warning::

    From time to time Microsoft updates the Administrative templates on the
    machine. This can cause the policy name to change or the list of
    settings that must be applied at the same time. These settings often
    change between versions of Windows as well. For example, Windows Server
    2019 allows you to also specify a specific week of the month to apply
    the update.

Another thing note is the long policy name returned by the `get` function:

.. code-block:: bash

    Windows Components\Windows Update\Configure Automatic Updates:

When we wrote the state for this policy we only used the final portion of
the policy name, `Configure Automatic Updates`. This usually works fine, but
if you are having problems, you may try the long policy name.

When writing the long name in a state file either wrap the name in single
quotes to make yaml see it as raw data, or escape the back slashes.

.. code-block:: bash
```

(continues on next page)

(continued from previous page)

```
    'Windows Components\Windows Update\Configure Automatic Updates:'

    or

    Windows Components\\Windows Update\\Configure Automatic Updates:
```

`salt.states.win_lgpo.`**`set_`**`(`*name*, *setting=None*, *policy_class=None*, *computer_policy=None*, *user_policy=None*, *cumulative_rights_assignments=True*, *adml_language='en-US'*, *refresh_cache=False*`)`

Ensure the specified policy is set.

> **Warning:** The `setting` argument cannot be used in conjunction with the `computer_policy` or `user_policy` arguments

Parameters

- **name** (*str*) -- The name of a single policy to configure
- **setting** (*str, dict, list*) -- The configuration setting for the single named policy. If this argument is used the `computer_policy` / `user_policy` arguments will be ignored
- **policy_class** (*str*) -- The policy class of the single named policy to configure. This can `machine`, `user`, or `both`
- **computer_policy** (*dict*) -- A dictionary of containing the policy name and key/value pairs of a set of computer policies to configure. If this argument is used, the `name` / `policy_class` arguments will be ignored
- **user_policy** (*dict*) -- A dictionary of containing the policy name and key/value pairs of a set of user policies to configure. If this argument is used, the `name` / `policy_class` arguments will be ignored
- **cumulative_rights_assignments** (*bool*) -- If user rights assignments are being configured, determines if any user right assignment policies specified will be cumulative or explicit
- **adml_language** (*str*) -- The adml language to use for AMDX policy data/display conversions. Default is `en-US`
- **refresh_cache** (*bool*) -- Clear the cached policy definitions before applying the state. This is useful when the underlying policy files (ADMX/ADML) have been added/modified in the same state. This will allow those new policies to be picked up. This adds time to the state run when applied to multiple states within the same run. Therefore, it is best to only apply this to the first policy that is applied. For individual runs this will have no effect. Default is `False`

  New in version 3006.8.

  New in version 3007.1.

26.19.108 salt.states.win_lgpo_reg

LGPO - Registry.pol

New in version 3006.0.

A state module for working with registry based policies in Windows Local Group Policy (LGPO). This module contains functions for working with the `Registry.pol` file. The `Registry.pol` file is the source of truth for registry settings and LGPO.

Group Policy is refreshed every 90 seconds by default. During that refresh the contents of the `Registry.pol` file are applied to the Registry. If the setting is changed outside of Group Policy to something other than what is contained in the `Registry.pol` file, it will be changed back during the next refresh.

In the Group Policy Editor (`gpedit.msc`) these policies can be set to three states:

- Not Configured
- Enabled
- Disabled

A policy that is ”Not Configured” does not have an entry in the `Registry.pol` file. A Group Policy refresh will not make any changes to key/value pairs in the registry that are not specified in the `Registry.pol` file.

An ”Enabled” policy will have an entry in the `Registry.pol` files that contains its key path, value name, value type, value size, and value data. When Group Policy is refreshed, existing values will be overwritten with those contained in the `Registry.pol` file.

A ”Disabled” policy will have an entry in the `Registry.pol` file with the key path and the value name, but the value name will be prepended with `**del.`. When Group Policy is refreshed the key/value will be deleted from the registry. If the key contains no values, it will also be deleted.

Working with LGPO Reg

The easiest way to figure out the values needed for this module is to set the policy using the Group Policy Editor (`gpedit.msc`) and then run the `lgpo_reg.read_reg_pol` function. This function will display a dictionary of all registry-based policies in the `Registry.pol` file. From its return you can get the `key`, `v_name`, `v_type`, and `v_data` required to configure that policy.

Note: Not all policies in the Group Policy Editor (`gpedit.msc`) that write to the registry make that change in the `Registry.pol` file. Those policies could still be enforced via the `Registry.pol` file... theoretically. But you will have to find the values needed to set them with this module using a different method.

`salt.states.win_lgpo_reg.`**`value_absent`**`(`*name*, *key*, *policy_class='Machine'*`)`

Ensure a registry setting is not present in the Registry.pol file.

Parameters

- **`key`** (*`str`*) -- The registry key path
- **`name`** (*`str`*) -- The registry value name within the key
- **`policy_class`** (*`str`*) -- The registry class to write to. Can be one of the following:
  - Computer
  - Machine
  - User

  Default is `Machine`

CLI Example:

```
# Using the name parameter in the definition
set_reg_pol_value:
  lgpo_reg.value_absent:
    - key: SOFTWARE\MyKey
    - name: MyValue
    - policy_class: Machine

# Using the name as the parameter and modifying the User policy
MyValue:
  lgpo_reg.value_absent:
    - key: SOFTWARE\MyKey
    - policy_class: User
```

`salt.states.win_lgpo_reg.`**`value_disabled`**`(`*name, key, policy_class='Machine'*`)`

Ensure a registry setting is disabled in the Registry.pol file.

Parameters

- **`key`** (*`str`*) -- The registry key path
- **`name`** (*`str`*) -- The registry value name within the key
- **`policy_class`** (*`str`*) -- The registry class to write to. Can be one of the following:
  - Computer
  - Machine
  - User

  Default is `Machine`

CLI Example:

```
# Using the name parameter in the definition
set_reg_pol_value:
  lgpo_reg.value_disabled:
    - key: SOFTWARE\MyKey
    - name: MyValue
    - policy_class: Machine

# Using the name as the parameter and modifying the User policy
MyValue:
  lgpo_reg.value_disabled:
    - key: SOFTWARE\MyKey
    - policy_class: User
```

`salt.states.win_lgpo_reg.`**`value_present`**`(`*name, key, v_data, v_type='REG_DWORD', policy_class='Machine'*`)`

Ensure a registry setting is present in the Registry.pol file.

Parameters

- **`name`** (*`str`*) -- The registry value name within the key
- **`key`** (*`str`*) -- The registry key path
- **`v_data`** (*`str`*) -- The registry value
- **`v_type`** (*`str`*) -- The registry value type. Must be one of the following:
  - REG_BINARY
  - REG_DWORD
  - REG_EXPAND_SZ
  - REG_MULTI_SZ
  - REG_QWORD

    - REG_SZ

  Default is REG_DWORD
- **policy_class** (*str*) -- The registry class to write to. Can be one of the following:
    - Computer
    - Machine
    - User

  Default is `Machine`

CLI Example:

```
# Using the name parameter in the definition
set_reg_pol_value:
  lgpo_reg.value_present:
    - key: SOFTWARE\MyKey
    - name: MyValue
    - v_type: REG_SZ
    - v_data: "some string data"
    - policy_class: Machine

# Using the name as the parameter and modifying the User policy
MyValue:
  lgpo_reg.value_present:
    - key: SOFTWARE\MyKey
    - v_type: REG_SZ
    - v_data: "some string data"
    - policy_class: User
```

26.19.109 salt.states.win_license

Installation and activation of windows licenses

Install and activate windows licenses

```
XXXXX-XXXXX-XXXXX-XXXXX-XXXXX:
  license.activate
```

`salt.states.win_license.`**`activate`**(*name*)

Install and activate the given product key

name

The 5x5 product key given to you by Microsoft

26.19.110 salt.states.win_network

Configuration of network interfaces on Windows hosts

New in version 2014.1.0.

This module provides the `network` state(s) on Windows hosts. DNS servers, IP addresses and default gateways can currently be managed.

Below is an example of the configuration for an interface that uses DHCP for both DNS servers and IP addresses:

```
Local Area Connection #2:
  network.managed:
    - dns_proto: dhcp
    - ip_proto: dhcp
```

Note: Both the `dns_proto` and `ip_proto` arguments are required.

Static DNS and IP addresses can be configured like so:

```
Local Area Connection #2:
  network.managed:
    - dns_proto: static
    - dns_servers:
      - 8.8.8.8
      - 8.8.4.4
    - ip_proto: static
    - ip_addrs:
      - 10.2.3.4/24
```

Note: IP addresses are specified using the format `<ip-address>/<subnet-length>`. Salt provides a convenience function called *`ip.get_subnet_length`* to calculate the subnet length from a netmask.

Optionally, if you are setting a static IP address, you can also specify the default gateway using the `gateway` parameter:

```
Local Area Connection #2:
  network.managed:
    - dns_proto: static
    - dns_servers:
      - 8.8.8.8
      - 8.8.4.4
    - ip_proto: static
    - ip_addrs:
      - 10.2.3.4/24
    - gateway: 10.2.3.1
```

`salt.states.win_network.`**`managed`**(*name*, *dns_proto=None*, *dns_servers=None*, *ip_proto=None*, *ip_addrs=None*, *gateway=None*, *enabled=True*, ***kwargs*)

Ensure that the named interface is configured properly.

Parameters

- **`name`** (*`str`*) -- The name of the interface to manage
- **`dns_proto`** (*`str`*) -- None Set to `static` and use the `dns_servers` parameter to provide a list of DNS nameservers. set to `dhcp` to use DHCP to get the DNS servers.
- **`dns_servers`** (*`list`*) -- None A list of static DNS servers. To clear the list of DNS servers pass an empty list (`[]`). `None` will make no changes.
- **`ip_proto`** (*`str`*) -- None Set to `static` and use the `ip_addrs` and (optionally) `gateway` parameters to provide a list of static IP addresses and the default gateway. Set to `dhcp` to use DHCP.
- **`ip_addrs`** (*`list`*) -- None A list of static IP addresses with netmask flag, ie: 192.168.0.11/24
- **`gateway`** (*`str`*) -- None The gateway to set for the interface

- **enabled** (*bool*) -- True Set to `False` to ensure that this interface is disabled.

Returns
A dictionary of old and new settings

Return type
dict

Example:

```
Ethernet1:
  network.managed:
    - dns_proto: static
    - dns_servers:
      - 8.8.8.8
      - 8.8.8.4
    - ip_proto: static
    - ip_addrs:
      - 192.168.0.100/24
```

Clear DNS entries example:

```
Ethernet1:
  network.managed:
    - dns_proto: static
    - dns_servers: []
    - ip_proto: dhcp
```

26.19.111 salt.states.win_path

Manage the Windows System PATH

`salt.states.win_path.`**`absent`**(*name*)

Remove the directory from the SYSTEM path

Example:

```
'C:\sysinternals':
  win_path.absent
```

`salt.states.win_path.`**`exists`**(*name, index=None*)

Add the directory to the system PATH at index location

index
Position where the directory should be placed in the PATH. This is 0-indexed, so 0 means to prepend at the very start of the PATH.

Note: If the index is not specified, and the directory needs to be added to the PATH, then the directory will be appended to the PATH, and this state will not enforce its location within the PATH.

Examples:

```
'C:\python27':
  win_path.exists

'C:\sysinternals':
  win_path.exists:
```

(continues on next page)

(continued from previous page)

```
    - index: 0

'C:\mystuff':
  win_path.exists:
    - index: -1
```

26.19.112 salt.states.win_pki

Microsoft certificate management via the Pki PowerShell module.

platform
Windows

New in version 2016.11.0.

`salt.states.win_pki.`**`import_cert`**(*name, cert_format='cer', context='LocalMachine', store='My', exportable=True, password='', saltenv='base'*)

Import the certificate file into the given certificate store.

Parameters

- **name** (*str*) -- The path of the certificate file to import.
- **cert_format** (*str*) -- The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
- **context** (*str*) -- The name of the certificate store location context.
- **store** (*str*) -- The name of the certificate store.
- **exportable** (*bool*) -- Mark the certificate as exportable. Only applicable to pfx format.
- **password** (*str*) -- The password of the certificate. Only applicable to pfx format.
- **saltenv** (*str*) -- The environment the file resides in.

Example of usage with only the required arguments:

```
site0-cert-imported:
    win_pki.import_cert:
        - name: salt://win/webserver/certs/site0.cer
```

Example of usage specifying all available arguments:

```
site0-cert-imported:
    win_pki.import_cert:
        - name: salt://win/webserver/certs/site0.pfx
        - cert_format: pfx
        - context: LocalMachine
        - store: My
        - exportable: True
        - password: TestPassword
        - saltenv: base
```

`salt.states.win_pki.`**`remove_cert`**(*name, thumbprint, context='LocalMachine', store='My'*)

Remove the certificate from the given certificate store.

Parameters

- **thumbprint** (*str*) -- The thumbprint value of the target certificate.
- **context** (*str*) -- The name of the certificate store location context.
- **store** (*str*) -- The name of the certificate store.

Example of usage with only the required arguments:

```
site0-cert-removed:
    win_pki.remove_cert:
        - thumbprint: 9988776655443322111000AAABBBCCCDDDEEEFFF
```

Example of usage specifying all available arguments:

```
site0-cert-removed:
    win_pki.remove_cert:
        - thumbprint: 9988776655443322111000AAABBBCCCDDDEEEFFF
        - context: LocalMachine
        - store: My
```

26.19.113 salt.states.win_powercfg

This module allows you to control the power settings of a windows minion via powercfg.

New in version 2015.8.0.

```
# Set timeout to 30 minutes on battery power
monitor:
    powercfg.set_timeout:
        - value: 30
        - power: dc
```

`salt.states.win_powercfg.`**`set_timeout`**(*name*, *value*, *power='ac'*, *scheme=None*)

Set the sleep timeouts of specific items such as disk, monitor, etc.

Parameters

- **name** (*str*) -- The setting to change, can be one of the following:
  - `monitor`
  - `disk`
  - `standby`
  - `hibernate`
- **value** (*int*) -- The amount of time in minutes before the item will timeout
- **power** (*str*) -- Set the value for AC or DC power. Default is `ac`. Valid options are:
  - `ac` (AC Power)
  - `dc` (Battery)
- **scheme** (*str*) -- The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - `SCHEME_BALANCED` - Balanced
  - `SCHEME_MAX` - Power saver
  - `SCHEME_MIN` - High performance

CLI Example:

```
# Set monitor timeout to 30 minutes on Battery
monitor:
  powercfg.set_timeout:
    - value: 30
    - power: dc

# Set disk timeout to 10 minutes on AC Power
disk:
  powercfg.set_timeout:
```

(continues on next page)

(continued from previous page)

```
    - value: 10
    - power: ac
```

26.19.114 salt.states.win_servermanager

Manage Windows features via the ServerManager powershell module. Can install and remove roles/features.

maintainer
Shane Lee <slee@saltstack.com>

platform
Windows Server 2008R2 or greater

depends
win_servermanager.install

depends
win_servermanager.remove

`salt.states.win_servermanager.`**`installed`**`(`*name*, *features=None*, *recurse=False*, *restart=False*, *source=None*, *exclude=None*, ***kwargs*`)`

Install the windows feature. To install a single feature, use the `name` parameter. To install multiple features, use the `features` parameter.

Note: Some features require reboot after un/installation. If so, until the server is restarted other features can not be installed!

Parameters

- **`name`** (*str*) -- Short name of the feature (the right column in win_servermanager.list_available). This can be a single feature or a string of features in a comma delimited list (no spaces)

  Note: A list is not allowed in the name parameter of any state. Use the `features` parameter if you want to pass the features as a list

- **`features`** (*Optional[list]*) -- A list of features to install. If this is passed it will be used instead of the `name` parameter.

  New in version 2018.3.0.
- **`recurse`** (*Optional[bool]*) -- Install all sub-features as well. If the feature is installed but one of its sub-features are not installed set this will install additional sub-features. This argument was previously renamed from `force`. To ensure backwards compatibility `force` will continue to work but please update your states to use the preferred `recurse` arg.
- **`source`** (*Optional[str]*) -- Path to the source files if missing from the target system. None means that the system will use windows update services to find the required files. Default is None
- **`restart`** (*Optional[bool]*) -- Restarts the computer when installation is complete, if required by the role/feature installed. Default is False
- **`exclude`** (*Optional[str]*) -- The name of the feature to exclude when installing the named feature. This can be a single feature, a string of features in a comma-delimited list (no spaces), or a list of features.

> **Warning:** As there is no exclude option for the `Add-WindowsFeature` or `Install-WindowsFeature` PowerShell commands the features named in `exclude` will be installed with other sub-features and will then be removed. **If the feature named in ``exclude`` is not a sub-feature of one of the installed items it will still be removed.**

Example

Do not use the role or feature names mentioned in the PKGMGR documentation. To get a list of available roles and features run the following command:

```
salt <minion_name> win_servermanager.list_available
```

Use the name in the right column of the results.

```
# Installs the IIS Web Server Role (Web-Server)
IIS-WebServerRole:
  win_servermanager.installed:
    - recurse: True
    - name: Web-Server

# Install multiple features, exclude the Web-Service
install_multiple_features:
  win_servermanager.installed:
    - recurse: True
    - features:
      - RemoteAccess
      - XPS-Viewer
      - SNMP-Service
    - exclude:
      - Web-Server
```

`salt.states.win_servermanager.`**`removed`**(*name*, *features=None*, *remove_payload=False*, *restart=False*)

Remove the windows feature To remove a single feature, use the `name` parameter. To remove multiple features, use the `features` parameter.

Parameters

- **`name`** (*`str`*) -- Short name of the feature (the right column in win_servermanager.list_available). This can be a single feature or a string of features in a comma-delimited list (no spaces)

  Note: A list is not allowed in the name parameter of any state. Use the `features` parameter if you want to pass the features as a list

- **`features`** (*`Optional[list]`*) -- A list of features to remove. If this is passed it will be used instead of the `name` parameter.

  New in version 2018.3.0.
- **`remove_payload`** (*`Optional[bool]`*) -- True will cause the feature to be removed from the side-by-side store. To install the feature in the future you will need to specify the `source`
- **`restart`** (*`Optional[bool]`*) -- Restarts the computer when uninstall is complete if required by the role/feature uninstall. Default is False

---

Note: Some features require a reboot after uninstall. If so the feature will not be completely uninstalled until the server is restarted.

Example

Do not use the role or feature names mentioned in the PKGMGR documentation. To get a list of available roles and features run the following command:

```
salt <minion_name> win_servermanager.list_available
```

Use the name in the right column of the results.

```
# Uninstall the IIS Web Server Rol (Web-Server)
IIS-WebserverRole:
  win_servermanager.removed:
    - name: Web-Server

# Uninstall multiple features, reboot if required
uninstall_multiple_features:
  win_servermanager.removed:
    - features:
      - RemoteAccess
      - XPX-Viewer
      - SNMP-Service
    - restart: True
```

26.19.115 salt.states.win_shortcut

State module for creating shortcuts on Windows. Handles file shortcuts (*.lnk*) and url shortcuts (*.url*). Allows for the configuration of icons and hot keys on file shortcuts. Changing the icon and hot keys are unsupported for url shortcuts.

New in version 3005.

`salt.states.win_shortcut.`**`present`**(*name, arguments='', description='', hot_key='', icon_location='', icon_index=0, target='', window_style='Normal', working_dir='', backup=False, force=False, make_dirs=False, user=None*)

Create a new shortcut. This can be a file shortcut (`.lnk`) or a url shortcut (`.url`).

Parameters

- **name** (*str*) -- The full path to the shortcut
- **target** (*str*) -- The full path to the target
- **arguments** (*str, optional*) -- Any arguments to be passed to the target
- **description** (*str, optional*) -- The description for the shortcut. This is shown in the `Comment` field of the dialog box. Default is an empty string
- **hot_key** (*str, optional*) -- A combination of hot Keys to trigger this shortcut. This is something like `Ctrl+Alt+D`. This is shown in the `Shortcut key` field in the dialog box. Default is an empty string. Available options are:
  - Ctrl
  - Alt
  - Shift
  - Ext

- **icon_index** (*int, optional*) -- The index for the icon to use in files that contain multiple icons. Default is 0
- **icon_location** (*str, optional*) -- The full path to a file containing icons. This is shown in the `Change Icon` dialog box by clicking the `Change Icon` button. If no file is specified and a binary is passed as the target, Windows will attempt to get the icon from the binary file. Default is an empty string
- **window_style** (*str, optional*) -- The window style the program should start in. This is shown in the `Run` field of the dialog box. Default is `Normal`. Valid options are:
  - Normal
  - Minimized
  - Maximized
- **working_dir** (*str, optional*) -- The full path to the working directory for the program to run in. This is shown in the `Start in` field of the dialog box.
- **backup** (*bool, optional*) -- If there is already a shortcut with the same name, set this value to `True` to backup the existing shortcut and continue creating the new shortcut. Default is `False`
- **force** (*bool, optional*) -- If there is already a shortcut with the same name and you aren't backing up the shortcut, set this value to `True` to remove the existing shortcut and create a new with these settings. Default is `False`
- **make_dirs** (*bool, optional*) -- If the parent directory structure does not exist for the new shortcut, create it. Default is `False`
- **user** (*str, optional*) -- The user to be the owner of any directories created by setting `make_dirs` to `True`. If no value is passed Salt will use the user account that it is running under. Default is an empty string.

Returns

A dictionary containing the changes, comments, and result of the
state

Return type

dict

Example:

```
KB123456:
  wusa.installed:
    - source: salt://kb123456.msu

# Create a shortcut and set the ``Shortcut key`` (``hot_key``)
new_shortcut:
  shortcut.present:
    - name: C:\path\to\shortcut.lnk
    - target: C:\Windows\notepad.exe
    - hot_key: Ctrl+Alt+N

# Create a shortcut and change the icon to the 3rd one in the icon file
new_shortcut:
  shortcut.present:
    - name: C:\path\to\shortcut.lnk
    - target: C:\Windows\notepad.exe
    - icon_location: C:\path\to\icon.ico
    - icon_index: 2

# Create a shortcut and change the startup mode to full screen
new_shortcut:
```

(continues on next page)

(continued from previous page)

```
  shortcut.present:
    - name: C:\path\to\shortcut.lnk
    - target: C:\Windows\notepad.exe
    - window_style: Maximized

# Create a shortcut and change the icon
new_shortcut:
  shortcut.present:
    - name: C:\path\to\shortcut.lnk
    - target: C:\Windows\notepad.exe
    - icon_location: C:\path\to\icon.ico

# Create a shortcut and force it to overwrite an existing shortcut
new_shortcut:
  shortcut.present:
    - name: C:\path\to\shortcut.lnk
    - target: C:\Windows\notepad.exe
    - force: True

# Create a shortcut and create any parent directories if they are missing
new_shortcut:
  shortcut.present:
    - name: C:\path\to\shortcut.lnk
    - target: C:\Windows\notepad.exe
    - make_dirs: True
```

26.19.116 salt.states.win_smtp_server

Module for managing IIS SMTP server configuration on Windows servers.

`salt.states.win_smtp_server.`**`active_log_format`**`(`*name*, *log_format*, *server='SmtpSvc/1'*`)`

Manage the active log format for the SMTP server.

Parameters

- **`log_format`** (*`str`*) -- The log format name.
- **`server`** (*`str`*) -- The SMTP server name.

Example of usage:

```
smtp-log-format:
    win_smtp_server.active_log_format:
        - log_format: Microsoft IIS Log File Format
```

`salt.states.win_smtp_server.`**`connection_ip_list`**`(`*name*, *addresses=None*, *grant_by_default=False*, *server='SmtpSvc/1'*`)`

Manage IP list for SMTP connections.

Parameters

- **`addresses`** (*`str`*) -- A dictionary of IP + subnet pairs.
- **`grant_by_default`** (*`bool`*) -- Whether the addresses should be a blacklist or whitelist.
- **`server`** (*`str`*) -- The SMTP server name.

Example of usage for creating a whitelist:

```
smtp-connection-whitelist:
    win_smtp_server.connection_ip_list:
        - addresses:
            127.0.0.1: 255.255.255.255
            172.16.1.98: 255.255.255.255
            172.16.1.99: 255.255.255.255
        - grant_by_default: False
```

Example of usage for creating a blacklist:

```
smtp-connection-blacklist:
    win_smtp_server.connection_ip_list:
        - addresses:
            172.16.1.100: 255.255.255.255
            172.16.1.101: 255.255.255.255
        - grant_by_default: True
```

Example of usage for allowing any source to connect:

```
smtp-connection-blacklist:
    win_smtp_server.connection_ip_list:
        - addresses: {}
        - grant_by_default: True
```

`salt.states.win_smtp_server.`**`relay_ip_list`**(*name*, *addresses=None*, *server='SmtpSvc/1'*)

Manage IP list for SMTP relay connections.

Due to the unusual way that Windows stores the relay IPs, it is advisable to retrieve the existing list you wish to set from a pre-configured server.

For example, setting '127.0.0.1' as an allowed relay IP through the GUI would generate an actual relay IP list similar to the following:

```
['24.0.0.128', '32.0.0.128', '60.0.0.128', '68.0.0.128', '1.0.0.0', '76.0.
↪0.0',
  '0.0.0.0', '0.0.0.0', '1.0.0.0', '1.0.0.0', '2.0.0.0', '2.0.0.0', '4.0.
↪0.0',
  '0.0.0.0', '76.0.0.128', '0.0.0.0', '0.0.0.0', '0.0.0.0', '0.0.0.0',
  '255.255.255.255', '127.0.0.1']
```

Note: Setting the list to None corresponds to the restrictive 'Only the list below' GUI parameter with an empty access list configured, and setting an empty list/tuple corresponds to the more permissive 'All except the list below' GUI parameter.

Parameters

- **addresses** (*str*) -- A list of the relay IPs. The order of the list is important.
- **server** (*str*) -- The SMTP server name.

Example of usage:

```
smtp-relay-list:
  win_smtp_server.relay_ip_list:
    - addresses:
```

(continues on next page)

(continued from previous page)

```
        - 24.0.0.128
        - 32.0.0.128
        - 60.0.0.128
        - 1.0.0.0
        - 76.0.0.0
        - 0.0.0.0
        - 0.0.0.0
        - 1.0.0.0
        - 1.0.0.0
        - 2.0.0.0
        - 2.0.0.0
        - 4.0.0.0
        - 0.0.0.0
        - 76.0.0.128
        - 0.0.0.0
        - 0.0.0.0
        - 0.0.0.0
        - 0.0.0.0
        - 255.255.255.255
        - 127.0.0.1
```

Example of usage for disabling relaying:

```
smtp-relay-list:
    win_smtp_server.relay_ip_list:
        - addresses: None
```

Example of usage for allowing relaying from any source:

```
smtp-relay-list:
    win_smtp_server.relay_ip_list:
        - addresses: []
```

`salt.states.win_smtp_server.`**`server_setting`**(*name*, *settings=None*, *server='SmtpSvc/1'*)

Ensure the value is set for the specified setting.

Note: The setting names are case-sensitive.

Parameters

- **settings** (*str*) -- A dictionary of the setting names and their values.
- **server** (*str*) -- The SMTP server name.

Example of usage:

```
smtp-settings:
    win_smtp_server.server_setting:
        - settings:
            LogType: 1
            LogFilePeriod: 1
            MaxMessageSize: 16777216
            MaxRecipients: 10000
            MaxSessionSize: 16777216
```

26.19.117 salt.states.win_snmp

Module for managing SNMP service settings on Windows servers.

`salt.states.win_snmp.`**`agent_settings`**(*name*, *contact*, *location*, *services=None*)

Manage the SNMP sysContact, sysLocation, and sysServices settings.

Parameters

- **`contact`** (*`str`*) -- The SNMP contact.
- **`location`** (*`str`*) -- The SNMP location.
- **`services`** (*`str`*) -- A list of selected services.

Example of usage:

```
snmp-agent-settings:
    win_snmp.agent_settings:
        - contact: Test Contact
        - location: Test Location
        - services:
            - Physical
            - Internet
```

`salt.states.win_snmp.`**`auth_traps_enabled`**(*name*, *status=True*)

Manage the sending of authentication traps.

Parameters

`status` (*`bool`*) -- The enabled status.

Example of usage:

```
snmp-auth-traps:
    win_snmp.auth_traps_enabled:
        - status: True
```

`salt.states.win_snmp.`**`community_names`**(*name*, *communities=None*)

Manage the SNMP accepted community names and their permissions.

Parameters

`communities` (*`str`*) -- A dictionary of SNMP communities and permissions.

Example of usage:

```
snmp-community-names:
    win_snmp.community_names:
        - communities:
            TestCommunity: Read Only
            OtherCommunity: Read Write
```

26.19.118 salt.states.win_system

Management of Windows system information

New in version 2014.1.0.

This state is used to manage system information such as the computer name and description.

```
ERIK-WORKSTATION:
  system.computer_name: []
```

(continues on next page)

(continued from previous page)

```
This is Erik's computer, don't touch!:
  system.computer_desc: []
```

`salt.states.win_system.`**`computer_desc`**(*name*)

Manage the computer's description field

name
: The desired computer description

`salt.states.win_system.`**`computer_description`**(*name*)

This function is an alias of `computer_desc`.

Manage the computer's description field

name
: The desired computer description

`salt.states.win_system.`**`computer_name`**(*name*)

Manage the computer's name

name
: The desired computer name

`salt.states.win_system.`**`hostname`**(*name*)

New in version 2016.3.0.

Manage the hostname of the computer

name
: The hostname to set

`salt.states.win_system.`**`join_domain`**(*name, username=None, password=None, account_ou=None, account_exists=False, restart=False*)

Checks if a computer is joined to the Domain. If the computer is not in the Domain, it will be joined.

Parameters

- **`name`** (*`str`*) -- The name of the Domain.
- **`username`** (*`str`*) -- Username of an account which is authorized to join computers to the specified domain. Need to be either fully qualified like user@domain.tld or simply user.
- **`password`** (*`str`*) -- Password of the account to add the computer to the Domain.
- **`account_ou`** (*`str`*) -- The DN of the OU below which the account for this computer should be created when joining the domain, e.g. ou=computers,ou=departm_432,dc=my-company,dc=com.
- **`account_exists`** (*`bool`*) -- Needs to be set to `True` to allow re-using an existing computer account.
- **`restart`** (*`bool`*) -- Needs to be set to `True` to restart the computer after a successful join.

Example:

```
join_to_domain:
  system.join_domain:
    - name: mydomain.local.com
    - username: myaccount@mydomain.local.com
    - password: mysecretpassword
    - restart: True
```

`salt.states.win_system.`**`reboot`**(*name, message=None, timeout=5, force_close=True, in_seconds=False, only_on_pending_reboot=True*)

Reboot the computer

Parameters

- **`message`** (*`str`*) -- An optional message to display to users. It will also be used as a comment in the event log entry.

  The default value is None.
- **`timeout`** (*`int`*) -- The number of minutes or seconds before a reboot will occur. Whether this number represents minutes or seconds depends on the value of `in_seconds`.

  The default value is 5.
- **`in_seconds`** (*`bool`*) -- If this is True, the value of `timeout` will be treated as a number of seconds. If this is False, the value of `timeout` will be treated as a number of minutes.

  The default value is False.
- **`force_close`** (*`bool`*) -- If this is True, running applications will be forced to close without warning. If this is False, running applications will not get the opportunity to prompt users about unsaved data.

  The default value is True.
- **`only_on_pending_reboot`** (*`bool`*) -- If this is True, the reboot will only occur if the system reports a pending reboot. If this is False, the reboot will always occur.

  The default value is True.

`salt.states.win_system.`**`shutdown`**`(`*name*, *message=None*, *timeout=5*, *force_close=True*, *reboot=False*, *in_seconds=False*, *only_on_pending_reboot=False*`)`

Shutdown the computer

Parameters

- **`message`** (*`str`*) -- An optional message to display to users. It will also be used as a comment in the event log entry.

  The default value is None.
- **`timeout`** (*`int`*) -- The number of minutes or seconds before a shutdown will occur. Whether this number represents minutes or seconds depends on the value of `in_seconds`.

  The default value is 5.
- **`in_seconds`** (*`bool`*) -- If this is True, the value of `timeout` will be treated as a number of seconds. If this is False, the value of `timeout` will be treated as a number of minutes.

  The default value is False.
- **`force_close`** (*`bool`*) -- If this is True, running applications will be forced to close without warning. If this is False, running applications will not get the opportunity to prompt users about unsaved data.

  The default value is True.
- **`reboot`** (*`bool`*) -- If this is True, the computer will restart immediately after shutting down. If False the system flushes all caches to disk and safely powers down the system.

  The default value is False.
- **`only_on_pending_reboot`** (*`bool`*) -- If this is True, the shutdown will only occur if the system reports a pending reboot. If this is False, the shutdown will always occur.

  The default value is False.

`salt.states.win_system.`**`workgroup`**`(`*name*`)`

New in version 3001.

Manage the workgroup of the computer

Parameters

name (*str*) -- The workgroup to set

Example:

```
set workgroup:
  system.workgroup:
    - name: local
```

26.19.119 salt.states.win_task

State module for adding and removing scheduled tasks using the Windows Task Scheduler.

`salt.states.win_task.`**`absent`**`(`*name, location='\\'*`)`

Delete a task from the task scheduler.

New in version 3007.0.

Parameters

- **name** (*str*) -- The name of the task to delete.
- **location** (*str*) -- A string value representing the location of the task. Default is "\" which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns

`True` if successful, otherwise `False`

Return type

bool

CLI Example:

```
test_win_task_absent:
  task.absent:
    - name: salt
    - location: ""
```

`salt.states.win_task.`**`present`**`(`*name, location='\\', user_name='System', password=None, force=False, **kwargs*`)`

Create a new task in the designated location. This function has many keyword arguments that are not listed here. For additional arguments see:

New in version 3007.0.

- `edit_task()`
- `add_action()`
- `add_trigger()`

Parameters

- **name** (*str*) -- The name of the task. This will be displayed in the task scheduler.
- **location** (*str*) -- A string value representing the location in which to create the task. Default is "\" which is the root for the task scheduler (C:WindowsSystem32tasks).
- **user_name** (*str*) -- The user account under which to run the task. To specify the "System" account, use "System". The password will be ignored.
- **password** (*str*) -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.
- **force** (*bool*) -- Overwrite the existing task.

Returns
A dictionary containing the results of the state

Return type
dict

CLI Example:

```
test_win_task_present:
  task.present:
    - name: salt
    - location: ""
    - force: True
    - action_type: Execute
    - cmd: "del /Q /S C:\\Temp"
    - trigger_type: Once
    - start_date: 12-1-16
    - start_time: 01:00
```

26.19.120 salt.states.win_wua

Installation of Windows Updates using the Windows Update Agent

New in version 2017.7.0.

Salt can manage Windows updates via the "wua" state module. Updates can be installed and removed. Update management declarations are as follows:

For installation:

```
# Install a single update using the KB
KB3194343:
  wua.installed

# Install a single update using the name parameter
install_update:
  wua.installed:
    - name: KB3194343

# Install multiple updates using the updates parameter and a combination of
# KB number and GUID
install_updates:
  wua.installed:
   - updates:
     - KB3194343
     - bb1dbb26-3fb6-45fd-bb05-e3c8e379195c
```

For removal:

```
# Remove a single update using the KB
KB3194343:
  wua.removed

# Remove a single update using the name parameter
remove_update:
```

(continues on next page)

(continued from previous page)

```
  wua.removed:
    - name: KB3194343

# Remove multiple updates using the updates parameter and a combination of
# KB number and GUID
remove_updates:
  wua.removed:
   - updates:
     - KB3194343
     - bb1dbb26-3fb6-45fd-bb05-e3c8e379195c
```

salt.states.win_wua.**installed**(*name*, *updates=None*)

Ensure Microsoft Updates are installed. Updates will be downloaded if needed.

Parameters

- **name** (*str*) -- The identifier of a single update to install.
- **updates** (*list*) -- A list of identifiers for updates to be installed. Overrides `name`. Default is None.

Note: Identifiers can be the GUID, the KB number, or any part of the Title of the Microsoft update. GUIDs and KBs are the preferred method to ensure you're installing the correct update.

Warning: Using a partial KB number or a partial Title could result in more than one update being installed.

Returns

A dictionary containing the results of the update. There are three

keys under changes. *installed* is a list of updates that were successfully installed. *failed* is a list of updates that failed to install. *superseded* is a list of updates that were not installed because they were superseded by another update.

Return type

dict

CLI Example:

```
# using a GUID
install_update:
  wua.installed:
    - name: 28cf1b09-2b1a-458c-9bd1-971d1b26b211

# using a KB
install_update:
  wua.installed:
    - name: KB3194343

# using the full Title
install_update:
  wua.installed:
    - name: Security Update for Adobe Flash Player for Windows 10 Version
↪1607 (for x64-based Systems) (KB3194343)

# Install multiple updates
```

(continues on next page)

(continued from previous page)

```
install_updates:
  wua.installed:
    - updates:
      - KB3194343
      - 28cf1b09-2b1a-458c-9bd1-971d1b26b211
```

`salt.states.win_wua.`**`removed`**`(`*name*, *updates=None*`)`

Ensure Microsoft Updates are uninstalled.

Parameters

- **`name`** (*`str`*) -- The identifier of a single update to uninstall.
- **`updates`** (*`list`*) -- A list of identifiers for updates to be removed. Overrides `name`. Default is None.

Note: Identifiers can be the GUID, the KB number, or any part of the Title of the Microsoft update. GUIDs and KBs are the preferred method to ensure you're uninstalling the correct update.

Warning: Using a partial KB number or a partial Title could result in more than one update being removed.

Returns

A dictionary containing the results of the removal. There are

three keys under changes. *removed* is a list of updates that were successfully removed. *failed* is a list of updates that failed to be removed.

Return type

dict

CLI Example:

```
# using a GUID
uninstall_update:
  wua.removed:
    - name: 28cf1b09-2b1a-458c-9bd1-971d1b26b211

# using a KB
uninstall_update:
  wua.removed:
    - name: KB3194343

# using the full Title
uninstall_update:
  wua.removed:
    - name: Security Update for Adobe Flash Player for Windows 10 Version
↪1607 (for x64-based Systems) (KB3194343)

# Install multiple updates
uninstall_updates:
  wua.removed:
    - updates:
      - KB3194343
      - 28cf1b09-2b1a-458c-9bd1-971d1b26b211
```

`salt.states.win_wua.`**`uptodate`**(*name*, *software=True*, *drivers=False*, *skip_hidden=False*, *skip_mandatory=False*, *skip_reboot=True*, *categories=None*, *severities=None*)

Ensure Microsoft Updates that match the passed criteria are installed. Updates will be downloaded if needed.

This state allows you to update a system without specifying a specific update to apply. All matching updates will be installed.

Parameters

- **name** (*str*) -- The name has no functional value and is only used as a tracking reference
- **software** (*bool*) -- Include software updates in the results (default is True)
- **drivers** (*bool*) -- Include driver updates in the results (default is False)
- **skip_hidden** (*bool*) -- Skip updates that have been hidden. Default is False.
- **skip_mandatory** (*bool*) -- Skip mandatory updates. Default is False.
- **skip_reboot** (*bool*) -- Skip updates that require a reboot. Default is True.
- **categories** (*list*) -- Specify the categories to list. Must be passed as a list. All categories returned by default.

  Categories include the following:
  - Critical Updates
  - Definition Updates
  - Drivers (make sure you set drivers=True)
  - Feature Packs
  - Security Updates
  - Update Rollups
  - Updates
  - Update Rollups
  - Windows 7
  - Windows 8.1
  - Windows 8.1 drivers
  - Windows 8.1 and later drivers
  - Windows Defender
- **severities** (*list*) -- Specify the severities to include. Must be passed as a list. All severities returned by default.

  Severities include the following:
  - Critical
  - Important

Returns

A dictionary containing the results of the update. There are three

keys under changes. *installed* is a list of updates that were successfully installed. *failed* is a list of updates that failed to install. *superseded* is a list of updates that were not installed because they were superseded by another update.

Return type

dict

CLI Example:

```
# Update the system using the state defaults
update_system:
  wua.uptodate

# Update the drivers
update_drivers:
  wua.uptodate:
    - software: False
```

(continues on next page)

(continued from previous page)

```
    - drivers: True
    - skip_reboot: False

# Apply all critical updates
update_critical:
  wua.uptodate:
    - severities:
      - Critical
```

26.19.121 salt.states.win_wusa

Microsoft Updates (KB) Management

This module provides the ability to enforce KB installations from files (.msu), without WSUS or Windows Update

New in version 2018.3.4.

`salt.states.win_wusa.`**`installed`**`(`*name*, *source*`)`

Ensure an update is installed on the minion

Parameters

- **name** (*str*) -- Name of the Windows KB ("KB123456")
- **source** (*str*) -- Source of .msu file corresponding to the KB

Example:

```
KB123456:
  wusa.installed:
    - source: salt://kb123456.msu
```

`salt.states.win_wusa.`**`uninstalled`**`(`*name*`)`

Ensure an update is uninstalled from the minion

Parameters

name (*str*) -- Name of the Windows KB ("KB123456")

Example:

```
KB123456:
  wusa.uninstalled
```

26.19.122 salt.states.winrepo

Manage Windows Package Repository

`salt.states.winrepo.`**`genrepo`**`(`*name*, *force=False*, *allow_empty=False*`)`

Refresh the winrepo.p file of the repository (salt-run winrepo.genrepo)

If `force` is `True` no checks will be made and the repository will be generated if `allow_empty` is `True` then the state will not return an error if there are 0 packages,

Note: This state only loads on minions that have the `roles: salt-master` grain set.

Example:

```
winrepo:
  winrepo.genrepo
```

26.19.123 salt.states.x509

Manage X509 Certificates

New in version 2015.8.0.

depends
M2Crypto

Deprecated since version 3006.0.

> **Warning:** This module has been deprecated and will be removed in Salt 3009 (Potassium). Please migrate to the replacement modules. For breaking changes between both versions, you can refer to the *x509_v2 execution module docs*.
>
> They have become the default `x509` modules in Salt 3008.0 (Argon). Until they are removed, you can still revert to the deprecated modules by setting `features: {x509_v2: false}` in your minion configuration.

This module can enable managing a complete PKI infrastructure including creating private keys, CAs, certificates and CRLs. It includes the ability to generate a private key on a server, and have the corresponding public key sent to a remote CA to create a CA signed certificate. This can be done in a secure manner, where private keys are always generated locally and never moved across the network.

Here is a simple example scenario. In this example `ca` is the ca server, and `www` is a web server that needs a certificate signed by `ca`.

For remote signing, peers must be permitted to remotely call the *`sign_remote_certificate`* function.

/etc/salt/master.d/peer.conf

```
peer:
  .*:
    - x509.sign_remote_certificate
```

/srv/salt/top.sls

```
base:
  '*':
    - cert
  'ca':
    - ca
  'www':
    - www
```

This state creates the CA key, certificate and signing policy. It also publishes the certificate to the mine where it can be easily retrieved by other minions.

/srv/salt/ca.sls

```
/etc/salt/minion.d/x509.conf:
  file.managed:
```

(continues on next page)

(continued from previous page)

```
    - source: salt://x509.conf

restart-salt-minion:
  cmd.run:
    - name: 'salt-call service.restart salt-minion'
    - bg: True
    - onchanges:
      - file: /etc/salt/minion.d/x509.conf

/etc/pki:
  file.directory

/etc/pki/issued_certs:
  file.directory

/etc/pki/ca.key:
  x509.private_key_managed:
    - bits: 4096
    - backup: True

/etc/pki/ca.crt:
  x509.certificate_managed:
    - signing_private_key: /etc/pki/ca.key
    - CN: ca.example.com
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:true"
    - keyUsage: "critical cRLSign, keyCertSign"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 3650
    - days_remaining: 0
    - backup: True
    - require:
      - file: /etc/pki
```

The signing policy defines properties that override any property requested or included in a CRL. It also can define a restricted list of minions which are allowed to remotely invoke this signing policy.

/srv/salt/x509.conf

```
mine_functions:
  x509.get_pem_entries: [/etc/pki/ca.crt]

x509_signing_policies:
  www:
    - minions: 'www'
    - signing_private_key: /etc/pki/ca.key
    - signing_cert: /etc/pki/ca.crt
    - C: US
    - ST: Utah
    - L: Salt Lake City
```

(continues on next page)

(continued from previous page)

```
    - basicConstraints: "critical CA:false"
    - keyUsage: "critical keyEncipherment"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 90
    - copypath: /etc/pki/issued_certs/
```

This state will instruct all minions to trust certificates signed by our new CA. Using Jinja to strip newlines from the text avoids dealing with newlines in the rendered YAML, and the `sign_remote_certificate` state will handle properly formatting the text before writing the output.

/srv/salt/cert.sls

```
/usr/local/share/ca-certificates:
  file.directory

/usr/local/share/ca-certificates/intca.crt:
  x509.pem_managed:
    - text: {{ salt['mine.get']('ca', 'x509.get_pem_entries')['ca']['/etc/pki/
→ca.crt']|replace('\n', '') }}
```

This state creates a private key then requests a certificate signed by ca according to the www policy.

/srv/salt/www.sls

```
/etc/pki/www.crt:
  x509.private_key_managed:
    - name: /etc/pki/www.key
    - bits: 4096
    - backup: True

/etc/pki/www.crt:
  x509.certificate_managed:
    - ca_server: ca
    - signing_policy: www
    - public_key: /etc/pki/www.key
    - CN: www.example.com
    - days_remaining: 30
    - backup: True
```

This other state creates a private key then requests a certificate signed by ca according to the www policy but adds a strict date range for the certificate to be considered valid.

/srv/salt/www-time-limited.sls

```
/etc/pki/www-time-limited.crt:
  x509.certificate_managed:
    - ca_server: ca
    - signing_policy: www
    - public_key: /etc/pki/www-time-limited.key
    - CN: www.example.com
    - not_before: 2019-05-05 00:00:00
    - not_after: 2020-05-05 14:30:00
    - backup: True
```

`salt.states.x509.`**`certificate_managed`**(*name*, *days_remaining=90*, *append_certs=None*, ***kwargs*)

Manage a Certificate

name

Path to the certificate

days_remaining

[90] Recreate the certificate if the number of days remaining on it are less than this number. The value should be less than `days_valid`, otherwise the certificate will be recreated every time the state is run. A value of 0 disables automatic renewal.

append_certs:

A list of certificates to be appended to the managed file. They must be valid PEM files, otherwise an error will be thrown.

kwargs:

Any arguments supported by *`x509.create_certificate`* or *`file.managed`* are supported.

not_before:

Initial validity date for the certificate. This date must be specified in the format '%Y-%m-%d %H:%M:%S'.

New in version 3001.

not_after:

Final validity date for the certificate. This date must be specified in the format '%Y-%m-%d %H:%M:%S'.

New in version 3001.

Examples:

```
/etc/pki/ca.crt:
  x509.certificate_managed:
    - signing_private_key: /etc/pki/ca.key
    - CN: ca.example.com
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:true"
    - keyUsage: "critical cRLSign, keyCertSign"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 3650
    - days_remaining: 0
    - backup: True
```

```
/etc/ssl/www.crt:
  x509.certificate_managed:
    - ca_server: pki
    - signing_policy: www
    - public_key: /etc/ssl/www.key
    - CN: www.example.com
    - days_valid: 90
    - days_remaining: 30
    - backup: True
```

`salt.states.x509.`**`crl_managed`**(*name*, *signing_private_key*, *signing_private_key_passphrase=None*, *signing_cert=None*, *revoked=None*, *days_valid=100*, *digest=''*, *days_remaining=30*, *include_expired=False*, ***kwargs*)

Manage a Certificate Revocation List

name

Path to the certificate

signing_private_key
The private key that will be used to sign the CRL. This is usually your CA's private key.

signing_private_key_passphrase
Passphrase to decrypt the private key.

signing_cert
The certificate of the authority that will be used to sign the CRL. This is usually your CA's certificate.

revoked
A list of certificates to revoke. Must include either a serial number or a the certificate itself. Can optionally include the revocation date and notAfter date from the certificate. See example below for details.

days_valid
[100] The number of days the certificate should be valid for.

digest
The digest to use for signing the CRL. This has no effect on versions of pyOpenSSL less than 0.14.

days_remaining
[30] The CRL should be automatically recreated if there are less than `days_remaining` days until the CRL expires. Set to 0 to disable automatic renewal.

include_expired
[False] If `True`, include expired certificates in the CRL.

kwargs
Any arguments supported by *`file.managed`* are supported.

Example:

```
/etc/pki/ca.crl:
  x509.crl_managed:
    - signing_private_key: /etc/pki/myca.key
    - signing_cert: /etc/pki/myca.crt
    - revoked:
      - compromized_Web_key:
        - certificate: /etc/pki/certs/badweb.crt
        - revocation_date: 2015-03-01 00:00:00
        - reason: keyCompromise
      - terminated_vpn_user:
        - serial_number: D6:D2:DC:D8:4D:5C:C0:F4
        - not_after: 2016-01-01 00:00:00
        - revocation_date: 2015-02-25 00:00:00
        - reason: cessationOfOperation
```

`salt.states.x509.`**`csr_managed`**`(`*name*, ***kwargs*`)`

Manage a Certificate Signing Request

name:
Path to the CSR

properties:
The properties to be added to the certificate request, including items like subject, extensions and public key. See above for valid properties.

kwargs:
Any arguments supported by *`file.managed`* are supported.

Example:

```
/etc/pki/mycert.csr:
  x509.csr_managed:
     - private_key: /etc/pki/mycert.key
     - CN: www.example.com
     - C: US
```

(continues on next page)

(continued from previous page)

```
      - ST: Utah
      - L: Salt Lake City
      - keyUsage: 'critical dataEncipherment'
```

`salt.states.x509.`**`pem_managed`**`(`*name*, *text*, *backup=False*, ***kwargs*`)`

Manage the contents of a PEM file directly with the content in text, ensuring correct formatting.

name:
The path to the file to manage

text:
The PEM formatted text to write.

kwargs:
Any arguments supported by *`file.managed`* are supported.

`salt.states.x509.`**`private_key_managed`**`(`*name*, *bits=2048*, *passphrase=None*, *cipher='aes_128_cbc'*, *new=False*, *overwrite=False*, *verbose=True*, ***kwargs*`)`

Manage a private key's existence.

name:
Path to the private key

bits:
Key length in bits. Default 2048.

passphrase:
Passphrase for encrypting the private key.

cipher:
Cipher for encrypting the private key.

new:
Always create a new key. Defaults to `False`. Combining new with `prereq` can allow key rotation whenever a new certificate is generated.

overwrite:
Overwrite an existing private key if the provided passphrase cannot decrypt it.

verbose:
Provide visual feedback on stdout, dots while key is generated. Default is True.

New in version 2016.11.0.

kwargs:
Any kwargs supported by file.managed are supported.

Example:

The JINJA templating in this example ensures a private key is generated if the file doesn't exist and that a new private key is generated whenever the certificate that uses it is to be renewed.

```
/etc/pki/www.key:
  x509.private_key_managed:
    - bits: 4096
    - new: True
    {% if salt['file.file_exists']('/etc/pki/www.key') -%}
    - prereq:
      - x509: /etc/pki/www.crt
    {%- endif %}
```

26.19.124 salt.states.x509_v2

Manage X.509 certificates

New in version 3006.0: This module represents a complete rewrite of the original `x509` modules and is named `x509_v2` since it introduces breaking changes.

depends
cryptography

Note: All parameters that take a public key, private key, certificate, CSR or CRL can be specified either as a PEM/hex/base64 string or a path to a local file encoded in all supported formats for the type.

Configuration instructions and general remarks are documented in the *execution module docs*.

For the list of breaking changes versus the previous `x509` modules, please also refer to the *execution module docs*.

About

This module can enable managing a complete PKI infrastructure, including creating private keys, CAs, certificates and CRLs. It includes the ability to generate a private key on a server, and have the corresponding public key sent to a remote CA to create a CA signed certificate. This can be done in a secure manner, where private keys are always generated locally and never moved across the network.

Example

Here is a simple example scenario. In this example `ca` is the ca server, and www is a web server that needs a certificate signed by `ca`.

Note: Remote signing requires the setup of *Peer Communication* and signing policies. Please see the *execution module docs*.

/srv/salt/top.sls

```
base:
  '*':
    - cert
  'ca':
    - ca
  'www':
    - www
```

This state creates the CA key, certificate and signing policy. It also publishes the certificate to the mine, where it can be easily retrieved by other minions.

```
# /srv/salt/ca.sls

Configure the x509 module:
  file.managed:
    - name: /etc/salt/minion.d/x509.conf
    - source: salt://x509.conf
```

(continues on next page)

(continued from previous page)

```
Restart Salt minion:
  cmd.run:
    - name: 'salt-call service.restart salt-minion'
    - bg: true
    - onchanges:
      - file: /etc/salt/minion.d/x509.conf

Ensure PKI directories exist:
  file.directory:
    - name: /etc/pki/issued_certs
    - makedirs: true

Create CA private key:
  x509.private_key_managed:
    - name: /etc/pki/ca.key
    - keysize: 4096
    - backup: true
    - require:
      - file: /etc/pki/issued_certs

Create self-signed CA certificate:
  x509.certificate_managed:
    - name: /etc/pki/ca.crt
    - signing_private_key: /etc/pki/ca.key
    - CN: ca.example.com
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical, CA:true"
    - keyUsage: "critical, cRLSign, keyCertSign"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid:always,issuer
    - days_valid: 3650
    - days_remaining: 0
    - backup: true
    - require:
      - x509: /etc/pki/ca.key
```

```
# /srv/salt/x509.conf

# enable x509_v2
features:
  x509_v2: true

# publish the CA certificate to the mine
mine_functions:
  x509.get_pem_entries: [/etc/pki/ca.crt]

# define at least one signing policy for remote signing
x509_signing_policies:
  www:
```

(continues on next page)

(continued from previous page)

```
    - minions: 'www'
    - signing_private_key: /etc/pki/ca.key
    - signing_cert: /etc/pki/ca.crt
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:false"
    - keyUsage: "critical keyEncipherment"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid:always,issuer
    - days_valid: 30
    - copypath: /etc/pki/issued_certs/
```

This example state will instruct all minions to trust certificates signed by our new CA. Mind that this example works for Debian-based OS only. Also note the Jinja call to encode the string to JSON, which will avoid YAML issues with newline characters.

```
# /srv/salt/cert.sls

Ensure the CA trust bundle exists:
  file.directory:
    - name: /usr/local/share/ca-certificates

Ensure our self-signed CA certificate is included:
  x509.pem_managed:
    - name: /usr/local/share/ca-certificates/myca.crt
    - text: {{ salt["mine.get"]("ca", "x509.get_pem_entries")["ca"]["/etc/pki/
↪ca.crt"] | json }}
```

This state creates a private key, then requests a certificate signed by our CA according to the www policy.

```
# /srv/salt/www.sls

Ensure PKI directory exists:
  file.directory:
    - name: /etc/pki

Create private key for the certificate:
  x509.private_key_managed:
    - name: /etc/pki/www.key
    - keysize: 4096
    - backup: true
    - require:
      - file: /etc/pki

Request certificate:
  x509.certificate_managed:
    - name: /etc/pki/www.crt
    - ca_server: ca
    - signing_policy: www
    - private_key: /etc/pki/www.key
    - CN: www.example.com
```

(continues on next page)

(continued from previous page)

```
    - days_remaining: 7
    - backup: true
    - require:
      - x509: /etc/pki/www.key
```

salt.states.x509_v2.**certificate_managed**(*name, days_remaining=None, ca_server=None, signing_policy=None, encoding='pem', append_certs=None, copypath=None, prepend_cn=False, digest='sha256', signing_private_key=None, signing_private_key_passphrase=None, signing_cert=None, public_key=None, private_key=None, private_key_passphrase=None, csr=None, subject=None, serial_number=None, not_before=None, not_after=None, days_valid=None, pkcs12_passphrase=None, pkcs12_encryption_compat=False, pkcs12_friendlyname=None, **kwargs*)

Ensure an X.509 certificate is present as specified.

This function accepts the same arguments as `x509.create_certificate`, as well as most ones for *:py:func:`file.managed <salt.states.file.managed>*.

name
The path the certificate should be present at.

days_remaining
The certificate will be recreated once the remaining certificate validity period is less than this number of days. Defaults to `90` (until v3009) or `7` (from v3009 onwards).

ca_server
Request a remotely signed certificate from ca_server. For this to work, a `signing_policy` must be specified, and that same policy must be configured on the ca_server. Also, the Salt master must permit peers to call the `x509.sign_remote_certificate` function. See the *execution module docs* for details.

signing_policy
The name of a configured signing policy. Parameters specified in there are hardcoded and cannot be overridden. This is required for remote signing, otherwise optional.

encoding
Specify the encoding of the resulting certificate. It can be serialized as a `pem` (or `pkcs7_pem`) text file or in several binary formats (`der`, `pkcs7_der`, `pkcs12`). Defaults to `pem`.

append_certs
A list of additional certificates to append to the new one, e.g. to create a CA chain.

Note: Mind that when `der` encoding is in use, appending certificatees is prohibited.

copypath
Create a copy of the issued certificate in PEM format in this directory. The file will be named `<serial_number>.crt` if prepend_cn is false.

prepend_cn
When `copypath` is set, prepend the common name of the certificate to the file name like so: `<CN>-<serial_number>.crt`. Defaults to false.

digest
The hashing algorithm to use for the signature. Valid values are: sha1, sha224, sha256, sha384, sha512, sha512_224, sha512_256, sha3_224, sha3_256, sha3_384, sha3_512. Defaults to `sha256`. This will be ignored for `ed25519` and `ed448` key types.

signing_private_key

The private key corresponding to the public key in `signing_cert`. Required.

signing_private_key_passphrase
If `signing_private_key` is encrypted, the passphrase to decrypt it.

signing_cert
The CA certificate to be used for signing the issued certificate.

public_key
The public key the certificate should be issued for. Other ways of passing the required information are `private_key` and `csr`. If neither are set, the public key of the `signing_private_key` will be included, i.e. a self-signed certificate is generated.

private_key
The private key corresponding to the public key the certificate should be issued for. This is one way of specifying the public key that will be included in the certificate, the other ones being `public_key` and `csr`.

private_key_passphrase
If `private_key` is specified and encrypted, the passphrase to decrypt it.

csr
A certificate signing request to use as a base for generating the certificate. The following information will be respected, depending on configuration:

- public key
- extensions, if not otherwise specified (arguments, signing_policy)

subject
The subject's distinguished name embedded in the certificate. This is one way of passing this information (see `kwargs` below for the other). This argument will be preferred and allows to control the order of RDNs in the DN as well as to embed RDNs with multiple attributes. This can be specified as a RFC4514-encoded string (`CN=example.com,O=Example Inc,C=US`, mind that the rendered order is reversed from what is embedded), a list of RDNs encoded as in RFC4514 (`["C=US", "O=Example Inc", "CN=example.com"]`) or a dictionary (`{"CN": "example.com", "C": "US", "O": "Example Inc"}`, default ordering). Multiple name attributes per RDN are concatenated with a `+`.

Note: Parsing of RFC4514 strings requires at least cryptography release 37.

serial_number
A serial number to be embedded in the certificate. If unspecified, will autogenerate one. This should be an integer, either in decimal or hexadecimal notation.

not_before
Set a specific date the certificate should not be valid before. The format should follow `%Y-%m-%d %H:%M:%S` and will be interpreted as GMT/UTC. Defaults to the time of issuance.

not_after
Set a specific date the certificate should not be valid after. The format should follow `%Y-%m-%d %H:%M:%S` and will be interpreted as GMT/UTC. If unspecified, defaults to the current time plus `days_valid` days.

days_valid
If `not_after` is unspecified, the number of days from the time of issuance the certificate should be valid for. Defaults to `365` (until v3009) or `30` (from v3009 onwards).

pkcs12_passphrase
When encoding a certificate as `pkcs12`, encrypt it with this passphrase.

Note: PKCS12 encryption is very weak and should not be relied on for security.

pkcs12_encryption_compat
OpenSSL 3 and cryptography v37 switched to a much more secure default encryption for PKCS12, which might be incompatible with some systems. This forces the legacy encryption. Defaults to False.

pkcs12_friendlyname
When encoding a certificate as `pkcs12`, a name for the certificate can be included.

kwargs
Embedded X.509v3 extensions and the subject's distinguished name can be controlled via supplemental keyword arguments. See `x509.create_certificate` for an overview.

`salt.states.x509_v2.`**`crl_managed`**`(`*name*, *signing_private_key*, *revoked*, *days_remaining=None*, *signing_cert=None*, *signing_private_key_passphrase=None*, *include_expired=False*, *days_valid=None*, *digest='sha256'*, *encoding='pem'*, *extensions=None*, ***kwargs*`)`

Ensure a certificate revocation list is present as specified.

This function accepts the same arguments as `x509.create_crl`, as well as most ones for *:py:func:`file.managed <salt.states.file.managed>*.

name
The path the certificate revocation list should be present at.

signing_private_key
Your certificate authority's private key. It will be used to sign the CRL. Required.

revoked
A list of dicts containing all the certificates to revoke. Each dict represents one certificate. A dict must contain either the key `serial_number` with the value of the serial number to revoke, or `certificate` with some reference to the certificate to revoke.

The dict can optionally contain the `revocation_date` key. If this key is omitted, the revocation date will be set to now. It should be a string in the format `%Y-%m-%d %H:%M:%S`.

The dict can also optionally contain the `not_after` key. This is redundant if the `certificate` key is included. If the `certificate` key is not included, this can be used for the logic behind the `include_expired` parameter. It should be a string in the format `%Y-%m-%d %H:%M:%S`.

The dict can also optionally contain the `extensions` key, which allows to set CRL entry-specific extensions. The following extensions are supported:

certificateIssuer
Identifies the certificate issuer associated with an entry in an indirect CRL. The format is the same as for subjectAltName.

CRLReason
Identifies the reason for certificate revocation. Available choices are `unspecified`, `keyCompromise`, `CACompromise`, `affiliationChanged`, `superseded`, `cessationOfOperation`, `certificateHold`, `privilegeWithdrawn`, `aACompromise` and `removeFromCRL`.

invalidityDate
Provides the date on which the certificate became invalid. The value should be a string in the same format as `revocation_date`.

days_remaining
The certificate revocation list will be recreated once the remaining CRL validity period is less than this number of days. Defaults to `30` (until v3009) or `3` (from v3009 onwards). Set to `0` to disable automatic renewal without anything changing.

signing_cert
The CA certificate to be used for signing the issued certificate.

signing_private_key_passphrase
If `signing_private_key` is encrypted, the passphrase to decrypt it.

include_expired
Also include already expired certificates in the CRL. Defaults to false.

days_valid
The number of days that the CRL should be valid for. This sets the `Next Update` field in the CRL. Defaults to `100` (until v3009) or `7` (from v3009 onwards).

digest
The hashing algorithm to use for the signature. Valid values are: sha1, sha224, sha256, sha384, sha512, sha512_224, sha512_256, sha3_224, sha3_256, sha3_384, sha3_512. Defaults to `sha256`. This will be ignored for `ed25519` and `ed448` key types.

encoding
Specify the encoding of the resulting certificate revocation list. It can be serialized as a `pem` text or binary `der` file. Defaults to `pem`.

extensions
Add CRL extensions. See *`x509.create_crl`* for details.

Note: For `cRLNumber`, in addition the value `auto` is supported, which automatically increases the counter every time a new CRL is issued.

Example:

```
Manage CRL:
  x509.crl_managed:
    - name: /etc/pki/ca.crl
    - signing_private_key: /etc/pki/myca.key
    - signing_cert: /etc/pki/myca.crt
    - revoked:
      - certificate: /etc/pki/certs/badweb.crt
        revocation_date: 2022-11-01 00:00:00
        extensions:
          CRLReason: keyCompromise
      - serial_number: D6:D2:DC:D8:4D:5C:C0:F4
        not_after: 2023-03-14 00:00:00
        revocation_date: 2022-10-25 00:00:00
        extensions:
          CRLReason: cessationOfOperation
    - extensions:
        cRLNumber: auto
```

`salt.states.x509_v2.`**`csr_managed`**(*name*, *private_key*, *private_key_passphrase=None*, *digest='sha256'*, *encoding='pem'*, *subject=None*, ***kwargs*)

Ensure a certificate signing request is present as specified.

This function accepts the same arguments as *`x509.create_csr`*, as well as most ones for *`file.managed`*.

name
The path the certificate signing request should be present at.

private_key
The private key corresponding to the public key the certificate should be issued for. The CSR will be signed by it. Required.

private_key_passphrase
If `private_key` is encrypted, the passphrase to decrypt it.

digest
The hashing algorithm to use for the signature. Valid values are: sha1, sha224, sha256, sha384, sha512, sha512_224, sha512_256, sha3_224, sha3_256, sha3_384, sha3_512. Defaults to `sha256`. This will be ignored for `ed25519` and `ed448` key types.

encoding
Specify the encoding of the resulting certificate revocation list. It can be serialized as a `pem` text or binary `der` file. Defaults to `pem`.

kwargs
Embedded X.509v3 extensions and the subject's distinguished name can be controlled via supple-

mental keyword arguments. See *x509.create_certificate* for an overview. Mind that some extensions are not available for CSR (`authorityInfoAccess`, `authorityKeyIdentifier`, `issuerAltName`, `crlDistributionPoints`).

`salt.states.x509_v2.`**`pem_managed`**`(`*name*, *text*, ***kwargs*`)`

Manage the contents of a PEM file directly with the content in text, ensuring correct formatting.

name

The path to the file to manage.

text

The PEM-formatted text to write.

kwargs

Most arguments supported by *file.managed* are passed through.

`salt.states.x509_v2.`**`private_key_managed`**`(`*name*, *algo='rsa'*, *keysize=None*, *passphrase=None*, *encoding='pem'*, *new=False*, *overwrite=False*, *pkcs12_encryption_compat=False*, ***kwargs*`)`

Ensure a private key is present as specified.

This function accepts the same arguments as *x509.create_private_key*, as well as most ones for *file.managed*.

Note: If `mode` is unspecified, it will default to `0400`.

name

The path the private key should be present at.

algo

The digital signature scheme the private key should be based on. Available: `rsa`, `ec`, `ed25519`, `ed448`. Defaults to `rsa`.

keysize

For `rsa`, specifies the bitlength of the private key (2048, 3072, 4096). For `ec`, specifies the NIST curve to use (256, 384, 521). Irrelevant for Edwards-curve schemes (`ed25519`, `ed448`). Defaults to 2048 for RSA and 256 for EC.

passphrase

If this is specified, the private key will be encrypted using this passphrase. The encryption algorithm cannot be selected, it will be determined automatically as the best available one.

encoding

Specify the encoding of the resulting private key. It can be serialized as a `pem` text, binary `der` or `pkcs12` file. Defaults to `pem`.

new

Always create a new key. Defaults to false. Combining new with `prereq` can allow key rotation whenever a new certificate is generated.

overwrite

Overwrite an existing private key if the provided passphrase cannot decrypt it. Defaults to false.

pkcs12_encryption_compat

Some operating systems are incompatible with the encryption defaults for PKCS12 used since OpenSSL v3. This switch triggers a fallback to `PBESv1SHA1And3KeyTripleDESCBC`. Please consider the notes on PKCS12 encryption.

Example:

The Jinja templating in this example ensures a new private key is generated if the file does not exist and whenever the associated certificate is to be renewed.

```
Manage www private key:
  x509.private_key_managed:
    - name: /etc/pki/www.key
    - keysize: 4096
    - new: true
{%- if salt["file.file_exists"]("/etc/pki/www.key") %}
    - prereq:
      - x509: /etc/pki/www.crt
{%- endif %}
```

26.20 thorium modules

calc	Used to manage the thorium register.
check	The check Thorium state is used to create gateways to commands, the checks make it easy to make states that watch registers for changes and then just succeed or fail based on the state of the register, this creates the pattern of having a command execution get gated by a check state via a requisite.
file	Writes matches to disk to verify activity, helpful when testing
key	The key Thorium State is used to apply changes to the accepted/rejected/pending keys
local	Run remote execution commands via the local client
reg	Used to manage the thorium register.
runner	React by calling asynchronous runners
status	This thorium state is used to track the status beacon events and keep track of the active status of minions
timer	Allow for flow based timers.
wheel	React by calling asynchronous runners

26.20.1 salt.thorium.calc

Used to manage the thorium register. The thorium register is where compound values are stored and computed, such as averages etc.

New in version 2016.11.0.

depends
statistics PyPi module

`salt.thorium.calc.`**`add`**(*name*, *num*, *minimum=0*, *maximum=0*, *ref=None*)

Adds together the `num` most recent values. Requires a list.

USAGE:

```
foo:
  calc.add:
    - name: myregentry
    - num: 5
```

`salt.thorium.calc.`**`calc`**(*name, num, oper, minimum=0, maximum=0, ref=None*)

Perform a calculation on the `num` most recent values. Requires a list. Valid values for `oper` are:

- add: Add last `num` values together
- mul: Multiple last `num` values together
- mean: Calculate mean of last `num` values
- median: Calculate median of last `num` values
- median_low: Calculate low median of last `num` values
- median_high: Calculate high median of last `num` values
- median_grouped: Calculate grouped median of last `num` values
- mode: Calculate mode of last `num` values

USAGE:

```
foo:
  calc.calc:
    - name: myregentry
    - num: 5
    - oper: mean
```

`salt.thorium.calc.`**`mean`**(*name, num, minimum=0, maximum=0, ref=None*)

Calculates the mean of the `num` most recent values. Requires a list.

USAGE:

```
foo:
  calc.mean:
    - name: myregentry
    - num: 5
```

`salt.thorium.calc.`**`median`**(*name, num, minimum=0, maximum=0, ref=None*)

Calculates the mean of the `num` most recent values. Requires a list.

USAGE:

```
foo:
  calc.median:
    - name: myregentry
    - num: 5
```

`salt.thorium.calc.`**`median_grouped`**(*name, num, minimum=0, maximum=0, ref=None*)

Calculates the grouped mean of the `num` most recent values. Requires a list.

USAGE:

```
foo:
  calc.median_grouped:
    - name: myregentry
    - num: 5
```

`salt.thorium.calc.`**`median_high`**(*name, num, minimum=0, maximum=0, ref=None*)

Calculates the high mean of the `num` most recent values. Requires a list.

USAGE:

```
foo:
  calc.median_high:
```

(continues on next page)

(continued from previous page)

```
    - name: myregentry
    - num: 5
```

salt.thorium.calc.**median_low**(*name*, *num*, *minimum=0*, *maximum=0*, *ref=None*)

Calculates the low mean of the `num` most recent values. Requires a list.

USAGE:

```
foo:
  calc.median_low:
    - name: myregentry
    - num: 5
```

salt.thorium.calc.**mode**(*name*, *num*, *minimum=0*, *maximum=0*, *ref=None*)

Calculates the mode of the `num` most recent values. Requires a list.

USAGE:

```
foo:
  calc.mode:
    - name: myregentry
    - num: 5
```

salt.thorium.calc.**mul**(*name*, *num*, *minimum=0*, *maximum=0*, *ref=None*)

Multiplies together the `num` most recent values. Requires a list.

USAGE:

```
foo:
  calc.mul:
    - name: myregentry
    - num: 5
```

26.20.2 salt.thorium.check

The check Thorium state is used to create gateways to commands, the checks make it easy to make states that watch registers for changes and then just succeed or fail based on the state of the register, this creates the pattern of having a command execution get gated by a check state via a requisite.

salt.thorium.check.**contains**(*name*, *value*, *count_lt=None*, *count_lte=None*, *count_eq=None*, *count_gte=None*, *count_gt=None*, *count_ne=None*)

Only succeed if the value in the given register location contains the given value

USAGE:

```
foo:
  check.contains:
    - value: itni

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
```

(continues on next page)

(continued from previous page)

```
    - require:
      - check: foo
```

salt.thorium.check.**eq**(*name*, *value*)

Only succeed if the value in the given register location is equal to the given value

USAGE:

```
foo:
  check.eq:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

salt.thorium.check.**event**(*name*)

Chekcs for a specific event match and returns result True if the match happens

USAGE:

```
salt/foo/*/bar:
  check.event

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: salt/foo/*/bar
```

salt.thorium.check.**gt**(*name*, *value*)

Only succeed if the value in the given register location is greater than the given value

USAGE:

```
foo:
  check.gt:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

salt.thorium.check.**gte**(*name*, *value*)

Only succeed if the value in the given register location is greater or equal than the given value

USAGE:

```
foo:
  check.gte:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

salt.thorium.check.**len_eq**(*name*, *value*)

Only succeed if the length of the given register location is equal to the given value.

USAGE:

```
foo:
  check.len_eq:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

salt.thorium.check.**len_gt**(*name*, *value*)

Only succeed if length of the given register location is greater than the given value.

USAGE:

```
foo:
  check.len_gt:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

salt.thorium.check.**len_gte**(*name*, *value*)

Only succeed if the length of the given register location is greater or equal than the given value

USAGE:

```
foo:
  check.len_gte:
    - value: 42

run_remote_ex:
  local.cmd:
```

(continues on next page)

(continued from previous page)

```
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

salt.thorium.check.**len_lt**(*name*, *value*)

Only succeed if the length of the given register location is less than the given value.

USAGE:

```
foo:
  check.len_lt:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

salt.thorium.check.**len_lte**(*name*, *value*)

Only succeed if the length of the given register location is less than or equal the given value

USAGE:

```
foo:
  check.len_lte:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

salt.thorium.check.**len_ne**(*name*, *value*)

Only succeed if the length of the given register location is not equal to the given value.

USAGE:

```
foo:
  check.len_ne:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

`salt.thorium.check.lt(name, value)`

Only succeed if the value in the given register location is less than the given value

USAGE:

```
foo:
  check.lt:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

`salt.thorium.check.lte(name, value)`

Only succeed if the value in the given register location is less than or equal the given value

USAGE:

```
foo:
  check.lte:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

`salt.thorium.check.ne(name, value)`

Only succeed if the value in the given register location is not equal to the given value

USAGE:

```
foo:
  check.ne:
    - value: 42

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping
    - require:
      - check: foo
```

26.20.3 salt.thorium.file

Writes matches to disk to verify activity, helpful when testing

Normally this is used by giving the name of the file (without a path) that the data will be saved to. If for instance you use `foo` as the name:

```
foo:
  file.save
```

Then the file will be saved to:

```
<salt cachedir>/thorium/saves/foo
```

You may also provide an absolute path for the file to be saved to:

```
/tmp/foo.save:
    file.save
```

Files will be saved in JSON format. However, JSON does not support `set()``s. If you are saving a register entry that contains a ``set()`, then it will fail to save to JSON format. However, you may pass data through a filter which makes it JSON compliant:

```
foo:
  file.save:
    filter: True
```

Be warned that if you do this, then the file will be saved, but not in a format that can be re-imported into Python.

`salt.thorium.file.`**`save`**`(`*name*, *filter=False*`)`

Save the register to <salt cachedir>/thorium/saves/<name>, or to an absolute path.

If an absolute path is specified, then the directory will be created non-recursively if it doesn't exist.

USAGE:

```
foo:
  file.save

/tmp/foo:
  file.save
```

26.20.4 salt.thorium.key

The key Thorium State is used to apply changes to the accepted/rejected/pending keys

New in version 2016.11.0.

`salt.thorium.key.`**`timeout`**`(`*name*, *delete=0*, *reject=0*`)`

If any minion's status is older than the timeout value then apply the given action to the timed out key. This example will remove keys to minions that have not checked in for 300 seconds (5 minutes)

USAGE:

```
statreg:
  status.reg

clean_keys:
  key.timeout:
    - require:
      - status: statreg
    - delete: 300
```

26.20.5 salt.thorium.local

Run remote execution commands via the local client

`salt.thorium.local.`**`cmd`**(*name, tgt, func, arg=(), tgt_type='glob', ret='', kwarg=None, **kwargs*)

Execute a remote execution command

USAGE:

```
run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.ping

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.sleep
    - arg:
      - 30

run_remote_ex:
  local.cmd:
    - tgt: '*'
    - func: test.sleep
    - kwarg:
      length: 30
```

26.20.6 salt.thorium.reg

Used to manage the thorium register. The thorium register is where compound values are stored and computed, such as averages etc.

`salt.thorium.reg.`**`clear`**(*name*)

Clear the namespace from the register

USAGE:

```
clearns:
  reg.clear:
    - name: myregister
```

`salt.thorium.reg.`**`delete`**`(`*name*`)`

Delete the namespace from the register

USAGE:

```
deletens:
  reg.delete:
    - name: myregister
```

`salt.thorium.reg.`**`list_`**`(`*name, add, match, stamp=False, prune=0*`)`

Add the specified values to the named list

If `stamp` is True, then the timestamp from the event will also be added if `prune` is set to an integer higher than `0`, then only the last `prune` values will be kept in the list.

USAGE:

```
foo:
  reg.list:
    - add: bar
    - match: my/custom/event
    - stamp: True
```

`salt.thorium.reg.`**`mean`**`(`*name, add, match*`)`

Accept a numeric value from the matched events and store a running average of the values in the given register. If the specified value is not numeric it will be skipped

USAGE:

```
foo:
  reg.mean:
    - add: data_field
    - match: my/custom/event
```

`salt.thorium.reg.`**`set_`**`(`*name, add, match*`)`

Add a value to the named set

USAGE:

```
foo:
  reg.set:
    - add: bar
    - match: my/custom/event
```

26.20.7 salt.thorium.runner

React by calling asynchronous runners

`salt.thorium.runner.`**`cmd`**`(`*name, func=None, arg=(), **kwargs*`)`

Execute a runner asynchronous:

USAGE:

```
run_cloud:
  runner.cmd:
    - func: cloud.create
    - arg:
        - my-ec2-config
        - myinstance

run_cloud:
  runner.cmd:
    - func: cloud.create
    - kwargs:
        provider: my-ec2-config
        instances: myinstance
```

26.20.8 salt.thorium.status

This thorium state is used to track the status beacon events and keep track of the active status of minions

New in version 2016.11.0.

`salt.thorium.status.`**`reg`**`(`*name*`)`

Activate this register to turn on a minion status tracking register, this register keeps the current status beacon data and the time that each beacon was last checked in.

26.20.9 salt.thorium.timer

Allow for flow based timers. These timers allow for a sleep to exist across multiple runs of the flow

`salt.thorium.timer.`**`hold`**`(`*name, seconds*`)`

Wait for a given period of time, then fire a result of True, requiring this state allows for an action to be blocked for evaluation based on time

USAGE:

```
hold_on_a_moment:
  timer.hold:
    - seconds: 30
```

26.20.10 salt.thorium.wheel

React by calling asynchronous runners

`salt.thorium.wheel.`**`cmd`**`(`*name, fun=None, arg=(), **kwargs*`)`

Execute a runner asynchronous:

USAGE:

```
run_cloud:
  wheel.cmd:
    - fun: key.delete
    - match: minion_id
```

26.21 token modules

localfs	Stores eauth tokens in the filesystem of the master.
rediscluster	Provide token storage in Redis cluster.

26.21.1 salt.tokens.localfs

Stores eauth tokens in the filesystem of the master. Location is configured by the master config option 'token_dir'

`salt.tokens.localfs.`**`get_token`**`(`*opts*, *tok*`)`

Fetch the token data from the store.

Parameters

- **`opts`** -- Salt master config options
- **`tok`** -- Token value to get

Returns

Token data if successful. Empty dict if failed.

`salt.tokens.localfs.`**`list_tokens`**`(`*opts*`)`

List all tokens in the store.

Parameters

`opts` -- Salt master config options

Returns

List of dicts (tokens)

`salt.tokens.localfs.`**`mk_token`**`(`*opts*, *tdata*`)`

Mint a new token using the config option hash_type and store tdata with 'token' attribute set to the token. This module uses the hash of random 512 bytes as a token.

Parameters

- **`opts`** -- Salt master config options
- **`tdata`** -- Token data to be stored with 'token' attribute of this dict set to the token.

Returns

tdata with token if successful. Empty dict if failed.

`salt.tokens.localfs.`**`rm_token`**`(`*opts*, *tok*`)`

Remove token from the store.

Parameters

- **`opts`** -- Salt master config options
- **`tok`** -- Token to remove

Returns

Empty dict if successful. None if failed.

26.21.2 salt.tokens.rediscluster

Provide token storage in Redis cluster.

To get started simply start a redis cluster and assign all hashslots to the connected nodes. Add the redis hostname and port to master configs as eauth_redis_host and eauth_redis_port. Default values for these configs are as follow:

```
eauth_redis_host: localhost
eauth_redis_port: 6379
```

depends

- redis-py-cluster Python package

`salt.tokens.rediscluster.`**`get_token`**`(`*opts*, *tok*`)`

Fetch the token data from the store.

Parameters

- **`opts`** -- Salt master config options
- **`tok`** -- Token value to get

Returns

Token data if successful. Empty dict if failed.

`salt.tokens.rediscluster.`**`list_tokens`**`(`*opts*`)`

List all tokens in the store.

Parameters

`opts` -- Salt master config options

Returns

List of dicts (token_data)

`salt.tokens.rediscluster.`**`mk_token`**`(`*opts*, *tdata*`)`

Mint a new token using the config option hash_type and store tdata with 'token' attribute set to the token. This module uses the hash of random 512 bytes as a token.

Parameters

- **`opts`** -- Salt master config options
- **`tdata`** -- Token data to be stored with 'token' attribute of this dict set to the token.

Returns

tdata with token if successful. Empty dict if failed.

`salt.tokens.rediscluster.`**`rm_token`**`(`*opts*, *tok*`)`

Remove token from the store.

Parameters

- **`opts`** -- Salt master config options
- **`tok`** -- Token to remove

Returns

Empty dict if successful. None if failed.

26.22 master tops modules

`cobbler`	Cobbler Tops
`ext_nodes`	External Nodes Classifier
`mongo`	Read tops data from a mongodb collection
`reclass_adapter`	Read tops data from a reclass database
`saltclass`	Saltclass Configuration
`varstack_top`	Use Varstack to provide tops data

26.22.1 salt.tops.cobbler

Cobbler Tops

Cobbler Tops is a master tops subsystem used to look up mapping information from Cobbler via its API. The same cobbler.* parameters are used for both the Cobbler tops and Cobbler pillar modules.

```
master_tops:
  cobbler: {}
cobbler.url: https://example.com/cobbler_api #default is http://localhost/
↪cobbler_api
cobbler.user: username # default is no username
cobbler.password: password # default is no password
```

Module Documentation

`salt.tops.cobbler.`**`top`**`(`*`**kwargs`*`)`

Look up top data in Cobbler for a minion.

26.22.2 salt.tops.ext_nodes

External Nodes Classifier

The External Nodes Classifier is a master tops subsystem that retrieves mapping information from major configuration management systems. One of the most common external nodes classifiers system is provided by Cobbler and is called `cobbler-ext-nodes`.

The cobbler-ext-nodes command can be used with this configuration:

```
master_tops:
  ext_nodes: cobbler-ext-nodes
```

It is noteworthy that the Salt system does not directly ingest the data sent from the `cobbler-ext-nodes` command, but converts the data into information that is used by a Salt top file.

Any command can replace the call to 'cobbler-ext-nodes' above, but currently the data must be formatted in the same way that the standard 'cobbler-ext-nodes' does.

See (admittedly degenerate and probably not complete) example:

```
classes:
  - basepackages
  - database
```

The above essentially is the same as a top.sls containing the following:

```
base:
  '*':
    - basepackages
    - database

base:
  '*':
```

(continues on next page)

(continued from previous page)

```
    - basepackages
    - database
```

`salt.tops.ext_nodes.`**`top`**`(`*`**kwargs`*`)`

Run the command configured

26.22.3 salt.tops.mongo

Read tops data from a mongodb collection

This module will load tops data from a mongo collection. It uses the node's id for lookups.

Salt Master Mongo Configuration

The module shares the same base mongo connection variables as `salt.returners.mongo_return`. These variables go in your master config file.

- `mongo.db` - The mongo database to connect to. Defaults to `'salt'`.
- `mongo.host` - The mongo host to connect to. Supports replica sets by specifying all hosts in the set, comma-delimited. Defaults to `'salt'`.
- `mongo.port` - The port that the mongo database is running on. Defaults to `27017`.
- `mongo.user` - The username for connecting to mongo. Only required if you are using mongo authentication. Defaults to `''`.
- `mongo.password` - The password for connecting to mongo. Only required if you are using mongo authentication. Defaults to `''`.

Configuring the Mongo Tops Subsystem

```
master_tops:
  mongo:
    collection: tops
    id_field: _id
    re_replace: ""
    re_pattern: \.example\.com
    states_field: states
    environment_field: environment
```

Module Documentation

`salt.tops.mongo.`**`top`**`(`*`**kwargs`*`)`

Connect to a mongo database and read per-node tops data.

Parameters

- **`collection`** (*) -- The mongodb collection to read data from. Defaults to `'tops'`.
- **`id_field`** (*) -- The field in the collection that represents an individual minion id. Defaults to `'_id'`.

- **`re_pattern`** (*) -- If your naming convention in the collection is shorter than the minion id, you can use this to trim the name. *re_pattern* will be used to match the name, and *re_replace* will be used to replace it. Backrefs are supported as they are in the Python standard library. If `None`, no mangling of the name will be performed - the collection will be searched with the entire minion id. Defaults to `None`.
- **`re_replace`** (*) -- Use as the replacement value in node ids matched with *re_pattern*. Defaults to ''. Feel free to use backreferences here.
- **`states_field`** (*) -- The name of the field providing a list of states.
- **`environment_field`** (*) -- The name of the field providing the environment. Defaults to `environment`.

26.22.4 salt.tops.reclass_adapter

Read tops data from a reclass database

This *master_tops* plugin provides access to the **reclass** database, such that state information (top data) are retrieved from **reclass**.

You can find more information about **reclass** at http://reclass.pantsfullofunix.net.

To use the plugin, add it to the `master_tops` list in the Salt master config and tell **reclass** by way of a few options how and where to find the inventory:

```
master_tops:
  reclass:
    storage_type: yaml_fs
    inventory_base_uri: /srv/salt
```

This would cause **reclass** to read the inventory from YAML files in `/srv/salt/nodes` and `/srv/salt/classes`.

If you are also using **reclass** as `ext_pillar` plugin, and you want to avoid having to specify the same information for both, use YAML anchors (take note of the differing data types for `ext_pillar` and `master_tops`):

```
reclass: &reclass
  storage_type: yaml_fs
  inventory_base_uri: /srv/salt
  reclass_source_path: ~/code/reclass

ext_pillar:
  - reclass: *reclass

master_tops:
  reclass: *reclass
```

If you want to run reclass from source, rather than installing it, you can either let the master know via the `PYTHONPATH` environment variable, or by setting the configuration option, like in the example above.

`salt.tops.reclass_adapter.`**`top`**`(`***kwargs*`)`

Query **reclass** for the top data (states of the minions).

26.22.5 salt.tops.saltclass

Saltclass Configuration

```
master_tops:
  saltclass:
    path: /srv/saltclass
```

Description

This module clones the behaviour of reclass (http://reclass.pantsfullofunix.net/), without the need of an external app, and add several features to improve flexibility. Saltclass lets you define your nodes from simple `yaml` files (`.yml`) through hierarchical class inheritance with the possibility to override pillars down the tree.

Features

- Define your nodes through hierarchical class inheritance
- **Reuse your reclass datas with minimal modifications**
    - applications => states
    - parameters => pillars
- Use Jinja templating in your yaml definitions
- **Access to the following Salt objects in Jinja**
    - `__opts__`
    - `__salt__`
    - `__grains__`
    - `__pillars__`
    - `minion_id`
- Chose how to merge or override your lists using ^ character (see examples)
- Expand variables ${} with possibility to escape them if needed ${} (see examples)
- Ignores missing node/class and will simply return empty without breaking the pillar module completely - will be logged

An example subset of datas is available here: http://git.mauras.ch/salt/saltclass/src/master/examples

Terms usable in yaml files	Description
classes	A list of classes that will be processed in order
states	A list of states that will be returned by master_tops function
pillars	A yaml dictionary that will be returned by the ext_pillar function
environment	Node saltenv that will be used by master_tops

A class consists of:

- zero or more parent classes
- zero or more states

- any number of pillars

A child class can override pillars from a parent class. A node definition is a class in itself with an added `environment` parameter for `saltenv` definition.

Class names

Class names mimic salt way of defining states and pillar files. This means that `default.users` class name will correspond to one of these:

- `<saltclass_path>/classes/default/users.yml`
- `<saltclass_path>/classes/default/users/init.yml`

Saltclass file hierarchy

A saltclass tree would look like this:

```
<saltclass_path>
├── classes
│   ├── app
│   │   ├── borgbackup.yml
│   │   └── ssh
│   │       └── server.yml
│   ├── default
│   │   ├── init.yml
│   │   ├── motd.yml
│   │   └── users.yml
│   ├── roles
│   │   ├── app.yml
│   │   └── nginx
│   │       ├── init.yml
│   │       └── server.yml
│   └── subsidiaries
│       ├── gnv.yml
│       ├── qls.yml
│       └── zrh.yml
└── nodes
    ├── geneva
    │   └── gnv.node1.yml
    ├── lausanne
    │   ├── qls.node1.yml
    │   └── qls.node2.yml
    ├── node127.yml
    └── zurich
        ├── zrh.node1.yml
        ├── zrh.node2.yml
        └── zrh.node3.yml
```

Saltclass Examples

<saltclass_path>/nodes/lausanne/qls.node1.yml

```
environment: base

classes:
{% for class in ['default'] %}
  - {{ class }}
{% endfor %}
  - subsidiaries.{{ __grains__['id'].split('.')[0] }}
```

<saltclass_path>/classes/default/init.yml

```
classes:
  - default.users
  - default.motd

states:
  - openssh

pillars:
  default:
    network:
      dns:
        srv1: 192.168.0.1
        srv2: 192.168.0.2
        domain: example.com
    ntp:
      srv1: 192.168.10.10
      srv2: 192.168.10.20
```

<saltclass_path>/classes/subsidiaries/gnv.yml

```
pillars:
  default:
    network:
      sub: Geneva
      dns:
        srv1: 10.20.0.1
        srv2: 10.20.0.2
        srv3: 192.168.1.1
        domain: gnv.example.com
    users:
      adm1:
        uid: 1210
        gid: 1210
        gecos: 'Super user admin1'
        homedir: /srv/app/adm1
      adm3:
        uid: 1203
        gid: 1203
        gecos: 'Super user adm
```

Variable expansions

Escaped variables are rendered as is: `${test}`

Missing variables are rendered as is: `${net:dns:srv2}`

```
pillars:
  app:
  config:
    dns:
      srv1: ${default:network:dns:srv1}
      srv2: ${net:dns:srv2}
    uri: https://application.domain/call?\${test}
    prod_parameters:
      - p1
      - p2
      - p3
  pkg:
    - app-core
    - app-backend
```

List override

Not using ^ as the first entry will simply merge the lists

```
pillars:
  app:
    pkg:
      - ^
      - app-frontend
```

Note: Known limitation

Currently you can't have both a variable and an escaped variable in the same string as the escaped one will not be correctly rendered - '${xx}' will stay as is instead of being rendered as '${xx}'

`salt.tops.saltclass.`**`top`**`(`***kwargs*`)`

Compile tops

26.22.6 salt.tops.varstack_top

Use Varstack to provide tops data

This *master_tops* plugin provides access to the **varstack** hierarchical yaml files, so you can user **varstack** as a full *`external node classifier`* and store state information (top data) in it.

Configuring Varstack

To use varstack as a master top external node classifier, install varstack as documented. Then, add to your master's configuration:

```
master_tops:
  varstack: /path/to/the/config/file/varstack.yaml
```

Varstack will then use /path/to/the/config/file/varstack.yaml (usually /etc/varstack.yaml) to determine which configuration data to return as adapter information. From there you can take a look at the README of varstack to learn how this file is evaluated. The ENC part will just return the 'states' dictionary for the node.

Ie, if my.fqdn.yaml file contains:

```
---
states:
  - sudo
  - openssh
  - apache
  - salt.minion
```

these will be returned as {'base': ['sudo', 'openssh', 'apache', 'salt.minion']} and managed by salt as if given from a top.sls file.

`salt.tops.varstack_top.`**`top`**`(`*`**kwargs`*`)`

Query **varstack** for the top data (states of the minions).

26.23 wheel modules

`config`	Manage the master configuration file
`error`	Error generator to enable integration testing of salt wheel error handling
`file_roots`	Read in files from the file_root and save files to the file root
`key`	Wheel system wrapper for the Salt key system to be used in interactions with the Salt Master programmatically.
`minions`	Wheel system wrapper for connected minions
`pillar_roots`	The *pillar_roots* wheel module is used to manage files under the pillar roots directories on the master server.

26.23.1 salt.wheel.config

Manage the master configuration file

`salt.wheel.config.`**`apply`**`(`*`key, value`*`)`

Set a single key

Note: This will strip comments from your config file `salt.wheel.config.`**`update_config`**`(`*file_name, yaml_contents*`)`

Update master config with `yaml_contents`.

Writes `yaml_contents` to a file named `file_name.conf` under the folder specified by `default_include`. This folder is named `master.d` by default. Please look at `include-configuration` for more information.

Example low data:

```
data = {
    'username': 'salt',
    'password': 'salt',
    'fun': 'config.update_config',
    'file_name': 'gui',
    'yaml_contents': {'id': 1},
    'client': 'wheel',
    'eauth': 'pam',
}
```

`salt.wheel.config.`**`values`**`()`

Return the raw values of the config file

26.23.2 salt.wheel.error

Error generator to enable integration testing of salt wheel error handling

`salt.wheel.error.`**`error`**`(`*name=None, message=''*`)`

If name is None Then return empty dict

Otherwise raise an exception with __name__ from name, message from message

CLI Example:

```
salt-wheel error
salt-wheel error.error name="Exception" message="This is an error."
```

26.23.3 salt.wheel.file_roots

Read in files from the file_root and save files to the file root

`salt.wheel.file_roots.`**`find`**`(`*path, saltenv='base'*`)`

Return a dict of the files located with the given path and environment

`salt.wheel.file_roots.`**`list_env`**`(`*saltenv='base'*`)`

Return all of the file paths found in an environment

`salt.wheel.file_roots.`**`list_roots`**`()`

Return all of the files names in all available environments

`salt.wheel.file_roots.`**`read`**`(`*path, saltenv='base'*`)`

Read the contents of a text file, if the file is binary then ignore it

`salt.wheel.file_roots.`**`write`**`(`*data, path, saltenv='base', index=0*`)`

Write the named file, by default the first file found is written, but the index of the file can be specified to write to a lower priority file root

26.23.4 salt.wheel.key

Wheel system wrapper for the Salt key system to be used in interactions with the Salt Master programmatically.

The key module for the wheel system is meant to provide an internal interface for other Salt systems to interact with the Salt Master. The following usage examples assume that a WheelClient is available:

```
import salt.config
import salt.wheel
opts = salt.config.master_config('/etc/salt/master')
wheel = salt.wheel.WheelClient(opts)
```

Note that importing and using the `WheelClient` must be performed on the same machine as the Salt Master and as the same user that runs the Salt Master, unless *`external_auth`* is configured and the user is authorized to execute wheel functions.

The function documentation starts with the `wheel` reference from the code sample above and use the `WheelClient` functions to show how they can be called from a Python interpreter.

The wheel key functions can also be called via a `salt` command at the CLI using the *`saltutil execution module`*.

`salt.wheel.key.`**`accept`**(*match*, *include_rejected=False*, *include_denied=False*)

Accept keys based on a glob match. Returns a dictionary.

match
The glob match of keys to accept.

include_rejected
To include rejected keys in the match along with pending keys, set this to `True`. Defaults to `False`.

include_denied
To include denied keys in the match along with pending keys, set this to `True`. Defaults to `False`.

```
>>> wheel.cmd('key.accept', ['minion1'])
{'minions': ['minion1']}
```

`salt.wheel.key.`**`accept_dict`**(*match*, *include_rejected=False*, *include_denied=False*)

Accept keys based on a dict of keys. Returns a dictionary.

match
The dictionary of keys to accept.

include_rejected
To include rejected keys in the match along with pending keys, set this to `True`. Defaults to `False`.

New in version 2016.3.4.

include_denied
To include denied keys in the match along with pending keys, set this to `True`. Defaults to `False`.

New in version 2016.3.4.

Example to move a list of keys from the `minions_pre` (pending) directory to the `minions` (accepted) directory:

```
>>> wheel.cmd('key.accept_dict',
{
    'minions_pre': [
        'jerry',
        'stuart',
        'bob',
    ],
```

(continues on next page)

(continued from previous page)

```
})
{'minions': ['jerry', 'stuart', 'bob']}
```

`salt.wheel.key.`**`delete`**`(`*match*`)`

Delete keys based on a glob match. Returns a dictionary.

match

The glob match of keys to delete.

```
>>> wheel.cmd_async({'fun': 'key.delete', 'match': 'minion1'})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

`salt.wheel.key.`**`delete_dict`**`(`*match*`)`

Delete keys based on a dict of keys. Returns a dictionary.

match

The dictionary of keys to delete.

```
>>> wheel.cmd_async({'fun': 'key.delete_dict',
'match': {
    'minions': [
        'jerry',
        'stuart',
        'bob',
    ],
}})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

`salt.wheel.key.`**`finger`**`(`*match, hash_type=None*`)`

Return the matching key fingerprints. Returns a dictionary.

match

The key for with to retrieve the fingerprint.

hash_type

The hash algorithm used to calculate the fingerprint

```
>>> wheel.cmd('key.finger', ['minion1'])
{'minions': {'minion1': '5d:f6:79:43:5e:d4:42:3f:57:b8:45:a8:7e:a4:6e:ca'}
↪}
```

`salt.wheel.key.`**`finger_master`**`(`*hash_type=None*`)`

Return the fingerprint of the master's public key

hash_type

The hash algorithm used to calculate the fingerprint

```
>>> wheel.cmd('key.finger_master')
{'local': {'master.pub': '5d:f6:79:43:5e:d4:42:3f:57:b8:45:a8:7e:a4:6e:ca
↪'}}
```

`salt.wheel.key.`**`gen`**`(`*id_=None, keysize=2048*`)`

Generate a key pair. No keys are stored on the master. A key pair is returned as a dict containing pub and priv keys. Returns a dictionary containing the `pub` and `priv` keys with their generated values.

id_

Set a name to generate a key pair for use with salt. If not specified, a random name will be specified.

keysize
The size of the key pair to generate. The size must be `2048`, which is the default, or greater. If set to a value less than `2048`, the key size will be rounded up to `2048`.

```
>>> wheel.cmd('key.gen')
{'pub': '-----BEGIN PUBLIC KEY-----\nMIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBC
...
BBPfamX9gGPQTpN9e8HwcZjXQnmg8OrcUl10WHw09SDWLOlnW+ueTWugEQpPt\niQIDAQAB\n
-----END PUBLIC KEY-----',
'priv': '-----BEGIN RSA PRIVATE KEY-----\nMIIEpAIBAAKCAQEA42Kf+w9XeZWgguzv
...
QH3/W74X1+WTBlx4R2KGLYBiH+bCCFEQ/Zvcu4Xp4bIOPtRKozEQ==\n
-----END RSA PRIVATE KEY-----'}
```

`salt.wheel.key.`**`gen_accept`**(*id_*, *keysize=2048*, *force=False*)

Generate a key pair then accept the public key. This function returns the key pair in a dict, only the public key is preserved on the master. Returns a dictionary.

id_
The name of the minion for which to generate a key pair.

keysize
The size of the key pair to generate. The size must be `2048`, which is the default, or greater. If set to a value less than `2048`, the key size will be rounded up to `2048`.

force
If a public key has already been accepted for the given minion on the master, then the gen_accept function will return an empty dictionary and not create a new key. This is the default behavior. If `force` is set to `True`, then the minion's previously accepted key will be overwritten.

```
>>> wheel.cmd('key.gen_accept', ['foo'])
{'pub': '-----BEGIN PUBLIC KEY-----\nMIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBC
...
BBPfamX9gGPQTpN9e8HwcZjXQnmg8OrcUl10WHw09SDWLOlnW+ueTWugEQpPt\niQIDAQAB\n
-----END PUBLIC KEY-----',
'priv': '-----BEGIN RSA PRIVATE KEY-----\nMIIEpAIBAAKCAQEA42Kf+w9XeZWgguzv
...
QH3/W74X1+WTBlx4R2KGLYBiH+bCCFEQ/Zvcu4Xp4bIOPtRKozEQ==\n
-----END RSA PRIVATE KEY-----'}
```

We can now see that the `foo` minion's key has been accepted by the master:

```
>>> wheel.cmd('key.list', ['accepted'])
{'minions': ['foo', 'minion1', 'minion2', 'minion3']}
```

`salt.wheel.key.`**`gen_keys`**(*keydir=None*, *keyname=None*, *keysize=None*, *user=None*)

Generate minion RSA public keypair

`salt.wheel.key.`**`gen_signature`**(*priv*, *pub*, *signature_path*, *auto_create=False*, *keysize=None*)

Generate master public-key-signature

`salt.wheel.key.`**`glob_match`**(*match*)

List all the keys based on a glob match

`salt.wheel.key.`**`key_str`**(*match*)

Return information about the key. Returns a dictionary.

match
The key to return information about.

```
>>> wheel.cmd('key.print', ['minion1'])
{'minions': {'minion1': '-----BEGIN PUBLIC KEY-----\nMIIBIjANBgkqhkiG9w0B
...
TWugEQpPt\niQIDAQAB\n-----END PUBLIC KEY-----'}}
```

`salt.wheel.key.`**`list_`**(*match*)

List all the keys under a named status. Returns a dictionary.

match

The type of keys to list. The `pre`, `un`, and `unaccepted` options will list unaccepted/unsigned keys. `acc` or `accepted` will list accepted/signed keys. `rej` or `rejected` will list rejected keys. Finally, `all` will list all keys.

```
>>> wheel.cmd('key.list', ['accepted'])
{'minions': ['minion1', 'minion2', 'minion3']}
```

`salt.wheel.key.`**`list_all`**()

List all the keys. Returns a dictionary containing lists of the minions in each salt-key category, including `minions`, `minions_rejected`, `minions_denied`, etc. Returns a dictionary.

```
>>> wheel.cmd('key.list_all')
{'local': ['master.pem', 'master.pub'], 'minions_rejected': [],
'minions_denied': [], 'minions_pre': [],
'minions': ['minion1', 'minion2', 'minion3']}
```

`salt.wheel.key.`**`master_key_str`**()

Returns master's public key. Returns a dictionary

```
>>> wheel.cmd('key.master_key_str')
{'local': {'master.pub': '-----BEGIN PUBLIC KEY-----\nMIIBIjANBgkqhkiG9w0B
...
TWugEQpPt\niQIDAQAB\n-----END PUBLIC KEY-----'}}
```

`salt.wheel.key.`**`name_match`**(*match*)

Alias to glob_match

`salt.wheel.key.`**`reject`**(*match*, *include_accepted=False*, *include_denied=False*)

Reject keys based on a glob match. Returns a dictionary.

match

The glob match of keys to reject.

include_accepted

To include accepted keys in the match along with pending keys, set this to `True`. Defaults to `False`.

include_denied

To include denied keys in the match along with pending keys, set this to `True`. Defaults to `False`.

```
>>> wheel.cmd_async({'fun': 'key.reject', 'match': 'minion1'})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

`salt.wheel.key.`**`reject_dict`**(*match*, *include_accepted=False*, *include_denied=False*)

Reject keys based on a dict of keys. Returns a dictionary.

match

The dictionary of keys to reject.

include_accepted

To include accepted keys in the match along with pending keys, set this to `True`. Defaults to `False`.

New in version 2016.3.4.

include_denied

To include denied keys in the match along with pending keys, set this to `True`. Defaults to `False`.

New in version 2016.3.4.

```
>>> wheel.cmd_async({'fun': 'key.reject_dict',
'match': {
    'minions': [
        'jerry',
        'stuart',
        'bob',
    ],
}})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

26.23.5 salt.wheel.minions

Wheel system wrapper for connected minions

`salt.wheel.minions.`**`connected`**`()`

List all connected minions on a salt-master

26.23.6 salt.wheel.pillar_roots

The *pillar_roots* wheel module is used to manage files under the pillar roots directories on the master server.

`salt.wheel.pillar_roots.`**`find`**`(`*path, saltenv='base'*`)`

Return a dict of the files located with the given path and environment

`salt.wheel.pillar_roots.`**`list_env`**`(`*saltenv='base'*`)`

Return all of the file paths found in an environment

`salt.wheel.pillar_roots.`**`list_roots`**`()`

Return all of the files names in all available environments

`salt.wheel.pillar_roots.`**`read`**`(`*path, saltenv='base'*`)`

Read the contents of a text file, if the file is binary then

`salt.wheel.pillar_roots.`**`write`**`(`*data, path, saltenv='base', index=0*`)`

Write the named file, by default the first file found is written, but the index of the file can be specified to write to a lower priority file root

CHAPTER

TWENTYSEVEN

APIS

27.1 Python client API

Salt provides several entry points for interfacing with Python applications. These entry points are often referred to as `*Client()` APIs. Each client accesses different parts of Salt, either from the master or from a minion. Each client is detailed below.

Note: For Tiamat-bundled Salt distribution, you need to use the bundled Python runtime as the system Python won't be able to access Salt internals.

To execute scripts via bundled Python runtime, either run the script with `/path/to/salt python script.py` or use `#!/path/to/salt python` shebang

---

See also:

There are many ways to access Salt programmatically.

Salt can be used from CLI scripts as well as via a REST interface.

See Salt's *outputter system* to retrieve structured data from Salt as JSON, or as shell-friendly text, or many other formats.

See the *`state.event`* runner to utilize Salt's event bus from shell scripts.

Salt's netapi module provides access to Salt externally via a REST interface. Review the netapi module documentation for more information.

27.1.1 Salt's `opts` dictionary

Some clients require access to Salt's `opts` dictionary. (The dictionary representation of the *master* or *minion* config files.)

A common pattern for fetching the `opts` dictionary is to defer to environment variables if they exist or otherwise fetch the config from the default location.

`salt.config.`**`client_config`**(*path*, *env_var='SALT_CLIENT_CONFIG'*, *defaults=None*)

Load Master configuration data

Usage:

```
import salt.config
master_opts = salt.config.client_config('/etc/salt/master')
```

Returns a dictionary of the Salt Master configuration file with necessary options needed to communicate with a locally-running Salt Master daemon. This function searches for client specific configurations and adds them to the data from the master configuration.

This is useful for master-side operations like `LocalClient`.

`salt.config.`**`minion_config`**(*path*, *env_var='SALT_MINION_CONFIG'*, *defaults=None*, *cache_minion_id=False*, *ignore_config_errors=True*, *minion_id=None*, *role='minion'*)

Reads in the minion configuration file and sets up special options

This is useful for Minion-side operations, such as the `Caller` class, and manually running the loader interface.

```
import salt.config
minion_opts = salt.config.minion_config('/etc/salt/minion')
```

27.1.2 Salt's Loader Interface

Modules in the Salt ecosystem are loaded into memory using a custom loader system. This allows modules to have conditional requirements (OS, OS version, installed libraries, etc) and allows Salt to inject special variables (`__salt__`, `__opts__`, etc).

Most modules can be manually loaded. This is often useful in third-party Python apps or when writing tests. However some modules require and expect a full, running Salt system underneath. Notably modules that facilitate master-to-minion communication such as the `mine`, `publish`, and `peer` execution modules. The error `KeyError: 'master_uri'` is a likely indicator for this situation. In those instances use the `Caller` class to execute those modules instead.

Each module type has a corresponding loader function.

`salt.loader.`**`minion_mods`**(*opts*, *context=None*, *utils=None*, *whitelist=None*, *initial_load=False*, *loaded_base_name=None*, *notify=False*, *static_modules=None*, *proxy=None*, *file_client=None*)

Load execution modules

Returns a dictionary of execution modules appropriate for the current system by evaluating the __virtual__() function in each module.

Parameters

- **`opts`** (*`dict`*) -- The Salt options dictionary
- **`context`** (*`dict`*) -- A Salt context that should be made present inside generated modules in __context__
- **`utils`** (*`dict`*) -- Utility functions which should be made available to Salt modules in __utils__. See *utils_dirs* in salt.config for additional information about configuration.
- **`whitelist`** (*`list`*) -- A list of modules which should be whitelisted.
- **`initial_load`** (*`bool`*) -- Deprecated flag! Unused.
- **`loaded_base_name`** (*`str`*) -- The imported modules namespace when imported by the salt loader.
- **`notify`** (*`bool`*) -- Flag indicating that an event should be fired upon completion of module loading.

Example:

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
```

(continues on next page)

(continued from previous page)

```
__grains__ = salt.loader.grains(__opts__)
__opts__['grains'] = __grains__
__utils__ = salt.loader.utils(__opts__)
__salt__ = salt.loader.minion_mods(__opts__, utils=__utils__)
__salt__['test.ping']()
```

`salt.loader.`**`raw_mod`**(*opts*, *name*, *functions*, *mod='modules'*, *loaded_base_name=None*)

Returns a single module loaded raw and bypassing the __virtual__ function

Parameters

- **`opts`** (*`dict`*) -- The Salt options dictionary
- **`name`** (*`str`*) -- The name of the module to load
- **`functions`** (*`LazyLoader`*) -- A LazyLoader instance returned from `minion_mods`.
- **`mod`** (*`str`*) -- The extension type.
- **`loaded_base_name`** (*`str`*) -- The imported modules namespace when imported by the salt loader.

Example:

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
testmod = salt.loader.raw_mod(__opts__, 'test', None)
testmod['test.ping']()
```

`salt.loader.`**`states`**(*opts*, *functions*, *utils*, *serializers*, *whitelist=None*, *proxy=None*, *context=None*, *loaded_base_name=None*, *file_client=None*)

Returns the state modules

Parameters

- **`opts`** (*`dict`*) -- The Salt options dictionary
- **`functions`** (*`LazyLoader`*) -- A LazyLoader instance returned from `minion_mods`.
- **`runners`** (*`LazyLoader`*) -- A LazyLoader instance returned from `runner`.
- **`utils`** (*`LazyLoader`*) -- A LazyLoader instance returned from `utils`.
- **`serializers`** (*`LazyLoader`*) -- An optional LazyLoader instance returned from `serializers`.
- **`proxy`** (*`LazyLoader`*) -- An optional LazyLoader instance returned from `proxy`.
- **`whitelist`** (*`list`*) -- A list of modules which should be whitelisted.
- **`context`** (*`dict`*) -- A Salt context that should be made present inside generated modules in __context__
- **`loaded_base_name`** (*`str`*) -- The imported modules namespace when imported by the salt loader.

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
statemods = salt.loader.states(__opts__, None, None)
```

`salt.loader.`**`grains`**(*opts*, *force_refresh=False*, *proxy=None*, *context=None*, *loaded_base_name=None*)

Return the functions for the dynamic grains and the values for the static grains.

Parameters

- **opts** (*dict*) -- The Salt options dictionary
- **force_refresh** (*bool*) -- Force the refresh of grains
- **context** (*dict*) -- A Salt context that should be made present inside generated modules in __context__
- **proxy** (*LazyLoader*) -- An optional LazyLoader instance returned from `proxy`.
- **loaded_base_name** (*str*) -- The imported modules namespace when imported by the salt loader.

Since grains are computed early in the startup process, grains functions do not have __salt__ or __proxy__ available. At proxy-minion startup, this function is called with the proxymodule LazyLoader object so grains functions can communicate with their controlled device.

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
__grains__ = salt.loader.grains(__opts__)
print __grains__['id']
```

`salt.loader.`**`grain_funcs`**(*opts*, *proxy=None*, *context=None*, *loaded_base_name=None*)

Returns the grain functions

Parameters

- **opts** (*dict*) -- The Salt options dictionary
- **context** (*dict*) -- A Salt context that should be made present inside generated modules in __context__
- **proxy** (*LazyLoader*) -- An optional LazyLoader instance returned from `proxy`.
- **loaded_base_name** (*str*) --

  The imported modules namespace when imported

  by the salt loader.

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
grainfuncs = salt.loader.grain_funcs(__opts__)
```

27.1.3 Salt's Client Interfaces

LocalClient

class `salt.client.`**`LocalClient`**(*c_path='/etc/salt/master'*, *mopts=None*, *skip_perm_errors=False*, *io_loop=None*, *keep_loop=False*, *auto_reconnect=False*, *listen=False*)

The interface used by the **`salt`** CLI tool on the Salt Master

`LocalClient` is used to send a command to Salt minions to execute *execution modules* and return the results to the Salt Master.

Importing and using `LocalClient` must be done on the same machine as the Salt Master and it must be done using the same user that the Salt Master is running as. (Unless `external_auth` is configured and authentication credentials are included in the execution).

Note: The LocalClient uses a Tornado IOLoop, this can create issues when using the LocalClient inside an existing IOLoop. If creating the LocalClient in partnership with another IOLoop either create the IOLoop before creating the LocalClient, or when creating the IOLoop use ioloop.current() which will return the ioloop created by LocalClient.

```
import salt.client

local = salt.client.LocalClient()
local.cmd('*', 'test.fib', [10])
```

cmd(*tgt*, *fun*, *arg=()*, *timeout=None*, *tgt_type='glob'*, *ret=''*, *jid=''*, *full_return=False*, *kwarg=None*, ***kwargs*)

Synchronously execute a command on targeted minions

The cmd method will execute and wait for the timeout period for all minions to reply, then it will return all minion data at once.

```
>>> import salt.client
>>> local = salt.client.LocalClient()
>>> local.cmd('*', 'cmd.run', ['whoami'])
{'jerry': 'root'}
```

With extra keyword arguments for the command function to be run:

```
local.cmd('*', 'test.arg', ['arg1', 'arg2'], kwarg={'foo': 'bar'})
```

Compound commands can be used for multiple executions in a single publish. Function names and function arguments are provided in separate lists but the index values must correlate and an empty list must be used if no arguments are required.

```
>>> local.cmd('*', [
        'grains.items',
        'sys.doc',
        'cmd.run',
    ],
    [
        [],
        [],
        ['uptime'],
    ])
```

Parameters

- **tgt** (*string or list*) -- Which minions to target for the execution. Default is shell glob. Modified by the `tgt_type` option.
- **fun** (*string or list of strings*) -- The module and function to call on the specified minions of the form `module.function`. For example `test.ping` or `grains.items`.

  Compound commands

  Multiple functions may be called in a single publish by passing a list of commands. This can dramatically lower overhead and speed up the application communicating with Salt.

  This requires that the `arg` param is a list of lists. The `fun` list and the `arg` list must correlate by index meaning a function that does not take arguments must still have a corresponding empty list at the expected index.
- **arg** (*list or list-of-lists*) -- A list of arguments to pass to the remote function. If the function takes no arguments `arg` may be omitted except

when executing a compound command.

- **`timeout`** -- Seconds to wait after the last minion returns but before all minions return.
- **`tgt_type`** -- The type of `tgt`. Allowed values:
  - `glob` - Bash glob completion - Default
  - `pcre` - Perl style regular expression
  - `list` - Python list of hosts
  - `grain` - Match based on a grain comparison
  - `grain_pcre` - Grain comparison with a regex
  - `pillar` - Pillar data comparison
  - `pillar_pcre` - Pillar data comparison with a regex
  - `nodegroup` - Match on nodegroup
  - `range` - Use a Range server for matching
  - `compound` - Pass a compound match string
  - `ipcidr` - Match based on Subnet (CIDR notation) or IPv4 address.

  Changed in version 2017.7.0: Renamed from `expr_form` to `tgt_type`
- **`ret`** -- The returner to use. The value passed can be single returner, or a comma delimited list of returners to call in order on the minions
- **`kwarg`** -- A dictionary with keyword arguments for the function.
- **`full_return`** -- Output the job return only (default) or the full return including exit code and other job metadata.
- **`kwargs`** -- Optional keyword arguments. Authentication credentials may be passed when using *`external_auth`*.

  For example: `local.cmd('*', 'test.ping', username='saltdev', password='saltdev', eauth='pam')`. Or: `local.cmd('*', 'test.ping', token='5871821ea51754fdcea8153c1c745433')`

Returns

A dictionary with the result of the execution, keyed by minion ID. A compound command will return a sub-dictionary keyed by function name.

`cmd_async`(*tgt*, *fun*, *arg=()*, *tgt_type='glob'*, *ret=''*, *jid=''*, *kwarg=None*, ***kwargs*)

Asynchronously send a command to connected minions

The function signature is the same as *`cmd()`* with the following exceptions.

Returns

A job ID or 0 on failure.

```
>>> local.cmd_async('*', 'test.sleep', [300])
'20131219215921857715'
```

`cmd_batch`(*tgt*, *fun*, *arg=()*, *tgt_type='glob'*, *ret=''*, *kwarg=None*, *batch='10%'*, ***kwargs*)

Iteratively execute a command on subsets of minions at a time

The function signature is the same as *`cmd()`* with the following exceptions.

Parameters

`batch` -- The batch identifier of systems to execute on

Returns

A generator of minion returns

```
>>> returns = local.cmd_batch('*', 'state.highstate', batch='10%')
>>> for ret in returns:
...     print(ret)
{'jerry': {...}}
```

(continues on next page)

(continued from previous page)

```
{'dave': {...}}
{'stewart': {...}}
```

cmd_iter(*tgt*, *fun*, *arg=()*, *timeout=None*, *tgt_type='glob'*, *ret=''*, *kwarg=None*, ***kwargs*)

Yields the individual minion returns as they come in

The function signature is the same as `cmd()` with the following exceptions.

Normally `cmd_iter()` does not yield results for minions that are not connected. If you want it to return results for disconnected minions set *expect_minions=True* in *kwargs*.

Returns

A generator yielding the individual minion returns

```
>>> ret = local.cmd_iter('*', 'test.ping')
>>> for i in ret:
...     print(i)
{'jerry': {'ret': True}}
{'dave': {'ret': True}}
{'stewart': {'ret': True}}
```

cmd_iter_no_block(*tgt*, *fun*, *arg=()*, *timeout=None*, *tgt_type='glob'*, *ret=''*, *kwarg=None*, *show_jid=False*, *verbose=False*, ***kwargs*)

Yields the individual minion returns as they come in, or None

when no returns are available.

The function signature is the same as `cmd()` with the following exceptions.

Returns

A generator yielding the individual minion returns, or None when no returns are available. This allows for actions to be injected in between minion returns.

```
>>> ret = local.cmd_iter_no_block('*', 'test.ping')
>>> for i in ret:
...     print(i)
None
{'jerry': {'ret': True}}
{'dave': {'ret': True}}
None
{'stewart': {'ret': True}}
```

cmd_subset(*tgt*, *fun*, *arg=()*, *tgt_type='glob'*, *ret=''*, *kwarg=None*, *subset=3*, *cli=False*, *progress=False*, *full_return=False*, ***kwargs*)

Execute a command on a random subset of the targeted systems

The function signature is the same as `cmd()` with the following exceptions.

Parameters

- **subset** -- The number of systems to execute on
- **cli** -- When this is set to True, a generator is returned, otherwise a dictionary of the minion returns is returned

```
>>> SLC.cmd_subset('*', 'test.ping', subset=1)
{'jerry': True}
```

get_cli_returns(*jid*, *minions*, *timeout=None*, *tgt='*'*, *tgt_type='glob'*, *verbose=False*, *show_jid=False*, ***kwargs*)

Starts a watcher looking at the return data for a specified JID

Returns
all of the information for the JID

get_event_iter_returns(*jid, minions, timeout=None*)

Gather the return data from the event system, break hard when timeout is reached.

run_job(*tgt, fun, arg=(), tgt_type='glob', ret='', timeout=None, jid='', kwarg=None, listen=False, **kwargs*)

Asynchronously send a command to connected minions

Prep the job directory and publish a command to any targeted minions.

Returns
A dictionary of (validated) `pub_data` or an empty dictionary on failure. The `pub_data` contains the job ID and a list of all minions that are expected to return data.

```
>>> local.run_job('*', 'test.sleep', [300])
{'jid': '20131219215650131543', 'minions': ['jerry']}
```

Salt Caller

class salt.client.Caller(*c_path='/etc/salt/minion', mopts=None*)

`Caller` is the same interface used by the **salt-call** command-line tool on the Salt Minion.

Changed in version 2015.8.0: Added the `cmd` method for consistency with the other Salt clients. The existing `function` and `sminion.functions` interfaces still exist but have been removed from the docs.

Importing and using `Caller` must be done on the same machine as a Salt Minion and it must be done using the same user that the Salt Minion is running as.

Usage:

```
import salt.client
caller = salt.client.Caller()
caller.cmd('test.ping')
```

Note, a running master or minion daemon is not required to use this class. Running `salt-call --local` simply sets *`file_client`* to `'local'`. The same can be achieved at the Python level by including that setting in a minion config file.

New in version 2014.7.0: Pass the minion config as the `mopts` dictionary.

```
import salt.client
import salt.config
__opts__ = salt.config.minion_config('/etc/salt/minion')
__opts__['file_client'] = 'local'
caller = salt.client.Caller(mopts=__opts__)
```

cmd(*fun, *args, **kwargs*)

Call an execution module with the given arguments and keyword arguments

Changed in version 2015.8.0: Added the `cmd` method for consistency with the other Salt clients. The existing `function` and `sminion.functions` interfaces still exist but have been removed from the docs.

```
caller.cmd('test.arg', 'Foo', 'Bar', baz='Baz')

caller.cmd('event.send', 'myco/myevent/something',
    data={'foo': 'Foo'}, with_env=['GIT_COMMIT'], with_grains=True)
```

Salt Proxy Caller

class `salt.client.`**`ProxyCaller`**(*c_path='/etc/salt/proxy'*, *mopts=None*)

`ProxyCaller` is the same interface used by the **`salt-call`** with the args `--proxyid <proxyid>` command-line tool on the Salt Proxy Minion.

Importing and using `ProxyCaller` must be done on the same machine as a Salt Minion and it must be done using the same user that the Salt Minion is running as.

Usage:

```
import salt.client
caller = salt.client.ProxyCaller()
caller.cmd('test.ping')
```

Note, a running master or minion daemon is not required to use this class. Running `salt-call --local` simply sets *`file_client`* to `'local'`. The same can be achieved at the Python level by including that setting in a minion config file.

```
import salt.client
import salt.config
__opts__ = salt.config.proxy_config('/etc/salt/proxy', minion_id='quirky_
↪edison')
__opts__['file_client'] = 'local'
caller = salt.client.ProxyCaller(mopts=__opts__)
```

Note: To use this for calling proxies, the `is_proxy functions` requires that `--proxyid` be an argument on the commandline for the script this is used in, or that the string `proxy` is in the name of the script.

`cmd`(*fun*, **args*, ***kwargs*)

Call an execution module with the given arguments and keyword arguments

```
caller.cmd('test.arg', 'Foo', 'Bar', baz='Baz')

caller.cmd('event.send', 'myco/myevent/something',
    data={'foo': 'Foo'}, with_env=['GIT_COMMIT'], with_grains=True)
```

RunnerClient

class `salt.runner.`**`RunnerClient`**(*opts*, *context=None*)

The interface used by the **`salt-run`** CLI tool on the Salt Master

It executes *runner modules* which run on the Salt Master.

Importing and using `RunnerClient` must be done on the same machine as the Salt Master and it must be done using the same user that the Salt Master is running as.

Salt's *`external_auth`* can be used to authenticate calls. The eauth user must be authorized to execute runner modules: (`@runner`). Only the `master_call()` below supports eauth.

`asynchronous`(*fun*, *low*, *user='UNKNOWN'*, *pub=None*, *local=True*)

Execute the function in a multiprocess and return the event tag to use to watch for the return

`cmd`(*fun*, *arg=None*, *pub_data=None*, *kwarg=None*, *print_event=True*, *full_return=False*)

Execute a function

```
>>> opts = salt.config.master_config('/etc/salt/master')
>>> runner = salt.runner.RunnerClient(opts)
>>> runner.cmd('jobs.list_jobs', [])
{
    '20131219215650131543': {
        'Arguments': [300],
        'Function': 'test.sleep',
        'StartTime': '2013, Dec 19 21:56:50.131543',
        'Target': '*',
        'Target-type': 'glob',
        'User': 'saltdev'
    },
    '20131219215921857715': {
        'Arguments': [300],
        'Function': 'test.sleep',
        'StartTime': '2013, Dec 19 21:59:21.857715',
        'Target': '*',
        'Target-type': 'glob',
        'User': 'saltdev'
    },
}
```

`cmd_async`(*low*)

Execute a runner function asynchronously; eauth is respected

This function requires that *`external_auth`* is configured and the user is authorized to execute runner functions: (`@runner`).

```
runner.cmd_async({
    'fun': 'jobs.list_jobs',
    'username': 'saltdev',
    'password': 'saltdev',
    'eauth': 'pam',
})
```

`cmd_sync`(*low*, *timeout=None*, *full_return=False*)

Execute a runner function synchronously; eauth is respected

This function requires that *external_auth* is configured and the user is authorized to execute runner functions: (`@runner`).

```
runner.cmd_sync({
    'fun': 'jobs.list_jobs',
    'username': 'saltdev',
    'password': 'saltdev',
    'eauth': 'pam',
})
```

WheelClient

class `salt.wheel.`**`WheelClient`**(*opts*, *context=None*)

An interface to Salt's wheel modules

Wheel modules interact with various parts of the Salt Master.

Importing and using `WheelClient` must be done on the same machine as the Salt Master and it must be done using the same user that the Salt Master is running as. Unless *external_auth* is configured and the user is authorized to execute wheel functions: (`@wheel`).

Usage:

```
import salt.config
import salt.wheel
opts = salt.config.master_config('/etc/salt/master')
wheel = salt.wheel.WheelClient(opts)
```

`asynchronous`(*fun*, *low*, *user='UNKNOWN'*, *pub=None*, *local=True*)

Execute the function in a multiprocess and return the event tag to use to watch for the return

`cmd`(*fun*, *arg=None*, *pub_data=None*, *kwarg=None*, *print_event=True*, *full_return=False*)

Execute a function

```
>>> wheel.cmd('key.finger', ['jerry'])
{'minions': {'jerry':
↪'5d:f6:79:43:5e:d4:42:3f:57:b8:45:a8:7e:a4:6e:ca'}}
```

`cmd_async`(*low*)

Execute a function asynchronously; eauth is respected

This function requires that *external_auth* is configured and the user is authorized

```
>>> wheel.cmd_async({
    'fun': 'key.finger',
    'match': 'jerry',
    'eauth': 'auto',
    'username': 'saltdev',
    'password': 'saltdev',
})
{'jid': '20131219224744416681', 'tag': 'salt/wheel/
↪20131219224744416681'}
```

cmd_sync(*low*, *timeout=None*, *full_return=False*)

Execute a wheel function synchronously; eauth is respected

This function requires that `external_auth` is configured and the user is authorized to execute runner functions: (`@wheel`).

```
>>> wheel.cmd_sync({
'fun': 'key.finger',
'match': 'jerry',
'eauth': 'auto',
'username': 'saltdev',
'password': 'saltdev',
})
{'minions': {'jerry':
↪'5d:f6:79:43:5e:d4:42:3f:57:b8:45:a8:7e:a4:6e:ca'}}
```

CloudClient

class salt.cloud.**CloudClient**(*path=None*, *opts=None*, *config_dir=None*, *pillars=None*)

The client class to wrap cloud interactions

action(*fun=None*, *cloudmap=None*, *names=None*, *provider=None*, *instance=None*, *kwargs=None*)

Execute a single action via the cloud plugin backend

Examples:

```
client.action(fun='show_instance', names=['myinstance'])
client.action(fun='show_image', provider='my-ec2-config',
    kwargs={'image': 'ami-10314d79'}
)
```

create(*provider*, *names*, ***kwargs*)

Create the named VMs, without using a profile

Example:

```
client.create(provider='my-ec2-config', names=['myinstance'],
    image='ami-1624987f', size='t1.micro', ssh_username='ec2-user',
    securitygroup='default', delvol_on_destroy=True)
```

destroy(*names*)

Destroy the named VMs

extra_action(*names*, *provider*, *action*, ***kwargs*)

Perform actions with block storage devices

Example:

```
client.extra_action(names=['myblock'], action='volume_create',
    provider='my-nova', kwargs={'voltype': 'SSD', 'size': 1000}
)
client.extra_action(names=['salt-net'], action='network_create',
    provider='my-nova', kwargs={'cidr': '192.168.100.0/24'}
)
```

full_query(*query_type='list_nodes_full'*)

Query all instance information

list_images(*provider=None*)

List all available images in configured cloud systems

list_locations(*provider=None*)

List all available locations in configured cloud systems

list_sizes(*provider=None*)

List all available sizes in configured cloud systems

low(*fun, low*)

Pass the cloud function and low data structure to run

map_run(*path=None, **kwargs*)

To execute a map

min_query(*query_type='list_nodes_min'*)

Query select instance information

profile(*profile, names, vm_overrides=None, **kwargs*)

Pass in a profile to create, names is a list of vm names to allocate
vm_overrides is a special dict that will be per node options overrides

Example:

```
>>> client= salt.cloud.CloudClient(path='/etc/salt/cloud')
>>> client.profile('do_512_git', names=['minion01',])
{'minion01': {'backups_active': 'False',
        'created_at': '2014-09-04T18:10:15Z',
        'droplet': {'event_id': 31000502,
                     'id': 2530006,
                     'image_id': 5140006,
                     'name': 'minion01',
                     'size_id': 66},
        'id': '2530006',
        'image_id': '5140006',
        'ip_address': '107.XXX.XXX.XXX',
        'locked': 'True',
        'name': 'minion01',
        'private_ip_address': None,
        'region_id': '4',
        'size_id': '66',
        'status': 'new'}}
```

query(*query_type='list_nodes'*)

Query basic instance information

select_query(*query_type='list_nodes_select'*)

Query select instance information

SSHClient

class `salt.client.ssh.client.`**`SSHClient`**(*c_path='/etc/salt/master'*, *mopts=None*, *disable_custom_roster=False*)

Create a client object for executing routines via the salt-ssh backend

New in version 2015.5.0.

`cmd`(*tgt*, *fun*, *arg=()*, *timeout=None*, *tgt_type='glob'*, *kwarg=None*, ***kwargs*)

Execute a single command via the salt-ssh subsystem and return all routines at once

New in version 2015.5.0.

`cmd_iter`(*tgt*, *fun*, *arg=()*, *timeout=None*, *tgt_type='glob'*, *ret=''*, *kwarg=None*, ***kwargs*)

Execute a single command via the salt-ssh subsystem and return a generator

New in version 2015.5.0.

27.2 `netapi` modules

netapi modules provide API access to Salt functionality over the network.

The included *netapi modules* support REST (over HTTP and WSGI) and WebSockets.

Modules expose functions from the `NetapiClient` and give access to the same functionality as the Salt commandline tools (**`salt`**, **`salt-run`**, etc).

27.2.1 Client interfaces

Salt's client interfaces provide the ability to execute functions from execution, runnner, and wheel modules.

The client interfaces available via netapi modules are defined in the `NetapiClient`, which is a limited version of the *Python API*.

The client interfaces accept a dictionary with values for the function and its arguments.

Available interfaces:

- local - run execution modules on minions
- local_subset - run execution modules on a subset of minions
- runner - run runner modules on master
- ssh - run salt-ssh commands
- wheel - run wheel modules

The local, runner, and wheel clients also have async variants to run modules asynchronously.

27.2.2 Configuration

The `netapi_enable_clients` list in the master config sets which client interfaces are available. It is recommended to only enable the client interfaces required to complete the tasks needed to reduce the amount of Salt functionality exposed via the netapi. See the *netapi_enable clients* documentation.

Enabling netapi client interfaces

From Salt's 3006.0 release onwards, all netapi client interfaces are disabled by default.

To enable netapi/**`salt-api`** functionality, users should follow the process in this documentation. If the `netapi_enable_clients` configuration is not added to the Salt master configuration, then the netapi/**`salt-api`** will not function.

Breaking change in Salt 3006.0 and above

Users of netapi/**`salt-api`** upgrading to Salt 3006.0 **must** follow the process in this documentation to enable the required netapi client interfaces. If the `netapi_enable_clients` configuration is not added to the Salt master configuration netapi/**`salt-api`** will not function

---

Steps to enable netapi client interfaces

1. *Select client interfaces to enable*
2. *Update Salt master config*
3. *Restart salt-master and salt-api*
4. *Verify required functionality*

Select client interfaces to enable

Salt's client interfaces provide the ability to execute functions from execution, runner, wheel modules, and via the salt-ssh system.

It is recommended to only enable the client interfaces required to complete the tasks needed to reduce the amount of Salt functionality exposed via the netapi. For example, if the salt-ssh system is not in use, not enabling the ssh client interface will help protect the Salt master from attacks which look to exploit salt-ssh.

The main client interfaces are:

- local - run execution modules on minions
- local_subset - run execution modules on a subset of minions
- runner - run runner modules on master
- ssh - run salt-ssh commands
- wheel - run wheel modules

The local, runner, and wheel clients also have async variants to run modules asynchronously. See `netapi_enable_clients` for the complete list.

Most scenarios will require enabling the local client (and potentially its local_subset and local_async variants). The local client is equivalent to the **`salt`** command line tool and is required to run execution modules against minions.

Many deployments may also require the ability to call runner functions on the master (for example, where orchestrations are used), but the runner client should only be enabled if this is the case.

As there is not a standard netapi client application, existing users will need to assess which client interfaces are in use. Where an application or tool is making a request to a netapi module, it will usually pass an option indicating which client to use and it should be possible to inspect the source of any tools to understand which client interfaces should be enabled.

For common command line clients, such as pepper they will normally default to using the local client interface unless passed an option to specify a different client interface.

Update Salt master config

Once it has been established which client interfaces will be required or are currently in use, those should be listed in the Salt master config, under the `netapi_enable_clients` key.

Example configuration to enable only the local client interfaces:

```
netapi_enable_clients:
  - local
  - local_async
  - local_batch
  - local_subset
```

Example configuration to enable local client functionality and runners:

```
netapi_enable_clients:
  - local
  - local_async
  - local_batch
  - local_subset
  - runner
  - runner_async
```

See `netapi_enable_clients` for the full list of available client interfaces.

Restart salt-master and salt-api

Changes to the Salt master configuration require a restart of the **`salt-master`** service. The **`salt-api`** service should also be restarted.

Verify required functionality

Testing that the required functionality is available can be done using curl. It is recommended to also check that client interfaces that are not required are not enabled.

Examples

Examples will have to be adjusted to set the correct username, password and *external authentication* values for the user's system.

Checking that the local client is enabled:

```
curl -sSKi https://localhost:8000/run \
    -H 'Accept: application/x-yaml' \
    -d client='local' \
    -d tgt='*' \
    -d fun='test.ping' \
    -d username='saltdev' \
    -d password='saltdev' \
    -d eauth='auto'

HTTP/1.1 200 OK
Content-Type: application/x-yaml
Server: CherryPy/18.8.0
Date: Mon, 23 Jan 2023 14:54:58 GMT
Allow: GET, HEAD, POST
Access-Control-Allow-Origin: *
Access-Control-Expose-Headers: GET, POST
Access-Control-Allow-Credentials: true
Vary: Accept-Encoding
Content-Length: 25

return:
  - saltdev1: true
```

Checking that the runner client is **not** enabled:

```
curl -sSKi https://localhost:8000/run \
    -H 'Accept: application/x-yaml' \
    -d client='runner' \
    -d fun='test.arg' \
    -d arg='test arg' \
    -d username='saltdev' \
    -d password='saltdev' \
    -d eauth='auto'

HTTP/1.1 400 Bad Request
Content-Type: text/html;charset=utf-8
Server: CherryPy/18.8.0
Date: Mon, 23 Jan 2023 14:59:33 GMT
Allow: GET, HEAD, POST
Access-Control-Allow-Origin: *
Access-Control-Expose-Headers: GET, POST
Access-Control-Allow-Credentials: true
Content-Length: 750
Vary: Accept-Encoding
...
```

Further examples are available in the *neatpi modules* documentation.

Individual netapi modules can be enabled by adding the module configuration section to the master config. The required configuration and dependencies are documented for each *module*.

The **`salt-api`** daemon manages netapi modules instances and must be started to enable the configured netapi modules. It is possible to run multiple netapi modules and multiple instances of each module.

---

netapi_enable_clients

Prior to Salt's 3006.0 release all client interfaces were enabled and it was not possible to disable clients individually.

27.2.3 Developing modules

Developing custom netapi modules for new transports or protocols is documented in the *Writing netapi modules* and *NetapiClient* documentation.

Writing netapi modules

`netapi` modules, put simply, bind a port and start a service. They are purposefully open-ended and can be used to present a variety of external interfaces to Salt, and even present multiple interfaces at once.

See also:

The full list of netapi modules

Configuration

All `netapi` configuration is done in the *Salt master config* and takes a form similar to the following:

```
rest_cherrypy:
  port: 8000
  debug: True
  ssl_crt: /etc/pki/tls/certs/localhost.crt
  ssl_key: /etc/pki/tls/certs/localhost.key
```

The `__virtual__` function

Like all module types in Salt, `netapi` modules go through Salt's loader interface to determine if they should be loaded into memory and then executed.

The `__virtual__` function in the module makes this determination and should return `False` or a string that will serve as the name of the module. If the module raises an `ImportError` or any other errors, it will not be loaded.

The `start` function

The `start()` function will be called for each `netapi` module that is loaded. This function should contain the server loop that actually starts the service. This is started in a multiprocess.

Multiple instances

New in version 2016.11.0.

rest_cherrypy and *rest_tornado* support running multiple instances by copying and renaming entire directory of those. To start the copied multiple `netapi` modules, add configuration blocks for the copied `netapi` modules in the Salt Master config. The name of each added configuration block must match with the name of each directory of the copied `netapi` module.

Inline documentation

As with the rest of Salt, it is a best-practice to include liberal inline documentation in the form of a module docstring and docstrings on any classes, methods, and functions in your `netapi` module.

Loader "magic" methods

The loader makes the `__opts__` data structure available to any function in a `netapi` module.

NetapiClient

The `NetapiClient` class provides access to *Python API client interfaces* when *developing netapi modules*

class salt.netapi.**NetapiClient**(*opts*)

Provide a uniform method of accessing the various client interfaces in Salt in the form of low-data data structures. For example:

```
>>> client = NetapiClient(__opts__)
>>> lowstate = {'client': 'local', 'tgt': '*', 'fun': 'test.ping', 'arg':
↪''}
>>> client.run(lowstate)
```

local(**args*, ***kwargs*)

Run *execution modules* synchronously

See *salt.client.LocalClient.cmd()* for all available parameters.

Sends a command from the master to the targeted minions. This is the same interface that Salt's own CLI uses. Note the `arg` and `kwarg` parameters are sent down to the minion(s) and the given function, `fun`, is called with those parameters.

Returns

Returns the result from the execution module

local_async(**args*, ***kwargs*)

Run *execution modules* asynchronously

Wraps *salt.client.LocalClient.run_job()*.

Returns

job ID

local_subset(**args*, ***kwargs*)

Run *execution modules* against subsets of minions

New in version 2016.3.0.

Wraps *salt.client.LocalClient.cmd_subset()*

`run`(*low*)

Execute the specified function in the specified client by passing the lowstate

`runner`(*fun*, *timeout=None*, *full_return=False*, ***kwargs*)

Run *runner modules <all-salt.runners>* synchronously

Wraps `salt.runner.RunnerClient.cmd_sync()`.

Note that runner functions must be called using keyword arguments. Positional arguments are not supported.

Returns

Returns the result from the runner module

`runner_async`(*fun*, ***kwargs*)

Run *runner modules <all-salt.runners>* asynchronously

Wraps `salt.runner.RunnerClient.cmd_async()`.

Note that runner functions must be called using keyword arguments. Positional arguments are not supported.

Returns

event data and a job ID for the executed function.

`ssh`(**args*, ***kwargs*)

Run salt-ssh commands synchronously

Wraps `salt.client.ssh.client.SSHClient.cmd_sync()`.

Returns

Returns the result from the salt-ssh command

`wheel`(*fun*, ***kwargs*)

Run *wheel modules* synchronously

Wraps `salt.wheel.WheelClient.master_call()`.

Note that wheel functions must be called using keyword arguments. Positional arguments are not supported.

Returns

Returns the result from the wheel module

`wheel_async`(*fun*, ***kwargs*)

Run *wheel modules* asynchronously

Wraps `salt.wheel.WheelClient.master_call()`.

Note that wheel functions must be called using keyword arguments. Positional arguments are not supported.

Returns

Returns the result from the wheel module

CHAPTER

TWENTYEIGHT

ARCHITECTURE

If you are used to configuration management tools that require you to plan down to the last detail before you install anything, you are probably wondering why this section doesn't appear before the installation instructions. With Salt, you can switch to a high availability architecture at any time, and add additional components to scale your deployment as you go.

Since a single Salt master can manage thousands of systems, we usually recommend that you start by deploying a single Salt master, and then modifying your deployment as needed for redundancy, geographical distribution, and scale.

28.1 High Availability Features in Salt

Salt supports several features for high availability and fault tolerance. Brief documentation for these features is listed alongside their configuration parameters in *Configuration file examples*.

28.1.1 Master Cluster

New in version 3007.

Salt masters can be configured to act as a cluster. All masters in a cluster are peers. Job workloads are shared accross the cluster. Master clusters provide a way to scale masters horizontally. They do not require changes to the minions' configuration to add more resources. Cluster implementations are expected to use a load balancer, shared filesystem, and run on a reliable network.

Master Cluster Tutorial

28.1.2 Multimaster

Salt minions can connect to multiple masters at one time by configuring the *master* configuration parameter as a YAML list of all the available masters. By default, all masters are "hot", meaning that any master can direct commands to the Salt infrastructure.

In a multimaster configuration, each master must have the same cryptographic keys, and minion keys must be accepted on all masters separately. The contents of file_roots and pillar_roots need to be kept in sync with processes external to Salt as well

A tutorial on setting up multimaster with "hot" masters is here:

Multimaster Tutorial

28.1.3 Multimaster with Failover

Changing the `master_type` parameter from `str` to `failover` will cause minions to connect to the first responding master in the list of masters. Every *`master_alive_interval`* seconds the minions will check to make sure the current master is still responding. If the master does not respond, the minion will attempt to connect to the next master in the list. If the minion runs out of masters, the list will be recycled in case dead masters have been restored. Note that *`master_alive_interval`* must be present in the minion configuration, or else the recurring job to check master status will not get scheduled.

Failover can be combined with PKI-style encrypted keys, but PKI is NOT REQUIRED to use failover.

Multimaster with PKI and Failover is discussed in *this tutorial*

`master_type: failover` can be combined with `random_master: True` to spread minion connections across all masters (one master per minion, not each minion connecting to all masters). Adding Salt Syndics into the mix makes it possible to create a load-balanced Salt infrastructure. If a master fails, minions will notice and select another master from the available list.

28.1.4 Syndic

Salt's Syndic feature is a way to create differing infrastructure topologies. It is not strictly an HA feature, but can be treated as such.

With the syndic, a Salt infrastructure can be partitioned in such a way that certain masters control certain segments of the infrastructure, and ”Master of Masters” nodes can control multiple segments underneath them.

Syndics are covered in depth in *Salt Syndic*.

28.1.5 Syndic with Multimaster

New in version 2015.5.0.

Syndic with Multimaster lets you connect a syndic to multiple masters to provide an additional layer of redundancy in a syndic configuration.

Syndics are covered in depth in *Salt Syndic*.

28.2 Salt Syndic

The most basic or typical Salt topology consists of a single Master node controlling a group of Minion nodes. An intermediate node type, called Syndic, when used offers greater structural flexibility and scalability in the construction of Salt topologies than topologies constructed only out of Master and Minion node types.

A Syndic node can be thought of as a special passthrough Minion node. A Syndic node consists of a `salt-syndic` daemon and a `salt-master` daemon running on the same system. The `salt-master` daemon running on the Syndic node controls a group of lower level Minion nodes and the `salt-syndic` daemon connects higher level Master node, sometimes called a Master of Masters.

The `salt-syndic` daemon relays publications and events between the Master node and the local `salt-master` daemon. This gives the Master node control over the Minion nodes attached to the `salt-master` daemon running on the Syndic node.

28.2.1 Configuring the Syndic

To setup a Salt Syndic you need to tell the Syndic node and its Master node about each other. If your Master node is located at `10.10.0.1`, then your configurations would be:

On the Syndic node:

```
# /etc/salt/master
syndic_master: 10.10.0.1  # may be either an IP address or a hostname
```

```
# /etc/salt/minion

# id is shared by the salt-syndic daemon and a possible salt-minion daemon
# on the Syndic node
id: my_syndic
```

On the Master node:

```
# /etc/salt/master
order_masters: True
```

The *`syndic_master`* option tells the Syndic node where to find the Master node in the same way that the *`master`* option tells a Minion node where to find a Master node.

The *`id`* option is used by the `salt-syndic` daemon to identify with the Master node and if unset will default to the hostname or IP address of the Syndic just as with a Minion.

The *`order_masters`* option configures the Master node to send extra information with its publications that is needed by Syndic nodes connected directly to it.

Warning: The syndic process must be run as the same user as the syndic master.

Note: Each Syndic must provide its own `file_roots` directory. Files will not be automatically transferred from the Master node.

28.2.2 Configuring the Syndic with Multimaster

New in version 2015.5.0.

Syndic with Multimaster lets you connect a syndic to multiple masters to provide an additional layer of redundancy in a syndic configuration.

Higher level masters should first be configured in a multimaster configuration. See *Multimaster Tutorial*.

On the syndic, the *`syndic_master`* option is populated with a list of the higher level masters.

Since each syndic is connected to each master, jobs sent from any master are forwarded to minions that are connected to each syndic. If the `master_id` value is set in the master config on the higher level masters, job results are returned to the master that originated the request in a best effort fashion. Events/jobs without a `master_id` are returned to any available master.

28.2.3 Running the Syndic

The `salt-syndic` daemon is a separate process that needs to be started in addition to the `salt-master` daemon running on the Syndic node. Starting the `salt-syndic` daemon is the same as starting the other Salt daemons.

The Master node in many ways sees the Syndic as an ordinary Minion node. In particular, the Master will need to accept the Syndic's Minion key as it would for any other Minion.

On the Syndic node:

```
# salt-syndic
or
# service salt-syndic start
```

On the Master node:

```
# salt-key -a my_syndic
```

The Master node will now be able to control the Minion nodes connected to the Syndic. Only the Syndic key will be listed in the Master node's key registry but this also means that key activity between the Syndic's Minions and the Syndic does not encumber the Master node. In this way, the Syndic's key on the Master node can be thought of as a placeholder for the keys of all the Minion and Syndic nodes beneath it, giving the Master node a clear, high level structural view on the Salt cluster.

On the Master node:

```
# salt-key -L
Accepted Keys:
my_syndic
Denied Keys:
Unaccepted Keys:
Rejected Keys:

# salt '*' test.version
minion_1:
    2018.3.4
minion_2:
    2018.3.4
minion_4:
    2018.3.4
minion_3:
    2018.3.4
```

28.2.4 Topology

A Master node (a node which is itself not a Syndic to another higher level Master node) must run a `salt-master` daemon and optionally a `salt-minion` daemon.

A Syndic node must run `salt-syndic` and `salt-master` daemons and optionally a `salt-minion` daemon.

A Minion node must run a `salt-minion` daemon.

When a `salt-master` daemon issues a command, it will be received by the Syndic and Minion nodes directly connected to it. A Minion node will process the command in the way it ordinarily would. On a Syndic node, the `salt-syndic` daemon will relay the command to the `salt-master` daemon running on the Syndic node, which then propagates the command to the Minions and Syndics connected to it.

When events and job return data are generated by `salt-minion` daemons, they are aggregated by the `salt-master` daemon they are connected to, which `salt-master` daemon then relays the data back through its `salt-syndic` daemon until the data reaches the Master or Syndic node that issued the command.

28.2.5 Syndic wait

`syndic_wait` is a master configuration file setting that specifies the number of seconds the Salt client should wait for additional syndics to check in with their lists of expected minions before giving up. This value defaults to `5` seconds.

The `syndic_wait` setting is necessary because the higher-level master does not have a way of knowing which minions are below the syndics. The higher-level master has its own list of expected minions and the masters below them have their own lists as well, so the Salt client does not know how long to wait for all returns. The `syndic_wait` option allows time for all minions to return to the Salt client.

Note: To reduce the amount of time the CLI waits for Minions to respond, install a Minion on the Syndic or tune the value of the `syndic_wait` configuration.

While it is possible to run a Syndic without a Minion installed on the same system, it is recommended, for a faster CLI response time, to do so. Without a Minion installed on the Syndic node, the timeout value of `syndic_wait` increases significantly - about three-fold. With a Minion installed on the Syndic, the CLI timeout resides at the value defined in `syndic_wait`.

Note: If you have a very large infrastructure or many layers of Syndics, you may find that the CLI doesn't wait long enough for the Syndics to return their events. If you think this is the case, you can set the *`syndic_wait`* value in the Master configs on the Master or Syndic nodes from which commands are executed. The default value is `5`, and should work for the majority of deployments.

In order for a Master or Syndic node to return information from Minions that are below their Syndics, the CLI requires a short wait time in order to allow the Syndics to gather responses from their Minions. This value is defined in the *`syndic_wait`* config option and has a default of five seconds.

28.2.6 Syndic config options

These are the options that can be used to configure a Syndic node. Note that other than `id`, Syndic config options are placed in the Master config on the Syndic node.

- *`id`*: Syndic id (shared by the `salt-syndic` daemon with a potential `salt-minion` daemon on the same system)
- *`syndic_master`*: Master node IP address or hostname
- *`syndic_master_port`*: Master node ret_port
- *`syndic_log_file`*: path to the logfile (absolute or not)
- *`syndic_pidfile`*: path to the pidfile (absolute or not)
- *`syndic_wait`*: time in seconds to wait on returns from this syndic

28.2.7 Minion Data Cache

Beginning with Salt 2016.11.0, the *Pluggable Minion Data Cache* was introduced. The minion data cache contains the Salt Mine data, minion grains, and minion pillar information cached on the Salt Master. By default, Salt uses the `localfs` cache module, but other external data stores can be used instead.

Using a pluggable minion cache modules allows for the data stored on a Salt Master about Salt Minions to be replicated on other Salt Masters the Minion is connected to. Please see the *Minion Data Cache* documentation for more information and configuration examples.

CHAPTER

TWENTYNINE

MINION DATA CACHE

New in version 2016.11.0.

The Minion data cache contains the Salt Mine data, minion grains and minion pillar information cached on the Salt Master. By default, Salt uses the `localfs` cache module to save the data in a `msgpack` file on the Salt Master.

29.1 Pluggable Data Cache

While the default Minion data cache is the `localfs` cache, other external data stores can also be used to store this data such as the `consul` module. To configure a Salt Master to use a different data store, the `cache` setting needs to be established:

```
cache: consul
```

The pluggable data cache streamlines using various Salt topologies such as a *Multi-Master* or *Salt Syndics* configuration by allowing the data stored on the Salt Master about a Salt Minion to be available to other Salt Syndics or Salt Masters that a Salt Minion is connected to.

Additional minion data cache modules can be easily created by modeling the custom data store after one of the existing cache modules.

See *cache modules* for a current list.

29.2 Configuring the Minion Data Cache

The default `localfs` Minion data cache module doesn't require any configuration. External data cache modules with external data stores such as Consul require a configuration setting in the master config.

Here's an example config for Consul:

```
consul.host: 127.0.0.1
consul.port: 8500
consul.token: None
consul.scheme: http
consul.consistency: default
consul.dc: dc1
consul.verify: True

cache: consul
```

CHAPTER

THIRTY

SLOTS

New in version 2018.3.0.

Changed in version 3000.

Note: This functionality is under development and could be changed in the future releases

---

Many times it is useful to store the results of a command during the course of an execution. Salt Slots are designed to allow you to store this information and use it later during the *highstate* or other job execution.

Slots extend the state syntax and allows you to do things right before the state function is executed. So you can make a decision in the last moment right before a state is executed.

30.1 Execution functions

Note: Using execution modules return data as a state values is a first step of Slots development. Other functionality is under development.

Slots allow you to use the return from a remote-execution function as an argument value in states.

Slot syntax looks close to the simple python function call.

```
__slot__:salt:<module>.<function>(<args>, ..., <kwargs...>, ...)
```

For the 3000 release, this syntax has been updated to support parsing functions which return dictionaries and for appending text to the slot result.

```
__slot__:salt:<module>.<function>(<args>..., <kwargs...>, ...).dictionary ~
↪append
```

There are some specifics in the syntax coming from the execution functions nature and a desire to simplify the user experience. First one is that you don't need to quote the strings passed to the slots functions. The second one is that all arguments handled as strings.

Here is a simple example:

```
copy-some-file:
  file.copy:
    - name: __slot__:salt:test.echo(text=/tmp/some_file)
    - source: __slot__:salt:test.echo(/etc/hosts)
```

This will execute the `test.echo` execution functions right before calling the state. The functions in the example will return */tmp/some_file* and */etc/hosts* strings that will be used as a target and source arguments in the state function *file.copy*.

Here is an example of result parsing and appending:

```
file-in-user-home:
  file.copy:
    - name: __slot__:salt:user.info(someuser).home ~ /subdirectory
    - source: salt://somefile
```

30.2 Example Usage

In Salt, slots are a powerful feature that allows you to populate information dynamically within your Salt states. One of the best use cases for slots is when you need to reference data that is created or modified during the course of a Salt run.

Consider the following example, where we aim to add a user named 'foobar' to a group named 'known_users' with specific user and group IDs. To achieve this, we utilize slots to retrieve the group ID of 'known_users' as it is created or modified during the Salt run.

```
add_group_known_users:
  group.present:
    - name: known_users

add_user:
  user.present:
    - name: foobar
    - uid: 600
    - gid: __slot__:salt:group.info("known_users").gid
    - require:
      - group: add_group_known_users
```

In this example, the `add_group_known_users` state ensures the presence of the 'known_users' group. Then, within the `add_user` state, we use the slot `__slot__:salt:group.info("known_users").gid` to dynamically retrieve the group ID of 'known_users,' which may have been modified during the execution of the previous state. This approach ensures that our user 'foobar' is associated with the correct group, even if the group information changes during the Salt run.

Slots offer a flexible way to work with changing data and dynamically populate your Salt states, making your configurations adaptable and robust.

30.3 Execution module returns as file contents or data

The following examples demonstrate how to use execution module returns as file contents or data in Salt states. These examples show how to incorporate the output of execution functions into file contents or data in the *file.managed* and *file.serialize* states.

30.3.1 Content from execution modules

You can use the results of execution modules directly as file contents in Salt states. This can be useful for dynamically generating file content based on the output of execution functions.

Example 1: Using `test.echo` Output as File Content

The following Salt state uses the *test.echo* execution function to generate the text "hello world." This output is then used as the content of the file */tmp/things.txt*:

```
content-from-slots:
  file.managed:
    - name: /tmp/things.txt
    - contents: __slot__:salt:test.echo("hello world")
```

Example 2: Using Multiple `test.echo` Outputs as Appended Content

In this example, two *test.echo* execution functions are used to generate "hello" and "world" strings. These strings are then joined by newline characters and then used as the content of the file */tmp/things.txt*:

```
content-from-multiple-slots:
  file.managed:
    - name: /tmp/things.txt
    - contents:
      - __slot__:salt:test.echo("hello")
      - __slot__:salt:test.echo("world")
```

30.3.2 Serializing data from execution modules

You can also serialize data obtained from execution modules and write it to files using Salt states. This allows you to capture and store structured data for later use.

Example: Serializing `grains.items()` Output to JSON

In this example, the *grains.items()* execution function retrieves system information. The obtained data is then serialized into JSON format and saved to the file */tmp/grains.json*:

```
serialize-dataset-from-slots:
  file.serialize:
    - name: /tmp/grains.json
    - serializer: json
    - dataset: __slot__:salt:grains.items()
```

These examples showcase how to leverage Salt's flexibility to use execution module returns as file contents or serialized data in your Salt states, allowing for dynamic and customized configurations.

CHAPTER

THIRTYONE

WINDOWS

This section contains details on the Windows Package Manager, and specific information you need to use Salt on Windows.

31.1 Multi-minion setup on Windows

There may be a scenario where having a minion running in the context of the current, logged-in user would be useful. For example, the normal minion running under the service account would perform machine-wide, administrative tasks. The minion running under the user context could be launched when the user logs in and would be able to perform configuration tasks as if it were the user itself.

The steps required to do this are as follows:

1. Create new root_dir
2. Set root_dir permissions
3. Create directory structure
4. Write minion config
5. Start the minion
6. Register the minion as a service (optional)

Note: The Salt Project has created a powershell script that will configure an additional minion on the system for you. It can be found in the root of the Salt installation. The script is named `multi-minion.ps1`. You can get help on how to use the script by running the following in a PowerShell prompt:

```
Get-Help .\multi-minion.ps1 -Detailed
```

The following guide explains these steps in more detail.

31.1.1 1. Create new `root_dir`

The minion requires a root directory to store config, cache, logs, etc. The user must have full permissions to this directory. The easiest way to do this is to put the `root_dir` in the Local AppData directory (`$env:LocalAppData`).

```
New-Item -Path "$env:LocalAppData\Salt Project\Salt" -Type Directory
```

31.1.2 2. Set `root_dir` permissions

The user running Salt requires full access to the `root_dir`. If you have placed the root_dir in a location that the user does not have access to, you'll need to give the user full permissions to that directory. Replace the <placeholder variables> in this example with your own configuration information.

```
$RootDir = "<new root_dir location>"
$User    = "<user running salt>"
$acl = Get-Acl -Path "$RootDir"
$access_rule = New-Object System.Security.AccessControl.FileSystemAccessRule(
↪$User, "Modify", "Allow")
$acl.AddAccessRule($access_rule)
Set-Acl -Path "$RootDir" -AclObject $acl
```

31.1.3 3. Create directory structure

Salt expects a certain directory structure to be present to avoid unnecessary messages in the logs. This is usually handled by the installer. Since you're running your own instance, you need to do it. Make sure the following directories are present:

- root_dir\conf\minion.d
- root_dir\conf\pki
- root_dir\var\log\salt
- root_dir\var\run
- root_dir\var\cache\salt\minion\extmods\grains
- root_dir\var\cache\salt\minion\proc

```
$RootDir = "<new root_dir location>"
$cache_dir = "$RootDir\var\cache\salt\minion"
New-Item -Path "$RootDir\conf" -Type Directory
New-Item -Path "$RootDir\conf\minion.d" -Type Directory
New-Item -Path "$RootDir\conf\pki" -Type Directory
New-Item -Path "$RootDir\var\log\salt" -Type Directory
New-Item -Path "$RootDir\var\run" -Type Directory
New-Item -Path "$cache_dir\extmods\grains" -Type Directory
New-Item -Path "$cache_dir\proc" -Type Directory
```

31.1.4 4. Write minion config

The minion will need its own config, separate from the system minion config. This config tells the minion where everything is located in the file structure and also defines the master and minion id. Create a minion config file named `minion` in the conf directory.

```
New-Item -Path "$env:LocalAppData\Salt Project\Salt\conf\minion" -Type File
```

Make sure the config file has at least the following contents:

```
master: <ip address, dns name, etc>
id: <minion id>

root_dir: <root_dir>
log_file: <root_dir>\val\log\salt\minion
utils_dirs:
  - <root_dir>\var\cache\salt\minion\extmods
winrepo_dir: <root_dir>\srv\salt\win\repo
winrepo_dir_ng: <root_dir>\srv\salt\win\repo-ng

file_roots:
  base:
    - <root_dir>\srv\salt
    - <root_dir>\srv\spm\salt

pillar_roots:
  base:
    - <root_dir>\srv\pillar
    - <root_dir>\srv\spm\pillar

thorium_roots:
  base:
    - <root_dir>\srv\thorium
```

31.1.5 5. Run the minion

Everything is now set up to run the minion. You can start the minion as you would normally, but you need to specify the full path to the config file you created above.

```
salt-minion.exe -c <root_dir>\conf
```

31.1.6 6. Register the minion as a service (optional)

You can also register the minion as a service, but you need to understand the implications of doing so.

- You will need to have administrator privileges to register this minion service.
- You will need the password to the user account that will be running the minion.
- If the user password changes, you will have to update the service definition to reflect the new password.
- The minion runs all the time under the user context, whether that user is logged in or not.

- This requires great trust from the user as the minion will be able to perform operations under the user's name without the user knowing, whether they are logged in or not.
- If you decide to run the new minion under the Local System account, it might as well just be a normal minion.
- The helper script does not support registering the second minion as a service.

To register the minion as a service, use the `ssm.exe` binary that came with the Salt installation. Run the following commands, replacing `<service-name>`, `<root_dir>`, `<user_name>`, and `<password>` as necessary:

```
ssm.exe install <service-name> "salt-minion.exe" "-c `"<root_dir>\conf`" -l quiet"
ssm.exe set <service-name> Description "Salt Minion <user_name>"
ssm.exe set <service-name> Start SERVICE_AUTO_START
ssm.exe set <service-name> AppStopMethodConsole 24000
ssm.exe set <service-name> AppStopMethodWindow 2000
ssm.exe set <service-name> AppRestartDelay 60000
ssm.exe set <service-name> ObjectName ".\<user_name>" "<password>"
```

31.2 Windows Package Manager

31.2.1 Introduction

Salt provides a Windows package management tool for installing, updating, removing, and managing software packages on remote Windows systems. This tool provides a software repository and a package manager similar to what is provided by `yum` and `apt` on Linux. The repository contains a collection of package definition files.

What are package definition files?

A package definition file is a YAML/JINJA2 file with a `.sls` file extension that contains all the information needed to install software using Salt. It defines:

- Full name of the software package
- The version of the software package
- Download location of the software package
- Command-line switches for silent install and uninstall
- Whether or not to use the Windows task scheduler to install the package

Package definition files can be hosted in one or more Git repositories. The `.sls` files used to install Windows packages are not distributed by default with Salt. You have to initialize and clone the default repository salt-winrepo-ng which is hosted on GitHub by SaltStack. The repository contains package definition files for many common Windows packages and is maintained by SaltStack and the Salt community. Anyone can submit a pull request to this repo to add new package definitions.

You can manage the package definition file through either Salt or Git. You can download software packages from either a git repository or from HTTP(S) or FTP URLs. You can store the installer defined in the package definition file anywhere as long as it is accessible from the host running Salt.

You can use the Salt Windows package manager like `yum` on Linux. You do not have to know the underlying command to install the software.

- Use `pkg.install` to install a package using a package manager based on the OS the system runs on.

- Use `pkg.installed` to check if a particular package is installed in the minion.

Note: The Salt Windows package manager does not automatically resolve dependencies while installing, updating, or removing packages. You have to manage the dependencies between packages manually.

Quickstart

This quickstart guides you through using the Windows Salt package manager (winrepo) to install software packages in four steps:

1. (Optional) *Install libraries*
2. *Populate the local Git repository*
3. *Update minion database*
4. *Install software packages*

31.2.2 Install libraries

(Optional) If you are using the Salt Windows package manager with package definition files hosted on a Salt Git repo, install the libraries `GitPython` or `pygit2`.

31.2.3 Populate the local Git repository

The SLS files used to install Windows packages are not distributed by default with Salt. Assuming no changes to the default configuration (`file_roots`), initialize and clone salt-winrepo-ng repository.

```
salt-run winrepo.update_git_repos
```

On successful execution of *`winrepo.update_git_repos`*, the winrepo repository is cloned on the master in the location specified in `winrepo_dir_ng` and all package definition files are pulled down from the Git repository.

On a masterless minion, use `salt-call` to initialize and clone the salt-winrepo-ng

```
salt-call --local winrepo.update_git_repos
```

On successful execution of the runner, the winrepo repository is cloned on the minion in the location specified in `winrepo_dir_ng` and all package definition files are pulled down from the Git repository.

31.2.4 Update minion database

Run *`pkg.refresh_db`* on all Windows minions to create a database entry for every package definition file and build the package database.

```
# From the master
salt -G 'os:windows' pkg.refresh_db

# From the minion in masterless mode
salt-call --local pkg.refresh_db
```

The *pkg.refresh_db* command parses the YAML/JINJA package definition files and generates the database. The above command returns the following summary denoting the number of packages that succeeded or failed to compile:

```
local:
    ----------
    failed:
        0
    success:
        301
    total:
        301
```

Note: This command can take a few minutes to complete as all the package definition files are copied to the minion and the database is generated.

Note: You can use `pkg.refresh_db` when writing new Windows package definitions to check for errors in the definitions against one or more Windows minions.

31.2.5 Install software package

You can now install a software package using *pkg.install*:

```
# From the master
salt * pkg.install 'firefox_x64'

# From the minion in masterless mode
salt-call --local pkg.install "firefox_x64"
```

The above command installs the latest version of Firefox on the minions.

31.2.6 Configuration

The Github repository (winrepo) is synced to the `file_roots` in a location specified by the `winrepo_dir_ng` setting in the config. The default value of `winrepo_dir_ng` is as follows:

- Linux master: `/srv/salt/win/repo-ng` (`salt://win/repo-ng`)
- Masterless minion: `C:\salt\srv\salt\win\repo-ng` (`salt://win/repo-ng`)

Master Configuration

The following settings are available for configuring the winrepo on the master:

- *winrepo_dir*
- *winrepo_dir_ng*
- *winrepo_remotes*
- *winrepo_remotes_ng*
- *winrepo_branch*

- *winrepo_provider*
- *winrepo_ssl_verify*

See *here* for detailed information on all master config options for winrepo.

winrepo_dir

winrepo_dir (str)

This setting is maintained for backwards compatibility with legacy minions. It points to the location in the `file_roots` where the winrepo files are kept. The default is: `/srv/salt/win/repo`

winrepo_dir_ng

winrepo_dir_ng (str)

The location in the `file_roots` where the winrepo files are kept. The default is `/srv/salt/win/repo-ng`.

Warning: You can change the location of the winrepo directory. However, it must always be set to a path that is inside the `file_roots`. Otherwise, the software definition files will be unreachable by the minion.

Important: A common mistake is to change the `file_roots` setting and fail to update the `winrepo_dir_ng` and `winrepo_dir` settings so that they are inside the `file_roots`

winrepo_remotes

winrepo_remotes (list)

This setting is maintained for backwards compatibility with legacy minions. It points to the legacy git repo. The default is a list containing a single URL:

https://github.com/saltstack/salt-winrepo

The legacy repo can be disabled by setting it to an empty list in the master config.

```
winrepo_remotes: []
```

winrepo_remotes_ng

winrepo_remotes_ng (list)

This setting tells the `winrepo.update_git_repos` command where the next generation winrepo is hosted. This a list of URLs to multiple git repos. The default is a list containing a single URL:

https://github.com/saltstack/salt-winrepo-ng

winrepo_refspecs

`winrepo_refspecs` (list)

Specify what references to fetch from remote repositories. The default is `['+refs/heads/*:refs/remotes/origin/*', '+refs/tags/*:refs/tags/*']`

winrepo_branch

`winrepo_branch` (str)

The branch of the git repo to checkout. The default is `master`

winrepo_provider

`winrepo_provider` (str)

The provider to be used for winrepo. Default is `pygit2`. Falls back to `gitpython` when `pygit2` is not available

winrepo_ssl_verify

`winrepo_ssl_verify` (bool)

Ignore SSL certificate errors when contacting remote repository. Default is `False`

Master Configuration (pygit2)

The following configuration options only apply when the *`winrepo_provider`* option is set to `pygit2`.

- *`winrepo_insecure_auth`*
- *`winrepo_passphrase`*
- *`winrepo_password`*
- *`winrepo_privkey`*
- *`winrepo_pubkey`*
- *`winrepo_user`*

winrepo_insecure_auth

`winrepo_insecure_auth` (bool)

Used only with `pygit2` provider. Whether or not to allow insecure auth. Default is `False`

winrepo_passphrase

`winrepo_passphrase` (str)

Used only with `pygit2` provider. Used when the SSH key being used to authenticate is protected by a passphrase. Default is `''`

winrepo_privkey

`winrepo_privkey` (str)

Used only with `pygit2` provider. Used with *`winrepo_pubkey`* to authenticate to SSH remotes. Default is `''`

winrepo_pubkey

`winrepo_pubkey` (str)

Used only with `pygit2` provider. Used with *`winrepo_privkey`* to authenticate to SSH remotes. Default is `''`

winrepo_user

`winrepo_user` (str)

Used only with `pygit2` provider. Used with *`winrepo_password`* to authenticate to HTTPS remotes. Default is `''`

winrepo_password

`winrepo_password` (str)

Used only with `pygit2` provider. Used with *`winrepo_user`* to authenticate to HTTPS remotes. Default is `''`

Minion Configuration

Refreshing the package definitions can take some time, these options were introduced to allow more control of when it occurs. These settings apply to all minions whether in masterless mode or not.

- *`winrepo_cache_expire_max`*
- *`winrepo_cache_expire_min`*
- *`winrepo_cachefile`*
- *`winrepo_source_dir`*

winrepo_cache_expire_max

`winrepo_cache_expire_max` (int)

Sets the maximum age in seconds of the winrepo metadata file to avoid it becoming stale. If the metadata file is older than this setting, it will trigger a `pkg.refresh_db` on the next run of any `pkg` module function that requires the metadata file. Default is 604800 (1 week).

Software package definitions are automatically refreshed if stale after *`winrepo_cache_expire_max`*. Running a highstate forces the refresh of the package definitions and regenerates the metadata, unless the metadata is younger than *`winrepo_cache_expire_max`*.

winrepo_cache_expire_min

`winrepo_cache_expire_min` (int)

Sets the minimum age in seconds of the winrepo metadata file to avoid refreshing too often. If the metadata file is older than this setting, the metadata will be refreshed unless you pass `refresh: False` in the state. Default is 1800 (30 min).

winrepo_cachefile

`winrepo_cachefile` (str)

The file name of the winrepo cache file. The file is placed at the root of `winrepo_dir_ng`. Default is `winrepo.p`.

winrepo_source_dir

`winrepo_source_dir` (str)

The location of the .sls files on the Salt file server. Default is `salt://win/repo-ng/`.

Warning: If the default for `winrepo_dir_ng` is changed, then this setting will also need to be changed on each minion. The default setting for `winrepo_dir_ng` is `/srv/salt/win/repo-ng`. If that were changed to `/srv/salt/new/repo-ng` then the `winrepo_source_dir` would need to be changed to `salt://new/repo-ng`

Masterless Minion Configuration

The following settings are available for configuring the winrepo on a masterless minion:

- *`winrepo_dir`*
- *`winrepo_dir_ng`*
- *`winrepo_remotes`*
- *`winrepo_remotes_ng`*

See *here* for detailed information on all minion config options for winrepo.

winrepo_dir

winrepo_dir (str)

This setting is maintained for backwards compatibility with legacy minions. It points to the location in the `file_roots` where the winrepo files are kept. The default is: `C:\ProgramData\Salt Project\Salt\srv\salt\win\repo`

winrepo_dir_ng

winrepo_dir_ng (str)

The location in the `file_roots` where the winrepo files are kept. The default is `C:\ProgramData\Salt Project\Salt\srv\salt\win\repo-ng`.

> **Warning:** You can change the location of the winrepo directory. However, it must always be set to a path that is inside the `file_roots`. Otherwise, the software definition files will be unreachable by the minion.

Important: A common mistake is to change the `file_roots` setting and fail to update the `winrepo_dir_ng` and `winrepo_dir` settings so that they are inside the `file_roots`. You might also want to verify `winrepo_source_dir` on the minion as well.

winrepo_remotes

winrepo_remotes (list)

This setting is maintained for backwards compatibility with legacy minions. It points to the legacy git repo. The default is a list containing a single URL:

https://github.com/saltstack/salt-winrepo

The legacy repo can be disabled by setting it to an empty list in the minion config.

```
winrepo_remotes: []
```

winrepo_remotes_ng

winrepo_remotes_ng (list)

This setting tells the `winrepo.update_git_repos` command where the next generation winrepo is hosted. This a list of URLs to multiple git repos. The default is a list containing a single URL:

https://github.com/saltstack/salt-winrepo-ng

31.2.7 Sample Configurations

Masterless

The configs in this section are for working with winrepo on a Windows minion using `salt-call --local`.

Default Configuration

This is the default configuration if nothing is configured in the minion config. The config is shown here for clarity. These are the defaults:

```
file_roots:
  base:
    - C:\ProgramData\Salt Project\Salt\srv\salt
winrepo_source_dir: 'salt://win/repo-ng'
winrepo_dir_ng: C:\ProgramData\Salt Project\Salt\srv\salt\win\repo-ng
```

The *winrepo.update_git_repos* command will clone the repository to `win\repo-ng` on the file_roots.

Multiple Salt Environments

This starts to get a little tricky. The winrepo repository doesn't get cloned to each environment when you run *winrepo.update_git_repos*, so to make this work, all environments share the same winrepo. Applying states using the `saltenv` option will find the state files in the appropriate environment, but the package definition files will always be pulled from the same location. Therefore, you have to put the same winrepo location in each saltenv. Here's how this would look:

```
file_roots:
  base:
    - C:\ProgramData\Salt Project\Salt\srv\salt\base
    - C:\ProgramData\Salt Project\Salt\srv\salt\winrepo
  test:
    - C:\ProgramData\Salt Project\Salt\srv\salt\test
    - C:\ProgramData\Salt Project\Salt\srv\salt\winrepo
winrepo_source_dir: 'salt://salt-winrepo-ng'
winrepo_dir_ng: C:\ProgramData\Salt Project\Salt\srv\salt\winrepo
winrepo_dir: C:\ProgramData\Salt Project\Salt\srv\salt\winrepo
```

When you run *winrepo.update_git_repos* the Git repository will be cloned to the location specified in the `winrepo_dir_ng` setting. I specified the `winrepo_dir` setting just so everything gets cloned to the same place. The directory that gets cloned is named `salt-winrepo-ng` so you specify that in the `winrepo_source_dir` setting.

The `winrepo` directory should only contain the package definition files. You wouldn't want to place any states in the `winrepo` directory as they will be available to both environments.

Master

When working in a Master/Minion environment you have to split up some of the config settings between the master and the minion. Here are some sample configs for winrepo in a Master/Minion environment.

Default Configuration

This is the default configuration if nothing is configured. The config is shown here for clarity. These are the defaults on the master:

```
file_roots:
  base:
    - /srv/salt
winrepo_dir_ng: /srv/salt/win/repo-ng
```

This is the default in the minion config:

```
winrepo_source_dir: 'salt://win/repo-ng'
```

The *winrepo.update_git_repos* command will clone the repository to `win\repo-ng` on the file_roots.

Multiple Salt Environments

To set up multiple saltenvs using a Master/Minion configuration set the following in the master config:

```
file_roots:
  base:
    - /srv/salt/base
    - /srv/salt/winrepo
  test:
    - /srv/salt/test
    - /srv/salt/winrepo
winrepo_dir_ng: /srv/salt/winrepo
winrepo_dir: /srv/salt/winrepo
```

Use the winrepo runner to set up the winrepo repository on the master.

```
salt-run winrepo.update_git_repos
```

The winrepo will be cloned to `/srv/salt/winrepo` under a directory named `salt-winrepo-ng`.

Set the following on the minion config so the minion knows where to find the package definition files in the file_roots:

```
winrepo_source_dir: 'salt://salt-winrepo-ng'
```

The same stipulations apply in a Master/Minion configuration as they do in a Masterless configuration

31.2.8 Usage

After completing the configuration and initialization, you can use the Salt package manager commands to manage software on Windows minions.

Note: The following example commands can be run from the master using `salt` or on a masterless minion using `salt-call`

	Command	Description
1	*pkg.list_pkgs*	Displays a list of all packages installed in the system.
2	*pkg.list_available*	Displays the versions available of a particular package to be installed.
3	*pkg.install*	Installs a given package.
4	*pkg.remove*	Uninstalls a given package.

List installed packages

Use *`pkg.list_pkgs`* to display a list of packages installed on the system.

```
# From the master
salt -G 'os:windows' pkg.list_pkgs

# From the minion in masterless mode
salt-call --local pkg.list_pkgs
```

The command displays the software name and the version for every package installed on the system irrespective of whether it was installed by the Salt package manager.

```
local:
    ----------
    Frhed 1.6.0:
        1.6.0
    GNU Privacy Guard:
        2.2.16
    Gpg4win (3.1.9):
        3.1.9
    git:
        2.17.1.2
    nsis:
        3.03
    python3_x64:
        3.7.4150.0
    salt-minion-py3:
        2019.2.3
```

The software name indicates whether the software is managed by Salt or not.

If Salt finds a match in the winrepo database, then the software name is the short name as defined in the package definition file. It is usually a single-word, lower-case name.

All other software names are displayed as the full name as shown in Add/Remove Programs. In the above example, Git (git), Nullsoft Installer (nsis), Python 3.7 (python3_x64), and Salt (salt-minion-py3) have corresponding package definition files and are managed by Salt, while Frhed 1.6.0, GNU Privacy guard, and GPG4win are not.

List available versions

Use *pkg.list_available* to display a list of versions of a package available for installation. You can pass the name of the software in the command. You can refer to the software by its `name` or its `full_name` surrounded by quotes.

```
# From the master
salt winminion pkg.list_available firefox_x64

# From the minion in masterless mode
salt-call --local pkg.list_available firefox_x64
```

The command lists all versions of Firefox available for installation.

```
winminion:
    - 69.0
    - 69.0.1
    - 69.0.2
    - 69.0.3
    - 70.0
    - 70.0.1
    - 71.0
    - 72.0
    - 72.0.1
    - 72.0.2
    - 73.0
    - 73.0.1
    - 74.0
```

Note: For a Linux master, you can surround the file name with single quotes. However, for the `cmd` shell on Windows, use double quotes when wrapping strings that may contain spaces. Powershell accepts either single quotes or double quotes.

Install a package

Use *pkg.install*: to install a package.

```
# From the master
salt winminion pkg.install 'firefox_x64'

# From the minion in masterless mode
salt-call --local pkg.install "firefox_x64"
```

The command installs the latest version of Firefox.

```
# From the master
salt winminion pkg.install 'firefox_x64' version=74.0

# From the minion in masterless mode
salt-call --local pkg.install "firefox_x64" version=74.0
```

The command installs version 74.0 of Firefox.

If a different version of the package is already installed, then the old version is replaced with the version in the winrepo (only if the package supports live updating).

You can also specify the full name of the software while installing:

```
# From the master
salt winminion pkg.install 'Mozilla Firefox 17.0.1 (x86 en-US)'

# From the minion in masterless mode
salt-call --local pkg.install "Mozilla Firefox 17.0.1 (x86 en-US)"
```

Remove a package

Use *`pkg.remove`* to remove a package.

```
# From the master
salt winminion pkg.remove firefox_x64

# From the minion in masterless mode
salt-call --local pkg.remove firefox_x64
```

Package definition file directory structure and naming

All package definition files are stored in the location configured in the `winrepo_dir_ng` setting. All files in this directory with a `.sls` file extension are considered package definition files. These files are evaluated to create the metadata file on the minion.

You can maintain standalone package definition files that point to software on other servers or on the internet. In this case the file name is the short name of the software with the `.sls` extension, for example,``firefox.sls``.

You can also store the binaries for your software together with their software definition files in their own directory. In this scenario, the directory name is the short name for the software and the package definition file stored that directory is named `init.sls`.

Look at the following example directory structure on a Linux master assuming default config settings:

```
srv/
|---salt/
|   |---win/
|   |   |---repo-ng/
|   |   |   |---custom_defs/
|   |   |   |   |---ms_office_2013_x64/
|   |   |   |   |   |---access.en-us/
|   |   |   |   |   |---excel.en-us/
|   |   |   |   |   |---outlook.en-us/
```

(continues on next page)

(continued from previous page)

```
|   |   |   |   |   |---powerpoint.en-us/
|   |   |   |   |   |---word.en-us/
|   |   |   |   |   |---init.sls
|   |   |   |   |   |---setup.dll
|   |   |   |   |   |---setup.exe
|   |   |   |   |---openssl.sls
|   |   |   |   |---zoom.sls
|   |   |   |---salt-winrepo-ng/
|   |   |   |   |---auditbeat/
|   |   |   |   |   |---init.sls
|   |   |   |   |   |---install.cmd
|   |   |   |   |   |---install.ps1
|   |   |   |   |   |---remove.cmd
|   |   |   |   |---gpg4win/
|   |   |   |   |   |---init.sls
|   |   |   |   |   |---silent.ini
|   |   |   |   |---7zip.sls
|   |   |   |   |---adobereader.sls
|   |   |   |   |---audacity.sls
|   |   |   |   |---ccleaner.sls
|   |   |   |   |---chrome.sls
|   |   |   |   |---firefox.sls
```

In the above directory structure:

- The `custom_defs` directory contains the following custom package definition files.
  - A folder for MS Office 2013 that contains the installer files for all the MS Office software and a package definition file named `init.sls`.
  - Two additional standalone package definition files `openssl.sls` and `zoom.sls` to install OpenSSl and Zoom.
- The `salt-winrepo-ng` directory contains the clone of the git repo specified by the `winrepo_remotes_ng` config setting.

Warning: Do not modify the files in the `salt-winrepo-ng` directory as it breaks future runs of `winrepo.update_git_repos`.

Warning: Do not place any custom software definition files in the `salt-winrepo-ng` directory as the `winrepo.update_git_repos` command wipes out the contents of the `salt-winrepo-ng` directory each time it is run and any extra files stored in the Salt winrepo are lost.

Writing package definition files

You can write your own software definition file if you know:

- The full name of the software as shown in Add/Remove Programs
- The exact version number as shown in Add/Remove Programs
- How to install your software silently from the command line

Here is a YAML software definition file for Firefox:

```yaml
firefox_x64:
  '74.0':
    full_name: Mozilla Firefox 74.0 (x64 en-US)
    installer: 'https://download-installer.cdn.mozilla.net/pub/firefox/
↪releases/74.0/win64/en-US/Firefox%20Setup%2074.0.exe'
    install_flags: '/S'
    uninstaller: '%ProgramFiles(x86)%/Mozilla Firefox/uninstall/helper.exe'
    uninstall_flags: '/S'
  '73.0.1':
    full_name: Mozilla Firefox 73.0.1 (x64 en-US)
    installer: 'https://download-installer.cdn.mozilla.net/pub/firefox/
↪releases/73.0.1/win64/en-US/Firefox%20Setup%2073.0.1.exe'
    install_flags: '/S'
    uninstaller: '%ProgramFiles(x86)%/Mozilla Firefox/uninstall/helper.exe'
    uninstall_flags: '/S'
```

The package definition file itself is a data structure written in YAML with three indentation levels:

- The first level item is a short name that Salt uses to reference the software. This short name is used to install and remove the software and it must be unique across all package definition files in the repo. Also, there must be only one short name in the file.
- The second level item is the version number. There can be multiple version numbers for a package but they must be unique within the file.

Note: When running `pkg.list_pkgs`, the short name and version number are displayed when Salt finds a match in the repo. Otherwise, the full package name is displayed.

- The third indentation level contains all parameters that Salt needs to install the software. The parameters are:
  - `full_name` : The full name as displayed in Add/Remove Programs
  - `installer` : The location of the installer binary
  - `install_flags` : The flags required to install silently
  - `uninstaller` : The location of the uninstaller binary
  - `uninstall_flags` : The flags required to uninstall silently
  - `msiexec` : Use msiexec to install this package
  - `allusers` : If this is an MSI, install to all users
  - `cache_dir` : Cache the entire directory in the installer URL if it starts with `salt://`
  - `cache_file` : Cache a single file in the installer URL if it starts with `salt://`
  - `use_scheduler` : Launch the installer using the task scheduler

   - `source_hash` : The hash sum for the installer

Example package definition files

This section provides some examples of package definition files for different use cases such as:

- Writing a *simple package definition file*
- Writing a *JINJA templated package definition file*
- Writing a package definition file to *install the latest version of the software*
- Writing a package definition file to *install an MSI patch*

These examples enable you to gain a better understanding of the usage of different file parameters. To understand the examples, you need a basic Understanding Jinja. For an exhaustive dive into Jinja, refer to the official Jinja Template Designer documentation.

Example: Simple

Here is a pure YAML example of a simple package definition file for Firefox:

```yaml
firefox_x64:
  '74.0':
    full_name: Mozilla Firefox 74.0 (x64 en-US)
    installer: 'https://download-installer.cdn.mozilla.net/pub/firefox/
↪releases/74.0/win64/en-US/Firefox%20Setup%2074.0.exe'
    install_flags: '/S'
    uninstaller: '%ProgramFiles(x86)%/Mozilla Firefox/uninstall/helper.exe'
    uninstall_flags: '/S'
  '73.0.1':
    full_name: Mozilla Firefox 73.0.1 (x64 en-US)
    installer: 'https://download-installer.cdn.mozilla.net/pub/firefox/
↪releases/73.0.1/win64/en-US/Firefox%20Setup%2073.0.1.exe'
    install_flags: '/S'
    uninstaller: '%ProgramFiles(x86)%/Mozilla Firefox/uninstall/helper.exe'
    uninstall_flags: '/S'
```

The first line is the short name of the software which is `firefox_x64`.

Important: The short name must be unique across all other short names in the software repository. The `full_name` combined with the version must also be unique.

The second line is the `software version` and is indented two spaces.

Important: The version number must be enclosed in quotes or the YAML parser removes the trailing zeros. For example, if the version number `74.0` is not enclosed within quotes, then the version number is rendered as `74`.

The lines following the `version` are indented two more spaces and contain all the information needed to install the Firefox package.

Important: You can specify multiple versions of software by specifying multiple version numbers at the same indentation level as the first with its software definition below it.

Important: The `full_name` must match exactly what is shown in Add/Remove Programs (`appwiz.cpl`)

Example: JINJA templated package definition file

JINJA is the default templating language used in package definition files. You can use JINJA to add variables and expressions to package definition files that get replaced with values when the `.sls` go through the Salt renderer.

When there are tens or hundreds of versions available for a piece of software, the definition file can become large and cumbersome to maintain. In this scenario, JINJA can be used to add logic, variables, and expressions to automatically create the package definition file for software with multiple versions.

Here is a an example of a package definition file for Firefox that uses JINJA:

```
{%- set lang = salt['config.get']('firefox:pkg:lang', 'en-US') %}

firefox_x64:
  {% for version in ['74.0',
                     '73.0.1', '73.0',
                     '72.0.2', '72.0.1', '72.0',
                     '71.0', '70.0.1', '70.0',
                     '69.0.3', '69.0.2', '69.0.1'] %}
  '{{ version }}':
    full_name: 'Mozilla Firefox {{ version }} (x64 {{ lang }})'
    installer: 'https://download-installer.cdn.mozilla.net/pub/firefox/
↪releases/{{ version }}/win64/{{ lang }}/Firefox%20Setup%20{{ version }}.exe'
    install_flags: '/S'
    uninstaller: '%ProgramFiles%\Mozilla Firefox\uninstall\helper.exe'
    uninstall_flags: '/S'
  {% endfor %}
```

In this example, JINJA is used to generate a package definition file that defines how to install 12 versions of Firefox. Jinja is used to create a list of available versions. The list is iterated through a `for loop` where each version is placed in the `version` variable. The version is inserted everywhere there is a `{{ version }}` marker inside the `for loop`.

The single variable (`lang`) defined at the top of the package definition identifies the language of the package. You can access the Salt modules using the `salt` keyword. In this case, the `config.get` function is invoked to retrieve the language setting. If the `lang` variable is not defined then the default value is `en-US`.

Example: Package definition file to install the latest version

Some software vendors do not provide access to all versions of their software. Instead, they provide a single URL to what is always the latest version. In some cases, the software keeps itself up to date. One example of this is the Google Chrome web browser.

To handle situations such as these, set the version to *latest*. Here's an example of a package definition file to install the latest version of Chrome.

```
chrome:
  latest:
    full_name: 'Google Chrome'
    installer: 'https://dl.google.com/edgedl/chrome/install/
↪GoogleChromeStandaloneEnterprise.msi'
    install_flags: '/qn /norestart'
    uninstaller: 'https://dl.google.com/edgedl/chrome/install/
↪GoogleChromeStandaloneEnterprise.msi'
    uninstall_flags: '/qn /norestart'
    msiexec: True
```

In the above example:

- `Version` is set to `latest`. Salt then installs the latest version of Chrome at the URL and displays that version.
- `msiexec` is set to `True`, hence the software is installed using an MSI.

Example: Package definition file to install an MSI patch

For MSI installers, when the `msiexec` parameter is set to true, the `/i` option is used for installation, and the `/x` option is used for uninstallation. However, when installing an MSI patch, the `/i` and `/x` options cannot be combined.

Here is an example of a package definition file to install an MSI patch:

```
MyApp:
  '1.0':
    full_name: MyApp
    installer: 'salt://win/repo-ng/MyApp/MyApp.1.0.msi'
    install_flags: '/qn /norestart'
    uninstaller: '{B5B5868F-23BA-297A-917D-0DF345TF5764}'
    uninstall_flags: '/qn /norestart'
    msiexec: True
  '1.1':
    full_name: MyApp
    installer: 'salt://win/repo-ng/MyApp/MyApp.1.0.msi'
    install_flags: '/qn /norestart /update "%cd%\\MyApp.1.1.msp" '
    uninstaller: '{B5B5868F-23BA-297A-917D-0DF345TF5764}'
    uninstall_flags: '/qn /norestart'
    msiexec: True
    cache_file: salt://win/repo-ng/MyApp/MyApp.1.1.msp
```

In the above example:

- Version `1.0` of the software installs the application using the `1.0` MSI defined in the `installer` parameter.
- There is no file to be cached and the `install_flags` parameter does not include any special values.

Version `1.1` of the software uses the same installer file as Version `1.0`. Now, to apply a patch to Version 1.0, make the following changes in the package definition file:

- Place the patch file (MSP file) in the same directory as the installer file (MSI file) on the `file_roots`
- In the `cache_file` parameter, specify the path to the single patch file.
- In the `install_flags` parameter, add the `/update` flag and include the path to the MSP file using the `%cd%` environment variable. `%cd%` resolves to the current working directory, which is the location in the minion cache where the installer file is cached.

For more information, see issue #32780.

The same approach could be used for applying MST files for MSIs and answer files for other types of .exe-based installers.

Parameters

This section describes the parameters placed under the `version` in the package definition file. Examples can be found on the Salt winrepo repository.

full_name (str)

The full name of the software as shown in "Add/Remove Programs". You can also retrieve the full name of the package by installing the package manually and then running `pkg.list_pkgs`. Here's an example of the output from `pkg.list_pkgs`:

```
salt 'test-2008' pkg.list_pkgs
test-2008
    ----------
    7-Zip 9.20 (x64 edition):
        9.20.00.0
    Mozilla Firefox 74.0 (x64 en-US)
        74.0
    Mozilla Maintenance Service:
        74.0
    salt-minion-py3:
        3001
```

Notice the full Name for Firefox: `Mozilla Firefox 74.0 (x64 en-US)`. The `full_name` parameter in the package definition file must match this name.

The example below shows the `pkg.list_pkgs` for a machine that has Mozilla Firefox 74.0 installed with a package definition file for that version of Firefox.

```
test-2008:
    ----------
    7zip:
        9.20.00.0
    Mozilla Maintenance Service:
        74.0
    firefox_x64:
        74.0
    salt-minion-py3:
        3001
```

On running `pkg.list_pkgs`, if any of the software installed on the machine matches the full name defined in any one of the software definition files in the repository, then the package name is displayed in the output.

Important: The version number and `full_name` must match the output of `pkg.list_pkgs` so that the installation status can be verified by the state system.

Note: You can successfully install packages using `pkg.install`, even if the `full_name` or the version number doesn't match. The module will complete successfully, but continue to display the full name in `pkg.list_pkgs`. If this is happening, verify that the `full_name` and the `version` match exactly what is displayed in Add/Remove Programs.

Tip: To force Salt to display the full name when there's already an existing package definition file on the system, you can pass a bogus `saltenv` parameter to the command like so: `pkg.list_pkgs saltenv=NotARealEnv`

Tip: It's important use *`pkg.refresh_db`* to check for errors and ensure the latest package definition is on any minion you're testing new definitions on.

---

installer (str)

The path to the binary (`.exe`, `.msi`) that installs the package.

This can be a local path or a URL. If it is a URL or a Salt path (`salt://`), then the package is cached locally and then executed. If it is a path to a file on disk or a file share, then it is executed directly.

Note: When storing software in the same location as the winrepo:

- Create a sub folder named after the package.
- Store the package definition file named `init.sls` and the binary installer in the same sub folder if you are hosting those files on the `file_roots`.

Note: The `pkg.refresh_db` command processes all `.sls` files in all sub directories in the `winrepo_dir_ng` directory.

---

install_flags (str)

The flags passed to the installer for silent installation.

You may be able to find these flags by adding `/?` or `/h` when running the installer from the command line. See WPKG project wiki for information on silent install flags.

Warning: Always ensure that the installer has the ability to install silently, otherwise Salt appears to hang while the installer waits for user input.

uninstaller (str)

The path to the program to uninstall the software.

This can be the path to the same `.exe` or `.msi` used to install the software. If you use a `.msi` to install the software, then you can either use the GUID of the software or the same `.msi` to uninstall the software.

You can find the uninstall information in the registry:

- Software\Microsoft\Windows\CurrentVersion\Uninstall
- Software\WOW6432Node\Microsoft\Windows\CurrentVersion\Uninstall

Here's an example that uses the GUID to uninstall software:

```
7zip:
  '9.20.00.0':
    full_name: 7-Zip 9.20 (x64 edition)
    installer: salt://win/repo-ng/7zip/7z920-x64.msi
    install_flags: '/qn /norestart'
    uninstaller: '{23170F69-40C1-2702-0920-000001000000}'
    uninstall_flags: '/qn /norestart'
    msiexec: True
```

Here's an example that uses the MSI installer to uninstall software:

```
7zip:
  '9.20.00.0':
    full_name: 7-Zip 9.20 (x64 edition)
    installer: salt://win/repo-ng/7zip/7z920-x64.msi
    install_flags: '/qn /norestart'
    uninstaller: salt://win/repo-ng/7zip/7z920-x64.msi
    uninstall_flags: '/qn /norestart'
    msiexec: True
```

uninstall_flags (str)

The flags passed to the uninstaller for silent uninstallation.

You may be able to find these flags by adding `/?` or `/h` when running the uninstaller from the command-line. See WPKG project wiki for information on silent uninstall flags.

Warning: Always ensure that the installer has the ability to uninstall silently, otherwise Salt appears to hang while the uninstaller waits for user input.

msiexec (bool, str)

This setting informs Salt to use `msiexec /i` to install the package and `msiexec /x` to uninstall. This setting only applies to `.msi` installations.

Possible options are:

- True
- False (default)
- the path to `msiexec.exe` on your system

```yaml
7zip:
  '9.20.00.0':
    full_name: 7-Zip 9.20 (x64 edition)
    installer: salt://win/repo/7zip/7z920-x64.msi
    install_flags: '/qn /norestart'
    uninstaller: salt://win/repo/7zip/7z920-x64.msi
    uninstall_flags: '/qn /norestart'
    msiexec: 'C:\Windows\System32\msiexec.exe'
```

allusers (bool)

This parameter is specific to `.msi` installations. It tells `msiexec` to install the software for all users. The default is `True`.

cache_dir (bool)

This setting requires the software to be stored on the `file_roots` and only applies to URLs that begin with `salt://`. If set to `True`, then the entire directory where the installer resides is recursively cached. This is useful for installers that depend on other files in the same directory for installation.

> **Warning:** If set to `True`, then all files and directories in the same location as the installer file are copied down to the minion. For example, if you place your package definition file with `cache_dir: True` in the root of winrepo (`/srv/salt/win/repo-ng`) then the entire contents of winrepo is cached to the minion. Therefore, it is best practice to place your package definition file along with its installer files in a subdirectory if they are stored in winrepo.

Here's an example using cache_dir:

```yaml
sqlexpress:
  '12.0.2000.8':
    full_name: Microsoft SQL Server 2014 Setup (English)
    installer: 'salt://win/repo/sqlexpress/setup.exe'
    install_flags: '/ACTION=install /IACCEPTSQLSERVERLICENSETERMS /Q'
    cache_dir: True
```

cache_file (str)

This setting requires the file to be stored on the `file_roots` and only applies to URLs that begin with `salt://`. It indicates that the single file specified is copied down for use with the installer. It is copied to the same location as the installer. Use this setting instead of `cache_dir` when you only need to cache a single file.

use_scheduler (bool)

If set to `True`, Windows uses the task scheduler to run the installation. A one-time task is created in the task scheduler and launched. The return to the minion is that the task was launched successfully, not that the software was installed successfully.

Note: This is used in the package definition for Salt itself. The first thing the Salt installer does is kill the Salt service, which then kills all child processes. If the Salt installer is launched via Salt, then the installer is killed with the salt-minion service, leaving Salt on the machine but not running. Using the task scheduler allows an external process to launch the Salt installer so its processes aren't killed when the Salt service is stopped.

source_hash (str)

This setting informs Salt to compare a hash sum of the installer to the provided hash sum before execution. The value can be formatted as `<hash_algorithm>=<hash_sum>`, or it can be a URI to a file containing the hash sum.

For a list of supported algorithms, see the hashlib documentation.

Here's an example using `source_hash`:

```
messageanalyzer:
  '4.0.7551.0':
    full_name: 'Microsoft Message Analyzer'
    installer: 'salt://win/repo/messageanalyzer/MessageAnalyzer64.msi'
    install_flags: '/quiet /norestart'
    uninstaller: '{1CC02C23-8FCD-487E-860C-311EC0A0C933}'
    uninstall_flags: '/quiet /norestart'
    msiexec: True
    source_hash: 'sha1=62875ff451f13b10a8ff988f2943e76a4735d3d4'
```

Not Implemented

The following parameters are often seen in the software definition files hosted on the Git repo. However, they are not implemented and do not affect the installation process.

param bool reboot
Not implemented

param str locale
Not implemented

31.2.9 Managing Windows Software on a Standalone Windows Minion

The Windows Software Repository functions similarly in a standalone environment, with a few differences in the configuration.

To replace the winrepo runner used on the Salt master, an `execution module` exists to provide the same functionality to standalone minions. The functions for the module share the same names with functions in the runner and are used in the same way; the only difference is that `salt-call` is used instead of `salt-run` to run those functions:

```
salt-call winrepo.update_git_repos
salt-call pkg.refresh_db
```

After executing the previous commands, the repository on the standalone system is ready for use.

31.2.10 Troubleshooting

My software installs correctly but `pkg.installed` says it failed

If you have a package that seems to install properly but Salt reports a failure then it is likely you have a `version` or `full_name` mismatch.

- Check the `full_name` and `version` of the package as shown in Add/Remove Programs (`appwiz.cpl`).
- Use `pkg.list_pkgs` to check that the `full_name` and `version` exactly match what is installed.
- Verify that the `full_name` and `version` in the package definition file match the full name and version in Add/Remove programs.
- Ensure that the `version` is wrapped in single quotes in the package definition file.

Changes to package definition files not being picked up

Make sure you refresh the database on the minion (`pkg.refresh_db`) after updating package definition files in the repo.

```
salt winminion pkg.refresh_db
```

Winrepo upgrade issues

To minimize potential issues, it is a good idea to remove any winrepo git repositories that were checked out by the legacy (pre-2015.8.0) winrepo code when upgrading the master to 2015.8.0 or later. Run *`winrepo.update_git_repos`* to clone them anew after the master is started.

31.2.11 pygit2 / GitPython Support for Maintaining Git Repos

pygit2 and GitPython are the supported python interfaces to Git. The runner *winrepo.update_git_repos* uses the same underlying code as *Git Fileserver Backend* and *Git External Pillar* to maintain and update its local clones of git repositories.

Note: If compatible versions of both pygit2 and GitPython are installed, then Salt will prefer pygit2. To override this behavior use the *winrepo_provider* configuration parameter, ie: `winrepo_provider: gitpython`

31.2.12 Accessing authenticated Git repos (pygit2)

pygit2 enables you to access authenticated git repositories and set per-remote config settings. An example of this is:

```
winrepo_remotes:
  - https://github.com/saltstack/salt-winrepo.git
  - git@github.com:myuser/myrepo.git:
    - pubkey: /path/to/key.pub
    - privkey: /path/to/key
    - passphrase: myaw3s0m3pa$$phr4$3
  - https://github.com/myuser/privaterepo.git:
    - user: mygithubuser
    - password: CorrectHorseBatteryStaple
```

Note: The per-remote configuration settings work in the same manner as they do in gitfs, with global parameters being overridden by their per-remote counterparts. For instance, setting *winrepo_passphrase* sets a global passphrase for winrepo that applies to all SSH-based remotes, unless overridden by a `passphrase` per-remote parameter.

See *here* for a detailed explanation of how per-remote configuration works in gitfs. The same principles apply to winrepo.

31.2.13 Maintaining Git repos

A `clean` argument is added to the *winrepo.update_git_repos* runner to maintain the Git repos. When `clean=True` the runner removes directories under the *winrepo_dir_ng*/*winrepo_dir_ng* that are not explicitly configured. This eliminates the need to manually remove these directories when a repo is removed from the config file.

```
salt-run winrepo.update_git_repos clean=True
```

If a mix of git and non-git Windows Repo definition files are used, then do not pass `clean=True`, as it removes the directories containing non-git definitions.

31.2.14 Name collisions between repos

Salt detects collisions between repository names. The *winrepo.update_git_repos* runner does not execute successfully if any collisions between repository names are detected. Consider the following configuration:

```
winrepo_remotes:
  - https://foo.com/bar/baz.git
  - https://mydomain.tld/baz.git
  - https://github.com/foobar/baz.git
```

With the above configuration, the *winrepo.update_git_repos* runner fails to execute as all three repos would be checked out to the same directory. To resolve this conflict, use the per-remote parameter called `name`.

```
winrepo_remotes:
  - https://foo.com/bar/baz.git
  - https://mydomain.tld/baz.git:
    - name: baz_junior
  - https://github.com/foobar/baz.git:
    - name: baz_the_third
```

Now on running the *winrepo.update_git_repos*:

- https://foo.com/bar/baz.git repo is initialized and cloned under the `win_repo_dir_ng` directory.
- https://mydomain.tld/baz.git repo is initialized and cloned under the `win_repo_dir_ng\baz_junior` directory.
- https://github.com/foobar/baz.git repo is initialized and cloned under the `win_repo_dir_ng\baz_the_third` directory.

31.3 Windows-specific Behaviour

Salt is capable of managing Windows systems, however due to various differences between the operating systems, there are some things you need to keep in mind.

This document will contain any quirks that apply across Salt or generally across multiple module functions. Any Windows-specific behavior for particular module functions will be documented in the module function documentation. Therefore this document should be read in conjunction with the module function documentation.

31.3.1 Group parameter for files

Salt was originally written for managing Unix-based systems, and therefore the file module functions were designed around that security model. Rather than trying to shoehorn that model on to Windows, Salt ignores these parameters and makes non-applicable module functions unavailable instead.

One of the commonly ignored parameters is the `group` parameter for managing files. Under Windows, while files do have a 'primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Because of this, any file module functions that typically require a group, do not under Windows. Attempts to directly use file module functions that operate on the group (e.g. `file.chgrp`) will return a pseudo-value and cause a log message to appear. No group parameters will be acted on.

If you do want to access and change the 'primary group' property and understand the implications, use the `file.get_pgid` or `file.get_pgroup` functions or the `pgroup` parameter on the `file.chown` module function.

31.3.2 Dealing with case-insensitive but case-preserving names

Windows is case-insensitive, but however preserves the case of names and it is this preserved form that is returned from system functions. This causes some issues with Salt because it assumes case-sensitive names. These issues generally occur in the state functions and can cause bizarre looking errors.

To avoid such issues, always pretend Windows is case-sensitive and use the right case for names, e.g. specify `user=Administrator` instead of `user=administrator`.

Follow issue 11801 for any changes to this behavior.

31.3.3 Dealing with various username forms

Salt does not understand the various forms that Windows usernames can come in, e.g. username, mydomain\username, username@mydomain.tld can all refer to the same user. In fact, Salt generally only considers the raw username value, i.e. the username without the domain or host information.

Using these alternative forms will likely confuse Salt and cause odd errors to happen. Use only the raw username value in the correct case to avoid problems.

Follow issue 11801 for any changes to this behavior.

31.3.4 Specifying the None group

Each Windows system has built-in _None_ group. This is the default 'primary group' for files for users not on a domain environment.

Unfortunately, the word _None_ has special meaning in Python - it is a special value indicating 'nothing', similar to `null` or `nil` in other languages.

To specify the None group, it must be specified in quotes, e.g. `./salt '*' file.chpgrp C:\path\to\file "'None'"`.

31.3.5 Symbolic link loops

Under Windows, if any symbolic link loops are detected or if there are too many levels of symlinks (defaults to 64), an error is always raised.

For some functions, this behavior is different to the behavior on Unix platforms. In general, avoid symlink loops on either platform.

CHAPTER

THIRTYTWO

DEVELOPING SALT

32.1 Overview

In its most typical use, Salt is a software application in which clients, called ”minions” can be commanded and controlled from a central command server called a ”master”.

Commands are normally issued to the minions (via the master) by calling a client script simply called, 'salt'.

Salt features a pluggable transport system to issue commands from a master to minions. The default transport is ZeroMQ.

32.2 Salt Client

32.2.1 Overview

The salt client is run on the same machine as the Salt Master and communicates with the salt-master to issue commands and to receive the results and display them to the user.

The primary abstraction for the salt client is called 'LocalClient'.

When LocalClient wants to publish a command to minions, it connects to the master by issuing a request to the master's ReqServer (TCP: 4506)

The LocalClient system listens to responses for its requests by listening to the master event bus publisher (master_event_pub.ipc).

32.3 Salt Master

32.3.1 Overview

The salt-master daemon runs on the designated Salt master and performs functions such as authenticating minions, sending, and receiving requests from connected minions and sending and receiving requests and replies to the 'salt' CLI.

32.3.2 Moving Pieces

When a Salt master starts up, a number of processes are started, all of which are called 'salt-master' in a process-list but have various role categories.

Among those categories are:

- Publisher
- EventPublisher
- MWorker

32.3.3 Publisher

The Publisher process is responsible for sending commands over the designated transport to connected minions. The Publisher is bound to the following:

- TCP: port 4505
- IPC: publish_pull.ipc

Each salt minion establishes a connection to the master Publisher.

32.3.4 EventPublisher

The EventPublisher publishes master events out to any event listeners. It is bound to the following:

- IPC: master_event_pull.ipc
- IPC: master_event_pub.ipc

32.3.5 MWorker

Worker processes manage the back-end operations for the Salt Master.

The number of workers is equivalent to the number of 'worker_threads' specified in the master configuration and is always at least one.

Workers are bound to the following:

- IPC: workers.ipc

32.3.6 ReqServer

The Salt request server takes requests and distributes them to available MWorker processes for processing. It also receives replies back from minions.

The ReqServer is bound to the following:

  - TCP: 4506
  - IPC: workers.ipc

Each salt minion establishes a connection to the master ReqServer.

32.3.7 Job Flow

The Salt master works by always publishing commands to all connected minions and the minions decide if the command is meant for them by checking themselves against the command target.

The typical lifecycle of a salt job from the perspective of the master might be as follows:

1) A command is issued on the CLI. For example, 'salt my_minion test.version'.
2) The 'salt' command uses LocalClient to generate a request to the salt master by connecting to the ReqServer on TCP:4506 and issuing the job.
3) The salt-master ReqServer sees the request and passes it to an available MWorker over workers.ipc.
4) A worker picks up the request and handles it. First, it checks to ensure that the requested user has permissions to issue the command. Then, it sends the publish command to all connected minions. For the curious, this happens in ClearFuncs.publish().
5) The worker announces on the master event bus that it is about to publish a job to connected minions. This happens by placing the event on the master event bus (master_event_pull.ipc) where the EventPublisher picks it up and distributes it to all connected event listeners on master_event_pub.ipc.
6) The message to the minions is encrypted and sent to the Publisher via IPC on publish_pull.ipc.
7) Connected minions have a TCP session established with the Publisher on TCP port 4505 where they await commands. When the Publisher receives the job over publish_pull, it sends the jobs across the wire to the minions for processing.
8) After the minions receive the request, they decrypt it and perform any requested work, if they determine that they are targeted to do so.
9) When the minion is ready to respond, it publishes the result of its job back to the master by sending the encrypted result back to the master on TCP 4506 where it is again picked up by the ReqServer and forwarded to an available MWorker for processing. (Again, this happens by passing this message across workers.ipc to an available worker.)
10) When the MWorker receives the job it decrypts it and fires an event onto the master event bus (master_event_pull.ipc). (Again for the curious, this happens in AESFuncs._return().
11) The EventPublisher sees this event and re-publishes it on the bus to all connected listeners of the master event bus (on master_event_pub.ipc). This is where the LocalClient has been waiting, listening to the event bus for minion replies. It gathers the job and stores the result.
12) When all targeted minions have replied or the timeout has been exceeded, the salt client displays the results of the job to the user on the CLI.

32.4 Salt Minion

32.4.1 Overview

The salt-minion is a single process that sits on machines to be managed by Salt. It can either operate as a stand-alone daemon which accepts commands locally via 'salt-call' or it can connect back to a master and receive commands remotely.

When starting up, salt minions connect *back* to a master defined in the minion config file. They connect to two ports on the master:

- **TCP: 4505**
  This is the connection to the master Publisher. It is on this port that the minion receives jobs from the master.
- **TCP: 4506**
  This is the connection to the master ReqServer. It is on this port that the minion sends job results back to the master.

32.4.2 Event System

Similar to the master, a salt-minion has its own event system that operates over IPC by default. The minion event system operates on a push/pull system with IPC files at minion_event_<unique_id>_pub.ipc and minion_event_<unique_id>_pull.ipc.

The astute reader might ask why have an event bus at all with a single-process daemon. The answer is that the salt-minion may fork other processes as required to do the work without blocking the main salt-minion process and this necessitates a mechanism by which those processes can communicate with each other. Secondarily, this provides a bus by which any user with sufficient permissions can read or write to the bus as a common interface with the salt minion.

32.4.3 Minion Job Flow

When a salt minion starts up, it attempts to connect to the Publisher and the ReqServer on the salt master. It then attempts to authenticate and once the minion has successfully authenticated, it simply listens for jobs.

Jobs normally come either come from the 'salt-call' script run by a local user on the salt minion or they can come directly from a master.

The job flow on a minion, coming from the master via a 'salt' command is as follows:

1) A master publishes a job that is received by a minion as outlined by the master's job flow above. 2) The minion is polling its receive socket that's connected to the master Publisher (TCP 4505 on master). When it detects an incoming message, it picks it up from the socket and decrypts it. 3) A new minion process or thread is created and provided with the contents of the decrypted message. The _thread_return() method is provided with the contents of the received message. 4) The new minion thread is created. The _thread_return() function starts up and actually calls out to the requested function contained in the job. 5) The requested function runs and returns a result. [Still in thread.] 6) The result of the function that's run is published on the minion's local event bus with event tag "__master_req_channel_payload" [Still in thread.] 7) Thread exits. Because the main thread was only blocked for the time that it took to initialize the worker thread, many other requests could have been received and processed during this time. 8) Minion event handler gets the event with tag "__master_req_channel_payload" and sends the payload to master's ReqServer (TCP 4506 on master), via the long-running async request channel that was opened when minion first started up.

32.5 A Note on ClearFuncs vs. AESFuncs

A common source of confusion is determining when messages are passed in the clear and when they are passed using encryption. There are two rules governing this behaviour:

1) ClearFuncs is used for intra-master communication and during the initial authentication handshake between a minion and master during the key exchange. 2) AESFuncs is used everywhere else.

32.6 Changelog

With the addition of SEP 01 the keepachangelog format was introduced into our CHANGELOG.md file. The Salt project is using the towncrier tool to manage the CHANGELOG.md file. The reason this tool was added to manage the changelog was because we were previously managing the file manually and it would cause many merge conflicts. This tool allows us to add changelog entries into separate files and before a release we simply need to run `towncrier --version=<version>` for it to compile the changelog correctly.

32.6.1 How do I add a changelog entry

To add a changelog entry you will need to add a file in the *changelog* directory. The file name should follow the syntax `<issue #>.<type>.md`. If it is a security fix then the following syntax will need to be used `cve-<cve-number>.security.md`.

The types are in alignment with keepachangelog:

removed:
any features that have been removed

deprecated:
any features that will soon be removed

changed:
any changes in current existing features

fixed:
any bug fixes

added:
any new features added

security:
any fixes for a cve

For example if you are fixing a bug for issue number #1234 your filename would look like this: *changelog/1234.fixed.md*. The contents of the file should contain a summary of what you are fixing. If there is a legitimate reason to not include an issue number with a given contribution you can add the PR number as the file name (`<PR #>.<type>.md`).

For a security fix your filename would look like this: *changelog/cve-2021-25283.security.md.*

If your PR does not align with any of the types, then you do not need to add a changelog entry.

Note: Requirement Files: Updates to package requirements files also require a changelog file. This will usually be associated with *.fixed* if its resolving an issue or *.security* if it's resolving a CVE issue in an upstream project. If updates are made to testing requirement files it does not require a changelog.

32.6.2 How to generate the changelog

This step is only used when we need to generate the changelog right before releasing. You should NOT run towncrier on your PR, unless you are preparing the final PR to update the changelog before a release.

You can run the *towncrier* tool directly or you can use *tools* to help run the command and ensure towncrier is installed in a virtual environment. The instructions below will detail both approaches.

Installing *tools*

If you want to see what output towncrier will produce before generating the change log you can run towncrier in draft mode:

```
towncrier --draft --version=3001
```

```
tools changelog update-changelog-md --draft 3000.1
```

Version will need to be set to whichever version we are about to release. Once you are confident the draft output looks correct you can now generate the changelog by running:

```
towncrier --version=3001
```

```
tools changelog update-changelog-md 3000.1
```

After this is run towncrier will automatically remove all the files in the changelog directory.

If you want to force towncrier to automatically remove all the files in the changelog directory without asking you to type yes, you can set force to True.

```
towncrier --yes --version=3001
```

The *tools changelog update-changelog-md <version>* command will automatically add *--yes* if *--draft* is not passed.

32.7 Contributing to Salt: A Guide for Contributors

So, you want to contribute to the Salt project? That's fantastic! There are many ways you can help improve Salt:

- Use Salt and report bugs with clear, detailed descriptions.
- Join a working group to collaborate with other contributors.
- Answer questions on platforms like the community Discord, the salt-users mailing list, Server Fault, or r/saltstack on Reddit.
- Fix bugs or contribute to the documentation.
- Submit workarounds, patches, or code (even without tests).
- Share your experiences and solutions to problems you've solved using Salt.

32.7.1 Choosing the Right Branch for Your Pull Request

We appreciate your contributions to the project! To ensure a smooth and efficient workflow, please follow these guidelines when submitting a Pull Request. Each type of contribution—whether it's fixing a bug, adding a feature, updating documentation, or fixing tests—should be targeted at the appropriate branch. This helps us manage changes effectively and maintain stability across versions.

- **Bug Fixes**:

  Create your Pull Request against the oldest supported branch where the bug exists. This ensures that the fix can be applied to all relevant versions.

- **New Features**:

  For new features or enhancements, create your Pull Request against the master branch.

- **Documentation Updates**:

  Documentation changes should be made against the master branch, unless they are related to a bug fix, in which case they should follow the same branch as the bug fix.

- **Test Fixes**:

  Pull Requests that fix broken or failing tests should be created against the oldest supported branch where the issue occurs.

32.7.2 Setting Up Your Salt Development Environment

To hack on Salt or the docs you're going to need to set up your development environment. If you already have a workflow that you're comfortable with, you can use that, but otherwise this is an opinionated guide for setting up your dev environment. Follow these steps and you'll end out with a functioning dev environment and be able to submit your first PR.

This guide assumes at least a passing familiarity with Git, a common version control tool used across many open source projects, and is necessary for contributing to Salt. For an introduction to Git, watch Salt Docs Clinic - Git For the True Beginner. Because of its widespread use, there are many resources for learning more about Git. One popular resource is the free online book Learn Git in a Month of Lunches.

pyenv, Virtual Environments, and you

We recommend pyenv, since it allows installing multiple different Python versions, which is important for testing Salt across all the versions of Python that we support.

On Linux

Install pyenv:

```
git clone https://github.com/pyenv/pyenv.git ~/.pyenv
export PATH="$HOME/.pyenv/bin:$PATH"
git clone https://github.com/pyenv/pyenv-virtualenv.git $(pyenv root)/plugins/
↪pyenv-virtualenv
```

On Mac

Install pyenv using brew:

```
brew update
brew install pyenv
brew install pyenv-virtualenv
```

Now add pyenv to your `.bashrc`:

```
echo 'export PATH="$HOME/.pyenv/bin:$PATH"' >> ~/.bashrc
pyenv init 2>> ~/.bashrc
pyenv virtualenv-init 2>> ~/.bashrc
```

For other shells, see the pyenv instructions.

Go ahead and restart your shell. Now you should be able to install a new version of Python:

```
pyenv install 3.9.18
```

If that fails, don't panic! You're probably just missing some build dependencies. Check out pyenv common build problems.

Now that you've got your version of Python installed, you can create a new virtual environment with this command:

```
pyenv virtualenv 3.9.18 salt
```

Then activate it:

```
pyenv activate salt
```

Sweet! Now you're ready to clone Salt so you can start hacking away! If you get stuck at any point, check out the resources at the beginning of this guide. Discord and GitHub Discussions are particularly helpful places to go.

Get the source!

Salt uses the fork and clone workflow for Git contributions. See Using the Fork-and-Branch Git Workflow for how to implement it. But if you just want to hurry and get started you can go ahead and follow these steps:

Clones are so shallow. Well, this one is anyway:

```
git clone --depth=1 --origin salt https://github.com/saltstack/salt.git
```

This creates a shallow clone of Salt, which should be fast. Most of the time that's all you'll need, and you can start building out other commits as you go. If you *really* want all 108,300+ commits you can just run `git fetch --unshallow`. Then go make a sandwich because it's gonna be a while.

You're also going to want to head over to GitHub and create your own fork of Salt. Once you've got that set up you can add it as a remote:

```
git remote add yourname <YOUR SALT REMOTE>
```

If you use your name to refer to your fork, and `salt` to refer to the official Salt repo you'll never get `upstream` or `origin` confused.

Note: Each time you start work on a new issue you should fetch the most recent changes from `salt/upstream`.

Set up `pre-commit` and `nox`

Here at Salt we use pre-commit and nox to make it easier for contributors to get quick feedback, for quality control, and to increase the chance that your merge request will get reviewed and merged. Nox enables us to run multiple different test configurations, as well as other common tasks. You can think of it as Make with superpowers. Pre-commit does what it sounds like: it configures some Git pre-commit hooks to run `black` for formatting, `isort` for keeping our imports sorted, and `pylint` to catch issues like unused imports, among others. You can easily install them in your virtualenv with:

```
python -m pip install pre-commit nox
pre-commit install
```

Warning: Currently there is an issue with the pip-tools-compile pre-commit hook on Windows. The details around this issue are included here: https://github.com/saltstack/salt/issues/56642. Please ensure you export `SKIP=pip-tools-compile` to skip pip-tools-compile.

Now before each commit, it will ensure that your code at least *looks* right before you open a pull request. And with that step, it's time to start hacking on Salt!

Set up imagemagick

One last prerequisite is to have `imagemagick` installed, as it is required by Sphinx for generating the HTML documentation.

```
# On Mac, via homebrew
brew install imagemagick
```

```
# Example Linux installation: Debian-based
sudo apt install imagemagick
```

32.7.3 Salt issues

Create your own

Perhaps you've come to this guide because you found a problem in Salt, and you've diagnosed the cause. Maybe you need some help figuring out the problem. In any case, creating quality bug reports is a great way to contribute to Salt even if you lack the skills, time, or inclination to fix it yourself. If that's the case, head on over to Salt's issue tracker on GitHub.

Creating a **good** report can take a little bit of time - but every minute you invest in making it easier for others to reproduce and understand your issue is time well spent. The faster someone can understand your issue, the faster it will be able to get fixed correctly.

The thing that every issue needs goes by many names, but one at least as good as any other is MCVE - **M**inimum **C**omplete **V**erifiable **E**xample.

In a nutshell:

- **Minimum**: All of the **extra** information has been removed. Will 2 or 3 lines of master/minion config still exhibit the behavior?
- **Complete**: Minimum also means complete. If your example is missing information, then it's not complete. Salt, Python, and OS versions are all bits of information that make your example complete. Have you provided the commands that you ran?
- **Verifiable**: Can someone take your report and reproduce it?

Slow is smooth, and smooth is fast - it may feel like you're taking a long time to create your issue if you're creating a proper MCVE, but a MCVE eliminates back and forth required to reproduce/verify the issue so someone can actually create a fix.

Pick an issue

If you don't already have an issue in mind, you can search for help wanted issues. If you also search for good first issue then you should be able to find some issues that are good for getting started contributing to Salt. Documentation issues are also good starter issues. When you find an issue that catches your eye (or one of your own), it's a good idea to comment on the issue and mention that you're working on it. Good communication is key to collaboration - so if you don't have time to complete work on the issue, just leaving some information about when you expect to pick things up again is a great idea!

32.7.4 Hacking away

Salt, tests, documentation, and you

Before approving code contributions, Salt requires:

- documentation
- meaningful passing tests
- correct code

Documentation fixes just require correct documentation.

What if I don't write tests or docs?

If you aren't into writing documentation or tests, we still welcome your contributions! But your PR will be labeled `Needs Testcase` and `Help Wanted` until someone can get to write the tests/documentation. Of course, if you have a desire but just lack the skill we are more than happy to collaborate and help out! There's the documentation working group and the testing working group. We also regularly stream our test clinic live on Twitch every Tuesday afternoon and Thursday morning, Central Time. If you'd like specific help with tests, bring them to the clinic. If no community members need help, you can also just watch tests written in real time.

Documentation

Salt uses both docstrings, as well as normal reStructuredText files in the `salt/doc` folder for documentation. Sphinx is used to generate the documentation, and does require `imagemagick`. See *Set up imagemagick* for more information.

Before submitting a documentation PR, it helps to first build the Salt docs locally on your machine and preview them. Local previews helps you:

- Debug potential documentation output errors before submitting a PR.
- Saves you time by not needing to use the Salt CI/CD test suite to debug, which takes more than 30 minutes to run on a PR.
- Ensures the final output looks the way you intended it to look.

To set up your local environment to preview the core Salt and module documentation:

1. Install the documentation dependencies. For example, on Ubuntu:

```
sudo apt-get update

sudo apt-get install -y enchant-2 git gcc imagemagick make zlib1g-dev
↪libc-dev libffi-dev g++ libxml2 libxml2-dev libxslt-dev libcurl4-
↪openssl-dev libssl-dev libgnutls28-dev xz-utils inkscape
```

2. Navigate to the folder where you store your Salt repository and remove any *.nox* directories that might be in that folder:

```
rm -rf .nox
```

3. Install *pyenv* for the version of Python needed to run the docs. As of the time of writing, the Salt docs theme is not compatible with Python 3.10, so you'll need to run 3.9 or earlier. For example:

```
pyenv install 3.9.18
pyenv virtualenv 3.9.18 salt-docs
echo 'salt-docs' > .python-version
```

4. Activate *pyenv* if it's not auto-activated:

```
pyenv exec pip install -U pip setuptools wheel
```

5. Install *nox* into your pyenv environment, which is the utility that will build the Salt documentation:

```
pyenv exec pip install nox
```

Since we use `nox`, you can build your docs and view them in your browser with this one-liner:

```
python -m nox -e 'docs-html(compress=False, clean=False)'; cd doc/_build/html;
↪ python -m webbrowser http://localhost:8000/contents.html; python -m http.
↪server
```

The first time you build the docs, it will take a while because there are a *lot* of modules. Maybe you should go grab some dessert if you already finished that sandwich. But once nox and Sphinx are done building the docs, python should launch your default browser with the URL http://localhost:8000/contents.html. Now you can navigate to your docs and ensure your changes exist. If you make changes, you can simply run this:

```
cd -; python -m nox -e 'docs-html(compress=False, clean=False)'; cd doc/_
↪build/html; python -m http.server
```

And then refresh your browser to get your updated docs. This one should be quite a bit faster since Sphinx won't need to rebuild everything.

Alternatively, you could build the docs on your local machine and then preview the build output. To build the docs locally:

```
pyenv exec nox -e 'docs-html(compress=False, clean=True)'
```

The output from this command will put the preview files in: `doc > _build > html`.

If your change is a docs-only change, you can go ahead and commit/push your code and open a PR. You can indicate that it's a docs-only change by adding `[Documentation]` to the title of your PR. Otherwise, you'll want to write some tests and code.

Running development Salt

Note: If you run into any issues in this section, check the Troubleshooting section.

If you're going to hack on the Salt codebase you're going to want to be able to run Salt locally. The first thing you need to do is install Salt as an editable pip install:

```
python -m pip install -e .
```

This will let you make changes to Salt without having to re-install it.

After all of the dependencies and Salt are installed, it's time to set up the config for development. Typically Salt runs as `root`, but you can specify which user to run as. To configure that, just copy the master and minion configs. We have .gitignore setup to ignore the `local/` directory, so we can put all of our personal files there.

```
mkdir -p local/etc/salt/
```

Create a master config file as `local/etc/salt/master`:

```
cat <<EOF >local/etc/salt/master
user: $(whoami)
root_dir: $PWD/local/
publish_port: 55505
ret_port: 55506
EOF
```

And a minion config as `local/etc/salt/minion`:

```
cat <<EOF >local/etc/salt/minion
user: $(whoami)
root_dir: $PWD/local/
master: localhost
id: saltdev
master_port: 55506
EOF
```

Now you can start your Salt master and minion, specifying the config dir.

```
salt-master --config-dir=local/etc/salt/ --log-level=debug --daemon
salt-minion --config-dir=local/etc/salt/ --log-level=debug --daemon
```

Now you should be able to accept the minion key:

```
salt-key -c local/etc/salt -Ay
```

And check that your master/minion are communicating:

```
salt -c local/etc/salt \* test.version
```

Rather than running `test.version` from your master, you can run it from the minion instead:

```
salt-call -c local/etc/salt test.version
```

Note that you're running `salt-call` instead of `salt`, and you're not specifying the minion (`\*`), but if you're running the dev version then you still will need to pass in the config dir. Now that you've got Salt running, you can hack away on the Salt codebase!

If you need to restart Salt for some reason, if you've made changes and they don't appear to be reflected, this is one option:

```
kill -INT $(pgrep salt-master)
kill -INT $(pgrep salt-minion)
```

If you'd rather not use `kill`, you can have a couple of terminals open with your salt virtualenv activated and omit the `--daemon` argument. Salt will run in the foreground, so you can just use ctrl+c to quit.

Test first? Test last? Test meaningfully!

You can write tests first or tests last, as long as your tests are meaningful and complete! *Typically* the best tests for Salt are going to be unit tests. Testing is a whole topic on its own, But you may also want to write functional or integration tests. You'll find those in the `tests/` directory.

When you're thinking about tests to write, the most important thing to keep in mind is, “What, exactly, am I testing?” When a test fails, you should know:

- What, specifically, failed?
- Why did it fail?
- As much as possible, what do I need to do to fix this failure?

If you can't answer those questions then you might need to refactor your tests.

When you're running tests locally, you should make sure that if you remove your code changes your tests are failing. If your tests *aren't* failing when you haven't yet made changes, then it's possible that you're testing the wrong thing.

But whether you adhere to TDD/BDD, or you write your code first and your tests last, ensure that your tests are meaningful.

Running tests

As previously mentioned, we use `nox`, and that's how we run our tests. You should have it installed by this point but if not you can install it with this:

```
python -m pip install nox
```

Now you can run your tests:

```
python -m nox -e "test-3(coverage=False)" -- tests/unit/cli/test_batch.py
```

It's a good idea to install espeak or use `say` on Mac if you're running some long-running tests. You can do something like this:

```
python -m nox -e "test-3(coverage=False)" -- tests/unit/cli/test_batch.py;
↪espeak "Tests done, woohoo!"
```

That way you don't have to keep monitoring the actual test run.

```
python -m nox -e "test-3(coverage=False)" -- --core-tests
```

You can enable or disable test groups locally by passing their respected flag:

- --no-fast-tests - Tests that are ~10s or faster. Fast tests make up ~75% of tests and can run in 10 to 20 minutes.
- --slow-tests - Tests that are ~10s or slower.
- --core-tests - Tests of any speed that test the root parts of salt.
- --flaky-jail - Test that need to be temporarily skipped.

In your PR, you can enable or disable test groups by setting a label. All fast, slow, and core tests specified in the change file will always run.

- test:no-fast
- test:core
- test:slow
- test:flaky-jail

Changelog and commit!

When you write your commit message you should use imperative style. Do this:

> Add frobnosticate capability

Don't do this:

> Added frobnosticate capability

But that advice is backwards for the changelog. We follow the keepachangelog approach for our changelog, and use towncrier to generate it for each release. As a contributor, all that means is that you need to add a file to the `salt/changelog` directory, using the `<issue #>.<type>.md` format. For instance, if you fixed issue 123, you would do:

```
echo "Made sys.doc inform when no minions return" > changelog/123.fixed.md
```

And that's all that would go into your file. When it comes to your commit message, it's usually a good idea to add other information, such as

- What does a reviewer need to know about the change that you made?
- If someone isn't an expert in this area, what will they need to know?

This will also help you out, because when you go to create the PR it will automatically insert the body of your commit messages.

See the changelog docs for more information.

Pull request time!

Once you've done all your dev work and tested locally, you should check out our PR guidelines. After you read that page, it's time to open a new PR. Fill out the PR template - you should have updated or created any necessary docs, and written tests if you're providing a code change. When you submit your PR, we have a suite of tests that will run across different platforms to help ensure that no known bugs were introduced.

Now what?

You've made your changes, added documentation, opened your PR, and have passing tests… now what? When can you expect your code to be merged?

When you open your PR, a reviewer will get automatically assigned. If your PR is submitted during the week you should be able to expect some kind of communication within that business day. If your tests are passing and we're not in a code freeze, ideally your code will be merged that week or month. If you haven't heard from your assigned reviewer, ping them on GitHub or Community Discord.

It's likely that your reviewer will leave some comments that need addressing - it may be a style change, or you forgot a changelog entry, or need to update the docs. Maybe it's something more fundamental - perhaps you encountered the rare case where your PR has a much larger scope than initially assumed.

Whatever the case, simply make the requested changes (or discuss why the requests are incorrect), and push up your new commits. If your PR is open for a significant period of time it may be worth rebasing your changes on the most recent changes to Salt. If you need help, the previously linked Git resources will be valuable.

But if, for whatever reason, you're not interested in driving your PR to completion then just note that in your PR. Something like, “I'm not interested in writing docs/tests, I just wanted to provide this fix - someone else will need to complete this PR.” If you do that then we'll add a “Help Wanted” label and someone will be able to pick up the PR, make the required changes, and it can eventually get merged in.

In any case, now that you have a PR open, congrats! You're a Salt developer! You rock!

32.7.5 Troubleshooting

zmq.core.error.ZMQError

Once the minion starts, you may see an error like the following:

```
::
```

> zmq.core.error.ZMQError: ipc path ”/path/to/your/virtualenv/var/run/salt/minion/minion_event_7824dcbcfd7a8f6755939af70b9
> is longer than 107 characters (sizeof(sockaddr_un.sun_path)).

This means that the path to the socket the minion is using is too long. This is a system limitation, so the only workaround is to reduce the length of this path. This can be done in a couple different ways:

1. Create your virtualenv in a path that is short enough.

2. Edit the :conf_minion:`sock_dir` minion config variable and reduce its length. Remember that this path is relative to the value you set in :conf_minion:`root_dir`.

NOTE: The socket path is limited to 107 characters on Solaris and Linux, and 103 characters on BSD-based systems.

No permissions to access ...

If you forget to pass your config path to any of the `salt*` commands, you might see

```
No permissions to access "/var/log/salt/master", are you running as the
correct user?
```

Just pass `-c local/etc/salt` (or whatever you named it)

File descriptor limit

You might need to raise your file descriptor limit. You can check it with:

```
ulimit -n
```

If the value is less than 3072, you should increase it with:

```
ulimit -n 3072
# For c-shell:
limit descriptors 3072
```

Pygit2 or other dependency install fails

You may see some failure messages when installing requirements. You can directly access your nox environment and possibly install pygit (or other dependency) that way. When you run nox, you'll see a message like this:

```
nox > Re-using existing virtual environment at .nox/pytest-parametrized-3-
↪crypto-none-transport-zeromq-coverage-false.
```

For this, you would be able to install with:

```
.nox/pytest-parametrized-3-crypto-none-transport-zeromq-coverage-false/bin/
↪python -m pip install pygit2
```

32.8 Deprecating Code

Salt should remain backwards compatible, though sometimes, this backwards compatibility needs to be broken because a specific feature and/or solution is no longer necessary or required. At first one might think, let me change this code, it seems that it's not used anywhere else so it should be safe to remove. Then, once there's a new release, users complain about functionality which was removed and they where using it, etc. This should, at all costs, be avoided, and, in these cases, *that* specific code should be deprecated.

In order to give users enough time to migrate from the old code behavior to the new behavior, the deprecation time frame should be carefully determined based on the significance and complexity of the changes required by the user.

Salt feature releases are based on the Periodic Table. Any new features going into the `master` branch will be named after the next element in the Periodic Table. For example, Magnesium was the feature release name associated with the `v3002` tag. At that point in time, any new features going into the `master` branch, after `v3002` was tagged, were part of the Aluminium feature release.

A deprecation warning should be in place for at least two major releases before the deprecated code and its accompanying deprecation warning are removed. More time should be given for more complex changes. For example, if the current release under development is `3001`, the deprecated code and associated warnings should remain in place and warn for at least `Aluminium`.

To help in this deprecation task, salt provides `salt.utils.versions.warn_until`. The idea behind this helper function is to show the deprecation warning to the user until salt reaches the provided version. Once that provided version is equaled `salt.utils.versions.warn_until` will raise a `RuntimeError` making salt stop its execution. This stoppage is unpleasant and will remind the developer that the deprecation limit has been reached and that the code can then be safely removed.

Consider the following example:

```
def some_function(bar=False, foo=None):
    if foo is not None:
        salt.utils.versions.warn_until(
            "Aluminium",
            "The 'foo' argument has been deprecated and its "
            "functionality removed, as such, its usage is no longer "
            "required.",
        )
```

Development begins on `Aluminium`, or `v3003`, after the `v3002` tag is applied to the `master` branch. Once this occurs, all uses of the `warn_until` function targeting `Aluminium`, along with the code they are warning about should be removed from the code.

32.8.1 Silence Deprecation Warnings

If you set the *PYTHONWARNINGS* environment variable to *ignore* Salt will not print the deprecation warnings.

32.9 Python 2 Deprecation FAQ

FAQ

- *Python 2 Deprecation FAQ*
  - *Why are we deprecating Python 2?*
  - *Was this announced/decided before making the change?*
  - *Can I contribute Python 2 code?*
  - *What if my OS does not include Python 3 packages? Or, how do I upgrade from Salt on Python 2 to Salt on Python 3?*
    - *On Modern Platforms*
    - *On Other Platforms*
      - *Build Your Own*
      - *`pop-build` distributions*

  - *Will you support a Python 3 master with an older Python 2 minion?*
  - *Will you support Python 2 master with a new Python 3 minion?*
  - *How does this impact Salt-SSH support?*
  - *What is your plan for removing Python 2 code?*
  - *Will Salt continue to package for Python 2?*

32.9.1 Why are we deprecating Python 2?

Python 2.7.18 was the final release of Python2, released in April 2020. At this point, Python 2 will no longer receive any unpaid support. The Python core developers are focusing their efforts on improving and enhancing Python 3. Additionally, many libraries that Salt depends on have also dropped Python 2 support.

To take advantage of continued support and improvements, Salt is joining the ranks of projects that are dropping legacy Python support in favor of Python 3.

32.9.2 Was this announced/decided before making the change?

SEP 5 was approved in April, 2019.

32.9.3 Can I contribute Python 2 code?

For several years, Salt has been a Python 2/3 codebase, requiring Python 3 support for all contributions. The only changes contributors can expect to this process is that we will now accept Python 3-only code changes.

While there *is* a significant subset of Python that is compatible with both Python 3 and legacy Python, changes requiring `six` or otherwise removing Python 3-only code will not be accepted.

32.9.4 What if my OS does not include Python 3 packages? Or, how do I upgrade from Salt on Python 2 to Salt on Python 3?

There are several options to upgrade to Python 3.

On Modern Platforms

At this point, most modern Linux distributions have Python 3 packages. Ubuntu 20.04 LTS has moved to Python 3.8 as it's default system Python.

On Other Platforms

Build Your Own

If your current distribution does not have Python 3 it's pretty simple to use Salt to build and distribute Python 3 on your own. Installing Python 3 and pip installing Salt gives you the most control over your distribution.

`pop-build` distributions

Another approach is to use the `pop-build` distribution of Salt. With the Sodium release we will begin releasing packages for Salt using `pop-build`, in tandem with our normal build process. The `pop-build` distribution will contain Salt, Python, and any necessary dependencies, which will make it trivial to have a completely supported version of Salt.

32.9.5 Will you support a Python 3 master with an older Python 2 minion?

Yes! Our policy of keeping newer masters backwards compatible with *at least* the most recent minion version is not changing. You should be able to run modern Salt Masters on Python 3 with slightly older minions running on legacy Python. Of course, if you want your minions to be able to take advantage of the newest features in Salt, upgrading to Python 3 will be necessary.

32.9.6 Will you support Python 2 master with a new Python 3 minion?

In keeping with our existing policy, we make no guarantees about older masters with newer minions. It *may* work, but breakages are common and should be expected.

32.9.7 How does this impact Salt-SSH support?

Salt-SSH will need Python 3 on the target minions. We will be upgrading Salt-SSH to provide instructions or recommendations on adding Python3 if it is not detected.

32.9.8 What is your plan for removing Python 2 code?

Legacy Python code will be gradually removed from the Salt codebase.

While we could remove most of it at once, that introduces a high level of risk. Instead, beginning with the Sodium (v3001) release, Salt will simply drop support for Python 2. PRs will no longer be required to support Python 2 before merging.

Over time, as modules are changed, `six` and other legacy Python syntax will be removed. It may be at some point in the future it becomes necessary to remove the last vestiges of legacy Python from Salt, but currently the plan is to take a more measured approach.

32.9.9 Will Salt continue to package for Python 2?

No. Beginning with Sodium (v3001), Salt will no longer release packages for, or support Python 2.

32.10 Installing Salt for development

Clone the repository using:

```
git clone https://github.com/saltstack/salt
```

Note: tags

Just cloning the repository is enough to work with Salt and make contributions. However, fetching additional tags from git is required to have Salt report the correct version for itself. To do this, first add the git repository as an upstream source:

```
git remote add upstream https://github.com/saltstack/salt
```

Fetching tags is done with the git 'fetch' utility:

```
git fetch --tags upstream
```

Create a new virtualenv:

```
virtualenv /path/to/your/virtualenv
```

Avoid making your *virtualenv path too long*.

On Arch Linux, where Python 3 is the default installation of Python, use the `virtualenv2` command instead of `virtualenv`.

On Gentoo you must use `--system-site-packages` to enable pkg and portage_config functionality

---

Note: Using system Python modules in the virtualenv

To use already-installed python modules in virtualenv (instead of having pip download and compile new ones), run `virtualenv --system-site-packages` Using this method eliminates the requirement to install the salt dependencies again, although it does assume that the listed modules are all installed in the system PYTHONPATH at the time of virtualenv creation.

Note: Python development package

Be sure to install python devel package in order to install required Python modules. In Debian/Ubuntu run `sudo apt-get install -y python-dev`. In RedHat based system install `python-devel`

Activate the virtualenv:

```
source /path/to/your/virtualenv/bin/activate
```

Install Salt (and dependencies) into the virtualenv:

```
pip install pyzmq PyYAML pycrypto msgpack jinja2 psutil futures tornado
pip install -e ./salt   # the path to the salt git clone from above
```

Note: Installing psutil

Python header files are required to build this module, otherwise the pip install will fail. If your distribution separates binaries and headers into separate packages, make sure that you have the headers installed. In most Linux distributions which split the headers into their own package, this can be done by installing the `python-dev` or `python-devel` package. For other platforms, the package will likely be similarly named.

Note: Installing dependencies on macOS.

You can install needed dependencies on macOS using homebrew or macports. See the Salt install guide for more information.

Warning: Installing on RedHat-based Distros

If installing from pip (or from source using `setup.py install`), be advised that the `yum-utils` package is needed for Salt to manage packages on RedHat-based systems.

32.10.1 Running a self-contained development version

During development it is easiest to be able to run the Salt master and minion that are installed in the virtualenv you created above, and also to have all the configuration, log, and cache files contained in the virtualenv as well.

The `/path/to/your/virtualenv` referenced multiple times below is also available in the variable `$VIRTUAL_ENV` once the virtual environment is activated.

Copy the master and minion config files into your virtualenv:

```
mkdir -p /path/to/your/virtualenv/etc/salt/pki/{master,minion}
cp ./salt/conf/master ./salt/conf/minion /path/to/your/virtualenv/etc/salt/
```

Edit the master config file:

1. Uncomment and change the `user: root` value to your own user.
2. Uncomment and change the `root_dir: /` value to point to `/path/to/your/virtualenv`.
3. Uncomment and change the `pki_dir: /etc/salt/pki/master` value to point to `/path/to/your/virtualenv/etc/salt/pki/master`
4. If you are running version 0.11.1 or older, uncomment, and change the `pidfile: /var/run/salt-master.pid` value to point to `/path/to/your/virtualenv/salt-master.pid`.
5. If you are also running a non-development version of Salt you will have to change the `publish_port` and `ret_port` values as well.

Edit the minion config file:

1. Repeat the edits you made in the master config for the `user` and `root_dir` values as well as any port changes.
2. Uncomment and change the `pki_dir: /etc/salt/pki/minion` value to point to `/path/to/your/virtualenv/etc/salt/pki/minion`
3. If you are running version 0.11.1 or older, uncomment, and change the `pidfile: /var/run/salt-minion.pid` value to point to `/path/to/your/virtualenv/salt-minion.pid`.
4. Uncomment and change the `master: salt` value to point at `localhost`.

5. Uncomment and change the `id:` value to something descriptive like "saltdev". This isn't strictly necessary but it will serve as a reminder of which Salt installation you are working with.
6. If you changed the `ret_port` value in the master config because you are also running a non-development version of Salt, then you will have to change the `master_port` value in the minion config to match.

Note: Using *salt-call* with a *Standalone Minion*

If you plan to run *salt-call* with this self-contained development environment in a masterless setup, you should invoke *salt-call* with `-c /path/to/your/virtualenv/etc/salt` so that salt can find the minion config file. Without the `-c` option, Salt finds its config files in */etc/salt*.

Start the master and minion, accept the minion's key, and verify your local Salt installation is working:

```
cd /path/to/your/virtualenv
salt-master -c ./etc/salt -d
salt-minion -c ./etc/salt -d
salt-key -c ./etc/salt -L
salt-key -c ./etc/salt -A
salt -c ./etc/salt '*' test.version
```

Running the master and minion in debug mode can be helpful when developing. To do this, add `-l debug` to the calls to `salt-master` and `salt-minion`. If you would like to log to the console instead of to the log file, remove the `-d`.

Note: Too long socket path?

Once the minion starts, you may see an error like the following:

```
zmq.core.error.ZMQError: ipc path "/path/to/your/virtualenv/
var/run/salt/minion/minion_event_7824dcbcfd7a8f6755939af70b96249f_pub.ipc"
is longer than 107 characters (sizeof(sockaddr_un.sun_path)).
```

This means that the path to the socket the minion is using is too long. This is a system limitation, so the only workaround is to reduce the length of this path. This can be done in a couple different ways:

1. Create your virtualenv in a path that is short enough.
2. Edit the *`sock_dir`* minion config variable and reduce its length. Remember that this path is relative to the value you set in *`root_dir`*.

`NOTE:` The socket path is limited to 107 characters on Solaris and Linux, and 103 characters on BSD-based systems.

Note: File descriptor limits

Ensure that the system open file limit is raised to at least 2047:

```
# check your current limit
ulimit -n

# raise the limit. persists only until reboot
# use 'limit descriptors 2047' for c-shell
ulimit -n 2047
```

To set file descriptors on macOS, see the Salt install guide instructions for macOS.

Changing Default Paths

Instead of updating your configuration files to point to the new root directory and having to pass the new configuration directory path to all of Salt's CLI tools, you can explicitly tweak the default system paths that Salt expects:

```
GENERATE_SALT_SYSPATHS=1 pip install --global-option='--salt-root-dir=/path/
↪to/your/virtualenv/' \
    -e ./salt   # the path to the salt git clone from above
```

You can now call all of Salt's CLI tools without explicitly passing the configuration directory.

Additional Options

If you want to distribute your virtualenv, you probably don't want to include Salt's clone `.git/` directory, and, without it, Salt won't report the accurate version. You can tell `setup.py` to generate the hardcoded version information which is distributable:

```
GENERATE_SALT_SYSPATHS=1 WRITE_SALT_VERSION=1 pip install --global-option='--
↪salt-root-dir=/path/to/your/virtualenv/' \
    -e ./salt   # the path to the salt git clone from above
```

Instead of passing those two environmental variables, you can just pass a single one which will trigger the other two:

```
MIMIC_SALT_INSTALL=1 pip install --global-option='--salt-root-dir=/path/to/
↪your/virtualenv/' \
    -e ./salt   # the path to the salt git clone from above
```

This last one will grant you an editable salt installation with hardcoded system paths and version information.

32.10.2 Installing Salt from the Python Package Index

If you are installing using `easy_install`, you will need to define a **USE_SETUPTOOLS** environment variable, otherwise dependencies will not be installed:

```
USE_SETUPTOOLS=1 easy_install salt
```

32.10.3 Editing and previewing the documentation

You need `sphinx-build` command to build the docs. In Debian/Ubuntu this is provided in the `python-sphinx` package. Sphinx can also be installed to a virtualenv using pip:

```
pip install Sphinx==1.3.1
```

Change to salt documentation directory, then:

```
cd doc; make html
```

- This will build the HTML docs. Run `make` without any arguments to see the available make targets, which include **html**, **man**, and **text**.
- The docs then are built within the **docs/_build/** folder. To update the docs after making changes, run `make` again.
- The docs use reStructuredText for markup. See a live demo at http://rst.ninjs.org/.
- The help information on each module or state is culled from the python code that runs for that piece. Find them in `salt/modules/` or `salt/states/`.
- To build the docs on Arch Linux, the **python2-sphinx** package is required. Additionally, it is necessary to tell **make** where to find the proper **sphinx-build** binary, like so:

```
make SPHINXBUILD=sphinx-build2 html
```

- To build the docs on RHEL/CentOS 6, the **python-sphinx10** package must be installed from EPEL, and the following make command must be used:

```
make SPHINXBUILD=sphinx-build html
```

Once you've updated the documentation, you can run the following command to launch a simple Python HTTP server to see your changes:

```
cd _build/html; python -m SimpleHTTPServer
```

32.10.4 Running unit and integration tests

Run the test suite with following command:

```
./setup.py test
```

See *here* for more information regarding the test suite.

32.10.5 Issue and Pull Request Labeling System

SaltStack uses several labeling schemes to help facilitate code contributions and bug resolution. See the *Labels and Milestones* documentation for more information.

32.11 GitHub Labels and Milestones

SaltStack uses several label categories, as well as milestones, to triage incoming issues and pull requests in the GitHub issue tracker. Labels are used to sort issues by type, priority, severity, status, functional area, functional group, and targeted release and pull requests by status, functional area, functional group, type of change, and test status. Milestones are used to indicate whether an issue is fully triaged or is scheduled to be fixed by SaltStack in an upcoming sprint.

32.11.1 Milestones

All issues are assigned to a milestone, whereas pull requests are almost never assigned to a milestone as the mean lifetime of pull requests is short enough that there is no need to track them temporally.

SaltStack uses milestones to indicate which issues are blocked on submitter or upstream actions, are approved, or are scheduled to be fixed or implemented in an upcoming sprint. If an issue is not attached to a sprint milestone, you are welcome to work on it at your own desire and convenience. If it is attached to a sprint milestone and you have already begun working on it or have a solution in mind or have other ideas related to the issue, you are encouraged to coordinate with the assignee via the GitHub issue tracker to create the best possible solution or implementation.

- `Approved` - The issue has been validated and has all necessary information.
- `Blocked` - The issue is waiting on actions by parties outside of SaltStack, such as receiving more information from the submitter or resolution of an upstream issue. This milestone is usually applied in conjunction with the labels `Info Needed`, `Question`, `Expected Behavior`, `Won't Fix For Now`, or `Upstream Bug`.

32.11.2 Labels

Labels are used to sort and describe issues and pull requests. Some labels are usually reserved for one or the other, though most labels may be applied to both.

New issues will receive at least one label and a milestone, and new pull requests will receive at least one label. Except for the *functional area* and *functional group* label categories, issues will generally receive only up to one label per category.

Type

Issues are categorized into one of several types. Type labels are almost never used for pull requests. GitHub treats pull requests like issues in many ways, so a pull request could be considered an issue with an implicit `Pull Request` type label applied.

- `Feature` - The issue is a request for new functionality including changes, enhancements, refactors, etc.
- `Bug` - The issue documents broken, incorrect, or confusing behavior. This label is always accompanied by a *severity label*.
- `Duplicate` - The issue is a duplicate of another feature request or bug report.
- `Upstream Bug` - The issue is a result of an upstream issue.
- `Question` - The issue is more of a question than a request for new features or a report of broken features, but can sometimes lead to further discussion or changes of confusing or incongruous behavior or documentation.
- `Expected Behavior` - The issue is a bug report of intended functionality.

Priority

An issue's priority is relative to its *functional area*. If a bug report, for example, about `gitfs` indicates that all users of `gitfs` will encounter this bug, then a `P1` label will be applied, even though users who are not using `gitfs` will not encounter the bug. If a feature is requested by many users, it may be given a high priority.

- `P1` - The issue will be seen by all users.
- `P2` - The issue will be seen by most users.
- `P3` - The issue will be seen by about half of users.
- `P4` - The issue will not be seen by most users. Usually the issue is a very specific use case or corner case.

Severity

Severity labels are almost always only applied to issues labeled `Bug`.

- `Blocker` - The issue is blocking an impending release.
- `Critical` - The issue causes data loss, crashes or hangs salt processes, makes the system unresponsive, etc.
- `High Severity` - The issue reports incorrect functionality, bad functionality, a confusing user experience, etc.
- `Medium Severity` - The issue reports cosmetic items, formatting, spelling, colors, etc.

Functional Area

Many major components of Salt have corresponding GitHub labels. These labels are applied to all issues and pull requests as is reasonably appropriate. They are useful in organizing issues and pull requests according to the source code relevant to issues or the source code changed by pull requests.

- `Execution Module`
- `File Servers`
- `Grains`
- `Multi-Master`
- `Packaging` Related to packaging of Salt, not Salt's support for package management.
- `Pillar`
- `RAET`
- `Returners`
- `Runners`
- `SPM`
- `Salt-API`
- `Salt-Cloud`
- `Salt-SSH`
- `Salt-Syndic`
- `State Module`
- `Tests`

- `Transport`
- `Windows`
- `ZMQ`

Functional Group

These labels sort issues and pull requests according to the internal SaltStack engineering teams.

- `Core` - The issue or pull request relates to code that is central or existential to Salt itself.
- `Platform` - The issue or pull request relates to support and integration with various platforms like traditional operating systems as well as containers, platform-based utilities like filesystems, command schedulers, etc., and system-based applications like webservers, databases, etc.
- `RIoT` - The issue or pull request relates to support and integration with various abstract systems like cloud providers, hypervisors, API-based services, etc.
- `Console` - The issue or pull request relates to the SaltStack enterprise console.
- `Documentation` - The issue or pull request relates to documentation.

Status

Status labels are used to define and track the state of issues and pull requests. Not all potential statuses correspond to a label, but some statuses are common enough that labels have been created for them. If an issue has not been moved beyond the `Blocked` milestone, it is very likely that it will only have a status label.

- `Cannot Reproduce` - The issue is a bug and has been reviewed by a SaltStack engineer, but it cannot be replicated with the provided information and context. Those involved with the bug will need to work through additional ideas until the bug can be isolated and verified.
- `Confirmed` - The issue is a bug and has been confirmed by a SaltStack engineer, who often documents a minimal working example that reproduces the bug.
- `Fixed Pending Verification` - The issue is a bug and has been fixed by one or more pull requests, which should link to the issue. Closure of the issue is contingent upon confirmation of resolution from the submitter. If the submitter reports a negative confirmation, this label is removed. If no response is given after a few weeks, then the issue will be assumed fixed and closed.
- `Info Needed` - The issue needs more information before it can be verified and resolved. For a feature request this may include a description of the use cases. Almost all bug reports need to include at least the versions of salt and its dependencies, the system type and version, commands used, debug logs, error messages, and relevant configs.
- `Pending Changes` - The pull request needs additional changes before it can be merged.
- `Pending Discussion` - The issue or pull request needs more discussion before it can be closed or merged. The status of the issue or pull request is not clear or apparent enough for definite action to be taken, or additional input from SaltStack, the submitter, or another party has been requested.

  If the issue is not a pull request, once the discussion has arrived at a cogent conclusion, this label will be removed and the issue will be accepted. If it is a pull request, the results of the discussion may require additional changes and thus, a `Pending Changes` label.
- `won't-fix` - The issue is legitimate, but it is not something the Salt core team is currently able or willing to fix or implement. Issues having this label may be revisited in the future, or solved by a Salt community member.

Test Status

These labels relate to the status of the automated tests that run on pull requests.

- `has-failing-test` - The PR currently has one or more failing tests that prevent the PR from being merged.
- `Needs Testcase` - The PR has code changes, but lack any automated tests. These PRs need automated tests written before they may be merged.

Other

These labels indicate miscellaneous issue types or statuses that are common or important enough to be tracked and sorted with labels.

- `Awesome` - The pull request implements an especially well crafted solution, or a very difficult but necessary change.
- `Help Wanted` - The issue appears to have a simple solution. Issues having this label should be a good starting place for new contributors to Salt.
- `Regression` - The issue is a bug that breaks functionality known to work in previous releases.
- `Story` - The issue is used by a SaltStack engineer to track progress on multiple related issues in a single place.
- `Stretch` - The issue is an optional goal for the current sprint but may not be delivered.
- `ZD` - The issue is related to a Zendesk customer support ticket.
- `<Release>` - The issue is scheduled to be implemented by `<Release>`. See here for a discussion of Salt's release codenames.

32.12 Logging Internals

TODO

32.13 Package Providers

This page contains guidelines for writing package providers.

32.13.1 Package Functions

One of the most important features of Salt is package management. There is no shortage of package managers, so in the interest of providing a consistent experience in *pkg* states, there are certain functions that should be present in a package provider. Note that these are subject to change as new features are added or existing features are enhanced.

list_pkgs

This function should declare an empty dict, and then add packages to it by calling *pkg_resource.add_pkg*, like so:

```
__salt__["pkg_resource.add_pkg"](ret, name, version)
```

The last thing that should be done before returning is to execute *pkg_resource.sort_pkglist*. This function does not presently do anything to the return dict, but will be used in future versions of Salt.

```
__salt__["pkg_resource.sort_pkglist"](ret)
```

`list_pkgs` returns a dictionary of installed packages, with the keys being the package names and the values being the version installed. Example return data:

```
{"foo": "1.2.3-4", "bar": "5.6.7-8"}
```

latest_version

Accepts an arbitrary number of arguments. Each argument is a package name. The return value for a package will be an empty string if the package is not found or if the package is up-to-date. The only case in which a non-empty string is returned is if the package is available for new installation (i.e. not already installed) or if there is an upgrade available.

If only one argument was passed, this function return a string, otherwise a dict of name/version pairs is returned.

This function must also accept `**kwargs`, in order to receive the `fromrepo` and `repo` keyword arguments from pkg states. Where supported, these arguments should be used to find the install/upgrade candidate in the specified repository. The `fromrepo` kwarg takes precedence over `repo`, so if both of those kwargs are present, the repository specified in `fromrepo` should be used. However, if `repo` is used instead of `fromrepo`, it should still work, to preserve backwards compatibility with older versions of Salt.

version

Like `latest_version`, accepts an arbitrary number of arguments and returns a string if a single package name was passed, or a dict of name/value pairs if more than one was passed. The only difference is that the return values are the currently-installed versions of whatever packages are passed. If the package is not installed, an empty string is returned for that package.

upgrade_available

Deprecated and destined to be removed. For now, should just do the following:

```
def myfunc():
    return __salt__["pkg.latest_version"](name) != ""
```

install

The following arguments are required and should default to `None`:

1. name (for single-package pkg states)
2. pkgs (for multiple-package pkg states)
3. sources (for binary package file installation)

The first thing that this function should do is call *pkg_resource.parse_targets* (see below). This function will convert the SLS input into a more easily parsed data structure. *pkg_resource.parse_targets* may need to be modified to support your new package provider, as it does things like parsing package metadata which cannot be done for every package management system.

```
pkg_params, pkg_type = __salt__["pkg_resource.parse_targets"](name, pkgs,
↪sources)
```

Two values will be returned to the **install** function. The first of them will be a dictionary. The keys of this dictionary will be package names, though the values will differ depending on what kind of installation is being done:

- If **name** was provided (and **pkgs** was not), then there will be a single key in the dictionary, and its value will be `None`. Once the data has been returned, if the **version** keyword argument was provided, then it should replace the `None` value in the dictionary.
- If **pkgs** was provided, then **name** is ignored, and the dictionary will contain one entry for each package in the **pkgs** list. The values in the dictionary will be `None` if a version was not specified for the package, and the desired version if specified. See the **Multiple Package Installation Options** section of the *pkg.installed* state for more info.
- If **sources** was provided, then **name** is ignored, and the dictionary values will be the path/URI for the package.

The second return value will be a string with two possible values: `repository` or `file`. The **install** function can use this value (if necessary) to build the proper command to install the targeted package(s).

Both before and after the installing the target(s), you should run **list_pkgs** to obtain a list of the installed packages. You should then return the output of `salt.utils.data.compare_dicts()`:

```
def myfunc():
    return salt.utils.data.compare_dicts(old, new)
```

remove

Removes the passed package and return a list of the packages removed.

32.13.2 Package Repo Functions

There are some functions provided by `pkg` which are specific to package repositories, and not to packages themselves. When writing modules for new package managers, these functions should be made available as stated below, in order to provide compatibility with the `pkgrepo` state.

All repo functions should accept a basedir option, which defines which directory repository configuration should be found in. The default for this is dictated by the repo manager that is being used, and rarely needs to be changed.

```
basedir = "/etc/yum.repos.d"
__salt__["pkg.list_repos"](basedir)
```

list_repos

Lists the repositories that are currently configured on this system.

```
__salt__["pkg.list_repos"]()
```

Returns a dictionary, in the following format:

```
{'reponame': 'config_key_1': 'config value 1',
             'config_key_2': 'config value 2',
             'config_key_3': ['list item 1 (when appropriate)',
                              'list item 2 (when appropriate)]}
```

get_repo

Displays all local configuration for a specific repository.

```
__salt__["pkg.get_repo"](repo="myrepo")
```

The information is formatted in much the same way as list_repos, but is specific to only one repo.

```
{'config_key_1': 'config value 1',
 'config_key_2': 'config value 2',
 'config_key_3': ['list item 1 (when appropriate)',
                  'list item 2 (when appropriate)]}
```

del_repo

Removes the local configuration for a specific repository. Requires a *repo* argument, which must match the locally configured name. This function returns a string, which informs the user as to whether or not the operation was a success.

```
__salt__["pkg.del_repo"](repo="myrepo")
```

mod_repo

Modify the local configuration for one or more option for a configured repo. This is also the way to create new repository configuration on the local system; if a repo is specified which does not yet exist, it will be created.

The options specified for this function are specific to the system; please refer to the documentation for your specific repo manager for specifics.

```
__salt__["pkg.mod_repo"](repo="myrepo", url="http://myurl.com/repo")
```

32.13.3 Low-Package Functions

In general, the standard package functions as describes above will meet your needs. These functions use the system's native repo manager (for instance, yum or the apt tools). In most cases, the repo manager is actually separate from the package manager. For instance, yum is usually a front-end for rpm, and apt is usually a front-end for dpkg. When possible, the package functions that use those package managers directly should do so through the low package functions.

It is normal and sane for `pkg` to make calls to `lowpkgs`, but `lowpkg` must never make calls to `pkg`. This is affects functions which are required by both `pkg` and `lowpkg`, but the technique in `pkg` is more performant than what is available to `lowpkg`. When this is the case, the `lowpkg` function that requires that technique must still use the `lowpkg` version.

list_pkgs

Returns a dict of packages installed, including the package name and version. Can accept a list of packages; if none are specified, then all installed packages will be listed.

```
installed = __salt__["lowpkg.list_pkgs"]("foo", "bar")
```

Example output:

```
{"foo": "1.2.3-4", "bar": "5.6.7-8"}
```

verify

Many (but not all) package management systems provide a way to verify that the files installed by the package manager have or have not changed. This function accepts a list of packages; if none are specified, all packages will be included.

```
installed = __salt__["lowpkg.verify"]("httpd")
```

Example output:

```
{
    "/etc/httpd/conf/httpd.conf": {
        "mismatch": ["size", "md5sum", "mtime"],
        "type": "config",
    }
}
```

file_list

Lists all of the files installed by all packages specified. If not packages are specified, then all files for all known packages are returned.

```
installed = __salt__["lowpkg.file_list"]("httpd", "apache")
```

This function does not return which files belong to which packages; all files are returned as one giant list (hence the *file_list* function name. However, This information is still returned inside of a dict, so that it can provide any errors to the user in a sane manner.

```
{
    "errors": ["package apache is not installed"],
    "files": ["/etc/httpd", "/etc/httpd/conf", "/etc/httpd/conf.d", "...SNIP..
↪."],
}
```

file_dict

Lists all of the files installed by all packages specified. If not packages are specified, then all files for all known packages are returned.

```
installed = __salt__["lowpkg.file_dict"]("httpd", "apache", "kernel")
```

Unlike *file_list*, this function will break down which files belong to which packages. It will also return errors in the same manner as *file_list*.

```
{
    "errors": ["package apache is not installed"],
    "packages": {
        "httpd": ["/etc/httpd", "/etc/httpd/conf", "...SNIP..."],
        "kernel": [
            "/boot/.vmlinuz-2.6.32-279.el6.x86_64.hmac",
            "/boot/System.map-2.6.32-279.el6.x86_64",
            "...SNIP...",
        ],
    },
}
```

32.14 Pull Requests

Salt is a large software project with many developers working together. We encourage all Salt users to contribute new features, bug fixes and documentation fixes. For those who haven't contributed to a large software project before we encourage you to consider the following questions when preparing a pull request.

This isn't an exhaustive list and these aren't necessarily hard and fast rules, but these are things we consider when reviewing a pull request.

- Does this change work on all platforms? In cases where it does not, is an appropriate and easy-to-understand reason presented to the user? Is it documented as-such? Have we thought about all the possible ways this code might be used and accounted as best we can for them?
- Will this code work on versions of all Python we support? Will it work on future versions?
- Are Python reserved keywords used? Are variables named in a way that will make it easy for the next person to understand what's going on?
- Does this code present a security risk in any way? What is the worst possible thing that an attacker could do with this code? If dangerous cases are possible, is it appropriate to document them? If so, has this been done? Would this change pass muster with a professional security audit? Is it obvious to a person using this code what the risks are?
- Is it readable? Does it conform to our style guide? Is the code documented such that the next person who comes along will be able to read and understand it? Most especially, are edge-cases documented to avoid regressions? Will it be immediately evident to the next person who comes along why this change was made?

- If appropriate, has the person who wrote the code which is being modified been notified and included in the process?
- What are the performance implications of this change? Is there a more efficient way to structure the logic and if so, does making the change balance itself against readability in a sensible way? Do the performance characteristics of the code change based on the way it is being invoked (i.e., through an API or various command-line tools.) Will it be easy to profile this change if it might be a problem?
- Are caveats considered and documented in the change?
- Will the code scale? More critically, will it scale in *both* directions? Salt runs in data-centers and on Raspberry Pi installations in the Sahara. It needs to work on big servers and tiny devices.
- Is appropriate documentation written both in public-facing docs and in-line? How will the user know how to use this? What will they do if it doesn't work as expected? Is this something a new user will understand? Can a user know all they need to about this functionality by reading the public docs?
- Is this a change in behavior? If so, is it in the appropriate branch? Are deprecation warnings necessary? Have those changes been fully documented? Have we fully thought through what implications a change in behavior might have?
- How has the code been tested? If appropriate are there automated tests which cover this? Is it likely to regress? If so, how has the potential of that regression been mitigated? What is the plan for ensuring that this code works going forward?
- If it's asynchronous code, what is the potential for a race condition?
- Is this code an original work? If it's borrowed from another project or found online are the appropriate licensing/attribution considerations handled?
- Is the reason for the change fully explained in the PR? If not for review, this is necessary so that somebody in the future can go back and figure out why it was necessary.
- Is the intended behavior of the change clear? How will that behavior be known to future contributors and to users?
- Does this code handle errors in a reasonable way? Have we gone back through the stack as much as possible to make sure that an error cannot be raised that we do not account for? Are errors tested for as well as proper functionality?
- If the code relies on external libraries, do we properly handle old versions of them? Do we require a specific version and if so is this version check implemented? Is the library available on the same platforms that module in question claims to support? If the code was written and tested against a particular library, have we documented that fact?
- Can this code freeze/hang/crash a running daemon? Can it stall a state run? Are there infinite loops? Are appropriate timeouts implemented?
- Is the function interface well documented? If argument types can not be inferred by introspection, are they documented?
- Are resources such as file-handles cleaned-up after they are used?
- Is it possible that a reference-cycle exists between objects that will leak memory?
- Has the code been linted and does it pass all tests?
- Does the change fully address the problem or is it limited to a small surface area? By this, I mean that it should be clear that the submitter has looked for other cases in the function or module where the given case might also be addressed. If additional changes are necessary are they documented in the code as a FIXME or the PR and in Github as an issue to be tracked?
- Will the code throw errors/warnings/stacktraces to the console during normal operation?

- Has all the debugging been removed?
- Does the code log any sensitive data? Does it show sensitive data in process lists? Does it store sensitive data to disk and if so, does it do so in a secure manner? Are there potential race conditions in between writing the data to disk and setting the appropriate permissions?
- Is it clear from the solution that the problem is well-understood? How can somebody who has never seen the problem feel confident that this proposed change is the best one?
- What's hard-coded that might not need to be? Are we making sensible decisions for the user and allowing them to tune and change things where appropriate?
- Are utility functions used where appropriate? Does this change re-implement something we already have code for?
- Is the right thing being fixed? There are cases where it's appropriate to fix a test and cases where it's appropriate to fix the code that's under test. Which is best for the user? Is this change a shortcut or a solution that will be solid in the months and years to come?
- How will this code react to changes elsewhere in the code base? What is it coupled to and have we fully thought through how best to present a coherent interface to consumers of a given function or method?
- Does this PR try to fix too many bugs/problems at once?
- Should this be split into multiple PRs to make them easier to test and reason about?

32.15 Pull Request Requirements

The following outlines what is required before a pull request can be merged into the salt project. For each of these requirements, an exception can be made that requires 3 approvals before merge. The exceptions are detailed more below.

32.15.1 All PR requirements

- Approval Required: approval review from core team member OR 1 approval review from captain of working group
- Cannot merge your own PR until 1 reviewer approves from defined list above that is not the author.
- All Tests Pass

32.15.2 Bug Fix PR requirements

- Test Coverage: regression test written to cover bug fix. Contributors only need to write test coverage for their specific changes.
- Point to the issue the PR is resolving. If there is not an issue one will need to be created.

32.15.3 Feature PR requirements

- Test Coverage: tests written to cover new feature. Contributors only need to write test coverage for their specific changes.
- Release Notes: Add note in release notes of new feature for relative release.
- Add .. versionadded:: <release> to module's documentation. If you are not certain which release your fix will be included in you can include TBD and the PR reviewer will let you know the correct name of the release you need to update to the versionadded.

32.15.4 Exceptions to all requirements

As previously stated, all of the above requirements can be bypassed with 3 approvals. PR's that do not require tests include:

- documentation
- cosmetic changes (for example changing from log.debug to log.trace)
- fixing tests
- pylint
- changes outside of the salt directory

32.16 Pull Request CI/CD test suite

By default, PRs run a limited subset of the test suite against the following operating systems:

- **Linux**:
    - Latest `Amazon Linux Arm64`
    - Latest `Amazon Linux x86_64`
    - Latest `Debian Linux Arm64`
    - Latest `Debian Linux x86_64`
    - Latest `Photon OS Arm64`
    - Latest `Photon OS x86_64`
    - Latest `Rocky Linux Arm64`
    - Latest `Rocky Linux x86_64`
    - Latest `Ubuntu LTS Arm64`
    - Latest `Ubuntu LTS x86_64`
- **Windows Server**:
    - Latest `Windows Server x86_64`
- **macOS**:
    - Latest `MacOS Arm64`
    - Latest `MacOS x86_64`

32.16.1 Optional OS additions

There are times where a PR is specifically addressing a target OS, or a core component of Salt is being updated that needs to be tested against all support operating systems. This is often required to fix `nightly` builds, or introduce a new operating system into CI/CD.

Labels can be applied to a PR, via those who have the appropriate permissions, using the `test:os:<os-name><os-arch>` format.

- Example: `test:os:debian-11-arm64` would also ensure the Debian 11 arm64 OS is included.

Optionally, `test:os:all` can be used as a way to target all operating systems that nightlies, staging, release target without having to add them all individually.

32.16.2 Optional test additions

If wanting to also increase the scope of tests themselves, not just the scope of operating systems, then additional labels can be used such as:

- `test:pkg`: Run all package-related tests that are otherwise not included by default on the currently selected operating systems.
- `test:full`: Run all tests in the Salt test suite that can be ran on the currently selected operating systems.
- `test:coverage`: Run all tests in the Salt test suite on all operating systems while collecting code coverage.
- `test:random-cache-seed`: Randomize the GH Actions cache seed to make sure no caches are used during the build.

32.17 Release Notes

You can edit the release notes to highlight a new feature being added to a given release. The release notes are templatized with Jinja and are generated at release time.

32.17.1 How do I edit the release notes

To edit the release notes you need to look in doc/topics/releases/templates for your given release and edit the template. Do not edit the release note files in doc/topics/releases/, as this will be written over with the content in the template file. For example, if you want to add content to the 3006.0 release notes you would edit the doc/topics/releases/templates/3006.0.md.template file. Do not edit the changelog portion of the template file, since that is auto generated with the content generated for the changelog for each release.

32.17.2 How to generate the release notes

This step is only used when we need to generate the release notes before releasing. You should NOT need to run these steps as they are ran in the pipeline, but this is documented so you can test your changes to the release notes template.

To generate the release notes requires the *tools* command. The instructions below will detail how to install and use *tools*.

Installing *tools*

To view the output the release notes will produce before generating them you can run *tools* in draft mode:

```
tools changelog update-release-notes --draft
```

To generate the release notes just remove the *--draft* argument:

```
tools changelog update-release-notes
```

To specify a specific Salt version you add that version as an argument:

```
tools changelog update-release-notes 3006.0
```

To only generate the template for a new release

```
tools changelog update-release-notes --template-only
```

32.18 Reporting Bugs

Salt uses GitHub to track open issues and feature requests.

To file a bug, please navigate to the new issue page for the Salt project.

In an issue report, please include the following information:

- The output of `salt --versions-report` from the relevant machines. This can also be gathered remotely by using `salt <my_tgt> test.versions_report`.
- A description of the problem including steps taken to cause the issue to occur and the expected behaviour.
- Any steps taken to attempt to remediate the problem.
- Any configuration options set in a configuration file that may be relevant.
- A reproducible test case. This may be as simple as an SLS file that illustrates a problem or it may be a link to a repository that contains a number of SLS files that can be used together to re-produce a problem. If the problem is transitory, any information that can be used to try and reproduce the problem is helpful.
- [Optional] The output of each salt component (master/minion/CLI) running with the `-ldebug` flag set.

Note: Please be certain to scrub any logs or SLS files for sensitive data!

32.19 Salt Extensions

Salt modules can be distributed as Salt Extensions.

The existing Salt modules will be carved up into one of three categories. Each category will be implemented in the following way:

## Core Modules

Core Modules will be kept inside the main Salt codebase, and development will be tied to the Salt release cycle.

## Supported Modules

Supported modules will be moved to their own repositories within the SaltStack Github organization where they can be maintained separately from the Salt codebase.

## Community Modules

Remaining modules will be deprecated from the Salt Core codebase and community members will be able to continue independent maintainership if they are interested. Some plugins are almost exclusively maintained by external corporations – if these corporations wish for formal documentation outlining transfer of ownership it can be handled on a case-by-case basis. The community modules can be hosted either in individual or corporate source control systems, alternatively they can also be hosted in the community run Salt Extensions Github organization, that will operate like the Salt Formulas Github organization. The criteria to determine which category to place modules in will follow these rules:

## Core Modules

1. Required Salt Functionality

a. Modules such as state, sys, peer, grains, pillar, etc.

2. Modules critical to Salt's Multi OS support

a. Modules that function across multiple operating systems like cmd and file.

## Supported Modules

1. Modules to support specific operating systems traditionally maintained by the core team – such as RedHat, MacOS, Windows, Solaris, etc.

2. Modules to support specific but critical applications, such as Apache, MySQL, etc.

3. Modules created and maintained as part of VMware backed support agreements and contracts.

## Community Extension Modules

1. Modules to support specific operating systems traditionally maintained by the OS vendor – such as SUSE, openBSD, NetBSD, etc.

2. Modules to support cloud interfaces, such as AWS, Azure, etc.

3. Modules no longer maintained, or which we suspect are also no longer used or maintained, such as moosefs, qemu_img, etc.

32.19.1 How do I deprecate a Salt module to a Salt extension

To indicate that a Salt module is being deprecated in favor of a Salt extension, for each Salt module include `__deprecated__` tuple in the module. The tuple should include the version of Salt that the module will be removed, the name of the collection of modules that are being deprecated, and the URL where the source for the new extension can be found. The version should be 2 major versions from the next major release. For example, if the next major release of Salt is 3100, the deprecation version should be set to 3102.

32.20 Salt Topology

Salt is based on a powerful, asynchronous, network topology using ZeroMQ. Many ZeroMQ systems are in place to enable communication. The central idea is to have the fastest communication possible.

32.20.1 Servers

The Salt Master runs 2 network services. First is the ZeroMQ PUB system. This service by default runs on port `4505/tcp` and can be configured via the `publish_port` option in the master configuration.

Second is the ZeroMQ REP system. This is a separate interface used for all bi-directional communication with minions. By default this system binds to port `4506/tcp` and can be configured via the `ret_port` option in the master.

32.20.2 PUB/SUB

The commands sent out via the salt client are broadcast out to the minions via ZeroMQ PUB/SUB. This is done by allowing the minions to maintain a connection back to the Salt Master and then all connections are informed to download the command data at once. The command data is kept extremely small (usually less than 1K) so it is not a burden on the network.

32.20.3 Return

The PUB/SUB system is a one way communication, so once a publish is sent out the PUB interface on the master has no further communication with the minion. The minion, after running the command, then sends the command's return data back to the master via the `ret_port`.

32.21 Developing Salt Tutorial

This tutorial assumes you have:

- a web browser
- a GitHub account (`<my_account>`)
- a command line (CLI)
- git
- a text editor

32.21.1 Fork

In your browser, navigate to the `saltstack/salt` GitHub repository.

Click on `Fork` (https://github.com/saltstack/salt/#fork-destination-box).

Note: If you have more than one GitHub presence, for example if you are a member of a team, GitHub will ask you into which area to clone Salt. If you don't know where, then select your personal GitHub account.

32.21.2 Clone

In your CLI, navigate to the directory into which you want clone the Salt codebase and submit the following command:

```
$ git clone https://github.com/<my_account>/salt.git
```

where `<my_account>` is the name of your GitHub account. After the clone has completed, add SaltStack as a second remote and fetch any changes from `upstream`.

```
$ cd salt
$ git remote add upstream https://github.com/saltstack/salt.git
$ git fetch upstream
```

For this tutorial, we will be working off from the `master` branch, which is the default branch for the SaltStack GitHub project. This branch needs to track `upstream/master` so that we will get all upstream changes when they happen.

```
$ git checkout master
$ git branch --set-upstream-to upstream/master
```

32.21.3 Fetch

Fetch any `upstream` changes on the `master` branch and sync them to your local copy of the branch with a single command:

```
$ git pull --rebase
```

Note: For an explanation on `pull` vs `pull --rebase` and other excellent points, see this article by Mislav Marohnić.

32.21.4 Branch

Now we are ready to get to work. Consult the sprint beginner bug list and select an execution module whose `__virtual__` function needs to be updated. I'll select the `alternatives` module.

Create a new branch off from `master`. Be sure to name it something short and descriptive.

```
$ git checkout -b virt_ret
```

32.21.5 Edit

Edit the file you have selected, and verify that the changes are correct.

```
$ vim salt/modules/alternatives.py
$ git diff
```

```
diff --git a/salt/modules/alternatives.py b/salt/modules/alternatives.py
index 1653e5f..30c0a59 100644
--- a/salt/modules/alternatives.py
+++ b/salt/modules/alternatives.py
@@ -30,7 +30,7 @@ def __virtual__():
         '''
         if os.path.isdir('/etc/alternatives'):
                 return True
-        return False
+        return (False, 'Cannot load alternatives module: /etc/alternatives␣
↪dir not found')

 def _get_cmd():
```

32.21.6 Commit

Stage and commit the changes. Write a descriptive commit summary, but try to keep it less than 50 characters. Review your commit.

```
$ git add salt/modules/alternatives.py
$ git commit -m 'modules.alternatives: __virtual__ return err msg'
$ git show
```

Note: If you need more room to describe the changes in your commit, run `git commit` (without the `-m`, message, option) and you will be presented with an editor. The first line is the commit summary and should still be 50 characters or less. The following paragraphs you create are free form and will be preserved as part of the commit.

32.21.7 Push

Push your branch to your GitHub account. You will likely need to enter your GitHub username and password.

```
$ git push origin virt_ret
Username for 'https://github.com': <my_account>
Password for 'https://<my_account>@github.com':
```

Note: If authentication over https does not work, you can alternatively setup ssh keys. Once you have done this, you may need add the keys to your git repository configuration

```
$ git config ssh.key ~/.ssh/<key_name>
```

where `<key_name>` is the file name of the private key you created.

32.21.8 Merge

In your browser, navigate to the new pull request page on the `saltstack/salt` GitHub repository and click on `compare across forks`. Select `<my_account>` from the list of head forks and the branch you are wanting to merge into `master` (`virt_ret` in this case).

When you have finished reviewing the changes, click `Create pull request`.

If your pull request contains only a single commit, the title and comment will be taken from that commit's summary and message, otherwise the branch name is used for the title. Edit these fields as necessary and click `Create pull request`.

Note: Although these instructions seem to be the official pull request procedure on github's website, here are two alternative methods that are simpler.

- If you navigate to your clone of salt, `https://github.com/<my_account>/salt`, depending on how old your branch is or how recently you pushed updates on it, you may be presented with a button to create a pull request with your branch.
- I find it easiest to edit the following URL:

  `https://github.com/saltstack/salt/compare/master...<my_account>:virt_ret`

32.21.9 Resources

GitHub offers many great tutorials on various aspects of the git- and GitHub-centric development workflow:

https://help.github.com/

There are many topics covered by the Salt Developer documentation:

https://docs.saltproject.io/en/latest/topics/development/index.html

The contributing documentation presents more details on specific contributing topics:

https://docs.saltproject.io/en/latest/topics/development/contributing.html

32.22 Modular Systems

When first working with Salt, it is not always clear where all of the modular components are and what they do. Salt comes loaded with more modular systems than many users are aware of, making Salt very easy to extend in many places.

The most commonly used modular systems are execution modules and states. But the modular systems extend well beyond the more easily exposed components and are often added to Salt to make the complete system more flexible.

32.22.1 Developing New Modules

Interactive Debugging

Sometimes debugging with `print()` and extra logs sprinkled everywhere is not the best strategy.

IPython is a helpful debug tool that has an interactive python environment which can be embedded in python programs.

First the system will require IPython to be installed.

```
# Debian
apt-get install ipython

# Arch Linux
pacman -Syu ipython2

# RHEL/CentOS (via EPEL)
yum install python-ipython
```

Now, in the troubling python module, add the following line at a location where the debugger should be started:

```
test = "test123"
import IPython

IPython.embed_kernel()
```

After running a Salt command that hits that line, the following will show up in the log file:

```
[CRITICAL] To connect another client to this kernel, use:
[IPKernelApp] --existing kernel-31271.json
```

Now on the system that invoked `embed_kernel`, run the following command from a shell:

```
# NOTE: use ipython2 instead of ipython for Arch Linux
ipython console --existing
```

This provides a console that has access to all the vars and functions, and even supports tab-completion.

```
print(test)
test123
```

To exit IPython and continue running Salt, press `Ctrl-d` to logout.

The Salt Loader

Salt's loader system is responsible for reading *Special Module Contents* and providing the context for the special *Dunder Dictionaries*. When modules developed for Salt's loader are imported directly, the dunder attributes won't be populated. You can use the *Loader Context* to work around this.

Loader Context

Given the following.

```
# coolmod.py

def utils_func_getter(name):
    return __utils__[name]
```

You would not be able import `coolmod` and run `utils_func_getter` because `__utils__` would not be defined. You must run `coolmod.utils_func_getter` in the context of a loader.

```
import coolmod
import salt.loader

opts = {}
utils = salt.loader.utils(opts)
with salt.loader.context(utils):
    func = coolmod.utils_func_getter("foo.bar")
```

Special Module Contents

These are things that may be defined by the module to influence various things.

__virtual__

__virtual_aliases__

__virtualname__

__init__

Called before `__virtual__()`

__proxyenabled__

grains and proxy modules

__proxyenabled__ as a list containing the names of the proxy types that the module supports.

__load__

__func_alias__

__outputter__

Dunder Dictionaries

Salt provides several special "dunder" dictionaries as a convenience for Salt development. These include `__opts__`, `__context__`, `__salt__`, and others. This document will describe each dictionary and detail where they exist and what information and/or functionality they provide.

The following dunder dictionaries are always defined, but may be empty

- `__context__`
- `__grains__`
- `__pillar__`
- `__opts__`

__opts__

Changed in version 3006.0: The `__opts__` dictionary can now be accessed via `` context` ``.

Defined in: All modules

The `__opts__` dictionary contains all of the options passed in the configuration file for the master or minion.

Note: In many places in salt, instead of pulling raw data from the __opts__ dict, configuration data should be pulled from the salt *get* functions such as config.get

```
__salt__["config.get"]("foo:bar")
```

The *get* functions also allow for dict traversal via the *:* delimiter. Consider using get functions whenever using `__opts__` or `__pillar__` and `__grains__` (when using grains for configuration data)

The configuration file data made available in the `__opts__` dictionary is the configuration data relative to the running daemon. If the modules are loaded and executed by the master, then the master configuration data is available, if the modules are executed by the minion, then the minion configuration is available. Any additional information passed into the respective configuration files is made available

__salt__

Defined in: Auth, Beacons, Engines, Execution, Executors, Outputters, Pillars, Proxies, Renderers, Returners, Runners, SDB, SSH Wrappers, State, Thorium

`__salt__` contains the execution module functions. This allows for all functions to be called as they have been set up by the salt loader.

```
__salt__["cmd.run"]("fdisk -l")
__salt__["network.ip_addrs"]()
```

Note: When used in runners or outputters, `__salt__` references other runner/outputter modules, and not execution modules.

__grains__

Filled in for: Execution, Pillar, Renderer, Returner, SSH Wrapper, State.

The `__grains__` dictionary contains the grains data generated by the minion that is currently being worked with. In execution modules, state modules and returners this is the grains of the minion running the calls, when generating the external pillar the `__grains__` is the grains data from the minion that the pillar is being generated for.

While `__grains__` is defined for every module, it's only filled in for some.

__pillar__

Filled in for: Execution, Renderer, Returner, SSH Wrapper, State

The `__pillar__` dictionary contains the pillar for the respective minion.

While `__pillar__` is defined for every module, it's only filled in for some.

__ext_pillar__

Filled in for: Pillar

The `__ext_pillar__` dictionary contains the external pillar modules.

__context__

During a state run the `__context__` dictionary persists across all states that are run and then is destroyed when the state ends.

When running an execution module `__context__` persists across all module executions until the modules are refreshed; such as when *`saltutil.sync_all`* or *`state.apply`* are executed.

```
if not "cp.fileclient" in __context__:
    __context__["cp.fileclient"] = salt.fileclient.get_file_client(__opts__)
```

Note: Because __context__ may or may not have been destroyed, always be sure to check for the existence of the key in __context__ and generate the key before using it.

__utils__

Defined in: Cloud, Engine, Execution, File Server, Grain, Pillar, Proxy, Roster, Runner, SDB, State

__proxy__

Defined in: Beacon, Engine, Execution, Executor, Proxy, Renderer, Returner, State, Util

__runner__

Defined in: Engine, Roster, Thorium

Note: When used in engines, it should be called __runners__ (plural)

__executors__

Defined in: Executor

__ret__

Defined in: Proxy

__thorium__

Defined in: Thorium

__states__

Defined in: Renderers, State

__serializers__

Defined in: State

__sdb__

Defined in: SDB

__file_client__

Changed in version 3006.5.

The `__file_client__` dunder was added to states and execution modules. This enables the use of a file client without haveing to instantiate one in the module.

32.22.2 Configuration Options

A number of configuration options can affect the load process. This is a quick list of them:

- `autoload_dynamic_modules` (*Minion*)
- `cython_enable` (*Minion*, *Master*)
- `disable_modules` (*Minion*)
- `disable_returners` (*Minion*)
- `enable_zip_modules` (*Minion*)
- `extension_modules` (*Master*)
- `extmod_whitelist` (*Minion*, *Master*)
- `extmod_blacklist` (*Minion*, *Master*)
- `whitelist_modules` (*Minion*)
- `grains_dirs` (*Minion*)
- `module_dirs` (*Minion*, *Master*)
- `outputter_dirs` (*Minion*, *Master*)
- `providers` (*Minion*)
- `render_dirs` (*Minion*)
- `returner_dirs` (*Minion*)
- `runner_dirs` (*Master*)
- `states_dirs` (*Minion*)
- `utils_dirs` (*Minion*)

32.22.3 Loading Modules

Modules come primarily from several sources:

- The Salt package itself
- The Salt File Server
- The extmods directory
- Secondary packages installed

Using one source to override another is not supported.

The Salt Package

Salt itself ships with a large number of modules. These are part of the Salt package itself and don't require the user to do anything to use them. (Although a number of them have additional dependencies and/or configuration.)

The Salt File Server

The user may add modules by simply placing them in special directories in their *fileserver*.

The name of the directory inside of the file server is the directory name prepended by underscore, such as:

- `_grains`
- `_modules`
- `_states`

Modules must be synced before they can be used. This can happen a few ways, discussed below.

Note: Using saltenvs besides `base` may not work in all contexts.

Sync Via States

The minion configuration contains an option `autoload_dynamic_modules` which defaults to `True`. This option makes the state system refresh all dynamic modules when states are run. To disable this behavior set *`autoload_dynamic_modules`* to `False` in the minion config.

When dynamic modules are autoloaded via states, only the modules defined in the same saltenv as the states currently being run are synced.

Sync Via the saltutil Module

The saltutil module has a number of functions that can be used to sync all or specific dynamic modules. The `saltutil.sync_*` *`execution functions`* and *`runner functions`* can be used to sync modules to minions and the master, respectively.

If saltenv environments are used (through the *top file*, the *`environment`* option of the minion configuration file, or as an argument on the command line) modules will be synced from the applied environments.

The extmods Directory

Any files places in the directory set by `extension_modules` settings (`minion`, *`master`*, default `/var/cache/salt/*/extmods`) can also be loaded as modules. Note that these directories are also used by the `saltutil.sync_*` functions (mentioned above) and files may be overwritten.

Secondary Packages

Third-party packages may also add modules to Salt if they are installed in the same system and Python environment as the Salt Minion or Master.

This is done via setuptools entry points:

```
setup(
    # ...
    entry_points={"salt.loader": ["module_dirs=spirofs.loader:module"]},
    # ...
)
```

Note that these are not synced from the Salt Master to the Minions. They must be installed independently on each Minion.

32.22.4 Module Types

The specific names used by each loading method above are as follows. See sections below for a short summary of each of these systems.

Module Type	Salt Package Name	FS/Directory Name	Entry Point
Auth	`salt.auth` (*index*)	`auth`[1]	`auth_dirs`
Beacon	`salt.beacons` (*index*)	`beacons`	`beacons_dirs`
Cache	`salt.cache` (*index*)	`cache`	`cache_dirs`
Cloud	`salt.cloud.clouds` (*index*)	`clouds`	`cloud_dirs`
Engine	`salt.engines` (*index*)	`engines`	`engines_dirs`
Execution	`salt.modules` (*index*)	`modules`	`module_dirs`
Executor	`salt.executors` (*index*)	`executors`	`executor_dirs`
File Server	`salt.fileserver` (*index*)	`fileserver`	`fileserver_dirs`
Grain	`salt.grains` (*index*)	`grains`	`grains_dirs`
Log Handler	`salt.log_handlers` (*index*)	`log_handlers`	`log_handlers_dirs`
Matcher	`salt.matchers`	`matchers`	`matchers_dirs`
Metaproxy	`salt.metaproxy`	`metaproxy`[Page 2856, 1]	`metaproxy_dirs`
Net API	`salt.netapi` (*index*)	`netapi`[Page 2856, 1]	`netapi_dirs`
Outputter	`salt.output` (*index*)	`output`	`outputter_dirs`
Pillar	`salt.pillar` (*index*)	`pillar`	`pillar_dirs`
Proxy	`salt.proxy` (*index*)	`proxy`	`proxy_dirs`
Queue	`salt.queues` (*index*)	`queues`	`queue_dirs`
Renderer	`salt.renderers` (*index*)	`renderers`	`render_dirs`

continues on next page

Table 1 – continued from previous page

Module Type	Salt Package Name	FS/Directory Name	Entry Point
Returner	`salt.returners` (*index*)	`returners`	`returner_dirs`
Roster	`salt.roster` (*index*)	`roster`	`roster_dirs`
Runner	`salt.runners` (*index*)	`runners`	`runner_dirs`
SDB	`salt.sdb` (*index*)	`sdb`	`sdb_dirs`
Serializer	`salt.serializers` (*index*)	`serializers`[Page 2856, 1]	`serializers_dirs`
SPM pkgdb	`salt.spm.pkgdb`	`pkgdb`[1]	`pkgdb_dirs`
SPM pkgfiles	`salt.spm.pkgfiles`	`pkgfiles`[1]	`pkgfiles_dirs`
SSH Wrapper	`salt.client.ssh.wrapper`	`wrapper`	`wrapper_dirs`
State	`salt.states` (*index*)	`states`	`states_dirs`
Thorium	`salt.thorium` (*index*)	`thorium`	`thorium_dirs`
Tokens	`salt.tokens`	`tokens`	`tokens_dirs`
Top	`salt.tops` (*index*)	`tops`	`top_dirs`
Util	`salt.utils`	`utils`	`utils_dirs`
Wheel	`salt.wheels` (*index*)	`wheel`	`wheel_dirs`

Note: While it is possible to import modules directly with the import statement, it is strongly recommended that the appropriate *dunder dictionary* is used to access them instead. This is because a number of factors affect module names, module selection, and module overloading.

Auth

The auth module system allows for external authentication routines to be easily added into Salt. The *auth* function needs to be implemented to satisfy the requirements of an auth module. Use the `pam` module as an example.

See *External Authentication System* for more about authentication in Salt.

Beacon

- *Writing Beacons*

Beacons are polled by the Salt event loop to monitor non-salt processes. See *Beacons* for more information about the beacon system.

Cache

The minion cache is used by the master to store various information about minions. See *Minion Data Cache* for more information.

---

[1] These modules cannot be loaded from the Salt File Server.

Cloud

Cloud modules are backend implementations used by *Salt Cloud*.

Engine

Engines are open-ended services managed by the Salt daemon (both master and minion). They may interact with event loop, call other modules, or a variety of non-salt tasks. See *Salt Engines* for complete details.

Execution

Execution modules make up the core of the functionality used by Salt to interact with client systems. The execution modules create the core system management library used by all Salt systems, including states, which interact with minion systems.

Execution modules are completely open ended in their execution. They can be used to do anything required on a minion, from installing packages to detecting information about the system. The only restraint in execution modules is that the defined functions always return a JSON serializable object.

Executor

Executors control how execution modules get called. The default is to just call them, but this can be customized.

File Server

The file server module system is used to create file server backends used by the Salt Master. These modules need to implement the functions used in the fileserver subsystem. Use the `gitfs` module as an example.

See *File Server Backends* for more information.

Grains

- *Writing Grains*

Grain modules define extra routines to populate grains data. All defined public functions will be executed and MUST return a Python dict object. The dict keys will be added to the grains made available to the minion.

See *Grains* for more.

Log Handler

Log handlers allows the logs from salt (master or minion) to be sent to log aggregation systems.

Matcher

Matcher modules are used to define the *minion targeting expressions*. For now, it is only possible to override the *existing matchers* (the required CLI plumbing for custom matchers is not implemented yet).

Metaproxy

Metaproxy is an abstraction layer above the existing proxy minion. It enables adding different types of proxy minions that can still load existing proxymodules.

Net API

Net API modules are the actual server implementation used by Salt API.

Output

The output modules supply the outputter system with routines to display data in the terminal. These modules are very simple and only require the *output* function to execute. The default system outputter is the `nested` module.

Pillar

External Pillars

Salt provides a mechanism for generating pillar data by calling external pillar interfaces. This document will describe an outline of an ext_pillar module.

Location

Salt expects to find your `ext_pillar` module in the same location where it looks for other python modules. If the `extension_modules` option in your Salt master configuration is set, Salt will look for a `pillar` directory under there and load all the modules it finds. Otherwise, it will look in your Python site-packages `salt/pillar` directory.

Configuration

The external pillars that are called when a minion refreshes its pillars is controlled by the `ext_pillar` option in the Salt master configuration. You can pass a single argument, a list of arguments or a dictionary of arguments to your pillar:

```
ext_pillar:
  - example_a: some argument
  - example_b:
    - argumentA
    - argumentB
  - example_c:
      keyA: valueA
      keyB: valueB
```

The Module

Imports and Logging

Import modules your external pillar module needs. You should first include generic modules that come with stock Python:

```
import logging
```

And then start logging. This is an idiomatic way of setting up logging in Salt:

```
log = logging.getLogger(__name__)
```

Finally, load modules that are specific to what you are doing. You should catch import errors and set a flag that the `__virtual__` function can use later.

```
try:
    import weird_thing

    EXAMPLE_A_LOADED = True
except ImportError:
    EXAMPLE_A_LOADED = False
```

Options

If you define an `__opts__` dictionary, it will be merged into the `__opts__` dictionary handed to the `ext_pillar` function later. This is a good place to put default configuration items. The convention is to name things `modulename.option`.

```
__opts__ = {"example_a.someconfig": 137}
```

Initialization

If you define an `__init__` function, it will be called with the following signature:

```
def __init__(__opts__):
    # Do init work here
    ...
```

Note: The `__init__` function is ran every time a particular minion causes the external pillar to be called, so don't put heavy initialization code here. The `__init__` functionality is a side-effect of the Salt loader, so it may not be as useful in pillars as it is in other Salt items.

__virtual__

If you define a `__virtual__` function, you can control whether or not this module is visible. If it returns `False` then Salt ignores this module. If it returns a string, then that string will be how Salt identifies this external pillar in its `ext_pillar` configuration. If you're not renaming the module, simply return `True` in the `__virtual__` function, which is the same as if this function did not exist, then, the name Salt's `ext_pillar` will use to identify this module is its conventional name in Python.

This is useful to write modules that can be installed on all Salt masters, but will only be visible if a particular piece of software your module requires is installed.

```
# This external pillar will be known as `example_a`
def __virtual__():
    if EXAMPLE_A_LOADED:
        return True
    return False
```

```
# This external pillar will be known as `something_else`
__virtualname__ = "something_else"

def __virtual__():
    if EXAMPLE_A_LOADED:
        return __virtualname__
    return False
```

ext_pillar

This is where the real work of an external pillar is done. If this module is active and has a function called `ext_pillar`, whenever a minion updates its pillar this function is called.

How it is called depends on how it is configured in the Salt master configuration. The first argument is always the current pillar dictionary, this contains pillar items that have already been added, starting with the data from `pillar_roots`, and then from any already-ran external pillars.

Using our example above:

```
ext_pillar(id, pillar, "some argument")  # example_a
ext_pillar(id, pillar, "argumentA", "argumentB")  # example_b
ext_pillar(id, pillar, keyA="valueA", keyB="valueB")  # example_c
```

In the `example_a` case, `pillar` will contain the items from the `pillar_roots`, in `example_b` `pillar` will contain that plus the items added by `example_a`, and in `example_c` `pillar` will contain that plus the items added by `example_b`. In all three cases, `id` will contain the ID of the minion making the pillar request.

This function should return a dictionary, the contents of which are merged in with all of the other pillars and returned to the minion. **Note**: this function is called once for each minion that fetches its pillar data.

```
def ext_pillar(minion_id, pillar, *args, **kwargs):

    my_pillar = {"external_pillar": {}}

    my_pillar["external_pillar"] = get_external_pillar_dictionary()
```

(continues on next page)

(continued from previous page)

```
    return my_pillar
```

You can call pillar with the dictionary's top name to retrieve its data. From above example, 'external_pillar' is the top dictionary name. Therefore:

```
salt '*' pillar.get external_pillar
```

You shouldn't just add items to `pillar` and return that, since that will cause Salt to merge data that already exists. Rather, just return the items you are adding or changing. You could, however, use `pillar` in your module to make some decision based on pillar data that already exists.

This function has access to some useful globals:

__opts__
A dictionary of mostly Salt configuration options. If you had an `__opts__` dictionary defined in your module, those values will be included.

__salt__
A dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist. E.g. `__salt__['cmd.run']( 'ls -l' )` **Note**, runs on the *master*

__grains__
A dictionary of the grains of the minion making this pillar call.

Example configuration

As an example, if you wanted to add external pillar via the `cmd_json` external pillar, add something like this to your master config:

```
ext_pillar:
  - cmd_json: 'echo {\"arg\":\"value\"}'
```

Reminder

Just as with traditional pillars, external pillars must be refreshed in order for minions to see any fresh data:

```
salt '*' saltutil.refresh_pillar
```

Used to define optional external pillar systems. The pillar generated via the filesystem pillar is passed into external pillars. This is commonly used as a bridge to database data for pillar, but is also the backend to the libvirt state used to generate and sign libvirt certificates on the fly.

Proxy

Proxy Minions are a way to manage devices that cannot run a full minion directly.

Renderers

Renderers are the system used to render sls files into salt highdata for the state compiler. They can be as simple as the `py` renderer and as complex as `stateconf` and `pydsl`.

Returners

Returners are used to send data from minions to external sources, commonly databases. A full returner will implement all routines to be supported as an external job cache. Use the `redis` returner as an example.

Roster

The *Roster system* is used by Salt SSH to enumerate devices.

Runners

Runners are purely master-side execution sequences.

SDB

- *Writing SDB Modules*

SDB is a way to store data that's not associated with a minion. See *Storing Data in Other Databases*.

Serializer

Primarily used with `file.serialize`.

State

State modules are used to define the state interfaces used by Salt States. These modules are restrictive in that they must follow a number of rules to function properly.

Note: State modules define the available routines in sls files. If calling an execution module directly is desired, take a look at the *module* state.

SPM pkgdb

- *SPM Development Guide: Package Database*

pkgdb modules provides storage backends to the package database.

SPM pkgfiles

- *SPM Development Guide: Package Database*

pkgfiles modules handle the actual installation.

SSH Wrapper

SSH Wrapper

Salt-SSH Background

Salt-SSH works by creating a tar ball of salt, a bunch of python modules, and a generated short minion config. It then copies this onto the destination host over ssh, then uses that host's local python install to run `salt-client --local` with any requested modules. It does not automatically copy over states or cache files and since it is uses a local file_client, modules that rely on `cp.cache*` functionality do not work.

SSH Wrapper modules

To support cp modules or other functionality which might not otherwise work in the remote environment, a wrapper module can be created. These modules are run from the salt-master initiating the salt-ssh command and can include logic to support the needed functionality. SSH Wrapper modules are located in /salt/client/ssh/wrapper/ and are named the same as the execution module being extended. Any functions defined inside of the wrapper module are called from the `salt-ssh module.function argument` command rather than executing on the minion.

State Module example

Running salt states on an salt-ssh minion, obviously requires the state files themselves. To support this, a state module wrapper script exists at salt/client/ssh/wrapper/state.py, and includes standard state functions like `apply`, `sls`, and `highstate`. When executing `salt-ssh minion state.highstate`, these wrapper functions are used and include the logic to walk the low_state output for that minion to determine files used, gather needed files, tar them together, transfer the tar file to the minion over ssh, and run a state on the ssh minion. This state then extracts the tar file, applies the needed states and data, and cleans up the transferred files.

Wrapper Handling

From the wrapper script any invocations of `__salt__['some.module']()` do not run on the master which is running the wrapper, but instead magically are invoked on the minion over ssh. Should the function being called exist in the wrapper, the wrapper function will be used instead.

One way of supporting this workflow may be to create a wrapper function which performs the needed file copy operations. Now that files are resident on the ssh minion, the next step is to run the original execution module function. But since that function name was already overridden by the wrapper, a function alias can be created in the original execution module, which can then be called from the wrapper.

Example

The saltcheck module needs sls and tst files on the minion to function. The invocation of *`saltcheck.run_state_tests`* is run from the wrapper module, and is responsible for performing the needed file copy. The *`saltcheck`* execution module includes an alias line of `run_state_tests_ssh = salt.utils.functools.alias_function(run_state_tests, 'run_state_tests_ssh')` which creates an alias of `run_state_tests` with the name `run_state_tests_ssh`. At the end of the `run_state_tests` function in the wrapper module, it then calls `__salt__['saltcheck.run_state_tests_ssh']()`. Since this function does not exist in the wrapper script, the call is made on the remote minion, which then having the needed files, runs as expected.

Replacement execution modules for *Salt SSH*.

Thorium

Modules for use in the *Thorium* event reactor.

Tokens

Token stores for *External Authentication*. See the `salt.tokens` docstring for details.

Note: The runner to load tokens modules is *`saltutil.sync_eauth_tokens`*.

Tops

Tops modules are used to convert external data sources into top file data for the state system.

Util

Just utility modules to use with other modules via `__utils__` (see *Dunder Dictionaries*).

Wheel

The wheel system is used to manage master side management routines. These routines are primarily intended for the API to enable master configuration.

32.23 Salt Extend

`salt-extend` is a templating tool for extending SaltStack. If you're looking to add a module to SaltStack, then the `salt-extend` utility can guide you through the process.

You can use Salt Extend to quickly create templated modules for adding new behaviours to some of the module subsystems within Salt.

Salt Extend takes a template directory and merges it into a SaltStack source code directory.

32.23.1 Command line usage

See salt-extend

32.23.2 Choosing a template

The following templates are available:

module

Creates a new execution module within salt/modules/{{module_name}}.py

module_unit

Creates a new execution module unit test suite within tests/unit/modules/test_{{module_name}}.py

state

Creates a new state module within salt/states/{{module_name}}.py

state_unit

Creates a new state module unit test suite within tests/unit/states/test_{{module_name}}.py

32.23.3 Adding templates

1. Create a directory under <src>/templates
2. Create a file `template.yml` containing properties for

- `description` - a description of the template
- `questions` - a collection of additional questions to ask the user, the name of the item will be used as the key in the context dictionary within the jinja template.
  - `question` - The question to ask the user, as a string
  - `default` - (optional) the default value, can contain Jinja2 template syntax and has access to the default context properties

Example template.yml

```
description: "Execution module"
questions:
    depending_libraries:
        question: "What libraries does this module depend upon?"
    virtual_name:
        question: "What module virtual name to use?"
        default: "{{module_name}}"
```

3. Create the files within <src>/templates/<your template> to match the target

---

Note: File names can contain Jinja 2 template syntax, e.g. *'{{module_name}}.py}}'*

Example file in the template directory

```
print("Hello {{module_name}}")
__virtual__ = "{{__virtual_name__}}"
```

Default context properties

The default context provides the following properties

- `description` - A description of the template
- `short_description` - A short description of the module as entered by the user
- `version` - The version name of the next release
- `module_name` - The module name as entered by the user
- `release_date` - The current date in the format *YYYY-MM-DD*
- `year` - The current year in the format *YYYY*

As well as any additional properties entered from the questions section of `template.yml`

32.23.4 API

salt.utils.extend module

SaltStack Extend

A templating tool for extending SaltStack.

Takes a template directory and merges it into a SaltStack source code directory. This tool uses Jinja2 for templating.

This tool is accessed using *salt-extend*

codeauthor
Anthony Shaw <anthonyshaw@apache.org>

`salt.utils.extend.`**`apply_template`**(*template_dir*, *output_dir*, *context*)

Apply the template from the template directory to the output using the supplied context dict.

Parameters

- **`src`** (`str`) -- The source path
- **`dst`** (`str`) -- The destination path
- **`context`** (`dict`) -- The dictionary to inject into the Jinja template as context

`salt.utils.extend.`**`run`**(*extension=None*, *name=None*, *description=None*, *salt_dir=None*, *merge=False*, *temp_dir=None*)

A template factory for extending the salt ecosystem

Parameters

- **`extension`** (`str`) -- The extension type, e.g. 'module', 'state', if omitted, user will be prompted
- **`name`** (`str`) -- Python-friendly name for the module, if omitted, user will be prompted

- **description** (`str`) -- A description of the extension, if omitted, user will be prompted
- **salt_dir** (`str`) -- The targeted Salt source directory
- **merge** (`bool`) -- Merge with salt directory, *False* to keep separate, *True* to merge trees.
- **temp_dir** (`str`) -- The directory for generated code, if omitted, system temp will be used

32.24 Salt's Test Suite

Salt comes with a powerful integration and unit test suite allowing for the fully automated run of integration and/or unit tests from a single interface. It uses the combination of pytest and nox to run these tests. Nox is used to manage all of the test python dependencies. When you run the test runner with nox, you will be installing the same python dependencies that we use to run our test suite on PRs and branch tests.

To learn the basics of how Salt's test suite works, be sure to check out the *Salt's Test Suite: An Introduction* tutorial.

32.24.1 Nox

Nox is used to manage all of the python dependencies used in the test suite and spins up the different nox sessions. You can look at the `noxfile.py` in the salt repo to view all of the current nox configurations. In that file you will notice various nox sessions. When creating each of these sessions, nox will create a virtualenv with the specified interpreter. Once the virtualenv is created it will also install all of the required python dependencies required for that session and run the tests.

For example if you want to run all of the tests using the zeromq transport on python3 you would need to specify the zeromq transport and python3.

```
nox -e 'test-zeromq-3(coverage=False)'
```

And because zeromq is the default transport, the following nox session can also be used:

```
nox -e 'test-zeromq-3(coverage=False)'
```

To run all the tests but on the tcp transport, you would need to specify the tcp session.

```
nox -e 'test-tcp-3(coverage=False)'
```

As a contrast, when using the deprecated `runtests.py` test runner, the command would be:

```
nox -e 'runtests-tcp-3(coverage=False)'
```

You can view all available sessions by running:

```
nox --list-sessions
```

For the most part you will only need nox to run the test suite, as this tool will install the exact same python dependencies we use to run on our test runs. The exception to this is when a system dependency is required, for example `mysql`. These system dependencies are installed with sls states managed in the salt-ci-images repo or you can manually install the dependency yourself.

32.24.2 System Dependencies

The system dependencies are installed from the salt-ci-images repo. The `golden-images-provision` state is what is run to determine what dependencies to install on which platform. We run this state only when we want to update our current VM images with new dependencies.

32.24.3 Test Directory Structure

Salt's test suite is located in the `tests/` directory in the root of Salt's codebase.

With the migration to PyTest, Salt has created a separate directory for tests that are written taking advantage of the full potential of PyTest. These are located under `tests/pytests`.

As for the old test suite, it is divided into two main groups:

- *Integration Tests*
- *Unit Tests*

Within each of these groups, the directory structure roughly mirrors the structure of Salt's own codebase. Notice that there are directories for `states`, `modules`, `runners`, `output`, and more in each testing group.

The files that are housed in the `modules` directory of either the unit or the integration testing factions contain respective integration or unit test files for Salt execution modules.

The PyTest only tests under `tests/pytests` should, more or less, follow the same grouping as the old test suite.

Integration Tests

The Integration section of Salt's test suite start up a number of Salt daemons to test functionality in a live environment. These daemons include two Salt Masters, one Syndic, and two Minions. This allows the Syndic interface to be tested and Master/Minion communication to be verified. All of the integration tests are executed as live Salt commands sent through the started daemons.

Integration tests are particularly good at testing modules, states, and shell commands, among other segments of Salt's ecosystem. By utilizing the integration test daemons, integration tests are easy to write. They are also SaltStack's generally preferred method of adding new tests.

The discussion in the *Integration vs. Unit* section of the *testing tutorial* is beneficial in learning why you might want to write integration tests vs. unit tests. Both testing arenas add value to Salt's test suite and you should consider adding both types of tests if possible and appropriate when contributing to Salt.

- *Integration Test Documentation*

Unit Tests

Unit tests do not spin up any Salt daemons, but instead find their value in testing singular implementations of individual functions. Instead of testing against specific interactions, unit tests should be used to test a function's logic as well as any `return` or `raises` statements. Unit tests also rely heavily on mocking external resources.

The discussion in the *Integration vs. Unit* section of the *testing tutorial* is useful in determining when you should consider writing unit tests instead of, or in addition to, integration tests when contributing to Salt.

- *Unit Test Documentation*

32.24.4 Running The Tests

There is only one requirement to install, to quickly get started running salt's test suite: `nox`.

```
pip install nox
```

Once this requirement is installed, you can use the `nox` binary to run all of the tests included in Salt's test suite:

```
nox -e 'test-3(coverage=False)'
```

For more information about options you can pass the test runner, see the `--help` option:

```
nox -e 'test-3(coverage=False)' -- --help
```

Running Test Subsections

Instead of running the entire test suite all at once, which can take a long time, there are several ways to run only specific groups of tests or individual tests:

- Run *unit tests only*: `nox -e 'test-3(coverage=False)' -- tests/unit/`.
- Run unit and integration tests for states: `nox -e 'test-3(coverage=False)' -- tests/unit/states/ tests/integration/states/`.
- Run integration tests for an individual module: `nox -e 'test-3(coverage=False)' -- tests/pytests/integration/modules/test_virt.py`.
- Run unit tests for an individual module: `nox -e 'test-3(coverage=False)' -- tests/unit/modules/test_virt.py`.
- Run an individual test by using the class and test name (this example is for the `test_default_kvm_profile` test in the `tests/pytests/integration/module/test_virt.py`): `nox -e 'test-3(coverage=False)' -- tests/pytests/integration/modules/test_virt.py::VirtTest::test_default_kvm_profile`.

For more specific examples of how to run various test subsections or individual tests, please see the pytest documentation on how to run specific tests or the *Running Specific Tests* section of the *Salt's Test Suite: An Introduction* tutorial.

Running Unit Tests Without Integration Test Daemons

Since the unit tests do not require a master or minion to execute, it is often useful to be able to run unit tests individually, or as a whole group, without having to start up the integration testing daemons. Starting up the master, minion, and syndic daemons takes a lot of time before the tests can even start running and is unnecessary to run unit tests. To run unit tests without invoking the integration test daemons, simply add the unit directory as an argument:

```
nox -e 'test-3(coverage=False)' -- tests/unit/
```

All of the other options to run individual tests, entire classes of tests, or entire test modules still apply.

Running Destructive Integration Tests

Salt is used to change the settings and behavior of systems. In order to effectively test Salt's functionality, some integration tests are written to make actual changes to the underlying system. These tests are referred to as "destructive tests". Some examples of destructive tests are changes may be testing the addition of a user or installing packages. By default, destructive tests are disabled and will be skipped.

Generally, destructive tests should clean up after themselves by attempting to restore the system to its original state. For instance, if a new user is created during a test, the user should be deleted after the related test(s) have completed. However, no guarantees are made that test clean-up will complete successfully. Therefore, running destructive tests should be done with caution.

Note: Running destructive tests will change the underlying system. Use caution when running destructive tests.

To run tests marked as destructive, set the `--run-destructive` flag:

```
nox -e 'test-3(coverage=False)' -- --run-destructive
```

Running Cloud Provider Tests

Salt's testing suite also includes integration tests to assess the successful creation and deletion of cloud instances using *Salt-Cloud* for providers supported by Salt-Cloud.

The cloud provider tests are off by default and run on sample configuration files provided in `tests/integration/files/conf/cloud.providers.d/`. In order to run the cloud provider tests, valid credentials, which differ per provider, must be supplied. Each credential item that must be supplied is indicated by an empty string value and should be edited by the user before running the tests. For example, DigitalOcean requires a client key and an api key to operate. Therefore, the default cloud provider configuration file for DigitalOcean looks like this:

```
digitalocean-config:
  driver: digitalocean
  client_key: ''
  api_key: ''
  location: New York 1
```

As indicated by the empty string values, the `client_key` and the `api_key` must be provided:

```
digitalocean-config:
  driver: digitalocean
  client_key: wFGEwgregeqw3435gDger
  api_key: GDE43t43REGTrkilg43934t34qT43t4dgegerGEgg
  location: New York 1
```

Note: When providing credential information in cloud provider configuration files, do not include the single quotes.

Once all of the valid credentials for the cloud provider have been supplied, the cloud provider tests can be run like:

```
nox -e 'test-cloud-3(coverage=False)'
```

32.24.5 Automated Test Runs

SaltStack maintains a Jenkins server to allow for the execution of tests across supported platforms. The tests executed from Salt's Jenkins server create fresh virtual machines for each test run, then execute destructive tests on the new, clean virtual machine.

SaltStack's Jenkins server continuously runs the entire test suite, including destructive tests, on an array of various supported operating systems throughout the day. Each actively supported branch of Salt's repository runs the tests located in the respective branch's code. Each set of branch tests also includes a pylint run. These branch tests help ensure the viability of Salt code at any given point in time as pull requests are merged into branches throughout the day.

In addition to branch tests, SaltStack's Jenkins server also runs tests on pull requests. These pull request tests include a smaller set of virtual machines that run on the branch tests. The pull request tests, like the branch tests, include a pylint test as well.

When a pull request is submitted to Salt's repository on GitHub, the suite of pull request tests are started by Jenkins. These tests are used to gauge the pull request's viability to merge into Salt's codebase. If these initial tests pass, the pull request can then merged into the Salt branch by one of Salt's core developers, pending their discretion. If the initial tests fail, core developers may request changes to the pull request. If the failure is unrelated to the changes in question, core developers may merge the pull request despite the initial failure.

As soon as the pull request is merged, the changes will be added to the next branch test run on Jenkins.

For a full list of currently running test environments, go to https://jenkins.saltproject.io.

Using Salt-Cloud on Jenkins

For testing Salt on Jenkins, SaltStack uses *Salt-Cloud* to spin up virtual machines. The script using Salt-Cloud to accomplish this is open source and can be found here: tests/jenkins.py

32.24.6 Writing Tests

The salt testing infrastructure is divided into two classes of tests, integration tests and unit tests. These terms may be defined differently in other contexts, but for Salt they are defined this way:

- Unit Test: Tests which validate isolated code blocks and do not require external interfaces such as `salt-call` or any of the salt daemons.
- Integration Test: Tests which validate externally accessible features.

Salt testing uses unittest2 from the python standard library and MagicMock.

- *Writing integration tests*
- *Writing unit tests*

Naming Conventions

Any function in either integration test files or unit test files that is doing the actual testing, such as functions containing assertions, must start with `test_`:

```
def test_user_present(self): ...
```

When functions in test files are not prepended with `test_`, the function acts as a normal, helper function and is not run as a test by the test suite.

Submitting New Tests

Which branch of the Salt codebase should new tests be written against? The location of where new tests should be submitted depends largely on the reason you're writing the tests.

Tests for New Features

If you are adding new functionality to Salt, please write the tests for this new feature in the same pull request as the new feature. New features should always be submitted to the `master` branch.

If you have already submitted the new feature, but did not write tests in the original pull request that has already been merged, please feel free to submit a new pull request containing tests. If the feature was recently added to Salt's `master` branch, then the tests should be added there as well. However, if the feature was added to `master` some time ago and is already present in one or more release branches, please refer to the *Tests for Entire Files or Functions* section below for more details about where to submit tests for functions or files that do not already have tests.

Tests to Accompany a Bugfix

If you are writing tests for code that fixes a bug in Salt, tests will be required before merging the PR. A great option for most bugfixes is to adopt a TDD style approach:

- reproduce the issue
- write a test that exhibits the behavior
- write the bugfix

This helps ensure that known issues are not reintroduced into the codebase.

Tests for Entire Files or Functions

Sometimes entire files in Salt are completely untested. If you are writing tests for a file that doesn't have any tests written for it, write your test against the earliest supported release branch that contains the file or function you're testing.

Once your tests are submitted in a pull request and is merged into the branch in question, the tests you wrote will be merged-forward by SaltStack core engineers and the new tests will propagate to the newer release branches. That way the tests you wrote will apply to all current and relevant release branches, and not just the `master` branch, for example. This methodology will help protect against regressions on older files in Salt's codebase.

There may be times when the tests you write against an older branch fail in the merge-forward process because functionality has changed in newer release branches. In these cases, a Salt core developer may reach out to you for advice on the tests in question if the path forward is unclear.

Note: If tests are written against a file in an older release branch and then merged forward, there may be new functionality in the file that is present in the new release branch that is untested.It would be wise to see if new functionality could use additional testing once the test file has propagated to newer release branches.

Module/Global Level Variables

If you need access to module or global level variables, please use a pytest fixture. The use of module and global variables can introduce mutable global objects and increases processing time because all globals are evaluated when collecting tests. If there is a use case where you cannot use a fixture and you are using a type of string, integer, or tuple you can use global/module level variables. Any mutable types such as lists and dictionaries must use pytest fixtures. For an example, if all of your tests need access to a string variable:

```
FOO = "bar"

def test_foo_bar():
    assert FOO == "bar"

def test_foo_not():
    assert not FOO == "foo"
```

We recommend using a pytest fixture:

```
import pytest

@pytest.fixture()
def foo():
    return "bar"

def test_foo_bar(foo):
    assert foo == "bar"

def test_foo_not(foo):
    assert not foo == "foo"
```

If you need a class to mock something, it can be defined at the global scope, but it should only be initialized on the fixture:

```
class Foo:
    def __init__(self):
        self.bar = True

@pytest.fixture
def foo():
    return Foo()
```

Test Helpers

Several Salt-specific helpers are available. A full list is available by inspecting functions exported under *tests/support/*.py*.

Test Markers

@pytest.mark.expensive_test -- Designates a test which typically requires a relatively costly external resource, like a cloud virtual machine. This decorator is not normally used by developers outside of the Salt core team.

@pytest.mark.destructive_test -- Marks a test as potentially destructive. It will not be run unless the `--run-destructive` flag is expressly passed.

@pytest.mark.requires_network -- Requires a network connection for the test to operate successfully. If a network connection is not detected, the test will not run.

These are just a small preview of the supported marker. For a full listing, please run:

```
nox -e 'test-3(coverage=False)' -- --markers
```

32.25 Integration Tests

The Salt integration tests come with a number of classes and methods which allow for components to be easily tested. These classes are generally inherited from and provide specific methods for hooking into the running integration test environment created by the integration tests.

It is noteworthy that since integration tests validate against a running environment that they are generally the preferred means to write tests.

The integration system is all located under `tests/integration` in the Salt source tree. Each directory within `tests/integration` corresponds to a directory in Salt's tree structure. For example, the integration tests for the `test.py` Salt module that is located in `salt/modules` should also be named `test.py` and reside in `tests/integration/modules`.

32.25.1 Preparing to Write Integration Tests

This guide assumes that your Salt development environment is already configured and that you have a basic understanding of contributing to the Salt codebase. If you're unfamiliar with either of these topics, please refer to the *Installing Salt for Development* and the *Contributing* pages, respectively.

This documentation also assumes that you have an understanding of how to *run Salt's test suite*, including running the *test subsections*, and running a single integration test file, class, or individual test.

32.25.2 Best Practices

Integration tests should be written to the following specifications.

What to Test?

Since integration tests are used to validate against a running Salt environment, integration tests should be written with the Salt components, and their various interactions, in mind.

- Isolate testing functionality. Don't rely on the pass or failure of other, separate tests.
- Individual tests should test against a single behavior.
- Since it occasionally takes some effort to ”set up” an individual test, it may be necessary to call several functions within a single test. However, be sure that once the work has been done to set up a test, make sure you are clear about the functionality that is being tested.

Naming Conventions

Test names and docstrings should indicate what functionality is being tested. Test functions are named `test_<fcn>_<test-name>` where `<fcn>` is the function being tested and `<test-name>` describes the behavior being tested.

In order for integration tests to get picked up during a run of the test suite, each individual test must be prepended with the `test_` naming syntax, as described above.

If a function does not start with `test_`, then the function acts as a ”normal” function and is not considered a testing function. It will not be included in the test run or testing output.

The setUp and tearDown Functions

There are two special functions that can be utilized in the integration side of Salt's test suite: `setUp` and `tearDown`. While these functions are not required in all test files, there are many examples in Salt's integration test suite illustrating the broad usefulness of each function.

The `setUp` function is used to set up any repetitive or useful tasks that the tests in a test class need before running. For example, any of the `mac_*` integration tests should only run on macOS machines. The `setUp` function can be used to test for the presence of the `Darwin` kernel. If the `Darwin` kernel is not present, then the test should be skipped.

```
def setUp(self):
    """
    Sets up test requirements
    """
    os_grain = self.run_function("grains.item", ["kernel"])
    if os_grain["kernel"] not in "Darwin":
        self.skipTest("Test not applicable to '{kernel}' kernel".format(**os_
↪grain))
```

The `setUp` function can be used for many things. The above code snippet is only one example. Another example might be to ensure that a particular setting is present before running tests that would require the setting.

The `tearDown` function is used to clean up after any tests. This function is useful for restoring any settings that might have been changed during the test run.

Note: The `setUp` and `tearDown` functions run before and after each test in the test class that the `setUp` and `tearDown` functions are defined.

Be sure to read the *Destructive vs Non-Destructive Tests* section when using any kind of destructive functions that might alter the system running the test suite in either the `setUp` or `tearDown` function definitions.

Testing Order

The test functions within a test class do not run in the order they were defined, but instead run in lexicographical order.

Note that if any `setUp` or `tearDown` functions are defined in the class, those functions will run before (for `setUp`) or after (for `tearDown`) each test case.

32.25.3 Integration Classes

The integration classes are located in `tests/integration/__init__.py` and can be extended therein. There are four classes available to extend:

- *ModuleCase*
- *ShellCase*
- *SSHCase*
- *SyndicCase*

ModuleCase

Used to define executions run via the master to minions and to call single modules and states. The available testing functions are:

run_function

Run a single salt function and condition the return down to match the behavior of the raw function call. This will run the command and only return the results from a single minion to verify.

run_state

Run the state.single command and return the state return structure.

minion_run

Run a single salt function on the 'minion' target and condition the return down to match the behavior of the raw function call.

ShellCase

Shell out to the scripts which ship with Salt. The testing functions are:

run_cp

Execute salt-cp. Pass in the argument string as it would be passed on the command line.

run_call

Execute salt-call, pass in the argument string as it would be passed on the command line.

run_cloud

Execute the salt-cloud command. Pass in the argument string as it would be passed on the command line.

run_key

Execute the salt-key command. Pass in the argument string as it would be passed on the command line.

run_run

Execute the salt-run command. Pass in the argument string as it would be passed on the command line.

run_run_plus

Execute the runner function the and return the return data and output in a dict

run_salt

Execute the salt command. Pass in the argument string as it would be passed on the command line.

run_script

Execute a salt script with the given argument string.

run_ssh

Execute the salt-ssh. Pass in the argument string as it would be passed on the command line.

SSHCase

Used to execute remote commands via salt-ssh. The available methods are as follows:

run_function

Run a single salt function via salt-ssh and condition the return down to match the behavior of the raw function call. This will run the command and only return the results from a single minion to verify.

SyndicCase

Used to execute remote commands via a syndic and is only used to verify the capabilities of the Salt Syndic. The available methods are as follows:

run_function

Run a single salt function and condition the return down to match the behavior of the raw function call. This will run the command and only return the results from a single minion to verify.

32.25.4 Examples

The following sections define simple integration tests present in Salt's integration test suite for each type of testing class.

Module Example via ModuleCase Class

Import the integration module, this module is already added to the python path by the test execution. Inherit from the `integration.ModuleCase` class.

Now the workhorse method `run_function` can be used to test a module:

```
import os
from tests.support.case import ModuleCase

class TestModuleTest(ModuleCase):
    """
    Validate the test module
    """

```

(continues on next page)

(continued from previous page)

```
    def test_ping(self):
        """
        test.ping
        """
        self.assertTrue(self.run_function("test.ping"))

    def test_echo(self):
        """
        test.echo
        """
        self.assertEqual(self.run_function("test.echo", ["text"]), "text")
```

The fist example illustrates the testing master issuing a `test.ping` call to a testing minion. The test asserts that the minion returned with a `True` value to the master from the `test.ping` call.

The second example similarly verifies that the minion executed the `test.echo` command with the `text` argument. The `assertEqual` call maintains that the minion ran the function and returned the data as expected to the master.

Shell Example via ShellCase

Validating the shell commands can be done via shell tests:

```
import sys
import shutil
import tempfile

from tests.support.case import ShellCase

class KeyTest(ShellCase):
    """
    Test salt-key script
    """

    _call_binary_ = "salt-key"

    def test_list(self):
        """
        test salt-key -L
        """
        data = self.run_key("-L")
        expect = [
            "Unaccepted Keys:",
            "Accepted Keys:",
            "minion",
            "sub_minion",
            "Rejected:",
            "",
        ]
        self.assertEqual(data, expect)
```

This example verifies that the `salt-key` command executes and returns as expected by making use of the `run_key` method.

SSH Example via SSHCase

Testing salt-ssh functionality can be done using the SSHCase test class:

```
from tests.support.case import SSHCase

class SSHGrainsTest(SSHCase):
    """
    Test salt-ssh grains functionality
    Depend on proper environment set by integration.SSHCase class
    """

    def test_grains_id(self):
        """
        Test salt-ssh grains id work for localhost.
        """
        cmd = self.run_function("grains.get", ["id"])
        self.assertEqual(cmd, "localhost")
```

Testing Event System via SaltMinionEventAssertsMixin

The fundamentially asynchronous nature of Salt makes testing the event system a challenge. The `SaltMinionEventAssertsMixin` provides a facility for testing that events were received on a minion event bus.

```
import salt.utils.event
from tests.support.mixins import SaltEventAssertsMixin

class TestEvent(SaltEventAssertsMixin):
    """
    Example test of firing an event and receiving it
    """

    def test_event(self):
        e = salt.utils.event.get_event(
            "minion", sock_dir=self.minion_opts["sock_dir"], opts=self.minion_
↪opts
        )

        e.fire_event({"a": "b"}, "/test_event")

        self.assertMinionEventReceived({"a": "b"})
```

Syndic Example via SyndicCase

Testing Salt's Syndic can be done via the SyndicCase test class:

```
from tests.support.case import SyndicCase

class TestSyndic(SyndicCase):
    """
    Validate the syndic interface by testing the test module
    """

    def test_ping(self):
        """
        test.ping
        """
        self.assertTrue(self.run_function("test.ping"))
```

This example verifies that a `test.ping` command is issued from the testing master, is passed through to the testing syndic, down to the minion, and back up again by using the `run_function` located with in the `SyndicCase` test class.

32.25.5 Integration Test Files

Since using Salt largely involves configuring states, editing files, and changing system data, the integration test suite contains a directory named `files` to aid in testing functions that require files. Various Salt integration tests use these example files to test against instead of altering system files and data.

Each directory within `tests/integration/files` contain files that accomplish different tasks, based on the needs of the integration tests using those files. For example, `tests/integration/files/ssh` is used to bootstrap the test runner for salt-ssh testing, while `tests/integration/files/pillar` contains files storing data needed to test various pillar functions.

The `tests/integration/files` directory also includes an integration state tree. The integration state tree can be found at `tests/integration/files/file/base`.

The following example demonstrates how integration files can be used with ModuleCase to test states:

```
# Import python libs
from __future__ import absolute_import
import os
import shutil

# Import Salt Testing libs
from tests.support.case import ModuleCase
from tests.support.paths import FILES, TMP
from tests.support.mixins import SaltReturnAssertsMixin

# Import salt libs
import salt.utils.files

HFILE = os.path.join(TMP, "hosts")
```

(continues on next page)

(continued from previous page)

```
class HostTest(ModuleCase, SaltReturnAssertsMixin):
    """
    Validate the host state
    """

    def setUp(self):
        shutil.copyfile(os.path.join(FILES, "hosts"), HFILE)
        super(HostTest, self).setUp()

    def tearDown(self):
        if os.path.exists(HFILE):
            os.remove(HFILE)
        super(HostTest, self).tearDown()

    def test_present(self):
        """
        host.present
        """
        name = "spam.bacon"
        ip = "10.10.10.10"
        ret = self.run_state("host.present", name=name, ip=ip)
        self.assertSaltTrueReturn(ret)
        with salt.utils.files.fopen(HFILE) as fp_:
            output = fp_.read()
            self.assertIn("{0}\t\t{1}".format(ip, name), output)
```

To access the integration files, a variable named `FILES` points to the `tests/integration/files` directory. This is where the referenced `host.present` sls file resides.

In addition to the static files in the integration state tree, the location `TMP` can also be used to store temporary files that the test system will clean up when the execution finishes.

32.25.6 Destructive vs Non-Destructive Tests

Since Salt is used to change the settings and behavior of systems, one testing approach is to run tests that make actual changes to the underlying system. This is where the concept of destructive integration tests comes into play. Tests can be written to alter the system they are running on. This capability is what fills in the gap needed to properly test aspects of system management like package installation.

Any test that changes the underlying system in any way, such as creating or deleting users, installing packages, or changing permissions should include the `@destructive` decorator to signal system changes and should be written with care. System changes executed within a destructive test should also be restored once the related tests have completed. For example, if a new user is created to test a module, the same user should be removed after the test is completed to maintain system integrity.

To write a destructive test, import, and use the destructiveTest decorator for the test method:

```
from tests.support.case import ModuleCase
from tests.support.helpers import destructiveTest, skip_if_not_root

class DestructiveExampleModuleTest(ModuleCase):
    """
```

(continues on next page)

(continued from previous page)

```
    Demonstrate a destructive test
    """

    @destructiveTest
    @skip_if_not_root
    def test_user_not_present(self):
        """
        This is a DESTRUCTIVE TEST it creates a new user on the minion.
        And then destroys that user.
        """
        ret = self.run_state("user.present", name="salt_test")
        self.assertSaltTrueReturn(ret)
        ret = self.run_state("user.absent", name="salt_test")
        self.assertSaltTrueReturn(ret)
```

32.25.7 Cloud Provider Tests

Cloud provider integration tests are used to assess *Salt-Cloud*'s ability to create and destroy cloud instances for various supported cloud providers. Cloud provider tests inherit from the ShellCase Integration Class.

Any new cloud provider test files should be added to the `tests/integration/cloud/providers/` directory. Each cloud provider test file also requires a sample cloud profile and cloud provider configuration file in the integration test file directory located at `tests/integration/files/conf/cloud.*.d/`.

The following is an example of the default profile configuration file for Digital Ocean, located at: `tests/integration/files/conf/cloud.profiles.d/digitalocean.conf`:

```
digitalocean-test:
  provider: digitalocean-config
  image: Ubuntu 14.04 x64
  size: 512MB
```

Each cloud provider requires different configuration credentials. Therefore, sensitive information such as API keys or passwords should be omitted from the cloud provider configuration file and replaced with an empty string. The necessary credentials can be provided by the user by editing the provider configuration file before running the tests.

The following is an example of the default provider configuration file for Digital Ocean, located at: `tests/integration/files/conf/cloud.providers.d/digitalocean.conf`:

```
digitalocean-config:
  driver: digitalocean
  client_key: ''
  api_key: ''
  location: New York 1
```

In addition to providing the necessary cloud profile and provider files in the integration test suite file structure, appropriate checks for if the configuration files exist and contain valid information are also required in the test class's `setUp` function:

```
from tests.support.case import ShellCase
from tests.support.paths import FILES
```

(continues on next page)

(continued from previous page)

```
class LinodeTest(ShellCase):
    """
    Integration tests for the Linode cloud provider in Salt-Cloud
    """

    def setUp(self):
        """
        Sets up the test requirements
        """
        super(LinodeTest, self).setUp()

        # check if appropriate cloud provider and profile files are present
        profile_str = "linode-config:"
        provider = "linode"
        providers = self.run_cloud("--list-providers")
        if profile_str not in providers:
            self.skipTest(
                "Configuration file for {0} was not found. Check {0}.conf␣
↪files "
                "in tests/integration/files/conf/cloud.*.d/ to run these␣
↪tests.".format(
                    provider
                )
            )

        # check if apikey and password are present
        path = os.path.join(FILES, "conf", "cloud.providers.d", provider + ".
↪conf")
        config = cloud_providers_config(path)
        api = config["linode-config"]["linode"]["apikey"]
        password = config["linode-config"]["linode"]["password"]
        if api == "" or password == "":
            self.skipTest(
                "An api key and password must be provided to run these tests.␣
↪Check "
                "tests/integration/files/conf/cloud.providers.d/{0}.conf".
↪format(
                    provider
                )
            )
```

Repeatedly creating and destroying instances on cloud providers can be costly. Therefore, cloud provider tests are off by default and do not run automatically. To run the cloud provider tests, the `--cloud-provider-tests` flag must be provided:

```
./tests/runtests.py --cloud-provider-tests
```

Since cloud provider tests do not run automatically, all provider tests must be preceded with the `@expensiveTest` decorator. The expensive test decorator is necessary because it signals to the test suite that the `--cloud-provider-tests` flag is required to run the cloud provider tests.

To write a cloud provider test, import, and use the expensiveTest decorator for the test function:

```
from tests.support.helpers import expensiveTest

@expensiveTest
def test_instance(self):
    """
    Test creating an instance on Linode
    """
    name = "linode-testing"

    # create the instance
    instance = self.run_cloud("-p linode-test {0}".format(name))
    str = "        {0}".format(name)

    # check if instance with salt installed returned as expected
    try:
        self.assertIn(str, instance)
    except AssertionError:
        self.run_cloud("-d {0} --assume-yes".format(name))
        raise

    # delete the instance
    delete = self.run_cloud("-d {0} --assume-yes".format(name))
    str = "            True"
    try:
        self.assertIn(str, delete)
    except AssertionError:
        raise
```

32.25.8 Adding New Directories

If the corresponding Salt directory does not exist within `tests/integration`, the new directory must be created along with the appropriate test file to maintain Salt's testing directory structure.

In order for Salt's test suite to recognize tests within the newly created directory, options to run the new integration tests must be added to `tests/runtests.py`. Examples of the necessary options that must be added can be found here: tests/runtests.py. The functions that need to be edited are `setup_additional_options`, `validate_options`, and `run_integration_tests`.

32.26 Writing Unit Tests

32.26.1 Introduction

Like many software projects, Salt has two broad-based testing approaches -- integration testing and unit testing. While integration testing focuses on the interaction between components in a sandboxed environment, unit testing focuses on the singular implementation of individual functions.

Unit tests should be used specifically to test a function's logic. Unit tests rely on mocking external resources.

While unit tests are good for ensuring consistent results, they are most useful when they do not require more than a few mocks. Effort should be made to mock as many external resources as possible. This effort is encouraged, but not required. Sometimes the isolation provided by completely mocking the external dependencies is not worth the effort of mocking those dependencies.

In these cases, requiring an external library to be installed on the system before running the test file is a useful way to strike this balance. For example, the unit tests for the MySQL execution module require the presence of the MySQL python bindings on the system running the test file before proceeding to run the tests.

Overly detailed mocking can also result in decreased test readability and brittleness as the tests are more likely to fail when the code or its dependencies legitimately change. In these cases, it is better to add dependencies to the test runner dependency state.

32.26.2 Preparing to Write a Unit Test

This guide assumes that your Salt development environment is already configured and that you have a basic understanding of contributing to the Salt codebase. If you're unfamiliar with either of these topics, please refer to the *Installing Salt for Development* and the *Contributing* pages, respectively.

This documentation also assumes that you have an understanding of how to *run Salt's test suite*, including running the *unit test subsection*, running the unit tests *without testing daemons* to speed up development wait times, and running a unit test file, class, or individual test.

32.26.3 Best Practices

Unit tests should be written to the following specifications.

What to Test?

Since unit testing focuses on the singular implementation of individual functions, unit tests should be used specifically to test a function's logic. The following guidelines should be followed when writing unit tests for Salt's test suite:

- Each `raise` and `return` statement needs to be independently tested.
- Isolate testing functionality. Don't rely on the pass or failure of other, separate tests.
- Test functions should contain only one assertion, at most, multiple assertions can be made, but against the same outcome.
- Many Salt execution modules are merely wrappers for distribution-specific functionality. If there isn't any logic present in a simple execution module, consider writing an *integration test* instead of heavily mocking a call to an external dependency.

Mocking Test Data

A reasonable effort needs to be made to mock external resources used in the code being tested, such as APIs, function calls, external data either globally available or passed in through function arguments, file data, etc.

- Test functions should contain only one assertion and all necessary mock code and data for that assertion.
- External resources should be mocked in order to "block all of the exits". If a test function fails because something in an external library wasn't mocked properly (or at all), this test is not addressing all of the "exits" a function may experience. We want the Salt code and logic to be tested, specifically.
- Consider the fragility and longevity of a test. If the test is so tightly coupled to the code being tested, this makes a test unnecessarily fragile.

- Make sure you are not mocking the function to be tested so vigorously that the test return merely tests the mocked output. The test should always be testing a function's logic.

Mocking Loader Modules

Salt loader modules use a series of globally available dunder variables, `__salt__`, `__opts__`, `__pillar__`, etc. To facilitate testing these modules pytest-salt-factories has a plugin which will prepare the module globals by patching and mocking the dunders prior to running each test, as long as the test module defines a fixture named `configure_loader_modules`. Check out the code for the *pytest-salt-factories plugin* to know how it's internals work.

The reason for the existence of this plugin is because historically one would add these dunder variables directly on the imported module. This, however, introduces unexpected behavior when running the full test suite since those attributes would not be removed once we were done testing the module and would therefore leak to other modules being tested with unpredictable results. This is the kind of work that should be deferred to mock, and that's exactly what this plugin provides.

As an example, if one needs to specify some options which should be available to the module being tested one should do:

```
import pytest
import salt.modules.somemodule as somemodule

@pytest.fixture
def configure_loader_modules():
    """
    This fixture should return a dictionary which is what's going to be used
↪to
    patch and mock Salt's loader
    """
    return {somemodule: {"__opts__": {"test": True}}}
```

Consider this more extensive example from `tests/pytests/unit/beacons/test_sensehat.py`:

```
import pytest
import salt.beacons.sensehat as sensehat
from tests.support.mock import MagicMock

@pytest.fixture
def configure_loader_modules():
    return {
        sensehat: {
            "__salt__": {
                "sensehat.get_humidity": MagicMock(return_value=80),
                "sensehat.get_temperature": MagicMock(return_value=30),
                "sensehat.get_pressure": MagicMock(return_value=1500),
            },
        }
    }

def test_non_list_config():
```

(continues on next page)

(continued from previous page)

```
    config = {}

    ret = sensehat.validate(config)

    assert ret == (False, "Configuration for sensehat beacon must be a list.")

def test_empty_config():
    config = [{}]

    ret = sensehat.validate(config)

    assert ret == (False, "Configuration for sensehat beacon requires sensors.
↪")

def test_sensehat_humidity_match():

    config = [{"sensors": {"humidity": "70%"}}]

    ret = sensehat.validate(config)
    assert ret == (True, "Valid beacon configuration")

    ret = sensehat.beacon(config)
    assert ret == [{"tag": "sensehat/humidity", "humidity": 80}]

def test_sensehat_temperature_match():

    config = [{"sensors": {"temperature": 20}}]

    ret = sensehat.validate(config)
    assert ret == (True, "Valid beacon configuration")

    ret = sensehat.beacon(config)
    assert ret == [{"tag": "sensehat/temperature", "temperature": 30}]

def test_sensehat_temperature_match_range():

    config = [{"sensors": {"temperature": [20, 29]}}]

    ret = sensehat.validate(config)
    assert ret == (True, "Valid beacon configuration")

    ret = sensehat.beacon(config)
    assert ret == [{"tag": "sensehat/temperature", "temperature": 30}]

def test_sensehat_pressure_match():

    config = [{"sensors": {"pressure": "1400"}}]
```

(continues on next page)

(continued from previous page)

```
    ret = sensehat.validate(config)
    assert ret == (True, "Valid beacon configuration")

    ret = sensehat.beacon(config)
    assert ret == [{"tag": "sensehat/pressure", "pressure": 1500}]

def test_sensehat_no_match():

    config = [{"sensors": {"pressure": "1600"}}]

    ret = sensehat.validate(config)
    assert ret == (True, "Valid beacon configuration")

    ret = sensehat.beacon(config)
    assert ret == []
```

What happens in the above example is we mock several calls of the `sensehat` module to return known expected values to assert against.

Mocking Filehandles

Note: This documentation applies to the 2018.3 release cycle and newer. The extended functionality for `mock_open` described below does not exist in the 2017.7 and older release branches.

Opening files in Salt is done using `salt.utils.files.fopen()`. When testing code that reads from files, the `mock_open` helper can be used to mock filehandles. Note that is not the same `mock_open` as `unittest.mock.mock_open()` from the Python standard library, but rather a separate implementation which has additional functionality.

```
from tests.support.mock import patch, mock_open

import salt.modules.mymod as mymod

def test_something():
    fopen_mock = mock_open(read_data="foo\nbar\nbaz\n")
    with patch("salt.utils.files.fopen", fopen_mock):
        result = mymod.myfunc()
        assert result is True
```

This will force any filehandle opened to mimic a filehandle which, when read, produces the specified contents.

Important: String Types

When configuring your read_data, make sure that you are using bytestrings (e.g. `b"foo\nbar\nbaz\n"`) when the code you are testing is opening a file for binary reading, otherwise the tests will fail. The mocked filehandles produced by `mock_open` will raise a `TypeError` if you attempt to read a bytestring when opening for non-binary reading, and similarly will not let you read a string when opening a file for binary reading. They will also not permit bytestrings to be ”written” if the mocked filehandle was opened for non-binary writing, and vice-versa when opened for non-binary writing. These enhancements force test writers to write more accurate tests.

More Complex Scenarios

Multiple File Paths

What happens when the code being tested reads from more than one file? For those cases, you can pass `read_data` as a dictionary:

```
import textwrap

from tests.support.mock import patch, mock_open

import salt.modules.mymod as mymod

def test_something():
    contents = {
        "/etc/foo.conf": textwrap.dedent(
            """\
            foo
            bar
            baz
            """
        ),
        "/etc/b*.conf": textwrap.dedent(
            """\
            one
            two
            three
            """
        ),
    }
    fopen_mock = mock_open(read_data=contents)
    with patch("salt.utils.files.fopen", fopen_mock):
        result = mymod.myfunc()
        assert result is True
```

This would make `salt.utils.files.fopen()` produce filehandles with different contents depending on which file was being opened by the code being tested. `/etc/foo.conf` and any file matching the pattern `/etc/b*.conf` would work, while opening any other path would result in a `FileNotFoundError` being raised.

Since file patterns are supported, it is possible to use a pattern of `'*'` to define a fallback if no other patterns match the filename being opened. The below two `mock_open` calls would produce identical results:

```
mock_open(read_data="foo\n")
mock_open(read_data={"*": "foo\n"})
```

Note: Take care when specifying the `read_data` as a dictionary, in cases where the patterns overlap (e.g. when both `/etc/b*.conf` and `/etc/bar.conf` are in the `read_data`). Dictionary iteration order will determine which pattern is attempted first, second, etc., with the exception of `*` which is used when no other pattern matches.

If your test case calls for specifying overlapping patterns, and you are not running Python 3.6 or newer, then an `OrderedDict` can be used to ensure matching is handled in the desired way:

```
contents = OrderedDict()
contents["/etc/bar.conf"] = "foo\nbar\nbaz\n"
contents["/etc/b*.conf"] = IOError(errno.EACCES, "Permission denied")
contents["*"] = 'This is a fallback for files not beginning with "/etc/b"\n'
fopen_mock = mock_open(read_data=contents)
```

Raising Exceptions

Instead of a string, an exception can also be used as the `read_data`:

```
import errno

from tests.support.mock import patch, mock_open

import salt.modules.mymod as mymod

def test_something():
    exc = IOError(errno.EACCES, "Permission denied")
    fopen_mock = mock_open(read_data=exc)
    with patch("salt.utils.files.fopen", fopen_mock):
        mymod.myfunc()
```

The above example would raise the specified exception when any file is opened. The expectation would be that `mymod.myfunc()` would gracefully handle the IOError, so a failure to do that would result in it being raised and causing the test to fail.

Multiple File Contents

For cases in which a file is being read more than once, and it is necessary to test a function's behavior based on what the file looks like the second (or third, etc.) time it is read, just specify the contents for that file as a list. Each time the file is opened, `mock_open` will cycle through the list and produce a mocked filehandle with the specified contents. For example:

```
import errno
import textwrap

from tests.support.mock import patch, mock_open

import salt.modules.mymod as mymod

def test_something():
    contents = {
        "/etc/foo.conf": [
            textwrap.dedent(
                """\
```

(continues on next page)

(continued from previous page)

```
                foo
                bar
                """
            ),
            textwrap.dedent(
                """\
                foo
                bar
                baz
                """
            ),
        ],
        "/etc/b*.conf": [
            IOError(errno.ENOENT, "No such file or directory"),
            textwrap.dedent(
                """\
                one
                two
                three
                """
            ),
        ],
    }
    fopen_mock = mock_open(read_data=contents)
    with patch("salt.utils.files.fopen", fopen_mock):
        result = mymod.myfunc()
        assert result is True
```

Using this example, the first time `/etc/foo.conf` is opened, it will simulate a file with the first string in the list as its contents, while the second time it is opened, the simulated file's contents will be the second string in the list.

If no more items remain in the list, then attempting to open the file will raise a `RuntimeError`. In the example above, if `/etc/foo.conf` were to be opened a third time, a `RuntimeError` would be raised.

Note that exceptions can also be mixed in with strings when using this technique. In the above example, if `/etc/bar.conf` were to be opened twice, the first time would simulate the file not existing, while the second time would simulate a file with string defined in the second element of the list.

Note: Notice that the second path in the `contents` dictionary above (`/etc/b*.conf`) contains an asterisk. The items in the list are cycled through for each match of a given pattern (*not* separately for each individual file path), so this means that only two files matching that pattern could be opened before the next one would raise a `RuntimeError`.

Accessing the Mocked Filehandles in a Test

Note: The code for the `MockOpen`, `MockCall`, and `MockFH` classes (referenced below) can be found in `tests/support/mock.py`. There are extensive unit tests for them located in `tests/unit/test_mock.py`.

The above examples simply show how to mock `salt.utils.files.fopen()` to simulate files with the contents you desire, but you can also access the mocked filehandles (and more), and use them to craft assertions in your tests. To do so, just add an `as` clause to the end of the `patch` statement:

```
fopen_mock = mock_open(read_data="foo\nbar\nbaz\n")
with patch("salt.utils.files.fopen", fopen_mock) as m_open:
    # do testing here
    ...
    ...
```

When doing this, `m_open` will be a `MockOpen` instance. It will contain several useful attributes:

- **read_data** - A dictionary containing the `read_data` passed when `mock_open` was invoked. In the event that *multiple file paths* are not used, then this will be a dictionary mapping `*` to the `read_data` passed to `mock_open`.
- **call_count** - An integer representing how many times `salt.utils.files.fopen()` was called to open a file.
- **calls** - A list of `MockCall` objects. A `MockCall` object is a simple class which stores the arguments passed to it, making the positional arguments available via its `args` attribute, and the keyword arguments available via its `kwargs` attribute.

  ```
  from tests.support.mock import patch, mock_open, MockCall

  import salt.modules.mymod as mymod

  def test_something():

      with patch("salt.utils.files.fopen", mock_open(read_data=b"foo\n"))
  ↪as m_open:
          mymod.myfunc()
          # Assert that only two opens attempted
          assert m_open.call_count == 2
          # Assert that only /etc/foo.conf was opened
          assert all(call.args[0] == "/etc/foo.conf" for call in m_open.
  ↪calls)
          # Asser that the first open was for binary read, and the
          # second was for binary write.
          assert m_open.calls == [
              MockCall("/etc/foo.conf", "rb"),
              MockCall("/etc/foo.conf", "wb"),
          ]
  ```

  Note that `MockCall` is imported from `tests.support.mock` in the above example. Also, the second assert above is redundant since it is covered in the final assert, but both are included simply as an example.

- **filehandles** - A dictionary mapping the unique file paths opened, to lists of `MockFH` objects. Each open creates a unique `MockFH` object. Each `MockFH` object itself has a number of useful attributes:

  - **filename** - The path to the file which was opened using `salt.utils.files.fopen()`
  - **call** - A `MockCall` object representing the arguments passed to `salt.utils.files.fopen()`. Note that this `MockCall` is also available in the parent `MockOpen` instance's **calls** list.
  - The following methods are mocked using `unittest.mock.Mock` objects, and Mock's built-in asserts (as well as the call data) can be used as you would with any other Mock object:
    * **.read()**
    * **.readlines()**
    * **.readline()**
    * **.close()**
    * **.write()**
    * **.writelines()**
    * **.seek()**
  - The read functions (**.read()**, **.readlines()**, **.readline()**) all work as expected, as does iterating through the file line by line (i.e. `for line in fh:`).
  - The .**tell()** method is also implemented in such a way that it updates after each time the mocked filehandle is read, and will report the correct position. The one caveat here is that .**seek()** doesn't actually work (it's simply mocked), and will not change the position. Additionally, neither .**write()** or .**writelines()** will modify the mocked filehandle's contents.
  - The attributes .**write_calls** and .**writelines_calls** (no parenthesis) are available as shorthands and correspond to lists containing the contents passed for all calls to .**write()** and .**writelines()**, respectively.

Examples

```
with patch("salt.utils.files.fopen", mock_open(read_data=contents)) as m_open:
    # Run the code you are unit testing
    mymod.myfunc()
    # Check that only the expected file was opened, and that it was opened
    # only once.
    assert m_open.call_count == 1
    assert list(m_open.filehandles) == ["/etc/foo.conf"]
    # "opens" will be a list of all the mocked filehandles opened
    opens = m_open.filehandles["/etc/foo.conf"]
    # Check that we wrote the expected lines ("expected" here is assumed to
    # be a list of strings)
    assert opens[0].write_calls == expected
```

```
with patch("salt.utils.files.fopen", mock_open(read_data=contents)) as m_open:
    # Run the code you are unit testing
    mymod.myfunc()
    # Check that .readlines() was called (remember, it's a Mock)
    m_open.filehandles["/etc/foo.conf"][0].readlines.assert_called()
```

```
with patch("salt.utils.files.fopen", mock_open(read_data=contents)) as m_open:
    # Run the code you are unit testing
    mymod.myfunc()
```

(continues on next page)

(continued from previous page)

```
    # Check that we read the file and also wrote to it
    m_open.filehandles["/etc/foo.conf"][0].read.assert_called_once()
    m_open.filehandles["/etc/foo.conf"][1].writelines.assert_called_once()
```

Naming Conventions

Test names and docstrings should indicate what functionality is being tested. Test functions are named `test_<fcn>_<test-name>` where `<fcn>` is the function being tested and `<test-name>` describes the `raise` or `return` being tested.

Unit tests for `salt/.../<module>.py` are contained in a file called `tests/pytests/unit/.../test_<module>.py`, e.g. the tests for `salt/modules/alternatives.py` are in `tests/pytests/unit/modules/test_alternatives.py`.

In order for unit tests to get picked up during a run of the unit test suite, each unit test file must be prefixed with `test_` and each individual test must also be prefixed with the `test_` naming syntax, as described above.

If a function does not start with `test_`, then the function acts as a ”normal” function and is not considered a testing function. It will not be included in the test run or testing output. The same principle applies to unit test files that do not have the `test_*.py` naming syntax. This test file naming convention is how the test runner recognizes that a test file contains tests.

Imports

Most commonly, the following imports are necessary to create a unit test:

```
import pytest
```

If you need mock support to your tests, please also import:

```
from tests.support.mock import MagicMock, patch, call
```

32.26.4 Evaluating Truth

A longer discussion on the types of assertions one can make can be found by reading PyTest's documentation on assertions.

32.26.5 Tests Using Mock Objects

In many cases, the purpose of a Salt module is to interact with some external system, whether it be to control a database, manipulate files on a filesystem or something else. In these varied cases, it's necessary to design a unit test which can test the function whilst replacing functions which might actually call out to external systems. One might think of this as ”blocking the exits” for code under tests and redirecting the calls to external systems with our own code which produces known results during the duration of the test.

To achieve this behavior, Salt makes heavy use of the MagicMock package.

To understand how one might integrate Mock into writing a unit test for Salt, let's imagine a scenario in which we're testing an execution module that's designed to operate on a database. Furthermore, let's imagine two separate methods, here presented in pseudo-code in an imaginary execution module called 'db.py'.

```
def create_user(username):
    qry = "CREATE USER {0}".format(username)
    execute_query(qry)

def execute_query(qry):
    # Connect to a database and actually do the query...
    ...
```

Here, let's imagine that we want to create a unit test for the *create_user* function. In doing so, we want to avoid any calls out to an external system and so while we are running our unit tests, we want to replace the actual interaction with a database with a function that can capture the parameters sent to it and return pre-defined values. Therefore, our task is clear -- to write a unit test which tests the functionality of *create_user* while also replacing 'execute_query' with a mocked function.

To begin, we set up the skeleton of our test much like we did before, but with additional imports for MagicMock:

```
from salt.modules import db
from tests.support.mock import MagicMock, patch, call

def test_create_user():
    """
    Test creating a user
    """
    # First, we replace 'execute_query' with our own mock function
    with patch.object(db, "execute_query", MagicMock()) as db_exq:

        # Now that the exits are blocked, we can run the function under test.
        db.create_user("testuser")

        # We could now query our mock object to see which calls were made
        # to it.
        ## print db_exq.mock_calls

        # Construct a call object that simulates the way we expected
        # execute_query to have been called.
        expected_call = call("CREATE USER testuser")

        # Compare the expected call with the list of actual calls.  The
        # test will succeed or fail depending on the output of this
        # assertion.
        db_exq.assert_has_calls(expected_call)
```

32.26.6 Modifying `__salt__` In Place

At times, it becomes necessary to make modifications to a module's view of functions in its own `__salt__` dictionary. Luckily, this process is quite easy.

Below is an example that uses MagicMock's `patch` functionality to insert a function into `__salt__` that's actually a MagicMock instance.

```
import pytest
import salt.modules.my_module as my_module

@pytest.fixture
def configure_loader_modules():
    """
    This fixture should return a dictionary which is what's going to be used␣
↪to
    patch and mock Salt's loader
    """
    return {my_module: {}}

def show_patch(self):
    with patch.dict(my_module.__salt__, {"function.to_replace": MagicMock()}):
        # From this scope, carry on with testing, with a modified __salt__!
        ...
```

32.26.7 A Simple Example

Let's assume that we're testing a very basic function in an imaginary Salt execution module. Given a module called `fib.py` that has a function called `calculate(num_of_results)`, which given a `num_of_results`, produces a list of sequential Fibonacci numbers of that length.

A unit test to test this function might be commonly placed in a file called `tests/pytests/unit/modules/test_fib.py`. The convention is to place unit tests for Salt execution modules in `test/pytests/unit/modules/` and to name the tests module prefixed with `test_*.py`.

Tests are grouped around test cases, which are logically grouped sets of tests against a piece of functionality in the tested software. To return to our example, here's how we might write the skeleton for testing `fib.py`:

```
import salt.modules.fib as fib

def test_fib():
    """
    To create a unit test, we should prefix the name with `test_' so
    that it's recognized by the test runner.
    """
    fib_five = (0, 1, 1, 2, 3)
    assert fib.calculate(5) == fib_five
```

At this point, the test can now be run, either individually or as a part of a full run of the test runner. To ease development, a single test can be executed:

```
nox -e 'test-3(coverage=False)' -- -v tests/pytests/unit/modules/test_fib.py
```

This will report the status of the test: success, failure, or error. The `-v` flag increases output verbosity.

To review the results of a particular run, take a note of the log location given in the output for each test run:

```
...etc... --log-file=artifacts/logs/runtests-20210106103414.685791.log ...etc.
↪..
```

32.26.8 A More Complete Example

Consider the following function from salt/modules/linux_sysctl.py.

```
def get(name):
    """
    Return a single sysctl parameter for this minion

    CLI Example:

    .. code-block:: bash

        salt '*' sysctl.get net.ipv4.ip_forward
    """
    cmd = "sysctl -n {}".format(name)
    out = __salt__["cmd.run"](cmd, python_shell=False)
    return out
```

This function is very simple, comprising only four source lines of code and having only one return statement, so we know only one test is needed. There are also two inputs to the function, the `name` function argument and the call to `__salt__['cmd.run']()`, both of which need to be appropriately mocked.

Mocking a function parameter is straightforward, whereas mocking a function call will require, in this case, the use of MagicMock. For added isolation, we will also redefine the `__salt__` dictionary such that it only contains `'cmd.run'`.

```
import pytest
import salt.modules.linux_sysictl as linux_sysctl
from tests.support.mock import MagicMock, patch

@pytest.fixture
def configure_loader_modules():
    return {linux_sysctl: {}}

def test_get():
    """
    Tests the return of get function
    """
    mock_cmd = MagicMock(return_value=1)
    with patch.dict(linux_sysctl.__salt__, {"cmd.run": mock_cmd}):
        assert linux_sysctl.get("net.ipv4.ip_forward") == 1
```

Since `get()` has only one raise or return statement and that statement is a success condition, the test function is simply named `test_get()`. As described, the single function call parameter, `name` is mocked with `net.ipv4.ip_forward` and `__salt__['cmd.run']` is replaced by a MagicMock function object. We are only interested in the return value of `__salt__['cmd.run']`, which MagicMock allows us by specifying via `return_value=1`. Finally, the test itself tests for equality between the return value of `get()` and the expected return of `1`. This assertion is expected to succeed because `get()` will determine its return value from `__salt__['cmd.run']`, which we have mocked to return `1`.

32.26.9 A Complex Example

Now consider the `assign()` function from the same salt/modules/linux_sysctl.py source file.

```
def assign(name, value):
    """
    Assign a single sysctl parameter for this minion

    CLI Example:

    .. code-block:: bash

        salt '*' sysctl.assign net.ipv4.ip_forward 1
    """
    value = str(value)

    tran_tab = name.translate("".maketrans("./", "/."))

    sysctl_file = "/proc/sys/{}".format(tran_tab)
    if not os.path.exists(sysctl_file):
        raise CommandExecutionError("sysctl {} does not exist".format(name))

    ret = {}
    cmd = 'sysctl -w {}="{}"'.format(name, value)
    data = __salt__["cmd.run_all"](cmd, python_shell=False)
    out = data["stdout"]
    err = data["stderr"]

    # Example:
    #    # sysctl -w net.ipv4.tcp_rmem="4096 87380 16777216"
    #    net.ipv4.tcp_rmem = 4096 87380 16777216
    regex = re.compile(r"^{}\s+=\s+{}$".format(re.escape(name), re.
↪escape(value)))

    if not regex.match(out) or "Invalid argument" in str(err):
        if data["retcode"] != 0 and err:
            error = err
        else:
            error = out
        raise CommandExecutionError("sysctl -w failed: {}".format(error))
    new_name, new_value = out.split(" = ", 1)
    ret[new_name] = new_value
    return ret
```

This function contains two raise statements and one return statement, so we know that we will need (at least) three tests. It has two function arguments and many references to non-builtin functions. In the tests below you will see that MagicMock's `patch()` method may be used as a context manager or as a decorator. When patching the salt dunders however, please use the context manager approach.

There are three test functions, one for each raise and return statement in the source function. Each function is self-contained and contains all and only the mocks and data needed to test the raise or return statement it is concerned with.

```
import pytest
import salt.modules.linux_sysctl as linux_sysctl
from salt.exceptions import CommandExecutionError
from tests.support.mock import MagicMock, patch

@pytest.fixture
def configure_loader_modules():
    return {linux_sysctl: {}}

def test_assign_proc_sys_failed():
    """
    Tests if /proc/sys/<kernel-subsystem> exists or not
    """
    with patch("os.path.exists", MagicMock(return_value=False)):
        cmd = {
            "pid": 1337,
            "retcode": 0,
            "stderr": "",
            "stdout": "net.ipv4.ip_forward = 1",
        }
        mock_cmd = MagicMock(return_value=cmd)
        with patch.dict(linux_sysctl.__salt__, {"cmd.run_all": mock_cmd}):
            with pytest.raises(CommandExecutionError):
                linux_sysctl.assign("net.ipv4.ip_forward", 1)

def test_assign_cmd_failed():
    """
    Tests if the assignment was successful or not
    """
    with patch("os.path.exists", MagicMock(return_value=True)):
        cmd = {
            "pid": 1337,
            "retcode": 0,
            "stderr": 'sysctl: setting key "net.ipv4.ip_forward": Invalid⊠
↪argument',
            "stdout": "net.ipv4.ip_forward = backward",
        }
        mock_cmd = MagicMock(return_value=cmd)
        with patch.dict(linux_sysctl.__salt__, {"cmd.run_all": mock_cmd}):
            with pytest.raises(CommandExecutionError):
                linux_sysctl.assign("net.ipv4.ip_forward", "backward")
```

(continues on next page)

(continued from previous page)

```
def test_assign_success():
    """
    Tests the return of successful assign function
    """
    with patch("os.path.exists", MagicMock(return_value=True)):
        cmd = {
            "pid": 1337,
            "retcode": 0,
            "stderr": "",
            "stdout": "net.ipv4.ip_forward = 1",
        }
        ret = {"net.ipv4.ip_forward": "1"}
        mock_cmd = MagicMock(return_value=cmd)
        with patch.dict(linux_sysctl.__salt__, {"cmd.run_all": mock_cmd}):
            assert linux_sysctl.assign("net.ipv4.ip_forward", 1) == ret
```

32.27 SaltStack Git Policy

The SaltStack team follows a git policy to maintain stability and consistency with the repository.

The git policy has been developed to encourage contributions and make contributing to Salt as easy as possible. Code contributors to SaltStack projects DO NOT NEED TO READ THIS DOCUMENT, because all contributions come into SaltStack via a single gateway to make it as easy as possible for contributors to give us code.

The primary rule of git management in SaltStack is to make life easy on contributors and developers to send in code. Simplicity is always a goal!

32.27.1 New Code Entry

All new SaltStack code should be submitted against `master`.

32.27.2 Release Branching

SaltStack maintains two types of releases, `Feature Releases` and `Point Releases` (also commonly referred to as `Bugfix Releases`. A feature release is managed by incrementing the first or second release point number, so 2015.5.5 -> 2015.8.0 signifies a feature release and 2015.8.0 -> 2015.8.1 signifies a point release.

Feature Release Branching

Each feature release is maintained in a dedicated git branch derived from the last applicable release commit on develop. All file changes relevant to the feature release will be completed in the `master` branch prior to the creation of the feature release branch. The feature release branch will be named after the relevant numbers to the feature release, which constitute the first two numbers. This means that the release branch for the 2015.8.0 series is named 2015.8.

A feature release branch is created with the following command:

```
# git checkout -b 2015.8 # From the master branch
# git push origin 2015.8
```

Point Releases

As documented in SEP 14, point releases should be rare.

32.28 Salt Conventions

32.28.1 Writing Salt documentation

For the latest information about writing Salt documentation, see:

- Salt docs contributing guide
- Salt rST guide
- Salt style guide

32.28.2 Salt Formulas

Formulas are pre-written Salt States. They are as open-ended as Salt States themselves and can be used for tasks such as installing a package, configuring, and starting a service, setting up users or permissions, and many other common tasks.

All official Salt Formulas are found as separate Git repositories in the "saltstack-formulas" organization on GitHub:

https://github.com/saltstack-formulas

As a simple example, to install the popular Apache web server (using the normal defaults for the underlying distro) simply include the url apache-formula from a top file:

```
base:
  'web*':
    - apache
```

Installation

Each Salt Formula is an individual Git repository designed as a drop-in addition to an existing Salt State tree. Formulas can be installed in the following ways.

Adding a Formula as a GitFS remote

One design goal of Salt's GitFS fileserver backend was to facilitate reusable States. GitFS is a quick and natural way to use Formulas.

1. *Install any necessary dependencies and configure GitFS*.
2. Add one or more Formula repository URLs as remotes in the `gitfs_remotes` list in the Salt Master configuration file:

   ```
   gitfs_remotes:
     - https://github.com/saltstack-formulas/apache-formula
     - https://github.com/saltstack-formulas/memcached-formula
   ```

   We strongly recommend forking a formula repository into your own GitHub account to avoid unexpected changes to your infrastructure.

   Many Salt Formulas are highly active repositories so pull new changes with care. Plus any additions you make to your fork can be easily sent back upstream with a quick pull request!

3. Restart the Salt master.

Beginning with the 2018.3.0 release, using formulas with GitFS is now much more convenient for deployments which use many different fileserver environments (i.e. saltenvs). Using the *all_saltenvs* parameter, files from a single git branch/tag will appear in all environments. See *here* for more information on this feature.

Adding a Formula directory manually

Formulas are simply directories that can be copied onto the local file system by using Git to clone the repository or by downloading and expanding a tarball or zip file of the repository. The directory structure is designed to work with `file_roots` in the Salt master configuration.

1. Clone or download the repository into a directory:

```
mkdir -p /srv/formulas
cd /srv/formulas
git clone https://github.com/saltstack-formulas/apache-formula.git

# or

mkdir -p /srv/formulas
cd /srv/formulas
wget -O apache-formula-master.tar.gz https://github.com/saltstack-
↪formulas/apache-formula/archive/master.tar.gz
tar xf apache-formula-master.tar.gz
```

2. Add the new directory to `file_roots`:

```
file_roots:
  base:
    - /srv/salt
    - /srv/formulas/apache-formula
```

3. Restart the Salt Master.

Usage

Each Formula is intended to be immediately usable with sane defaults without any additional configuration. Many formulas are also configurable by including data in Pillar; see the `pillar.example` file in each Formula repository for available options.

Including a Formula in an existing State tree

Formula may be included in an existing `sls` file. This is often useful when a state you are writing needs to `require` or `extend` a state defined in the formula.

Here is an example of a state that uses the url epel-formula in a `require` declaration which directs Salt to not install the `python26` package until after the EPEL repository has also been installed:

```
include:
  - epel

python26:
  pkg.installed:
    - require:
      - pkg: epel
```

Including a Formula from a Top File

Some Formula perform completely standalone installations that are not referenced from other state files. It is usually cleanest to include these Formula directly from a Top File.

For example the easiest way to set up an OpenStack deployment on a single machine is to include the url openstack-standalone-formula directly from a `top.sls` file:

```
base:
  'myopenstackmaster':
    - openstack
```

Quickly deploying OpenStack across several dedicated machines could also be done directly from a Top File and may look something like this:

```
base:
  'controller':
    - openstack.horizon

```

Configuring Formula using Pillar

Salt Formulas are designed to work out of the box with no additional configuration. However, many Formula support additional configuration and customization through *Pillar*. Examples of available options can be found in a file named `pillar.example` in the root directory of each Formula repository.

Using Formula with your own states

Remember that Formula are regular Salt States and can be used with all Salt's normal state mechanisms. Formula can be required from other States with *require* declarations, they can be modified using `extend`, they can made to watch other states with *The _in version of requisites*.

The following example uses the stock url apache-formula alongside a custom state to create a vhost on a Debian/Ubuntu system and to reload the Apache service whenever the vhost is changed.

```
# Include the stock, upstream apache formula.
include:
  - apache

# Use the watch_in requisite to cause the apache service state to reload
# apache whenever the my-example-com-vhost state changes.
my-example-com-vhost:
  file:
    - managed
    - name: /etc/apache2/sites-available/my-example-com
    - watch_in:
      - service: apache
```

Don't be shy to read through the source for each Formula!

Reporting problems & making additions

Each Formula is a separate repository on GitHub. If you encounter a bug with a Formula please file an issue in the respective repository! Send fixes and additions as a pull request. Add tips and tricks to the repository wiki.

Writing Formulas

Each Formula is a separate repository in the saltstack-formulas organization on GitHub.

Get involved creating new Formulas

The best way to create new Formula repositories for now is to create a repository in your own account on GitHub and notify a SaltStack employee when it is ready. We will add you to the Contributors team on the saltstack-formulas organization and help you transfer the repository over. Join the `#formulas` channel on the salt-discord or send an email to the salt-users mailing list.

Team members can manage which repositories they are subscribed to on GitHub's watching page: https://github.com/watching.

Members of the Contributors team are welcome to participate in reviewing pull requests across the Organization. Some repositories will have regular contributors and some repositories will not. As you get involved in a repository be sure to communicate with any other contributors there on pull requests that are large or have breaking changes.

In general it is best to have another Contributor review and merge any pull requests that you open. Feel free to at-mention other regular contributors to a repository and request a review. However, there are a lot of formula repositories so if a repository does not yet have regular contributors or if your pull request has stayed open for more than a couple days feel free to ”selfie-merge” your own pull request.

Style

Maintainability, readability, and reusability are all marks of a good Salt sls file. This section contains several suggestions and examples.

```
# Deploy the stable master branch unless version overridden by passing
# Pillar at the CLI or via the Reactor.

deploy_myapp:
  git.latest:
    - name: git@github.com/myco/myapp.git
    - version: {{ salt['pillar.get']('myapp:version', 'master') }}
```

Use a descriptive State ID

The ID of a state is used as a unique identifier that may be referenced via other states in *requisites*. It must be unique across the whole state tree (*it is a key in a dictionary*, after all).

In addition a state ID should be descriptive and serve as a high-level hint of what it will do, or manage, or change. For example, `deploy_webapp`, or `apache`, or `reload_firewall`.

Use `module.function` notation

So-called "short-declaration" notation is preferred for referencing state modules and state functions. It provides a consistent pattern of `module.function` shared between Salt States, the Reactor, Salt Mine, the Scheduler, as well as with the CLI.

```
# Do
apache:
  pkg.installed:
    - name: httpd

# Don't
apache:
  pkg:
    - installed
    - name: httpd
```

Salt's state compiler will transform "short-decs" into the longer format *when compiling the human-friendly highstate structure into the machine-friendly lowstate structure*.

Specify the `name` parameter

Use a unique and permanent identifier for the state ID and reserve `name` for data with variability.

The *name declaration* is a required parameter for all state functions. The state ID will implicitly be used as `name` if it is not explicitly set in the state.

In many state functions the `name` parameter is used for data that varies such as OS-specific package names, OS-specific file system paths, repository addresses, etc. Any time the ID of a state changes all references to that ID must also be changed. Use a permanent ID when writing a state the first time to future-proof that state and allow for easier refactors down the road.

Comment state files

YAML allows comments at varying indentation levels. It is a good practice to comment state files. Use vertical whitespace to visually separate different concepts or actions.

```
# Start with a high-level description of the current sls file.
# Explain the scope of what it will do or manage.

# Comment individual states as necessary.
update_a_config_file:
  # Provide details on why an unusual choice was made. For example:
  #
  # This template is fetched from a third-party and does not fit our
  # company norm of using Jinja. This must be processed using Mako.
  file.managed:
    - name: /path/to/file.cfg
    - source: salt://path/to/file.cfg.template
    - template: mako

  # Provide a description or explanation that did not fit within the state
  # ID. For example:
  #
  # Update the application's last-deployed timestamp.
  # This is a workaround until Bob configures Jenkins to automate RPM
  # builds of the app.
  cmd.run:
    # FIXME: Joe needs this to run on Windows by next quarter. Switch these
    # from shell commands to Salt's file.managed and file.replace state
    # modules.
    - name: |
        touch /path/to/file_last_updated
        sed -e 's/foo/bar/g' /path/to/file_environment
    - onchanges:
      - file: a_config_file
```

Be careful to use Jinja comments for commenting Jinja code and YAML comments for commenting YAML code.

```
# BAD EXAMPLE
# The Jinja in this YAML comment is still executed!
# {% set apache_is_installed = 'apache' in salt['pkg.list_pkgs']() %}

# GOOD EXAMPLE
# The Jinja in this Jinja comment will not be executed.
{# {% set apache_is_installed = 'apache' in salt['pkg.list_pkgs']() %} #}
```

Easy on the Jinja!

Jinja templating provides vast flexibility and power when building Salt sls files. It can also create an unmaintainable tangle of logic and data. Speaking broadly, Jinja is best used when kept apart from the states (as much as is possible).

Below are guidelines and examples of how Jinja can be used effectively.

Know the evaluation and execution order

High-level knowledge of how Salt states are compiled and run is useful when writing states.

The default *`renderer`* setting in Salt is Jinja piped to YAML. Each is a separate step. Each step is not aware of the previous or following step. Jinja is not YAML aware, YAML is not Jinja aware; they cannot share variables or interact.

- Whatever the Jinja step produces must be valid YAML.
- Whatever the YAML step produces must be a valid *highstate data structure*. (This is also true of the final step for *any of the alternate renderers* in Salt.)
- Highstate can be thought of as a human-friendly data structure; easy to write and easy to read.
- Salt's state compiler validates the *highstate* and compiles it to low state.
- Low state can be thought of as a machine-friendly data structure. It is a list of dictionaries that each map directly to a function call.
- Salt's state system finally starts and executes on each "chunk" in the low state. Remember that requisites are evaluated at runtime.
- The return for each function call is added to the "running" dictionary which is the final output at the end of the state run.

The full evaluation and execution order:

```
Jinja -> YAML -> Highstate -> low state -> execution
```

Avoid changing the underlying system with Jinja

Avoid calling commands from Jinja that change the underlying system. Commands run via Jinja do not respect Salt's dry-run mode (`test=True`)! This is usually in conflict with the idempotent nature of Salt states unless the command being run is also idempotent.

Inspect the local system

A common use for Jinja in Salt states is to gather information about the underlying system. The `grains` dictionary available in the Jinja context is a great example of common data points that Salt itself has already gathered. Less common values are often found by running commands. For example:

```
{% set is_selinux_enabled = salt['cmd.run']('sestatus') == '1' %}
```

This is usually best done with a variable assignment in order to separate the data from the state that will make use of the data.

Gather external data

One of the most common uses for Jinja is to pull external data into the state file. External data can come from anywhere like API calls or database queries, but it most commonly comes from flat files on the file system or Pillar data from the Salt Master. For example:

```
{% set some_data = salt['pillar.get']('some_data', {'sane default': True}) %}

{# or #}

{% import_yaml 'path/to/file.yaml' as some_data %}

{# or #}

{% import_json 'path/to/file.json' as some_data %}

{# or #}

{% import_text 'path/to/ssh_key.pub' as ssh_pub_key %}

{# or #}

{% from 'path/to/other_file.jinja' import some_data with context %}
```

This is usually best done with a variable assignment in order to separate the data from the state that will make use of the data.

Light conditionals and looping

Jinja is extremely powerful for programmatically generating Salt states. It is also easy to overuse. As a rule of thumb, if it is hard to read it will be hard to maintain!

Separate Jinja control-flow statements from the states as much as is possible to create readable states. Limit Jinja within states to simple variable lookups.

Below is a simple example of a readable loop:

```
{% for user in salt['pillar.get']('list_of_users', []) %}

{# Ensure unique state IDs when looping. #}
{{ user.name }}-{{ loop.index }}:
  user.present:
    - name: {{ user.name }}
    - shell: {{ user.shell }}

{% endfor %}
```

Avoid putting a Jinja conditionals within Salt states where possible. Readability suffers and the correct YAML indentation is difficult to see in the surrounding visual noise. Parametrization (discussed below) and variables are both useful techniques to avoid this. For example:

```
{# ---- Bad example ---- #}

```

(continues on next page)

(continued from previous page)

```
apache:
  pkg.installed:
    {% if grains.os_family == 'RedHat' %}
    - name: httpd
    {% elif grains.os_family == 'Debian' %}
    - name: apache2
    {% endif %}

{# ---- Better example ---- #}

{% if grains.os_family == 'RedHat' %}
{% set name = 'httpd' %}
{% elif grains.os_family == 'Debian' %}
{% set name = 'apache2' %}
{% endif %}

 apache:
  pkg.installed:
    - name: {{ name }}

{# ---- Good example ---- #}

{% set name = {
    'RedHat': 'httpd',
    'Debian': 'apache2',
}.get(grains.os_family) %}

 apache:
  pkg.installed:
    - name: {{ name }}
```

Dictionaries are useful to effectively "namespace" a collection of variables. This is useful with parametrization (discussed below). Dictionaries are also easily combined and merged. And they can be directly serialized into YAML which is often easier than trying to create valid YAML through templating. For example:

```
{# ---- Bad example ---- #}

haproxy_conf:
  file.managed:
    - name: /etc/haproxy/haproxy.cfg
    - template: jinja
    {% if 'external_loadbalancer' in grains.roles %}
    - source: salt://haproxy/external_haproxy.cfg
    {% elif 'internal_loadbalancer' in grains.roles %}
    - source: salt://haproxy/internal_haproxy.cfg
    {% endif %}
    - context:
        {% if 'external_loadbalancer' in grains.roles %}
        ssl_termination: True
        {% elif 'internal_loadbalancer' in grains.roles %}
        ssl_termination: False
        {% endif %}
```

(continues on next page)

(continued from previous page)

```
{# ---- Better example ---- #}

{% load_yaml as haproxy_defaults %}
common_settings:
  bind_port: 80

internal_loadbalancer:
  source: salt://haproxy/internal_haproxy.cfg
  settings:
    bind_port: 8080
    ssl_termination: False

external_loadbalancer:
  source: salt://haproxy/external_haproxy.cfg
  settings:
    ssl_termination: True
{% endload %}

{% if 'external_loadbalancer' in grains.roles %}
{% set haproxy = haproxy_defaults['external_loadbalancer'] %}
{% elif 'internal_loadbalancer' in grains.roles %}
{% set haproxy = haproxy_defaults['internal_loadbalancer'] %}
{% endif %}

{% do haproxy.settings.update(haproxy_defaults.common_settings) %}

haproxy_conf:
  file.managed:
    - name: /etc/haproxy/haproxy.cfg
    - template: jinja
    - source: {{ haproxy.source }}
    - context: {{ haproxy.settings | yaml() }}
```

There is still room for improvement in the above example. For example, extracting into an external file or replacing the if-elif conditional with a function call to filter the correct data more succinctly. However, the state itself is simple and legible, the data is separate and also simple and legible. And those suggested improvements can be made at some future date without altering the state at all!

Avoid heavy logic and programming

Jinja is not Python. It was made by Python programmers and shares many semantics and some syntax but it does not allow for arbitrary Python function calls or Python imports. Jinja is a fast and efficient templating language but the syntax can be verbose and visually noisy.

Once Jinja use within an sls file becomes slightly complicated -- long chains of if-elif-elif-else statements, nested conditionals, complicated dictionary merges, wanting to use sets -- instead consider using a different Salt renderer, such as the Python renderer. As a rule of thumb, if it is hard to read it will be hard to maintain -- switch to a format that is easier to read.

Using alternate renderers is very simple to do using Salt's "she-bang" syntax at the top of the file. The Python renderer must simply return the correct *highstate data structure*. The following example is a state tree of two sls files, one simple and one complicated.

`/srv/salt/top.sls`:

```
base:
  '*':
    - common_configuration
    - roles_configuration
```

`/srv/salt/common_configuration.sls`:

```
common_users:
  user.present:
    - names:
      - larry
      - curly
      - moe
```

`/srv/salt/roles_configuration`:

```
#!py
def run():
    list_of_roles = set()

    # This example has the minion id in the form 'web-03-dev'.
    # Easily access the grains dictionary:
    try:
        app, instance_number, environment = __grains__["id"].split("-")
        instance_number = int(instance_number)
    except ValueError:
        app, instance_number, environment = ["Unknown", 0, "dev"]

    list_of_roles.add(app)

    if app == "web" and environment == "dev":
        list_of_roles.add("primary")
        list_of_roles.add("secondary")
    elif app == "web" and environment == "staging":
        if instance_number == 0:
            list_of_roles.add("primary")
        else:
            list_of_roles.add("secondary")

    # Easily cross-call Salt execution modules:
    if __salt__["myutils.query_valid_ec2_instance"]():
        list_of_roles.add("is_ec2_instance")

    return {
        "set_roles_grains": {
            "grains.present": [{"name": "roles"}, {"value": list(list_of_
↪roles)}],
        },
    }
```

Jinja Macros

In Salt sls files Jinja macros are useful for one thing and one thing only: creating mini templates that can be reused and rendered on demand. Do not fall into the trap of thinking of macros as functions; Jinja is not Python (see above).

Macros are useful for creating reusable, parameterized states. For example:

```
{% macro user_state(state_id, user_name, shell='/bin/bash', groups=[]) %}
{{ state_id }}:
  user.present:
    - name: {{ user_name }}
    - shell: {{ shell }}
    - groups: {{ groups | json() }}
{% endmacro %}

{% for user_info in salt['pillar.get']('my_users', []) %}
{{ user_state('user_number_' ~ loop.index, **user_info) }}
{% endfor %}
```

Macros are also useful for creating one-off "serializers" that can accept a data structure and write that out as a domain-specific configuration file. For example, the following macro could be used to write a php.ini config file:

`/srv/salt/php.sls`:

```
php_ini:
  file.managed:
    - name: /etc/php.ini
    - source: salt://php.ini.tmpl
    - template: jinja
    - context:
        php_ini_settings: {{ salt['pillar.get']('php_ini', {}) | json() }}
```

`/srv/pillar/php.sls`:

```
php_ini:
  PHP:
    engine: 'On'
    short_open_tag: 'Off'
    error_reporting: 'E_ALL & ~E_DEPRECATED & ~E_STRICT'
```

`/srv/salt/php.ini.tmpl`:

```
{% macro php_ini_serializer(data) %}
{% for section_name, name_val_pairs in data.items() %}
[{{ section_name }}]
{% for name, val in name_val_pairs.items() -%}
{{ name }} = "{{ val }}"
{% endfor %}
{% endfor %}
{% endmacro %}

; File managed by Salt at <{{ source }}>.
; Your changes will be overwritten.

{{ php_ini_serializer(php_ini_settings) }}
```

Abstracting static defaults into a lookup table

Separate data that a state uses from the state itself to increases the flexibility and reusability of a state.

An obvious and common example of this is platform-specific package names and file system paths. Another example is sane defaults for an application, or common settings within a company or organization. Organizing such data as a dictionary (aka hash map, lookup table, associative array) often provides a lightweight namespacing and allows for quick and easy lookups. In addition, using a dictionary allows for easily merging and overriding static values within a lookup table with dynamic values fetched from Pillar.

A strong convention in Salt Formulas is to place platform-specific data, such as package names and file system paths, into a file named `map.jinja` that is placed alongside the state files.

The following is an example from the MySQL Formula. The *`grains.filter_by`* function performs a lookup on that table using the `os_family` grain (by default).

The result is that the `mysql` variable is assigned to a *subset* of the lookup table for the current platform. This allows states to reference, for example, the name of a package without worrying about the underlying OS. The syntax for referencing a value is a normal dictionary lookup in Jinja, such as `{{ mysql['service'] }}` or the shorthand `{{ mysql.service }}`.

`map.jinja`:

```
{% set mysql = salt['grains.filter_by']({
    'Debian': {
        'server': 'mysql-server',
        'client': 'mysql-client',
        'service': 'mysql',
        'config': '/etc/mysql/my.cnf',
        'python': 'python-mysqldb',
    },
    'RedHat': {
        'server': 'mysql-server',
        'client': 'mysql',
        'service': 'mysqld',
        'config': '/etc/my.cnf',
        'python': 'MySQL-python',
    },
    'Gentoo': {
        'server': 'dev-db/mysql',
        'client': 'dev-db/mysql',
        'service': 'mysql',
        'config': '/etc/mysql/my.cnf',
        'python': 'dev-python/mysql-python',
    },
}, merge=salt['pillar.get']('mysql:lookup')) %}
```

Values defined in the map file can be fetched for the current platform in any state file using the following syntax:

```
{% from "mysql/map.jinja" import mysql with context %}

mysql-server:
  pkg.installed:
    - name: {{ mysql.server }}
  service.running:
    - name: {{ mysql.service }}
```

Organizing Pillar data

It is considered a best practice to make formulas expect **all** formula-related parameters to be placed under second-level `lookup` key, within a main namespace designated for holding data for particular service/software/etc, managed by the formula:

```
mysql:
  lookup:
    version: 5.7.11
```

Collecting common values

Common values can be collected into a *base* dictionary. This minimizes repetition of identical values in each of the `lookup_dict` sub-dictionaries. Now only the values that are different from the base must be specified by the alternates:

`map.jinja`:

```
{% set mysql = salt['grains.filter_by']({
    'default': {
        'server': 'mysql-server',
        'client': 'mysql-client',
        'service': 'mysql',
        'config': '/etc/mysql/my.cnf',
        'python': 'python-mysqldb',
    },
    'Debian': {
    },
    'RedHat': {
        'client': 'mysql',
        'service': 'mysqld',
        'config': '/etc/my.cnf',
        'python': 'MySQL-python',
    },
    'Gentoo': {
        'server': 'dev-db/mysql',
        'client': 'dev-db/mysql',
        'python': 'dev-python/mysql-python',
    },
},
merge=salt['pillar.get']('mysql:lookup'), base='default') %}
```

Overriding values in the lookup table

Allow static values within lookup tables to be overridden. This is a simple pattern which once again increases flexibility and reusability for state files.

The `merge` argument in *`filter_by`* specifies the location of a dictionary in Pillar that can be used to override values returned from the lookup table. If the value exists in Pillar it will take precedence.

This is useful when software or configuration files is installed to non-standard locations or on unsupported platforms. For example, the following Pillar would replace the `config` value from the call above.

```
mysql:
  lookup:
    config: /usr/local/etc/mysql/my.cnf
```

Note: Protecting Expansion of Content with Special Characters

When templating keep in mind that YAML does have special characters for quoting, flows, and other special structure and content. When a Jinja substitution may have special characters that will be incorrectly parsed by YAML care must be taken. It is a good policy to use the `yaml_encode` or the `yaml_dquote` Jinja filters:

```
{%- set foo = 7.7 %}
{%- set bar = none %}
{%- set baz = true %}
{%- set zap = 'The word of the day is "salty".' %}
{%- set zip = '"The quick brown fox . . ."' %}

foo: {{ foo|yaml_encode }}
bar: {{ bar|yaml_encode }}
baz: {{ baz|yaml_encode }}
zap: {{ zap|yaml_encode }}
zip: {{ zip|yaml_dquote }}
```

The above will be rendered as below:

```
foo: 7.7
bar: null
baz: true
zap: "The word of the day is \"salty\"."
zip: "\"The quick brown fox . . .\""
```

The *filter_by* function performs a simple dictionary lookup but also allows for fetching data from Pillar and overriding data stored in the lookup table. That same workflow can be easily performed without using `filter_by`; other dictionaries besides data from Pillar can also be used.

```
{% set lookup_table = {...} %}
{% do lookup_table.update(salt['pillar.get']('my:custom:data')) %}
```

When to use lookup tables

The `map.jinja` file is only a convention within Salt Formulas. This greater pattern is useful for a wide variety of data in a wide variety of workflows. This pattern is not limited to pulling data from a single file or data source. This pattern is useful in States, Pillar and the Reactor, for example.

Working with a data structure instead of, say, a config file allows the data to be cobbled together from multiple sources (local files, remote Pillar, database queries, etc), combined, overridden, and searched.

Below are a few examples of what lookup tables may be useful for and how they may be used and represented.

Platform-specific information

An obvious pattern and one used heavily in Salt Formulas is extracting platform-specific information such as package names and file system paths in a file named `map.jinja`. The pattern is explained in detail above.

Sane defaults

Application settings can be a good fit for this pattern. Store default settings along with the states themselves and keep overrides and sensitive settings in Pillar. Combine both into a single dictionary and then write the application config or settings file.

The example below stores most of the Apache Tomcat `server.xml` file alongside the Tomcat states and then allows values to be updated or augmented via Pillar. (This example uses the BadgerFish format for transforming JSON to XML.)

`/srv/salt/tomcat/defaults.yaml`:

```
Server:
  '@port': '8005'
  '@shutdown': SHUTDOWN
  GlobalNamingResources:
    Resource:
      '@auth': Container
      '@description': User database that can be updated and saved
      '@factory': org.apache.catalina.users.MemoryUserDatabaseFactory
      '@name': UserDatabase
      '@pathname': conf/tomcat-users.xml
      '@type': org.apache.catalina.UserDatabase
  # <...snip...>
```

`/srv/pillar/tomcat.sls`:

```
appX:
  server_xml_overrides:
    Server:
      Service:
        '@name': Catalina
        Connector:
          '@port': '8009'
          '@protocol': AJP/1.3
          '@redirectPort': '8443'
          # <...snip...>
```

`/srv/salt/tomcat/server_xml.sls`:

```
{% import_yaml 'tomcat/defaults.yaml' as server_xml_defaults %}
{% set server_xml_final_values = salt['pillar.get'](
    'appX:server_xml_overrides',
    default=server_xml_defaults,
    merge=True)
%}

appX_server_xml:
```

(continues on next page)

(continued from previous page)

```
  file.serialize:
    - name: /etc/tomcat/server.xml
    - dataset: {{ server_xml_final_values | json() }}
    - formatter: xml_badgerfish
```

The `file.serialize` state can provide a shorthand for creating some files from data structures. There are also many examples within Salt Formulas of creating one-off "serializers" (often as Jinja macros) that reformat a data structure to a specific config file format. For example, look at the`Nginx vhosts`_ states or the php.ini file template.

Environment specific information

A single state can be reused when it is parameterized as described in the section below, by separating the data the state will use from the state that performs the work. This can be the difference between deploying *Application X* and *Application Y*, or the difference between production and development. For example:

`/srv/salt/app/deploy.sls`:

```
{# Load the map file. #}
{% import_yaml 'app/defaults.yaml' as app_defaults %}

{# Extract the relevant subset for the app configured on the current
   machine (configured via a grain in this example). #}
{% app = app_defaults.get(salt['grains.get']('role')) %}

{# Allow values from Pillar to (optionally) update values from the lookup
   table. #}
{% do app_defaults.update(salt['pillar.get']('myapp', {})) %}

deploy_application:
  git.latest:
    - name: {{ app.repo_url }}
    - version: {{ app.version }}
    - target: {{ app.deploy_dir }}

myco/myapp/deployed:
  event.send:
    - data:
        version: {{ app.version }}
    - onchanges:
      - git: deploy_application
```

`/srv/salt/app/defaults.yaml`:

```
appX:
  repo_url: git@github.com/myco/appX.git
  target: /var/www/appX
  version: master
appY:
  repo_url: git@github.com/myco/appY.git
  target: /var/www/appY
  version: v1.2.3.4
```

Single-purpose SLS files

Each sls file in a Formula should strive to do a single thing. This increases the reusability of this file by keeping unrelated tasks from getting coupled together.

As an example, the base Apache formula should only install the Apache httpd server and start the httpd service. This is the basic, expected behavior when installing Apache. It should not perform additional changes such as set the Apache configuration file or create vhosts.

If a formula is single-purpose as in the example above, other formulas, and also other states can `include` and use that formula with *Requisites and Other Global State Arguments* without also including undesirable or unintended side-effects.

The following is a best-practice example for a reusable Apache formula. (This skips platform-specific options for brevity. See the full url apache-formula for more.)

```
# apache/init.sls
apache:
  pkg.installed:
    [...]
  service.running:
    [...]

# apache/mod_wsgi.sls
include:
  - apache

mod_wsgi:
  pkg.installed:
    [...]
    - require:
      - pkg: apache

# apache/conf.sls
include:
  - apache

apache_conf:
  file.managed:
    [...]
    - watch_in:
      - service: apache
```

To illustrate a bad example, say the above Apache formula installed Apache and also created a default vhost. The mod_wsgi state would not be able to include the Apache formula to create that dependency tree without also installing the unneeded default vhost.

Formulas should be reusable. Avoid coupling unrelated actions together.

Parameterization

Parameterization is a key feature of Salt Formulas and also for Salt States. Parameterization allows a single Formula to be reused across many operating systems; to be reused across production, development, or staging environments; and to be reused by many people all with varying goals.

Writing states, specifying ordering and dependencies is the part that takes the longest to write and to test. Filling those states out with data such as users or package names or file locations is the easy part. How many users, what those users are named, or where the files live are all implementation details that **should be parameterized**. This separation between a state and the data that populates a state creates a reusable formula.

In the example below the data that populates the state can come from anywhere -- it can be hard-coded at the top of the state, it can come from an external file, it can come from Pillar, it can come from an execution function call, or it can come from a database query. The state itself doesn't change regardless of where the data comes from. Production data will vary from development data will vary from data from one company to another, however the state itself stays the same.

```
{% set user_list = [
    {'name': 'larry', 'shell': 'bash'},
    {'name': 'curly', 'shell': 'bash'},
    {'name': 'moe', 'shell': 'zsh'},
] %}

{# or #}

{% set user_list = salt['pillar.get']('user_list') %}

{# or #}

{% load_json "default_users.json" as user_list %}

{# or #}

{% set user_list = salt['acme_utils.get_user_list']() %}

{% for user in list_list %}
{{ user.name }}:
  user.present:
    - name: {{ user.name }}
    - shell: {{ user.shell }}
{% endfor %}
```

Configuration

Formulas should strive to use the defaults of the underlying platform, followed by defaults from the upstream project, followed by sane defaults for the formula itself.

As an example, a formula to install Apache **should not** change the default Apache configuration file installed by the OS package. However, the Apache formula **should** include a state to change or override the default configuration file.

Pillar overrides

Pillar lookups must use the safe *get()* and must provide a default value. Create local variables using the Jinja `set` construct to increase readability and to avoid potentially hundreds or thousands of function calls across a large state tree.

```
{% from "apache/map.jinja" import apache with context %}
{% set settings = salt['pillar.get']('apache', {}) %}

mod_status:
  file.managed:
    - name: {{ apache.conf_dir }}
    - source: {{ settings.get('mod_status_conf', 'salt://apache/mod_status.
↪conf') }}
    - template: {{ settings.get('template_engine', 'jinja') }}
```

Any default values used in the Formula must also be documented in the `pillar.example` file in the root of the repository. Comments should be used liberally to explain the intent of each configuration value. In addition, users should be able copy-and-paste the contents of this file into their own Pillar to make any desired changes.

Scripting

Remember that both State files and Pillar files can easily call out to Salt *execution modules* and have access to all the system grains as well.

```
{% if '/storage' in salt['mount.active']() %}
/usr/local/etc/myfile.conf:
  file:
    - symlink
    - target: /storage/myfile.conf
{% endif %}
```

Jinja macros to encapsulate logic or conditionals are discouraged in favor of *writing custom execution modules* in Python.

Repository structure

A basic Formula repository should have the following layout:

```
foo-formula
|-- foo/
|   |-- map.jinja
|   |-- init.sls
|   `-- bar.sls
|-- CHANGELOG.rst
|-- LICENSE
|-- pillar.example
|-- README.rst
`-- VERSION
```

See also:

url template-formula

The url template-formula repository has a pre-built layout that serves as the basic structure for a new formula repository. Just copy the files from there and edit them.

README.rst

The README should detail each available `.sls` file by explaining what it does, whether it has any dependencies on other formulas, whether it has a target platform, and any other installation or usage instructions or tips.

A sample skeleton for the `README.rst` file:

```
===
foo
===

Install and configure the FOO service.

**NOTE**

See the full `Salt Formulas installation and usage instructions
<https://docs.saltproject.io/en/latest/topics/development/conventions/
↪formulas.html>`_.

Available states
================

.. contents::
    :local:

``foo``
-------

Install the ``foo`` package and enable the service.

``foo.bar``
-----------

Install the ``bar`` package.
```

CHANGELOG.rst

The `CHANGELOG.rst` file should detail the individual versions, their release date and a set of bullet points for each version highlighting the overall changes in a given version of the formula.

A sample skeleton for the *CHANGELOG.rst* file:

`CHANGELOG.rst`:

```
foo formula
===========

0.0.2 (2013-01-01)

- Re-organized formula file layout
```

(continues on next page)

(continued from previous page)

```
- Fixed filename used for upstart logger template
- Allow for pillar message to have default if none specified
```

Versioning

Formula are versioned according to Semantic Versioning, https://semver.org/.

Note: Given a version number MAJOR.MINOR.PATCH, increment the:

1. MAJOR version when you make incompatible API changes,
2. MINOR version when you add functionality in a backwards-compatible manner, and
3. PATCH version when you make backwards-compatible bug fixes.

Additional labels for pre-release and build metadata are available as extensions to the MAJOR.MINOR.PATCH format.

Formula versions are tracked using Git tags as well as the `VERSION` file in the formula repository. The `VERSION` file should contain the currently released version of the particular formula.

Testing Formulas

A smoke-test for invalid Jinja, invalid YAML, or an invalid Salt state structure can be performed by with the *`state.show_sls`* function:

```
salt '*' state.show_sls apache
```

Salt Formulas can then be tested by running each `.sls` file via *`state.apply`* and checking the output for the success or failure of each state in the Formula. This should be done for each supported platform.

32.28.3 SaltStack Packaging Guide

Since Salt provides a powerful toolkit for system management and automation, the package can be spit into a number of sub-tools. While packaging Salt as a single package containing all components is perfectly acceptable, the split packages should follow this convention.

Patching Salt For Distributions

The occasion may arise where Salt source and default configurations may need to be patched. It is preferable if Salt is only patched to include platform specific additions or to fix release time bugs. It is preferable that configuration settings and operations remain in the default state, as changes here lowers the user experience for users moving across distributions.

In the event where a packager finds a need to change the default configuration it is advised to add the files to the master.d or minion.d directories.

Source Files

Release packages should always be built from the source tarball distributed via pypi. Release packages should *NEVER* use a git checkout as the source for distribution.

Single Package

Shipping Salt as a single package, where the minion, master, and all tools are together is perfectly acceptable and practiced by distributions such as FreeBSD.

Split Package

Salt Should always be split in a standard way, with standard dependencies, this lowers cross distribution confusion about what components are going to be shipped with specific packages. These packages can be defined from the Salt Source as of Salt 2014.1.0:

Salt Common

The *salt-common* or *salt* package should contain the files provided by the salt python package, or all files distributed from the `salt/` directory in the source distribution packages. The documentation contained under the `doc/` directory can be a part of this package but splitting out a doc package is preferred. Since salt-call is the entry point to utilize the libs and is useful for all salt packages it is included in the salt-common package.

Name

- *salt* OR *salt-common*

Files

- *salt/**
- *man/salt.7*
- *scripts/salt-call*
- *tests/**
- *man/salt-call.1*

Depends

- *Python 2.6-2.7*
- *PyYAML*
- *Jinja2*

Salt Master

The *salt-master* package contains the applicable scripts, related man pages and init information for the given platform.

Name

- *salt-master*

Files

- *scripts/salt-master*
- *scripts/salt*
- *scripts/salt-run*
- *scripts/salt-key*
- *scripts/salt-cp*
- *pkg/<master init data>*
- *man/salt.1*
- *man/salt-master.1*
- *man/salt-run.1*
- *man/salt-key.1*
- *man/salt-cp.1*
- *conf/master*

Depends

- *Salt Common*
- *ZeroMQ* >= 3.2
- *PyZMQ* >= 2.10
- *PyCrypto*
- *M2Crypto*
- *Python MessagePack* (Messagepack C lib, or msgpack-pure)

Salt Syndic

The Salt Syndic package can be rolled completely into the Salt Master package. Platforms which start services as part of the package deployment need to maintain a separate *salt-syndic* package (primarily Debian based platforms).

The Syndic may optionally not depend on the anything more than the Salt Master since the master will bring in all needed dependencies, but fall back to the platform specific packaging guidelines.

Name

- *salt-syndic*

Files

- *scripts/salt-syndic*
- *pkg/<syndic init data>*
- *man/salt-syndic.1*

Depends

- *Salt Common*
- *Salt Master*
- *ZeroMQ* >= 3.2
- *PyZMQ* >= 2.10
- *PyCrypto*
- *M2Crypto*
- *Python MessagePack* (Messagepack C lib, or msgpack-pure)

Salt Minion

The Minion is a standalone package and should not be split beyond the *salt-minion* and *salt-common* packages.

Name

- *salt-minion*

Files

- *scripts/salt-minion*
- *pkg/<minion init data>*
- *man/salt-minion.1*
- *conf/minion*

Depends

- *Salt Common*
- *ZeroMQ* >= 3.2
- *PyZMQ* >= 2.10
- *PyCrypto*
- *M2Crypto*
- *Python MessagePack* (Messagepack C lib, or msgpack-pure)

Salt SSH

Since Salt SSH does not require the same dependencies as the minion and master, it should be split out.

Name

- *salt-ssh*

Files

- *scripts/salt-ssh*
- *man/salt-ssh.1*
- *conf/cloud**

Depends

- *Salt Common*
- *Python MessagePack* (Messagepack C lib, or msgpack-pure)

Salt Cloud

As of Salt 2014.1.0 Salt Cloud is included in the same repo as Salt. This can be split out into a separate package or it can be included in the salt-master package.

Name

- *salt-cloud*

Files

- *scripts/salt-cloud*
- *man/salt-cloud.1*

Depends

- *Salt Common*
- *apache libcloud* >= 0.14.0

Salt Doc

The documentation package is very distribution optional. A completely split package will split out the documentation, but some platform conventions do not prefer this. If the documentation is not split out, it should be included with the *Salt Common* package.

Name

- *salt-doc*

Files

- *doc/**

Optional Depends

- *Salt Common*
- *Python Sphinx*
- *Make*

32.28.4 Salt Release Process

The goal for Salt projects is to cut a new feature release every three to four months. This document outlines the process for these releases, and the subsequent bug fix releases which follow.

Feature Release Process

When a new release is ready to be cut, the person responsible for cutting the release will follow the following steps (written using the 3000 release as an example):

1. Create first public draft of release notes with major features.
2. Remove any deprecations for the upcoming release.
3. Ensure all required features are merged.
4. Create issue to start the process of deprecating for the next feature release.

5. Run through a manual test run based off of the head of the feature branch.
6. Update all name references to version number in the docs. For example all neon references in the docs needs to be moved to v3000
7. Review the release notes with major features.
8. Generate the new man pages for the release.
9. Create internal RC tag for testing from the head of the master branch.
10. Build latest windows, mac, ubuntu, debian and redhat packages.
11. Run manual and package tests against new RC packages.
12. Push the internal tag live to salt's repo.
13. Publish release archive to pypi based off tag.
14. Push the RC packages live.
15. Announce new RC to salt-users and salt-announce google groups.
16. Triage incoming issues based on the new RC release.
17. Fix RC issues once they are categorized as a release blocker.
18. Depending on the issues found during the RC process make a decision on whether to release based off the RC or go through another RC process
19. If a RC is categorized as stable, build all required packages.
20. Test all release packages.
21. Test links from repo.saltproject.io.
22. Update installation instructions with new release number at repo.saltproject.io.
23. Review and update all impacted *Installation* documentation.
24. Update and build docs to include new version (3000) as the latest.
25. Pre-announce on salt-users google group that we are about to update our repo.
26. Publish release (v3000) archive to pypi based off tag.
27. Publish all packages live to repo.
28. Publish the docs.
29. Create release at github
30. Update win-repo-ng with new salt versions.
31. Announce release is live to irc, salt-users, salt-announce and release discord community channel.

Bugfix Releases

Once a feature release branch has been cut from the `master` branch, if serious bugs or a CVE is found for the most recent release a bugfix release will need to be cut. A temporary branch will be created based off of the previous release tag. For example, if it is determined that a 3000.1 release needs to occur a 3000.1 branch will be created based off of the v3000 tag. The fixes that need to go into 3000.1 will be added and merged into this branch. Here are the steps for a bugfix release.

1. Ensure all required bug fixes are merged.
2. Create release branch with the version of the release. (ex. 3000.1)

3. Run through a manual test run based off of the head of the branch.
4. Generate the new man pages for the release.
5. Create internal tag for testing.(ex v3000.1)
6. Build all release packages.
7. Run manual and package tests against new packages.
8. Update installation instructions with new release number at repo.saltproject.io.
9. Update and build docs to include new version. (ex. 3000.1)
10. Pre-announce on salt-users google groups that we are about to update our repo.
11. Push the internal tag live to salt's repo.
12. Publish release archive to pypi based off tag.
13. Push the packages live.
14. Publish release (v3000) archive to pypi based off tag.
15. Publish all packages live to repo.
16. Publish the docs.
17. Create release at github
18. Update win-repo-ng with new salt versions.
19. Announce release is live to irc, salt-users, salt-announce and release discord channel.

32.28.5 Salt Coding Style

To make it easier to contribute and read Salt code, SaltStack has adopted Black as its code formatter. There are a few places where Black is silent, and this guide should be used in those cases.

Coding style is NEVER grounds to reject code contributions, and is never grounds to talk down to another member of the community (There are no grounds to treat others without respect, especially people working to improve Salt)!

Linting

Most Salt style conventions are codified in Salt's `.pylintrc` file. Salt's linting has two major dependencies: pylint and saltpylint, the full lint requirements can be found under `requirements/static/ci/lint.in` and the pinned requirements at `requirements/static/ci/py3.<minor-version>/lint.txt`, however, linting should be done using *nox*, which is how pull requests are checked.

```
nox -e lint
```

One can target either salt's source code or the test suite(different pylint rules apply):

```
nox -e lint-salt
nox -e lint-tests
```

Variables

Variables should be a minimum of three characters and should provide an easy-to-understand name of the object being represented.

When keys and values are iterated over, descriptive names should be used to represent the temporary variables.

Multi-word variables should be separated by an underscore.

Variables which are two-letter words should have an underscore appended to them to pad them to three characters.

Formatting Strings

All strings which require formatting should use the *.format* string method:

Please do NOT use printf formatting, unless it's a log message.

Good:

```
data = "some text"
more = "{} and then some".format(data)
log.debug("%s and then some", data)
```

Bad:

```
data = "some text"
log.debug("{} and then some".format(data))
```

Docstring Conventions

When adding a new function or state, where possible try to use a `versionadded` directive to denote when the function, state, or parameter was added.

```
def new_func(msg=""):
    """
    .. versionadded:: 0.16.0

    Prints what was passed to the function.

    msg : None
        The string to be printed.
    """
    print(msg)
```

If you are uncertain what version should be used, either consult a core developer in the Community Discord or bring this up when opening your *pull request* and a core developer will let you know what version to add. Typically this will be the next element in the periodic table.

Similar to the above, when an existing function or state is modified (for example, when an argument is added), then under the explanation of that new argument a `versionadded` directive should be used to note the version in which the new argument was added. If an argument's function changes significantly, the `versionchanged` directive can be used to clarify this:

```
def new_func(msg="", signature=""):
    """
    .. versionadded:: 0.16.0

    Prints what was passed to the function.

    msg : None
        The string to be printed. Will be prepended with 'Greetings! '.

    .. versionchanged:: 0.17.1

    signature : None
        An optional signature.

    .. versionadded:: 0.17.0
    """
    print("Greetings! {0}\n\n{1}".format(msg, signature))
```

Dictionaries

Dictionaries should be initialized using *{}* instead of *dict()*.

See here for an in-depth discussion of this topic.

Imports

Salt code prefers importing modules and not explicit functions. This is both a style and functional preference. The functional preference originates around the fact that the module import system used by pluggable modules will include callable objects (functions) that exist in the direct module namespace. This is not only messy, but may unintentionally expose code python libs to the Salt interface and pose a security problem.

To say this more directly with an example, this is *GOOD*:

```
import os

def minion_path():
    path = os.path.join(self.opts["cachedir"], "minions")
    return path
```

This on the other hand is *DISCOURAGED*:

```
from os.path import join

def minion_path():
    path = join(self.opts["cachedir"], "minions")
    return path
```

The time when this is changed is for importing exceptions, generally directly importing exceptions is preferred:

This is a good way to import exceptions:

```
from salt.exceptions import CommandExecutionError
```

Absolute Imports

Although absolute imports seems like an awesome idea, please do not use it. Extra care would be necessary all over salt's code in order for absolute imports to work as supposed. Believe it, it has been tried before and, as a tried example, by renaming `salt.modules.sysmod` to `salt.modules.sys`, all other salt modules which needed to import `sys` would have to also import `absolute_import`, which should be avoided.

Note: An exception to this rule is the `absolute_import` from `__future__` at the top of each file within the Salt project. This import is necessary for Py3 compatibility. This particular import looks like this:

```
from __future__ import absolute_import
```

This import is required for all new Salt files and is a good idea to add to any custom states or modules. However, the practice of avoiding absolute imports still applies to all other cases as to avoid a name conflict.

Code Churn

Many pull requests have been submitted that only churn code in the name of PEP 8. Code churn is a leading source of bugs and is **strongly discouraged**. While style fixes are encouraged they should be isolated to a single file per commit, and the changes should be legitimate, if there are any questions about whether a style change is legitimate please reference this document and the official PEP 8 (https://legacy.python.org/dev/peps/pep-0008/) document before changing code. Many claims that a change is PEP 8 have been invalid, please double check before committing fixes.

32.29 Salt code and internals

Reference documentation on Salt's internal code.

32.29.1 Contents

salt.aggregation

salt.utils.aggregation

This library makes it possible to introspect dataset and aggregate nodes when it is instructed.

Note: The following examples with be expressed in YAML for convenience's sake:

- !aggr-scalar will refer to Scalar python function
- !aggr-map will refer to Map python object
- !aggr-seq will refer for Sequence python object

How to instructs merging

This yaml document has duplicate keys:

```
foo: !aggr-scalar first
foo: !aggr-scalar second
bar: !aggr-map {first: foo}
bar: !aggr-map {second: bar}
baz: !aggr-scalar 42
```

but tagged values instruct Salt that overlapping values they can be merged together:

```
foo: !aggr-seq [first, second]
bar: !aggr-map {first: foo, second: bar}
baz: !aggr-seq [42]
```

Default merge strategy is keep untouched

For example, this yaml document still has duplicate keys, but does not instruct aggregation:

```
foo: first
foo: second
bar: {first: foo}
bar: {second: bar}
baz: 42
```

So the late found values prevail:

```
foo: second
bar: {second: bar}
baz: 42
```

Limitations

Aggregation is permitted between tagged objects that share the same type. If not, the default merge strategy prevails.

For example, these examples:

```
foo: {first: value}
foo: !aggr-map {second: value}

bar: !aggr-map {first: value}
bar: 42

baz: !aggr-seq [42]
baz: [fail]

qux: 42
qux: !aggr-scalar fail
```

are interpreted like this:

```
foo: !aggr-map{second: value}

bar: 42

baz: [fail]

qux: !aggr-seq [fail]
```

Introspection

TODO: write this part

class `salt.utils.aggregation.`**`Aggregate`**

Aggregation base.

class `salt.utils.aggregation.`**`Map`**

Map aggregation.

class `salt.utils.aggregation.`**`OrderedDict`**

Dictionary that remembers insertion order

`clear`() → None. Remove all items from od.

`copy`() → a shallow copy of od

`fromkeys`(*value=None*)

Create a new ordered dictionary with keys from iterable and values set to value.

`items`() → a set-like object providing a view on D's items

`keys`() → a set-like object providing a view on D's keys

`move_to_end`(*key*, *last=True*)

Move an existing element to the end (or beginning if last is false).

Raise KeyError if the element does not exist.

`pop`(*key*[, *default*]) → v, remove specified key and return the corresponding value.

If the key is not found, return the default if given; otherwise, raise a KeyError.

`popitem`(*last=True*)

Remove and return a (key, value) pair from the dictionary.

Pairs are returned in LIFO order if last is true or FIFO order if false.

`setdefault`(*key*, *default=None*)

Insert key with a value of default if key is not in the dictionary.

Return the value for key if key is in the dictionary, else default.

`update`([*E*], ***F*) → None. Update D from dict/iterable E and F.

If E is present and has a .keys() method, then does: for k in E: D[k] = E[k] If E is present and lacks a .keys() method, then does: for k, v in E: D[k] = v In either case, this is followed by: for k in F: D[k] = F[k]

`values`() → an object providing a view on D's values `salt.utils.aggregation.`**`Scalar`**`(`*obj*`)`

Shortcut for Sequence creation

```
>>> Scalar('foo') == Sequence(['foo'])
True
```

`class` `salt.utils.aggregation.`**`Sequence`**`(`*iterable=(), /*`)`

Sequence aggregation.

`salt.utils.aggregation.`**`aggregate`**`(`*obj_a, obj_b, level=False, map_class=<class 'salt.utils.aggregation.Map'>, sequence_class=<class 'salt.utils.aggregation.Sequence'>*`)`

Merge obj_b into obj_a.

```
>>> aggregate('first', 'second', True) == ['first', 'second']
True
```

`salt.utils.aggregation.`**`levelise`**`(`*level*`)`

Describe which levels are allowed to do deep merging.

level can be:

True
all levels are True

False
all levels are False

an int
only the first levels are True, the others are False

a sequence
it describes which levels are True, it can be:

- a list of bool and int values
- a string of 0 and 1 characters

`salt.utils.aggregation.`**`mark`**`(`*obj, map_class=<class 'salt.utils.aggregation.Map'>, sequence_class=<class 'salt.utils.aggregation.Sequence'>*`)`

Convert obj into an Aggregate instance

Exceptions

Salt-specific exceptions should be thrown as often as possible so the various interfaces to Salt (CLI, API, etc) can handle those errors appropriately and display error messages appropriately.

`salt.exceptions`	This module is a central location for all salt exceptions

salt.exceptions

This module is a central location for all salt exceptions

exception `salt.exceptions.`**`ArgumentValueError`**(*message=''*, *info=None*)

Used when an invalid argument was passed to a command execution

exception `salt.exceptions.`**`AuthenticationError`**(*message=''*)

If sha256 signature fails during decryption

exception `salt.exceptions.`**`AuthorizationError`**(*message=''*)

Thrown when runner or wheel execution fails due to permissions

exception `salt.exceptions.`**`CheckError`**(*message=''*, *info=None*)

Used when a check fails

exception `salt.exceptions.`**`CodePageError`**(*message=''*, *info=None*)

Raised when an error ocurs while getting or setting the windows code page

exception `salt.exceptions.`**`CommandExecutionError`**(*message=''*, *info=None*)

Used when a module runs a command which returns an error and wants to show the user the output gracefully instead of dying

exception `salt.exceptions.`**`CommandNotFoundError`**(*message=''*)

Used in modules or grains when a required binary is not available

exception `salt.exceptions.`**`EauthAuthenticationError`**(*message=''*)

Thrown when eauth authentication fails

exception `salt.exceptions.`**`FileLockError`**(*message*, *time_start=None*, **args*, ***kwargs*)

Used when an error occurs obtaining a file lock

exception `salt.exceptions.`**`FileserverConfigError`**(*message=''*)

Used when invalid fileserver settings are detected

exception `salt.exceptions.`**`GitLockError`**(*errno*, *message*, **args*, ***kwargs*)

Raised when an uncaught error occurs in the midst of obtaining an update/checkout lock in salt.utils.gitfs.

NOTE: While this uses the errno param similar to an OSError, this exception class is *not* as subclass of OSError. This is done intentionally, so that this exception class can be caught in a try/except without being caught as an OSError.

exception `salt.exceptions.`**`GitRemoteError`**(*message=''*)

Used by GitFS to denote a problem with the existence of the ”origin” remote or part of its configuration

exception `salt.exceptions.`**`InvalidConfigError`**(*message=''*, *info=None*)

Used when the config is invalid

exception `salt.exceptions.`**`InvalidEntityError`**(*message=''*, *info=None*)

Used when an entity fails validation

exception `salt.exceptions.`**`InvalidKeyError`**(*message=''*)

Raised when we encounter an invalid RSA key.

exception `salt.exceptions.`**`LoaderError`**(*message=''*)

Problems loading the right renderer

exception `salt.exceptions.`**`LoggingRuntimeError`**

Raised when we encounter an error while logging

exception `salt.exceptions.`**`MasterExit`**

Rise when the master exits

exception `salt.exceptions.`**`MinionError`**(*message=''*)

Minion problems reading uris such as salt:// or http://

exception `salt.exceptions.`**`MissingSmb`**(*message=''*)

Raised when no smb library is found.

exception `salt.exceptions.`**`NotImplemented`**(*message=''*)

Used when a module runs a command which returns an error and wants to show the user the output gracefully instead of dying

exception `salt.exceptions.`**`NxosCliError`**(*message=''*)

NX-OS Cli Error raised when Cli command rejected by the NX-OS device

exception `salt.exceptions.`**`NxosClientError`**(*message=''*)

NX-OS Client Error raised for problems connecting to the NX-OS device

exception `salt.exceptions.`**`NxosError`**(*message=''*)

NX-OS Base Exception class

exception `salt.exceptions.`**`NxosRequestNotSupported`**(*message=''*)

Raised for unsupported client requests

exception `salt.exceptions.`**`PkgParseError`**(*message=''*)

Used when of the pkg modules cannot correctly parse the output from the CLI tool (pacman, yum, apt, aptitude, etc)

exception `salt.exceptions.`**`PublishError`**(*message=''*)

Problems encountered when trying to publish a command

exception `salt.exceptions.`**`SaltCacheError`**(*message=''*)

Thrown when a problem was encountered trying to read or write from the salt cache

exception `salt.exceptions.`**`SaltClientError`**(*message=''*)

Problem reading the master root key

exception `salt.exceptions.`**`SaltClientTimeout`**(*message*, *jid=None*, **args*, ***kwargs*)

Thrown when a job sent through one of the Client interfaces times out

Takes the `jid` as a parameter

exception `salt.exceptions.`**`SaltCloudConfigError`**(*message=''*)

Raised when a configuration setting is not found and should exist.

exception `salt.exceptions.`**`SaltCloudException`**`(`*message=''*`)`

Generic Salt Cloud Exception

exception `salt.exceptions.`**`SaltCloudExecutionFailure`**`(`*message=''*`)`

Raised when too much failures have occurred while querying/waiting for data.

exception `salt.exceptions.`**`SaltCloudExecutionTimeout`**`(`*message=''*`)`

Raised when too much time has passed while querying/waiting for data.

exception `salt.exceptions.`**`SaltCloudNotFound`**`(`*message=''*`)`

Raised when some cloud provider function cannot find what's being searched.

exception `salt.exceptions.`**`SaltCloudPasswordError`**`(`*message=''*`)`

Raise when virtual terminal password input failed

exception `salt.exceptions.`**`SaltCloudSystemExit`**`(`*message*, *exit_code=1*`)`

This exception is raised when the execution should be stopped.

exception `salt.exceptions.`**`SaltConfigurationError`**`(`*message=''*`)`

Configuration error

exception `salt.exceptions.`**`SaltDaemonNotRunning`**`(`*message=''*`)`

Throw when a running master/minion/syndic is not running but is needed to perform the requested operation (e.g., eauth).

exception `salt.exceptions.`**`SaltDeserializationError`**`(`*message=''*`)`

Thrown when salt cannot deserialize data.

exception `salt.exceptions.`**`SaltException`**`(`*message=''*`)`

Base exception class; all Salt-specific exceptions should subclass this

`pack``()`

Pack this exception into a serializable dictionary that is safe for transport via msgpack

exception `salt.exceptions.`**`SaltInvocationError`**`(`*message=''*`)`

Used when the wrong number of arguments are sent to modules or invalid arguments are specified on the command line

exception `salt.exceptions.`**`SaltMasterError`**`(`*message=''*`)`

Problem reading the master root key

exception `salt.exceptions.`**`SaltMasterUnresolvableError`**`(`*message=''*`)`

Problem resolving the name of the Salt master

exception `salt.exceptions.`**`SaltNoMinionsFound`**`(`*message=''*`)`

An attempt to retrieve a list of minions failed

exception `salt.exceptions.`**`SaltRenderError`**`(`*message*, *line_num=None*, *buf=''*, *marker='<======================'*, *trace=None*`)`

Used when a renderer needs to raise an explicit error. If a line number and buffer string are passed, get_context will be invoked to get the location of the error.

exception `salt.exceptions.`**`SaltReqTimeoutError`**`(`*message=''*`)`

Thrown when a salt master request call fails to return within the timeout

exception `salt.exceptions.`**`SaltRunnerError`**`(`*message=''*`)`

Problem in runner

exception salt.exceptions.**SaltSyndicMasterError**(*message=''*)

Problem while proxying a request in the syndication master

exception salt.exceptions.**SaltSystemExit**(*code=0, msg=None*)

This exception is raised when an unsolvable problem is found. There's nothing else to do, salt should just exit.

exception salt.exceptions.**SaltValidationError**(*message=''*)

Thrown when a value fails validation

exception salt.exceptions.**SaltWheelError**(*message=''*)

Problem in wheel

exception salt.exceptions.**TemplateError**(*message=''*)

Used when a custom error is triggered in a template

exception salt.exceptions.**TimedProcTimeoutError**(*message=''*)

Thrown when a timed subprocess does not terminate within the timeout, or if the specified timeout is not an int or a float

exception salt.exceptions.**TimeoutError**(*message=''*)

Thrown when an opration cannot be completet within a given time limit.

exception salt.exceptions.**TokenAuthenticationError**(*message=''*)

Thrown when token authentication fails

exception salt.exceptions.**UnsupportedAlgorithm**(*message=''*)

Thrown when a requested encryption or signing algorithm is un-supported.

exception salt.exceptions.**VMwareApiError**(*message='', info=None*)

Used when representing a generic VMware API error

exception salt.exceptions.**VMwareConnectionError**(*message='', info=None*)

Used when the client fails to connect to a either a VMware vCenter server or to a ESXi host

exception salt.exceptions.**VMwareFileNotFoundError**(*message='', info=None*)

Used when representing a generic VMware error if a file not found

exception salt.exceptions.**VMwareMultipleObjectsError**(*message='', info=None*)

Used when multiple objects were retrieved (and one was expected)

exception salt.exceptions.**VMwareNotFoundError**(*message='', info=None*)

Used when a VMware object was not found

exception salt.exceptions.**VMwareObjectExistsError**(*message='', info=None*)

Used when a VMware object already exists

exception salt.exceptions.**VMwareObjectNotFoundError**(*message='', info=None*)

Used when a VMware object was not found

exception salt.exceptions.**VMwareObjectRetrievalError**(*message='', info=None*)

Used when a VMware object cannot be retrieved

exception salt.exceptions.**VMwarePowerOnError**(*message='', info=None*)

Used when error occurred during power on

exception salt.exceptions.**VMwareRuntimeError**(*message='', info=None*)

Used when a runtime error is encountered when communicating with the vCenter

exception `salt.exceptions.`**`VMwareSaltError`**(*message='', info=None*)

Used when a VMware object cannot be retrieved

exception `salt.exceptions.`**`VMwareSystemError`**(*message='', info=None*)

Used when representing a generic VMware system error

exception `salt.exceptions.`**`VMwareVmCreationError`**(*message='', info=None*)

Used when a configuration parameter is incorrect

exception `salt.exceptions.`**`VMwareVmRegisterError`**(*message='', info=None*)

Used when a configuration parameter is incorrect

`salt.exceptions.`**`get_error_message`**(*error*)

Get human readable message from Python Exception

The Salt Fileserver and Client

Introduction

Salt has a modular fileserver, and multiple client classes which are used to interact with it. This page serves as a developer's reference, to help explain how the fileserver and clients both work.

Fileserver

The fileserver is not a daemon, so the fileserver and client are not a true server and client in the traditional sense. Instead, the fileserver is simply a class (`salt.fileserver.Fileserver`), located in salt/fileserver/__init__.py. This class has access to the configured fileserver backends via a loader instance, referenced as `self.servers`. When a request comes in from the fileclient, it will ultimately result in a `Fileserver` class function being run.

The functions in this class will run corresponding functions in the configured fileserver backends to perform the requested action. So, in summary:

1. A fileclient class makes a request...
2. which triggers the fileserver to run a function...
3. which runs a named function in each of the configured backends.

Not all of the functions will always execute on every configured backend. For instance, the `find_file` function in the fileserver will stop when it finds a match, so if it finds a match for the desired path in the first configured backend, it won't proceed and try to find the file in the next backend in the list.

Additionally, not all backends implement all functions in the `salt.fileserver.Fileserver` class. For instance, there is a function called `update`, which exists to update remote fileservers such as the `git`, `hg`, and `svn` backends. This action has no use however in the `roots` backend, so it is simply not implemented there, and thus the `roots` backend will be skipped if the `update` function is run on the fileserver.

Backends for the fileserver are located in salt/fileserver/ (the files not named `__init__.py`).

Fileclient

There are three fileclient classes:

salt.fileclient.RemoteClient

This client is used when *`file_client`* is set to `remote`. This is how minions request files from the master.

Functions in this client will craft a payload and send it to the master via the transport channel. This is the same way that the minion asks the minion to do other things, such as updating and requesting data from the mine. The payload will be a dictionary with a key called `cmd`, and other values as needed.

Payloads sent via the transport channel are processed my an MWorker instance on the master, and the MWorker's `_handle_aes()` function will execute the command. The command will be a function attribute of the `salt.master.AESFuncs` class. The AESFuncs class' `__setup_fileserver()` function instantiates a `salt.fileserver.Fileserver` instance and maps its member functions to AESFuncs attributes. This is what makes the fileserver functions available remotely. The result of the function is returned back through the transport channel to the minion.

Transporting files is done in chunks, the size of which is decided by the `file_buffer_size` config option. If you look at the `serve_file()` function in any of the fileserver backends, you can see how the `loc` value in the payload determines the offset so that an intermediate chunk of the file can be served. The RemoteClient's `get_file()` function will loop until the end of the file is reached, retrieving one chunk at a time.

salt.fileclient.FSClient

This client is used when *`file_client`* is set to `local`. This is how masterless minions request files.

This class inherits from the RemoteClient, but instead of using a transport channel (zmq, tcp, etc.), it uses a "fake" transport channel (`salt.fileserver.FSChan`), which implements its own `send()` function. Thus, when a function that the FSClient inherits from the RemoteClient runs `self.channel.send()`, it's actually calling `salt.fileserver.FSChan.send()`, which calls corresponding functions in the `salt.fileserver.Fileserver()` class. The result is that local file requests use the same code as remote file requests, they just bypass sending them through an actual transport channel and instead call them on the FSChan's Fileserver instance.

salt.fileclient.LocalClient

This client is now used exclusively by Pillar. This used to be used when *`file_client`* was set to `local`, but the `FSChan` class was written to allow minions with `file_client: local` to access the full set of backends. This class will probably be renamed at some point as it is often confused with `salt.client.LocalClient`.

The `cp` Module

Most of the user-facing interaction with the fileclient happens via the *`cp`* module. The functions in this module instantiate a fileclient instance (if one is not already saved to the `__context__` dunder) and run fileclient functions.

Updating the Fileserver

The master daemon spawns a process dedicated to routine maintenance tasks upon startup. This process runs an instance of `salt.master.Maintenance`, which loops forever, running a series of functions and then sleeping for a length of time determined by the *loop_interval* config option. One of the maintenance tasks is to update the fileserver, and it essentially runs `salt.fileserver.Fileserver.update()`, which as we know from above will run all configured backends' `update()` functions, if present. This is now remote fileservers like `git`, `hg`, and `svn` stay up-to-date.

For the local file_client (FSClient), since it does not interact with the master, upon spawning of its FSChan it will update the fileserver.

Salt opts dictionary

It is very common in the Salt codebase to see *opts* referred to in a number of contexts.

For example, it can be seen as *__opts__* in certain cases, or simply as *opts* as an argument to a function in others.

Simply put, this data structure is a dictionary of Salt's runtime configuration information that's passed around in order for functions to know how Salt is configured.

When writing Python code to use specific parts of Salt, it may become necessary to initialize a copy of *opts* from scratch in order to have it available for a given function.

To do so, use the utility functions available in *salt.config*.

As an example, here is how one might generate and print an options dictionary for a minion instance:

```
import salt.config

opts = salt.config.minion_config("/etc/salt/minion")
print(opts)
```

To generate and display *opts* for a master, the process is similar:

```
import salt.config

opts = salt.config.master_config("/etc/salt/master")
print(opts)
```

Unicode in Salt

Though Unicode handling in large projects can often be complex, Salt adheres to several basic rules to help developers handle Unicode correctly.

(For a basic introduction to this problem, see Ned Batchelder's *excellent intoroduction to the topic <http://nedbatchelder.com/text/unipain/unipain.html>*.

Salt's basic workflow for Unicode handling is as follows:

1) Salt should convert whatever data is passed on CLI/API to Unicode. Internally, everything that Salt does should be Unicode unless it is printing to the screen or writing to storage.

2) Modules and various Salt pluggable systems use incoming data assuming Unicode.

   2.1) For Salt modules that query an API; the module should convert the data
      received from the API into Unicode.

  2.2) **For Salt modules that shell out to get output; the module should**
  convert data received into Unicode. (This does not apply if using the *cmd* execution module, which should handle this for you.

  2.3) **For Salt modules which print directly to the console (not via an**
  outputter) or which write directly to disk, a string should be encoded when appropriate. To handle this conversion, the global variable `__salt_system_encoding__` is available, which declares the locale of the system that Salt is running on.

3) When a function in a Salt module returns a string, it should return a `unicode` type in Python 2.
4) When Salt delivers the data to an outputter or a returner, it is the job of the outputter or returner to encode the Unicode before displaying it on the console or writing it to storage.

32.30 Salt Community Projects

This page contains links to Salt-related projects created by community members. If you come across a useful project please add it to the list!

32.30.1 Hubblestack

Hubble is a modular, open-source security compliance framework built on top of SaltStack. The project provides on-demand profile-based auditing, real-time security event notifications, automated remediation, alerting and reporting.

https://hubblestack.io/

32.30.2 alkali

alkali is a collections of SaltStack states and pillar data that provide just the basics for provisioning Linux instances that may be built upon. alkali is a starter kit of sorts, to help new users to SaltStack get up-and-running quickly with the most commonly used, core packages.

https://github.com/zulily/alkali

32.30.3 buoyant

buoyant leverages docker to provide an alternative to VM-centric SaltStack development environments. buoyant containers may be spun up nearly instantly, once an initial docker image has been built.

https://github.com/zulily/buoyant

32.30.4 Salt Sandbox

Salt Sandbox is a multi-VM Vagrant-based Salt development environment used for creating and testing new Salt state modules outside of your production environment. It's also a great way to learn firsthand about Salt and its remote execution capabilities.

https://github.com/elasticdog/salt-sandbox

32.30.5 Salt Vagrant Demo

A Salt Demo using Vagrant.

https://github.com/UtahDave/salt-vagrant-demo

CHAPTER

THIRTYTHREE

RELEASE NOTES

This page links to the release notes for Salt, including the current, upcoming, and past releases.

- New releases and security updates are announced on the Salt Project blog. You can subscribe to an RSS feed for announcements.
- See the version numbers page for more information about the version numbering scheme.

33.1 Upcoming release

See Install a release candidate for more information about installing an RC when one is available.

33.2 Previous releases

(release-3007.0)=

33.2.1 Salt 3007.0 release notes

Salt's `setup.py` customizations

> :warning: **Deprecation Notice**: In Salt 3009, the `setup.py` file will be stripped of it's custom additions and migrated to a plain `pyproject.toml` python package or whatever is found best during the process of removing the customizations. **If you're relying on these customizations please stop as your workflow will break in the future**.

Python 3.7 Support Dropped

Support for python 3.7 has been dropped since it reached end-of-line in 27 Jun 2023.

Azure Salt Extension

Starting from Salt version 3007.0, the Azure functionality previously available in the Salt code base is fully removed. To continue using Salt's features for interacting with Azure resources, users are required to utilize the Azure Salt extension. For more information, refer to the Azure Salt Extension GitHub repository.

New Package Grain

A new `package` grain was added in 3007.0 This detects how Salt was installed using the `_pkg.txt` in the root of the directory. If you are building packages of Salt you need to ensure this file is set to the correct package type that you are building. The options are `pip`, `onedir`, or `system`. By default this file is already set to `pip`.

Improved Vault integration

This release features a much deeper integration with HashiCorp Vault, for which many parts of the implementation core were improved. Among other things, the Salt daemons now attempt to renew/revoke their access tokens and can manage long-lived leases, while the Salt master now distributes authentication secrets using response wrapping. An important new feature concerns the way Vault policies can be managed.

In versions before 3006, the Salt master only issued tokens to minions, whose policies could be templated with the minion ID and (insecure) grain values. 3006 introduced secure templating of those policies with pillar values, as well as templating of Vault external pillar paths with pillar values. These improvements reduced the overhead of managing Vault policies securely.

In addition, the Salt master can now be configured to issue AppRoles to minions and manage their metadata using a similar templating approach. Since this metadata can be taken advantage of in templated policies on the Vault side, the need for many boilerplate policies is reduced even further:

```
path "salt/data/minions/{{identity.entity.metadata.minion-id}}" {
    capabilities = ["create", "read", "write", "delete", "patch"]
}

path "salt/data/roles/{{identity.entity.metadata.role}}" {
    capabilities = ["read"]
}
```

Although existing configurations will keep working without intervention after upgrading the Salt master, it is strongly recommended to adjust the `peer_run` configuration to include the new issuance endpoints in order to avoid unnecessary overhead:

```
peer_run:
  .*:
    - vault.get_config
    - vault.generate_new_token
```

Please see the Vault execution module docs for details and setup instructions regarding AppRole issuance.

Note: The Vault modules are being moved to a Salt extension, but this improvement has still been merged into core for a smoother transition.

Changelog

Removed

- Removed RHEL 5 support since long since end-of-lifed #62520
- Removing Azure-Cloud modules from the code base. #64322
- Dropped Python 3.7 support since it's EOL in 27 Jun 2023 #64417
- Remove salt.payload.Serial #64459
- Remove netmiko_conn and pyeapi_conn from salt.modules.napalm_mod #64460
- Removed 'transport' arg from salt.utils.event.get_event #64461
- Removed the usage of retired Linode API v3 from Salt Cloud #64517

Deprecated

- Deprecate all Proxmox cloud modules #64224
- Deprecate all the Vault modules in favor of the Vault Salt Extension https://github.com/salt-extensions/saltext-vault. The Vault modules will be removed in Salt core in 3009.0. #64893
- Deprecate all the Docker modules in favor of the Docker Salt Extension https://github.com/saltstack/saltext-docker. The Docker modules will be removed in Salt core in 3009.0. #64894
- Deprecate all the Zabbix modules in favor of the Zabbix Salt Extension https://github.com/salt-extensions/saltext-zabbix. The Zabbix modules will be removed in Salt core in 3009.0. #64896
- Deprecate all the Apache modules in favor of the Apache Salt Extension https://github.com/salt-extensions/saltext-apache. The Apache modules will be removed in Salt core in 3009.0. #64909
- Deprecation warning for Salt's backport of `OrderedDict` class which will be removed in 3009 #65542
- Deprecate Kubernetes modules for move to saltext-kubernetes in version 3009 #65565
- Deprecated all Pushover modules in favor of the Salt Extension at https://github.com/salt-extensions/saltext-pushover. The Pushover modules will be removed from Salt core in 3009.0 #65567
- Removed deprecated code:
  - All of `salt/log/` which has been on a deprecation path for a long time.
  - Some of the logging handlers found in `salt/_logging/handlers` have been removed since the standard library provides them.
  - Removed the deprecated `salt/modules/cassandra_mod.py` module and any tests for it.
  - Removed the deprecated `salt/returners/cassandra_return.py` module and any tests for it.
  - Removed the deprecated `salt/returners/django_return.py` module and any tests for it. #65986

Changed

- Masquerade property will not default to false turning off masquerade if not specified. #53120
- Addressed Python 3.11 deprecations:
  - Switch to `FullArgSpec` since Py 3.11 no longer has `ArgSpec`, deprecated since Py 3.0
  - Stopped using the deprecated `cgi` module.
  - Stopped using the deprecated `pipes` module
  - Stopped using the deprecated `imp` module #64457
- changed 'gpg_decrypt_must_succeed' default from False to True #64462

Fixed

- When an NFS or FUSE mount fails to unmount when mount options have changed, try again with a lazy umount before mounting again. #18907
- fix autoaccept gpg keys by supporting it in refresh_db module #42039
- Made cmd.script work with files from the fileserver via salt-ssh #48067
- Made slsutil.renderer work with salt-ssh #50196
- Fixed defaults.merge is not available when using salt-ssh #51605
- Fix extfs.mkfs missing parameter handling for -C, -d, and -e #51858
- Fixed Salt master does not renew token #51986
- Fixed salt-ssh continues state/pillar rendering with incorrect data when an exception is raised by a module on the target #52452
- Fix extfs.tune has 'reserved' documented twice and is missing the 'reserved_percentage' keyword argument #54426
- Fix the ability of the 'selinux.port_policy_present' state to modify. #55687
- Fixed config.get does not support merge option with salt-ssh #56441
- Removed an unused assignment in file.patch #57204
- Fixed vault module fetching more than one secret in one run with single-use tokens #57561
- Use brew path from which in mac_brew_pkg module and rely on _homebrew_bin() everytime #57946
- Fixed Vault verify option to work on minions when only specified in master config #58174
- Fixed vault command errors configured locally #58580
- Fixed issue with basic auth causing invalid header error and 401 Bad Request, by using HTTPBasicAuthHandler instead of header. #58936
- Make the LXD module work with pyLXD > 2.10 #59514
- Return error if patch file passed to state file.patch is malformed. #59806
- Handle failure and error information from tuned module/state #60500
- Fixed sdb.get_or_set_hash with Vault single-use tokens #60779
- Fixed state.test does not work with salt-ssh #61100
- Made slsutil.findup work with salt-ssh #61143

- Allow all primitive grain types for autosign_grains #61416, #63708
- `ipset.new_set` no longer fails when creating a set type that uses the `family` create option #61620
- Fixed Vault session storage to allow unlimited use tokens #62380
- fix the efi grain on FreeBSD #63052
- Fixed gpg.receive_keys returns success on failed import #63144
- Fixed GPG state module always reports success without changes #63153
- Fixed GPG state module does not respect test mode #63156
- Fixed gpg.absent with gnupghome/user, fixed gpg.delete_key with gnupghome #63159
- Fixed service module does not handle enable/disable if systemd service is an alias #63214
- Made x509_v2 compound match detection use new runner instead of peer publishing #63278
- Need to make sure we update **pillar** during a pillar refresh to ensure that process_beacons has the updated beacons loaded from pillar. #63583
- This implements the vpc_uuid parameter when creating a droplet. This parameter selects the correct virtual private cloud (private network interface). #63714
- pkg.installed no longer reports failure when installing packages that are installed via the task manager #63767
- mac_xattr.list and mac_xattr.read will replace undecode-able bytes to avoid raising CommandExecutionError. #63779 #63779
- Fix aptpkg.latest_version performance, reducing number of times to 'shell out' #63982
- Added option to use a fresh connection for mysql cache #63991
- [lxd] Fixed a bug in `container_create` which prevented devices which are not of type `disk` to be correctly created and added to the container when passed via the `devices` parameter. #63996
- Skipped the `isfile` check to greatly increase speed of reading minion keys for systems with a large number of minions on slow file storage #64260
- Fix utf8 handling in 'pass' renderer #64300
- Upgade tornado to 6.3.2 #64305
- Prevent errors due missing 'transactional_update.apply' on SLE Micro and MicroOS. #64369
- Fix 'unable to unmount' failure to return False result instead of None #64420
- Fixed issue uninstalling duplicate packages in `win_appx` execution module #64450
- Clean up tech debt, IPC now uses tcp transport. #64488
- Made salt-ssh more strict when handling unexpected situations and state.* wrappers treat a remote exception as failure, excluded salt-ssh error returns from mine #64531
- Fix flaky test for LazyLoader with isolated mocking of threading.RLock #64567
- Fix possible `KeyError` exceptions in `salt.utils.user.get_group_dict` while reading improper duplicated GID assigned for the user. #64599
- changed vm_config() to deep-merge vm_overrides of specific VM, instead of simple-merging the whole vm_overrides #64610
- Fix the way Salt tries to get the Homebrew's prefix

The first attempt to get the Homebrew's prefix is to look for the `HOMEBREW_PREFIX` environment variable. If it's not set, then Salt tries to get the prefix from the `brew` command. However, the `brew` command can fail. So a last attempt is made to get the prefix by guessing the installation path. #64924

- Add missing MySQL Grant SERVICE_CONNECTION_ADMIN to mysql module. #64934
- Fixed slsutil.update with salt-ssh during template rendering #65067
- Keep track when an included file only includes sls files but is a requisite. #65080
- Fixed `gpg.present` succeeds when the keyserver is unreachable #65169
- Fix typo in nftables module to ensure unique nft family values #65295
- Dereference symlinks to set proper __cli opt #65435
- Made salt-ssh merge master top returns for the same environment #65480
- Account for situation where the metadata grain fails because the AWS environment requires an authentication token to query the metadata URL. #65513
- Improve the condition of overriding target for pip with VENV_PIP_TARGET environment variable. #65562
- Added SSH wrapper for logmod #65630
- Include changes in the results when schedule.present state is run with test=True. #65652
- Fix extfs.tune doesn't pass retcode to module.run #65686
- Return an error message when the DNS plugin is not supported #65739
- Execution modules have access to regular fileclient durring pillar rendering. #66124
- Fixed a issue with server channel where a minion's public key would be rejected if it contained a final newline character. #66126

Added

- Allowed publishing to regular minions from the SSH wrapper #40943
- Added syncing of custom salt-ssh wrappers #45450
- Made salt-ssh sync custom utils #53666
- Add ability to use file.managed style check_cmd in file.serialize #53982
- Revised use of deprecated net-tools and added support for ip neighbour with IPv4 ip_neighs, IPv6 ip_neighs6 #57541
- Added password support to Redis returner. #58044
- Added a state (win_task) for managing scheduled tasks on Windows #59037
- Added keyring param to gpg modules #59783
- Added new grain to detect the Salt package type: onedir, pip or system #62589
- Added Vault AppRole and identity issuance to minions #62823
- Added Vault AppRole auth mount path configuration option #62825
- Added distribution of Vault authentication details via response wrapping #62828
- Add salt package type information. Either onedir, pip or system. #62961
- Added signature verification to file.managed/archive.extracted #63143

- Added signed_by_any/signed_by_all parameters to gpg.verify #63166
- Added match runner #63278
- Added Vault token lifecycle management #63406
- adding new call for openscap xccdf eval supporting new parameters #63416
- Added Vault lease management utility #63440
- implement removal of ptf packages in zypper pkg module #63442
- add JUnit output for saltcheck #63463
- Add ability for file.keyvalue to create a file if it doesn't exist #63545
- added cleanup of temporary mountpoint dir for macpackage installed state #63905
- Add pkg.installed show installable version in test mode #63985
- Added patch option to Vault SDB driver #64096
- Added flags to create local users and groups #64256
- Added inline specification of trusted CA root certificate for Vault #64379
- Add ability to return False result in test mode of configurable_test_state #64418
- Switched Salt's onedir Python version to 3.11 #64457
- Added support for dnf5 and its new command syntax #64532
- Adding a new decorator to indicate when a module is deprecated in favor of a Salt extension. #64569
- Add jq-esque to_entries and from_entries functions #64600
- Added ability to use PYTHONWARNINGS=ignore to silence deprecation warnings. #64660
- Add follow_symlinks to file.symlink exec module to switch to os.path.lexists when False #64665
- Strenghten Salt's HA capabilities with master clustering. #64939
- Added win_appx state and execution modules for managing Microsoft Store apps and deprovisioning them from systems #64978
- Add support for show_jid to salt-run

  Adds support for show_jid master config option to salt-run, so its behaviour matches the salt cli command. #65008
- Add ability to remove packages by wildcard via apt execution module #65220
- Added support for master top modules on masterless minions #65479
- Allowed accessing the regular mine from the SSH wrapper #65645
- Allow enabling backup for Linode in Salt Cloud #65697
- Add a backup schedule setter fFunction for Linode VMs #65713
- Add acme support for manual plugin hooks #65744

Security

- Upgrade to `tornado>=6.3.3` due to https://github.com/advisories/GHSA-qppv-j76h-2rpx #64989
- Update to `gitpython>=3.1.35` due to https://github.com/advisories/GHSA-wfm5-v35h-vwf4 and https://github.com/advisories/GHSA-cwvm-v4w8-q58c #65137

(release-3007.1)=

33.2.2 Salt 3007.1 release notes

Changelog

Removed

- The `salt.utils.psutil_compat` was deprecated and now removed in Salt 3008. Please use the `psutil` module directly. #66160

Fixed

- Fixes multiple issues with the cmd module on Windows. Scripts are called using the `-File` parameter to the `powershell.exe` binary. `CLIXML` data in stderr is now removed (only applies to encoded commands). Commands can now be sent to `cmd.powershell` as a list. Makes sure JSON data returned is valid. Strips whitespace from the return when using `runas`. #61166
- Fixed the win_lgpo_netsh salt util to handle non-English systems. This was a rewrite to use PowerShell instead of netsh to make the changes on the system #61534
- Fix typo in nftables module to ensure unique nft family values #65295
- Corrected x509_v2 CRL creation `last_update` and `next_update` values when system timezone is not UTC #65837
- Fix for NoneType can't be used in 'await' expression error. #66177
- Log ”Publish server binding pub to” messages to debug instead of error level. #66179
- Fix syndic startup by making payload handler a coroutine #66237
- Fixed `aptpkg.remove` ”unable to locate package” error for non-existent package #66260
- Fixed pillar.ls doesn't accept kwargs #66262
- Fix cache directory setting in Master Cluster tutorial #66264
- Change log level of successful master cluster key exchange from error to info. #66266
- Made `file.managed` skip download of a remote source if the managed file already exists with the correct hash #66342
- Fixed nftables.build_rule breaks ipv6 rules by using the wrong syntax for source and destination addresses #66382

Added

- Added the ability to pass a version of chocolatey to install to the chocolatey.bootstrap function. Also added states to bootstrap and unbootstrap chocolatey. #64722
- Add Ubuntu 24.04 support #66180
- Add Fedora 40 support, replacing Fedora 39 #66300

Security

- Bump to `pydantic==2.6.4` due to https://github.com/advisories/GHSA-mr82-8j83-vxmv #66433
- Bump to `jinja2==3.1.4` due to https://github.com/advisories/GHSA-h75v-3vvj-5mfj #66488

(release-3007.2)=

33.2.3 Salt 3007.2 release notes

Changelog

Fixed

- Fixed `salt.*.get` shorthand via Salt-SSH #41794
- Show a better error when running cmd.* commands using runas and the runas user does not exist #56680
- Await on zmq monitor socket's poll method to fix publish server reliability in environment's with a large amount of minions. #65265
- Fixed result detection of module.run from returned dict #65842
- Fix vault module doesn't respect `server.verify` option during unwrap if verify is set to `False` or CA file on the disk #66213
- Make sure the master_event_pub.ipc file has correct reed/write permissions for salt group. #66228
- fix #66194: Exchange HTTPClient by AsyncHTTPClient in salt.utils.http #66330
- Fixed `salt.*.*` attribute syntax for non-Jinja renderers via Salt-SSH #66376
- Add integration tests for startup_states #66592
- Fixed accessing wrapper modules in Salt-SSH Jinja templates via attribute syntax #66600
- Fixed Salt-SSH crash when key deploy is skipped manually #66610
- Fixed gpp module trust level reporting/crash with python-gnupg>=0.5.1 #66685
- Update master cluster tutorial haproxy config with proper timeouts for publish port #66888
- transports.tcp: ensure pull path is being used before attempting chmod. The fix prevents an unnecessary traceback when the TCP transport is not using unix sockets. No functionaly has changed as the traceback occurs when an async task was about to exit anyway. #66931
- Fix an issue with the osrelease_info grain that was displaying empty strings #66936
- Added support for MAINTAIN (m) privilege to salt.modules.postgres #66962
- make file.symlink/_symlink_check() respect follow_symlinks #66980
- Salt master waits for publish servers while starting up. #66993

- Fix a stacktrace on Windows with pkg.installed and test=True. The `pkg.list_repo_pkgs` function does not exist on Windows. This uses the `pkg.list_available` function instead for Windows. #67171
- Made the correct PKI directory available for key_cache use #67185
- Removed support for end of life Python 3.8 from pre-commit and requirements #67730
- Fixed if arguments are passed to the key delete all, -D, it will throw an error #67903
- Set virtual grain for docker using systemd and virt-what #67905
- Remove broken salt-common bash-completion links in root filesystem #67915
- Fix refresh of osrelease and related grains on Python 3.10+ #67932
- Re-add -oProxyCommand to ssh gateway arguments when ssh_gateway is present. #67934
- Repair Git state comment formatting #67944
- Use a Jscript Custom Action to stop the salt-minion service on Windows instead of a VBscript Custom Action due to future deprecation and security issues #67982

(release-3007.3)=

33.2.4 Salt 3007.3 release notes

Changelog

Added

- Added the ability to configure the cluster event port and added documentation for it #66627

(release-3007.4)=

33.2.5 Salt 3007.4 release notes

Changelog

Fixed

- CVE-2024-38822 Multiple methods in the salt master skip minion token validation. Therefore a misbehaving minion can impersonate another minion.

  CVSS 2.7 V:N/AC:L/PR:H/UI:N/S:U/C:N/I:L/A:N

  CVE-2024-38823 Salt's request server is vulnerable to replay attacks when not using a TLS encrypted transport.

  CVSS Score 2.7 AV:N/AC:L/PR:H/UI:N/S:U/C:N/I:L/A:N

  CVE-2024-38824 Directory traversal vulnerability in recv_file method allows arbitrary files to be written to the master cache directory.

  CVSS Score 9.6 AV:N/AC:L/PR:L/UI:N/S:C/C:H/I:H/A:N

  CVE-2024-38825 The salt.auth.pki module does not properly authenticate callers. The "password" field contains a public certificate which is validated against a CA certificate by the module. This is not pki authentication, as the caller does not need access to the corresponding private key for the authentication attempt to be accepted.

  CVSS Score 6.4 AV:N/AC:L/PR:L/UI:N/S:C/C:L/I:L/A:N

CVE-2025-22236 Minion event bus authorization bypass. An attacker with access to a minion key can craft a message which may be able to execute a job on other minions (>= 3007.0).

CVSS 8.1 AV:L/AC:L/PR:H/UI:N/S:C/C:H/I:H/A:L

CVE-2025-22237 An attacker with access to a minion key can exploit the 'on demand' pillar functionality with a specially crafted git url which could cause and arbitrary command to be run on the master with the same privileges as the master process.

CVSS 6.7 AV:L/AC:L/PR:H/UI:N/S:U/C:H/I:H/A:H

CVE-2025-22238 Directory traversal attack in minion file cache creation. The master's default cache is vulnerable to a directory traversal attack. Which could be leveraged to write or overwrite 'cache' files outside of the cache directory.

CVSS 4.2 AV:L/AC:L/PR:H/UI:R/S:U/C:N/I:H/A:N

CVE-2025-22239 Arbitrary event injection on Salt Master. The master's ”_minion_event” method can be used by and authorized minion to send arbitrary events onto the master's event bus.

CVSS 8.1 AV:L/AC:L/PR:H/UI:N/S:C/C:H/I:H/A:L

CVE-2025-22240 Arbitrary directory creation or file deletion. In the find_file method of the GitFS class, a path is created using os.path.join using unvalidated input from the “tgt_env” variable. This can be exploited by an attacker to delete any file on the Master's process has permissions to

CVSS 6.3 AV:L/AC:H/PR:H/UI:R/S:U/C:H/I:H/A:H

CVE-2025-22241 File contents overwrite the VirtKey class is called when “on-demand pillar” data is requested and uses un-validated input to create paths to the “pki directory”. The functionality is used to auto-accept Minion authentication keys based on a pre-placed “authorization file” at a specific location and is present in the default configuration.

CVSS 5.6 AV:L/AC:H/PR:H/UI:R/S:U/C:H/I:H/A:N

CVE-2025-22242 Worker process denial of service through file read operation. .A vulnerability exists in the Master's “pub_ret” method which is exposed to all minions. The un-sanitized input value “jid” is used to construct a path which is then opened for reading. An attacker could exploit this vulnerabilities by attempting to read from a filename that will not return any data, e.g. by targeting a pipe node on the proc file system.

CVSS 5.6 AV:L/AC:H/PR:H/UI:R/S:U/C:H/I:N/A:H

This release also includes sqlite 3.50.1 to address CVE-2025-29087 #68033

(release-3006.0)=

33.2.6 Salt 3006.0 release notes

Onedir packaging

Going forward from the 3006.0 release, the Salt Project will only provide onedir packages to install or upgrade Salt. The classic, non-onedir packages will not be provided for supported operating systems. See Upgrade to onedir in the Salt Install Guide for information about upgrading from the classic packages to the onedir packages.

Linux Packaging Salt Master Salt User and Group

The linux Salt Master packages will now add a Salt user and group by default. The packages will add the `user: salt` config option to the Salt Master config. The Salt Master service will run as this user. If you do not want to run the Salt Master as a different user you can remove the `user: salt` config from /etc/salt/master or change the user to the desired user to run the Salt Master.

Since the Salt Master is running as a different user, you will need to ensure you set the owner and group to `salt` for your file_roots and pillar_roots(commonly `/srv/salt` and `/srv/pillar`).

If you are running a Salt Master, Salt-Api and a Salt Minion on the same host using the new `salt` user and you install a pip dependency into the onedir environment using `salt-pip` or the `pip` module, you need to to chown the directory `/opt/saltstack/salt/lib/<python_version>/site-packages/` with the `salt` user and group.

Caveat of salt-pip

Salt ships with a wrapper script around pip called `salt-pip`. Users should use `salt-pip` to install any python packages needed to extend Salt. `salt-pip` installs python packages into an `extras-3.10` directory located in the root of the ondir directory, by setting the `--target` argument for pip. This ensures those packages remain installed when upgrading Salt. There is a known bug in pip when using `--target` where scripts and other non-python assets may not be cleaned up properly when un-installing. The Salt team is working to resolve this bug in the up-stream pip project.

Dropping support for Python 3.5 and 3.6

Python 3.5 and 3.6 will no longer be supported by Salt since they are end of life. Going forward our policy will be to align with Python's supported versions. See Salt support for Python versions for more information.

All salt-api functionality disabled by default

All netapi clients, which provide the functionality to `salt-api`, will now be disabled by default as a security precaution. If you use `salt-api`, you must add the new `netapi_enable_clients` option to your salt master config. This is a breaking change and the `salt-api` will not function without this new configuration option. See Enabling netapi client interfaces for more information.

How do I migrate to the onedir packages?

The migration path from the classic, non-onedir packages to the onedir packages will include:

- Repo File: You need to update your repo file to point to the new repo paths for your platform. After the repo file is updated, upgrade your Salt packages.
- Pip packages: You need to ensure any 3rd party pip packages are installed in the correct onedir path. This can be accomplished in two ways:
  - `salt-pip install <package name>`
  - Using the `pip.installed` Salt state.

To install python packages into the system python environment, user's must now provide the `pip_bin` or `bin_env` to the pip state module.

For example:

```
lib-foo:
  pip.installed:
    - pip_bin: /usr/bin/pip3
lib-bar:
  pip.installed:
    - bin_env: /usr/bin/python3
```

Changelog

Removed

- Remove and deprecate the **orchestration** key from salt.runner and salt.wheel return data. To get it back, set features.enable_deprecated_orchestration_flag master configuration option to True. The flag will be completely removed in Salt 3008 Argon. #59917
- Removed distutils and replaced with setuptools, given distutils is deprecated and removed in Python 3.12 #60476
- Removed `runtests` targets from `noxfile.py` #62239
- Removed the PyObjC dependency.

  This addresses problems with building a one dir build for macOS. It became problematic because depending on the macOS version, it pulls different dependencies, and we would either have to build a macos onedir for each macOS supported release, or ship a crippled onedir(because it would be tied to the macOS version where the onedir was built). Since it's currently not being used, it's removed. #62432
- Removed `SixRedirectImporter` from Salt. Salt hasn't shipped `six` since Salt 3004. #63874

Deprecated

- renamed `keep_jobs`, specifying job cache TTL in hours, to `keep_jobs_seconds`, specifying TTL in seconds. `keep_jobs` will be removed in the Argon release #55295
- Removing all references to napalm-base which is no longer supported. #61542
- The 'ip_bracket' function has been moved from salt/utils/zeromq.py in salt/utils/network.py #62009
- The `expand_repo_def` function in `salt.modules.aptpkg` is now deprecated. It's only used in `salt.states.pkgrepo` and it has no use of being exposed to the CLI. #62485
- Deprecated defunct Django returner #62644
- Deprecate core ESXi and associated states and modules, vcenter and vsphere support in favor of Salt VMware Extensions #62754
- Removing manufacture grain which has been deprecated. #62914
- Removing deprecated utils/boto3_elasticsearch.py #62915
- Removing support for the now deprecated _ext_nodes from salt/master.py. #62917
- Deprecating the Salt Slack engine in favor of the Salt Slack Bolt Engine. #63095
- `salt.utils.version.StrictVersion` is now deprecated and it's use should be replaced with `salt.utils.version.Version`. #63383

Changed

- More intelligent diffing in changes of file.serialize state. #48609
- Move deprecation of the neutron module to Argon. Please migrate to the neutronng module instead. #49430
- `umask` is now a global state argument, instead of only applying to `cmd` states. #57803
- Update pillar.obfuscate to accept kwargs in addition to args. This is useful when passing in keyword arguments like saltenv that are then passed along to pillar.items. #58971
- Improve support for listing macOS brew casks #59439
- Add missing MariaDB Grants to mysql module. MariaDB has added some grants in 10.4.x and 10.5.x that are not present here, which results in an error when creating. Also improved exception handling in `grant_add` which did not log the original error message and replaced it with a generic error. #61409
- Use VENV_PIP_TARGET environment variable as a default target for pip if present. #62089
- Disabled FQDNs grains on macOS by default #62168
- Replaced pyroute2.IPDB with pyroute2.NDB, as the former is deprecated #62218
- Enhance capture of error messages for Zypper calls in zypperpkg module. #62346
- Removed GPG_1_3_1 check #62895
- Requisite state chunks now all consistently contain `__id__`, `__sls__` and `name`. #63012
- netapi_enable_clients option to allow enabling/disabling of clients in salt-api. By default all clients will now be disabled. Users of salt-api will need to update their master config to enable the clients that they use. Not adding the netapi_enable_clients option with required clients to the master config will disable salt-api. #63050
- Stop relying on `salt/_version.py` to write Salt's version. Instead use `salt/_version.txt` which only contains the version string. #63383
- Set enable_fqdns_grains to be False by default. #63595
- Changelog snippet files must now have a `.md` file extension to be more explicit on what type of rendering is done when they are included in the main `CHANGELOG.md` file. #63710
- Upgraded to `relenv==0.9.0` #63883

Fixed

- Add kwargs to handle extra parameters for http.query #36138
- Fix mounted bind mounts getting active mount options added #39292
- Fix `sysctl.present` converts spaces to tabs. #40054
- Fixes state pkg.purged to purge removed packages on Debian family systems #42306
- Fix fun_args missing from syndic returns #45823
- Fix mount.mounted with 'mount: False' reports unmounted file system as unchanged when running with test=True #47201
- Issue #49310: Allow users to touch a file with Unix date of birth #49310
- Do not raise an exception in pkg.info_installed on nonzero return code #51620
- Passes the value of the force parameter from file.copy to its call to file.remove so that files with the read-only attribute are handled. #51739

- Fixed x509.certificate_managed creates new certificate every run in the new cryptography x509 module. Please migrate to the new cryptography x509 module for this improvement. #52167
- Don't check for cached pillar errors on state.apply #52354, #57180, #59339
- Swapping out args and kwargs for arg and kwarg respectively in the Slack engine when the command passed is a runner. #52400
- Ensure when we're adding chunks to the rules when running aggregation with the iptables state module we use a copy of the chunk otherwise we end up with a recursive mess. #53353
- When user_create or user_remove fail, return False instead of returning the error. #53377
- Include sync_roster when sync_all is called. #53914
- Avoid warning noise in lograte.get #53988
- Fixed listing revoked keys with gpg.list_keys #54347
- Fix mount.mounted does not handle blanks properly #54508
- Fixed grain num_cpus get wrong CPUs count in case of inconsistent CPU numbering. #54682
- Fix spelling error for python_shell argument in dpkg_lower module #54907
- Cleaned up bytes response data before sending to non-bytes compatible returners (postgres, mysql) #55226
- Fixed malformed state return when testing file.managed with unavailable source file #55269
- Included stdout in error message for Zypper calls in zypperpkg module. #56016
- Fixed pillar.filter_by with salt-ssh #56093
- Fix boto_route53 issue with (multiple) VPCs. #57139
- Remove log from mine runner which was not used. #57463
- Fixed x509.read_certificate error when reading a Microsoft CA issued certificate in the new cryptography x509 module. Please migrate to the new cryptography x509 module for this improvement. #57535
- Updating Slack engine to use slack_bolt library. #57842
- Fixed warning about replace=True with x509.certificate_managed in the new cryptography x509 module. #58165
- Fix salt.modules.pip:is_installed doesn't handle locally installed packages #58202
- Add missing MariaDB Grants to mysql module. MariaDB has added some grants in 10.4.x and 10.5.x that are not present here, which results in an error when creating. #58297
- linux_shadow: Fix cases where malformed shadow entries cause `user.present` states to fail. #58423
- Fixed salt.utils.compat.cmp to work with dictionaries #58729
- Fixed formatting for terse output mode #58953
- Fixed RecursiveDictDiffer with added nested dicts #59017
- Fixed x509.certificate_managed has DoS effect on master in the new cryptography x509 module. Please migrate to the new cryptography x509 module for this improvement. #59169
- Fixed saltnado websockets disconnecting immediately #59183
- Fixed x509.certificate_managed rolls certificates every now and then in the new cryptography x509 module. Please migrate to the new cryptography x509 module for this improvement. #59315
- Fix postgres_privileges.present not idempotent for functions #59585

- Fixed influxdb_continuous_query.present state to provide the client args to the underlying module on create. #59766
- Warn when using insecure (http:// based) key_urls for apt-based systems in pkgrepo.managed, and add a kwarg that determines the validity of such a url. #59786
- add load balancing policy default option and ensure the module can be executed with arguments from CLI #59909
- Fix salt-ssh when using imports with extra-filerefs. #60003
- Fixed cache directory corruption startup error #60170
- Update docs remove dry_run in docstring of file.blockreplace state. #60227
- Adds Parrot to OS_Family_Map in grains. #60249
- Fixed stdout and stderr being empty sometimes when use_vt=True for the cmd.run[*] functions #60365
- Use return code in iptables --check to verify rule exists. #60467
- Fix regression pip.installed does not pass env_vars when calling pip.list #60557
- Fix xfs module when additional output included in mkfs.xfs command. #60853
- Fixed parsing new format of terraform states in roster.terraform #60915
- Fixed recognizing installed ARMv7 rpm packages in compatible architectures. #60994
- Fixing changes dict in pkg state to be consistent when installing and test=True. #60995
- Fix cron.present duplicating entries when changing timespec to special. #60997
- Made salt-ssh respect --wipe again #61083
- state.orchestrate_single only passes a pillar if it is set to the state function. This allows it to be used with state functions that don't accept a pillar keyword argument. #61092
- Fix ipset state when the comment kwarg is set. #61122
- Fix issue with archive.unzip where the password was not being encoded for the extract function #61422
- Some Linux distributions (like AlmaLinux, Astra Linux, Debian, Mendel, Linux Mint, Pop!_OS, Rocky Linux) report different `oscodename`, `osfullname`, `osfinger` grains if lsb-release is installed or not. They have been changed to only derive these OS grains from `/etc/os-release`. #61618
- Pop!_OS uses the full version (YY.MM) in the osfinger grain now, not just the year. This allows differentiating for example between 20.04 and 20.10. #61619
- Fix ssh config roster to correctly parse the ssh config files that contain spaces. #61650
- Fix SoftLayer configuration not raising an exception when a domain is missing #61727
- Allow the minion to start or salt-call to run even if the user doesn't have permissions to read the root_dir value from the registry #61789
- Need to move the creation of the proxy object for the ProxyMinion further down in the initialization for sub proxies to ensure that all modules, especially any custom proxy modules, are available before attempting to run the init function. #61805
- Fixed malformed state return when merge-serializing to an improperly formatted file #61814
- Made cmdmod._run[_all]_quiet work during minion startup on MacOS with runas specified (which fixed mac_service) #61816
- When deleting the vault cache, also delete from the session cache #61821

- Ignore errors on reading license info with dpkg_lowpkg to prevent tracebacks on getting package information. #61827
- win_lgpo: Display conflicting policy names when more than one policy is found #61859
- win_lgpo: Fixed intermittent KeyError when getting policy setting using lgpo.get_policy #61860
- Fixed listing minions on OpenBSD #61966
- Make Salt to return an error on "pkg" modules and states when targeting duplicated package names #62019
- Fix return of REST-returned permissions when auth_list is set #62022
- Normalize package names once on using pkg.installed/removed with yum to make it possible to install packages with the name containing a part similar to a name of architecture. #62029
- Fix inconsitency regarding name and pkgs parameters between zypperpkg.upgrade() and yumpkg.upgrade() #62030
- Fix attr=all handling in pkg.list_pkgs() (yum/zypper). #62032
- Fixed the humanname being ignored in pkgrepo.managed on openSUSE Leap #62053
- Fixed issue with some LGPO policies having whitespace at the beginning or end of the element alias #62058
- Fix ordering of args to libcloud_storage.download_object module #62074
- Ignore extend declarations in sls files that are excluded. #62082
- Remove leftover usage of impacket #62101
- Pass executable path from _get_path_exec() is used when calling the program. The $HOME env is no longer modified globally. Only trailing newlines are stripped from the fetched secret. Pass process arguments are handled in a secure way. #62120
- Ignore some command return codes in openbsdrcctl_service to prevent spurious errors #62131
- Fixed extra period in filename output in tls module. Instead of "server.crt." it will now be "server.crt". #62139
- Make sure lingering PAexec-*.exe files in the Windows directory are cleaned up #62152
- Restored Salt's DeprecationWarnings #62185
- Fixed issue with forward slashes on Windows with file.recurse and clean=True #62197
- Recognize OSMC as Debian-based #62198
- Fixed Zypper module failing on RPM lock file being temporarily unavailable. #62204
- Improved error handling and diagnostics in the proxmox salt-cloud driver #62211
- Added EndeavourOS to the Arch os_family. #62220
- Fix salt-ssh not detecting `platform-python` as a valid interpreter on EL8 #62235
- Fix pkg.version_cmp on openEuler and a few other os flavors. #62248
- Fix localhost detection in glusterfs.peers #62273
- Fix Salt Package Manager (SPM) exception when calling spm create_repo . #62281
- Fix matcher slowness due to loader invocation #62283
- Fixes the Puppet module for non-aio Puppet packages for example running the Puppet module on FreeBSD. #62323
- Issue 62334: Displays a debug log message instead of an error log message when the publisher fails to connect #62334

- Fix pyobjects renderer access to opts and sls #62336
- Fix use of random shuffle and sample functions as Jinja filters #62372
- Fix groups with duplicate GIDs are not returned by get_group_list #62377
- Fix the "zpool.present" state when enabling zpool features that are already active. #62390
- Fix ability to execute remote file client methods in saltcheck #62398
- Update all platforms to use pycparser 2.21 or greater for Py 3.9 or higher, fixes fips fault with openssl v3.x #62400
- Due to changes in the Netmiko library for the exception paths, need to check the version of Netmiko python library and then import the exceptions from different locations depending on the result. #62405
- When using preq on a state, then prereq state will first be run with test=True to determine if there are changes. When there are changes, the state with the prereq option will be run prior to the prereq state. If this state fails then the prereq state will not run and the state output uses the test=True run. However, the proposed changes are included for the prereq state are included from the test=True run. We should pull those out as there weren't actually changes since the prereq state did not run. #62408
- Added directory mode for file.copy with makedirs #62426
- Provide better error handling in the various napalm proxy minion functions when the device is not accessible. #62435
- When handling aggregation, change the order to ensure that the requisites are aggregated first and then the state functions are aggregated. Caching whether aggregate functions are available for particular states so we don't need to attempt to load them everytime. #62439
- The patch allows to boostrap kubernetes clusters in the version above 1.13 via salt module #62451
- sysctl.persist now updates the in-memory value on FreeBSD even if the on-disk value was already correct. #62461
- Fixed parsing CDROM apt sources #62474
- Update sanitizing masking for Salt SSH to include additional password like strings. #62483
- Fix user/group checking on file state functions in the test mode. #62499
- Fix user.present to allow removing groups using optional_groups parameter and enforcing idempotent group membership. #62502
- Fix possible tracebacks if there is a package with '------' or '======' in the description is installed on the Debian based minion. #62519
- Fixed the omitted "pool" parameter when cloning a VM with the proxmox salt-cloud driver #62521
- Fix rendering of pyobjects states in saltcheck #62523
- Fixes pillar where a corrupted CacheDisk file forces the pillar to be rebuilt #62527
- Use str() method instead of repo_line for when python3-apt is installed or not in aptpkg.py. #62546
- Remove the connection_timeout from netmiko_connection_args before netmiko_connection_args is added to **context**["netmiko_device"]["args"] which is passed along to the Netmiko library. #62547
- Fix order specific mount.mounted options for persist #62556
- Fixed salt-cloud cloning a proxmox VM with a specified new vmid. #62558
- Fix runas with cmd module when using the onedir bundled packages #62565
- Update setproctitle version for all platforms #62576

- Fixed missing parameters when cloning a VM with the proxmox salt-cloud driver #62580
- Handle PermissionError when importing crypt when FIPS is enabled. #62587
- Correctly reraise exceptions in states.http #62595
- Fixed syndic eauth. Now jobs will be published when a valid eauth user is targeting allowed minions/functions. #62618
- updated rest_cherry/app to properly detect arg sent as a string as curl will do when only one arg is supplied. #62624
- Prevent possible tracebacks in core grains module by ignoring non utf8 characters in /proc/1/environ, /proc/1/cmdline, /proc/cmdline #62633
- Fixed vault ext pillar return data for KV v2 #62651
- Fix saltcheck _get_top_states doesn't pass saltenv to state.show_top #62654
- Fix groupadd.* functions hard code relative command name #62657
- Fixed pdbedit.create trying to use a bytes-like hash as string. #62670
- Fix depenency on legacy boto module in boto3 modules #62672
- Modified "_get_flags" function so that it returns regex flags instead of integers #62676
- Change startup ReqServer log messages from error to info level. #62728
- Fix kmod.* functions hard code relative command name #62772
- Remove mako as a dependency in Windows and macOS. #62785
- Fix mac_brew_pkg to work with null taps #62793
- Fixing a bug when listing the running schedule if "schedule.enable" and/or "schedule.disable" has been run, where the "enabled" items is being treated as a schedule item. #62795
- Prevent annoying RuntimeWarning message about line buffering (buffering=1) not being supported in binary mode #62817
- Include UID and GID checks in modules.file.check_perms as well as comparing ownership by username and group name. #62818
- Fix presence events on TCP transport by removing a client's presence when minion disconnects from publish channel correctly #62826
- Remove Azure deprecation messages from functions that always run w/ salt-cloud #62845
- Use select instead of iterating over entrypoints as a dictionary for importlib_metadata>=5.0.0 #62854
- Fixed master job scheduler using when #62858
- LGPO: Added support for missing domain controller policies: VulnerableChannelAllowList and LdapEnforceChannelBinding #62873
- Fix unnecessarily complex gce metadata grains code to use googles metadata service more effectively. #62878
- Fixed dockermod version_info function for docker-py 6.0.0+ #62882
- Moving setting the LOAD_BALANCING_POLICY_MAP dictionary into the try except block that determines if the cassandra_cql module should be made available. #62886
- Updating various MongoDB module functions to work with latest version of pymongo. #62900
- Restored channel for Syndic minions to send job returns to the Salt master. #62933

- removed _resolve_deps as it required a library that is not generally avalible. and switched to apt-get for everything as that can auto resolve dependencies. #62934
- Updated pyzmq to version 22.0.3 on Windows builds because the old version was causing salt-minion/salt-call to hang #62937
- Allow root user to modify crontab lines for non-root users (except AIX and Solaris). Align crontab line changes with the file ones and also with listing crontab. #62940
- Fix systemd_service.* functions hard code relative command name #62942
- Fix file.symlink backupname operation can copy remote contents to local disk #62953
- Issue #62968: Fix issue where cloud deployments were putting the keys in the wrong location on Windows hosts #62968
- Fixed gpg_passphrase issue with gpg decrypt/encrypt functions #62977
- Fix file.tidied FileNotFoundError #62986
- Fixed bug where module.wait states were detected as running legacy module.run syntax #62988
- Fixed issue with win_wua module where it wouldn't load if the CryptSvc was set to Manual start #62993
- The `__opts__` dunder dictionary is now added to the loader's `pack` if not already present, which makes it accessible via the `salt.loader.context.NamedLoaderContext` class. #63013
- Issue #63024: Fix issue where grains and config data were being place in the wrong location on Windows hosts #63024
- Fix btrfs.subvolume_snapshot command failing #63025
- Fix file.retention_schedule always reports changes #63033
- Fix mongo authentication for mongo ext_pillar and mongo returner

  This fix also include the ability to use the mongo connection string for mongo ext_pillar #63058
- Fixed x509.create_csr creates invalid CSR by default in the new cryptography x509 module. #63103
- TCP transport documentation now contains proper master/minion-side filtering information #63120
- Fixed gpg.verify does not respect gnupghome #63145
- User responsible for the runner is now correctly reported in the events on the event bus for the runner. #63148
- Made pillar cache pass extra minion data as well #63208
- Fix serious performance issues with the file.tidied module #63231
- Fix rpm_lowpkg version comparison logic when using rpm-vercmp and only one version has a release number. #63317
- Import StrictVersion and LooseVersion from setuptools.distutils.verison or setuptools._distutils.version, if first not available #63350
- `service.status` on Windows does no longer throws a CommandExecutionError if the service is not found on the system. It now returns "Not Found" instead. #63577
- When the shell is passed as powershell or pwsh, only wrapper the shell in quotes if cmd.run is running on Windows. When quoted on Linux hosts, this results in an error when the keyword arguments are appended. #63590
- LGPO: Added support for "Relax minimum password length limits" #63596
- Fixed the ability to set a scheduled task to auto delete if not scheduled to run again (`delete_after`) #63650

- When a job is disabled only increase it's _next_fire_time value if the job would have run at the current time, eg. the current _next_fire_time == now. #63699
- have salt.template.compile_template_str cleanup its temp files. #63724
- Check file is not empty before attempting to read pillar disk cache file #63729
- Fixed an issue with generating fingerprints for public keys with different line endings #63742
- Add `fileserver_interval` and `maintenance_interval` master configuration options. These options control how often to restart the FileServerUpdate and Maintenance processes. Some file server and pillar configurations are known to cause memory leaks over time. A notable example of this are configurations that use pygit2. Salt can not guarantee dependency libraries like pygit2 won't leak memory. Restarting any long running processes that use pygit2 guarantees we can keep the master's memory usage in check. #63747
- mac_xattr.list and mac_xattr.read will replace undecode-able bytes to avoid raising CommandExecutionError. #63779 #63779
- Change default GPG keyserver from pgp.mit.edu to keys.openpgp.org. #63806
- fix cherrypy 400 error output to be less generic. #63835
- Ensure kwargs is passed along to _call_apt when passed into install function. #63847
- remove eval and update logging to be more informative on bad config #63879
- add linux_distribution to util to stop dep warning #63904
- Fix valuerror when trying to close fileclient. Remove usage of **del** and close the filclient properly. #63920
- Handle the situation when a sub proxy minion does not init properly, eg. an exception happens, and the sub proxy object is not available. #63923
- Clarifying documentation for extension_modules configuration option. #63929
- Windows pkg module now properly handles versions containing strings #63935
- Handle the scenario when the check_cmd requisite is used with a state function when the state has a local check_cmd function but that function isn't used by that function. #63948
- Issue #63981: Allow users to pass verify_ssl to pkg.install/pkg.installed on Windows #63981
- Hardened permissions on workers.ipc and master_event_pub.ipc. #64063

Added

- Introduce a `LIB_STATE_DIR` syspaths variable which defaults to `CONFIG_DIR`, but can be individually customized during installation by specifying `--salt-lib-state-dir` during installation. Change the default `pki_dir` to `<LIB_STATE_DIR>/pki/master` (for the master) and `<LIB_STATE_DIR>/pki/minion` (for the minion). #3396
- Allow users to enable 'queue=True' for all state runs via config file #31468
- Added pillar templating to vault policies #43287
- Add support for NVMeF as a transport protocol for hosts in a Pure Storage FlashArray #51088
- A new salt-ssh roster that generates a roster by parses a known_hosts file. #54679
- Added Windows Event Viewer support #54713
- Added the win_lgpo_reg state and execution modules which will allow registry based group policy to be set directly in the Registry.pol file #56013
- Added resource tagging functions to boto_dynamodb execution module #57500

- Added `openvswitch_db` state module and functions `bridge_to_parent`, `bridge_to_vlan`, `db_get`, and `db_set` to the `openvswitch` execution module. Also added optional `parent` and `vlan` parameters to the `openvswitch_bridge.present` state module function and the `openvswitch.bridge_create` execution module function. #58986
- State module to manage SysFS attributes #60154
- Added ability for `salt.wait_for_event` to handle `event_id`s that have a list value. #60430
- Added suport for Linux ppc64le core grains (cpu_model, virtual, productname, manufacturer, serialnumber) and arm core grains (serialnumber, productname) #60518
- Added autostart option to virt.defined and virt.running states, along with virt.update execution modules. #60700
- Added .0 back to our versioning scheme for future versions (e.g. 3006.0) #60722
- Initial work to allow parallel startup of proxy minions when used as sub proxies with Deltaproxy. #61153
- Added node label support for GCE #61245
- Support the --priority flag when adding sources to Chocolatey. #61319
- Add namespace option to ext_pillar.http_json #61335
- Added a filter function to ps module to get a list of processes on a minion according to their state. #61420
- Add postgres.timeout option to postgres module for limiting postgres query times #61433
- Added new optional vault option, `config_location`. This can be either `master` or `local` and defines where vault will look for connection details, either requesting them from the master or using the local config. #61857
- Add ipwrap() jinja filter to wrap IPv6 addresses with brackets. #61931
- 'tcp' transport is now available in ipv6-only network #62009
- Add `diff_attr` parameter to pkg.upgrade() (zypper/yum). #62031
- Config option pass_variable_prefix allows to distinguish variables that contain paths to pass secrets. Config option pass_strict_fetch allows to error out when a secret cannot be fetched from pass. Config option pass_dir allows setting the PASSWORD_STORE_DIR env for pass. Config option pass_gnupghome allows setting the $GNUPGHOME env for pass. #62120
- Add file.pruned state and expanded file.rmdir exec module functionality #62178
- Added ”dig.PTR” function to resolve PTR records for IPs, as well as tests and documentation #62275
- Added the ability to remove a KB using the DISM state/execution modules #62366
- Add ” python” subcommand to allow execution or arbitrary scripts via bundled Python runtime #62381
- Add ability to provide conditions which convert normal state actions to no-op when true #62446
- Added debug log messages displaying the command being run when installing packages on Windows #62480
- Add biosvendor grain #62496
- Add ifelse Jinja function as found in CFEngine #62508
- Implementation of Amazon EC2 instance detection and setting `virtual_subtype` grain accordingly including the product if possible to identify. #62539
- Adds __env__substitution to ext_pillar.stack; followup of #61531, improved exception handling for stacked template (jinja) template rendering and yaml parsing in ext_pillar.stack #62578
- Increase file.tidied flexibility with regard to age and size #62678

- Added ”connected_devices” feature to netbox pillar module. It contains extra information about devices connected to the minion #62761
- Add atomic file operation for symlink changes #62768
- Add password/account locking/unlocking in user.present state on supported operating systems #62856
- Added onchange configuration for script engine #62867
- Added output and bare functionality to export_key gpg module function #62978
- Add keyvalue serializer for environment files #62983
- Add ability to ignore symlinks in file.tidied #63042
- salt-cloud support IMDSv2 tokens when using 'use-instance-role-credentials' #63067
- Fix running fast tests twice and add git labels to suite. #63081
- Add ability for file.symlink to not set ownership on existing links #63093
- Restore the previous slack engine and deprecate it, rename replace the slack engine to slack_bolt until deprecation #63095
- Add functions that will return the underlying block device, mount point, and filesystem type for a given path #63098
- Add ethtool execution and state module functions for pause #63128
- Add boardname grain #63131
- Added management of ECDSA/EdDSA private keys with x509 modules in the new cryptography x509 module. Please migrate to the new cryptography x509 module for this improvement. #63248
- Added x509 modules support for different output formats in the new cryptography x509 module. Please migrate to the new cryptography x509 module for this improvement. #63249
- Added deprecation_warning test state for ensuring that deprecation warnings are correctly emitted. #63315
- Adds a state_events option to state.highstate, state.apply, state.sls, state.sls_id. This allows users to enable state_events on a per use basis rather than having to enable them globally for all state runs. #63316
- Allow max queue size setting for state runs to prevent performance problems from queue growth #63356
- Add support of exposing meta_server_grains for Azure VMs #63606
- Include the version of `relenv` in the versions report. #63827
- Added debug log messages displaying the command being run when removing packages on Windows #63866
- Adding the ability to exclude arguments from a state that end up passed to cmd.retcode when requisites such as onlyif or unless are used. #63956
- Add --next-release argument to salt/version.py, which prints the next upcoming release. #64023

Security

- Upgrade Requirements Due to Security Issues.
  - Upgrade to `cryptography>=39.0.1` due to:
    - https://github.com/advisories/GHSA-x4qr-2fvf-3mr5
    - https://github.com/advisories/GHSA-w7pp-m8wf-vj6r
  - Upgrade to `pyopenssl==23.0.0` due to the cryptography upgrade.
  - Update to `markdown-it-py==2.2.0` due to:
    - https://github.com/advisories/GHSA-jrwr-5x3p-hvc3
    - https://github.com/advisories/GHSA-vrjv-mxr7-vjf8 #63882

33.2.7 Salt 3006.1 release notes

Changelog

Fixed

- Check that the return data from the cloud create function is a dictionary before attempting to pull values out. #61236
- Ensure NamedLoaderContext's have their value() used if passing to other modules #62477
- add documentation note about reactor state ids. #63589
- Added support for `test=True` to the `file.cached` state module #63785
- Updated `source_hash` documentation and added a log warning when `source_hash` is used with a source other than `http`, `https` and `ftp`. #63810
- Fixed clear pillar cache on every highstate and added clean_pillar_cache=False to saltutil functions. #64081
- Fix dmsetup device names with hyphen being picked up. #64082
- Update all the scheduler functions to include a fire_event argument which will determine whether to fire the completion event onto the event bus. This event is only used when these functions are called via the schedule execution modules. Update all the calls to the schedule related functions in the deltaproxy proxy minion to include fire_event=False, as the event bus is not available when these functions are called. #64102, #64103
- Default to a 0 timeout if none is given for the terraform roster to avoid `-o ConnectTimeout=None` when using `salt-ssh` #64109
- Disable class level caching of the file client on `SaltCacheLoader` and properly use context managers to take care of initialization and termination of the file client. #64111
- Fixed several file client uses which were not properly terminating it by switching to using it as a context manager whenever possible or making sure `.destroy()` was called when using a context manager was not possible. #64113
- Fix running setup.py when passing in --salt-config-dir and --salt-cache-dir arguments. #64114
- Moved /etc/salt/proxy and /lib/systemd/system/salt-proxy@.service to the salt-minion DEB package #64117
- Stop passing `**kwargs` and be explicit about the keyword arguments to pass, namely, to `cp.cache_file` call in `salt.states.pkg` #64118

- lgpo_reg.set_value now returns `True` on success instead of `None` #64126
- Make salt user's home /opt/saltstack/salt #64141
- Fix cmd.run doesn't output changes in test mode #64150
- Move salt user and group creation to common package #64158
- Fixed issue in salt-cloud so that multiple masters specified in the cloud are written to the minion config properly #64170
- Make sure the `salt-ssh` CLI calls it's `fsclient.destroy()` method when done. #64184
- Stop using the deprecated `salt.transport.client` imports. #64186
- Add a `.pth` to the Salt onedir env to ensure packages in extras are importable. Bump relenv to 0.12.3. #64192
- Fix `lgpo_reg` state to work with User policy #64200
- Cloud deployment directories are owned by salt user and group #64204
- `lgpo_reg` state now enforces and reports changes to the registry #64222

(release-3006.10)=

33.2.8 Salt 3006.10 release notes

Changelog

Removed

- Remove psutil_compat.py file, which should have been removed when RHEL 6 EOL #66467
- Removed dependency on bsdmainutils package for Debian and Ubuntu #67184

Deprecated

- Drop Arch Linux support #66886
- Removed support for end of life Python 3.7 and 3.8 from pre-commit and requirements #67729

Fixed

- Commands on Windows are now prefixed with `cmd /c` so that compound commands (commands separated by &&) run properly when using `runas` #44736
- Issue 58969: Fixes an issue with `saltclass.expand_classes_in_order` function where it was losing nested classes states during class expansion. The logic now use `salt.utils.odict.OrderedDict` to keep the inclusion ordering. #58969
- Fix issue with RunAs on Windows so that usernames of all numeric characters are handled as strings #59344
- Fixed an issue on Windows where checking success_retcodes when using the runas parameter would fail. Now success_retcodes are checked correctly #59977
- Fix an issue with cmd.script in Windows so that the exit code from a script will be passed through to the retcode of the state #60884
- Fixed an issue uninstalling packages on Windows using pkg.removed where there are multiple versions of the same software installed #61001

- Ensure file clients for runner, wheel, local and caller are available from the client_cache if called upon. #61416
- Convert stdin string to bytes regardless of stdin_raw_newlines #62501
- Issue 63933: Fixes an issue with `saltclass.expanded_dict_from_minion` function where it was passing a reference to minion `dict` which was overridden by nested classes during class expansion. Copy the node definition with `copy.deepcopy` instead of passing a reference. #63933
- Fixed an intermittent issue with file.recurse where the state would report failure even on success. Makes sure symlinks are created after the target file is created #64630
- The 'profile' outputter does not crash with incorrectly formatted data #65104
- Updating version comparison for rpm and removed obsolete comparison methods for rpms #65443
- Fix batch mode hang indefinitely in some scenarios #66249
- Applying `selinux.fcontext_policy_present` to a shorter path than an existing entry now works #66252
- Correct bash-completion for Debian / Ubuntu #66560
- Fix minion config option startup_states #66592
- Fixed an issue with cmd.run with requirements when the shell is not the default #66596
- Fixes an issue when getting account names using the get_name function in the win_dacl.py salt util. Capability SIDs return `None`. SIDs for deleted accounts return the SID. SIDs for domain accounts where the system is not connected to the domain return the SID. #66637
- Fixed an issue where `status.master` wasn't detecting a connection to the specified master properly #66716
- Fixed `win_wua.available` when some of the update objects are empty CDispatch objects. The `available` function no longer crashes #66718
- Clean up multiprocessing file handles on minion #66726
- Fixed nacl.keygen for not yet existing sk_file or pk_file #66772
- fix yaml output #66783
- Fixed an issue where enabling `grain_opts` in the minion config would cause some core grains to be overwritten. #66784
- Fix an issue where files created using `salt.utils.atomicile.atomic_open()` were created with restrictive permissions instead of respecting the umask. #66786
- Fix bad async_method name on AsyncPubClient class #66789
- Ensure Manjaro ARM reports the correct os_family of Arch. #66796
- Removed `salt.utils.data.decode` usage from the fileserver. This function was necessary to support Python 2. This speeds up loading the list cache by 80-90x. #66835
- Issue 66837: Fixes an issue with the `network.local_port_tcp` function where it was not parsing the IPv4 mapped IPv6 address correctly. The `::ffff:` is now removed and only the IP address is returned. #66837
- Better handling output of `systemctl --version` with salt.grains.core._systemd #66856
- Upgrade relenv to 0.17.3. This release includes python 3.10.15, openssl 3.2.3, and fixes for pip 24.2. #66858
- Remove caching of 'systemctl status' in systemd_service to fix automatic daemon-reload for repeated invocations. #66864
- Added cryptogrpahy back to base.txt requirements as a dependency #66883

- Remove "perms" from `linux_acl.list_absent()` documentation #66891
- Ensure minion start event coroutines are run #66932
- Allow for secure-boot efivars directory having SecureBoot-xxx files, not directories with a data file #66955
- Removed the usage of wmic to get the disk and iscsi grains for Windows. The wmic binary is being deprecated. #66959
- Fixes an issue with the LGPO module when trying to parse ADMX/ADML files that have a space in the XMLNS url in the policyDefinitionsResources header. #66992
- Ensured global dunders like **env** are defined in state module that are run in parallel on spawning platforms #66996
- Filtered unpicklable objects from the context dict when invoking states in parallel on spawning platforms to avoid a crash #66999
- Update for deprecation of hex in pygit2 1.15.0 and above #67017
- Fixed blob path for salt.ufw in the firewall tutorial documentation #67019
- Update locations for bootstrap scripts, to new infrastructure, GitHub releases for bootstrap #67020
- Constrained the localfs module to operations inside the specified cachedir #67031
- Added support for dnf5 (backport from 3007) and update to its new command syntax changes since 2023 #67057
- Recognise newer AMD GPU devices #67058
- Fix yumpkg module for Python<3.8 #67091
- Fixed an issue with making changes to the Windows Firewall when the AllowInboundRules setting is set to True #67122
- Added support and tests for dnf5 to services_need_restart for yum packages #67177
- Use os.walk to traverse git branches, and no longer replace slash '/' in git branch names #67722
- Set correct virtual grain in systemd based Podman containers #67733
- Corrected option --upgrades for dnf[5] for function list_upgrades #67743
- Fix salt-ssh for hosts that use password as the SSH password #67754
- Corrected dnf5 option --downloadonly for dnf5 install #67769
- Upgrade relenv to 0.18.1. Which includes python 3.10.16 and openssl 3.2.4. Openssl 3.2.4 fixes CVE-2024-12797 and CVE-2024-13176 #67792
- Update jinja2 to 3.1.5, advisories GHSA-q2x7-8rv6-6q7h and GHSA-gmj6-6f8f-6699 Update urllib3 to 1.26.18 advisories GHSA-34jh-p97f-mpxf #67794
- Ensure salt-cloud has salt-master dependency on Debian and Ubuntu #67810
- Fix traceback from _send_req_sync method on minion by raising proper timeout error. #67891

Added

- Issue #33669: Fixes an issue with the `ini_managed` execution module where it would always wrap the separator with spaces. Adds a new parameter named `no_spaces` that will not warp the separator with spaces. #33669
- Enhance json.find_json to return json even when it contains text on the same line of the last closing parenthesis #67023

(release-3006.11)=

33.2.9 Salt 3006.11 release notes

Changelog

Fixed

- Fixes an issue with cmd.run where the command is a built-in command and must be run with cmd. #54821
- Show a better error when running cmd.* commands using runas and the runas user does not exist #56680
- Make sure the comment field is populated when test=True for the reg state #65514
- Fixed result detection of module.run from returned dict #65842
- Fix an issue with the osrelease_info grain that was displaying empty strings #66936
- support retry: True as per docs #67049
- Fixed if arguments are passed to the key delete all, -D, it will throw an error #67903
- Set virtual grain for docker using systemd and virt-what #67905
- Remove broken salt-common bash-completion links in root filesystem #67915
- Fix refresh of osrelease and related grains on Python 3.10+ #67932
- Re-add -oProxyCommand to ssh gateway arguments when ssh_gateway is present. #67934
- Repair Git state comment formatting #67944
- Use a Jscript Custom Action to stop the salt-minion service on Windows instead of a VBscript Custom Action due to future deprecation and security issues #67982

(release-3006.12)=

33.2.10 Salt 3006.12 release notes

Changelog

Fixed

- CVE-2024-38822 Multiple methods in the salt master skip minion token validation. Therefore a misbehaving minion can impersonate another minion.

  CVSS 2.7 V:N/AC:L/PR:H/UI:N/S:U/C:N/I:L/A:N

  CVE-2024-38823 Salt's request server is vulnerable to replay attacks when not using a TLS encrypted transport.

  CVSS Score 2.7 AV:N/AC:L/PR:H/UI:N/S:U/C:N/I:L/A:N

CVE-2024-38824 Directory traversal vulnerability in recv_file method allows arbitrary files to be written to the master cache directory.

CVSS Score 9.6 AV:N/AC:L/PR:L/UI:N/S:C/C:H/I:H/A:N

CVE-2024-38825 The salt.auth.pki module does not properly authenticate callers. The "password" field contains a public certificate which is validated against a CA certificate by the module. This is not pki authentication, as the caller does not need access to the corresponding private key for the authentication attempt to be accepted.

CVSS Score 6.4 AV:N/AC:L/PR:L/UI:N/S:C/C:L/I:L/A:N

CVE-2025-22236 Minion event bus authorization bypass. An attacker with access to a minion key can craft a message which may be able to execute a job on other minions (>= 3007.0).

CVSS 8.1 AV:L/AC:L/PR:H/UI:N/S:C/C:H/I:H/A:L

CVE-2025-22237 An attacker with access to a minion key can exploit the 'on demand' pillar functionality with a specially crafted git url which could cause and arbitrary command to be run on the master with the same privileges as the master process.

CVSS 6.7 AV:L/AC:L/PR:H/UI:N/S:U/C:H/I:H/A:H

CVE-2025-22238 Directory traversal attack in minion file cache creation. The master's default cache is vulnerable to a directory traversal attack. Which could be leveraged to write or overwrite 'cache' files outside of the cache directory.

CVSS 4.2 AV:L/AC:L/PR:H/UI:R/S:U/C:N/I:H/A:N

CVE-2025-22239 Arbitrary event injection on Salt Master. The master's "_minion_event" method can be used by and authorized minion to send arbitrary events onto the master's event bus.

CVSS 8.1 AV:L/AC:L/PR:H/UI:N/S:C/C:H/I:H/A:L

CVE-2025-22240 Arbitrary directory creation or file deletion. In the find_file method of the GitFS class, a path is created using os.path.join using unvalidated input from the "tgt_env" variable. This can be exploited by an attacker to delete any file on the Master's process has permissions to

CVSS 6.3 AV:L/AC:H/PR:H/UI:R/S:U/C:H/I:H/A:H

CVE-2025-22241 File contents overwrite the VirtKey class is called when "on-demand pillar" data is requested and uses un-validated input to create paths to the "pki directory". The functionality is used to auto-accept Minion authentication keys based on a pre-placed "authorization file" at a specific location and is present in the default configuration.

CVSS 5.6 AV:L/AC:H/PR:H/UI:R/S:U/C:H/I:H/A:N

CVE-2025-22242 Worker process denial of service through file read operation. .A vulnerability exists in the Master's "pub_ret" method which is exposed to all minions. The un-sanitized input value "jid" is used to construct a path which is then opened for reading. An attacker could exploit this vulnerabilities by attempting to read from a filename that will not return any data, e.g. by targeting a pipe node on the proc file system.

CVSS 5.6 AV:L/AC:H/PR:H/UI:R/S:U/C:H/I:N/A:H

This release also includes sqlite 3.50.1 to address CVE-2025-29087 #68033

(release-3006.2)=

33.2.11 Salt 3006.2 release notes

Changelog

Fixed

- In scenarios where PythonNet fails to load, Salt will now fall back to WMI for gathering grains information #64897

Security

- fix CVE-2023-20897 by catching exception instead of letting exception disrupt connection #cve-2023-20897
- Fixed gitfs cachedir_basename to avoid hash collisions. Added MP Lock to gitfs. These changes should stop race conditions. #cve-2023-20898
- Upgrade to `requests==2.31.0`

  Due to:

  - https://github.com/advisories/GHSA-j8r2-6x86-q33q #64336
- Upgrade to `cryptography==41.0.3`(and therefor `pyopenssl==23.2.0` due to https://github.com/advisories/GHSA-jm77-qphf-c4w8)

  This only really impacts pip installs of Salt and the windows onedir since the linux and macos onedir build every package dependency from source, not from pre-existing wheels.

  Also resolves the following cryptography advisories:

  Due to:

  - https://github.com/advisories/GHSA-5cpq-8wj7-hf2v
  - https://github.com/advisories/GHSA-x4qr-2fvf-3mr5
  - https://github.com/advisories/GHSA-w7pp-m8wf-vj6r

  There is no security upgrade available for Py3.5 #64595
- Bump to `certifi==2023.07.22` due to https://github.com/advisories/GHSA-xqr8-7jwr-rhp7 #64718
- Upgrade `relenv` to `0.13.2` and Python to `3.10.12`

  Addresses multiple CVEs in Python's dependencies: https://docs.python.org/release/3.10.12/whatsnew/changelog.html#python-3-10-12 #64719

(release-3006.3)=

33.2.12 Salt 3006.3 release notes

Changelog

Removed

- Fedora 36 support was removed because it reached EOL #64315
- Handle deprecation warnings:
  - Switch to `FullArgSpec` since Py 3.11 no longer has `ArgSpec`, deprecated since Py 3.0

  - Stop using the deprecated `cgi` module
  - Stop using the deprecated `pipes` module
  - Stop using the deprecated `imp` module #64553

Changed

- Replace libnacl with PyNaCl #64372
- Don't hardcode the python version on the Salt Package tests and on the `pkg/debian/salt-cloud.postinst` file #64553
- Some more deprecated code fixes:
  - Stop using the deprecated `locale.getdefaultlocale()` function
  - Stop accessing deprecated attributes
  - `pathlib.Path.__enter__()` usage is deprecated and not required, a no-op #64565
- Bump to `pyyaml==6.0.1` due to https://github.com/yaml/pyyaml/issues/601 and address lint issues #64657

Fixed

- Fix for assume role when used salt-cloud to create aws ec2. #52501
- fixes aptpkg module by checking for blank comps. #58667
- `wheel.file_roots.find` is now able to find files in subdirectories of the roots. #59800
- pkg.latest no longer fails when multiple versions are reported to be installed (e.g. updating the kernel) #60931
- Do not update the credentials dictionary in `utils/aws.py` while iterating over it, and use the correct delete functionality #61049
- fixed runner not having a proper exit code when runner modules throw an exception. #61173
- `pip.list_all_versions` now works with `index_url` and `extra_index_url` #61610
- speed up file.recurse by using prefix with cp.list_master_dir and remove an un-needed loop. #61998
- Preserve test=True condition while running sub states. #62590
- Job returns are only sent to originating master #62834
- Fixes an issue with failing subsequent state runs with the lgpo state module. The `lgpo.get_polcy` function now returns all boolean settings. #63296
- Fix SELinux get policy with trailing whitespace #63336
- Fixes an issue with boolean settings not being reported after being set. The `lgpo.get_polcy` function now returns all boolean settings. #63473
- Ensure body is returned when salt.utils.http returns something other than 200 with tornado backend. #63557
- Allow long running pillar and file client requests to finish using request_channel_timeout and request_channel_tries minion config. #63824
- Fix state_queue type checking to allow int values #64122
- Call global logger when catching pip.list exceptions in states.pip.installed Rename global logger `log` to `logger` inside pip_state #64169

- Fixes permissions created by the Debian and RPM packages for the salt user.

  The salt user created by the Debian and RPM packages to run the salt-master process, was previously given ownership of various directories in a way which compromised the benefits of running the salt-master process as a non-root user.

  This fix sets the salt user to only have write access to those files and directories required for the salt-master process to run. #64193
- Fix user.present state when groups is unset to ensure the groups are unchanged, as documented. #64211
- Fixes issue with MasterMinion class loading configuration from `/etc/salt/minion.d/*.conf.

  The MasterMinion class (used for running orchestraions on master and other functionality) was incorrectly loading configuration from `/etc/salt/minion.d/*.conf`, when it should only load configuration from `/etc/salt/master` and `/etc/salt/master.d/*.conf`. #64219
- Fixed issue in mac_user.enable_auto_login that caused the user's keychain to be reset at each boot #64226
- Fixed KeyError in logs when running a state that fails. #64231
- Fixed x509_v2 `create_private_key`/`create_crl` unknown kwargs: __pub_fun... #64232
- remove the hard coded python version in error. #64237
- `salt-pip` now properly errors out when being called from a non `onedir` environment. #64249
- Ensure we return an error when adding the key fails in the pkgrepo state for debian hosts. #64253
- Fixed file client private attribute reference on `SaltMakoTemplateLookup` #64280
- Fix pkgrepo.absent failures on apt-based systems when repo either a) contains a trailing slash, or b) there is an arch mismatch. #64286
- Fix detection of Salt codename by "salt_version" execution module #64306
- Ensure selinux values are handled lowercase #64318
- Remove the `clr.AddReference`, it is causing an `Illegal characters in path` exception #64339
- Update `pkg.group_installed` state to support repo options #64348
- Fix salt user login shell path in Debian packages #64377
- Allow for multiple user's keys presented when authenticating, for example: root, salt, etc. #64398
- Fixed an issue with `lgpo_reg` where existing entries for the same key in `Registry.pol` were being overwritten in subsequent runs if the value name in the subesequent run was contained in the existing value name. For example, a key named `SetUpdateNotificationLevel` would be overwritten by a subsequent run attempting to set `UpdateNotificationLevel` #64401
- Add search for %ProgramData%\Chocolatey\choco.exe to determine if Chocolatey is installed or not #64427
- Fix regression for user.present on handling groups with dupe GIDs #64430
- Fix inconsistent use of args in ssh_auth.managed #64442
- Ensure we raise an error when the name argument is invalid in pkgrepo.managed state for systems using apt. #64451
- Fix file.symlink will not replace/update existing symlink #64477
- Fixed salt-ssh state.* commands returning retcode 0 when state/pillar rendering fails #64514
- Fix pkg.install when using a port in the url. #64516
- `win_pkg` Fixes an issue runing `pkg.install` with `version=latest` where the new installer would not be cached if there was already an installer present with the same name. #64519

- Added a `test:full` label in the salt repository, which, when selected, will force a full test run. #64539
- Syndic's async_req_channel uses the asynchornous version of request channel #64552
- Ensure runners properly save information to job cache. #64570
- Added salt.ufw to salt-master install on Debian and Ubuntu #64572
- Added support for Chocolatey 2.0.0+ while maintaining support for older versions #64622
- Updated semanage fcontext to use --modify if context already exists when adding context #64625
- Preserve request client socket between requests. #64627
- Show user friendly message when pillars timeout #64651
- File client timeouts durring jobs show user friendly errors instead of tracbacks #64653
- SaltClientError does not log a traceback on minions, we expect these to happen so a user friendly log is shown. #64729
- Look in location salt is running from, this accounts for running from an unpacked onedir file that has not been installed. #64877
- Preserve credentials on spawning platforms, minions no longer re-authenticate with every job when using `multiprocessing=True`. #64914
- Fixed uninstaller to not remove the `salt` directory by default. This allows the `extras-3.##` folder to persist so salt-pip dependencies are not wiped out during an upgrade. #64957
- fix msteams by adding the missing header that Microsoft is now enforcing. #64973
- Fix **env** and improve cache cleaning see more info at pull #65017. #65002
- Better error message on inconsistent decoded payload #65020
- Handle permissions access error when calling `lsb_release` with the salt user #65024
- Allow schedule state module to update schedule when the minion is offline. #65033
- Fixed creation of wildcard DNS in SAN in `x509_v2` #65072
- The macOS installer no longer removes the extras directory #65073

Added

- Added a script to automate setting up a 2nd minion in a user context on Windows #64439
- Several fixes to the CI workflow:
  - Don't override the `on` Jinja block on the `ci.yaml` template. This enables reacting to labels getting added/removed to/from pull requests.
  - Switch to using `tools` and re-use the event payload available instead of querying the GH API again to get the pull request labels
  - Concentrate test selection by labels to a single place
  - Enable code coverage on pull-requests by setting the `test:coverage` label #64547

Security

- Upgrade to `cryptography==41.0.3`(and therefor `pyopenssl==23.2.0` due to https://github.com/advisories/GHSA-jm77-qphf-c4w8)

  This only really impacts pip installs of Salt and the windows onedir since the linux and macos onedir build every package dependency from source, not from pre-existing wheels.

  Also resolves the following cryptography advisories:

  Due to:

  - https://github.com/advisories/GHSA-5cpq-8wj7-hf2v
  - https://github.com/advisories/GHSA-x4qr-2fvf-3mr5
  - https://github.com/advisories/GHSA-w7pp-m8wf-vj6r #64595
- Bump to `aiohttp==3.8.5` due to https://github.com/advisories/GHSA-45c4-8wx5-qw6w #64687
- Bump to `certifi==2023.07.22` due to https://github.com/advisories/GHSA-xqr8-7jwr-rhp7 #64718
- Upgrade `relenv` to `0.13.2` and Python to `3.10.12`

  Addresses multiple CVEs in Python's dependencies: https://docs.python.org/release/3.10.12/whatsnew/changelog.html#python-3-10-12 #64719
- Update to `gitpython>=3.1.32` due to https://github.com/advisories/GHSA-pr76-5cm5-w9cj #64988

(release-3006.4)=

33.2.13 Salt 3006.4 release notes

Changelog

Security

- Fix CVE-2023-34049 by ensuring we do not use a predictable name for the script and correctly check returncode of scp command. This only impacts salt-ssh users using the pre-flight option. #cve-2023-34049
- Update to `gitpython>=3.1.35` due to https://github.com/advisories/GHSA-wfm5-v35h-vwf4 and https://github.com/advisories/GHSA-cwvm-v4w8-q58c #65163
- Bump to `cryptography==41.0.4` due to https://github.com/advisories/GHSA-v8gr-m533-ghj9 #65268
- Upgrade relenv to 0.13.12 to address CVE-2023-4807 #65316
- Bump to `urllib3==1.26.17` or `urllib3==2.0.6` due to https://github.com/advisories/GHSA-v845-jxx5-vc9f #65334
- Bump to `gitpython==3.1.37` due to https://github.com/advisories/GHSA-cwvm-v4w8-q58c #65383

(release-3006.5)=

33.2.14 Salt 3006.5 release notes

Changelog

Removed

- Tech Debt - support for pysss removed due to functionality addition in Python 3.3 #65029

Fixed

- Improved error message when state arguments are accidentally passed as a string #38098
- Allow `pip.install` to create a log file that is passed in if the parent directory is writeable #44722
- Fixed merging of complex pillar overrides with salt-ssh states #59802
- Fixed gpg pillar rendering with salt-ssh #60002
- Made salt-ssh states not re-render pillars unnecessarily #62230
- Made Salt maintain options in Debian package repo definitions #64130
- Migrated all `invoke` tasks to `python-tools-scripts`.
  - `tasks/docs.py` -> `tools/precommit/docs.py`
  - `tasks/docstrings.py` -> `tools/precommit/docstrings.py`
  - `tasks/loader.py` -> `tools/precommit/loader.py`
  - `tasks/filemap.py` -> `tools/precommit/filemap.py` #64374
- Fix salt user login shell path in Debian packages #64377
- Fill out lsb_distrib_xxxx (best estimate) grains if problems with retrieving lsb_release data #64473
- Fixed an issue in the `file.directory` state where the `children_only` keyword argument was not being respected. #64497
- Move salt.ufw to correct location /etc/ufw/applications.d/ #64572
- Fixed salt-ssh stacktrace when retcode is not an integer #64575
- Fixed SSH shell seldomly fails to report any exit code #64588
- Fixed some issues in x509_v2 execution module private key functions #64597
- Fixed grp.getgrall() in utils/user.py causing performance issues #64888
- Fix user.list_groups omits remote groups via sssd, etc. #64953
- Ensure sync from _grains occurs before attempting pillar compilation in case custom grain used in pillar file #65027
- Moved gitfs locks to salt working dir to avoid lock wipes #65086
- Only attempt to create a keys directory when `--gen-keys` is passed to the `salt-key` CLI #65093
- Fix nonce verification, request server replies do not stomp on eachother. #65114
- speed up yumpkg list_pkgs by not requiring digest or signature verification on lookup. #65152
- Fix pkg.latest failing on windows for winrepo packages where the package is already up to date #65165

- Ensure **kwarg** is preserved when checking for kwargs. This change affects proxy minions when used with Deltaproxy, which had kwargs popped when targeting multiple minions id. #65179
- Fixes traceback when state id is an int in a reactor SLS file. #65210
- Install logrotate config as /etc/logrotate.d/salt-common for Debian packages Remove broken /etc/logrotate.d/salt directory from 3006.3 if it exists. #65231
- Use `sha256` as the default `hash_type`. It has been the default since Salt v2016.9 #65287
- Preserve ownership on log rotation #65288
- Ensure that the correct value of jid_inclue is passed if the argument is included in the passed keyword arguments. #65302
- Uprade relenv to 0.14.2
  - Update openssl to address CVE-2023-5363.
  - Fix bug in openssl setup when openssl binary can't be found.
  - Add M1 mac support. #65316
- Fix regex for filespec adding/deleting fcontext policy in selinux #65340
- Ensure CLI options take priority over Saltfile options #65358
- Test mode for state function `saltmod.wheel` no longer set's `result` to `(None,)` #65372
- Client only process events which tag conforms to an event return. #65400
- Fixes an issue setting user or machine policy on Windows when the Group Policy directory is missing #65411
- Fix regression in file module which was not re-using a file client. #65450
- pip.installed state will now properly fail when a specified user does not exists #65458
- Publish channel connect callback method properly closes it's request channel. #65464
- Ensured the pillar in SSH wrapper modules is the same as the one used in template rendering when overrides are passed #65483
- Fix file.comment ignore_missing not working with multiline char #65501
- Warn when an un-closed transport client is being garbage collected. #65554
- Only generate the HMAC's for `libssl.so.1.1` and `libcrypto.so.1.1` if those files exist. #65581
- Fixed an issue where Salt Cloud would fail if it could not delete lingering PAexec binaries #65584

Added

- Added Salt support for Debian 12 #64223
- Added Salt support for Amazon Linux 2023 #64455

Security

- Bump to `cryptography==41.0.4` due to https://github.com/advisories/GHSA-v8gr-m533-ghj9 #65268
- Bump to `cryptography==41.0.7` due to https://github.com/advisories/GHSA-jfhm-5ghh-2f97 #65643

(release-3006.6)=

33.2.15 Salt 3006.6 release notes

Changelog

Changed

- Salt no longer time bombs user installations on code using `salt.utils.versions.warn_until_date` #665924

Fixed

- Fix un-closed transport in tornado netapi #65759

Security

- CVE-2024-22231 Prevent directory traversal when creating syndic cache directory on the master CVE-2024-22232 Prevent directory traversal attacks in the master's serve_file method. These vulerablities were discovered and reported by: Yudi Zhao(Huawei Nebula Security Lab),Chenwei Jiang(Huawei Nebula Security Lab) #565
- Update some requirements which had some security issues:
  - Bump to `pycryptodome==3.19.1` and `pycryptodomex==3.19.1` due to https://github.com/advisories/GHSA-j225-cvw7-qrx7
  - Bump to `gitpython==3.1.41` due to https://github.com/advisories/GHSA-2mqj-m65w-jghx
  - Bump to `jinja2==3.1.3` due to https://github.com/advisories/GHSA-h5c8-rqwp-cp95 #65830

(release-3006.7)=

33.2.16 Salt 3006.7 release notes

Changelog

Deprecated

- Deprecate and stop using `salt.features` #65951

Changed

- Change module search path priority, so Salt extensions can be overridden by syncable modules and module_dirs. You can switch back to the old logic by setting features.enable_deprecated_module_search_path_priority to true, but it will be removed in Salt 3008. #65938

Fixed

- Fix an issue with mac_shadow that was causing a command execution error when retrieving values that were not yet set. For example, retrieving last login before the user had logged in. #34658
- Fixed an issue when keys didn't match because of line endings #52289
- Corrected encoding of credentials for use with Artifactory #63063
- Use `send_multipart` instead of `send` when sending multipart message. #65018
- Fix an issue where the minion would crash on Windows if some of the grains failed to resolve #65154
- Fix issue with openscap when the error was outside the expected scope. It now returns failed with the error code and the error #65193
- Upgrade relenv to 0.15.0 to fix namespaced packages installed by salt-pip #65433
- Fix regression of fileclient re-use when rendering sls pillars and states #65450
- Fixes the s3fs backend computing the local cache's files with the wrong hash type #65589
- Fixed Salt-SSH pillar rendering and state rendering with nested SSH calls when called via saltutil.cmd or in an orchestration #65670
- Fix boto execution module loading #65691
- Removed PR 65185 changes since incomplete solution #65692
- catch only ret/ events not all returning events. #65727
- Fix nonsensical time in fileclient timeout error. #65752
- Fixes an issue when reading/modifying ini files that contain unicode characters #65777
- added https proxy to the list of proxies so that requests knows what to do with https based proxies #65824
- Ensure minion channels are closed on any master connection error. #65932
- Fixed issue where Salt can't find libcrypto when pip installed from a cloned repo #65954
- Fix RPM package systemd scriptlets to make RPM packages more universal #65987
- Fixed an issue where fileclient requests during Pillar rendering cause fileserver backends to be needlessly refreshed. #65990
- Fix exceptions being set on futures that are already done in ZeroMQ transport #66006
- Use hmac compare_digest method in hashutil module to mitigate potential timing attacks #66041
- Fix request channel default timeout regression. In 3006.5 it was changed from 60 to 30 and is now set back to 60 by default. #66061
- Upgrade relenv to 0.15.1 to fix debugpy support. #66094

Security

- Bump to `cryptography==42.0.0` due to https://github.com/advisories/GHSA-3ww4-gg4f-jr7f

  In the process, we were also required to update to `pyOpenSSL==24.0.0` #66004
- Bump to `cryptography==42.0.3` due to https://github.com/advisories/GHSA-3ww4-gg4f-jr7f #66090

(release-3006.8)=

33.2.17 Salt 3006.8 release notes

Changelog

Removed

- Removed deprecated code scheduled to be removed on 2024-01-01:
  - `TemporaryLoggingHandler` and `QueueHandler` in `salt/_logging/handlers.py`
  - All of the `salt/log` package.
  - The `salt/modules/cassandra_mod.py` module.
  - The `salt/returners/cassandra_return.py` returner.
  - The `salt/returners/django_return.py` returner. #66147

Deprecated

- Drop Fedora 37 and Fedora 38 support #65860
- Drop CentOS Stream 8 and 9 from CI/CD #66104
- Drop Photon OS 3 support #66105
- The `salt.utils.psutil_compat` module has been deprecated and will be removed in Salt 3008. Please use the `psutil` module directly. #66139

Fixed

- `user.add` on Windows now allows you to add user names that contain all numeric characters #53363
- Fix an issue with the win_system module detecting established connections on non-Windows systems. Uses psutils instead of parsing the return of netstat #60508
- pkg.refresh_db on Windows now honors saltenv #61807
- Fixed an issue with adding new machine policies and applying those same policies in the same state by adding a `refresh_cache` option to the `lgpo.set` state. #62734
- file.managed correctly handles file path with '#' #63060
- Fix master ip detection when DNS records change #63654
- Fix user and group management on Windows to handle the Everyone group #63667
- Fixes an issue in pkg.refresh_db on Windows where new package definition files were not being picked up on the first run #63848

- Display a proper error when pki commands fail in the win_pki module #64933
- Prevent full system upgrade on single package install for Arch Linux #65200
- When using s3fs, if files are deleted from the bucket, they were not deleted in the master or minion local cache, which could lead to unexpected file copies or even state applications. This change makes the local cache consistent with the remote bucket by deleting files locally that are deleted from the bucket.

  NOTE this could lead to **breakage** on your affected systems if it was inadvertently depending on previously deleted files. #65611
- Fixed an issue with file.directory state where paths would be modified in test mode if backupname is used. #66049
- Execution modules have access to regular fileclient durring pillar rendering. #66124
- Fixed a issue with server channel where a minion's public key would be rejected if it contained a final newline character. #66126
- Fix content type backwards compatablity with http proxy post requests in the http utils module. #66127
- Fix systemctl with "try-restart" instead of "retry-restart" within the RPM spec, properly restarting upgraded services #66143
- Auto discovery of ssh, scp and ssh-keygen binaries. #66205
- Add leading slash to salt helper file paths as per dh_links requirement #66280
- Fixed x509.certificate_managed - ca_server did not return a certificate #66284
- removed log line that did nothing. #66289
- Chocolatey: Make sure the return dictionary from `chocolatey.version` contains lowercase keys #66290
- fix cacheing inline pillar, by not rendering inline pillar during cache save function. #66292
- The file module correctly perserves file permissions on link target. #66400
- Upgrade relenv to 0.16.0 and python to 3.10.14 #66402
- backport the fix from #66164 to fix #65703. use OrderedDict to fix bad indexing. #66705

Added

- Add Fedora 39 support #65859

Security

- Upgrade to `cryptography==42.0.5` due to a few security issues:
  - https://github.com/advisories/GHSA-9v9h-cgj8-h64p
  - https://github.com/advisories/GHSA-3ww4-gg4f-jr7f
  - https://github.com/advisories/GHSA-6vqw-3v5j-54x4 #66141
- Bump to `idna==3.7` due to https://github.com/advisories/GHSA-jjg7-2v4v-x38h #66377
- Bump to `aiohttp==3.9.4` due to https://github.com/advisories/GHSA-7gpw-8wmc-pm8g #66411

(release-3006.9)=

33.2.18 Salt 3006.9 release notes

Changelog

Deprecated

- Drop CentOS 7 support #66623
- No longer build RPM packages with CentOS Stream 9 #66624

Fixed

- Made slsutil.renderer work with salt-ssh #50196
- Fixed defaults.merge is not available when using salt-ssh #51605
- Fixed config.get does not support merge option with salt-ssh #56441
- Update to include croniter in pkg requirements #57649
- Fixed state.test does not work with salt-ssh #61100
- Made slsutil.findup work with salt-ssh #61143
- Fixes multiple issues with the cmd module on Windows. Scripts are called using the `-File` parameter to the `powershell.exe` binary. `CLIXML` data in stderr is now removed (only applies to encoded commands). Commands can now be sent to `cmd.powershell` as a list. Makes sure JSON data returned is valid. Strips whitespace from the return when using `runas`. #61166
- Fixed the win_lgpo_netsh salt util to handle non-English systems. This was a rewrite to use PowerShell instead of netsh to make the changes on the system #61534
- file.replace and file.search work properly with /proc files #63102
- Fix utf8 handling in 'pass' renderer #64300
- Fixed incorrect version argument will be ignored for multiple package targets warning when using pkgs argument to yumpkg module. #64563
- salt-cloud honors root_dir config setting for log_file location and fixes for root_dir locations on windows. #64728
- Fixed slsutil.update with salt-ssh during template rendering #65067
- Fix config.items when called on minion #65251
- Ensure on rpm and deb systems, that user and group for existing Salt, is maintained on upgrade #65264
- Fix typo in nftables module to ensure unique nft family values #65295
- pkg.installed state aggregate does not honors requires requisite #65304
- Added SSH wrapper for logmod #65630
- Fix for GitFS failure to unlock lock file, and resource cleanup for process SIGTERM #65816
- Corrected x509_v2 CRL creation `last_update` and `next_update` values when system timezone is not UTC #65837
- Make sure the root minion process handles SIGUSR1 and emits a traceback like it's child processes #66095
- Replaced pyvenv with builtin venv for virtualenv_mod #66132

- Made `file.managed` skip download of a remote source if the managed file already exists with the correct hash #66342
- Fix win_task ExecutionTimeLimit and result/error code interpretation #66347, #66441
- Fixed nftables.build_rule breaks ipv6 rules by using the wrong syntax for source and destination addresses #66382
- Fixed x509_v2 certificate.managed crash for locally signed certificates if the signing policy defines signing_private_key #66414
- Fixed parallel state execution with Salt-SSH #66514
- Fix support for FIPS approved encryption and signing algorithms. #66579
- Fix relative file_roots paths #66588
- Fixed an issue with cmd.run with requirements when the shell is not the default #66596
- Fix RPM package provides #66604
- Upgrade relAenv to 0.16.1. This release fixes several package installs for salt-pip #66632
- Upgrade relenv to 0.17.0 (https://github.com/saltstack/relenv/blob/v0.17.0/CHANGELOG.md) #66663
- Upgrade dependencies due to security issues:
  - pymysql>=1.1.1
  - requests>=2.32.0
  - docker>=7.1.0 #66666
- Corrected missed line in branch 3006.x when backporting from PR 61620 and 65044 #66683
- Remove debug output from shell scripts for packaging #66747

Added

- Add Ubuntu 24.04 support #66180
- Add Fedora 40 support, replacing Fedora 39 #66300
- Build RPM packages with Rocky Linux 9 (instead of CentOS Stream 9) #66624

Security

- Bump to `jinja2==3.1.4` due to https://github.com/advisories/GHSA-h75v-3vvj-5mfj #66488
- CVE-2024-37088 salt-call will fail with exit code 1 if bad pillar data is encountered. #66702

33.2.19 Salt 3005 release notes - Codename Phosphorus

Python 3.5 and 3.6 deprecation

This will be the last release we will support Python versions 3.5 and 3.6. In Salt release 3006, we will only support Python versions 3.7 and higher. Going forward, our policy will be to align with Python's supported versions.

OS support end of life

Debian and Raspbian 9 are now EOL, therefore we will no longer be building packages for these platforms.

Raspberry Pi

We will no longer build the Raspberry Pi packages after the 3005 release but will provide open sources project links in an updated announcement later. Please see the announcement for more details: https://saltproject.io/salt-project-announces-the-open-sourcing-of-several-saltstack-native-minions/

New packages available

With the release of Salt 3005, we are pleased to announce the new onedir packages using pyinstaller are now out of beta and ready for production. These new packages make the installation process easier. Onedir packages install Salt with one directory that includes all the executables Salt needs to run effectively, including the version of Python and the required dependencies that Salt needs. These packages make it easier to use Salt out of the box without installing Python first.

Going forward, any new OS platforms supported by the Salt Project from version 3005 can only be installed using onedir packages. For this release, this includes Redhat 9, Ubuntu 22.04, and Photon OS 3. The Salt Project will phase out the old (”classic”) Salt package builds for currently supported operating systems by 3006. See Upgrade to onedir for more information.

On the day of the Phosphorus release, the onedir packages will be available on https://repo.saltproject.io for each platform. The instructions for installing onedir packages and the classic packages will be available on the new Salt Install Guide.

If you want to test out the packages today, you can install them from https://repo.saltproject.io/salt-dev/py3/ using the correct directory for your platform. If you find any issues with the packages, please open an issue on this repo: https://gitlab.com/saltstack/open/salt-pkg

Classic, non-onedir packaging support

The classic, non-onedir packaging system previously used for Salt will also be provided for platforms supported in previous Salt versions. The classic packaging will only be available for the 3005 release. The 3006 release and all releases going forward will only provide the onedir packages.

Platform package support

OS	New onedir packages	Classic, non-onedir packages
RHEL 7	yes	yes
RHEL 8	yes	yes
RHEL 9	yes	no
Ubuntu 18.04	yes	yes
Ubuntu 20.04	yes	yes
Ubuntu 22.04	yes	no
Debian 10	yes	yes
Debian 11	yes	yes
Raspbian 10	no	yes
Raspbian 11	no	yes
Fedora 35	yes	yes
Fedora 36	yes	yes
MacOS	yes	yes
Windows	yes	yes

Repo paths

OS	Onedir path	Classic, Non-onedir path
RHEL	https://repo.saltproject.io/salt/py3/redhat/	https://repo.saltproject.io/py3/redhat/
Ubuntu	https://repo.saltproject.io/salt/py3/ubuntu/	https://repo.saltproject.io/py3/ubuntu/
Debian	https://repo.saltproject.io/salt/py3/debian/	https://repo.saltproject.io/py3/debian/
Raspbian	Not available	https://repo.saltproject.io/py3/debian/
Fedora	Hosted on Fedora Repos	Hosted on Fedora Repos
MacOS	https://repo.saltproject.io/salt/py3/osx/	https://repo.saltproject.io/osx/
Windows	https://repo.saltproject.io/salt/py3/windows/	https://repo.saltproject.io/windows/

Note that the onedir paths above will not be available until the day of the Phosphorus release.

How do I migrate to the onedir packages?

The migration path from the classic, non-onedir packages to the onedir packages will include:

- Repo File: You need to update your repo file to point to the new repo paths for your platform. After the repo file is updated, upgrade your Salt packages.
- Pip packages: You need to ensure any 3rd party pip packages are installed in the correct onedir path. This can be accomplished in two ways:
  - `salt-pip install <package name>`
  - Using the `pip.installed` Salt state.

To install python packages into the system python environment, users must now provide the `pip_bin` or `bin_env` to the pip state module.

For example:

```
lib-foo:
  pip.installed:
    - pip_bin: /usr/bin/pip3
lib-bar:
  pip.installed:
    - bin_env: /usr/bin/python3
```

Known issues

- To make use of Salt 3005 or later on a Salt master connected to SaltStack Config, you must use SaltStack Config version 8.9.0 or later.

  The root cause of the issue is a breaking change to `AsyncClient._proc_function()`` in Salt, which is the function that the raas-master uses to run `salt-run` commands. As this is a private API, there's no expectation that the API should remain backward-compatible.

  It is recommended to upgrade SaltStack Config before upgrading your Salt masters. However, if a Salt master is upgraded to version 3005 before upgrading SaltStack Config, the upgrade can still be completed.

  After upgrading SaltStack Config, including the SSC plugin on each Salt master, restart the Salt masters.
- Salt does not currently support napalm 4. Users will need to install napalm 3.x to ensure they do not run into issue #62468

Removed

- Deprecating and removing salt-unity. (#56055)
- Removed support for macos mojave (#61130)
- Removed *salt.utils.MultiprocessingProcess* and *salt.utils.SignalHandlingMultiprocessingProcess*. Please use *salt.utils.Process* and *salt.utils.SignalHandlingProcess* instead. (#61573)
- Remove the grains.get_or_set_hash function. Please reference pillar and SDB documentation for secure ways to manage sensitive information. Grains are an insecure way to store secrets. (#61691)
- Removed the *telnet_port*, *serial_type* and *console* parameters in salt/modules/virt.py. Use the *serials* and *consoles* parameters instead. Use the *serials* parameter with a value like `{{{{'type': 'tcp', 'protocol': 'telnet', 'port': {}}}}}` instead and a similar *consoles* parameter. (#61693)
- Remove remove_lock in zypperpkg.py in favor of unhold. Remove add_lock in zypperpkg.py in favor of hold. (#61694)
- Removed support for old-style Windows Group Policy names Recommended policy names will be displayed in comments (#61696)
- Remove the feature flag feature.enable_slsvars_fixes and enable the fixes for *sls_path*, *tpl_file*, and *tpldir* by default. Enabling this behavior by default will fix the following: - tpldir: If your directory name and your SLS file name are the same tpldir used to return a ., now it returns the correct directory name. - slspath,slsdotpath,slscolonpath,sls_path: If an init.sls file is accessed by its explicit name path.to.init instead of path.to, init shows up as a directory for in various sls context parameters, now it will only show as a file. - tplfile: When using tplfile in a SLS file in the root directory of file roots it returns empty. Now it returns the filename. (#61697)
- Remove SaltMessageServer.shutdown in favor of close. Remove LoadBalancerWorker.stop in favor of close. (#61698)

- Removed the PyObjC dependency.

  This addresses problems with building a one dir build for macOS. It became problematic because depending on the macOS version, it pulls different dependencies, and we would either have to build a macos onedir for each macOS supported release, or ship a crippled onedir(because it would be tied to the macOS version where the onedir was built). Since it's currently not being used, it's removed. (#62432)

Deprecated

- In etcd_util, the recursive kwarg in the read and delete methods has been deprecated in favor of recurse for both client versions. In etcd_util, the index kwarg in the watch method has been deprecated in favor of start_revision for both client versions. In etcd_util, the waitIndex kwarg in the read method has been deprecated in favor of start_revision for both client versions. The etcd API v2 implementation has been deprecated in favor of etcd API v3. (#60325)
- Deprecated transport kwarg inside salt.utils.event.get_event (#61275)
- Deprecated netmiko_conn and pyeapi_conn in napalm_mod.py as these function should not be called from the CLI (#61566)
- Deprecate all Azure cloud modules (#62183)
- Deprecated `defaults` and `preserve_context` for `salt.utils.functools.namespaced_function`. Additionally, the behavior when `preserve_namespace=True` was passed is now the default in order not to require duplicating imports on the modules that are namespacing functions. (#62272)
- Added a pyinstaller hook that traverses the python used on the tiamat package to add all possible modules as hidden imports. (#62362)
- Fix use of random shuffle and sample functions as Jinja filters (#62372)
- All of the requirements provided in the requirements files are now included. The job of evaluating platform markers is not Salt's it's pip's. (#62392)
- Update all platforms to use pycparser 2.21 or greater for Py 3.9 or higher, fixes fips fault with openssl v3.x (#62400)
- Due to changes in the Netmiko library for the exception paths, need to check the version of Netmiko python library and then import the exceptions from different locations depending on the result. (#62405)
- Deprecated the cassandra module in favor of the cassandra_cql module/returner. (#62327)

Changed

- alternatives: Do not access /var/lib/dpkg/alternatives directly (#58745)
- Enhance logging when there are errors at loading beacons (#60402)
- Updated mysql cache module to also store updated timestamp, making it consistent with default cache module. Users of mysql cache should ensure database size before updating, as ALTER TABLE will add the timestamp column. (#61081)
- Changed linux_shadow to test success of commands using cmd.retcode instead of cmd.run (#61932)
- *zabbix.user_get* returns full user info with groups and medias *zabbix.user_addmedia* returns error for Zabbix 4.0+ due to *user.addmedia* method removal *zabbix.user_deletemedia* returns error for Zabbix 4.0+ due to *user.deletemedia* method removal (#62012)
- ”Sign before ending the testrun in x509.create_certificate” (#62100)

Fixed

- Fix salt-ssh using sudo with a password (#8882)
- Fix SSH password regex to not search for content after password:. (#25721)
- Addressing a few issues when having keep_symlinks set to True with file.recurse. Also allow symlinks that are outside the salt fileserver root to be discoverable as symlinks when fileserver_followsymlinks is set to False. (#29562)
- serialize to JSON only non string objects. (#35215)
- Fix archive.extracted doesn't set user/group ownership correctly (#38605)
- Make sys.argspec work on functions with annotations (#48735)
- Fixed pdbedit.list_users with Samba 4.8 (#49648)
- Fixes a scenario where ipv6 is enabled but the master is configured as an ipv4 IP address. (#49835)
- Ensure that NOTIFY_SOCKET is not passed to child processes created with cmdmod unless it's set explicitly for such call. (#50851)
- remove escaping of dbname in mysql.alter_db function. (#51559)
- Fix runit module failing to find service if it is not symlinked. (#52759)
- Changed manage.versions to report minions offline if minion call fails. (#53513)
- Fixed events stream from /events endpoint not halting when auth token has expired. (#53742)
- Fixed user.present which was breaking when updating workphone,homephone, fullname and ”other” fields in case int was passed instead of string (#53961)
- Fix error in webutil state module when attempting to grep a file that does not exist. (#53977)
- Fixed ability to modify the ”Audit: Force audit policy subcategory settings...” policy (#54301)
- Fix timeout handling in netapi/saltnado. (#55394)
- Fixing REST auth so that we actually support using ACLs from the REST server like we said in the documentation. (#55654)
- Salt now correctly handles macOS after Py3.8 where python defaults to spawn instead of fork. (#55847)
- Factor out sum and sorting of permissions into separate functions. Additionally, the same logic was applied to the rest_cherrypy netapi (#56495)
- Display packages that are marked NoRemove in pkg.list_pkgs for Windows platforms (#56864)
- Attempt to fix 56957 by detecting the broken recusion and stopping it. (#56957)
- Fixed bytes vs. text issue when using sqlite for sdb backend. (#57133)
- Ensure test is added to opts when using the state module with salt-ssh. (#57144)
- Fixed RuntimeError OrderedDict mutated in network.managed for Debian systems. (#57721)
- Improved the multiprocessing classes to better handle spawning platforms (#57742)
- Config options are enforced according to config type (#57873)
- fixed 57992 fix multi item kv v2 items read. (#57992)
- Fixed thread leak during FQDN lookup when DNS entries had malformed PTR records, or other similar issues. (#58141)
- Remove unnecessary dot in template that cause the bridge interface to fail on debian. Fixes #58195 (#58195)

- update salt.module.schedule to check the job_args and job_kwargs for valid formatting. (#58329)
- Allowe use of *roster* in salt.function state when using the SSH client. (#58662)
- Detect new and legacy styles of calling module.run and support them both. (#58763)
- Clean repo uri before checking if it's present, avoiding ghost change. (#58807)
- Fix error "'__opts__' is not defined" when using the boto v2 modules (#58934)
- hgfs: fix bytes vs str issues within hgfs. (#58963)
- Fixes salt-ssh error when targetting IPs or hostnames directly. (#59033)
- Allow for multiple configuration entries with keyword strict_config=False on yum-based systems (#59090)
- Fixed error when running legacy code in winrepo.update_git_repos (#59101)
- Clarify the persist argument in the scheduler module. Adding code in the list function to indicate if the schedule job is saved or not. (#59102)
- Swap ret["retcode"] for ret.get("retcode") in the event that there is no retcode, eg. when a function is not passed with a module. (#59331)
- Fix race condition when caching vault tokens (#59361)
- The ssh module now accepts all ssh public key types as of openssh server version 8.7. (#59429)
- Set default transport and port settings for Napalm NXOS, if not set. (#59448)
- Use __salt_system_encoding__ when retrieving keystore certificate SHA1 str (#59503)
- Fix error being thrown on empty flags list given to file.replace (#59554)
- Update url for ez_setup.py script in virtualenv_mod.py (#59604)
- Changed yumpkg module to normalize versions to strings when they were ambiguously floats (example version=3005.0). (#59705)
- Fix pillar_roots.write on subdirectories broken after CVE-2021-25282 patch. (#59935)
- Improved performance of zfs.filesystem_present and zfs.volume_present. When applying these states, only query specified ZFS properties rather than all properties. (#59970)
- Fixed highstate outputter not displaying with salt.function in orchestration when module returns a dictionary. (#60029)
- Update docs where python-dateutil is required for schedule. (#60070)
- Send un-parsed username to LookupAccountName function (#60076)
- Fix ability to set propagation on a folder to "this_folder_only" (#60103)
- Fix name attribute access error in spm. (#60106)
- Fix zeromq stream.send exception message (#60228)
- Exit gracefully on ctrl+c. (#60242)
- Corrected import statement for redis_cache in cluster mode. (#60272)
- loader: Fix loading grains with annotations (#60285)
- fix docker_network.present when com.docker.network.bridge.name is being used as the unixes can not have a bridge of the same name (#60316)
- Fix exception in yumpkg.remove for not installed package on calling pkg.remove or pkg.removed (#60356)
- Batch runs now return proper retcodes in a tuple of the form (result, retcode) (#60361)

- Fixed issue with ansible roster __virtual__ when ansible is not installed. (#60370)
- Fixed error being thrown when None was passed as src/defaults or dest to defaults.update and defaults.merge (#60431)
- Allow for additional options for xmit hash policy in mode 4 NIC bonding on Redhat (#60583)
- Properly detect VMware grains on Windows Server 2019+ (#60593)
- Allow for minion failure to respond to job sent in batch mode (#60724)
- The mac assistive execution module no longer shells out to change the database. (#60819)
- Fix regression in win_timezone.get_zone which failed to resolve specific timezones that begin or end with d/s/t/o/f/_ characters (#60829)
- The TCP transport resets it's unpacker on stream disconnects (#60831)
- Moving the call to the validate function earlier to ensure that beacons are in the right format before we attempt to do anything to the configuration. Adding a generic validation to ensure the beacon configuration is in the wrong format when a validation function does not exist. (#60838)
- Update the mac installer welcome and conclusion page, add docs for the salt-config tool (#60858)
- Fixed external node classifier not callable due to wrong parameter (#60872)
- Adjust Debian/Ubuntu package use of name 'ifenslave-2.6' to 'ifenslave' (#60876)
- Clear and update the Pillar Cache when running saltutil.refresh_pillar. This only affects users that have *pillar_cache* set to True. If you do not want to clear the cache you can pass the kwarg *clean_cache=False* to *saltutil.refresh_pillar*. (#60897)
- Handle the situation when apt repo lines have or do not have trailing slashes properly. (#60907)
- Fixed Python 2 syntax for Python 3, allow for view objects returned by dictionary keys() function (#60909)
- Fix REST CherryPY append the default permissions every request (#60955)
- Do not consider ”skipped” targets as failed for ”ansible.playbooks” states (#60983)
- Fix behavior for internal ”_netlink_tool_remote_on” to filter results based on requested end (#61017)
- schedule.job_status module: Convert datetime objects into formatted strings (#61043)
- virt: don't crash if console doesn't have service or type attribute (#61054)
- Fixed conflict between importlib_metada from Salt and importlib.metadata from Python 3.10 (#61062)
- sys.argspec now works with pillar.get, vault.read_secret, and vault.list_secrets (#61084)
- Set virtual grain on FreeBSD EC2 instances (#61094)
- Fixed v3004 windows minion failing to open log file at C:ProgramDataSalt ProjectSaltvarlogsaltminion (#61113)
- Correct returned result to False when an error exception occurs for pip.installed (#61117)
- fixed extend being too strict and wanting the system_type to exist when it is only needed for requisites. (#61121)
- Fixed bug where deserialization in script engine would throw an error after all output was read. (#61124)
- Adding missing import for salt.utils.beacons into beacons that were updated to use it. (#61135)
- added exception catch to salt.utils.vt.terminal.isalive(). (#61160)
- Re-factor transport to make them more plug-able (#61161)
- Remove max zeromq pinned version due to issues on FreeBSD (#61163)

- Fixing deltaproxy code to handle the situation where the control proxy is configured to control a proxy minion whose pillar data could not be loaded. (#61172)
- Prevent get_tops from performing a Set operation on a List (#61176)
- Make "state.highstate" to acts on concurrent flag. Simplify "transactional_update" module to not use SSH wrapper and allow more flexible execution (#61188)
- Fix a failure with salt.utils.vault.make_request when namespace is not defined in the connection. (#61191)
- Fix race condition in *salt.utils.verify.verify_env* and ignore directories starting with dot (#61192)
- LGPO: Search for policies in a case-sensitive manner first, then fall back to non case-sensitive names (#61198)
- Fixed state includes in dynamic environments (#61200)
- Minimize the number of network connections minions to the master (#61247)
- Fix salt-call event.event with pillar or grains (#61252)
- Fixed failing dcs.compile_config where a successful compile errored with *AttributeError: 'list' object has no attribute 'get'*. (#61261)
- Make the salt.utils.win_dacl.get_name() function include the "NT Security" prefix for Virtual Accounts. Virtual Accounts can only be added with the fully qualified name. (#61271)
- Fixed tracebacks and print helpful error message when proxy_return = True but no platform or primary_ip set in NetBox pillar. (#61277)
- Ensure opts is included in pack for minion_mods and config loads opts from the named_context. (#61297)
- Added prefix length info for IPv6 addresses in Windows (#61316)
- Handle MariaDB 10.5+ SLAVE MONITOR grant (#61331)
- Fix secondary ip addresses being added to ip4_interfaces and ip6_interfaces at the same time (#61370)
- Do not block the deltaproxy startup. Wrap the call to the individual proxy initialization functions in a try...except, catching the exception, logging an error and moving onto the next proxy minion. (#61377)
- show_instance of hetzner cloud provider should enforce an action like the other ones (#61392)
- Fix Hetzner Cloud config loading mechanism (#61399)
- Sets correctly the lvm grain even when lvm's command execution outputs a WARNING (#61412)
- Use net instead of sc in salt cloud when restarting the salt service (#61413)
- Fix use_etag support in fileclient by removing case sensitivity of expected header (#61440)
- Expand environment variables in the root_dir registry key (#61445)
- Use salt.utils.path.readlink everywhere instead of os.readlink (#61458)
- Fix state_aggregate minion option not respected (#61478)
- Fixed wua.installed and wua.uptodate to return all changes, failures, and supersedences (#61479)
- When running with test=True and there are no changes, don't show that there are changes. (#61483)
- Fix issue with certutil when there's a space in the path to the certificate (#61494)
- Fix cmdmod not respecting config for saltenv (#61507)
- Convert Py 2'isms to Python 3, and add tests for set_filesystems on AIX (#61509)
- Fix tracebacks caused by missing block device type and wrong mode used for gzip.open while calling inspector.export (#61530)

- win_wua: Titles no longer limited to 40 characters (#61533)
- Fixed error when using network module on RHEL 8 due to the name of the service changing from ”network” to ”NetworkManager”. (#61538)
- Allow symlink to be created even if source is missing on Windows (#61544)
- Print jinja error context on *UndefinedError*. Previously *jinja2.exceptions.UndefinedError* resulted in a *SaltRenderError* without source file context, unlike all of the other Jinja exceptions handled in *salt/utils/templates.py*. (#61553)
- Fix uptime on AIX systems when less than 24 hours (#61557)
- Fix issue with state.show_state_usage when a saltenv is not referenced in any topfile (#61614)
- Making the retry state system feature available when parallel is set to True. (#61630)
- modules/aptpkg.SourceEntry: fix parsing lines with arbitrary comments in case HAS_APT=False (#61632)
- Fix file.comment incorrectly reports changes in test mode (#61662)
- Fix improper master caching of file listing in multiple dynamic environments (#61738)
- When configured beacons are empty write an empty beacon configuration file. (#61741)
- Fix file.replace updating mtime with no changes (#61743)
- Fixed etcd_return being out of sync with the underlying etcd_util. (#61756)
- Fixing items, values, and keys functions in the data module. (#61812)
- Ensure that *salt://* URIs never contain backslashes, converting them to forward slashes instead. A specific situation to handle is caching files on Windows minions, where Jinja relative imports introduce a backslash into the path. (#61829)
- Do not raise a UnicodeDecodeError when pillar cache cannot decode binary data. (#61836)
- Don't rely on `importlib.metadata`, even on Py3.10, use `importlib_metadata` instead. (#61839)
- Fix the reporting of errors for file.directory in test mode (#61846)
- Update Markup and contextfunction imports for jinja versions >=3.1. (#61848)
- Update states.chef for version 16.x and 17.x Chef Infra Client output. (#61891)
- Fixed some whitespace and `pathlib.Path` issues when not using the sytem `aptsources` package. (#61936)
- fixed error when using backslash literal in file.replace (#61944)
- Fix an issue where under spawning platforms, one could exhaust the available multiprocessing semaphores. (#61945)
- Fix salt-cloud sync_after_install functionality (#61946)
- Ensure that *common_prefix* matching only occurs if a directory name is identified (in the *archive.list* execution module function, which affects the *archive.extracted* state). (#61968)
- When states are running in parallel, ensure that the total run time produced by the highstate outputter takes that into account. (#61999)
- Temporary logging is now shutdown when logging has been configured. (#62005)
- modules/lxd.FilesManager: fix memory leak through pylxd.modules.container.Container.FilesManager (#62006)
- utils/jinja.SaltCacheLoader: fix leaking SaltCacheLoader through atexit.register (#62007)

- Fixed errors on calling *zabbix_user.admin_password_present* state, due to changed error message in Zabbix 6.0 Fixed *zabbix.host_update* not mapping group ids list to list of dicts in format *[{"groupid": groupid}, ...]* Fixed *zabbix.user_update* not mapping usergroup id list to list of dicts in format *[{"usrgrpid": usrgrpid}, ...]* (#62012)
- utils/yamlloader and yamlloader_old: fix leaking DuplicateKeyWarning through a warnings module (#62021)
- Fix cache checking for Jinja templates (#62042)
- Fixed salt.states.file.managed() for follow_symlinks=True and test=True (#62066)
- Stop trigering the GLIBC race condition when parallelizing the resolution of the fqnds. (#62071)
- Fix useradd functions hard-coded relative command name (#62087)
- Fix #62092: Catch zmq.error.ZMQError to set HWM for zmq >= 3.

  Run `git show 0be0941` for more info. (#62092)
- Allow emitatstartup to work when delay option is setup. (#62095)
- Fix broken relative jinja includes in local mode bug introduced in #62043 (#62117)
- Fix broken file.comment functionality introduced in #62045 (#62121)
- Fixed an incompatibility preventing salt-cloud from deploying VMs on Proxmox VE 7 (#62154)
- Fix sysctl functions hard-coded relative command name (#62164)
- All of Salt's loaders now accept `loaded_base_name` as a keyword argument, allowing different namespacing the loaded modules. (#62186)
- Only functions defined on the modules being loaded will be added to the lazy loader, functions imported from other modules, unless they are properly namespaced, are not included. (#62190)
- Fixes issue in postgresql privileges detection: privileges on views were never retrieved and always recreated. (#57690)
- Fix service.enabled error for unavailable service in test mode (#62258)
- Fix variable reuse causing requisite_in problems (#62264)
- Adding -G option to pkgdd cmd_prefix list when current_zone_only is True. (#62206)
- Don't expect `lsof` to be installed when trying check which minions are connected. (#62303)
- Fixed urlparse typo in rpmbuild_pkgbuild.py (#62442)
- Fixing changes dict in pkg state to be consistent when installing and test=True. (#60995)
- Use fire_event_async when expecting a coroutine (#62453)
- Fixes import error under windows. (#62459)
- account for revision number in formulas to account for difference between bottle and formula (#62466)
- Fixed stacktrace on Windows when running pkg.list_pkgs (#62479)
- Update sanitizing masking for Salt SSH to include additional password like strings. (#62483)
- Fixes an issue where the minion could not connect to a master after 2 failed attempts (#62489)

Added

- Added ability to request VPC peering connections in different AWS regions (boto_vpc). (#50394)
- Added event return capability to Splunk returner (#50815)
- Added allow downgrades support to apt upgrade (#52977)
- added new grain for metadata to handle googles metadata differences (#53223)
- Added win_shortcut execution and state module that does not prepend the current working directory to paths. Use shortcut.create and shortcut.present instead of file.shortcut. (#53706)
- Add __env__ substitution inside file and pillar root paths (#55747)
- Added support cpu hot add/remove, memory hot add, and nested virtualization to VMware salt-cloud driver. (#56144)
- Add a consul state module with acl_present and acl_absent functions. (#58101)
- Added restconf module/states/proxy code for network device automation (#59006)
- Adds the ability to get version information from a file on Windows systems (#59702)
- Add aptkey=False kwarg option to the aptpkg.py module and pkgrepo state. Apt-key is on the path to be deprecated. This will allow users to not use apt-key to manage the repo keys. It will set aptkey=False automatically if it does not detect apt-key exists on the machine. (#59785)
- Added "Instant Clone" feature in the existing VMware Cloud module (#60004)
- Added support for etcd API v3 (#60325)
- Added *pkg.held* and *pkg.unheld* state functions for Zypper, YUM/DNF and APT. Improved *zypperpkg.hold* and *zypperpkg.unhold* functions. (#60432)
- Added suse_ip module allowing to manage network interfaces on SUSE based Linux systems (#60702)
- Support querying for JSON data in SQL external pillar (#60905)
- Added support for yum and dnf on AIX (#60912)
- Added percent success/failure of state runs in highstate summary output via new state_output_pct option (#60990)
- Add support for retrieve IP-address from qemu agent by Salt-cloud on Proxmox (#61146)
- Added new shortcut execution and state module to better handle UNC shortcuts and to test more thoroughly (#61170)
- added yamllint utils module and yaml execution modules (#61182)
- Add "--no-return-event" option to salt-call to prevent sending return event back to master. (#61188)
- Add Etag support for file.managed web sources (#61270)
- Adding the ability to add, delete, purge, and modify Salt scheduler jobs when the Salt minion is not running. (#61324)
- Added a force option to file.symlink to overwrite an existing symlink with the same name (#61326)
- *gpg_decrypt_must_succeed* config to prevent gpg renderer from failing silently (#61418)
- Do not load a private copy of *__grains__* and *__salt__* for the sentry log handler if it is disabled. (#61484)
- Add Jinja filters for itertools functions, flatten, and a state template workflow (#61502)
- Add feature to allow roll-up of duplicate IDs with different names in highstate output (#61549)

- Allow cp functions to derive saltenv from config if not explicitly set (#61562)
- Multiprocessing logging no longer uses multiprocessing queues which penalized performance.

  Instead, each new process configures the terminal and file logging, and also any external logging handlers configured. (#61629)
- Add a function to the freezer module for comparison of packages and repos in two frozen states (#61682)
- Add grains_refresh_pre_exec option to allow grains to be refreshed before any operation (#61708)
- Add possibility to pass extra parameters to salt-ssh pre flight script with *ssh_pre_flight_args* (#61715)
- Add Etag support for archive.extracted web sources (#61763)
- Add regex exclusions, full path matching, symlink following, and mtime/ctime comparison to file.tidied (#61823)
- Add better handling for unit abbreviations and large values to salt.utils.stringutils.human_to_bytes (#61831)
- Provide PyInstaller hooks that provide some runtime adjustments when Salt is running from a onedir (PyInstaller) bundled package. (#61864)
- Add configurable onedir pip pypath location (#61937)
- Add CNAME record support to the dig exec module (#61991)
- Added support for changed user object in Zabbix 5.4+ Added compatibility with Zabbix 4.0+ for *zabbix.user_getmedia* method Added support for setting medias in *zabbix.user_update* for Zabbix 3.4+ (#62012)
- Add ignore_missing parameter to file.comment state (#62044)
- General improvements on the "ansiblegate" module: * Add "ansible.targets" method to gather Ansible inventory * Add "ansible.discover_playbooks" method to help collecting playbooks * Fix crash when running Ansible playbooks if ansible-playbook CLI output is not the expected JSON. * Fix issues when processing inventory and there are groups with no members. * Allow new types of targets for Ansible roster (#60056)
- Add sample and shuffle functions from random (#62225)
- Add "<tiamat> python" subcommand to allow execution or arbitrary scripts via bundled Python runtime (#62381)

(_release-3005-1)=

33.2.20 Salt 3005.1 Release Notes

Version 3005.1 is a bug fix release for *3005*.

Changelog

33.2.21 Fixed

- Fix arch parsing issue in apt source files (#62247)
- Fixed parsing CDROM apt sources (#62474)
- Use str() method instead of repo_line for when python3-apt is installed or not in aptpkg.py. (#62546)
- Remove the connection_timeout from netmiko_connection_args before netmiko_connection_args is added to **context**["netmiko_device"]["args"] which is passed along to the Netmiko library. (#62547)
- fixes #62553 by checking for disabled master_type before starting master connection and skipping it if set. (#62553)

- Fix runas with cmd module when using the onedir bundled packages (#62565)
- Fix the Pyinstaller hooks to preserve the environment if None is passed. (#62567, #62628)
- pkgrepo.managed sets wrong permissions on keys installed to /etc/apt/keyring (#62569)
- pkgrepo.managed creates zero byte gpg files when dearmoring contents to the same filename (#62570)
- Ensure default values for IPC Buffers are correct type (#62591)
- Fix a hang on salt-ssh when using sudo. (#62603)
- Renderers now have access to the correct set of salt functions. (#62610, #62620)
- Fix including Jinja template from absolute path (#62611)
- include jmespath in package requirements (#62613)
- Fix pkgrepo.managed signed-by in test=true mode (#62662)
- Ensure the status of the service is captured when the beacon function is called, even when the event is not being emitted. (#62675)
- The sub proxies controlled by Deltaproxy need to have their own req_channel otherwise there are timeout exceptions when the __master_req_channel_payload is fired and reacted on. (#62708)

33.2.22 Salt 3005.2 Release Notes

Version 3005.2 is a CVE security fix release for *3005*.

Changed

- Additional required package upgrades
    - It's now *pyzmq>=20.0.0* on all platforms, and *<=22.0.3* just for windows.
    - Upgrade to *pyopenssl==23.0.0* due to the cryptography upgrade. (#63757)

Security

- fix CVE-2023-20897 by catching exception instead of letting exception disrupt connection (cve-2023-20897)
- Fixed gitfs cachedir_basename to avoid hash collisions. Added MP Lock to gitfs. These changes should stop race conditions. (cve-2023-20898)
- Upgrade to *requests==2.31.0*

  Due to:

    - https://github.com/advisories/GHSA-j8r2-6x86-q33q (#64336)
- Upgrade to *cryptography==41.0.3`(and therefor `pyopenssl==23.2.0* due to https://github.com/advisories/GHSA-jm77-qphf-c4w8)

  Also resolves the following cryptography advisories:

  Due to:

    - https://github.com/advisories/GHSA-5cpq-8wj7-hf2v
    - https://github.com/advisories/GHSA-x4qr-2fvf-3mr5
    - https://github.com/advisories/GHSA-w7pp-m8wf-vj6r

There is no security upgrade available for Py3.5 (#64595)

- Bump to *certifi==2023.07.22* due to https://github.com/advisories/GHSA-xqr8-7jwr-rhp7

  Python 3.5 cannot get the updated requirements since certifi no longer supports this python version (#64720)

33.2.23 Salt 3005.3 Release Notes

Version 3005.3 is a Bug fix release for *3005*.

Changed

- Fix __env__ and improve cache cleaning see more info at pull #65017. (#65002)

Security

- Update to *gitpython>=3.1.35* due to https://github.com/advisories/GHSA-wfm5-v35h-vwf4 and https://github.com/advisories/GHSA-cwvm-v4w8-q58c (#65167)

33.2.24 Salt 3005.4 Release Notes

Version 3005.4 is a CVE security fix release for *3005*.

Security

- Fix CVE-2023-34049 by ensuring we do not use a predictable name for the script and correctly check returncode of scp command. This only impacts salt-ssh users using the pre-flight option. (cve-2023-34049)
- Bump to *cryptography==41.0.4* due to https://github.com/advisories/GHSA-v8gr-m533-ghj9 (#65267)
- Bump to *urllib3==1.26.17* or *urllib3==2.0.6* due to https://github.com/advisories/GHSA-v845-jxx5-vc9f (#65334)
- Bump to *gitpython==3.1.37* due to https://github.com/advisories/GHSA-cwvm-v4w8-q58c (#65383)

33.2.25 Salt 3005.5 Release Notes

Version 3005.5 is a CVE security fix release for *3005*.

Security

- Fix CVE-2024-22231 by preventing directory traversal when creating syndic cache directory on the master.
- Fix CVE-2024-22232 Prevent directory traversal attacks in the master's serve_file method.

These vulnerablities were discovered and reported by: Yudi Zhao(Huawei Nebula Security Lab),Chenwei Jiang(Huawei Nebula Security Lab) (#565)

33.2.26 Salt 3004 Release Notes - Codename Silicon

New Features

Transactional System Support (MicroOS)

A transactional system, like `MicroOS`, can present some challenges when the user decided to manage it via Salt.

MicroOS provide a read-only rootfs and a tool, `transactional-update`, that takes care of the management of the system (updating, upgrading, installation or reboot, among others) in an atomic way.

Atomicity is the main feature of MicroOS, and to guarantee this property, this model leverages `snapper`, `zypper`, `btrfs` and `overlayfs` to create snapshots that will be updated independently of the currently running system, and that are activated after the reboot. This implies, for example, that some changes made on the system are not visible until the next reboot, as those changes are living in a different snapshot of the file system.

Salt 3004 (Silicon) support this type of system via two new modules (`transactional_update` and `rebootmgr`) and a new executor (`transactional_update`).

The new modules will provide all the low level API for interacting with transactional systems, like defining a maintenance window where the system is free to reboot and activate the new state, or install new software in a new transaction. It will also provide hight level of abstractions that will allows us to execute Salt module functions or applying states inside new transactions.

The execution module will help us to treat the transactional system transparently (like the traditional ones), using a mechanism that will delegate some Salt modules execution into the new `transactional_update` module.

Removed

- Removed the deprecated glance state and execution module in favor of the glance_image state module and the glanceng execution module. (#59079)
- Removed support for Ubuntu 16.04 (#59869)
- Removed the deprecated support for `gid_from_name` from the `user` state module (#60565)
- Removed deprecated virt.migrate_non_shared, virt.migrate_non_shared_inc, ssh from virt.migrate, and python2/python3 args from salt.utils.thin.gen_min and .gen_thin (#60893)

Deprecated

- The _ext_nodes alias to the master_tops function was added back in 3004 to maintain backwards compatibility with older supported versions. This alias will now be removed in 3006. This change will break Master and Minion communication compatibility with Salt minions running versions 3003 and lower. (#60980)
- utils/boto3_elasticsearch is no longer needed (#59882)
- Changed ”manufacture” grain to ”manufacturer” for Solaris on SPARC to unify the name across all platforms. The old ”manufacture” grain is now deprecated and will be removed in Sulfur (#60511)
- Deprecate `salt.payload.Serial` (#60953)

Changed

- Changed nginx.version to return version without `nginx/` prefix. (#57111)
- Updated Slack webhook returner to support event returns on salt-master (#57182)
- Parsing Epoch out of version during pkg remove, since yum can't handle that in all of the cases. (#57881)
- Add extra onfail req check in the state engine to allow onfail to be used with onchanges and other reqs in the same state (#59026)
- Changed the default character set used by `utils.pycrypto.secure_password()` to include symbols and implemented arguments to control the used character set. (#59486)

Fixed

- Set default 'bootstrap_delay' to 0 (#61005)
- Fixed issue where multiple args to netapi were not preserved (#59182)
- Handle all repo formats in the aptpkg module. (#60971)
- Do not break master_tops for minion with version lower to 3003 This is going to be removed in Salt 3006 (Sulfur) (#60980)
- Reverting changes in PR #60150. Updating installed and removed functions to return changes when test=True. (#60995)
- Handle signals and properly exit, instead of raising exceptions. (#60391, #60963)
- Redirect imports of `salt.ext.six` to `six` (#60966)
- Surface strerror to user state instead of returning false (#20789)
- Fixing _get_envs() to preserve the order of pillar_roots. _get_envs() returned pillar_roots in a non-deterministic order. (#24501)
- Fixes salt-cloud `KeyError` that occurs when there exists any subnets with no tags when profiles use `subnetname` (#44330)
- Fixes postgres_local_cache by removing duplicate unicode encoding. (#46942)
- Fixing the state aggregation system to properly handle requisities. Fixing pkg state to exclude packages from aggregation if the hold attribute is in the state. (#47628)
- fix issue that allows case sensitive files to be carried through (#47969)
- Allow GCE Salt Cloud to use previously created IP Addresses. (#48947)
- Fixing rabbitmq.list_user_permissions to ensure we are returning a permission list with three elements even when some values are empty. (#49115)
- Periodically restart the fileserver update process to avoid leaks (#50313)
- Fix default value to dictionary for mine_function (#50695)
- Allow user.present to work on Alpine Linux by fixing linux_shadow.info (#50979)
- Ensure that zypper is called with only one --no-refresh parameter (#51382)
- Fixed fileclient cachedir path switching from master to minion due to incorrect MasterMinion configuration (#52288)
- Fixed the container detection inside virtual machines (#53868)
- Fix invalid dnf command when obsoletes=True in pkg.update function (#54224)

- Jinja renderer resolves wrong relative paths when importing subdirectories (#55159)
- Fixed bug #55262 where `salt.modules.iptables` would call `cmd.run` and receive and interpret interspersed `stdout` and `stderr` output from subprocesses. (#55262)
- Updated pcs support to handle auth and setup for new syntax supporting version 0.10 (#56924)
- Reinstate ignore_cidr option in salt-cloud openstack driver (#57127)
- Fix for network.wolmatch runner displaying 'invalid arguments' error with valid arguments (#57473)
- Fixed bug 57490, which prevented package installation for Open Euler and Issabel PBX. Both Open Euler and Issabel PBX use Yum for package management, added them to yumpkg.py. (#57490)
- Better handling of bad RSA public keys from minions (#57733)
- Fixing various functions in the file state module that use user.info to get group information, certain hosts particularly proxy minions do not have the user.info function available. (#57786)
- Do not monkey patch yaml loaders: Prevent breaking Ansible filter modules (#57995)
- Fix --subset command line option, and support old 'sub' parameter name in cmd_subset for backwards compatibility (#58600)
- When calling salt.utils.http.query with a HEAD method to check for the existence of a source ensure that decode_body is False, so the file is not downloaded into memory when we don't need the contents. (#58881)
- Update the runas user on freebsd for postgres versions >9.5, since freebsd will be removing the package on 2021-05-13. (#58915)
- Fix pip module linked requirements file parsing (#58944)
- Fix incorrect hostname quoting in /etc/sysconfig/networking on Red Hat family OS. (#58956)
- Fix Xen DomU virt detection in grains for long running machines. (#59001)
- add encoding when windows encoding is not defaulting to utf8 (#59063)
- Fix ”aptpkg.normalize_name” in case the arch is ”all” for DEB packages (#59269)
- Astra Linux now considered a Debian family distro (#59332)
- Reworking the mysql module and state so that passwordless does not try to use unix_socket until unix_socket is set to True. (#59337)
- Fixed the zabbix module to read the connection data from pillar. (#59338)
- Fix crash on ”yumpkg” execution module when unexpected output at listing patches (#59354)
- Remove return that had left over py2 code from win_path.py (#59396)
- Don't create spicevmc channel for Xen virtual machines (#59416)
- Fix win_servermanager.install so it will reboot when restart=True is passed (#59424)
- Clear the cached network interface grains during minion init and grains refresh (#59490)
- Normalized grain output for LXC containers (#59573)
- Fix typo in 'salt/states/cmd.py' to use ”comment” instead of ”commnd”. (#59581)
- add aliyun linux support and set alinux as redhat family (#59686)
- Don't fail updating network without netmask ip attribute (#59692)
- Fixed using reserved keyword 'set' as function argument in modules/ipset.py (#59714)
- Return empty changes when nothing has been done in virt.defined and virt.running states (#59739)

- Import salt.utils.azurearm instead of using __utils__ from loader in azure cloud. This fixes an issue where __utils__ would become unavailable when we are using the ThreadPool in azurearm. (#59744)
- Fix an issue with the LGPO module when the gpt.ini file contains unix style line endings (/n). This was happening on a Windows Server 2019 instance created in Google Cloud Platform (GCP). (#59769)
- The `ansiblegate` module now correctly passes keyword arguments to Ansible module calls (#59792)
- Make sure cmdmod._log_cmd handles tuples properly (#59793)
- Updating the add, delete, modify, enable_job, and disable_job functions to return appropriate changes. (#59844)
- Apply pre-commit changes to entire codebase. (#59847)
- Fix Hetzner cloud driver does not recognize machines when rolling out a map (#59864)
- Update Windows build deps & DLLs, Use Python 3.8, libsodium.dll 1.0.18, OpenSSL dlls to 1.1.1k (#59865)
- Salt api verifies proper log file path when providing '--log-file' from the cli (#59880)
- Detect Mendel Linux as Debian (#59892)
- Fixed compilation of requisite_ins by also checking state type along with name/id (#59922)
- Fix xen._get_vm() to not break silently when a VM and a template on XenServer have the same name. (#59932)
- Added missing space for nftables.build_rule when using saddr or daddr. (#59958)
- Add back support to load old entrypoints by iterating instead of type checking (#59961)
- Fixed interrupting salt-call in a pdb session. (#59966)
- Validate we can import map files in states (#60003)
- Update alter_db to return True or False depending on the success of failure of the alter. Update grant_exists to only use the full list of available privileges when the grant is on the global level, eg. datbase is ”.”. (#60031)
- Fixed firewalld.list_zones when any ”rich rules” is set (#60033)
- IPCMessageSubscriber objects expose their connect method as a corotine so they can be wrapped by SyncWrapper. (#60049)
- Allow for Napalm dependency netmiko_mod to load correctly when used by Napalm with Cisco IOS (#60061)
- Ensure proper access to the created temporary file when `runas` is passed to `cmd.exec_code_all` (#60072)
- Fixed an IndexError in pkgng.latest_version when querying an unknown package. (#60105)
- Fixed pkgng.latest_version when querying by origin (e.g. ”shells/bash”). (#60108)
- Gracefuly handle errors in virt.vm_info (#60132)
- The LGPO Module now uses ”Success and Failure” for normal audit settings and advanced audit settings (#60142)
- Fixing tests/pytests/unit/utils/scheduler/test_eval.py tests so the sleep happens before the status, so the job is given time before we check it. (#60149)
- Update the external ipaddress to the latest 3.9.5 version which has some security fixes. Updating the compat.p to use the vendored version if the python version is below 3.9.5 and only run the test_ipaddress.py tests if below 3.9.5. (#60168)
- Fixed ValueError exception in state.show_state_usage (#60179)
- Redact the username and password when something goes wrong when using an HTTP source and we raise an exception. (#60203)
- Inject the Ansible functions into Salt's `ansiblegate` module which was broken on the 3001 release. (#60207)

- Figure out the available Python version inside containers when executing "dockermod.call" function (#60229)
- Handle IPv6 route types such as anycast, multicast, etc when returned from IPv6 route table queries (#60232)
- Move the commonly used code that converts a list to a dictionary into salt.utils.beacons. Fixing inotify beacon close function to ensure the configuration is converted from the provided list format into a dictionary. (#60241)
- Set name of engine subprocesses (#60259)
- Properly discover block devices path in virt.running (#60296)
- Avoid exceptions when handling some exception cases. (#60330)
- Fixed faulty error message in npm.installed state. (#60339)
- Port option reinstated for Junos Proxy (accidentally removed) (#60340)
- Now hosts.rm_host can remove entries from /etc/hosts when this file have inline comments. (#60351)
- Fixes issue where the full same name is not used when making rights assignments with group policy (#60357)
- Fixed zabbix_host.present to not overwrite inventory_mode to "manual" every time inventory is updated. (#60382)
- Allowed zabbix_host.present to do partial updates of inventory, also don't erase everything if inventory is missing in state definition. (#60389)
- Fixing the mysql_cache module to handle binary inserting binary data into the database. Initially adding tests. (#60398)
- Fixed host_inventory_get to not throw an exception if host does not exist (#60418)
- Check for /dev/kvm to detect KVM hypervisor. (#60419)
- Fixing file.accumulated handling of dependencies when the state_id is used instead of {function: state_id} format. (#60426)
- Adding the ability for yumpkg.remove to handle package names with widdcards. (#60461)
- Pass emulator path to get guest capabilities from libvirt (#60491)
- virt.get_disks: properly report qemu-img errors (#60512)
- Make all platforms have psutils. This prevents a minion from starting if an instance is all ready running. (#60523)
- Ignore configuration for 'enable_fqdns_grains' for AIX, Solaris and Juniper, assume False (#60529)
- Remove check for TIAMAT_BUILD enforcing USE_STATIC_REQUIREMENTS, this is now controlled by Tiamat v7.10.1 and above (#60559)
- Have the beacon call run through a try…except, catching any errors, logging and firing an event that includes the error. Fixing the swapusage beacon to ensure value is a string before we attempt to filter out the %. (#60585)
- Refactor loader into logical sub-modules (#60594)
- Clean up references to ZMQDefaultLoop (#60617)
- change dep warn from Silicon to Phosphorus for the cmd,show,system_info and add_config functions in the nxos module. (#60669)
- Fix bug 60602 where the hetzner cloud provider isn't recognized correctly (#60675)
- Fix the `pwd.getpwnam` caching issue on macOS user module (#60676)
- Fixing beacons that can include a value in their configuration that may or may not included a percentage. We want to handle the situation where the percentage sign is not included and the value is not handled as a string. (#60684)

- Fix RuntimeError in process manager (#60749)
- Ensure all data that is being passed along to LDAP is in an OrderedSet and contains bytes. (#60760)
- Update the AWS API version so VMs spun up by salt-cloud where the VPC has it enabled to assign ipv6 addresses by default, actually get ipv6 addresses assigned by default. (#60804)
- Remove un-needed singletons from tranports (#60851)

Added

- Add windows support for file.patch with patch.exe from git for windows optional packages (#44783)
- Added ability to pass exclude kwarg to salt.state inside orchestrate. (#49130)
- Added `success_stdout` and `success_stderr` arguments to `cmd.run`, to override default return code behavior. (#50597)
- The netbox pillar now been enhanced to add support for querying virtual machines (in addition to devices), as well as minion interfaces and associated IP addresses. (#51490)
- Add support for transactional systems, like openSUSE MicroOS (#58519)
- Added namespace headers to allow use of namespace from config to communicate with Vault Enterprise namespaces (#58585)
- boto3mod unit tests (#58713)
- New decorators `allow_one_of()` and `require_one_of()` (#58742)
- Added `nosync` switch to disable initial raid synchronization (#59193)
- Expanded the documentation for the netbox pillar. (#59398)
- Rocky Linux has been added to the RedHat os_family. (#59682)
- Add "poudriere -i -j jail_name" option to list jail information for poudriere (#59831)
- Added the grains.uuid on Windows platform (#59888)
- Add a salt.util.platform check to detect the AArch64 64-bit extension of the ARM architecture. (#59915)
- Adding support for Deltaproxy controlled proxy minions into Salt Open. (#60090)
- Added functions to slsutil execution module to test if files exist in the state tree Added function to slsutil execution module to search for a file by walking up the state tree (#60159)
- Allow module_refresh to also refresh available beacons, eg. following a Python library being installed and "refresh_modules" being passed as an argument in a state. (#60541)
- Add the `detect_remote_minions` and `remote_minions_port` options to allow the master to detect remote ports for connected minions. This will allow users to detect Heist-Salt minions the master is connected to over port 22 by default. (#60612)
- Add the python rpm-vercmp library in the rpm_lowpkg.py module. (#60814)
- Allow a user to use the aptpkg.py module without installing python-apt. (#60818)

33.2.27 Salt 3004.1 Release Notes

Version 3004.1 is a CVE security fix release for *3004*.

Important notice about upgrading

Version 3004.1 is a security release. 3004.1 minions are not able to communicate with masters older than 3004.1. You must upgrade your masters before upgrading minions.

Minion authentication security

Authentication between masters and minions rely on public/private key encryption and message signing. To secure minion authentication before you must pre-seed the master's public key on minions. To pre-seed the minions' master key, place a copy of the master's public key in the minion's pki directory as `minion_master.pub`.

Security

- Sign authentication replies to prevent MiTM (cve-2022-22935)
- Prevent job and fileserver replays (cve-2022-22936)
- Sign pillar data to prevent MiTM attacks. (cve-2202-22934)
- Fixed targeting bug, especially visible when using syndic and user auth. (CVE-2022-22941) (#60413)
- Fix denial of service in junos ifconfig output parsing.

33.2.28 Salt 3004.2 Release Notes

Version 3004.2 is a CVE security fix release for *3004*.

Fixed

- Expand environment variables in the root_dir registry key (#61445)
- Update Markup and contextfunction imports for jinja versions >=3.1. (#61848)
- Fix bug in tcp transport (#61865)
- Make sure the correct key is being used when verifying or validating communication, eg. when a Salt syndic is involved use syndic_master.pub and when a Salt minion is involved use minion_master.pub. (#61868)

Security

- Fixed PAM auth to reject auth attempt if user account is locked. (cve-2022-22967)

33.2.29 Salt 3003 Release Notes - Codename Aluminium

New Features

SCRAM-SHA-256 support for PostgreSQL passwords

Support for SCRAM-SHA-256 password hashes has been added to the *`postgres_user.present`* and *`postgres_group.present`* states. This allows migration away from the insecure and deprecated previous storage methods.

Added

- Added ”fips_mode” config option to master and minion configs. (#59427)
- Firewall groups support to Vultr Salt Cloud provider
- Adding the ability to clear and show the pillar cache enabled when pillar_cache is True. (#37080)
- SCRAM-SHA-256 support for PostgreSQL passwords. Pass encrypted=scram-sha-256 to the postgres_user.present (or postgres_group.present) state. (#51271)
- The yumpkg module has been updated to support VMWare's Photon OS, which uses tdnf (a C implementation of dnf). ”VMware Photon OS” has been added to the ”RedHat” *os_family* map as part of this change. (#51912)
- The pkgrepo state now supports VMware Photon OS. (#52550)
- Added firewallgroups to Vultr Salt Cloud provider (#53677)
- Added arbitrary kwarg support for tojson filter. (#56012)
- Add salt monitor beacon to execute salt execution module functions. (#56461)
- Allow the nameservers to be populated from systemd-resolve. (#57618)
- Adding reactor_niceness to the default minion configuration. (#57701)
- CPU model, topology and NUMA node tuning (#57880)
- Added `pkg.services_need_restart` which lists system services that should be restarted after package management operations. (#58261)
- Allow handling special first boot definition on virtual machine (#58589)
- Added vgcreate custom parameters to module call: addtag, alloc, autobackup, metadatatype, zero (#58747)
- Enhance console and serial support in virt module (#58844)
- Salt's versions report *salt --versions-report* now includes all installed salt extensions into its versions report. (#58938)
- Support loading entrypoints by passing a module instead of a function. (#58939)
- Added shadow.gen_password for BSD operating systems. (#59140)
- Add more network and PCI/USB host devices passthrough support to virt module and states (#59143)
- Add interface channels management support to rh_ip module. (#59147)
- Add new minion option return_retry_tries for dynamic return retry tries (#59236)
- Added salt-cloud support for Hetzner Cloud via the `hcloud` library of the provider. (#59301)
- ”AlmaLinux” has been added to the ”RedHat” *os_family* map (#59404)
- Added *blocks* and *attachments* params to the *slack_notify.post_message* function (#59428)

- Added tcp_reconnect_backoff minion config option for specifying reconnection backoff time for TCP transport (#59431)
- Added `swapusage` beacon to complement the existing `memusage` beacon. (#59460)
- The *salt-run* CLI now accepts *--jid* (#59527)
- Add bytes option for FreeBSD pkg-stats(8) module. (#59540)
- Adding mod_beacon function to pkg, service, and file state modules. This function will act similar to the mod_watch function. This will allow supported functions in those state modules to automatically add associated beacons to monitor for changes to the respective resources in the state file and fire events to the event bus when changes occur. (#59559)
- Add -B flag to FreeBSD pkgng.check() to regenerate the library dependency metadata for a package by extracting library requirement information from the binary ELF files in the package. (#59569)

Changed

- The *pkg* module now supports `tdnf` used by VMWare Photon OS. As part of this change, `VMWare Photon OS`'s `os_family` grain will now resolve as `RedHat`. This may require changes to existing uses of `grains.filter_by`
- The `salt-run` CLI now accepts `--jid` which allows scripting against it.
- Change *brew cask --list* to *brew list --cask* (#58381)
- Store git sha in salt/_version.py when installing from a tag so it can be found if needed later. (#59137)
- Changed package manager detection in yumpkg module (#59201)
- Updating the pkg beacon to fire the events when there are upgrades to packages, but also when watched packages are installed or removed. Breaking out the logic for listing pkgs from context into a separate function to aid in testing. Updating tests to ensure context is not used when use_context option to list_pkgs is False. (#59463)

Removed

- Removed the deprecated glance state and execution module in favor of the glance_image state module and the glanceng execution module. (#59079)
- Removing the _ext_nodes deprecation warning and alias to the master_tops function. This change will break compatibility with a Salt master running versions 2017.7.8 and older and Salt minions running versions 3003 and newer. (#59804)
- removed the arg *managed_private_key* from 'salt.states.x509.certificate_managed' (#59247)
- Drop support for python 3.5 on Windows (#59479)
- Removed support for Ubuntu 16.04 (#59913)

Deprecated

- Added deprecation warning for grains.get_or_set_hash (#59425)

Fixed

- When instantiating the loader grab values of grains and pillars if they are NamedLoaderContext instances. (#59773)
- Fixed installation on Apple Silicon Macs by checking $HOMEBREW_PREFIX for *libcrypto* instead of assuming /usr/local. (#59808)
- The Google Cloud Engine salt-cloud provider now requires *apache-libcloud>=2.5.0*. Service account authentication is broken on older versions.
- Fix incorrect documentation for pillar_source_merging_strategy (#26396)
- Don't iterate through cloud map errors (#34033)
- Suppress noisy warnings when very old pyzmq is used. (#50327)
- Fixed glusterfs version parsing for pre-4.0 (#50707)
- Prevent traceback when trying to list reactors when none are configured. (#53334)
- Fixed zabbix_host.present to accept all Zabbix host properties (#53838)
- Binaries for the salt installer package for OSX are now signed and the installer package is notarized (#54513)
- Guard boto3_elasticsearch loading properly (#55848)
- Use a capitalized string version of the value of *NodeState* instead (#56589)
- Adding missing error case to the validation for service beacon. (#56623)
- The GCE cloud driver only works with apache-libcloud>=2.5.0, prior versions have authentication issues (#56862)
- zypperpkg add_lock and remove_lock examples do not work (#56922)
- Compare bytes to bytes so we don't overwrite a correct value (#57212)
- Fixing expand_repo_def in aptpkg module to include the architecture in the line attribute when it is passed in. (#57600)
- When passing arguments pass them as keyword arguments so that we can be sure the right value is going where. (#58006, #58579, #59075)
- Improve module whitelist logic for file backends (#58041)
- Fix behavior for "onlyif/unless" state conditionals when multiple declarations (#58085)
- Ensure data is a valid keyword argument for the event.wait function. (#58182)
- Do not raise "StreamClosedError" traceback on the master logs but only log it (#58301)
- Fixed issue with win_timezone when dst is turned off. This was causing the minion not to start Use default timezone offset in scheduler when correct timezone cannot be determined (#58379)
- Pop!_OS 20.04 and 20.10 now support using pkg.* / aptpkg.* (#58395)
- Restoring functionality of the textfsm module when using textfsm_path argument (#58499)
- Invalidate file list cache when cache file has a future last modified time (#58529)
- Fix issue with setting permissions in combination with the win_perms_reset option (#58541)

- Adds support for Powershell 7. It is specified by passing shell="pwsh". Only valid if Powershell 7 is installed on the system. (#58598)
- Fixed the zabbix.host_create call on zabbix_host.present to include the optional parameter visible_name. Now working as documented. (#58602)
- Fixed some bugs to allow zabbix_host.present to update a host already existent on Zabbix server:
    - Added checks before "pop" the elements "bulk" and "details" from hostinterfaces_get's response. Without that, the interface comparison didn't works with Zabbix >= 5.0
    - Fixed the "inventory" comparison. It failed when both current and new inventory were missing.
    - Rewrite of the update_interfaces routine to really "update" the interfaces and not trying to delete and recreate all interfaces, which almost always gives errors as interfaces with linked items can't be deleted. (#58603)
- Added the "details" mandatory object with the properly default values when creating a SNMP hostinterface in Zabbix 5.0 (#58620)
- Fixing an issue preventing running pillar.get against pillar values with integers as pillar keys. (#58714)
- Adding a new option to pass client_flags to MySQL connections, for example passing the option to support multiple statements in queries. (#58718)
- Fixed two performance bugs in the sysctl.present state. Their impact is especially great on FreeBSD machines with large amounts of RAM. (#58732)
- Fixed an issue when pillar files are included in the *top.sls* and then later included in another pillar file. (#58736)
- Left over py2 code was causing windows encoding to misbehave (#58749)
- Return result=None from module.run state to indicate that changes would be made Return result=False from module.run state when called with no functions (#58752)
- Fix duplicate IP addresses in fqdn_ip4 and fqdn_ip6 grains (#58799)
- Rename *salt.renderers.toml* to *salt.renderers.tomlmod* which fixes the import error issues as described in #58822 Do note that, the renderer is still called *toml*. (#58822)
- Fixing unhold in yumpkg. Removing unnecessary code and relying on the code that handles dicts later. Adding tests when pkg.installed is called with hold=False. (#58883)
- Converts the given "grant" to upper case before compare to "ALL". This fixes a problem granting "all privileges" to a MySQL user. (#58933)
- Strip trailing "/" from repo.uri when comparing repos in "apktpkg.mod_repo" (#58962)
- When we are checking requisites, run reconcile_procs just on those requisite states not all running states. (#58976)
- Allow the gpg module to use export_key, delete_key and create_key without a passphrase in GnuPG >= 2.1 (#58980)
- Updated the documentation, handling and error messages for what size units are allowed by "size" parameter in lvm.lv_present (#58985)
- Fixing the two failing tests when running on Photon OS. Python 3 installed on Photon OS does not support MD4 hashing, so don't load pdbedit module and skip the test_generate_nt_hash test. Default unmask for files and directories results in them having only user and group permissions so update the test_directory_max_depth test. (#58991)
- Fixes to netmiko module and proxy module to handle situations where the device is unreachable during the initial connection phase. (#59011)

- Correct comment when updating postrges users and groups. Errors reported when removing postgres groups. Partial group membership changes in postgres groups. (#59034)
- Fixed an error when running svn.latest in test mode and using the trust_failures option. (#59069)
- Fixes to storing schedule items in pillar, when refreshing pillar only update the schedule items if something has changed. (#59104)
- Fixed timezone module to work in Slackware Linux (#59130)
- Enforces pywinrm to be version 0.3.0 or higher and upgrade to latest (#59138)
- Fix a race condition in the ldx module which sometimes caused devices not to be created during container creation. (#59145)
- Fix issue where passed smb port was being passed to the smb connection when deploying Windows with salt-cloud (#59153)
- Fixed an error when running on CentOS Stream 8. (#59161)
- Fix event publish retry when using TCP transport (#59162)
- Fix docs for *auth_timeout* (#59175)
- virt.update doesn't update the definition if efi=True and a loader is already set (#59188)
- Fixed salt.modules.solaris_shadow failing on bytes-like object is require, not 'str'. (#59191)
- Added support for io2 volumes in ec2 cloud (#59218)
- When checking if the mode had changed in the file state module, only do so if the passed mode is not None. (#59276)
- Fixing _sanitze_comments to use sqlparse instead of re.sub. (#59336)
- Allow use of query parameters in cmd.script source url (#59362)
- Access user from global group if local group fails to find user. (#59412)
- Detect and fix grub.xen path (#59484)
- Stop raising *StopIteration* on generators (#59512)
- Fix minion race conditions handling SIGTERM signal when loading modules (#59524)
- Support new output of systemd systemctl list-unit-files in the following modules systemd_service.get_enabled, systemd_service.get_disabled and systemd_service.get_static (#59526)
- Fix pkg.upgrade with -U arg on FreeBSD, -L flag was deprecated long time. (#59565)
- Fixing the virtual function for the netimiko module to allow it to run outside of a proxy minion. Adding additional tests. (#59635)
- Allow ”extra_filerefs” as sanitized kwargs for SSH client. Fix regression on ”cmd.run” when passing tuples as cmd. (#59664)

33.2.30 Salt 3003.1 Release Notes

Version 3003.1 is a bug fix release for *3003*.

Fixed

- Fixed race condition in batch logic. Added *listen* option to *LocalClient* to prevent event subscriber from purging cached events during batch iteration. (#56273)
- Fixed dependencies for Amazon Linux 2 on https://repo.saltproject.io since Amazon Linux 2 now provides some of the python libraries in their repos. (#59982)
- IPCMessageSubscriber objects expose their connect method as a coroutine so they can be wrapped by SyncWrapper. (#60049)
- Import salt.utils.azurearm instead of using __utils__ from loader in azure cloud. This fixes an issue where __utils__ would become unavailable when we are using the ThreadPool in azurearm. (#59744)
- Use contextvars library from site-packages if it is intalled. Fixes salt ssh for targets with python <=3.6 (#59942)
- Add back support to load old entrypoints by iterating instead of type checking (#59961)
- Pass the value of the `__grains__` NamedContext to salt.pillar.get_pillar, instead of the NamedContext object itself. (#59975)
- Fix pillar serialization in jinja templates (#60083)

33.2.31 Salt 3003.2 Release Notes

Version 3003.2 is a bug fix release for *3003*.

Fixed

- Periodically restart the fileserver update process to avoid leaks (#50313)
- Add ssh_timeout to kwargs in deploy_script (#59901)
- Update the external ipaddress to the latest 3.9.5 version which has some security fixes. Updating the compat.p to use the vendored version if the python version is below 3.9.5 and only run the test_ipaddress.py tests if below 3.9.5. (#60168)
- Use the right crypto library for salt.utils.crypt.reinit_crypto (#60215)
- Stop SSH from hanging if connection is lost. Also added args to customize grace period. (#60216)
- Improve reliability of Terminal class (#60504)
- Ignore configuration for 'enable_fqdns_grains' for AIX, Solaris and Juniper, assume False (#60529)

33.2.32 Salt 3003.3 (2021-08-20)

Version 3003.3 is a CVE security fix release for *3003*.

Fixed

- Fix issue introduced in https://github.com/saltstack/salt/pull/59648 (#60046)

Security

- Verify the owner of an existing config before trusting it during install. If the owner cannot be verified, back it up and use defaults. (CVE-2021-22004)
- Ensure that sourced file is cached using its hash name (cve-2021-21996)

33.2.33 Salt 3003.4 (2022-02-25)

Version 3003.4 is a CVE security fix release for *3003*.

Important notice about upgrading

Version 3003.4 is a security release. 3003.4 minions are not able to communicate with masters older than 3003.4. You must upgrade your masters before upgrading minions.

Minion authentication security

Authentication between masters and minions rely on public/private key encryption and message signing. To secure minion authentication before you must pre-seed the master's public key on minions. To pre-seed the minions' master key, place a copy of the master's public key in the minion's pki directory as `minion_master.pub`.

Security

- Sign authentication replies to prevent MiTM (cve-2022-22935)
- Prevent job and fileserver replays (cve-2022-22936)
- Sign pillar data to prevent MiTM attacks. (cve-2202-22934)
- Fixed targeting bug, especially visible when using syndic and user auth. (CVE-2022-22941) (#60413)
- Fix denial of service in junos ifconfig output parsing.

33.2.34 Salt 3003.5 (2022-07-05)

Version 3003.5 is a CVE security fix release for *3003*.

Fixed

- Update Markup and contextfunction imports for jinja versions >=3.1. (#61848)
- Fix bug in tcp transport (#61865)
- Make sure the correct key is being used when verifying or validating communication, eg. when a Salt syndic is involved use syndic_master.pub and when a Salt minion is involved use minion_master.pub. (#61868)

Security

- Fixed PAM auth to reject auth attempt if user account is locked. (cve-2022-22967)

33.2.35 Salt 3002 Release Notes - Codename Magnesium

New Features

Network Teaming Support Added (RHEL/CentOS)

Support for two new interface types (`team` and `teamport`) has been added to the *`network.managed`* state. See the documentation for example usage.

Execution Module Changes

The `ip.get_bond` and `ip.build_bond` functions have been removed from the `ip` module for RHEL/CentOS. Configuring bonding opts in modprobe configurations has not been necessary since RHEL 4, and Salt was in fact redundantly both creating modprobe configurations *and* using the `BONDING_OPTS` interface configuration parameter.

Removed

- removed boto_vpc.describe_route_table please use boto_vpc.describe_route_tables (#58636)
- removed show_ipv4 arg from all functions in from salt.runners.manage (#58638)
- removed kwargs from mandrill.send if you use "async" please use "asynchronous" (#58640)
- removed salt/modules/mac_brew_pkg.__fix_cask_namespace (#58641)
- zfs.mount Passing '-a' as name is deprecated please just pass 'None' (#58642)
- Remove include_localhost kwarg for connected_ids method in salt/utils/minions.py (#58224)
- deprecated opts default argument of none and removed deprecation warnings (#58635)

Deprecated

- The *ssh* parameter of *virt.migrate* has been deprecated. Use a libvirt URI *target* value instead. Both *virt.migrate_non_shared* and *virt.migrate_non_shared_inc* have been deprecated. Use the *copy_storage* parameter with *virt.migrate* instead. (#57947)

Changed

- Allow specifying a custom port for Proxmox connection (#50620)
- Changed the lvm.lv_present state to accept a resizefs switch. So, when the logical volume is resized, the filesystem will be resized too. (#55265)
- Change the `enable_fqdns_grains` setting to default to `False` on proxy minions as it is generally not needed and just slows down start up time.. (#57676)
- Adds network teaming support to `network.managed` state for RHEL-based distros. Removes `ip.get_bond` and `ip.build_bond` for the same, as is redundant and not needed for any current RHEL/CentOS/Fedora/etc. release. (#57775)
- The `serializer` argument has been added to the *`file.serialize`* state, as an alternative to `formatter`. This brings it more in line with the `serializer_opts` and `deserializer_opts` arguments. `formatter` is still supported, but using both `serializer` and `formatter` will cause the state to fail. (#57858)

Fixed

- *file.read* exec module function no longer fails on binary data. (#58033)
- Remove py2 support from winrepo execution module and runner (#58596)
- Create ini file if does not exist when using ini.options_present state module. (#34236)
- Added an bool ”strict” argument to sdb.get module to force module to fail if the sdb uri is not correct. (#39163)
- Fixed issue with postgres.has_privilege breaking on ALL. (#48465)
- check for azurearm username in config before adding username and password to the virtual machine properties (#49063)
- Fixes service.status to return True/False instead of empty strings or PIDs of the service. This brings macOS into parity with the other service modules. (#49237)
- fix frequent rest_tornado non-fatal tracebacks (#49572)
- Do not use reverse DNS of the target used in salt-ssh. Use the target the user provides. (#49840)
- Fixes startup issue where it tried to load the kernalparams grain on Windows (#49901)
- Fixed error in nilrt_ip.get_interfaces_details when loading config. (#50416)
- Doesn't remove underscore when sanitizing hostname in network salt util (#50527)
- **permit the use of int/float type for the version in**:
    - the state postgres_cluster.present
    - the state postgres_cluster.absent
    - the module postgres.cluster_create
    - the module postgres.cluster_remove (#50899)

- Cleaned up a trackback in lvm.pv_present when the disk doesn't exist. (#52363)
- Fixed UnboundLocalError when using win_network.connect (#53371)
- Add accept_ra 2 option to modules.debian_ip (#54067)
- salt.runner test mode support (#54382)
- Fixed mkpart to allow the creation of a partition without filesystem (#54456)
- Fixes bogus warning message when an empty list is used for an environment in a topfile. This allows *[]* to be used as a placeholder in a topfile without needing to comment everything out as a workaround. (#54882)
- win_certutil state will no longer fail on non-English systems upon successful additions and deletions of a certificate. (#55024)
- Fixed file.directory state always showing mode change for symlinks. (#55878)
- check for a docker error that the swarm already exists when calling swarm.swarm_init on an existing docker swarm (#55949)
- Fixing stalekey engine so it deletes the keys when they are a list. (#55977)
- An invalid _schedule.conf configuration file is renamed to _schedule.confYAMLError. This avoids disabling the minion and busy polling the CPU on Windows. (#56216, #58177)
- Proper calculation of tpldir and related context parameters (#56410)
- Make gpg.encrypt examples work (#56646)
- Artifactory encoding of headers fixed for py3 (#56660)
- Fixed handling of extents extended attribute in file.managed state. (#57189)
- Remove buggy start parameter from virt.pool_running docstring (#57275)
- Fixed saltcheck rendering of map.jinja files from saltenv (#57327)
- Fix for *virt.get_profiles* resolves an error that appears due to new parameters introduced with *_disk_profile()* (#57431)
- Accept nested namespaces in spacewalk.api runner function. (#57442)
- virt.init fix the disk target names (#57477)
- Fix volume name for disk-typed pools in virt.defined (#57497)
- Fixes an issue with filesystems options ordering which kept already applied NFS fstab entries being updated. (#57520)
- Do not allow python2 to be added to salt-ssh tar since Salt deprecated Python 2. (#57647)
- Fixed exception on loading custom zipped modules. (#57674)
- corrected support for app_id or local vault configurations (#57705)
- Fix the registration of libvirt pool and nodedev events (#57746)
- Pass cmd.run state arguments to unless and onlyif when they exist (#57760)
- The 2004 release of Windows 10 introduced a bug in the InstallationBehavior COM object where you can no longer get properties from that object. Calls to this object are now wrapped in a try/except block with sane defaults when it fails to read attributes.

  Additionally, some pre-flight checks have been added to the win_wua module to make sure Windows Update can actually run. (#57762)

- Changed get_repo in yumpkg.py to use "repo" as first parameter. This fixes #57778, a bug were every run of pkgrepo.managed state were marked as changed because the get_repo did fail to detect a previously applied run. (#57778)
- Raise SaltClientError in parse_host_port insted of ValueError so it is caught and handled properly when the minion is connecting to the master. (#57789)
- Fixed issue with the return dictionary from the workgroup() function in the salt.states.win_system module. This resulted in a windows-based minion logging an error and could also interfere with a highstate being applied. (#57790)
- Fixes broken block_device_mapping and block_device_mapping_v2 type checks in the OpenStack cloud driver. Salt was looking for a dict and the shade library was looking for a list of dicts. This made it impossible to use those params. (#57802)
- Fixed incorrect parsing of `Set-Cookie` response headers. (#57829)
- When using yumpkg, report stdout when stderr is redirected to stdout. (#57862)
- Fixes an issue on macOS where if you try and restart the macOS using serivce.restart salt-minion it would fail because the service names are different on macOS. (#57878)
- Fixes an issue on macOS where salt would take extra time to run on a service.dead call and the service is missing. (#57907)
- Fixes an issue where a disabled macOS and Windows service would fail to start with service.running. (#57908)
- Use "use_bin_type" to differentiate between bytes and str when writing cache for pillar and grains. (#57918)
- Set the comment to "No minions responded" if salt.function fails to find any minions (#57920)
- Fix issue with __*utils*__ usage in the __*virtual*__ functions on a few of the execution modules. (#57948)
- remove encoding kwarg for both pack(b)/unpack(b) in msgpack for versions >=1.0.0 https://github.com/msgpack/msgpack-python/blob/master/ChangeLog.rst#100 (#57965)
- Replace deprecated *cgi.escape()* with *html.escape()* after it was removed from Python 3.8. (#57983)
- Fix btrfs state decorator, that produces exceptions when creating subvolumes. (#58012)
- Fix kubeadm token_list when the list of tokens is empty (#58116)
- Add a fix for the mac_service modules where it would fail to load in some new services and crash on Big Sur. (#58143)
- Fix blank tplfile context parameter when loading top level sls files (#58249)
- Do not include init directory in sls context parameters if explicitly specified (#58250)
- Fixing pillar caching when pillar environments are involved. (#58274)
- Make proxy_config read in the proxy specific configuration which is typically found in /etc/salt/proxy.d/minionid/. (#58307)
- Add timeout kwarg docs for service.running and service.dead (#58311)
- Return empty dict on win_pdh.get_counters rather than raising exception when no data are available (#58327)
- Leave boot parameters untouched if boot parameter is set to None in virt.update (#58331)
- Convert disks of volume type to file or block disks on Xen (#58333)
- Apparently Apple is using both "10.16" and "11" for versioning Big Sur, depending on where you look. The mac_softwareupdate module uses a different regex depending on OS version, and the determination was based on the osrelease_info grain. This results in a Big Sur machine not using the correct regex; osrelease_info[1] is 0 for Big Sur.

This change simply adds an additional clause to the if statement to handle osmajorrelease > 10. (#58340)

- Fixed zmq salt-call hang!

  Some objects from the 3rd party module zmq fail to deconstruct if left to the GC when Python exits. This is because the objects get destroyed out of order. This only happens on some platforms like ubuntu 20.04 and some versions of FreeBSD. We fixed this hang by deconstructing all zmq objects in the right order before we exit salt-call. (#58364)
- Reactor runner functions will now ensure reactor system is available before attempting to run and error out if it is not available. (#58384)
- Fix enpoint typos (#58416)
- Make sure we repopulate `__utils__` on Windows when a job is run from the scheduler. (#58437)
- Adding a check when a source is an HTTP or FTP URL to do a query to ensure the URL is valid before returning, then we know if we need to move onto to the next source in the list or not. (#58441)
- Improved documentation for the LGPO state module (#58521)
- Remove old documented pending reboot key (#58530)
- On macOS, skip GUI dialog for Developer Command Line Tools when importing gitfs util. (#58575)
- Fixing a use case when multiple inotify beacons are defined but when notifications are fired the configuration from the first beacon are used. (#58655)

Added

- salt-api will now work on Windows platforms with limited support. You will be able to configure the `rest_cherrypy` module, without `pam` external authentication and without ssl support.(#49949)
- Added *execution_timeout* support to *chocolatey.installed* state (#50449)
- Add new verify_ssl option to file modules. This allows a user to not validate the server certificate for HTTPS source and source hash's. (#52663)
- Added list target type support to the *scan* salt-ssh roster. (#52675)
- Added pvresize and lvextend to linux_lvm (#56089)
- Added COPR option to states.pkgrepo (#57258)
- Add ”get_return” key for onlyif and unless requisites to parse deep module results (#57470)
- Allow setting VM boot devices order in virt.running and virt.defined states (#57544)
- Added grains to show the LVM Volume Groups and their Logical Volumes. (#57629)
- Memory Tuning Support which allows much greater control of memory allocation (#57639)
- Add output filter to saltcheck to only display test failures (#57788)
- Added an execution module for running idem exec modules
- Added a state module for running idem states (#57969)
- Added the ability for states to return *sub_state_run's* results from external state engines (#57993)
- Added salt-cloud support for Linode APIv4 via the `api_version` provider configuration parameter. (#58093)
- Added support to manage services in Slackware Linux. (#58206)
- Added list_sources to chocolatey module to have an overview of the repositories present on the minions. Added source_added to chocolatey state in order to add repositories to chocolatey. (#58588)

- Adding tests for changes to virtual function for netmiko module. Adding tests for netmiko proxy minion module. (#58609)
- Added features config option for feature flags. Added a feature flag *enable_slsvars_fixes* to enable fixes to tpldir, tplfile and sls_path. This flag will be deprecated in the Phosphorus release when this functionality becomes the default. (#58652)

33.2.36 Salt 3002.1 Release Notes

Version 3002.1 is a CVE fix release for *3002*.

Fixed

- Prevent shell injections in netapi ssh client (cve-2020-16846)
- Prevent creating world readable private keys with the tls execution module. (cve-2020-17490)
- Properly validate eauth credentials and tokens along with their ACLs. Prior to this change eauth was not properly validated when calling Salt ssh via the salt-api. Any value for 'eauth' or 'token' would allow a user to bypass authentication and make calls to Salt ssh. (CVE-2020-25592)

33.2.37 Salt 3002.2 Release Notes

Version 3002.2 is a bugfix release for *3002*.

Fixed

- Change dict check to isinstance instead of type() for key_values in file.keyvalue. (#57758)
- Fail when func_ret is False when using the new module.run syntax. (#57768)
- Fix comparison of certificate values (#58296)
- When using ssh_pre_flight if there is a failure, fail on retcode not stderr. (#58439)
- Fix use of unauthd cached vmware service instance (#58691)
- Removing use of undefined varilable in utils/slack.py. (#58753)
- Restored the ability to specify the amount of extents for a Logical Volume as a percentage. (#58759)
- Ensuring that the version check function is run a second time in all the user related functions in case the user being managed is the connection user and the password has been updated. (#58773)
- Allow bytes in gpg renderer (#58794)
- Fix issue where win_wua module fails to load when BITS is set to Manual (#58848)
- Ensure that elasticsearch.index_exists is available before loading the elasticsearch returner. (#58851)
- Log a different object when debugging if we're using disk cache vs memory cache. The disk cache pillar class has the dict object but the cache pillar object which is used with the memory cache does not include a _dict obeject because it is a dict already. (#58861)
- Do not generate grains for every job run on Windows minions. This makes Windows conform more to the way posix OSes work today. (#58904)
- Fixes salt-ssh authentication when using tty (#58922)

- Revert LazyLoader finalizer. Removed the weakref.finalizer code. On some occasions, the finalized would run when trying to load a new module, firing a race condition. (#58947)

33.2.38 Salt 3002.3 Release Notes

Version 3002.3 is a CVE fix release for *3002*.

Fixed

- CVE-2020-28243 - Fix local privilege escalation in the restartcheck module.
- CVE-2020-28972 - Ensure authentication to vcenter, vsphere, and esxi server validates the SSL/TLS certificate by default. If you want to skip SSL verification you can use *verify_ssl: False*.
- CVE-2020-35662 - Ensure the asam runner, qingcloud, splunk returner, panos proxy, cimc proxy, zenoss module, esxi module, vsphere module, glassfish module, bigip module, and keystone module validate SSL by default. If you want to skip SSL verification you can use *verify_ssl: False*.
- CVE-2021-3148 - Fix a command injection in the Salt-API when using the Salt-SSH client.
- CVE-2021-3144 - Fix eauth tokens can be used once after expiration
- CVE-2021-25281 - Fix salt-api so it honors eauth credentials for the wheel_async client.
- CVE-2021-25282 - Fix the salt.wheel.pillar_roots.write method so it is not vulnerable to directory traversal.
- CVE-2021-25283 - Fix the jinja render to protect against server side template injection attacks.
- CVE-2021-25284 - Fix cmdmod so it will not log credentials to log levels info and error.
- CVE-2021-3197 - Fix ssh client to remove ProxyCommand from arguments provided by cli and netapi.

33.2.39 Salt 3002.4 Release Notes

Version 3002.4 is a bug fix release for *3002*.

Fixed

- Fix runners that broke when patching for CVE-2021-25281
- Fix issue with runners in SSE

Known Issue

When using the Salt-API with the SSH client some of the SSH options are not working currently and will be fixed in an upcoming bug fix release. We are currently testing and fixing which options still need to be fixed, but have confirmed the following ones do not work in this release: extra-filerefs, pre-flight. This does not impact normal Salt-SSH usage on the cli.

33.2.40 Salt 3002.5 Release Notes

Version 3002.5 is a cve fix release for *3002*.

Fixed

- Tests and fix for CVE-2021-25283

Known Issue

When using the Salt-API with the SSH client some of the SSH options are not working currently and will be fixed in an upcoming bug fix release. We are currently testing and fixing which options still need to be fixed, but have confirmed the following ones do not work in this release: extra-filerefs, pre-flight. This does not impact normal Salt-SSH usage on the cli.

33.2.41 Salt 3002.6 Release Notes

Version 3002.6 is a bug fix release for *3002*.

Changed

- Store git sha in salt/_version.py when installing from a tag so it can be found if needed later. (#59137)

Fixed

- Fix argument injection bug in restartcheck.restartcheck. This change hardens the fix for CVE-2020-28243. (#200)
- Allow ”extra_filerefs” as sanitized kwargs for SSH client. Fix regression on ”cmd.run” when passing tuples as cmd. (#59664)
- Allow all ssh kwargs as sanitized kwargs for SSH client. (#59748)

33.2.42 Salt 3002.7 (2021-08-20)

Version 3002.7 is a CVE security fix release for *3002*.

Fixed

- Verify the owner of an existing config before trusting it during install. If the owner cannot be verified, back it up and use defaults. (CVE-2021-22004)

Security

- Fix the CVE-2021-31607 vulnerability Additionally, an audit and a tool was put in place, `bandit`, to address similar issues througout the code base, and prevent them. (CVE-2021-31607)
- Ensure that sourced file is cached using its hash name (cve-2021-21996)

33.2.43 Salt 3002.8 (2022-02-25)

Version 3002.8 is a CVE security fix release for *3002*.

Important notice about upgrading

Version 3002.8 is a security release. 3002.8 minions are not able to communicate with masters older than 3002.8. You must upgrade your masters before upgrading minions.

Minion authentication security

Authentication between masters and minions rely on public/private key encryption and message signing. To secure minion authentication before you must pre-seed the master's public key on minions. To pre-seed the minions' master key, place a copy of the master's public key in the minion's pki directory as `minion_master.pub`.

Security

- Sign authentication replies to prevent MiTM (cve-2020-22935)
- Sign pillar data to prevent MiTM attacks. (cve-2022-22934)
- Prevent job and fileserver replays (cve-2022-22936)
- Fixed targeting bug, especially visible when using syndic and user auth. (CVE-2022-22941) (#60413)

33.2.44 Salt 3002.9 (2022-05-25)

Version 3002.9 is a CVE security fix release for *3002*.

Fixed

- Fixed an error when running on CentOS Stream 8. (#59161)
- Fix bug in tcp transport (#61865)
- Make sure the correct key is being used when verifying or validating communication, eg. when a Salt syndic is involved use syndic_master.pub and when a Salt minion is involved use minion_master.pub. (#61868)

Security

- Fixed PAM auth to reject auth attempt if user account is locked. (cve-2022-22967)

33.2.45 Salt 3001 Release Notes - Codename Sodium

Python 2 Dropped

Python 2 support has been dropped in Salt 3001. See https://community.saltstack.com/blog/sunsetting-python-2-support/ for more info.

Salt mine updates

Syntax update

The syntax for defining salt functions in config or pillar files has changed to also support the syntax used in *`module.run`*. The old syntax for the mine_function - as a dict, or as a list with dicts that contain more than exactly one key - is still supported but discouraged in favor of the more uniform syntax of module.run.

State updates

The `creates` state requisite has been migrated from the `docker_container` and *`cmd`* states to become a global option. This acts similar to an equivalent `unless: test -f filename` but can also accept a list of filenames. This allows all states to take advantage of the enhanced functionality released in Neon, of allowing salt execution modules for requisite checks.

When using salt functions `onlyif` or `unless` requisites, a `get_return` key can now be used to specify a key to evaluate for truthiness. This can be used for execution modules which return status in a nested key.

```
test:
  test.nop:
    - name: foo
    - onlyif:
      - fun: consul.get
        consul_url: http://127.0.0.1:8500
        key:  not-existing
        get_return: res
```

State Execution Module

The *`state.test`* function can be used to test a state on a minion. This works by executing the `state.apply` function while forcing the `test` kwarg to `True` so that the `state.apply` function is not required to be called by the user directly. This also allows you to add the `state.test` function to a minion's `minion_blackout_whitelist` pillar if you wish to be able to test a state while a minion is in blackout.

New Grains

systempath

This grain provides the same information as the `path` grain, only formatted as a list of directories.

Salt-SSH updates

ssh_pre_flight

A new Salt-SSH roster option `ssh_pre_flight` has been added. This enables you to run a script before Salt-SSH tries to run any commands. You can set this option in the roster for a specific minion or use the `roster_defaults` to set it for all minions.

Example for setting `ssh_pre_flight` for specific host in roster file

```yaml
minion1:
  host: localhost
  user: root
  passwd: P@ssword
  ssh_pre_flight: /srv/salt/pre_flight.sh
```

Example for setting `ssh_pre_flight` using roster_defaults, so all minions run this script.

```yaml
roster_defaults:
  ssh_pre_flight: /srv/salt/pre_flight.sh
```

The `ssh_pre_flight` script will only run if the thin dir is not currently on the minion. If you want to force the script to run you have the following options:

- Wipe the thin dir on the targeted minion using the -w arg.
- Set ssh_run_pre_flight to True in the config.
- Run salt-ssh with the --pre-flight arg.

set_path

A new salt-ssh roster option *set_path* has been added. This allows you to set the path environment variable used to run the salt-ssh command on the target minion. You can set this setting in your roster file like so:

```yaml
minion1:
  host: localhost
  user: root
  passwd: P@ssword
  set_path: '$PATH:/usr/local/bin/'
```

auto_detect

You can now auto detect the dependencies to be packed into the salt thin when using the `ssh_ext_alternatives` feature.

```
ssh_ext_alternatives:
    2019.2:                     # Namespace, can be anything.
        py-version: [2, 7]      # Constraint to specific interpreter version
        path: /opt/2019.2/salt  # Main Salt installation directory.
        auto_detect: True       # Auto detect dependencies
        py_bin: /usr/bin/python2.7 # Python binary path used to auto detect dependencies
```

This new `auto_detect` option needs to be set to True in your `ssh_ext_alternatives` configuration. Salt-ssh will attempt to auto detect the file paths required for the default dependencies to include in the thin. If you have a dependency already set in your configuration, it will not attempt to auto detect for that dependency.

You can also set the `py_bin` option to set the python binary to be used to auto detect the dependencies. If `py_bin` is not set, it will attempt to use the major Python version set in `py-version`. For example, if you set `py-version` to be `[2, 7]` it will attempt to find and use the `python2` binary.

State Changes

- Adding a new option for the State compiler, `disabled_requisites` will allow requisites to be disabled during State runs.

Salt Renderer updates

A new renderer for toml files has been added.

```
#!jinja|toml

{% set myvar = "sometext" %}

[["some id"."test.nop"]]
name = "{{ myvar }}"
[["some id"."test.nop"]]
txt = "hello"
[["some id"."test.nop"]]
"somekey" = "somevalue"
```

Execution Module updates

Vault Module

The `vault module` has been updated with the ability to cache generated tokens. By specifying `uses` and optionally `ttl`, the token generated on behalf of the minion will be allowed to persist and function for the defined time period or number of uses. Setting `uses: 0` creates an unlimited use token, that is only constrained by the `ttl`.

```
vault:
  auth:
    uses: 25
```

This functionality is configured by default on the master and is thus shared behavior for all minion token generation. To delegate use count to individual minions, specify `allow_minion_override: True` in the master config, and define `uses` and `ttl` in the minion config as directed above.

```
vault:
auth:
  method: token
  allow_minion_override: True
```

Additionally, the vault module now supports Vault secrets backend version 2. The approperate secrets backend will be automatically detected, and cached in the same credentials file as long lived vault tokens mentioned above. For any configurations that worked around KV v2 handling by adding a manual data key to the end of vault lookups, `salt['vault'].read_secret('secret/my/secret')['data']`, these are automatically detected and will continue to function, but will generate a debug log message and can be removed.

The long lived token and secret metadata cache file can be cleared with the new `vault.clear_token_cache` execution function.

33.2.46 Salt 3001.1 Release Notes

Version 3001.1 is a bugfix release for *3001*.

Changed

- Change the `enable_fqdns_grains` setting to default to `False` on Windows to address some issues with slowness. (#56296, #57529)
- Handle the UCRT libraries the same way they are handled in the Python 3 installer (#57594)
- Changes the 'SSDs' grain name to 'ssds' as all grains needs to be resolved in lowered case. (#57612)

Fixed

- When running scheduled jobs from a proxy minion with multiprocessing turned off (default) a recursive error occurs as __pub_fun_args is repeated over and over again in the kwargs element in the data dictionary. Now we make a copy of data['kwargs'] instead of using a reference. (#57941)
- The *x509.certificate_managed* state no longer triggers a change because of sorting issues if the certificate being evaluated was previously generated under Python 2. (#56556)
- Added support to lo ip alias in network.managed state by checking if lo inet data from network.interfaces contains label with the name of managed interface. Return status True if match found. (#56901)
- Redact passwords in the return when setting credentials using `win_iis.container_setting` (#57285)
- Fixes issue with cmd.powershell. Some powershell commands do not return anything in stdout. This causes the JSON parser to fail because an empty string is not valid JSON. This changes an empty string to *{}* which is valid JSON and will not cause the JSON loader to stacktrace. (#57493)
- Improves performance. Profiling *test.ping* on Windows shows that 13 of 17 seconds are wasted when the esxi grain loads vsphere before noting that the OS is not a esxi host. (#57529)
- Fixed permissions issue with certain pip/virtualenv states/modules when configured for non-root user. (#57550)
- Allow running nox sessions either using our nox-py2 fork or upstream nox. (#57583)

- Fixes issue with lgpo.get when there are unicode characters in the hostname (#57591)
- Fixes issue with virtual block devices, like loopbacks and LVMs, wrongly populating the "disks" or "ssds" grains. (#57612)
- Due to some optimization the *virtual* grain was never updated on illumos. Move the fallback in prtdiag output parsing outside the loop that now gets skipped due to the command exiting non-zero. (#57714)
- Grains module delkey and delval methods now support the force option. This is needed for deleting grains with complex (nested) values. (#57718)
- Moving import salt.modules.vsphere into __*virtual*__ so we have access to test proxytype in opts, previously this was causing a traceback when run on proxy minion as __*opts*__ does not exist outside of any functions. Introducing a new utils function, is_proxytype, to check that the device is a proxy minion and also that the proxy type matches. (#57743)
- Fixed fail_with_changes in the test state to use the comment argument when passed. (#57766)
- Adds a fix so salt can run on the latest macOS version Big Sur. (#57787)
- Fixes UnpackValueError when using GPG cache by using atomic open. (#57798)
- The `gid_from_name` argument was removed from the `user.present` state in version 3001, with no deprecation path. It has been restored and put on a proper deprecation path. (#57843)
- Fixes dictionary being changed during iteration. (#57845)

Added

- Added docs demonstrating how to apply an MSI patch with winrepo (#32780)

33.2.47 Salt 3001.2 Release Notes

Version 3001.2 is a CVE fix release for *3001*.

Fixed

- Prevent shell injections in netapi ssh client (cve-2020-16846)
- Prevent creating world readable private keys with the tls execution module. (cve-2020-17490)

33.2.48 Salt 3001.3 Release Notes

Version 3001.3 is a CVE fix release for *3001*.

Fixed

- Properly validate eauth credentials and tokens along with their ACLs. Prior to this change eauth was not properly validated when calling Salt ssh via the salt-api. Any value for 'eauth' or 'token' would allow a user to bypass authentication and make calls to Salt ssh. (CVE-2020-25592)

33.2.49 Salt 3001.4 Release Notes

Version 3001.4 is a bugfix release for *3001*.

Fixed

- Fixes salt-ssh authentication when using tty (#58922)

33.2.50 Salt 3001.5 Release Notes

Version 3001.5 is a CVE fix release for *3001*.

Fixed

- CVE-2020-28243 - Fix local privilege escalation in the restartcheck module.
- CVE-2020-28972 - Ensure authentication to vcenter, vsphere, and esxi server validates the SSL/TLS certificate by default. If you want to skip SSL verification you can use *verify_ssl: False*.
- CVE-2020-35662 - Ensure the asam runner, qingcloud, splunk returner, panos proxy, cimc proxy, zenoss module, esxi module, vsphere module, glassfish module, bigip module, and keystone module validate SSL by default. If you want to skip SSL verification you can use *verify_ssl: False*.
- CVE-2021-3148 - Fix a command injection in the Salt-API when using the Salt-SSH client.
- CVE-2021-3144 - Fix eauth tokens can be used once after expiration
- CVE-2021-25281 - Fix salt-api so it honors eauth credentials for the wheel_async client.
- CVE-2021-25282 - Fix the salt.wheel.pillar_roots.write method so it is not vulnerable to directory traversal.
- CVE-2021-25283 - Fix the jinja render to protect against server side template injection attacks.
- CVE-2021-25284 - Fix cmdmod so it will not log credentials to log levels info and error.
- CVE-2021-3197 - Fix ssh client to remove ProxyCommand from arguments provided by cli and netapi.

33.2.51 Salt 3001.6 Release Notes

Version 3001.6 is a bug fix release for *3001*.

Fixed

- Fix runners that broke when patching for CVE-2021-25281
- Fix issue with runners in SSE

Known Issue

When using the Salt-API with the SSH client some of the SSH options are not working currently and will be fixed in an upcoming bug fix release. We are currently testing and fixing which options still need to be fixed, but have confirmed the following ones do not work in this release: extra-filerefs, pre-flight. This does not impact normal Salt-SSH usage on the cli.

33.2.52 Salt 3001.7 Release Notes

Version 3001.7 is a bug fix release for *3001*.

Fixed

- Allow "extra_filerefs" as sanitized kwargs for SSH client. Fix regression on "cmd.run" when passing tuples as cmd. (#59664)
- Allow all ssh kwargs as sanitized kwargs for SSH client. (#59748)
- Fix argument injection bug in restartcheck.restartcheck. This change hardens the fix for CVE-2020-28243.

33.2.53 Salt 3001.8 (2021-08-20)

Version 3001.8 is a CVE security fix release for *3001*.

Fixed

- Verify the owner of an existing config before trusting it during install. If the owner cannot be verified, back it up and use defaults. (CVE-2021-22004)

Security

- Fix the CVE-2021-31607 vulnerability Additionally, an audit and a tool was put in place, `bandit`, to address similar issues througout the code base, and prevent them. (CVE-2021-31607)
- Ensure that sourced file is cached using its hash name (cve-2021-21996)

33.2.54 Salt 3000 Release Notes - Codename Neon

Security Advisory

For historical reasons, Salt requires PyCrypto as a "lowest common denominator". However, PyCrypto is unmaintained and best practice is to manually upgrade to use a more maintained library such as PyCryptodome. See Issue #52674 and Issue #54115 for more info

New Versioning

The neon release has removed the date versioning. Going forward we will use a non-date based version schema beginning at 3000. The version will be MAJOR.PATCH. For a planned release containing features and/or bug fixes the MAJOR version will be incremented. Please review the approved SEP for further details.

The new versioning scheme is PEP 440 compliant, but distutils.StrictVersion will result in an error `invalid version number`. If using StrictVersion to compare Salt's versions, please use LooseVersion. There is also the packaging library you can use to compare versions. Another alternative is using the *salt version module*

Python 3.8 Not Supported

Please note that running Salt with Python 3.8 is currently not supported. It is recommended to not use a version higher than 3.7.

Vendored Tornado Code Base

The Tornado code base has been included as `salt.ext.tornado`. This was done to provide a consistent version of Tornado across all operating systems while we continue to work on upgrading Tornado to a recent version. New code that uses Tornado should import the module from `salt.ext.tornado` instead of importing the system version of Tornado.

Msgpack 1.0.0rc1 Incompatibility

Salt is currently incompatible with msgpack 1.0.0rc1. We recommend using versions < 1.0.0 . This impacts the Salt Master's ability to run commands against minions. Please see Issue 56007 for more details and updates.

Pip Installing Salt On Windows

This release will not install correctly on windows when using pip to install salt. This issue is addressed in PR 56099. The workaround for this issue is:

```
pip install "pywin32==224" "WMI==1.4.9"
```

Those using the Salt Windows Installer are not affected by this issue.

Saltcheck Updates

Available since 2018.3, the *saltcheck module* has been enhanced to:

- Support saltenv environments
- Associate tests with states by naming convention
- Adds report_highstate_tests function
- Adds empty and notempty assertions
- Adds skip keyword
- Adds print_result keyword
- Adds assertion_section keyword
- Use saltcheck.state_apply to run state.apply for test setup or teardown

- Changes output to display test time
- Works with salt-ssh

Saltcheck provides unittest like functionality requiring only the knowledge of salt module execution and yaml. Saltcheck uses salt modules to return data, then runs an assertion against that return. This allows for testing with all the features included in salt modules.

In order to run state and highstate saltcheck tests, a sub-folder in the state directory must be created and named `saltcheck-tests`. Tests for a state should be created in files ending in `*.tst` and placed in the `saltcheck-tests` folder. `tst` files are run through the salt rendering system, enabling tests to be written in yaml (or renderer of choice), and include jinja, as well as the usual grain and pillar information. Like states, multiple tests can be specified in a `tst` file. Multiple `tst` files can be created in the `saltcheck-tests` folder, and should be named the same as the associated state. The `id` of a test works in the same manner as in salt state files and should be unique and descriptive.

Usage

Example file system layout:

```
/srv/salt/apache/
    init.sls
    config.sls
    saltcheck-tests/
        init.tst
        config.tst
        deployment_validation.tst
```

Tests can be run for each state by name, for all `apache/saltcheck/*.tst` files, or for all states assigned to the minion in top.sls. Tests may also be created with no associated state. These tests will be run through the use of `saltcheck.run_state_tests`, but will not be automatically run by `saltcheck.run_highstate_tests`.

```
salt '*' saltcheck.run_state_tests apache,apache.config
salt '*' saltcheck.run_state_tests apache check_all=True
salt '*' saltcheck.run_highstate_tests
salt '*' saltcheck.run_state_tests apache.deployment_validation
```

Example Tests

```
{# will run the common salt state before further testing #}
setup_test_environment:
  module_and_function: saltcheck.state_apply
  args:
    - common
  pillar-data:
    data: value

{% for package in ["apache2", "openssh"] %}
{# or another example #}
{# for package in salt['pillar.get']("packages") #}
jinja_test_{{ package }}_latest:
```

(continues on next page)

(continued from previous page)

```
  module_and_function: pkg.upgrade_available
  args:
    - {{ package }}
  assertion: assertFalse
{% endfor %}

validate_user_present_and_shell:
  module_and_function: user.info
  args:
    - root
  assertion: assertEqual
  expected-return: /bin/bash
  assertion_section: shell
  print_result: False

skip_test:
  module_and_function: pkg.upgrade_available
  args:
    - apache2
  assertion: assertFalse
  skip: True
```

Output Format Changes

Saltcheck output has been enhanced to display the time taken per test. This results in a change to the output format.

Previous Output:

```
local:
  |_
    ----------
    ntp:
        ----------
        ntp-client-installed:
            Pass
        ntp-service-status:
            Pass
  |_
    ----------
    TEST RESULTS:
        ----------
        Failed:
            0
        Missing Tests:
            0
        Passed:
            2
```

New output:

```
local:
  |_
    ----------
    ntp:
        ----------
        ntp-client-installed:
            ----------
            duration:
                1.0408
            status:
                Pass
        ntp-service-status:
            ----------
            duration:
                1.464
            status:
                Pass
  |_
    ----------
    TEST RESULTS:
        ----------
        Execution Time:
            2.5048
        Failed:
            0
        Missing Tests:
            0
        Passed:
            2
        Skipped:
            0
```

Unless and onlyif Enhancements

The `unless` and `onlyif` requisites can now be operated with salt modules. The dictionary must contain an argument `fun` which is the module that is being run, and everything else must be passed in under the args key or will be passed as individual kwargs to the module function.

Note: Certain states have an `unless`/`onlyif` implementation that predates this feature, and may not work as expected:

- states.git
- states.cmd
- states.macpackage
- states.file
- states.docker_container

Examples:

```
check external ip address:
  http.query:
    - name: https://icanhazip.com
    - status: 200
    - onlyif:
      - fun: file.file_exists
        path: /usr/local/bin/whatever
```

is equivalent to

```
check another ip address:
  http.query:
    - name: https://icanhazip.com
    - status: 200
    - onlyif:
      - test -f /tmp/fnord.txt
```

Another example:

```
set mysql root password:
  debconf.set:
    - name: mysql-server-5.7
    - data:
        'mysql-server/root_password': {'type': 'password', 'value': {{pillar[
↪'mysql.pass']}} }
    - unless:
      - fun: pkg.version
        args:
          - mysql-server-5.7
```

Keystore State and Module

A new `state` and `execution module` for manaing Java Keystore files is now included. It allows for adding/removing/listing as well as managing keystore files.

```
# salt-call keystore.list /path/to/keystore.jks changeit
local:
  |_
    ----------
    alias:
        hostname1
    expired:
        True
    sha1:
        CB:5E:DE:50:57:99:51:87:8E:2E:67:13:C5:3B:E9:38:EB:23:7E:40
    type:
        TrustedCertEntry
    valid_start:
        August 22 2012
    valid_until:
        August 21 2017
```

```
define_keystore:
  keystore.managed:
    - name: /tmp/statestore.jks
    - passphrase: changeit
    - force_remove: True
    - entries:
      - alias: hostname1
        certificate: /tmp/testcert.crt
      - alias: remotehost
        certificate: /tmp/512.cert
        private_key: /tmp/512.key
      - alias: stringhost
        certificate: |
          -----BEGIN CERTIFICATE-----
          MIICEjCCAX
          Hn+GmxZA
          -----END CERTIFICATE-----
```

XML Module

A new state and execution module for editing XML files is now included. Currently it allows for editing values from an xpath query, or editing XML IDs.

```
# salt-call xml.set_attribute /tmp/test.xml ".//actor[@id='3']" editedby
↪"Jane Doe"
local:
    True
# salt-call xml.get_attribute /tmp/test.xml ".//actor[@id='3']"
local:
    ----------
    editedby:
        Jane Doe
    id:
        3
# salt-call xml.get_value /tmp/test.xml ".//actor[@id='2']"
local:
    Liam Neeson
# salt-call xml.set_value /tmp/test.xml ".//actor[@id='2']" "Patrick Stewart"
local:
    True
# salt-call xml.get_value /tmp/test.xml ".//actor[@id='2']"
local:
    Patrick Stewart
```

```
ensure_value_true:
  xml.value_present:
    - name: /tmp/test.xml
    - xpath: .//actor[@id='1']
    - value: William Shatner
```

LGPO Execution Module

Multiple fixes were made to the *win_lgpo* to expand support for additional policies and improve performance. Issues with encoding and unsupported characters (smart-quotes, em-dash, etc) found in the ADML files as well as whitespace in some policies have been addressed.

Speed enhancements include:

- Caching the compiled xml from ADMX/ADML files in `__context__`
- Lowercasing all keys before compiling XML to remove an expensive XPath lookup

Additional functionality:

- Adds the *lgpo.get_policy* function that allows you to get the current settings for a single policy.
- Changes some policy names that were overly long

LGPO State Module

Multiple changes were made to the *win_lgpo* state to improve performance.

It now uses the *lgpo.get_policy* function instead of the *lgpo.get* to avoid reloading all settings on the machine at the beginning and end of each state run.

Supports the new shorter policy names but also attempts to resolve the older, longer policy names.

Win_network Salt Util

Now uses .NET libraries to obtain Interface information on Windows systems that support it. Unsupported systems fall back to the more expensive WMI calls. This is important as this data is gathered for grains and occurs each time a process is forked.

Jinja enhancements

Troubleshooting Jinja map files

A new *execution module* for `map.jinja` troubleshooting has been added.

Assuming the map is loaded in your formula SLS as follows:

```
{% from "myformula/map.jinja" import myformula with context %}
```

The following command can be used to load the map and check the results:

```
salt myminion jinja.load_map myformula/map.jinja myformula
```

The module can be also used to test `json` and `yaml` maps:

```
salt myminion jinja.import_yaml myformula/defaults.yaml

salt myminion jinja.import_json myformula/defaults.json
```

json_query filter

A port of Ansible *json_query* Jinja filter has been added. It allows making queries against JSON data using JMESPath language. Could be used to filter `pillar` data, `yaml` maps, and also useful with *http_query*.

Depends on the jmespath Python module.

Slot Syntax Updates

The slot syntax has been updated to support parsing dictionary responses and to append text.

```
demo dict parsing and append:
  test.configurable_test_state:
    - name: slot example
    - changes: False
    - comment: __slot__:salt:test.arg(shell="/bin/bash").kwargs.shell ~ /
↪appended
```

```
local:
  ----------
        ID: demo dict parsing and append
  Function: test.configurable_test_state
      Name: slot example
    Result: True
   Comment: /bin/bash/appended
   Started: 09:59:58.623575
  Duration: 1.229 ms
   Changes:
```

Also, slot parsing is now supported inside of nested state data structures (dicts, lists, unless/onlyif args):

```
demo slot parsing for nested elements:
  file.managed:
    - name: /tmp/slot.txt
    - source: salt://slot.j2
    - template: jinja
    - context:
        # Slot inside of the nested context dictionary
        variable: __slot__:salt:test.echo(a_value)
    - unless:
      - fun: file.search
        args:
          # Slot as unless argument
          - __slot__:salt:test.echo(/tmp/slot.txt)
          - "DO NOT OVERRIDE"
        ignore_if_missing: True
```

State Changes

- The *`file.symlink`* state was fixed to remove existing file system entries other than files, directories and symbolic links properly.
- The `onchanges` and `prereq` *requisites* now behave properly in test mode, due to removing `pchanges`.
- Added new *`ssh_auth.manage`* state to ensure only the specified ssh keys are present for the specified user.
- Added new *`saltutil`* state to use instead of `module.run` to more easily handle change.

Module Changes

- Added new `boto_ssm` module to set and query secrets in AWS SSM parameters.
- Added new `flatpak` module to work with flatpak packages.
- The *`file.remove`* module was fixed to remove file system entries other than files, directories and symbolic links properly.
- The *`debian_ip`* module used by the *`network.managed`* state has been heavily refactored. The order that options appear in inet/inet6 blocks may produce cosmetic changes. Many options without an 'ipvX' prefix will now be shared between inet and inet6 blocks. The options `enable_ipv4` and `enabled_ipv6` will now fully remove relevant inet/inet6 blocks. Overriding options by prefixing them with 'ipvX' will now work with most options (i.e. `dns` can be overridden by `ipv4dns` or `ipv6dns`). The `proto` option is now required.

Enhancements to Engines

Multiple copies of a particular Salt engine can be configured by including the `engine_module` parameter in the engine configuration.

```
engines:
  - production_logstash:
      host: production_log.my_network.com
      port: 5959
      proto: tcp
      engine_module: logstash
  - develop_logstash:
      host: develop_log.my_network.com
      port: 5959
      proto: tcp
      engine_module: logstash
```

- A new `fluent engine` has been added to export Salt events to fluentd.

  ```
  engines:
    - fluent
        host: localhost
        port: 24224
  ```

  ```
  <source>
    @type forward
    port 24224
  </source>
  <match saltstack.**>
  ```

(continues on next page)

(continued from previous page)

```
  @type file
  path /var/log/td-agent/saltstack
</match>
```

Enhancements to Beacons

Multiple copies of a particular Salt beacon can be configured by including the `beacon_module` parameter in the beacon configuration.

```
beacons:
  watch_importand_file:
    - files:
        /etc/important_file: {}
    - beacon_module: inotify
  watch_another_file:
    - files:
        /etc/another_file: {}
    - beacon_module: inotify
```

Enhancements to chroot

- New functions added to chroot *`apply`*, *`sls`*, and *`highstate`* that allow executing states in sls files or running apply/highstate inside of a chroot.

Minion-side ACL

Salt has had master-side ACL for the salt mine for some time, where the master configuration contained *mine_get* that specified which minions could request which functions. However, now you can specify which minions can access a function in the salt mine function definition itself (or when calling *`mine.send`*). This targeting works the same as the generic minion targeting as specified *here*. The parameters used are `allow_tgt` and `allow_tgt_type`. See also *the documentation of the Salt Mine*. Please note that if you want to use this new feature both your minion and masters will need to be on atleast version 3000.

Deprecations

Raet Deprecated

- The Raet transport has been deprecated. Please use the supported transport protocols tcp or zeromq.

Module Deprecations

- The hipchat module has been removed due to the service being retired. `Google Chat`, `MS Teams`, or *`Slack`* may be suitable replacements.
- The `dockermod` module has been changed as follows:
  - Support for the `tags` kwarg has been removed from the `dockermod.resolve_tag` function.
  - Support for the `network_id` kwarg has been removed from the `dockermod.connect_container_to_network` function. Please use `net_id` instead.
  - Support for the `name` kwarg has been removed from the `dockermod.sls_build` function. Please use `repository` and `tag` instead.
  - Support for the `image` kwarg has been removed from the following functions. In all cases, please use both the `repository` and `tag` options instead:
    - `dockermod.build`
    - `dockermod.commit`
    - `dockermod.import`
    - `dockermod.load`
    - `dockermod.tag`
- The heat module has removed the `enviroment` kwarg from the `heat.create_stack` and `heat.update_stack` functions due to a spelling error. Please use `environment` instead.
- The *`ssh`* execution module has been changed as follows:
  - Support for the `ssh.get_known_host` function has been removed. Please use the *`ssh.get_known_host_entries`* function instead.
  - Support for the `ssh.recv_known_host` function has been removed. Please use the *`ssh.recv_known_host_entries`* function instead.
- The :py:mod`firewalld <salt.modules.firewalld>` module has been changed as follows:
  - The default setting for the `force_masquerade` option in the `firewalld.add_port <salt.module.firewalld.add_port()` function has changed from `True` to `False`.
  - Support for the `force_masquerade` option in the `firewalld.add_port_fwd <salt.module.firewalld.add_port_fwd()` function has been changed from `True` to `False`.

State Deprecations

- The hipchat state has been removed due to the service being retired. `MS Teams` or `Slack` may be suitable replacements.
- The cmd state module has removed the `quiet` kwarg from the *`cmd.run`* function. Please set `output_loglevel` to `quiet` instead.
- The heat state module has removed the `enviroment` kwarg from the `heat.deployed` function due to a spelling error. Please use `environment` instead.
- The :py:mod`firewalld <salt.states.firewalld>` state has been changed as follows:
  - The default setting for the `prune_services` option in the *`firewalld.present`* function has changed from `True` to `False`.

Fileserver Deprecations

- The hgfs fileserver had the following config options removed:
  - The `hgfs_env_whitelist` config option has been removed in favor of `hgfs_saltenv_whitelist`.
  - The `hgfs_env_blacklist` config option has been removed in favor of `hgfs_saltenv_blacklist`.
- The svnfs fileserver had the following config options removed:
  - The `svnfs_env_whitelist` config option has been removed in favor of `svnfs_saltenv_whitelist`.
  - The `svnfs_env_blacklist` config option has been removed in favor of `svnfs_saltenv_blacklist`.
- The gitfs fileserver had the following config options removed:
  - The `gitfs_env_whitelist` config option has been removed in favor of `gitfs_saltenv_whitelist`.
  - The `gitfs_env_blacklist` config option has been removed in favor of `gitfs_saltenv_blacklist`.

Engine Removal

- The hipchat engine has been removed due to the service being retired. For users migrating to Slack, the `slack` engine may be a suitable replacement.

Returner Removal

- The hipchat returner has been removed due to the service being retired. For users migrating to Slack, the `slack` returner may be a suitable replacement.

Grain Deprecations

For `smartos` some grains have been deprecated. These grains have been removed.

- The `hypervisor_uuid` has been replaced with `mdata:sdc:server_uuid` grain.
- The `datacenter` has been replaced with `mdata:sdc:datacenter_name` grain.

Cloud Deprecations

- The nova cloud driver has been removed in favor of the openstack cloud driver.

Jinja Filter Deprecations

- The following jinja filters are set to be removed in the 3003 release:
    - `json_decode_dict` in favor of `tojson`
    - `json_decode_list` in favor of `tojson`

Utils Deprecations

- All of the functions in salt.utils.__init__.py have been removed. These include:
    - *salt.utils.option*
    - *salt.utils.required_module_list*
    - *salt.utils.required_modules_error*
    - *salt.utils.get_accumulator_dir*. Please use `salt.state.get_accumulator_dir()` instead.
    - *salt.utils.fnmatch_multiple*. Please use `salt.utils.itertools.fnmatch_multiple()` instead.
    - *salt.utils.appendproctitle*. Please use `salt.utils.process.appendproctitle()` instead.
    - *salt.utils.daemonize*. Please use `salt.utils.process.daemonize()` instead.
    - *salt.utils.daemonize_if*. Please use `salt.utils.process.daemonize_if()` instead.
    - *salt.utils.reinit_crypto*. Please use `salt.utils.crypt.reinit_crypto()` instead.
    - *salt.utils.pem_finger*. Please use `salt.utils.crypt.pem_finger()` instead.
    - *salt.utils.to_bytes*. Please use `salt.utils.stringutils.to_bytes()` instead.
    - *salt.utils.to_str*. Please use `salt.utils.stringutils.to_str()` instead.
    - *salt.utils.to_unicode*. Please use `salt.utils.stringutils.to_unicode()` instead.
    - *salt.utils.str_to_num*. Please use `salt.utils.stringutils.to_num()` instead.
    - *salt.utils.is_quoted*. Please use `salt.utils.stringutils.is_quoted()` instead.
    - *salt.utils.dequote*. Please use `salt.utils.stringutils.dequote()` instead.
    - *salt.utils.is_hex*. Please use `salt.utils.stringutils.is_hex()` instead.
    - *salt.utils.is_bin_str*. Please use `salt.utils.stringutils.is_binary()` instead.
    - *salt.utils.rand_string*. Please use `salt.utils.stringutils.random()` instead.
    - *salt.utils.contains_whitespace*. Please use `salt.utils.stringutils.contains_whitespace()` instead.
    - *salt.utils.build_whitespace_split_regex*. Please use `salt.utils.stringutils.build_whitespace_split_regex()` instead.
    - *salt.utils.expr_match*. Please use `salt.utils.stringutils.expr_match()` instead.
    - *salt.utils.check_whitelist_blacklist*. Please use `salt.utils.stringutils.check_whitelist_blacklist()` instead.
    - *salt.utils.check_include_exclude*.Please use `salt.utils.stringutils.check_include_exclude()` instead.
    - *salt.utils.print_cli*.Please use `salt.utils.stringutils.print_cli()` instead.

- *salt.utils.clean_kwargs.*Please use `salt.utils.args.clean_kwargs()` instead.
- *salt.utils.invalid_kwargs.*Please use `salt.utils.args.invalid_kwargs()` instead.
- *salt.utils.shlex_split.*Please use `salt.utils.args.shlex_split()` instead.
- *salt.utils.arg_lookup.*Please use `salt.utils.args.arg_lookup()` instead.
- *salt.utils.argspec_report.*Please use `salt.utils.args.argspec_report()` instead.
- *salt.utils.split_input.*Please use `salt.utils.args.split_input()` instead.
- *salt.utils.test_mode.*Please use `salt.utils.args.test_mode()` instead.
- *salt.utils.format_call.*Please use `salt.utils.args.format_call()` instead.
- *salt.utils.which.*Please use `salt.utils.path.which()` instead.
- *salt.utils.which_bin.*Please use `salt.utils.path.which_bin()` instead.
- *salt.utils.path_join.*Please use `salt.utils.path.join()` instead.
- *salt.utils.check_or_die.*Please use `salt.utils.path.check_or_die()` instead.
- *salt.utils.sanitize_win_path_string.*Please use `salt.utils.path.sanitize_win_path()` instead.
- *salt.utils.rand_str.*Please use `salt.utils.hashutils.random_hash()` instead.
- *salt.utils.get_hash.*Please use `salt.utils.hashutils.get_hash()` instead.
- *salt.utils.is_windows.*Please use `salt.utils.platform.is_windows()` instead.
- *salt.utils.is_proxy.*Please use `salt.utils.platform.is_proxy()` instead.
- *salt.utils.is_linux.*Please use `salt.utils.platform.is_linux()` instead.
- *salt.utils.is_darwin.*Please use `salt.utils.platform.is_darwin()` instead.
- *salt.utils.is_sunos.*Please use `salt.utils.platform.is_sunos()` instead.
- *salt.utils.is_smartos.*Please use `salt.utils.platform.is_smartos()` instead.
- *salt.utils.is_smartos_globalzone.*Please use `salt.utils.platform.is_smartos_globalzone()` instead.
- *salt.utils.is_smartos_zone.*Please use `salt.utils.platform.is_smartos_zone()` instead.
- *salt.utils.is_freebsd.*Please use `salt.utils.platform.is_freebsd()` instead.
- *salt.utils.is_netbsd.*Please use `salt.utils.platform.is_netbsd()` instead.
- *salt.utils.is_openbsd.*Please use `salt.utils.platform.is_openbsd()` instead.
- *salt.utils.is_aix.*Please use `salt.utils.platform.is_aix()` instead.
- *salt.utils.safe_rm.*Please use `salt.utils.files.safe_rm()` instead.
- *salt.utils.is_empty.*Please use `salt.utils.files.is_empty()` instead.
- *salt.utils.fopen.*Please use `salt.utils.files.fopen()` instead.
- *salt.utils.flopen.*Please use `salt.utils.files.flopen()` instead.
- *salt.utils.fpopen.*Please use `salt.utils.files.fpopen()` instead.
- *salt.utils.rm_rf.*Please use `salt.utils.files.rm_rf()` instead.
- *salt.utils.mkstemp.*Please use `salt.utils.files.mkstemp()` instead.
- *salt.utils.istextfile.*Please use `salt.utils.files.is_text_file()` instead.

  - *salt.utils.is_bin_file*.Please use `salt.utils.files.is_binary()` instead.
  - *salt.utils.list_files*.Please use `salt.utils.files.list_files()` instead.
  - *salt.utils.safe_walk*.Please use `salt.utils.files.safe_walk()` instead.
  - *salt.utils.st_mode_to_octal*.Please use `salt.utils.files.st_mode_to_octal()` instead.
  - *salt.utils.normalize_mode*.Please use `salt.utils.files.normalize_mode()` instead.
  - *salt.utils.human_size_to_bytes*.Please use `salt.utils.files.human_size_to_bytes()` instead.
  - *salt.utils.backup_minion*.Please use `salt.utils.files.backup_minion()` instead.
  - *salt.utils.str_version_to_evr*.Please use `salt.utils.pkg.rpm.version_to_evr()` instead.
  - *salt.utils.parse_docstring*.Please use `salt.utils.doc.parse_docstring()` instead.
  - *salt.utils.compare_versions*.Please use `salt.utils.versions.compare()` instead.
  - *salt.utils.version_cmp*.Please use `salt.utils.versions.version_cmp()` instead.
  - *salt.utils.warn_until*.Please use `salt.utils.versions.warn_until()` instead.
  - *salt.utils.kwargs_warn_until*.Please use `salt.utils.versions.kwargs_warn_until()` instead.
  - *salt.utils.get_color_theme*.Please use `salt.utils.color.get_color_theme()` instead.
  - *salt.utils.get_colors*.Please use `salt.utils.color.get_colors()` instead.
  - *salt.utils.gen_state_tag*.Please use `salt.utils.state.gen_tag()` instead.
  - *salt.utils.search_onfail_requisites*.Please use `salt.utils.state.search_onfail_requisites()` instead.
  - *salt.utils.check_onfail_requisites*.Please use `salt.utils.state.check_onfail_requisites()` instead.
  - *salt.utils.check_state_result*.Please use `salt.utils.state.check_result()` instead.
  - *salt.utils.get_user*.Please use `salt.utils.user.get_user()` instead.
  - *salt.utils.get_uid*.Please use `salt.utils.user.get_uid()` instead.
  - *salt.utils.get_specific_user*.Please use `salt.utils.user.get_specific_user()` instead.
  - *salt.utils.chugid*.Please use `salt.utils.user.chugid()` instead.
  - *salt.utils.chugid_and_umask*.Please use `salt.utils.user.chugid_and_umask()` instead.
  - *salt.utils.get_default_group*.Please use `salt.utils.user.get_default_group()` instead.
  - *salt.utils.get_group_list*.Please use `salt.utils.user.get_group_list()` instead.
  - *salt.utils.get_group_dict*.Please use `salt.utils.user.get_group_dict()` instead.
  - *salt.utils.get_gid_list*.Please use `salt.utils.user.get_gid_list()` instead.
  - *salt.utils.get_gid*.Please use `salt.utils.user.get_gid()` instead.
  - *salt.utils.enable_ctrl_logoff_handler*.Please use `salt.utils.win_functions.enable_ctrl_logoff_handler()` instead.
  - *salt.utils.traverse_dict*.Please use `salt.utils.data.traverse_dict()` instead.
  - *salt.utils.traverse_dict_and_list*.Please use `salt.utils.data.traverse_dict_and_list()` instead.

  - *salt.utils.filter_by*.Please use `salt.utils.data.filter_by()` instead.
  - *salt.utils.subdict_match*.Please use `salt.utils.data.subdict_match()` instead.
  - *salt.utils.substr_in_list*.Please use `salt.utils.data.substr_in_list()` instead.
  - *salt.utils.is_dictlist*.Please use `salt.utils.data.is_dictlist()` instead.
  - *salt.utils.repack_dictlist*.Please use `salt.utils.data.repack_dictlist()` instead.
  - *salt.utils.compare_dicts*.Please use `salt.utils.data.compare_dicts()` instead.
  - *salt.utils.compare_lists*.Please use `salt.utils.data.compare_lists()` instead.
  - *salt.utils.decode_dict*.Please use `salt.utils.data.encode_dict()` instead.
  - *salt.utils.decode_list*.Please use `salt.utils.data.encode_list()` instead.
  - *salt.utils.exactly_n*.Please use `salt.utils.data.exactly_n()` instead.
  - *salt.utils.exactly_one*.Please use `salt.utils.data.exactly_one()` instead.
  - *salt.utils.is_list*.Please use `salt.utils.data.is_list()` instead.
  - *salt.utils.is_iter*.Please use `salt.utils.data.is_iter()` instead.
  - *salt.utils.isorted*.Please use `salt.utils.data.sorted_ignorecase()` instead.
  - *salt.utils.is_true*.Please use `salt.utils.data.is_true()` instead.
  - *salt.utils.mysql_to_dict*.Please use `salt.utils.data.mysql_to_dict()` instead.
  - *salt.utils.simple_types_filter*.Please use `salt.utils.data.simple_types_filter()` instead.
  - *salt.utils.ip_bracket*.Please use `salt.utils.zeromq.ip_bracket()` instead.
  - *salt.utils.gen_mac*.Please use `salt.utils.network.gen_mac()` instead.
  - *salt.utils.mac_str_to_bytes*.Please use `salt.utils.network.mac_str_to_bytes()` instead.
  - *salt.utils.refresh_dns*.Please use `salt.utils.network.refresh_dns()` instead.
  - *salt.utils.dns_check*.Please use `salt.utils.network.dns_check()` instead.
  - *salt.utils.get_context*.Please use `salt.utils.stringutils.get_context()` instead.
  - *salt.utils.get_master_key*.Please use `salt.utils.master.get_master_key()` instead.
  - *salt.utils.get_values_of_matching_keys*.Please use `salt.utils.master.get_values_of_matching_keys()` instead.
  - *salt.utils.date_cast*.Please use `salt.utils.dateutils.date_cast()` instead.
  - *salt.utils.date_format*.Please use `salt.utils.dateutils.strftime()` instead.
  - *salt.utils.total_seconds*.Please use `salt.utils.dateutils.total_seconds()` instead.
  - *salt.utils.find_json*.Please use `salt.utils.json.find_json()` instead.
  - *salt.utils.import_json*.Please use `salt.utils.json.import_json()` instead.
  - *salt.utils.namespaced_function*.Please use `salt.utils.functools.namespaced_function()` instead.
  - *salt.utils.alias_function*.Please use `salt.utils.functools.alias_function()` instead.
  - *salt.utils.profile_func*.Please use `salt.utils.profile.profile_func()` instead.
  - *salt.utils.activate_profile*.Please use `salt.utils.profile.activate_profile()` instead.
  - *salt.utils.output_profile*.Please use `salt.utils.profile.output_profile()` instead.

salt.auth.Authorize Class Removal

- The salt.auth.Authorize Class inside of the *salt/auth/__init__.py* file has been removed and the *any_auth* method inside of the file *salt/utils/minions.py*. These method and classes were not being used inside of the salt code base.

33.2.55 Salt 3000.1 Release Notes

Version 3000.1 is a bugfix release for *3000*.

Statistics

- Total Merges: **53**
- Total Issue References: **15**
- Total PR References: **54**
- Contributors: **16** (Ch3LL, UtahDave, bryceml, cmcmarrow, dwoz, frogunder, garethgreenaway, lorengordon, mchugh19, oeuftete, raddessi, s0undt3ch, sjorge, terminalmage, twangboy, waynew)

Changelog for v3000..v3000.1

Generated at: 2020-03-27 16:48:41 UTC

- **PR** #56455: (s0undt3ch) Fix gitpython windows requirement @ *2020-03-27 16:31:57 UTC*
  - c5a700e01e Merge pull request #56455 from s0undt3ch/hotfix/gitpython
  - d9791c393f Revert and fix windows requirements
  - 4b573c1c94 Revert "Fix win deps"
- **PR** #56446: (frogunder) 3000.1 releasenotes updates @ *2020-03-24 20:28:23 UTC*
  - 7ba36325d9 Merge pull request #56446 from frogunder/releasenotes_3000.1_updates
  - 6b47f474af 3000.1 releasenotes updates
- **PR** #56435: (twangboy) Update mac build scripts @ *2020-03-24 19:47:40 UTC*
  - 4d2bc7004d Merge pull request #56435 from twangboy/update_mac_build_scripts
  - 5d244b0aa6 Merge branch 'master' into update_mac_build_scripts
  - 8fdf52a243 Update gitpython to 2.1.15
  - afcedc5232 Remove --ignore-installed
  - e6cc2a6192 Separate pyobjc requirements
  - 262ad2e98a Compile static requirements
  - 224f72d0f2 Update noxfile and .precommit
  - 68a36f2e37 Add req_ext.txt
  - 5851a5c2cd Roll back changes, fix dependencies
- **ISSUE** #56433: (Ch3LL) integration.states.test_pip_state.PipStateTest.test_pip_installed_specific_env failing on MAC (refs: #56436)

- **PR** #56436: (Ch3LL) Fix #56433 - test_pip_installed_specific_env @ *2020-03-24 19:47:20 UTC*
  - 8a8ae8ebe4 Merge pull request #56436 from Ch3LL/pip_custom_pypi
  - 55655ff96c Merge branch 'master' into pip_custom_pypi
- **PR** #56423: (Ch3LL) Update changelog with package fixes @ *2020-03-24 16:42:17 UTC*
  - 3a993d73a9 Merge pull request #56423 from Ch3LL/changelog_again
  - 963c16e1a7 update pr number for mac build changes in changelog
  - 83e22b77c7 Update changelog with package fixes
- **PR** #56417: (twangboy) Update mac build scripts @ *2020-03-23 18:45:34 UTC*
  - d2a5bd8add Merge pull request #56417 from twangboy/update_mac_build_scripts
  - 3bda8ddb82 Update noxfile and pre-commit
  - de58c52d66 Merge branch 'update_mac_build_scripts' of https://github.com/twangboy/salt into update_mac_build_scripts
    - e7f08d5349 Update static requirements
    - a53977de5b Merge branch 'update_mac_build_scripts' of github.com:twangboy/salt into update_mac_build_scripts
    - 04e5cde9dd *pkg/osx/req_ext.txt* no longer exists
    - be4a272d07 Update static requirements
  - 02dfe4119c Add pyobjc in its own requirements file
  - 6b2ac2be64 Remove pyobjc, enforce pip install location
  - 30ca5d04ec Remove cryptography, it gets installed by pyopenssl
  - fda8abf4a8 Update static requirements
  - 732ecc83c1 Update pre-commit config
  - 1fa9864e3d Don't set a version for pyopenssl
  - 461b198978 Update dependencies, remove req_ext.txt
- **PR** #56418: (Ch3LL) Ensure version.py included before we install @ *2020-03-23 18:27:46 UTC*
  - 74575a6993 Merge pull request #56418 from Ch3LL/egg_version
  - 85d7c784ef Fix integration setup egg test
  - a8a22a4040 Ensure version.py included before we install
  - 86fe450c82 Fix #56433 - test_pip_installed_specific_env
- **PR** #56403: (frogunder) update 3000.1 releasenotes @ *2020-03-17 23:50:21 UTC*
  - 249367b462 Merge pull request #56403 from frogunder/update_releasenotes_3000.1
  - 9d972c96e8 update 3000.1 releasenotes
- **PR** #56398: (Ch3LL) Add additional PRs to 3000.1 changelog @ *2020-03-17 18:08:15 UTC*
  - 0de5c1e136 Merge pull request #56398 from Ch3LL/change_3000.1
  - 79c337b3db Add additional PRs to 3000.1 changelog
- **PR** #56376: (twangboy) Fix win deps @ *2020-03-17 17:02:46 UTC*
  - 5ac09decb9 Merge pull request #56376 from twangboy/fix_win_deps

  - 6c83beeb9e Fix win deps
- **PR** #56378: (Ch3LL) Include _version.py if building wheel @ *2020-03-17 17:01:33 UTC*
  - e72a8d2cbc Merge pull request #56378 from Ch3LL/wheel_version
  - 22cccd2107 Use virtualenv test helper that already exists and fix setup.py
  - 293b1fddf2 cleanup code
  - ddfb065bfb add bdist_wheel test
  - fceff0287c ensure name is included in new version
  - 0cbf6d3246 Ensure SaltStackVersion attributes in _version.py correct
  - 39cdf5382d Include _version.py if building wheel
- **PR** #56387: (bryceml) update gpg key expiration date @ *2020-03-17 16:59:30 UTC*
  - 6a9326fb70 Merge pull request #56387 from bryceml/update_gpg_key
  - b74b26ccf3 update gpg key expiration date
- **PR** #55822: (cmcmarrow) fix_Indefinitely_code @ *2020-03-16 17:34:11 UTC*
  - fcee692c4a Merge pull request #55822 from cmcmarrow/win_task_repeat
  - e257fb2804 Merge branch 'master' into win_task_repeat
  - 07cada0f8f Merge branch 'master' into win_task_repeat
  - 4b80301338 Merge branch 'master' into win_task_repeat
  - 9df94569c4 Merge branch 'master' into win_task_repeat
  - 22a2d0b9ec Merge branch 'master' into win_task_repeat
  - dee9c134e7 Merge branch 'master' into win_task_repeat
  - beaf05d514 Update test_win_task.py
  - 6e923f75fc Merge branch 'master' into win_task_repeat
  - 5839da81ee add test
  - 2aa6338ed0 fix Indefinitely code
- **PR** #56373: (frogunder) update 3000.1 releasenotes @ *2020-03-13 18:58:43 UTC*
  - c11ef89200 Merge pull request #56373 from frogunder/releasenotes_3000.1
  - a5ca8b5277 Fix doc test errors
  - 47e483187e update 3000.1 releasenotes
- **PR** #56365: (Ch3LL) Update 3000.1 changelog @ *2020-03-13 17:21:02 UTC*
  - 62857a9f0e Merge pull request #56365 from Ch3LL/changelog_3000.1
  - 851d7d8fc7 Update 3000.1 changelog
- **PR** #56360: (Ch3LL) Use virtualenv 20.0.10 for macosx tests @ *2020-03-13 16:39:57 UTC*
  - a660e96fb2 Merge pull request #56360 from Ch3LL/mac_virtual
  - abda125086 Update static requirements files
  - dca3390c0c skip zcbuildout state test when virtualenv 20.0.0
  - fdeae1f0e1 Use virtualenv 20.0.10 for macosx tests

- **ISSUE** #56324: (kiemlicz) Cannot use Saltcheck module (refs: #56327)
- **PR** #56327: (mchugh19) keep cache_copied_files variable a list @ *2020-03-13 16:39:32 UTC*
  - d8fc07274c Merge pull request #56327 from mchugh19/56324
  - e1e2df2b1d Merge branch 'master' into 56324
  - 6d7572706d use includes for saltcheck integration test
  - 5b7073b01d keep cache_copied_files variable a list
- **PR** #56023: (cmcmarrow) add fix for bin_env @ *2020-03-13 16:39:09 UTC*
  - 2d31d61ab9 Merge pull request #56023 from cmcmarrow/binary_fix_pip_bin_env
  - f780fd013e Merge branch 'master' into binary_fix_pip_bin_env
  - d642c7c270 Merge branch 'master' into binary_fix_pip_bin_env
  - 82b39d26f8 Merge branch 'binary_fix_pip_bin_env' of https://github.com/cmcmarrow/salt into binary_fix_pip_bin_env
    - a5fa22528a Merge branch 'master' into binary_fix_pip_bin_env
  - 10ca0fa5d6 fix space
  - 22fff6c180 fix _pip_bin_env
  - d5425e6630 Merge branch 'master' into binary_fix_pip_bin_env
  - ceda3fde00 add full support for when missing kwargs or args
  - cf4ab215b5 add fix for bin_env
- **PR** #56310: (twangboy) Only process ADMX files when loading policies @ *2020-03-11 23:47:50 UTC*
  - 19bb6aae0c Merge pull request #56310 from twangboy/fix_lgpo_admx
  - 4bc5b05586 Fix some lint
  - ce282f9754 Mark destructive test
  - 8af09c31ca Add test case
  - 547d35cf4c Only process ADMX files when loading policies
- **PR** #56272: (twangboy) Properly resolve the policy name @ *2020-03-11 22:11:02 UTC*
  - 2d78931eaf Merge pull request #56272 from twangboy/fix_lgpo_names
  - 233ed12472 Add comments to helper function
  - a7369e41d7 Remove redundent code... some more
  - 1db3052b94 Consolidate duplicate code
  - b25b56299d Fix failing PY2 tests
  - 36a24ac28f Only load adml data once
  - bc13be6850 Add some tests
  - 2e9be6e461 Properly resolve the policy name
- **PR** #56358: (s0undt3ch) Fix version instantiation when minor is an empty string @ *2020-03-11 22:10:04 UTC*
  - c6c6e2e3d9 Merge pull request #56358 from s0undt3ch/hotfix/version-parsing
  - cb22e78502 Fix version instantiation when minor is an empty string

- **PR** #56160: (twangboy) Fix issue with existing reg_dword entries @ *2020-03-11 22:09:21 UTC*
  - b33047c574 Merge pull request #56160 from twangboy/fix_reg_dword
  - 80650c2a8c Make test more explicit
  - 67dd1c18c7 Fix issue with existing reg_dword entries
- **PR** #56337: (twangboy) Handle Adapter Type 53 and Undefined Types @ *2020-03-11 22:08:19 UTC*
  - 8f23706871 Merge pull request #56337 from twangboy/fix_win_network_type
  - 18a31a0b22 Merge branch 'master' into fix_win_network_type
  - d92914ad91 Merge branch 'master' into fix_win_network_type
  - 224629bdeb Handle Adapter Type 53 and Undefined Types
- **PR** #56060: (twangboy) Fix regex string for **Del and **DelVals @ *2020-03-11 22:05:43 UTC*
  - e551ff6a31 Merge pull request #56060 from twangboy/fix_lgpo_regex
  - ca260ef582 Use byte-strings in the test
  - 7c81874a5b Add some tests
  - 944b022f33 Fix regex string for **Del and **DelVals
- **ISSUE** #56131: (thusoy) Salt v3000 crashes with unless clause if pip is missing (refs: #56215)
- **PR** #56215: (dwoz) Fix for unless requisite when pip is not installed @ *2020-03-11 22:04:30 UTC*
  - c9bc9431c1 Merge pull request #56215 from dwoz/issue-56131
  - 5dd8f8eabe Fix linter
  - 7492c2f7c7 Remove crufty prints from test
  - 8ceaa6e6f3 Only remove pip relasted modules
  - 69b21e5e68 Add regression test for issue 56131
  - 9d23f55adc Fix for unless requisite when pip is not installed
- **PR** #56339: (twangboy) Fix win_dns_client when used with scheduler @ *2020-03-11 22:01:32 UTC*
  - 74b67ea741 Merge pull request #56339 from twangboy/fix_win_dns_client
  - d6a4fbe85d Fix bad test (lint)
  - 47bd67373f Add some tests
  - 995975649a Add missing import, improve docs
- **ISSUE** #56288: (lorengordon) win_lgpo: *lgpo.set* with secedit policy always generates *KeyError: u'lgpo.secedit_data'* (refs: #56290)
- **PR** #56290: (lorengordon) Ensures popping lgpo.secedit_data does not throw KeyError @ *2020-03-11 17:27:04 UTC*
  - 7701e8762d Merge pull request #56290 from lorengordon/pop-secdata
  - 62453bb6ce Merge branch 'master' into pop-secdata
  - 95d5cea9ff Merge branch 'master' into pop-secdata
  - 2979158a8b Tests the *if _secedits:* logic path in *lgpo.set_*
  - d1f776178c Ensures popping lgpo.secedit_data does not throw KeyError
- **ISSUE** #56119: (finalduty) Release notes for v3000 do not mention changes to *slspath* variable (refs: #56341)

- **PR** #56341: (dwoz) Revert "Don't remove one directory level from slspath" @ *2020-03-11 17:03:33 UTC*
  - 84c60708cd Merge pull request #56341 from dwoz/issue-56119
  - afe6e84c36 Clarify slspath documentation
  - 6dfc098fd1 Add debug for test asserts
  - 9fa9dab8b2 Fix linter warts
  - fd702bdd44 Add regression test for #56119
  - 3d3b673cec Revert "Don't remove one directory level from slspath"
- **PR** #56185: (terminalmage) Fix regression in service states with reload argument @ *2020-03-11 16:45:58 UTC*
  - 4f9813a49c Merge pull request #56185 from terminalmage/issue56167
  - 65b3f4c9a0 Merge branch 'master' into issue56167

  - 95d46d6cc8 #55185 pdbedit module should check for version 4.8.x or newer

33.2.56 Salt 3000.2 Release Notes

Version 3000.2 is a CVE-fix release for *3000*.

Security Fix

CVE-2020-11651

An issue was discovered in SaltStack Salt before 2019.2.4 and 3000 before 3000.2. The salt-master process ClearFuncs class does not properly validate method calls. This allows a remote user to access some methods without authentication. These methods can be used to retrieve user tokens from the salt master and/or run arbitrary commands on salt minions.

CVE-2020-11652

An issue was discovered in SaltStack Salt before 2019.2.4 and 3000 before 3000.2. The salt-master process ClearFuncs class allows access to some methods that improperly sanitize paths. These methods allow arbitrary directory access to authenticated users.

Known Issue

Part of the fix for CVE-2020-11651 added better validation of the methods allowed to be called by remote clients. Both AESFuncs and ClearFuncs now have an explicit list of methods that can be called. The name of one of these whitlisted methods on AESFuncs had a typo. The _minion_runner method should be minion_runner (without the underscore prefix). This typo breaks the publish module's runner method. Calling runners, for example:

```
salt minion publish.runner manage.down
```

Will not work, and you will receive and empty reply from the salt master.

This will be addressed in the 3001 release of Salt set for mid-June 2020.

33.2.57 Salt 3000.3 Release Notes

Version 3000.3 is a bug-fix release for *3000*.

Changelog for v3000.2..v3000.3

Generated at: 2020-05-06 02:53:12 UTC

- **PR** #57097: (frogunder) Update man_pages 3000.3 @ *2020-05-05 22:13:09 UTC*
- **ISSUE** #57027: (ecarson) [BUG] Master running 2019.2.4 or 3000.2 unable to synchronize files using saltutil.sync_all to 2017.7.1 minion due to CVE fix (refs: #57100)
- **ISSUE** #57016: (idontwanttosignin) [BUG] Requested method not exposed: minion_runner (refs: #57100)
- **PR** #57100: (dwoz) Address Issues in CVE Release @ *2020-05-05 22:09:25 UTC*

33.2.58 Salt 3000.4 Release Notes

Version 3000.4 is a CVE fix release for *3000*.

Fixed

- Prevent shell injections in netapi ssh client (cve-2020-16846)
- Prevent creating world readable private keys with the tls execution module. (cve-2020-17490)

33.2.59 Salt 3000.5 Release Notes

Version 3000.5 is a CVE fix release for *3000*.

Fixed

- Properly validate eauth credentials and tokens along with their ACLs. Prior to this change eauth was not properly validated when calling Salt ssh via the salt-api. Any value for 'eauth' or 'token' would allow a user to bypass authentication and make calls to Salt ssh. (CVE-2020-25592)

33.2.60 Salt 3000.6 Release Notes

Version 3000.6 is a bugfix release for *3000*.

Fixed

- Fixes salt-ssh authentication when using tty (#58922)

33.2.61 Salt 3000.7 Release Notes

Version 3000.7 is a CVE fix release for *3000*.

Fixed

- CVE-2020-28243 - Fix local privilege escalation in the restartcheck module.
- CVE-2020-28972 - Ensure authentication to vcenter, vsphere, and esxi server validates the SSL/TLS certificate by default. If you want to skip SSL verification you can use *verify_ssl: False*.
- CVE-2020-35662 - Ensure the asam runner, qingcloud, splunk returner, panos proxy, cimc proxy, zenoss module, esxi module, vsphere module, glassfish module, bigip module, and keystone module validate SSL by default. If you want to skip SSL verification you can use *verify_ssl: False*.
- CVE-2021-3148 - Fix a command injection in the Salt-API when using the Salt-SSH client.
- CVE-2021-3144 - Fix eauth tokens can be used once after expiration
- CVE-2021-25281 - Fix salt-api so it honors eauth credentials for the wheel_async client.
- CVE-2021-25282 - Fix the salt.wheel.pillar_roots.write method so it is not vulnerable to directory traversal.
- CVE-2021-25283 - Fix the jinja render to protect against server side template injection attacks.
- CVE-2021-25284 - Fix cmdmod so it will not log credentials to log levels info and error.
- CVE-2021-3197 - Fix ssh client to remove ProxyCommand from arguments provided by cli and netapi.

33.2.62 Salt 3000.8 Release Notes

Version 3000.8 is a bug fix release for *3000*.

Fixed

- Fix runners that broke when patching for CVE-2021-25281
- Fix issue with runners in SSE

Known Issue

When using the Salt-API with the SSH client some of the SSH options are not working currently and will be fixed in an upcoming bug fix release. We are currently testing and fixing which options still need to be fixed, but have confirmed the following ones do not work in this release: extra-filerefs, pre-flight. This does not impact normal Salt-SSH usage on the cli.

33.2.63 Salt 3000.9 Release Notes

Version 3000.9 is a bug fix release for *3000*.

Fixed

- Allow "extra_filerefs" as sanitized kwargs for SSH client. Fix regression on "cmd.run" when passing tuples as cmd. (#59664)
- Allow all ssh kwargs as sanitized kwargs for SSH client. (#59748)
- Fix argument injection bug in restartcheck.restartcheck. This change hardens the fix for CVE-2020-28243.

33.2.64 Salt 2019.2.0 Release Notes - Codename Fluorine

Python 2.7 Deprecation

In light of Python 2.7 reaching its End of Life (EOL) on Jan 1st 2020, Python 2 will be deprecated from SaltStack no earlier than the 3001 release, that is either the 3001 release or a later release. This decision is pending further community discussion.

Known Issues

The following are known issues for the 2019.2.0 release and will be fixed for 2019.2.1:

- #51699

Non-Backward-Compatible Change to YAML Renderer

In earlier releases, this was considered valid usage in Python 2, assuming that `data` was a list or dictionary containing keys/values which are `unicode` types:

```
/etc/foo.conf:
  file.managed:
    - source: salt://foo.conf.jinja
    - template: jinja
    - context:
        data: {{ data }}
```

One common use case for this is when using one of Salt's *custom Jinja filters* which return lists or dictionaries, such as the *ipv4* filter.

In Python 2, Jinja will render the `unicode` string types within the list/dictionary with the "u" prefix (e.g. `{u'foo': u'bar'}`). While not valid YAML, earlier releases would successfully load these values.

As of this release, the above SLS would result in an error message. To allow for a data structure to be dumped directly into your SLS file, use the tojson Jinja filter:

```
/etc/foo.conf:
  file.managed:
    - source: salt://foo.conf.jinja
    - template: jinja
    - context:
        data: {{ data|tojson }}
```

Another example where the new filter needs to be used is the following state example:

```
grafana_packages:
  pkg.installed:
  - names: {{ server.pkgs }}
```

This will fail when pkgs is a list or dictionary. You will need to update the state:

```
grafana_packages:
  pkg.installed:
  - names: {{ server.pkgs|tojson }}
```

This test case has also been tested with the `yaml` and `json` filters successfully.

Note: This filter was added in Jinja 2.9. However, fear not! The 2018.3.3 release added a `tojson` filter which will be used if this filter is not already present, making it available on platforms like RHEL 7 and Ubuntu 14.04 which provide older versions of Jinja.

Important: The *`json_encode_dict`* and *`json_encode_list`* filters do not actually dump the results to JSON. Since `tojson` accomplishes what those filters were designed to do, they are now deprecated and will be removed in the 3000 release. The `tojson` filter should be used in all cases where *`json_encode_dict`* and *`json_encode_list`* would have been used.

Ansible Playbook State and Execution Modules

Along with the including the `ansible modules` in the Oxygen release, running playbooks has been added in 2019.2.0 with the *`playbooks function`*. This also includes an *`ansible playbooks state module`* which can be used on a targeted host to run ansible playbooks, or used in an orchestration state runner.

```
install nginx:
  ansible.playbooks:
    - name: install.yml
    - git_repo: git://github.com/gtmanfred/playbook.git
    - git_kwargs:
        rev: master
```

The playbooks modules also includes the ability to specify a git repo to clone and use, or a specific directory can to used when running the playbook.

Network Automation

Beginning with this release, Salt provides much broader support for a variety of network operating systems, and features for configuration manipulation or operational command execution.

NetBox

Added in the previous release, 2018.3.0, the capabilities of the `netbox` Execution Module have been extended, with a much longer list of available features:

- `netbox.create_circuit`
- `netbox.create_circuit_provider`
- `netbox.create_circuit_termination`
- `netbox.create_circuit_type`
- `netbox.create_device`
- `netbox.create_device_role`
- `netbox.create_device_type`
- `netbox.create_interface`
- `netbox.create_interface_connection`
- `netbox.create_inventory_item`
- `netbox.create_ipaddress`
- `netbox.create_manufacturer`
- `netbox.create_platform`
- `netbox.create_site`
- `netbox.delete_interface`
- `netbox.delete_inventory_item`
- `netbox.delete_ipaddress`
- `netbox.get_circuit_provider`
- `netbox.get_interfaces`
- `netbox.get_ipaddresses`
- `netbox.make_interface_child`
- `netbox.make_interface_lag`
- `netbox.openconfig_interfaces`
- `netbox.openconfig_lacp`
- `netbox.update_device`
- `netbox.update_interface`

Besides this Execution Module, Salt users can load data directly from NetBox into the device Pillar, via the `netbox` External Pillar module.

Netmiko

Netmiko, the multi-vendor library to simplify Paramiko SSH connections to network devices, is now officially integrated into Salt. The network community can use it via the `netmiko` Proxy Module or directly from any Salt Minions, passing the connection credentials - see the documentation for the `netmiko` Execution Module.

Arista

Arista switches can now be managed running under the `pyeapi` Proxy Module, and execute RPC requests via the *`pyeapi`* Execution Module.

Cisco Nexus

While support for SSH-based operations has been added in the release codename Carbon (2016.11), the new `nxos_api` Proxy Module and *`nxos_api`* allow management of Cisco Nexus switches via the NX-API.

It is important to note that these modules don't have third party dependencies, therefore they can be used straight away from any Salt Minion. This also means that the user may be able to install the regular Salt Minion on the Nexus switch directly and manage the network devices like a regular server.

General-purpose Modules

The new `ciscoconfparse` Execution Module can be used for basic configuration parsing, audit or validation for a variety of network platforms having Cisco IOS style configuration (one space indentation), as well as brace-delimited configuration style.

The *`iosconfig`* can be used for various configuration manipulation for Cisco IOS style configuration, such as: *`configuration cleanup`*, *`tree representation of the config`*, etc.

NAPALM

Commit At and Commit Confirmed

Beginning with this release, NAPALM users are able to execute scheduled commits (broadly known as "commit at") and "commit confirmed" (revert the configuration change unless the user confirms by running another command). These features are available via the `commit_in`, `commit_at`, `revert_in`, or `revert_at` arguments for the *`net.load_config`* and *`net.load_template`* execution functions, or *`netconfig.managed`*.

The counterpart execution functions *`net.confirm_commit`*, or *`net.cancel_commit`*, as well as the State functions *`netconfig.commit_cancelled`*, or *`netconfig.commit_confirmed`* can be used to confirm or cancel a commit.

Please note that the commit confirmed and commit cancelled functionalities are available for any platform whether the network devices supports the features natively or not. However, be cautious and make sure you read and understand the caveats before using them in production.

Multiple Templates Rendered Simultaneously

The `template_name` argument of the *net.load_template* Execution and *netconfig.managed* State function now supports a list of templates. This is particularly useful when a very large Jinja template is split into multiple smaller and easier to read templates that can eventually be reused in other States. For example, the following syntax is not correct to manage the configuration of NTP and BGP simultaneously, using two different templates and changing the device configuration through one single commit:

```
manage_bgp_and_ntp:
  netconfig.managed:
    - template_name:
        - salt://templates/bgp.jinja
        - salt://templates/ntp.jinja
    - context:
        bpg: {{ pillar.bgp }}
        ntp: {{ pillar.ntp }}
```

Connection Re-establishment on Demand

Beginning with this release, any NAPALM command executed when running under a NAPALM Proxy Minion supports the `force_reconnect` magic argument.

Proxy Minions generally establish a connection with the remote network device at the time of the Minion startup and that connection is going to be used forever.

If one would need to execute a command on the device but is connecting using different parameters (due to various causes, e.g., unable to authenticate the user specified in the Pillar as the authentication system - say TACACS+ is not available, or the DNS resolver is currently down and would like to temporarily use the IP address instead, etc.), it implies updating the Pillar data and restarting the Proxy Minion process restart. In particular cases like that, you can pass the `force_reconnect=True` keyword argument, together with the alternative connection details, to enforce the command to be executed over a separate connection.

For example, if the usual command is `salt '*' net.arp`, you can use the following to connect using a different username instead:

```
salt '*' net.arp username=my-alt-usr force_reconnect=True
```

The same goes with any of the other configuration arguments required for the NAPALM connection - see `NAPALM proxy documentation`.

Configuration Replace Features

To replace various configuration chunks, you can use the new *net.replace_pattern* execution function, or the *netconfig.replace_pattern* State function. For example, if you want to update your configuration and rename a BGP policy referenced in many places, you can do so by running:

```
salt '*' net.replace_pattern OLD-POLICY-CONFIG new-policy-config
```

Similarly, you can also replace entire configuration blocks using the *net.blockreplace* function.

Configuration Save Features

The *net.save_config* function can be used to save the configuration of the managed device into a file. For the State subsystem, the *netconfig.saved* function has been added which provides a complete list of facilities when managing the target file where the configuration of the network device can be saved.

For example, backup the running configuration of each device under its own directory tree:

```
/var/backups/{{ opts.id }}/running.cfg:
  netconfig.saved:
    - source: running
    - makedirs: true
```

All the new network automation modules mentioned above are directly exposed to the NAPALM users, without requiring any architectural changes, just eventually install some requirements:

Junos

The features from the existing *junos* Execution Module are available via the following functions:

- *napalm.junos_cli*: Execute a CLI command and return the output as text or Python dictionary.
- *napalm.junos_rpc*: Execute an RPC request on the remote Junos device, and return the result as a Python dictionary, easy to digest and manipulate.
- *napalm.junos_install_os*: Install the given image on the device.
- *napalm.junos_facts*: The complete list of Junos facts collected by the `junos-eznc` underlying library.

Note: To be able to use these features, you muse ensure that you meet the requirements for the *junos* module. As `junos-eznc` is already a dependency of NAPALM, you will only have to install `jxmlease`.

Usage examples:

```
salt '*' napalm.junos_cli 'show arp' format=xml
salt '*' napalm.junos_rpc get-interface-information
```

Netmiko

The features from the newly added `netmiko` Execution Module are available as:

- *napalm.netmiko_commands*: Execute one or more commands to be execute on the remote device, via Netmiko, and return the output as a text.
- *napalm.netmiko_config*: Load a list of configuration command on the remote device, via Netmiko. The commands can equally be loaded from a local or remote path, and passed through Salt's template rendering pipeline (by default using `Jinja` as the template rendering engine).

Usage examples:

```
salt '*' napalm.netmiko_commands 'show version' 'show interfaces'
salt '*' napalm.netmiko_config config_file=https://bit.ly/2sgljCB
```

Arista pyeapi

For various operations and various extension modules, the following features have been added to gate functionality from the *pyeapi* module:

- *napalm.pyeapi_run_commands*: Execute a list of commands on the Arista switch, via the `pyeapi` library.
- *napalm.pyeapi_config*: Configure the Arista switch with the specified commands, via the `pyeapi` Python library. Similarly to *napalm.netmiko_config*, you can use both local and remote files, with or without templating.

Usage examples:

```
salt '*' napalm.pyeapi_run_commands 'show version' 'show interfaces'
salt '*' napalm.pyeapi_config config_file=salt://path/to/template.jinja
```

Cisco NX-API

In the exact same way as above, the user has absolute control by using the following primitives to manage Cisco Nexus switches via the NX-API:

- *napalm.nxos_api_show*: Execute one or more show (non-configuration) commands, and return the output as plain text or Python dictionary.
- *napalm.nxos_api_rpc*: Execute arbitrary RPC requests via the Nexus API.
- *napalm.nxos_api_config*: Configures the Nexus switch with the specified commands, via the NX-API. The commands can be loaded from the command line, or a local or remote file, eventually rendered using the templating engine of choice (default: `jinja`).

Usage examples:

```
salt '*' napalm.nxos_api_show 'show bgp sessions' 'show processes' raw_
↪text=False
```

Ciscoconfparse

The following list of function may be handy when manipulating Cisco IOS or Junos style configurations:

- *napalm.config_filter_lines*: Return a list of detailed matches, for the configuration blocks (parent-child relationship) whose parent and children respect the regular expressions provided.
- *napalm.config_find_lines*: Return the configuration lines that match the regular expression provided.
- *napalm.config_lines_w_child*: Return the configuration lines that match a regular expression, having child lines matching the child regular expression.
- *napalm.config_lines_wo_child*: Return the configuration lines that match a regular expression, that don't have child lines matching the child regular expression.

Note: These functions require the `ciscoconfparse` Python library to be installed.

Usage example (find interfaces that are administratively shut down):

```
salt '*' napalm.config_lines_w_child 'interface' 'shutdown'
```

IOSConfig

For Cisco IOS style configuration, the following features have been added to the *napalm* Execution Module:

- *napalm.config_tree*: Transform Cisco IOS style configuration to structured Python dictionary, using the configuration of the interrogated network device.
- *napalm.config_merge_tree*: Return the merge tree of the configuration of the managed network device with a different configuration to be merged with (without actually loading any changes on the device).
- *napalm.config_merge_text*: Return the merge result (as text) of the configuration of the managed network device with a different configuration to be merged with.
- *napalm.config_merge_diff*: Return the merge diff after merging the configuration of the managed network device with a different configuration (without actually loading any changes on the device).

SCP

Reusing the already available connection credentials provided for NAPALM, the following features are now available:

- *napalm.scp_put*: Transfer files and directories to remote network device.
- *napalm.scp_get*: Transfer files and directories from remote network device to the localhost of the Minion.

PeeringDB

The `peeringdb` Execution Module is useful to gather information about other networks you can potentially peer with, and automatically establish BGP sessions, e.g., given just a specific AS number, the rest of the data (i.e., IP addresses, locations where the remote network is available, etc.) is retrieved from PeeringDB, and the session configuration is automated with minimal to no effort (typing the IP addresses manually can be both tedious and error prone).

New Docker Proxy Minion

Docker containers can now be treated as actual minions without installing salt in the container, using the new `docker proxy minion`.

This proxy minion uses the `docker executor` to pass commands to the docker container using `docker.call`. Any state module calls are passed through the corresponding function from the `docker` module.

```
proxy:
  proxytype: docker
  name: keen_proskuriakova
```

Terraform Salt-SSH Roster

You can now dynamically generate a Salt-SSH roster from the terraform resources defined with terraform-provider-salt.

This allows you to combine both terraform and Salt-SSH to provision and configure your hosts. See the `terraform roster` for an example on how to setup and use.

Grains Dictionary Passed into Custom Grains

Starting in this release, if a custom grains function accepts a variable named `grains`, the Grains dictionary of the already compiled grains will be passed in. Because of the non-deterministic order that grains are rendered in, the only grains that can be relied upon to be passed in are `core.py` grains, since those are compiled first.

More Precise `virtual` Grain

This release improves the accuracy of the `virtual` grain when running Salt in a nested virtualization environment (e.g. `systemd-nspawn` container inside a VM) and having `virt-what` installed.

Until now, the `virtual` grain was determined by matching against all output lines of `virt-what` instead of individual items which could lead to not quite precise results (e.g. reporting `HyperV` inside a `systemd-nspawn` container running within a Hyper-V-based VM.

Configurable Module Environment

Salt modules (states, execution modules, returners, etc.) now can have custom environment variables applied when running shell commands. This can be configured by setting a `system-environment` key either in Grains or Pillar. The syntax is as follows:

```
system-environment:
  <type>
    <module>:
      # Namespace for all functions in the module
      _:
        <key>: <value>

      # Namespace only for particular function in the module
      <function>:
        <key>: <value>
```

- `<type>` would be the type of module (i.e. `states`, `modules`, etc.).
- `<module>` would be the module's name.

  Note: The module name can be either the virtual name (e.g. `pkg`), or the physical name (e.g. `yumpkg`).

- `<function>` would be the function name within that module. To apply environment variables to *all* functions in a given module, use an underscore (i.e. `_`) as the function name. For example, to set the same environment variable for all package management functions, the following could be used:

```
system-environment:
  modules:
    pkg:
      _:
        SOMETHING: for_all
```

To set an environment variable in `pkg.install` only:

```
system-environment:
  modules:
    pkg:
      install:
        LC_ALL: en_GB.UTF-8
```

To set the same variable but only for SUSE minions (which use zypper for package management):

```
system-environment:
  modules:
    zypper:
      install:
        LC_ALL: en_GB.UTF-8
```

Note: This is not supported throughout Salt; the module must explicitly support this feature (though this may change in the future). As of this release, the only modules which support this are the following `pkg` virtual modules:

- *`aptpkg`*
- *`yumpkg`*
- `zypper`

"Virtual Package" Support Dropped for APT

In APT, some packages have an associated list of packages which they provide. This allows one to do things like run `apt-get install foo` when the real package name is `foo1.0`, and get the right package installed.

Salt has traditionally designated as "virtual packages" those which are provided by an installed package, but for which there is no real package by that name installed. Given the above example, if one were to run a *`pkg.installed`* state for a package named `foo`, then *`pkg.list_pkgs`* would show a package version of simply `1` for package `foo`, denoting that it is a virtual package.

However, while this makes certain aspects of package management convenient, there are issues with this approach that make relying on "virtual packages" problematic. For instance, Ubuntu has four different mutually-conflicting packages for `nginx`:

- nginx-core
- nginx-full
- nginx-light
- nginx-extras

All four of these provide `nginx`. Yet there is an nginx package as well, which has no actual content and merely has dependencies on any one of the above four packages. If one used `nginx` in a *`pkg.installed`* state, and none of the above four packages were installed, then the nginx metapackage would be installed, which would pull in *nginx-core_*. Later, if `nginx` were used in a *pkg.removed* state, the nginx metapackage would be removed, leaving nginx-core installed. The result would be that, since *nginx-core_* provides *nginx_*, Salt would now see nginx as an installed virtual package, and the *pkg.removed* state would fail. Moreover, *nginx would not actually have been removed*, since nginx-core would remain installed.

Starting with this release, Salt will no longer support using "virtual package" names in `pkg` states, and package names will need to be specified using the proper package name. The *pkg.list_repo_pkgs* function can be used to find matching package names in the repositories, given a package name (or glob):

```
# salt myminion pkg.list_repo_pkgs 'nginx*'
myminion:
    ----------
    nginx:
        - 1.10.3-0ubuntu0.16.04.2
        - 1.9.15-0ubuntu1
    nginx-common:
        - 1.10.3-0ubuntu0.16.04.2
        - 1.9.15-0ubuntu1
    nginx-core:
        - 1.10.3-0ubuntu0.16.04.2
        - 1.9.15-0ubuntu1
    nginx-core-dbg:
        - 1.10.3-0ubuntu0.16.04.2
        - 1.9.15-0ubuntu1
    nginx-doc:
        - 1.10.3-0ubuntu0.16.04.2
        - 1.9.15-0ubuntu1
    nginx-extras:
        - 1.10.3-0ubuntu0.16.04.2
        - 1.9.15-0ubuntu1
    nginx-extras-dbg:
        - 1.10.3-0ubuntu0.16.04.2
        - 1.9.15-0ubuntu1
    nginx-full:
        - 1.10.3-0ubuntu0.16.04.2
        - 1.9.15-0ubuntu1
    nginx-full-dbg:
        - 1.10.3-0ubuntu0.16.04.2
        - 1.9.15-0ubuntu1
    nginx-light:
        - 1.10.3-0ubuntu0.16.04.2
        - 1.9.15-0ubuntu1
    nginx-light-dbg:
        - 1.10.3-0ubuntu0.16.04.2
        - 1.9.15-0ubuntu1
```

Alternatively, the newly-added *pkg.show* function can be used to get more detailed information about a given package and help determine what package name is correct:

```
# salt myminion pkg.show 'nginx*' filter=description,provides
myminion:
    ----------
    nginx:
        ----------
```

Minion Startup Events

When a minion starts up it sends a notification on the event bus with a tag that looks like this: `salt/minion/<minion_id>/start`. For historical reasons the minion also sends a similar event with an event tag like this: `minion_start`. This duplication can cause a lot of clutter on the event bus when there are many minions. Set `enable_legacy_startup_events: False` in the minion config to ensure only the `salt/minion/<minion_id>/start` events are sent.

The new *`enable_legacy_startup_events`* minion config option defaults to `True`, but will be set to default to `False` beginning with the 3001 release of Salt.

The Salt Syndic currently sends an old style `syndic_start` event as well. The syndic respects *`enable_legacy_startup_events`* as well.

Failhard changes

It is now possible to override a global failhard setting with a state-level failhard setting. This is most useful in case where global failhard is set to `True` and you want the execution not to stop for a specific state that could fail, by setting the state level failhard to `False`. This also allows for the use of `onfail*`-requisites, which would previously be ignored when a global failhard was set to `True`. This is a deviation from previous behavior, where the global failhard setting always resulted in an immediate stop whenever any state failed (regardless of whether the failing state had a failhard setting of its own, or whether any `onfail*`-requisites were used).

Pass Through Options to `file.serialize` State

This allows for more granular control over the way in which the dataset is serialized. See the documentation for the new `serializer_opts` and `deserializer_opts` options in the *`file.serialize`* state for more information.

`file.patch` State Rewritten

The `file.patch` state has been rewritten with several new features:

- Patch sources can now be remote files instead of only `salt://` URLs
- Multi-file patches are now supported
- Patch files can be templated

In addition, it is no longer necessary to specify what the hash of the patched file should be.

New no_proxy Minion Configuration

Pass a list of hosts using the `no_proxy` minion config option to bypass an HTTP proxy.

Note: This key does nothing unless proxy_host is configured and it does not support any kind of wildcards.

```
no_proxy: [ '127.0.0.1', 'foo.tld' ]
```

Changes to `slack` Engine

The output returned to Slack from functions run using this engine is now formatted using that function's proper outputter. Earlier releases would format the output in YAML for all functions except for when states were run.

Enhancements to `wtmp` Beacon

A new key, `action`, has been added to the events fired by this beacon, which will contain either the string `login` or `logout`. This will simplify reactors which use this beacon's data, as it will no longer be necessary to check the integer value of the `type` key to know whether the event is a login or logout.

Additionally, in the event that your platform has a non-standard `utmp.h`, you can now configure which type numbers indicate a login and logout.

See the `wtmp beacon documentation` for more information.

Deprecated and Removed Options

API Removed Arguments

Support for *LocalClient*'s `expr_form` argument has been removed. Please use `tgt_type` instead. This change was made due to numerous reports of confusion among community members, since the targeting method is published to minions as `tgt_type`, and appears as `tgt_type` in the job cache as well.

Those who are using the *LocalClient* (either directly, or implicitly via a *netapi module*) need to update their code to use `tgt_type`.

```
>>> import salt.client
>>> local = salt.client.LocalClient()
>>> local.cmd("*", "cmd.run", ["whoami"], tgt_type="glob")
{'jerry': 'root'}
```

Minion Configuration Deprecated Option

The *`master_shuffle`* configuration option is deprecated as of the `2019.2.0` release. Please use the *`random_master`* option instead.

Module Removed Options

- The *`napalm_network`* module has been changed as follows:
  - Support for the `template_path` has been removed from *`net.load_template`* function. This is because support for NAPALM native templates has been dropped.
- The *`pip`* module has been changed as follows:
  - Support for the `no_chown` option has been removed from *`pip.install`* function.
- The `trafficserver` module has been changed as follows:
  - The `trafficserver.match_var` function was removed. Please use `trafficserver.match_metric` instead.
  - The `trafficserver.read_var` function was removed. Please use `trafficserver.read_config` instead.
  - The `trafficserver.set_var` function was removed. Please use `trafficserver.set_config` instead.
- The `win_update` module has been removed. It has been replaced by *`win_wua`*.
- The *`win_wua`* module has been changed as follows:
  - The `win_wua.download_update` and `win_wua.download_updates` functions have been removed. Please use *`win_wua.download`* instead.
  - The `win_wua.install_update` and `win_wua.install_updates` functions have been removed. Please use *`win_wua.install`* instead.
  - The `win_wua.list_update` function has been removed. Please use functions have been removed. Please use *`win_wua.get`* instead.
  - The `win_wua.list_updates` function has been removed. Please use functions have been removed. Please use `win_wua.list` instead.

Pillar Removed Option

- The `vault` external pillar has been changed as follows:
  - Support for the `profile` argument was removed. Any options passed up until and following the first `path=` are discarded.

Roster Removed Option

- The *cache* roster has been changed as follows:
  - Support for `roster_order` as a list or tuple has been removed. As of the `2019.2.0` release, `roster_order` must be a dictionary.
  - The `roster_order` option now includes IPv6 in addition to IPv4 for the `private`, `public`, `global` or `local` settings. The syntax for these settings has changed to `ipv4-*` or `ipv6-*`, respectively.

State Removed Modules and Options

- The `docker` state module has been removed
  - In *2017.7.0*, the states from this module were split into four separate state modules:
    - `docker_container`
    - `docker_image`
    - `docker_volume`
    - `docker_network`
  - The `docker` module remained, for backward-compatibility, but it has now been removed. Please update SLS files to use the new state names:
    - `docker.running` => `docker_container.running`
    - `docker.stopped` => `docker_container.stopped`
    - `docker.absent` => `docker_container.absent`
    - `docker.network_present` => `docker_network.present`
    - `docker.network_absent` => `docker_network.absent`
    - `docker.image_present` => `docker_image.present`
    - `docker.image_absent` => `docker_image.absent`
    - `docker.volume_present` => `docker_volume.present`
    - `docker.volume_absent` => `docker_volume.absent`
- The `docker_network` state module has been changed as follows:
  - The `driver` option has been removed from `docker_network.absent`. It had no functionality, as the state simply deletes the specified network name if it exists.
- The deprecated `ref` option has been removed from the *git.detached* state. Please use `rev` instead.
- The `k8s` state module has been removed in favor of the `kubernetes` state mdoule. Please update SLS files as follows:
  - In place of `k8s.label_present`, use `kubernetes.node_label_present`

  - In place of `k8s.label_absent`, use `kubernetes.node_label_absent`
  - In place of `k8s.label_folder_absent`, use `kubernetes.node_label_folder_absent`
- Support for the `template_path` option in the `netconfig.managed <salt.states.netconfig.managed()` state has been removed. This is because support for NAPALM native templates has been dropped.
- Support for the `no_chown` option in the `pip.insalled` state has been removed.
- The `trafficserver.set_var` state has been removed. Please use `trafficserver.config` instead.
- Support for the `no_chown` option in the :py:func`virtualenv.managed <salt.states.virtualenv.managed>` function has been removed.
- The `win_update` state module has been removed. It has been replaced by *`win_wua`*.
- Support for virtual packages has been removed from the py:mod:*pkg state <salt.states.pkg>*.

Utils Removed Options

The `cloud` utils module had the following changes:

- Support for the `cache_nodes_ip` function in `salt utils module` has been removed. The function was incomplete and non-functional.

The `vault` utils module had the following changes:

- Support for specifying Vault connection data within a 'profile' has been removed. Please see the `vault execution module` documentation for details on the new configuration schema.

Dependency Deprecations

Salt-Cloud has been updated to use the `pypsexec` Python library instead of the `winexe` executable. Both `winexe` and `pypsexec` run remote commands against Windows OSes. Since `winexe` is not packaged for every system, it has been deprecated in favor of `pypsexec`.

Salt-Cloud has deprecated the use `impacket` in favor of `smbprotocol`. This changes was made because `impacket` is not compatible with Python 3.

SaltSSH Major Updates

SaltSSH now works across different major Python versions. Python 2.7 ~ Python 3.x are now supported transparently. Requirement is, however, that the SaltMaster should have installed Salt, including all related dependencies for Python 2 and Python 3. Everything needs to be importable from the respective Python environment.

SaltSSH can bundle up an arbitrary version of Salt. If there would be an old box for example, running an outdated and unsupported Python 2.6, it is still possible from a SaltMaster with Python 3.5 or newer to access it. This feature requires an additional configuration in /etc/salt/master as follows:

```
ssh_ext_alternatives:
    2016.3:                     # Namespace, can be actually anything.
        py-version: [2, 6]      # Constraint to specific interpreter version
        path: /opt/2016.3/salt  # Main Salt installation
        dependencies:           # List of dependencies and their installation
↪paths
          jinja2: /opt/jinja2
          yaml: /opt/yaml
```

(continues on next page)

(continued from previous page)

```
            tornado: /opt/tornado
            msgpack: /opt/msgpack
            certifi: /opt/certifi
            singledispatch: /opt/singledispatch.py
            singledispatch_helpers: /opt/singledispatch_helpers.py
            markupsafe: /opt/markupsafe
            backports_abc: /opt/backports_abc.py
```

It is also possible to use several alternative versions of Salt. You can for instance generate a minimal tarball using runners and include that. But this is only possible, when such specific Salt version is also available on the Master machine, although does not need to be directly installed together with the older Python interpreter.

SaltSSH now support private key's passphrase. You can configure it by:

- *--priv-passwd* for salt-ssh cli
- *salt_priv_passwd* for salt master configure file
- *priv_passwd* for salt roster file

State Module Changes

`salt` State Module (used in orchestration)

The `test` option now defaults to None. A value of `True` or `False` set here is passed to the state being run and can be used to override a `test: True` option set in the minion's config file. In previous releases the minion's config option would take precedence and it would be impossible to run an orchestration on a minion with test mode set to True in the config file.

If a minion is not in permanent test mode due to the config file and the 'test' argument here is left as None then a value of `test=True` on the command-line is passed correctly to the minion to run an orchestration in test mode. At present it is not possible to pass `test=False` on the command-line to override a minion in permanent test mode and so the `test: False` option must still be set in the orchestration file.

`event.send` State

The `event.send` state does not know the results of the sent event, so returns changed every state run. It can now be set to return changed or unchanged.

`influxdb_user.present` Influxdb User Module State

The `password` parameter has been changed to `passwd` to remove the name collusion with the influxdb client configuration (`client_kwargs`) allowing management of users when authentication is enabled on the influxdb instance

Old behavior:

```
influxdb_user.present:
  - name: exampleuser
  - password: exampleuserpassword
  - user: admin
  - password: adminpassword
```

New behavior:

```
influxdb_user.present:
  - name: exampleuser
  - passwd: exampleuserpassword
  - user: admin
  - password: adminpassword
```

`winrepo_cache_expire_min` Windows Package Definitions Caching

The *`winrepo_cache_expire_min`* has been changed from 0 to 1800 (30 minutes) For example if you run highstate the package definitions are normally updated, however now if the package definitions are younger than *`winrepo_cache_expire_min`* (30 minutes) the package definitions will not be refreshed, reducing the amount of time taken to run a 2nd highstate. To get the old behaviour change the value back to 0 in the minion configuration file. This also effects the behaviour of other functions which default to refresh. The `pkg.refresh_db` will always refresh the package definitions.

LDAP External Authentication

freeipa `groupattribute` support

Previously, if Salt was using external authentication against a freeipa LDAP system it could only search for users via the `accountattributename` field. This release add an additional search using the `groupattribute` field as well. The original `accountattributename` search is done first then the `groupattribute` allowing for backward compatibility with previous Salt releases.

Jinja Include Relative Paths

When a jinja include template name begins with `./` or `../` then the import will be relative to the importing file.

Prior practices required the following construct:

```
{% from tpldir ~ '/foo' import bar %}
```

A more ”natural” construct is now supported:

```
{% from './foo' import bar %}
```

Comparatively when importing from a parent directory - prior practice:

```
{% from tpldir ~ '/../foo' import bar %}
```

New style for including from a parent directory:

```
{% from '../foo' import bar %}
```

salt-api

salt-api Windows support

Previously, salt-api was was not supported on the Microsoft Windows platforms. Now it is! salt-api provides a RESTful interface to a running Salt system. It allows for viewing minions, runners, and jobs as well as running execution modules and runners of a running Salt system through a REST API that returns JSON. See *Salt-API* documentation. .. _Salt-API: https://docs.saltproject.io/en/latest/topics/netapi/index.html

Logging Changes

Include Job ID (JID) in Minion and Master Logs

The Job ID (JID) can now be optionally included in both the minion and master logs by including `jid` in either the `log_fmt_console` or `log_fmt_logfile` configuration option:

```
log_fmt_console: "[%(levelname)-8s] %(jid)s %(message)s"
```

The will cause the JID to be included in any log entries that are related to a particular Salt job. The JID will be included using the default format, `[JID: %(jid)s]` but can be overridden with the `log_fmt_jid` configuration item.

```
log_fmt_jid: "[JID: %(jid)s]"
```

Security

Windows runas changes

A password is no longer required with `runas` under normal circumstances. The password option is only needed if the minion process is run under a restricted (non-administrator) account. In the aforementioned case, a password is only required when using the `runas` argument to run command as a different user.

New Modules

Execution Modules

- `salt.modules.ciscoconfparse_mod`
- `salt.modules.jira`
- `salt.modules.google_chat`
- *`salt.modules.iosconfig`*
- `salt.modules.netmiko`
- *`salt.modules.nxos_api`*
- `salt.modules.peeringdb`
- `salt.modules.purefb`
- *`salt.modules.pyeapi`*

Pillar Modules

- `netbox`

Proxy Modules

- `salt.proxy.netmiko`
- `salt.proxy.nxos_api`
- `salt.proxy.pyeapi`

33.2.65 Salt 2019.2.1 Release Notes

Version 2019.2.1 is a bugfix release for *2019.2.0*.

Known Issues

- **ISSUE** #54751: Proxy minion fails to start. Fix planned in 2019.2.2 release.
- **ISSUE** #54762: URIs with IPv6 addresses are broken, preventing master-minion communication in IPv6-only environments. Fix planned in 2019.2.2 release.
- **ISSUE** #54776: Minion fails to start when it contains *ping_interval* in minion configuration file. Fix planned in 2019.2.2 release.
- **ISSUE** #54731: Returners (except for default salt master returner) not loading properly in Py3. Fix planned in 2019.2.2 release.
- **ISSUE** #54758: salt-call state.show_states gives ”Passed invalid arguments” error when a sls defined in top.sls file is missing. Fix planned in 2019.2.2 release.
- **ISSUE** #54765: Jinja from import is broken. Fix planned in 2019.2.2 release.
- **ISSUE** #54771: Affects only Debian 10. pkgrepo.managed does not work if used with proxy (configured at salt-minion). No fix date available yet.
- **ISSUE** #54759: Deprecation warnings for pyzmq. No fix date available yet.

Change to YAML Renderer

```
/etc/foo.conf:
  file.managed:
    - source: salt://foo.conf.jinja
    - template: jinja
    - context:
        data: {{ data }}
```

In 2019.2.0, the above SLS will result in an error message following changes to the YAML renderer that now require the new Jinja filter *tojson*.

```
/etc/foo.conf:
  file.managed:
    - source: salt://foo.conf.jinja
    - template: jinja
    - context:
        data: {{ data|tojson }}
```

In 2019.2.1, we introduce a new configuration option for both the Salt master and Salt minion configurations to be able to support the older YAML renderer. Using the option `use_yamlloader_old` will allow the YAML renderer to function as before.

- **PR** #54376: (dwoz) Move tokens in place with an atomic operation @ *2019-09-03 20:40:50 UTC*
  - 11016ce Merge pull request #54376 from dwoz/tmp_token
  - 0b28c60 Fix linter complaints
  - 8e33343 Move tokens in place with an atomic operation
- **PR** #54386: (twangboy) Fix unit.utils.test_win_dacl (2019.2.1) @ *2019-09-03 16:57:25 UTC*
  - 5161203 Merge pull request #54386 from twangboy/fix_test_win_dacl_2019.2.1
  - b8fa7d3 Sort the perms
- **PR** #54355: (s0undt3ch) [2019.2.1] [GitPillar Tests] Have the started processes log instead of just writing to stdout/stderr @ *2019-08-29 23:26:50 UTC*

  - b4caaad Merge pull request #54355 from s0undt3ch/hotfix/test-daemons-2019.2.1
  - 561c0a2 Have the started processes log instead of just writing to stdout/stderr
  - c2a3115 Don't overwritethe stderr logger
- **PR** #54353: (cmcmarrow) adds @skipIf not windows @ *2019-08-29 19:33:11 UTC*
  - ce5b109 Merge pull request #54353 from cmcmarrow/2019_win_system_skip
  - 8e28074 adds @skipIf not windows
- **PR** #54338: (dwoz) Log server closes completely during shutdown @ *2019-08-29 17:14:05 UTC*
  - 94c03e5 Merge pull request #54338 from dwoz/logging_fixup
  - a3e227e Log server closes completely during shutdown
- **PR** #54327: (garethgreenaway) [2019.2.1] Catch the AccessDenied exception and continue when running under Py3. @ *2019-08-29 16:59:34 UTC*
  - 490ee69 Merge pull request #54327 from garethgreenaway/more_test_program_fixes
  - 97b4d86 Catch the AccessDenied exception and continue when running under Py3.
- **PR** #54316: (Akm0d) Azure cleanup @ *2019-08-27 16:14:09 UTC*
  - bb911c3 Merge pull request #54316 from Akm0d/azure-cleanup
  - 2072773 pass longer timeout to msazure destroyinstance
  - 34eb477 Merge branch '2019.2.1' of https://github.com/saltstack/salt into azure-cleanup
  - 7ae48b1 Allow azure tests enough time to clean up interfaces
  - b45ae74 Clean up azure instances properly
- **PR** #54314: (garethgreenaway) [2019.2.1] Do not raise the exception in testprogram.py @ *2019-08-26 23:59:37 UTC*
  - 9334e4e Merge pull request #54314 from garethgreenaway/testprogram_access_denied_do_not_raise
  - a53bacb Do not raise the exception if a process can not be access, just continue
- **PR** #54305: (dwoz) Fix wart in test_process tests on windows @ *2019-08-26 17:59:12 UTC*
  - 71fb051 Merge pull request #54305 from dwoz/winfix
  - 4e68860 Fix wart in test_process tests on windows
- **PR** #54303: (dwoz) Fix wart in periodic callback interval @ *2019-08-24 20:04:35 UTC*
  - 4d80f0a Merge pull request #54303 from dwoz/periodic_cb
  - bf5f7de Fix wart in periodic callback interval
- **ISSUE** #54219: (KChandrashekhar) integration.shell.test_call.py and tests/integration/shell/test_proxy.py (refs: #54259)
- **ISSUE** #54153: (KChandrashekhar) Ubuntu 16.04 Proxy failures (refs: #54259)
- **PR** #54259: (dwoz) Call os.fork less to avoid race conditions @ *2019-08-24 02:12:42 UTC*
  - 5838851 Merge pull request #54259 from dwoz/less_forking
  - bf4d0dd Fix process list tests on windows py3
  - 316ec78 Allow more time for slow test
  - 9baf86f Do not remove attributes from process class

  - e7b6aa8 Clean up cruft
  - ed7103a Attempt to fix integration.shell.test_call test
  - 659c805 Change noise log to debug
  - 0660b1a Clean up typos
  - 9f1fe42 Call os.fork less to avoid race conditions
- **ISSUE** #50814: (doesitblend) Minion continues trying down master (refs: #54239, #53417)
- **ISSUE** #49680: (doesitblend) Beacon events handled differently than event.send (refs: #53344, #54239)
- **ISSUE** #49663: (doesitblend) Beacon only fires to single random master in HA mode (refs: #53344, #54239)
- **PR** #54247: (DmitryKuzmenko) 2019.2.1 with multimaster bb fixes @ *2019-08-23 20:19:19 UTC*
  - **PR** #54239: (DmitryKuzmenko) Multimaster tests with bb fixes (refs: #54247)
  - **PR** #53848: (DmitryKuzmenko) Features/multimaster tests (refs: #54239)
  - **PR** #53417: (DmitryKuzmenko) Multimaster minion hang on fire_master (refs: #54239, #53848)
  - **PR** #53344: (DmitryKuzmenko) Run beacons on the only one minion instance. Return to all masters. (refs: #54239, #53848)
  - 531f3aa Merge pull request #54247 from DSRCorporation/2019.2.1_with_multimaster_bb_fixes
  - 62cd8cd Merge branch '2019.2.1' into 2019.2.1_with_multimaster_bb_fixes
- **PR** #54235: (github-abcde) Fix 46034 2019.2.1 @ *2019-08-22 22:32:09 UTC*
  - 993c341 Merge pull request #54235 from ogd-software/fix_46034-2019.2.1
  - 93bd30d Add alternative fix for "!" stomping Apparently (after watching Jenkins tests fail), what yaml.safe_load returns depends not on the version of salt, but on some other external dependency. Because of this, fix both possible return values.
  - c95dd4d Add test for this specific bugfix
  - efc29d8 Prevent yamlify_arg from stomping "!"
- **PR** #54282: (Akm0d) clean up renamed instances in the teardown @ *2019-08-22 22:13:51 UTC*
  - 5d1a4d0 Merge pull request #54282 from Akm0d/clean-up-renamed
  - 11c1117 Removed redundant parenthesis
  - 802235d don't delete shutting down ec2 instances
  - 3602942 reversed the order in which an instance was renamed
  - 5500ede renamed _alt_name function
  - 23beab4 clean up renamed instances in the teardown
- **PR** #54252: (s0undt3ch) [2019.2.1] More control on spun test daemons on git pillar tests @ *2019-08-22 22:13:08 UTC*
  - c181f5a Merge pull request #54252 from s0undt3ch/hotfix/git-pillar-2019.2.1
  - 4eb85fa Skip tests on RHEL family < 7
  - 64a1be8 Don't even go through the transport to get the system grains
  - d0f8efa Don't keep recreating the git repos. Restore from backup.
  - 6114e9d All prep work is done in *setUpClass*.

  - 5b030dd Daemons are now started/stopped on tests, not by salt
  - ed60f0d We don't actually need grains
  - 911446d Lock *uwsgi* requirement.
    - 805f0ac Merge branch '2019.2.1' into 2019.2.1_with_multimaster_bb_fixes
- **PR** #54214: (Ch3LL) Remove unnecessary logging from minion.py @ *2019-08-22 18:08:26 UTC*
  - b40cdbf Merge pull request #54214 from Ch3LL/fix_logging
  - 8fd24cf Remove unnecessary logging from minion.py
    - 9d28098 Merge branch '2019.2.1' into 2019.2.1_with_multimaster_bb_fixes
- **PR** #54277: (dwoz) Win runas plus @ *2019-08-21 23:59:16 UTC*
  - de77762 Merge pull request #54277 from dwoz/win_runas_plus
  - f719591 Update tests
  - d8749d9 Do not remove attributes from process class
  - ac5a2a4 Only close handle if it got created
- **PR** #54278: (Akm0d) Correctly detect when an ms_azure instance is deleted @ *2019-08-21 23:14:01 UTC*
  - 93cf40a Merge pull request #54278 from Akm0d/cloud-test-logging
  - 2dc1520 Merge branch '2019.2.1' into cloud-test-logging
  - 3867448 Fixed incorrect arguments
  - bdce5f4 Fix detecting msazure deletion with multiple tries
- **PR** #54263: (s0undt3ch) [2019.2.1] Exit test suite if test daemons fail to start @ *2019-08-21 22:06:52 UTC*
  - 94f77a0 Merge pull request #54263 from s0undt3ch/hotfix/test-daemons-2019.2.1
  - 655efd6 Rearrange logging termination
  - 28fa5d2 Prevent traceback on python interpreter shutdown
  - 9035731 Write to stderr a message with the exit code
  - 566c620 Exit the test suite if one of the test daemons fails to start
- **PR** #54270: (s0undt3ch) [2019.2.1] Speedup testing helpers decorators @ *2019-08-21 20:33:25 UTC*
  - 3b9fd44 Merge pull request #54270 from s0undt3ch/hotfix/requires-system-grains-2019.2.1
  - 9f99bff Speedup testing helpers decorators
- **ISSUE** #53931: (KChandrashekhar) integration.states.test_pip_state.PipStateTest.test_issue_6912_wrong_owner_requirements_f (refs: #54274)
- **PR** #54274: (felippeb) #53931 never fail on codecov curls @ *2019-08-21 18:12:19 UTC*
  - 2c4afa0 Merge pull request #54274 from felippeb/2019.2.1
  - 9c0b216 #53931 never fail on codecov curls
- **PR** #54264: (dwoz) Fix unit utils jinja when run on their own @ *2019-08-21 17:22:10 UTC*
  - b3c70c3 Merge pull request #54264 from dwoz/jinja_units
  - 10a6d53 Fix unit utils jinja when run on their own
- **PR** #54266: (Akm0d) Fix incorrect types on failing cloud tests @ *2019-08-21 17:14:40 UTC*

  - 308ba55 Merge pull request #54266 from Akm0d/cloud_test_ultimate_fix
  - ff2125a Invert assertion to test for instance gone
  - 82136a8 test for ec2 instance shutting down
  - 283f631 run cloud --query if delete string is not available
  - 33e6b6d changed deprecated assertEquals
  - 41e6bc8 Cloud tests run correctly everywhere
  - 03a8b2c reverted literal_eval
- **PR** #54251: (Akm0d) reduced query calls to salt-cloud @ *2019-08-20 20:10:59 UTC*
  - 25d0b52 Merge pull request #54251 from Akm0d/cloud_test_optimization
  - 5fe6bfc Optimized salt-cloud queries
  - 43418a4 Merge pull request #7 from Ch3LL/cloud_provider_files
    - b93944b Remove joyent config cloud test files
    - bd37849 Rename provider azure-config to azurearm-config
  - e7c06cb Added longer delays for ec2 tests
  - 5ceb47e Correctly check for GCE and EC2 deletion
  - 52c178c Added pretty yaml formatting to cloud-test logs
  - 4fc5e9e re-fixed simultaneous GCE tests
  - 326e9f2 Merge pull request #6 from Ch3LL/cloud_provider_files
    - adb1464 fix pylint
    - 51ce819 Move provider config setup into Setup/Teardown class
  - e58b40a Merge pull request #5 from Ch3LL/cloud_provider_files
    - ab8adcc Only use the provider conf.d file we are testing
  - 76609ad Merge branch '2019.2.1' into cloud_test_optimization
  - f764bc0 Clean up expensive queries
  - b3d02df reduced query calls to salt-cloud
- **PR** #54240: (Ch3LL) Fix TypeError python3 in get_image_id ec2 cloud @ *2019-08-20 20:10:01 UTC*
  - ba81ca3 Merge pull request #54240 from Ch3LL/get_image_ec2
  - a3a39f3 Use ami variable instead in test
  - dc1ae52 Fix TypeError python3 in get_image_id
    - d6ad475 Merge branch '2019.2.1' into 2019.2.1_with_multimaster_bb_fixes
- **PR** #54246: (dwoz) Cut down on log noise @ *2019-08-19 17:20:03 UTC*
  - 8404ec2 Merge pull request #54246 from dwoz/log_noise
  - e572711 Cut down on log noise
- **PR** #54245: (dwoz) Fix the sshd pid file @ *2019-08-19 17:19:32 UTC*
  - 5b3e925 Merge pull request #54245 from dwoz/sshd_pid_file
  - df95347 Fix the sshd pid file

- **PR** #54237: (dwoz) Do not dup2 things without fileno @ *2019-08-18 17:13:29 UTC*
  - 268803b Merge pull request #54237 from dwoz/dup2
  - 2ebd22b Fix linter
  - 63c616a Do not dup2 things without fileno
    - 0b33498 Workaround for beacons.list_available slowness.
    - b7a1058 Minor: Better support of named multimaster tests.
    - a5cccdf Minor: remove unneded logging
    - 314bbb3 Support tcp transport in multimaster tests. Minor beacon update.
    - fcb8ff0 Properly set HAS_IPTABLES from __virtual__ return.
    - a75db01 Multimaster related fixup: don't run test engine on minions
    - 8a88542 Multimaster beacons fix: put list into a dict to fire on the bus
    - 790fb41 Inotify beacons test logging and cleanup update
    - d84c8851 Inotify beacon test fixes and improvements.
    - 472ffc0 Give minion more time to handle beacon creation.
    - 17ceee0 Fixed Lint errors
    - 0bcf53c Fixed the unicode and timing inotify test issues.
    - f17bcf3 Improved assertion error diagnostic for master down test.
    - db0bae8 Run multimaster as well tests when no specific group is set
    - 723f363 Ignore the multimaster minion subgroup test in module names test.
    - 612191c Fixed lint failures
    - c1efae6 Multimaster test for events handling on master disconnect
    - 1654fe8 Multimaster inotify beacons test
    - 65dc47c Multimaster tests environment and test module test.
    - 2c178b0 Moved annoying message to trace log level.
    - 3e497c1 Handle minion events asynchronously.
    - 909323a Tests fixes
    - 6dad18f Cleanup event object
    - 2bf55be Run beacons on the only one minion instance. Return to all masters.
- **PR** #54121: (Akm0d) Refactored cloud tests @ *2019-08-16 17:24:14 UTC*
  - 27d89bd Merge pull request #54121 from Akm0d/gce_cloud_test
  - 48c57b3 Try multiple times to detect deletion of an instance
  - 74300eb return a valid set
  - 2d63b87 Wait for an instance to be fully created if necessary
  - 83ad8b3 Merge branch '2019.2.1' of github.com:SaltStack/salt into gce_cloud_test
- **ISSUE** #54174: (dwoz) SignalHandlingMultiprocessingProcess bugs (refs: #54204)
- **PR** #54204: (dwoz) Fix signal handling in subprocesses @ *2019-08-16 00:46:40 UTC*

  - c5ee91c Merge pull request #54204 from dwoz/signal_proc
  - 09e5e49 Merge branch '2019.2.1' into signal_proc
- **ISSUE** #7745: (mgwilliams) yaml 'module' has no attribute 'Dumper' (refs: #54223)
- **PR** #54223: (dwoz) Test verify logs without a whole minion @ *2019-08-16 00:46:09 UTC*
  - 99a8fc5 Merge pull request #54223 from dwoz/7754_test_removal
  - 4be711e Fix up linter warts
  - 7573826 Remove crufty un-needed tests
  - effa77d Test verify logs without a whole minion
    - b40f41f Revert fallback to default signals change
    - 1d83b10 Fix signal handling in subprocesses
      - f90fe66 Reverted foo/bar creds per #46265
      - 3f56bad Reduced the amount of informtaion in debuggings tatements
      - de53bf0 Merge branch '2019.2.1' of github.com:SaltStack/salt into gce_cloud_test
- **PR** #54203: (dwoz) Run transport test loops in single thread @ *2019-08-15 20:10:20 UTC*
  - 8d440e0 Merge pull request #54203 from dwoz/transport_tests
  - 22b9d38 Run transsport test loops in single thread
    - f6180a6 Even better logging of errors
    - a15dc4b better formatting and error reporting
    - 51fbc2a better logging on instance create failure
    - 1f7dd52 removed hack fixes from gce
    - 31cdc7c WAR ROOM SKIP GCE TESTS
    - 7d603be hasattr cannot find parent properties starting with __
    - 686cab9 Separated assertInstanceDestroy and _destry_instance
    - 158a38c Revert "Removed subclass from cloud name"
    - b7cf43d Removed subclass from cloud name
    - 8c5eb18 fixed pylint error on format string
    - 59e20bc Merge branch '2019.2.1' of https://github.com/saltstack/salt into gce_cloud_test
- **PR** #54191: (garethgreenaway) [2019.2.1] Addition logging in testprogram used by integration.shell.test_minion.MinionTest.test_exit_status_correct_usage @ *2019-08-13 21:44:41 UTC*
  - a05018e Merge pull request #54191 from garethgreenaway/test_program_test_mininion
  - 8463f84 Adding some additional logging when the call to "proc_cmdline = proc.cmdline()" reults in a AccessDenied exception, so we can see what the process is and who the process is running as.
- **PR** #54202: (waynew) Only run one filter test @ *2019-08-13 21:33:32 UTC*
  - e5e9299 Merge pull request #54202 from waynew/shorter-jinja-ssh-tests
  - c333ac8 Only run one filter test
    - 5912f24 Switched to Azurearm over msazure
- **PR** #54172: (Ch3LL) Migrate from azure to azurearm tests @ *2019-08-13 20:07:34 UTC*

  - a13cb3e Merge pull request #54172 from Ch3LL/azurearm_tests
  - 465523f Migrate from azure to azurearm tests
- **ISSUE** #50535: (wyardley) salt errors with current azure-storage because of no version set (refs: #50567)
- **PR** #54173: (Ch3LL) Cherry Pick #50567 and #53238 into 2019.2.1 @ *2019-08-13 20:07:09 UTC*
  - **PR** #53238: (nicholasmhughes) Azure: Fixed ability to pass SSH key to Linux VMs (refs: #54173)
  - **PR** #50567: (rombert) azurefs: gracefully handle AttributeError (refs: #54173)
  - 39d0c59 Merge pull request #54173 from Ch3LL/azure_fixes
  - 9052eaf reverting log string handling
  - a1a61ee fixed ability to pass ssh key to Linux VMs
  - 4a141a1 azurefs: gracefully handle AttributeError
    - 6fa28de fixed underscore
      - c35379a Moved finding installer into class
    - 95484f8 Moved finding installer into class
    - a86ae34 moved installer finder to SetUp method
    - 933964a removed default user/pass from profitbricks test file
    - 2a2437d fixed dictionary access
    - b9ee411 Fixed broken tests
    - 80efd26 fixed misspelled provider information
    - 511779b removed unused imports
    - 1cd1c13 setUp all cloud tests the same way
    - d322408 Got rid of unnecessary delay
    - 98ba18c fixed pylint error
    - c34c17e Merge branch '2019.2.1' of https://github.com/saltstack/salt into gce_cloud_test
- **PR** #54178: (dwoz) Fix flaky set_computer_name in mac_system module @ *2019-08-12 18:26:40 UTC*
  - 19f4d5e Merge pull request #54178 from dwoz/mac_computer_name
  - e51100e Fix skip on non macos platforms
  - a3a9d92 Fix linter
  - c499d44 Revert unwanted flaky from non computer name tests
  - 941fcc8 Fix flaky set_computer_name in mac_system module
    - 90e8350 Merge branch '2019.2.1' of https://github.com/saltstack/salt into gce_cloud_test
- **PR** #54180: (dwoz) Point test-kitchen to my keepalive_maxcount branch @ *2019-08-12 18:18:26 UTC*
  - 6fe6799 Merge pull request #54180 from dwoz/keepalive_maxcount
  - dc9ee21 Add reminder about kitchen version
  - 19a1f1b Point test-kitchen to my keepalive_maxcount branch
    - 60f8351 Fixed failing Ec2 Tests
    - e2f085c removed py3-only function call

    - 4406c57 fixed lint errors, more descriptive fails
    - 6840d5f assert instances exist in unified way
    - 03da233 skip EOL joyent tests, secure delete instances
    - 3123bb1 Merge branch '2019.2.1' of https://github.com/saltstack/salt into gce_cloud_test
- **ISSUE** #53306: (doesitblend) Fully Qualify CMD on Windows Minions (refs: #53311, #54033)
- **PR** #54033: (twangboy) Backport #53311 to 2019.2.1 @ *2019-08-09 16:46:36 UTC*
  - **PR** #53311: (doesitblend) Add fully qualified cmd call (refs: #54033)
  - 9f5302d Merge pull request #54033 from twangboy/fix_win_service_2019.2.1
  - 2850fab Merge branch '2019.2.1' into fix_win_service_2019.2.1
  - 0e2a2b8 Merge branch '2019.2.1' into fix_win_service_2019.2.1
  - 16c704e Backport #53311 to 2019.2.1
- **PR** #53900: (twangboy) Fix inconsistent full names in LGPO @ *2019-08-09 09:15:41 UTC*
  - c0e49d9 Merge pull request #53900 from twangboy/fix_lgpo
  - e05abdf Merge branch '2019.2.1' into fix_lgpo
  - e4e71cd Remove duplicate test
  - 68c632b Add some tests
  - 3c34075 Fall back to slower method if new method not available
  - 0108bcd Avoid using the lowercase method in XPath
  - fcc0405 Fix telemetry issue, add some timining logs
- **PR** #52818: (twangboy) Add watchdog as a bundled dependency on Windows @ *2019-08-09 04:26:54 UTC*
  - 9eb2938 Merge pull request #52818 from twangboy/add_watchdog
  - 2658634 pre-commit
  - 35691f2 Add watchdog to Linux and OSX .in files
  - 5ef5969 Rremove opensuse 42 static files
  - ec285d0 Remove watchdog from the rest of the .in files
  - 86e64ae Remove unused import, remove Windows reference
  - b934d53 Remove watchdog from windows.in
  - cfaee96 Fix and unify watchdog beacon tests for all OS's
  - cc73204 Put Windows tests in their own class
  - 6fbf1a3 Remove unused import… lint
  - 832a1db Fix windowsisms
  - 4f47d50 Update static requirements
  - 762fe3b Remove some fluff
  - 946076c Add watchdog for tests
  - 02248dc Fix modified test to account for OS variances
  - 15ee479 Compile static requirements

  - 78a5723 Add watchdog to Linux and OSX .in files
  - 9a0f08a Update static requirements
  - 5cad13b Rremove opensuse 42 static files
  - 1f05fce Remove watchdog from the rest of the .in files
  - 121595a Remove unused import, remove Windows reference
  - c410a4b Remove watchdog from windows.in
  - 05a0845 Fix and unify watchdog beacon tests for all OS's
  - 200e230 Put Windows tests in their own class
  - 6cc8d96 Remove unused import… lint
  - a4abb72 Fix windowsisms
  - 005bed9 Update static requirements
  - c1bc627 Remove some fluff
  - 92c8d47 Add watchdog for tests
  - 9544624 Add watchdog as a bundled dependency on Windows
- **PR** #54143: (Akm0d) Don't call potentially missing shade library (#53734) @ *2019-08-09 01:05:26 UTC*
  - **PR** #53734: (Akm0d) Don't call potentially missing shade library (refs: #54143)
  - 5bef520 Merge pull request #54143 from Akm0d/openstack_fix
  - 3f58885 Merge branch '2019.2.1' into openstack_fix
  - 71f5f38 Don't call potentially missing shade library (#53734)
    - 29ee7ce removed print statements, optimized query
    - 14b7539 added back print statements for easy debug
    - 823b3b2 Removed print statements and broken re
    - 9696ed9 experiment with sublcass names
    - 2fa6157 more verbose instance names based on test
    - 2acb2df undercased non-const variable and added print statements
    - c5e875d Merge branch '2019.2.1' of https://github.com/saltstack/salt into gce_cloud_test
- **PR** #54001: (garethgreenaway) [2019.2.1] Porting metaproxy changes in #50183 to 2019.2.1 @ *2019-08-08 04:24:31 UTC*
  - **PR** #50183: (cro) Allow proxy minion types to be dynamically loaded (refs: #54001)
  - 584e3f2 Merge pull request #54001 from garethgreenaway/add_metaproxy_2019_2_1
  - 8353467 Merge branch 'add_metaproxy_2019_2_1' of github.com:garethgreenaway/salt into add_metaproxy_2019_2_1
    - 1892d86 Merge branch '2019.2.1' into add_metaproxy_2019_2_1
  - ab72e1b Adding unit.test_proxy_minion to ignore list
  - 09f6fed Removing match tests, functionality does not exist in 2019.2.1
  - 4af95e4 Adding tests to ensure _metaproxy_call to called when ProxyMinion objects are created.
  - d162a88 Adding salt/metaproxy/proxy.py and tests/unit/modules/test_match.py

  - 51726b1 POrting metaproxy changes in #50183 to 2019.2.1
- **ISSUE** #51008: (cdalvaro) cwd option not working with cmd.run and runas (refs: #52632, #54079)
- **PR** #54136: (ScoreUnder) Fix cmd.run on MacOS (rebased) @ *2019-08-08 04:20:31 UTC*
  - **PR** #54079: (ScoreUnder) Fix cmd.run on MacOS -- wrong environment variables (refs: #54136)
  - **PR** #52632: (cdalvaro) Prevent shell injection as root with cmd.run on macOS (refs: #54079)
  - **PR** #47212: (weswhet) fix macOS running as user. (refs: #54079)
  - bf863d0 Merge pull request #54136 from ScoreUnder/2019.2.1-patch-macos-cmd.run
  - 1182eb9 Add integration test justifying strange use of braces after cd in cmd.run
  - 733d2e7 Fixes to ITs
  - da38993 Add integration tests for cwd/runas changes on MacOS
  - ab8b39c Fix environment in cmd.run runas on MacOS
    - c9cb18f Don't call potentially missing shade library (#53734)
    - 5ef8414 Added more verbose logging to cloud tests
    - 2f3942f better logging and fail messages
    - 9454f4c Fixed pylint errors and temporary print statements
    - fd13ce1 Further refactored cloud test code
    - b03cc48 Assume the instance exists and needs to be deleted
    - 0991ff5 fixed pylint errors and failed tests
    - 55e502a Merge branch '2019.2.1' of https://github.com/saltstack/salt into gce_cloud_test
- **PR** #53974: (Ch3LL) [2019.2.1] Add pygit2 requirement @ *2019-08-06 17:32:05 UTC*
  - e268b95 Merge pull request #53974 from Ch3LL/add_pygit2
  - 11864a0 Merge branch '2019.2.1' into add_pygit2
  - d1b1452 Merge branch '2019.2.1' into add_pygit2
  - a5698cc Merge branch '2019.2.1' into add_pygit2
  - 7dd97a6 Merge branch '2019.2.1' into add_pygit2
  - 358974a Skip Pygit2 tests on windows
  - bc64961 Use accurate file:/// URI on windows for gitfs tests
  - 894f958 Fix GitFS support for pygit2 >= 0.28.0
  - 4580030 [2019.2.1] Add pygit2 requirement
    - 4009bb5 fixed pylint errors
    - 459b16d put cloudtest base in separate file so that only one change needs to be made
    - 8e72335 Merge branch 'gce_cloud_test' of github.com:Akm0d/salt into gce_cloud_test
      - 0e2621e Merge branch '2019.2.1' into gce_cloud_test
    - 9f98b16 finished merge
- **PR** #54108: (dwoz) More robust azure instance deletion @ *2019-08-03 03:58:20 UTC*
  - 46f5e2e Merge pull request #54108 from dwoz/azure_test

  - 754b719 Fix linter
  - 773235d Fix missing time import
  - 5a8f2ec More robust azure instance deletion
- **PR** #54017: (dmurphy18) Allow for main thread having terminated pid, before ThreadPoolExecutor threads @ *2019-08-02 18:11:48 UTC*
  - 2cb5a0b Merge pull request #54017 from dmurphy18/fix_deb9_build90_tests
  - 2866520 Skip process kill tests on Windows
  - 5577f14 Clean up lint errors
  - 4ca709e Merge branch '2019.2.1' into fix_deb9_build90_tests
  - 264c767 Merge pull request #1 from dwoz/fix_deb9_build90_tests
    - 9bb9466 Add unit tests for weird pid does not exist cases
    - 64d9752 Add warning messages to help determine why pids do not exist
  - 406d382 Adjusted for review comments
  - 2d20fbe Adjusted try/except statements on process checking
  - e189177 Removed typos
  - 2e3ca43 Updated for review comments
  - 68c29af Allow for main thread having terminated pid, before ThreadPoolExecutor threads
    - e3158c8 refactored all cloud tests
    - 194e0c7 Refactored GCE cloud test
- **PR** #54080: (dmurphy18) Disabling random website tests till allow for quota usage @ *2019-07-31 21:16:54 UTC*
  - 4e2efcd Merge pull request #54080 from dmurphy18/u1804_py3_random_skip
  - 0660e6e Disabling random website tests till allow for quota usage
- **PR** #54063: (twangboy) Make the skip apply to any system missing crypt @ *2019-07-30 19:22:07 UTC*
  - dbbbcc9 Merge pull request #54063 from twangboy/fix_test_pycrypto_2019.2.1
  - 6fcf035 Make the skip apply to any system missing crypt
- **PR** #54050: (cmcmarrow) fixs integration terminate error @ *2019-07-30 13:38:55 UTC*
  - 4df6271 Merge pull request #54050 from cmcmarrow/integration_terminate_fix
  - ebb07f4 Merge branch '2019.2.1' into integration_terminate_fix
- **PR** #54057: (dmurphy18) Added support for is_fedora and skip Minion test test_issue_7754 on Fedora @ *2019-07-29 22:41:25 UTC*
  - 9d1bd63 Merge pull request #54057 from dmurphy18/fix_fedora30_test
  - 30f3bda Added support for is_fedora and skip Minion test test_issue_7754
  - b3293a9 Merge branch '2019.2.1' into integration_terminate_fix
- **ISSUE** #53948: (KChandrashekhar) integration.shell.test_call.CallTest.test_issue_2731_masterless (refs: #54040)
- **ISSUE** #2731: (cwood) Masterless Broken in 0.10.5 (refs: #54040)
- **PR** #54040: (waynew) Remove dead test @ *2019-07-29 17:23:45 UTC*

  - 5d3bcd7 Merge pull request #54040 from waynew/remove-dead-test
  - e9a5a57 Remove dead test
    - ba3e867 Merge branch '2019.2.1' into integration_terminate_fix
- **PR** #54051: (twangboy) Skip get time test @ *2019-07-29 16:54:50 UTC*
  - 70ffcec Merge pull request #54051 from twangboy/fix_test_system
  - ceaba05 Skip get time test
- **PR** #54038: (Ch3LL) Pyton3 digital ocean test fix: to_str on key @ *2019-07-29 16:54:19 UTC*
  - 4aed833 Merge pull request #54038 from Ch3LL/do_py3_fix
  - f7346db Pyton3 digital ocean test fix: to_str on key
    - 05cd93f fixs integration terminate error
    - 69c3106 fixs integration terminate error
- **PR** #53735: (twangboy) Fix Windows tests in test_system @ *2019-07-26 22:38:28 UTC*
  - 3cedacd Merge pull request #53735 from twangboy/fix_test_system
  - a9e9c97 Add timeouts and account for those in assert
  - d3a160e Merge branch '2019.2.1' into fix_test_system
  - f95f0e7 Merge branch '2019.2.1' into fix_test_system
  - 87e02b8 Use setUpClass
  - 6a685bd Fix some tests in the Windows Class
- **PR** #53953: (Ch3LL) Send SIGTERM to webserver in teardown of gitfs tests @ *2019-07-25 21:12:42 UTC*
  - cc1cda1 Merge pull request #53953 from Ch3LL/improve_git_test
  - 347ea1e Use Sigkill and add time.sleep before check
  - 637bf95 Merge branch '2019.2.1' into improve_git_test
  - c0be147 Send SIGTERM webserver during teardown of gitfs tests
  - b776c0c Check if gitfs server fails to setup for tests
- **PR** #53999: (Ch3LL) Generate new key each time for digital ocean key test @ *2019-07-25 21:07:45 UTC*
  - 2324167 Merge pull request #53999 from Ch3LL/fix_digital_ocean
  - b0b6e3b Generate new key each time for digital ocean key test
- **PR** #53970: (garethgreenaway) [2019.2.1] Adding a WAR ROOM Skip for test_directory_clean_require_with_name @ *2019-07-25 21:03:49 UTC*
  - 32fec66 Merge pull request #53970 from garethgreenaway/osx_skip_test_directory_clean_require_with_name
  - 362b84a Adding a WAR ROOM Skip for test_directory_clean_require_with_name
- **PR** #54003: (dwoz) War room skip for tcp build @ *2019-07-24 22:52:18 UTC*
  - 213dfff Merge pull request #54003 from dwoz/skip_test
  - 6cdb8fa War room skip for tcp build
- **PR** #53897: (cmcmarrow) patches salt grains locale_info decode error @ *2019-07-23 13:19:00 UTC*
  - 048c097 Merge pull request #53897 from cmcmarrow/timezone_fix

  - d9e402d Merge branch '2019.2.1' into timezone_fix
- **PR** #53920: (s0undt3ch) [2019.2.1] Update CI pipelines. Remove old jenkins cruft. @ *2019-07-20 12:33:01 UTC*
  - 9a846b4 Merge pull request #53920 from s0undt3ch/hotfix/ci-pipelines-2019.2.1
  - b09963b Update CI pipelines. Remove old jenkins cruft.
- **PR** #53728: (garethgreenaway) [2019.2.1] Disabling test_get_set_computer_name on OS X and Py3 @ *2019-07-19 17:18:33 UTC*
  - 15accef Merge pull request #53728 from garethgreenaway/2019_2_1_mac_system_disable_test_get_set_computer_name
  - a6d853c Merge branch '2019.2.1' into 2019_2_1_mac_system_disable_test_get_set_computer_name
  - 5d537ed Missing six import. Updating skip message.
  - ac6dccd Disabling test_get_set_computer_name on OS X and Py3.
- **PR** #53913: (garethgreenaway) [2019.2.1] skip test_issue_2594_non_invalidated_cache on MacOS @ *2019-07-19 17:17:36 UTC*
  - a54ec89 Merge pull request #53913 from garethgreenaway/disable_test_issue_2594_non_invalidated_cache_macos
  - c65c5d5 Skip the test test_issue_2594_non_invalidated_cache on MacOS where it is flakey.
- **PR** #53902: (twangboy) Skip tests that modify date or time @ *2019-07-18 17:53:31 UTC*
  - b091eb7 Merge pull request #53902 from twangboy/skip_dt
  - 76cf936 Skip tests that modify date or time
- **PR** #53901: (s0undt3ch) [2019.2.1] Don't fail when combining coverage files @ *2019-07-18 17:46:32 UTC*
  - 22b7b1a Merge pull request #53901 from s0undt3ch/hotfix/wrap-coverage-combine
  - b459a48 Don't fail when combining coverage files
- **PR** #53542: (dwoz) Fix leak of SaltMessageClient instances when using tcp transport @ *2019-07-18 17:44:44 UTC*
  - 84e798a Merge pull request #53542 from dwoz/tcp_leak
  - 3daeb4f Update TCP pipelines
  - 52f9556 Merge branch '2019.2.1' into tcp_leak
  - f5313fd Fix tcp message client test
  - 3419bf5 Merge branch '2019.2.1' into tcp_leak
  - 3125cd3 Merge branch '2019.2.1' into tcp_leak
  - 9a33582 Merge branch '2019.2.1' into tcp_leak
  - 7eb5d41 Merge branch '2019.2.1' into tcp_leak
  - 481372b Fix torando loop thread issue
  - aff15d4 Fix linter wart
  - 9606db7 Comment the tcp message client test better
  - dcf576f Add unit test for tcp message client close method
  - 4420556 Download artifacts for tcp jobs
  - e6a09dd Merge remote-tracking branch 'origin/tcp_leak' into tcp_leak
    - f484f3f Merge branch '2019.2.1' into tcp_leak

  - 4a37234 Add tcp suffix to github notifications
  - 4a2848b Add transport PR tests
  - 9a4b407 Fix leak of SaltMessageClient instances when using tcp transport
    - 592f3fe undo test
    - bc550ad wip pytest test david
    - 75571e4 fixs timezone decode error
    - d041660 fixes timezone decode error
    - 1ddd1a9 fixs timezone decode error
    - e75dafa patches timezone grain
    - eaca473 patches salt grains locale_info decode error
- **PR** #53873: (bryceml) increase sleep time between kitchen create failures to account for ap… @ *2019-07-16 23:46:09 UTC*
  - 61e9efd Merge pull request #53873 from bryceml/2019.2.1-increase-sleep
  - aae0bf6 increase sleep time between kitchen create failures to account for api limits
- **PR** #53750: (twangboy) Fix memory error when the test suite cleans up (2019.2.1) @ *2019-07-16 23:00:07 UTC*
  - 317d9af Merge pull request #53750 from twangboy/fix_helpers
  - fa0e9c3 Merge branch '2019.2.1' into fix_helpers
- **PR** #53851: (dwoz) Master stats revert @ *2019-07-16 16:05:38 UTC*
  - 6c2b3a5 Merge pull request #53851 from dwoz/master_stats_revert
  - 0bc72e4 Revert "Merge pull request #53822 from dwoz/master_stats_test"
  - 4553ba7 Revert "Merge pull request #53829 from saltstack/fix_stats_2019.2.1"
- **PR** #53829: (dwoz) Fix stats on windows @ *2019-07-12 01:03:47 UTC*
  - 5064027 Merge pull request #53829 from saltstack/fix_stats_2019.2.1
  - 9f2d20d Fix stats on windows
- **PR** #53826: (dmurphy18) WAR ROOM test skip till rewritten to allow for dnf on RHEL 8 and F30 @ *2019-07-12 00:39:11 UTC*
  - 971eda3 Merge pull request #53826 from dmurphy18/fedora30_fixes
  - 34b261d WAR ROOM test skip till rewritten to allow for dnf on RHEL 8 and Fedora 30
- **PR** #53822: (dwoz) Enable master stats for tests @ *2019-07-11 23:37:55 UTC*
  - ba33d76 Merge pull request #53822 from dwoz/master_stats_test
  - d2b8315 Enable master stats for tests
  - 3471422 Fix memory error when the test suite cleans up
- **PR** #53591: (twangboy) Fix whitelist errors in *test_boto_** state tests on Windows @ *2019-07-07 05:45:21 UTC*
  - 1756156 Merge pull request #53591 from twangboy/fix_boto_tests
  - ba8ba26 Merge branch '2019.2.1' into fix_boto_tests

  - 75175bb Merge pull request #53466 from dwoz/test_pres_abs
  - f24bf06 Use new pipeline format
  - a74580b Clean up cruft
  - 68958f5 Do not create duplicate minion ids

  - c47eeb4 Add amazon 2 to PR tests
  - dc90b47 More robust beacon state test
    - 95b1819 Initial working tests for gpg fixes and import keys, signing
    - b2c9ae2 Update access to str/bytes with to_unicode/to_bytes for Python 3
- **PR** #53609: (s0undt3ch) CI Pipelines. Timeout after getting a node. Report exit code. @ *2019-06-27 16:09:54 UTC*
  - 582ac5f Merge pull request #53609 from s0undt3ch/hotfix/fix-nox-bypass-2019.2.1
  - 024be84 CI Pipelines. Timeout after getting a node. Report exit code.
- **PR** #53574: (s0undt3ch) [2019.2.1] Minor fixes/adjustments to the new CI pipelines @ *2019-06-25 18:48:25 UTC*
  - f568796 Merge pull request #53574 from s0undt3ch/hotfix/fix-nox-bypass-2019.2.1
  - e85e2f4 Minor fixes/adjustments to the new CI pipelines
- **PR** #53584: (dwoz) Add unit tests for recent SaltCacheLoader changes @ *2019-06-24 23:40:43 UTC*
  - **PR** #53563: (twangboy) SaltCacheLoader does not create multiple FileClients (refs: #53584)
  - 77b7fc4 Merge pull request #53584 from dwoz/client_cache
  - e9b61dc Add unit tests for recent SaltCacheLoader changes
    - 5558a0a Add reg to the whitelist
- **PR** #53563: (twangboy) SaltCacheLoader does not create multiple FileClients (refs: #53584) @ *2019-06-22 23:23:03 UTC*
  - 6ed6c31 Merge pull request #53563 from twangboy/py3_windows_hang
  - 369720e Allow the file_client to be overridden
  - f6c592c Don't instantiate the file_client every time
- **PR** #53432: (garethgreenaway) [2019.2.1] Various fixes for 2019.2.1 to ensure tests pass on Mac OS X @ *2019-06-21 13:47:41 UTC*
  - c606952 Merge pull request #53432 from garethgreenaway/2019_2_1_mac_fixes
  - 1974f11 Disabling a couple more tests in integration.modules.test_cp that hang on OS X and Py2.
  - 7721151 Fixing lint.
  - 1d4e228 Updating various skips for tests to only skip if OS is OS X and Python is Python2.
  - 01dafdc Skipping integration.modules.test_cp.CPModuleTest.test_get_file_str_https on OS X
  - c02db20 Disabling integration.modules.test_state.StateModuleTest.test_parallel_state_with_long_tag
  - 8788877 Skip integration.states.test_file.FileTest.test_issue_11003_immutable_lazy_proxy_sum and integration.states.test_pip_state.PipStateTest.test_22359_pip_installed_unless_does_not_trigger_warnings when running on OS X.
  - cf76027 Removing wrong import of skipIf
  - b10e1e7 Moving the skipIf for OS X from the beacon state tests to the renderer state tests.
  - d2fef9a Disabling beacon state tests on OS X for the time being.
  - 1741bb0 Adding some timeouts to see if it helps the tests pass on OS X.
  - fd0ba0a Ensure the user and group used by @with_system_user_and_group are consistent.
  - e03ab81 Using salt.utils.path.which to find false, on OSX it lives under /usr/bin/

  - 353f9d4 Fixing the beacons.reset function. Once the reset has taken place in beacons/__init__.py we need to fire an event back to complete the loop and ensure that everything worked as expected.
  - ee3cbc7 fix to how the depends decorator works. Only run the dependency commands for the module we're checking.
  - 8440176 Fixing a log issue that pops up after test_gen_thin_compression_fallback_py3 on "OS X, need to ensure that salt.utils.thin.os.close is mocked.
  - 9767ddd Format for the sqlite3 database used for the assistive information changed in Mojave, additional columns added.
  - 9c8a7e6 Fixing a bug when the roots fileserver and the location is a symlink to another location. This fix ensures that when fsroot is referenced we are using the real path and not the symlink path.
- **PR** #53526: (s0undt3ch) [2019.2.1] Update pipelines to work on old and new jenkins @ *2019-06-20 15:29:13 UTC*
  - 59e2a1f Merge pull request #53526 from s0undt3ch/hotfix/fix-nox-bypass-2019.2.1
  - 24d6d09 Update pipelines to work on old and new jenkins
- **PR** #53210: (Ch3LL) Cherry-Pick #52787 into 2019.2.1 @ *2019-06-20 13:33:13 UTC*
  - **PR** #52787: (garethgreenaway) [2018.3] Fixes to test_pip state sls files (refs: #53210)
  - f5f80af Merge pull request #53210 from Ch3LL/cp-52787
  - f27c434 Merge branch '2019.2.1' into cp-52787
- **PR** #53467: (twangboy) Check valid username first (fixes failing symlink test) @ *2019-06-19 17:04:30 UTC*
  - fd6cb35 Merge pull request #53467 from twangboy/fix_test_win_file
  - 92950c5 Merge branch '2019.2.1' into fix_test_win_file
  - 6a21edb Merge branch '2019.2.1' into fix_test_win_file
  - 31ce1fb Fix some lint, skip some tests
  - 6de4db6 Monkeypatch in the class instead of globally
  - d663a1f Fix the failing BlockReplace test cases on Windows
  - 299f88f Update test_managed_contents
  - 81110e5 Fix test_file_copy_make_dirs that was failing on Linux
  - 8d0529d Fix some lint
  - 4a9c020 Fix issues with win_runas
  - bceffa1 Remove privs message
  - 54be0a6 Verify username early in win_runas
- **PR** #53475: (Ch3LL) Add pypsexec requirement for cloud tests @ *2019-06-19 13:30:25 UTC*
  - 3230078 Merge pull request #53475 from Ch3LL/add_pypsexec
  - ab59a55 Merge branch '2019.2.1' into add_pypsexec
  - f954363 Merge branch '2019.2.1' into add_pypsexec
  - 8f7cbfc Merge branch '2019.2.1' into add_pypsexec
  - fa22b39 Add pypsexec requirement for cloud tests
- **PR** #53491: (Ch3LL) Update test_gen_hash for macosx @ *2019-06-19 13:16:04 UTC*
  - bdd7c2c Merge pull request #53491 from Ch3LL/crypt_test_mac

    - b84833d Merge branch '2019.2.1' into fix_53274
    - 7085f36 Fixed pylint issue on PR not showing when run pylint locally
    - 1200031 Updated to use package bash-doc if Amazon Linux 1 after review comments
    - b2a4a5e Fix for issue #53274, test on Amazon Linux 1
    - **PR** #53356: (Akm0d) Updated paramiko to version 2.2.3 for python3.7 support
- **ISSUE** #53137: (bryceml) update doc pr's to be built using python3 and sphinx 2.0.1 (refs: #53273)
- **PR** #53273: (s0undt3ch) [2019.2.1] Switch docs building under Py3 @ *2019-06-05 10:01:03 UTC*
    - 1cf57e9 Merge pull request #53273 from s0undt3ch/hotfix/py3-nox-docs-2019.2.1
    - 98653c0 Allow docs to be built on Python >= 3.5, not just Python 3.6
    - c54f06f Have sphinx turn errors into warnings
    - 07f4327 Switch docs building under Py3

- **PR** #53361: (s0undt3ch) [2019.2.1] Only make a new log record if it's a dictionary. @ *2019-06-05 09:56:15 UTC*
  - dfd36a2 Merge pull request #53361 from s0undt3ch/hotfix/fix-mp-logging-2019.2.1
  - d70d61f Fully revert 962b11687
- **ISSUE** #53171: (twangboy) integration.states.test_network.NetworkTest.test_managed (refs: #53351)
- **PR** #53351: (waynew) Add checks for Amazon Linux to ip module @ *2019-06-04 19:25:58 UTC*
  - 5efb670 Merge pull request #53351 from waynew/53171-fix-network-managed
  - e801afe Add checks for Amazon Linux to ip module
- **PR** #53242: (s0undt3ch) [2019.2.1] newer msgpack ipc fixes @ *2019-06-03 23:39:09 UTC*
  - **PR** #52934: (twangboy) Update msgpack calls for newer msgpack (refs: #53242)
  - **PR** #52755: (dwoz) Fix non raw msg pack msg decoding (refs: #53242)
  - **PR** #52488: (terminalmage) Fix deprecation warning in msgpack >= 0.5.2 (2018.3) (refs: #52755)
  - **PR** #52487: (terminalmage) Fix deprecation warning in msgpack >= 0.5.2 (develop) (refs: #53242)
  - ce5d79a Merge pull request #53242 from s0undt3ch/hotfix/msgpack-ipc-2019.2.1
  - d27a524 Merge branch '2019.2.1' into hotfix/msgpack-ipc-2019.2.1
- **PR** #53289: (cmcmarrow) stops pylint E1120 from showing @ *2019-06-01 04:57:27 UTC*
  - df448c2 Merge pull request #53289 from cmcmarrow/test_kubernetes_lint_failures_silenced
  - 03eacac Merge branch '2019.2.1' into test_kubernetes_lint_failures_silenced
- **PR** #53304: (s0undt3ch) [2019.2.1] Refactor Jenkins PR pipelines to download artifacts after timeout @ *2019-05-31 17:10:19 UTC*
  - 6fac22b Merge pull request #53304 from s0undt3ch/hotfix/jenkins-pipelines-refactor-2019.2.1
  - 6e778ef Refactor Jenkins PR pipelines to download artifacts after timeout
- **PR** #53297: (s0undt3ch) [2019.2.1] The TCP transport needs the exact same requirements as the ZeroMQ one @ *2019-05-30 19:42:29 UTC*
  - d359513 Merge pull request #53297 from s0undt3ch/hotfix/tcp-transport-tests
  - bec7fa5 The TCP transport needs the exact same requirements as the ZeroMQ one
  - f93e7d3 stops pylint E1120 from showing
  - cbe6423 stops pylint E1120 from showing
  - c5a5d43 test_kubernetes_lint_failures_silenced
  - b838395 test_kubernetes_lint_failures_silenced
  - 997d0a8 stops pylint E1120 from showing
    - 5542fa8 Add the missing, and required, top pillar file.
    - 0ae2ef0 Under Py2 we still want raw to be set to True
    - 714d663 Re-submit #52934 fixed after being reverted in #52755
    - 243b512 Update msgpack calls for newer msgpack
      - 0f9077b Merge branch '2019.2.1' into cp-52787
- **PR** #53264: (s0undt3ch) [2019.2.1] Minion blackout tests - Add the missing, and required, top pillar file @ *2019-05-29 07:30:45 UTC*

  - 50e31ec Merge pull request #53264 from s0undt3ch/2019.2.1
  - acabb70 Merge branch '2019.2.1' into 2019.2.1
- **PR** #52966: (s0undt3ch) Always run the full test suite on the 2019.2.1 release branch @ *2019-05-28 15:43:12 UTC*
  - 749c626 Merge pull request #52966 from s0undt3ch/hotfix/full-test-run
  - 247c461 Always run the full test suite on the 2019.2.1 release branch
- **PR** #53138: (frogunder) vultr cloudtest fix @ *2019-05-28 14:34:22 UTC*
  - a7afd31 Merge pull request #53138 from frogunder/fix_vultr_cloudtest
  - 9f4550c vultr cloudtest fix
    - 912b9b3 Add the missing, and required, top pillar file.
      - 9d21b75 Merge branch '2019.2.1' into cp-52787
- **PR** #53258: (s0undt3ch) [2019.2.1] Fix multiprocessing logging queue dict changing during iteration errors @ *2019-05-27 19:26:27 UTC*
  - d011beb Merge pull request #53258 from s0undt3ch/2019.2.1
  - ad01dd2 More robust minion blackout tests
  - a0346d1 Try harder to get the minion grains
  - 36717bd Try and address the test flakyness
  - ce07d8c Add more information when the assertion fails
  - b99e914 Attempt to fix mine tests
  - fca981c One more known to return None
  - 951df48 One more known to return None
  - eb5fd3e Fix *integration.modules.test_mine.MineTest.test_get* for sub_minion
  - 26314f5 Fix multiprocessing logging queue dict changing during iteration errors
- **PR** #53153: (s0undt3ch) [2019.2.1] Add Amazon Linux 2018.3 and 2 static requirements @ *2019-05-27 12:02:20 UTC*
  - b69e080 Merge pull request #53153 from s0undt3ch/2019.2.1
  - 166067c Use *currentBuild.resultIsBetterOrEqualTo* instead
  - cefdd90 Stop error messages about missing roster file on syndic master
  - 6bf8f46 Don't complain when attempting to close sockets at this stage
  - e3f3cc9 Add Amazon Linux 2018.3 and 2 static requirements
  - 872acc0 Switch the ubuntu-14.04 exception with amzn-1
  - **PR** saltstack/salt#52934: (twangboy) Update msgpack calls for newer msgpack (refs: #53235)
- **PR** #53235: (s0undt3ch) Revert "Update msgpack calls for newer msgpack" @ *2019-05-24 13:35:20 UTC*
  - 14aeeea Merge pull request #53235 from saltstack/revert-52934-fix_msgpack
  - 3295aea Revert "Update msgpack calls for newer msgpack"
- **PR** #53131: (s0undt3ch) [2019.2.1] Update to salt-bootstrap v2019.05.20 @ *2019-05-24 07:45:57 UTC*
  - 6923427 Merge pull request #53131 from s0undt3ch/hotfix/update-bootstrap-2019.2.1
  - 4cce4f4 Merge branch '2019.2.1' into hotfix/update-bootstrap-2019.2.1

  - 6751ee1 Merge branch '2019.2.1' into hotfix/update-bootstrap-2019.2.1
  - 6988e07 Update to salt-bootstrap v2019.05.20
- **PR** #52934: (twangboy) Update msgpack calls for newer msgpack (refs: #53242) @ *2019-05-23 23:18:23 UTC*
  - a61db20 Merge pull request #52934 from twangboy/fix_msgpack
  - f02a12e Merge branch '2019.2.1' into fix_msgpack
  - 7e2cd34 Merge branch '2019.2.1' into fix_msgpack
  - bc9ce8e Merge branch '2019.2.1' into fix_msgpack
  - 0abd1ec Update msgpack calls for newer msgpack
    - 3366d59 update pylint exceptoin
    - 6c452b3 removing unwanted commits from this branch
    - e0b0ba8 Handling in flaky when maximum number of attempts raised and the exception should be raised. Different approaches depending on Py2 vs Py3.
    - 434dcda Disabling two tests when using Python 3 and OS X
    - 5784e80 Disabling integration.shell.test_minion.MinionTest.test_issue_7754 test on OS X because it hangs the test suite.
    - 78aeb61 Dropping the version check for InstallationError down to anything 1.0 or greater. Removing the test that simulates versions of pip below 1.0.
    - 4ec90c2 Adding an jinja if statement to only the python parameter if the result from get_python_executable is a valid value. Maintaining backwards compatibility to run tests without Nox.
- **PR** #53192: (twangboy) Skip *test_gen_hash* test on Windows @ *2019-05-23 05:33:13 UTC*
  - 8a57270 Merge pull request #53192 from twangboy/skip_test_gen_hash
  - 758d020 Skip test on Windows
- **PR** #53157: (twangboy) Fix *unit.modules.test_win_file.WinFileTestCase.test_issue_52002_check_file_remove_symlink* @ *2019-05-22 22:32:26 UTC*
  - 446e70c Merge pull request #53157 from twangboy/fix_test_win_file_symlink
  - 5672076 Merge branch '2019.2.1' into fix_test_win_file_symlink
- **PR** #53141: (Ch3LL) Check for all non-word characters when calling secure_password @ *2019-05-22 17:24:54 UTC*
  - 6fbe9aa Merge pull request #53141 from Ch3LL/shadow_fed_fix
  - a3c4066 Merge branch '2019.2.1' into shadow_fed_fix
- **PR** #53161: (Ch3LL) Add HAS_REQUIRED_CRYPTO var for m2crypto in joyent @ *2019-05-22 13:36:07 UTC*
  - fb29512 Merge pull request #53161 from Ch3LL/joyent_m2crypto
  - 08d03e0 Add HAS_REQUIRED_CRYPTO var for m2crypto in joyent
  - 16ef3d2 Merge branch '2019.2.1' into shadow_fed_fix
  - 09ff867 Check for all non-word when calling secure_password
    - 334c93b Elevate token before creating symlink
- **PR** #53073: (Ch3LL) salt-ssh: python binary exists before version check @ *2019-05-20 22:36:34 UTC*

  - 85e9b2f Merge pull request #53073 from Ch3LL/ssh_py3_log
  - 383e781 Improve logging in salt-ssh gen_thin
  - 4371434 salt-ssh: python binary exists before version check
- **PR** #52957: (Ch3LL) Set default_flow_style=None in yaml.dump calls @ *2019-05-16 19:42:35 UTC*
  - bd02ea6 Merge pull request #52957 from Ch3LL/yaml_flow_style
  - 5f6581a Merge branch '2019.2.1' into yaml_flow_style
- **PR** #53072: (Ch3LL) Backport #52754 into 2019.2.1 @ *2019-05-16 19:29:22 UTC*
  - **PR** #52754: (garethgreenaway) [2018.3] Fixes to multiprocessing queue when using MacOS (refs: #53072)
  - f410346 Merge pull request #53072 from Ch3LL/bp-52754-2019.2.1
  - 13e5e55 The maximum for the multiprocessing queue on MacOS is 32767, so if we running on MacOS then we use that maximum.
- **ISSUE** #52817: (waynew) unit.modules.test_telegram.TelegramModuleTest.test_post_message (refs: #52972)
- **PR** #52972: (garethgreenaway) [2019.2.1] Fix to unit.modules.test_telegram @ *2019-05-15 07:50:13 UTC*
  - 06fa91b Merge pull request #52972 from garethgreenaway/52817_unit_modules_test_telegram_telegrammoduletest_test_p
  - cea7131 Removing global declaration.
  - 5bf9a95 Fixing lint.
  - 4d3c46d fixing broken unit.modules.test_telegram test.
- **PR** #53025: (Ch3LL) Change package name for suse pkg tests @ *2019-05-15 07:41:44 UTC*
  - d340cbc Merge pull request #53025 from Ch3LL/suse15_pkg_test
  - 0a213ee Change package name for suse pkg tests
- **PR** #53020: (Ch3LL) Change ssh tops log message to debug @ *2019-05-14 16:56:42 UTC*
  - c56fbb0 Merge pull request #53020 from Ch3LL/ssh_tops
  - cbbc764 Merge branch '2019.2.1' into ssh_tops
- **PR** #52973: (twangboy) Fix *integration.states.test_pip_state.PipStateTest.test_issue_2028_pip_installed_state* on Windows @ *2019-05-13 20:56:28 UTC*
  - ce099aa Merge pull request #52973 from twangboy/fix_test_pip_state
  - 21838a1 Merge branch '2019.2.1' into fix_test_pip_state
- **PR** #52986: (Ch3LL) Revert "Make sure --run-expensive runtests.py arg works" @ *2019-05-13 19:38:17 UTC*
  - 055d374 Merge pull request #52986 from Ch3LL/expensive_revert
  - 368c012 Revert "Make sure --run-expensive runtests.py arg works"
  - cce263e Merge branch '2019.2.1' into fix_test_pip_state
  - 351d415 Return path to Python instead of None
    - c0538d2 Change ssh tops log message to debug
    - e317186 Merge branch '2019.2.1' into yaml_flow_style
- **PR** #52968: (s0undt3ch) [2019.2.1] Salt >= 2018.3.x supports Py3.7 @ *2019-05-12 21:44:57 UTC*
  - ee05da5 Merge pull request #52968 from s0undt3ch/2019.2.1
  - 73c3726 Salt >= 2018.3.x supports Py3.7

- **ISSUE** #50310: (xuhcc) acme.cert falsely reports changes (refs: #50400)
- **PR** #52796: (Ch3LL) Backport #50400 and #50402 into 2019.2.1 @ *2019-05-10 19:30:12 UTC*
  - **PR** #50402: (xuhcc) Fix typo in salt.modules.acme (refs: #52796)
  - **PR** #50400: (xuhcc) Fix incorrect change reporting in acme.cert (refs: #50402, #52796)
  - cae51c2 Merge pull request #52796 from Ch3LL/bp-50400
  - 0c2e3e7 Merge branch '2019.2.1' into bp-50400
  - 1268e3e Merge branch '2019.2.1' into bp-50400
  - 09fa9e3 Fix typo
  - 9be5c0c Fix incorrect change reporting in acme.cert
    - 9a27fb3 Merge branch '2019.2.1' into yaml_flow_style
- **PR** #52770: (twangboy) Fix test_file_managed_should_fall_back_to_binary on Windows @ *2019-05-09 20:35:02 UTC*
  - 20cccd8 Merge pull request #52770 from twangboy/fix_test_file
  - ac27e69 Merge branch '2019.2.1' into fix_test_file
  - 30a5093 Merge branch '2019.2.1' into fix_test_file
  - c08b10d Merge branch '2019.2.1' into fix_test_file
  - 340ee23 Pass encoding to _validate_str_list
    - 0d0e354 Fix yamldumper test for both py2/py3
    - 20bc954 Update docs for yamldumper test
    - bf648e5 Update tests/unit/utils/test_yamldumper.py
    - 70d578a Set default_flow_style=None in yaml.dump calls
- **PR** #52943: (Ch3LL) Fix elasticsearch state module: allow user to define empty aliases @ *2019-05-09 15:46:38 UTC*
  - 4437764 Merge pull request #52943 from Ch3LL/fix_elastisearch
  - 451fb7e Merge branch '2019.2.1' into fix_elastisearch
  - ebff9b9 Fix elasticsearch state module: allow user to define empty aliases
- **PR** #52952: (s0undt3ch) [2019.2.1] More nox changes and test fixes @ *2019-05-09 15:03:07 UTC*
  - 9b290b6 Merge pull request #52952 from s0undt3ch/merge-forward/2018.3-to-2019.2.1-cherry
  - a06d7ce We need to call the decorator
  - 77185af Partial revert since this is a class method
  - f5c5771 Lint fixes
  - 3e43c87 Revert ”fix compare_versions method”
  - 0e139bf Fix *GOLDEN_IMAGES_CI_BRANCH* value
  - 12a9408 Add Py3.7 static requirements
  - 8e505fb Move tests to existing test modules
  - 4681609 *tests/unit/config/__init__.py* -> *tests/unit/config/test_config.py*
  - b1dc7f6 Pin to *moto<=1.3.7* because of https://github.com/spulec/moto/pull/1952

  - 0ffe7ca We no longer test againt Ubuntu 14.04 which reached EOL
  - 33743fc Don't traceback when trying to close a closed socket
  - da2e147 Always cleanup the changed environ
  - 087c74d No globals in tests, specially dictionaries!
  - a814fc0 Fix underscore wart (and linter)
  - 74b8f5f Fix deprecation warning in msgpack >= 0.5.2
  - 962b116 Try to address dict changing during iteration
  - c58af57 Tweak codeclimate settings for less noise
  - 5bb7869 fix linter
  - 0b81841 Cherry-pick test fix
  - 99f9e1c fix compare_versions method

- **PR** #52853: (s0undt3ch) [2019.2.1] Bring nox into 2019.2.1 @ *2019-05-09 09:52:42 UTC*
  - a510edf Merge pull request #52853 from s0undt3ch/merge-forward/2018.3-to-2019.2.1-cherry
  - a8f7b46 Test is not destructive.
  - 63663cf We no longer test againt Ubuntu 14.04 which reached EOL
  - 62574ee Typo
  - e3e3761 Proper english in requirements comments
  - e9f6a12 *identical_signature_wrapper* adds *__wrapped__* to function globals
  - 10283b4 Upload coverage reports on full test runs
  - 6e0b61b Less flaky mine tests
  - 3709ed7 msgpack returns string_types
  - a36b15e Add regression test
  - ce782ff Fix non raw msg pack msg decoding
  - f193f0f Update Issue Template: questions removed
  - 4417095 Fix underscore wart (and linter)
  - e6c2ae4 Fix deprecation warning in msgpack >= 0.5.2
  - 6375944 Add ubuntu1804 to pr tests
  - 8fdb04d SIGKILL is not always available use a local variable
  - 4d6b8da Fix linter
  - 759bccc Fix test_doc on windows by using grep yay!
  - 0ce086d Fix remaining failures on ubuntu 1404 and add to PR tests
  - fdf80fd Change py3 windows timeout from 6 to 8 hours
  - b0aa287 Fix missing class wart
  - 21ecb74 fix linter
  - 62c0f9f Skip tests when no libcloud
  - 1d92290 Fix unused import

- 72cdc91 Fix linter
- 238fd0f Fix broken pip state
- 89533ba Fix *NOX_ENV_NAME*
- 7cfc9e8 Fix *NOX_ENV_NAME*
- 2087c91 Fix *NOX_ENV_NAME*
- 2f1aff5 Rename kitchen-centos6-py3 to kitchen-centos6-py2
- 1eea990 Fix linter
- 52ca668 Skip tests when no libcloud
- 2cf4b98 Add centos-6-py2 and Debian 8,9 py2 and 3 to PR tests
- 522599d Don't fail just because some random process died
- 34cef86 Ignore super not called
- b7ace9c Fix linter
- aceb6d3 Skip libcloud unit tests when no libcloud
- f73420b Install mock on Python < 3.6
- 28fbde1 Add *moto* to the windows dependencies
- 8cbecc1 Pin kubernetes to <4.0
- 2acb0f3 Make sure --run-expensive runtests.py arg works
- 22cae20 Remove ref restriciton from kitche-salt
- 67095df Add 'runFull' build parameter for PR tests
- 12d8d35 Stop w32time before and start after testing
- 7f1c22c Skip tests that fail on Windows
- f4ae97f Upgrade etcd to > 0.4.2
- 381f5fe Limit and reduce the amount of log records sent over the wire
- 0c94b5d More entries to ignore
- c3a21f5 As a script, not as a module
- 8948b69 Include *COVERAGE_FILE* as an env variable.
- 0af561e Each generated script is now prepared for code coverage
- 294d6f4 Use the system's path separator
- e52ab87 Always combine and generate the XML coverage report
- 666ca9f Fix proxy minion startup issue on the test suite
- 7838ace *impacket* does not support Py3
- ba8d0fe Allow *--install-only* to gather the required information
- eed7d68 Create nox lint virtualenvs before running them
- e9e57cf Syndic roster not in 2017.7.9
- 111c63a4d Create the roster even when not running ssh
- 11c02a0 Fix unit.test_loader.LoaderGlobalsTest.test_states

- 8694db1 Fix windows tests
- 82e9ac5 Avoid race condition in even assertions
- 9443451 Revert part of 927219c since it is not a fix
- 5fee762 Fix timeout logic
- 517650f check timeout when queue empty
- 7c0a9af fix linter
- 961dc40 Ignore missing variable in six module
- 0f5a7f0 Fix typo
- 6c8c418 Do not limit event assert to first event
- 3042292 Wait longer for ping reaction
- 8c10f5f Fix xml block causing docs to fail
- 6e5768a Add a nox session for the Jenkins tornado jobs
- 43321e8 Add a cloud nox session for both runtests and pytest
- b6b4e95 Lint cleanup
- 0670614 Add tests for wraps
- 1670b5d Use functools.wraps with decorators
- 5ae263c Update static requirements for 2018.3 branch
- 3482c4d Disable code coverage uploads.
- 0e5bc67 Lint fixes
- 337c737 Update CI jobs to point to 2018.3
- 72e8603 Skip test if required cypto libs are not available
- e6bc9f8 Default to Cryptodome, fallback to PyCrypto
- b2b0764 Be aware of the different path separators
- 7e79b18 We need to make sure the virtualenv path entry is removed when searching
- ff6d3c6 We don't need to be root to run these tests
- 5965ab4 Disable progress bars on pip installs
- f86a44e Use the real python executable path when running within a virtualenv
- 3d407e8 Add a helper to return the path to the real python executable
- ea9d246 We must also provide *venv_bin* when running within a virtualenv
- 31e91b0 Fix pip tests, in particular under windows
- 493f493 Don't fail if pkg_resources is not importable
- a1eb400 Specify the SHA we need
- 0b01f21 Let's fully unload pip
- 0b6f848 Fix docker entries
- 870b899 Remove unused argument
- 1656cb4 Disable re-running failed tests for now

- 6db4141 Also ignore multiprocessing coverage files
- 83dc97d Actually write the lint reports.
- 5f97270 Try to make sure some pip internal functions are always present in sys.modules after reloads
- 0090c55 Try and address the fact that some python packages are only provided by the distro
- 4a072fe These tests aren't destructive
- 5c7a956 Don't fail the build if the issue was sending a slack notification
- 361ef6e Don't try to change ownership on non existing paths
- 7b17352 More insight(context) on failure reports
- 93b6b95 Lock supervisor to 3.3.5, last kown working(passing tests) version
- 51114aa Watch out for too long shebang's
- d97fe82 The output is important to know why it failed.
- 9fef385 Strings and integers are not comparable under Python 3
- d308dce Be verbose in a CI context
- 8b7105e Fix failed tests re-run logic
- d6d8db1 Blacklist *enum34* on Py>=3.4. Update requirements.
- 1cd00c0 Update PR CI jobs for nox
- 19a83d5 Blacklist pycrypto and install pycryptodome instead
- 91376b3 Ignore the generated docs archive
- 207b83a Update compiled requirements
- 535e7a7 Add TCP transport nox sessions
- 680b3e5 Compile requirements for the TCP transport
- 49a1ebe Throw error when running either on Py<2.7 or Py>=3.7
- 10528b9 Don't repeat filed tests on missing/empty failed test files file
- 4886809 We currently only support running lint under Py2.7
- a76981b Remove dead code
- 7b2c1ce Don't require six
- a27ed35 Add nox env to build docs
- e1b3f1d Lock docs python requirements
- c8de644 Fix lint issues under tests
- 0372718 Fix lint issues on salt
- 9eab9f4 Add nox session/env/target to run lint against Salt and its test suite
- 123f771 Lock lint requirements
- 8df33ad Back to *+apache-libcloud==1.0.0* and skip windows for now
- 43e3ae6 Bump apache-libcloud requirement because 1.0.0 fails to install on windows
- d5f7813 Remove requiremens for platforms which aren't tested under Py3
- 8f02ee9 Recompile requirements

  - 66626f2 Remove pycryptodome from compiled requirements files
  - 75693e5 Use pycryptodomex on windows and PyCrypto on the rest
  - 4a9c19c Update(fix) requirements
  - 33a3467 We don't test OSX nor Windows under Py3.4
  - fd44fce We want a more verbose pip-compile output
  - c2ae2d5 We now compile requirements for each of the supported minor version
  - 6ee1260 Static requirements are now placed on *py<major>.<minor>* subdirectories
  - 3504804 The required crypto library is pulled in from zeromq.txt or raet.txt
  - 3ffe03c PyZMQ is pulled in from zeromq.txt
  - 7c2fe16 Instead of quoting session parameters, proxy nox sessions
  - d3ae77b Add separate crypto sessions
  - 0399620 Parametrize the transport
  - d33fd03 Update/Generate static requirements to new layout
  - 52ac533 Add pre-commit config to generate static requirements
  - 3cfcb13 Be aware of the new static requirements layout
  - dc7e16a Don't lock the docker requirement. It's not locked on the other platforms
  - 5476ba2 Kubernetes 3.0.0 does include the requirements files. pip-compile chokes on that
  - 79a8261 Previously generated requirements were py2 only
  - 1e29666 IOFLO is pulled in from the raet requirements
  - 4945e35 Fix pylint on 2017.7.9
  - 036bf68 Rerun failed tests
  - 03a9601 Ignore *.nox* directory
  - 50cb630 We have long files
  - db2392f Update CodeClimate settings
  - 899c80e Fix integration.client.test_kwarg test timeouts
- **ISSUE** #52836: (Ch3LL) unit.utils.test_args.ArgsTestCase.test_argspec_report failing (refs: #52852)
- **PR** #52852: (garethgreenaway) [2019.2.1] Fixes to unit.utils.test_args.test_argspec_report @ *2019-05-07 19:25:48 UTC*
  - 77355e2 Merge pull request #52852 from garethgreenaway/52836_test_argspec_report_failing
  - eee5a38 Merge branch '2019.2.1' into 52836_test_argspec_report_failing
- **PR** #52845: (Ch3LL) Backport #52780 into 2019.2.1 @ *2019-05-07 16:27:21 UTC*
  - **PR** #52780: (sbrennan4) Handle ipv6 in _netlink_tool_remote_on (refs: #52845)
  - dcc5fde Merge pull request #52845 from Ch3LL/bp-52780
  - dfff09b Merge branch '2019.2.1' into bp-52780
- **PR** #52851: (Ch3LL) Reload matcher loader when ext_pillar_first set @ *2019-05-07 13:12:07 UTC*
  - 2e4f296 Merge pull request #52851 from Ch3LL/matcher_ext_pillar

  - bdcae5d Add docs for new reload kwarg
  - fc70884 Reload matcher loader when ext_pillar_first set
  - 8ac74e2 Merge branch '2019.2.1' into bp-52780
  - 226c7ce Merge branch '2019.2.1' into bp-52780
  - c1eae84 Add test
  - 69fe65b Use rsplit
    - 8fdc48c Removing create_autospec and having salt.utils.args.argspec_report run against the _test_spec function directly. Depending on the python version, create_autospec gives different results and cause the test to fail. The test is now more accurate at testing the arguments for the function.
- **PR** #52842: (s0undt3ch) *libcrypto.OpenSSL_version_num* might be a callable @ *2019-05-06 17:00:37 UTC*
  - cc7a0d1 Merge pull request #52842 from s0undt3ch/2019.2.1
  - a944017 *libcrypto.OpenSSL_version_num* might be a callable
- **PR** #52839: (twangboy) Add support for EC2 @ *2019-05-04 17:28:54 UTC*
  - b625a6a Merge pull request #52839 from twangboy/fix_test_grain
  - 1c9b372 Add support for EC2
- **ISSUE** #51982: (arsiesys) topic (minion_id) need to be encoded before being hash and sent using zeroMQ (refs: #51983)
- **PR** #52767: (Ch3LL) [2019.2.1] Add tests to PR #51983 @ *2019-05-03 08:35:27 UTC*
  - **PR** #51983: (arsiesys) encode topic before using hashlib (refs: #52767)
  - 6002939 Merge pull request #52767 from Ch3LL/zmq_filter_test
  - 1ee8f37 Merge branch '2019.2.1' into zmq_filter_test
  - d74b6ee Merge branch '2019.2.1' into zmq_filter_test
  - 3210274 Fix linter warnings
  - e7c9d6e increase timeout when gathering results
  - 784786d Add zmq_filter unit tests
  - 805c5ee encode topic before using hashlib
- **PR** #52827: (twangboy) Add pymssql dependency for Windows builds @ *2019-05-03 08:21:40 UTC*
  - 5996932 Merge pull request #52827 from twangboy/add_pymssql
  - 6f0b8e2 Add pymssql dependency for Windows builds
- **ISSUE** #52717: (Ch3LL) debian9 tests segmentation fault (refs: #52797)
- **PR** #52797: (garethgreenaway) [2019.2.1] Only run the libcrypto init if less than OpenSSL 1.1.0 @ *2019-05-03 05:12:31 UTC*
  - e3918c5 Merge pull request #52797 from garethgreenaway/52717_debian_tests_segmentation_fault
  - 7ab0961 Merge branch '52717_debian_tests_segmentation_fault' of github.com:garethgreenaway/salt into 52717_debian_tests_segmentation_fault
    - f8d816e Merge branch '2019.2.1' into 52717_debian_tests_segmentation_fault
- **PR** #52771: (twangboy) Fix *test_gpg* tests on Windows @ *2019-05-02 13:30:18 UTC*

  - b68544f Merge pull request #52771 from twangboy/fix_test_gpg
  - c7f45c2 Pass encoding to stringutils.to_unicode
- **PR** #52783: (Ch3LL) Fix boto_apigateway tests for PyYAML 5.1 @ *2019-05-02 13:26:34 UTC*
  - 316d05b Merge pull request #52783 from Ch3LL/fix_boto_yaml
  - cde29cb Fix boto_apigateway tests for PyYAML 5.1
  - 6ffbca5 Fixing lint.
  - e24f2f8 Only run the libcrypto init if less than OpenSSL 1.1.0.
- **PR** #52769: (twangboy) Remove domain grain from tests for Windows @ *2019-04-30 21:14:26 UTC*
  - 3509465 Merge pull request #52769 from twangboy/fix_test_core
  - 0049f85 Remove domain grain from tests
- **PR** #52768: (twangboy) Remove pchanges... again... @ *2019-04-30 20:24:27 UTC*
  - 30dc14b Merge pull request #52768 from twangboy/fix_test_win_dacl
  - 123b607 Remove pchanges... again...
- **PR** #52753: (twangboy) Skip test_gen_thin_compression_fallback_py3 @ *2019-04-30 03:36:27 UTC*
  - 3e46f51 Merge pull request #52753 from twangboy/skip_test_gen_thin
  - 811b381 Skip test_gen_thin_compression_fallback_py3
- **ISSUE** #52721: (Ch3LL) unit.cloud.clouds.test_ec2 test failing (refs: #52736)
- **PR** #52736: (dwoz) Skip password decryption test when no libraries available @ *2019-04-29 17:07:56 UTC*
  - 6bfca94 Merge pull request #52736 from dwoz/ec2test
  - 04ad027 Merge branch '2019.2.1' into ec2test
- **PR** #52624: (tanlingyun2005) fix TypeError: argument of type int is not iterable @ *2019-04-29 13:15:42 UTC*
  - 9a1ed78 Merge pull request #52624 from tanlingyun2005/2019.2.1
  - 2c6867e add test case to tests/unit/cli/test_batch.py
  - cb7742e Merge branch '2019.2.1' into 2019.2.1
  - c943900 Merge branch '2019.2.1' into 2019.2.1
  - d4abddd fix TypeError: argument of type int is not iterable
  - ed908b3 Merge branch '2019.2.1' into 2019.2.1
  - 463b60e Merge branch '2019.2.1' into 2019.2.1

    - f71168d Merge branch '2019.2.1' into 2019.2.1
  - 509c797 bug fix salt/cli/batch.py
  - 211915c fix salt/cli/batch.py TypeError: argument of type int is not iterable
  - 070ae84 fix TypeError: argument of type int is not iterable
    - b770f96 Skip test requiring crypto when none available
    - e52b390 Warn when password decrypton requested but not possible
- **PR** #52696: (Ch3LL) Backport #50087 into 2019.2.1 @ *2019-04-25 20:33:13 UTC*

  - **PR** #50087: (rbthomp) Fix applying of attributes for returner rawfile_json (refs: #52696)
  - 806307a Merge pull request #52696 from Ch3LL/bp-50087
  - 66e97e7 Fix applying of attributes for returner rawfile_json
- **PR** #52659: (twangboy) Fix issues with the win_file tests @ *2019-04-22 23:34:36 UTC*
  - 174f558 Merge pull request #52659 from twangboy/fix_test_win_file
  - 915c780 Fix issues with the win_file tests
- **PR** #52655: (dwoz) Parse chattr version and fix test case @ *2019-04-22 01:46:29 UTC*
  - d1a61a6 Merge pull request #52655 from dwoz/cron_test_fix
  - e69fcc5 Fix typo
  - 859d088 Merge remote-tracking branch 'origin/cron_test_fix' into cron_test_fix
    - 7f7bb90 Merge branch '2019.2.1' into cron_test_fix
- **PR** #52601: (Ch3LL) Cherry-Pick #52415 into 2019.2.1 @ *2019-04-21 19:33:03 UTC*
  - **PR** #52415: (Ch3LL) Backport #49832 into 2018.3 (refs: #52601)
  - **PR** #49832: (terminalmage) Replace pchanges with changes to make onchanges/prereq work in test mode (refs: #52415)
  - f7d823c Merge pull request #52601 from Ch3LL/cp-52415
  - ecd6802 Merge branch '2019.2.1' into cp-52415
  - 538d5cf Remove pchanges from win_dacl
  - 81b865f use same newfile message on linux for windows file state
  - 93bdd08 Update dict correctly in file state
  - f3c7f27 remove pchanges for windows file modules
  - fb3b75d Fix tests for pchanges backport into 2018.3
  - 0f296bb Update kernelpkg test to reflect pchanges removal
  - 885d6ff Update file.touch unit tests to reflect addition of changes in test mode
  - 4bc5fd0 Add integration tests for test mode onchanges/prereq
  - ed214c4 Make it possible to use prereq with test and saltmod state mods
  - ceb3f4d Add repack_state_returns to TestCase
  - 982e693 Add exception logging in flaky decorator
  - 0ba0ddf Add test mode changes to file.touch state
  - 6db2beb Replace ”pchanges” with ”changes” to fix onchanges/prereq requisites
    - 169c2d5 Chattr version py3 fix
    - cf88c27 Fix linter issues
    - 0ea007d Parse chattr version and fix test case
- **ISSUE** #52508: (Ch3LL) integration.modules.test_publish test failures (refs: #52645)
- **PR** #52645: (dwoz) Fix salt.modules.publish and salt.states.x509 tests @ *2019-04-20 08:17:19 UTC*
  - af4f204 Merge pull request #52645 from dwoz/test_fixes

  - 9b6f9f9 Clean up cruft
  - c3971a5 Fix salt.modules.publish and salt.states.x509 tests
- **PR** #52629: (dwoz) Fix event assertion race condition @ *2019-04-19 19:03:20 UTC*
  - **PR** #52540: (dwoz) Fix race condition in event assertion (refs: #52629)
  - 0a4d2d9 Merge pull request #52629 from dwoz/ping_wait_2019.2.1
  - c001022 Fix linter
  - 423f6f9 Fix vent assertion race condition
- **PR** #52619: (dwoz) Remove unused method from pytest engine @ *2019-04-18 23:45:35 UTC*
  - 4859e6c Merge pull request #52619 from dwoz/pytest_engine_2019.2.1
  - 105784a Remove unused method from pytest engine
- **PR** #52614: (Ch3LL) [2019.2.1] Update integration.modules.test_network.NetworkTest.test_network_ping… @ *2019-04-18 21:54:28 UTC*
  - 77943e5 Merge pull request #52614 from Ch3LL/cp-test_network-2019.2.1
  - 27c79d2 Update integration.modules.test_network.NetworkTest.test_network_ping test address
- **ISSUE** #32245: (tkwilliams) git_pillar should permit automatic mapping of environment to branch a-la gitfs (refs: #50768)
- **PR** #52615: (twangboy) Bring 51661 into 2019.2.1 @ *2019-04-18 21:53:35 UTC*
  - **PR** #51661: (sathieu) git_pillar: Fix all_saltenvs on base env (refs: #52615)
  - **PR** #51597: (sathieu) git_pillar: Fix all_saltenvs on base env (refs: #51661)
  - **PR** #50768: (sathieu) git_pillar: Add support for all_saltenvs parameter (refs: #51597, #51661)
  - c6b4986 Merge pull request #52615 from twangboy/gitfs_2019.2.1
  - d952674 Merge branch '2019.2.1' into gitfs_2019.2.1
- **ISSUE** #52547: (cbosdo) virt.purge throws a libvirt exception on Xen hypervisor (refs: #52548)
- **PR** #52548: (cbosdo) Virt purge fix @ *2019-04-18 20:07:36 UTC*
  - 8ee15a9 Merge pull request #52548 from cbosdo/virt-purge-fix
  - 6ca8f4b Try/except undefineFlags() as this operation is not supported on bhyve
    - 5a0464b Bring 51661 into 2019.2.1
- **PR** #52591: (Ch3LL) [2019.2.1] Update test_schema to mirror the new ValidationErrors in 3.0.0 @ *2019-04-18 16:34:22 UTC*
  - e03aed5 Merge pull request #52591 from Ch3LL/fix_jsonschema_2019.2
  - e09be842 Update test_schema to mirror the new ValidationErrors in 3.0.0
- **ISSUE** #52525: (lomeroe) deserializer_opts are not passed the serializer in file.serialize (refs: #52526)
- **PR** #52526: (lomeroe) Fix use of deserializer_opts in file.serialize @ *2019-04-17 14:08:52 UTC*
  - 21d6365 Merge pull request #52526 from lomeroe/deserializer_opts_fix
  - ea0520c update test for serialization opts
  - 84ff03a Correct attempting to use the serializer_name to pull deserializer_opts when deserializer_name is used as the key in the deserializer_options dict.

- **ISSUE** #49147: (furgerf) Log filled with "Exception occurred while Subscriber handling stream: Already reading" (refs: #51963)
- **PR** #52570: (DmitryKuzmenko) Simplify IPCClient and prevent corrupt messages (Turn 2) 2019.2 @ *2019-04-17 14:03:02 UTC*
  - **PR** #52564: (DmitryKuzmenko) Simplify IPCClient and prevent corrupt messages (Turn 2) (refs: #52570)
  - **PR** #52445: (dwoz) Simplify IPCClient and prevent corrupt messages (refs: #52564)
  - **PR** #51963: (DmitryKuzmenko) Allow multiple instances of IPCMessageSubscriber in one process (refs: #52564)
  - e522ffe Merge pull request #52570 from DSRCorporation/bugs/revert_51963_2019.2
  - fabbcac A couple of race conditions fixes and a test update.
  - 9c85734 Drop singleton from IPCClient
  - 7cf6d54 Revert "Support parallel work of multiple IPCMEssageSubscribers in one process"
  - 7f26e76 Revert "Update doc conf with the new import *tornado.queues*"
  - 69e9416 Revert "Minor: Fix typo in docstring"
- **ISSUE** #52449: (Ch3LL) integration.cloud.clouds.test_gce.GCETest.test_instance_extra failure (refs: #52551)
- **PR** #52551: (garethgreenaway) [2019.2] Marking the two tests in test_gce as flaky @ *2019-04-17 14:00:39 UTC*
  - b173406 Merge pull request #52551 from garethgreenaway/52449_test_gce_random_failures
  - 28af717 Marking the two tests in test_gce as flaky.
- **ISSUE** #51842: (mattLLVW) salt.auth.django docs use wrong model name (refs: #52553)
- **PR** #52553: (mattLLVW) fix: #51842 @ *2019-04-17 13:59:45 UTC*
  - 8352362 Merge pull request #52553 from mattLLVW/fix_django_auth_docs
  - 3baeedf fix: #51842
- **ISSUE** #52134: (sploenix) Regression: Include list of pillar files under different keys in 2019.2 (refs: #52490)
- **ISSUE** #22063: (jeanpralo) Wildcard inside top.sls file for pillar (refs: #52490)
- **PR** #52490: (dwoz) Fix pillar include regression @ *2019-04-17 13:54:39 UTC*
  - 9faa49c Merge pull request #52490 from dwoz/issue_52134
  - 876dd18 Fix merge wart
  - 2ed650b Merge remote-tracking branch 'saltstack/2019.2' into issue_52134
  - b0af11f Run include tests when pillar source changes
  - 307cec6 Fix pillar tests
  - 1a33bde import __future__.absolute_import
  - 5dc5de9 Use file encoding and add docstring
  - e84cd41 Fix pillar include wart
  - c79f496 Add pillar include tests
  - 7745242 Revert "Fix #22063: pillar wildcard support include"
- **PR** #52552: (twangboy) Bring 52170 into 2019.2 @ *2019-04-17 13:54:17 UTC*
  - **PR** #52170: (twangboy) Fix issue when task doesn't have delay_random defined (refs: #52552)

  - b0c0237 Merge pull request #52552 from twangboy/fix_win_task_2019.2
  - fd19cca Remove some warts in the docs
  - deb0b10 Fix some lint
  - a279d45 Final doc fixes
  - 58f0cd2 Fix docs… attempt 6
  - a66716e Fix docs… attempt 5
  - f6f3381 Fix docs… attempt 4
  - 18cfc15 Fix docs… attempt 3
  - c691e0d More doc fixes
  - e01077b Fix docs issue… maybe…
  - b649495 Honor 80 character line limit
  - eba4507 Bring 52170 into 2019.2
- **PR** #52528: (Ch3LL) [2019.2] Merge forward from 2018.3 to 2019.2 @ *2019-04-17 13:53:46 UTC*
  - cc0cd5d Merge pull request #52528 from Ch3LL/merge-2019.2
  - 87cf385 increase timeout on test_state for windows
  - 3442202 Increase timeout for test_kwarg tests
  - 2c3ff2f Merge branch '2019.2' into merge-2019.2
- **PR** #52534: (twangboy) Add TLS support up to TLS 1.2 @ *2019-04-13 22:56:41 UTC*
  - e91240b Merge pull request #52534 from twangboy/tls_support_2019.2
  - 9ec54c4 Add TLS support up to TLS 1.2
    - 474efa1 Fix pylint and state test failure
    - 048a82e Merge branch '2019.2' into merge-2019.2
- **PR** #52536: (twangboy) Bring #52191 into 2019.2 branch @ *2019-04-12 21:31:23 UTC*
  - **PR** #52191: (twangboy) Fix issue where version doesn't detect when check_remote=True (refs: #52536)
  - 2c42e4d Merge pull request #52536 from twangboy/fix_choco_2019.2
  - b394ad5 Bring #52191 into 2019.2 branch
  - 795a7f6 Fix windows tests - increase timeout
  - c70772c Fix linux state tests- add new comment
  - 2941567 Merge branch '2018.3' into '2019.2'
  - 262516c Merge pull request #52209 from twangboy/fix_choco_retcode
    - 7aec2d3 Merge branch '2018.3' into fix_choco_retcode
    - bfdc47b Handle new enhanced retcode 2
  - dd7a4ba Merge pull request #52046 from twangboy/use_reg_timezone
    - fc8e970 Merge branch '2018.3' into use_reg_timezone
    - d0987e6 Merge branch '2018.3' into use_reg_timezone
    - 1bf0cbc Merge branch '2018.3' into use_reg_timezone

    - b466f8a Merge branch '2018.3' into use_reg_timezone
    - 34bdae5 Merge branch '2018.3' into use_reg_timezone
    - 9a8afa6 Fix tests, add null byte test
    - 59b1d4f Revert back to using reg to get timezone
  - 0d09608 Merge pull request #52396 from dmurphy18/fix_aix_ssh
    - 8bfa340 Correct typo
    - 6d98577 Altered code to support salt-ssh on AIX
  - 576478e Merge pull request #52473 from Ch3LL/bp-49437
    - 781385f Merge branch '2018.3' into bp-49437
    - 3a3114d Fix merge conflict wart
    - bbfd412 Merge branch '2018.3' into bp-49437
    - 48ee82d Merge branch '2018.3' into bp-49437
    - f66d474 Add support to avoid calling refresh_db in opkg.del_repo
  - d830bc6 Merge pull request #52493 from dwoz/ping_reaction_test
    - 8b05e77 Merge branch '2018.3' into ping_reaction_test

    - 7c963c1 Merge branch '2018.3' into ping_reaction_test
    - 75ddeb3 fix linter
    - e3e1d2e fix reactor ping test
  - 9b7a0d1 Merge pull request #52505 from bloomberg/2018_zmq_uri
    - b682ec5 transport.zmq: fix bug introduced by b7df7e75cf2
  - 452bbeb Merge pull request #52512 from dwoz/supervisord_2018.3
    - cd5cd7d The exit code matters.
  - 53228ae Merge pull request #52475 from Ch3LL/bp-49464
    - a891fd3 Make opkg.del_repo be compatible with pkrepo state module
  - 6e79e24 Merge pull request #52500 from terminalmage/invalid-archive-source
    - e9d175b Fix traceback when invalid source passed to archive.extracted
  - 2df74ca Merge pull request #52476 from bloomberg/win_cmd_2018
    - 0e0c42e 2018 backport: modules.cmdmod: handle windows environ better
  - 4dfb2f8 Merge pull request #52474 from Ch3LL/bp-49984
    - c8d547e Use prune option in Pygit2 provider when fetching
  - d699485 Merge pull request #52393 from waynew/52087-mine-delete-test-enhancements
    - e3f5be3 Use uncommon item in mine delete test
  - 89bd258 Merge pull request #52445 from dwoz/ipc_fixes_2018.3
    - 1bdaf29 Ensure exceptions in service future are handled
    - c7ad732 Use six.reraise for py3 compatibility

    - 29999b0 Close message service on subscriber close
    - 47203f7 Fix ipc unit tests
    - 2b35437 Fix linter issues
    - 503cdd2 Remove IPCClient singleton
    - b374034 Re-raise queued exceptions with traceback

- **ISSUE** #51879: (whytewolf) 2019.2.0 binary pillar unicode error returns. (refs: #52334)
- **PR** #52334: (waynew) 51879 fix binary pillar return error @ *2019-04-12 03:45:17 UTC*
  - 6eb2bce Merge pull request #52334 from waynew/51879-fix-binary-pillar-return-error
  - ead856e Merge branch '2019.2' into 51879-fix-binary-pillar-return-error
  - 2aa971d lint cleanup
  - 28c2945 keep_pillar not needed
  - fb010c0 Add binary pillar to the docs
  - f2aebf9 Assume file contents are binary
  - 2b8c782 Test gpg render with replace newlines
  - c4b385b Allow binary pillar data
  - 604b671 Return binary data from gpg renderer
  - 32aafab Ignore vscode and fix swap ignore
- **ISSUE** #52041: (arsiesys) 2019.2 influxdb_retention_policy.present broken when used extra arguments (refs: #52043)
- **PR** #52043: (arsiesys) fix missing client_args in influxdb module @ *2019-04-12 03:43:03 UTC*
  - 2d59705 Merge pull request #52043 from arsiesys/fix_influxdb_state_rp
  - e617c5b Merge branch '2019.2' into fix_influxdb_state_rp
  - 7661860 fix missing client_args in influxdb module
- **PR** #52146: (twangboy) Add missing symlink test @ *2019-04-12 00:51:16 UTC*
  - 1b969c3 Merge pull request #52146 from twangboy/fix_test_symlink_2019.2
  - 8e1c882 Merge branch '2019.2' into fix_test_symlink_2019.2
  - a429542 Merge branch '2019.2' into fix_test_symlink_2019.2
  - 401c253 Merge branch '2019.2' into fix_test_symlink_2019.2
  - cce6200 Fixing lint
  - c7cb009 Merge branch '2019.2' into fix_test_symlink_2019.2
  - 3eae05a Merge branch '2019.2' into fix_test_symlink_2019.2
  - 83bed46 Add missing symlink test
- **PR** #52341: (cbosdo) virt.pool_running: fix pool start @ *2019-04-12 00:14:52 UTC*
  - 7a1b8ca Merge pull request #52341 from cbosdo/virt-state-fixes
  - 89f0bd8 Merge branch '2019.2' into virt-state-fixes
  - 25b9681 virt.pool_running: fix pool start

  - 30981d2 Remove unneeded kwargs in virt states
  - 0871c02 virt: allow defining the VM type and arch when creating it
  - 1c65d25 Updating running domains in virt.running
  - 13d7819 Add missing virt states unit tests
  - 0681d86 virt.running support for all virt.init options
  - c6a444b Add test case for virt.running
  - 2db7a98 Let virt running state provide errors
- **ISSUE** #52350: (Ch3LL) Re-Add Python 2 unicode string literals in YAML renderer (refs: #52427)
- **PR** #52427: (garethgreenaway) [2019.2] Support for old yaml render @ *2019-04-12 00:06:37 UTC*
  - 6040282 Merge pull request #52427 from garethgreenaway/52350_readd_and_gate_unicode_string_literal_support
  - 82f010a Merge branch '2019.2' into 52350_readd_and_gate_unicode_string_literal_support
  - ae81fee Merge branch '2019.2' into 52350_readd_and_gate_unicode_string_literal_support
  - b618d44 Merge branch '2019.2' into 52350_readd_and_gate_unicode_string_literal_support
  - b191bc0 Merge branch '2019.2' into 52350_readd_and_gate_unicode_string_literal_support
  - 38a9818 Merge branch '2019.2' into 52350_readd_and_gate_unicode_string_literal_support
  - 2767984 Removing logging entry
  - 71cd303 Adding missing yamlloader_old.py
  - f848aa4 Adding support back in with, a gated configuration option, for the old YAML Loader.
- **ISSUE** #51865: (magenbrot) salt.match.search_by resulting in 'None' since 2019.2 (refs: #52234)
- **PR** #52234: (garethgreenaway) [2019.2] Fixes to matchers when used in pillar @ *2019-04-12 00:05:48 UTC*
  - 05ba7c5 Merge pull request #52234 from garethgreenaway/51865_match_search_by_master
  - 1760245 Merge branch '2019.2' into 51865_match_search_by_master
  - d50f011 Merge branch '2019.2' into 51865_match_search_by_master
  - b0cbb60 Merge branch '2019.2' into 51865_match_search_by_master
  - 799a08b Merge branch '2019.2' into 51865_match_search_by_master
  - 21891d6 Merge branch '2019.2' into 51865_match_search_by_master
  - a2173d7 Fixing a typo where attempting to get a list from __opts__ instead of an individual item
  - 6a5b5b2 swapping out if…else approach for __opts__.get approach.
  - aa2c626 With the change/addition of the matcher subsystem in 2019.2, the match.search_by when used in pillar broke when targetting the minion that was also the salt master. This was caused by the id in __opts__ being used in all cases. This change updates the glob_match function to use the preserved minion_id of the master if it is available so that targeting works as expected.
- **PR** #52160: (cbosdo) Virt whitespace fix @ *2019-04-12 00:04:25 UTC*
  - 80d7aea Merge pull request #52160 from cbosdo/virt-whitespace-fix
  - fd1f539 Merge branch '2019.2' into virt-whitespace-fix
  - b297e7d virt: handle whitespaces in VM names
- **ISSUE** #51832: (nocturo) pillar include stopped working (refs: #52008)

- **PR** #52008: (waynew) Allow / in pillar includes @ *2019-04-12 00:02:40 UTC*
  - b551bbd Merge pull request #52008 from waynew/51832-re-allow-slash-includes
  - ee3115f Allow leading dots and / as pillar separators
  - 29c676d Ensure _closing exists
  - eb517e1 Swap '/' for '.' when matching
- **ISSUE** #51821: (OrangeDog) 'comment' is an invalid keyword argument for 'test.fail_without_changes' (refs: #51937)
- **PR** #51937: (garethgreenaway) [2019.2] Fix to test state functions to allow arguments that mod_watch uses @ *2019-04-11 23:57:44 UTC*
  - d3159cb Merge pull request #51937 from garethgreenaway/51821_ensure_result_comment_changes_valid_arguments
  - 86c63b5 Merge branch '2019.2' into 51821_ensure_result_comment_changes_valid_arguments
  - 0966d61 Merge branch '2019.2' into 51821_ensure_result_comment_changes_valid_arguments
  - 5527dff Ensure the comment, changes, and result are valid arguments for various test state functions as they are valid arguments for mod_watch.
- **ISSUE** #51818: (syphernl) salt.nacl.dec: expected str, bytearray, or unicode (refs: #51913)
- **PR** #51913: (garethgreenaway) [2019.2] Fixes to utils/nacl.py @ *2019-04-11 23:56:57 UTC*

  - c1063cf Merge pull request #52370 from jfindlay/traceroute
  - 2f49231 modules.network: update unit test
  - 5b64fc0 modules.network: log and skip problematic traceroute lines
  - e33f5c1 modules.network: standardize util check
- **PR** #52397: (garethgreenaway) [2019.2] Merge forward from 2018.3 to 2019.2 @ *2019-04-02 22:12:45 UTC*
  - 3675f1e Merge pull request #52397 from garethgreenaway/merge-2019.2
  - 28e76b1 Merge branch '2018.3' into merge-2019.2
  - 28f947e Merge pull request #52213 from garethgreenaway/beacon_state_dont_save_test_true
    - 7f83b4b Swapping out if state looking for test in opts for a __opts__.get
    - e1cf599 Merge branch '2018.3' into beacon_state_dont_save_test_true

    - b751122 Merge branch '2018.3' into beacon_state_dont_save_test_true
    - a901ec4 Don't save beacons when test=True
  - 10d041b Merge pull request #52344 from twangboy/os_release_embedded
    - 74ab4d3 Use old way to get osrelease if new way fails
  - e88d3ba Merge pull request #52345 from garethgreenaway/52197_incron_cannot_have_comments
    - 070837a Merge branch '2018.3' into 52197_incron_cannot_have_comments
    - 8461608 Updating the incron module, state module and tests to remove use of comments.
      - 855f31a Remove un-used file
      - affd9b8 Fix setup/teardown methods
      - 215bf93 Refresh after modifying tmp pillars
      - 95c3aba Add config for listener
      - 5d231f4 remove unused import
      - 8c1b1db Use tmp pillar for signing policies
      - a0e2458 fix unused import
      - 7f5f7dd Fix requisite path
      - 5630498 Fix signing policies path
      - 0bd0826 Fix issue #51869 and add cert signing test
- **PR** #52347: (Ch3LL) [2019.2] Merge forward from 2018.3 to 2019.2 @ *2019-03-28 16:41:53 UTC*
  - 27e6cbf Merge pull request #52347 from Ch3LL/merge-2019.2
  - 63962b5 Merge branch '2018.3' into '2019.2'
  - bda3ca2 Merge pull request #51749 from terminal-labs/salt-cloud-map-alt-update
    - 9ca0f72 Changed where to mention the map files compatibility for minion configuration options. This is a result of @Ch3LL suggestion on the PR itself for this doc change.
    - 364ef06 Added mention of map file alternative for minion configuration options.
  - a743fff Merge pull request #52113 from twangboy/fix_lgpo
    - bb4a704 Merge branch '2018.3' into fix_lgpo
    - 7186405 Merge branch '2018.3' into fix_lgpo
    - 7656331 Change default language from 1033 to en_US
  - 7040643 Merge pull request #52172 from garethgreenaway/51959_fix_acl_present_output
    - 8c53890 Merge branch '2018.3' into 51959_fix_acl_present_output
    - 0bdde94 Merge branch '2018.3' into 51959_fix_acl_present_output
    - c5337e1 Merge branch '2018.3' into 51959_fix_acl_present_output
    - 889660f Fixing lint.
    - bfdb669 Updating the reverse octal lookup dictionary. Updating tests.
    - 24c907b Adding additional permissions to the lookup.
    - 4b99afa Fixing the output when there are changes for the ACL state so the permissions are shown and not the octal number.

- 45d6cad Merge pull request #52283 from dmurphy18/fix_cpe_name_amzn2
    - cbe5f7d Update to allow for malformed CPE_NAME from some OS's
- 14a6b9d Merge pull request #52306 from terminal-labs/replace-ping-with-version
    - c04ba6e Changed a text artifact from the ping function to supporting text for the version function.
    - 0b1eb00 Replaced *test.ping* with *test.version* Result of issue #52277
- 7b2b521 Merge pull request #51963 from DSRCorporation/bugs/49147_ipc_subscriber
    - 37aeba3 Minor: Fix typo in docstring
    - cc46e9c Merge branch '2018.3' into bugs/49147_ipc_subscriber
    - 23733bd Regression test for parallel IPCMessageSubscriber support
    - 2bc2a7d Merge branch '2018.3' into bugs/49147_ipc_subscriber
    - 684bf58 Update doc conf with the new import *tornado.queues*
    - 008cf49 Merge branch '2018.3' into bugs/49147_ipc_subscriber
    - 01e9a3d Merge branch '2018.3' into bugs/49147_ipc_subscriber
    - 710ab50 Support parallel work of multiple IPCMEssageSubscribers in one process
- 87bb513 Fix failing symlink test (#52145)
- 8255901 document *regex_replace* Jinja filter (#52326)
- 3211397 Merge pull request #52310 from garethgreenaway/merge-2018.3
    - 9324b83 Merge branch '2018.3' into merge-2018.3
- 71e9b66 Merge pull request #52312 from terminal-labs/zone-clarification
    - ae0e18f Merge branch '2018.3' into zone-clarification
    - e8c8dba Added in an explanation of the --zone flag approved in #52251
        - 4908ed3 Merge branch '2017.7' into merge-2018.3
        - b6a0161 Merge remote-tracking branch 'upstream/2017.7.9' into 2017.7
        - 1f99e28 Let's not include raet by default
        - 4306779 Merge branch '2017.7.9' into 2017.7
        - 36ed50d Lock to unittest-xml-reporting 2.2.1
        - 3e6cb79 Merge branch '2017.7.9' into 2017.7
        - 57348ca Add static requirements for Arch linux
        - cc6fb46 Additionally ignore files in nox virtualenvs and CI artifacts directories
        - bf9c55e Previously have setuptools-git installed if ioflo is to be installed
        - 973e1ca Merge remote-tracking branch 'upstream/2017.7.9' into 2017.7
        - 981335a Revert ”Avoid a traceback on tornado.testing test classes”
        - f48ba6a Merge remote-tracking branch 'upstream/2017.7.9' into 2017.7
        - b039cec Windows now has a static requirements file and no longer needs hacks
        - a86af2b Merge pull request #52226 from dwoz/jenkins_build
        - 8c0f46b Use windows state to bootstrap windows builds

      - 7263956 Lock coverage and xml-unittest-reporting versions
      - dce4ffa Avoid a traceback on tornado.testing test classes
- **PR** #52314: (twangboy) Add the ability to pass a timeout to beacons @ *2019-03-27 19:11:13 UTC*
  - d3f4c9d Merge pull request #52314 from twangboy/fix_beacon_tests
  - a5fa99a Add missing **kwargs
  - 7e88d04 Add the ability to pass a timeout to beacons
- **PR** #52311: (garethgreenaway) [2019.2] Merge forward from 2018.3 to 2019.2 @ *2019-03-26 18:31:32 UTC*
  - bad4e47 Merge pull request #52311 from garethgreenaway/merge-2019.2
  - 11cd485 Merge branch '2018.3' into merge-2019.2
  - 582d306 Merge pull request #52307 from Akm0d/doc_fix
    - 4da0fd6 Fix x509 inconsistent file name in state example
  - 2cdf48e Merge pull request #52276 from terminal-labs/replace-github-dead-link
    - a2fbbe0 Merge branch '2018.3' into replace-github-dead-link
  - 8fa0e51 Merge pull request #52290 from Akm0d/doc_fix
    - ca00e4b Merge branch '2018.3' of github.com:saltstack/salt into doc_fix
    - 8e1ec15 Add missing master/minion docs for log_rotate*
      - 08728cf Merge branch '2018.3' into replace-github-dead-link
  - d2fd84f Merge pull request #51724 from clinta/docker-create-with-ip
    - c933663 Merge branch '2018.3' into docker-create-with-ip
  - 838a7aa Merge pull request #51753 from terminal-labs/docs-sphinx-ref-deadlink-fix
    - f2b6abd Merge branch '2018.3' into docs-sphinx-ref-deadlink-fix
    - 9857f53 Merge branch '2018.3' into docs-sphinx-ref-deadlink-fix
    - 8a11d27 Merge branch '2018.3' into docs-sphinx-ref-deadlink-fix
    - 842ec84 Merge branch '2018.3' into docs-sphinx-ref-deadlink-fix
    - 9275207 Merge branch '2017.7' into docs-sphinx-ref-deadlink-fix
    - 2330c2a makefile had an old sphinx-doc link, updated to new general front page of sphinx docs.
    - 8d70e3b Replaced all bad sphinx links with ones from the new sphinx doc site.
    - ebdffcd replaced two python sphinx deadlinks with sphinx new relevant documentation pages.
      - a4e3e34 Merge branch '2018.3' into docker-create-with-ip
  - efb9ec0 Merge pull request #52215 from garethgreenaway/bp-52212
    - 65857ef Merge branch '2018.3' into bp-52212
    - a96bf24 Back-port PR #52212 to 2018.3
      - c6e553c add networking_config to container_create for custom network_mode
      - 5c99dbd add test to expose ip not added to custom network #51723
  - 679c4b2 Merge pull request #52269 from garethgreenaway/merge-2018.3
    - ee58560 Merge branch '2018.3' into merge-2018.3

- 418e543 Merge pull request #52261 from dwoz/update_kitchen
  - a87c6ea Use windows state to bootstrap windows builds
  - 1aa1bd8 Merge branch '2017.7' into merge-2018.3
  - 2962e94 Lock coverage and xml-unittest-reporting versions
  - 595303b Merge remote-tracking branch 'upstream/2017.7.9' into 2017.7
    - 55e150c Proper setup and teardown
    - b9b6009 Don't run distro on windows
    - 3cb5c82 Merge pull request #52208 from s0undt3ch/2017.7.9
  - b14dbc9 Merge branch '2017.7.9' into 2017.7
    - 6a789a1 Update static requirements
    - cee9480 Lock PyYAML to < 5.1
    - a4f241d The kitchen nox verifier already takes care of the sinlge *-v* flag.
    - 0cb641e Fix static requirements search bad logic
    - 45a3e4a *distro* reports Opensuse 15 as Opensuse Leap 15

  - e99654d Merge branch '2017.7' into avoid_ssl_race
  - c0bb1f7 Merge pull request #51850 from waynew/cherry-pick-ping-fix
  - 6da495f Fix linter
  - f78b360 fix reactor ping test
  - ad7a9ec Merge pull request #51893 from twangboy/gate_zfs_2017.7
  - e0d58eb Gate zfs module on Windows
  - f758a10 Avoid race condition when initializing OpenSSL
  - 0f125db Add __virtual__ to win_update
  - 864d4be Merge pull request #51770 from Ch3LL/doc_conf_2017
  - 25d9ca2 Update release versions for the 2017.7 branch
  - 3cf3099 Merge pull request #51774 from terminal-labs/py3-server-docs-update
  - 1f00c89 Added in python 3 server according to the consensus from #51748
  - bfb9d87 added the python3 command for startign the python http server.
  - b4153d3 Merge pull request #51757 from twangboy/fix_case_2017.7
  - 6b0b5d2 Fix failing py3 tests
  - feb29f3 Make recurse and directory case sensitive
- 2c4dff6 Merge pull request #51905 from aplanas/fix_mount
  - ac688df mount: fix extra -t parameter
- 4b2c8cc Merge pull request #51815 from garethgreenaway/51673_multiple_file_sections_with_excludes
  - 58ef51d Merge branch '2018.3' into 51673_multiple_file_sections_with_excludes
  - 8c4485d Merge branch '2018.3' into 51673_multiple_file_sections_with_excludes
  - b55a894 Fixing some code that was not working correctly with Python 3.

        - 63da8be Fixing a bug that caused excludes to not work as expected when multiple file options were in place, the excludes of the last file section were being used over any previous ones. Including a test to ensure excludes work as expected when multiple file sections are in place.
    - 1bf3fc8 Merge pull request #51867 from Oloremo/mysql-module-fix-for-python3
        - dfcfebd Merge branch '2018.3' into mysql-module-fix-for-python3
        - b6d217c Merge branch '2018.3' into mysql-module-fix-for-python3
        - 9745b0a Fixed typo
        - 8149e9e Merge branch '2018.3' into mysql-module-fix-for-python3
        - 58d8a2e Merge branch '2018.3' into mysql-module-fix-for-python3
        - f964962 Added handling of empty server_version
        - 58791e9 Decode mysql_version for python3 compatibility
    - 7f05abf Merge pull request #51908 from garethgreenaway/51862_icinga_fixes
        - 233dbaf Adding __salt__ to utils/icinga so cmd.run_all is available.
        - 1e7490c update kubernetesmod in index.rst
        - 1f3be1c fix import in test
        - 8572c17 rename kubernetes module to kubernetesmod

- **PR** #52032: (Ch3LL) Add azure state and execution modules to doc index @ *2019-03-11 15:46:49 UTC*
    - 7d6b53c Merge pull request #52032 from Ch3LL/fix_azure_docs
    - 8a8a5fa Add azure module ref pages and fix doc errors
    - 6a1d06a fix additional azure state module doc errors
    - 65d8f27 Update doc failures in azure modules
    - 92dbe2a Merge branch '2019.2' into fix_azure_docs
- **PR** #52037: (Ch3LL) Backport #51201 into 2019.2 @ *2019-03-07 19:45:18 UTC*
    - **PR** #51201: (terminalmage) Lint: Fix str-format-in-logging, len-as-condition, etc. (2) (refs: #52037)
    - 96935c9 Merge pull request #52037 from Ch3LL/bp-51201
    - 1fb0697 Remove develop modules not needed in 2019.2
    - e3adc2f Lint: Fix str-format-in-logging, len-as-condition, etc. (2)
- **PR** #52034: (terminalmage) fileclient: Fix traceback when template file cannot be cached @ *2019-03-07 19:41:24 UTC*
    - 75398e4 Merge pull request #52034 from terminalmage/fix-get-template
    - 744dfd9 fileclient: Fix traceback when template file cannot be cached
- **PR** #51984: (Ch3LL) [2019.2] Merge forward from 2018.3 to 2019.2 @ *2019-03-07 17:58:42 UTC*
    - 7af4f5c Merge pull request #51984 from Ch3LL/merge-2019.2
    - 54ea40a Merge branch '2019.2' into merge-2019.2
    - 227ddbb Fix linter
    - a168913 Merge branch '2018.3' into '2019.2'

- c68744a Merge pull request #51975 from s0undt3ch/features/nox-2018.3
    - af4ae91 Lint fixes
    - 33955c9 Windows needs special treatment
    - d4f899f Requirements fixes
    - e550c60 We need a fixed winrm-fs so that dotfiles are also included
    - ada1ef3 use kitchen-salt from my fork for now
- a689177 Merge pull request #51807 from Ch3LL/2018.3.5_rn
    - 2c0b85c Add 2018.3.5 release notes
- 6aee2c4 Merge pull request #51806 from twangboy/fix_beacon
    - 2bf6179 Fix some lint
    - 0f38eea Add lowercase test
    - 1459985 Make sure drive letter is uppercase for re compare
    - 7cdc660 Add some tests
    - 48ae8c6 Fix disk.usage beacon on Windows
- da815ba Merge pull request #51966 from twangboy/use_winapi_com
    - a38300b Use winapi.com instead of coinitialize
- 7673c69 Merge pull request #51920 from twangboy/add_zabbix
    - e2d496c Add zabbix to the Windows builds
- 77c2796 Merge pull request #51802 from garethgreenaway/merge-2018.3.4
    - 2e20939 Merge branch '2018.3' into merge-2018.3.4
    - 769f002 Merge branch '2018.3.4' into merge-2018.3.4
    - b53a843 Merge pull request #51713 from dwoz/gemstestagain_2018.3.4
    - f2c6631 Merge branch '2018.3.4' into gemstestagain_2018.3.4
    - 1c82d24 Fix ruby gems tests, again
- 496525d Merge pull request #51930 from Ch3LL/release_docs
    - 9a68136 Update release documentation
- a027c97 Merge pull request #51931 from Ch3LL/bp_51298
    - 873cabd Roll back some changes to _compat.py
    - 1fcb0ff Fix edge case when minion ID is a 16-character string
- 1fa2072 Merge pull request #51892 from twangboy/gate_zfs
    - fbc2c0c Gate zfs grain on Windows
- 89b0991 Merge pull request #51836 from stratusjerry/backport_49039_2018.3
    - 35fdc4c Update win_pkg.py
- c1ab63d Merge pull request #51771 from Ch3LL/doc_conf_2018
    - 904beb3 [2018.3] change build_type and release in doc/conf.py
    - 3efcea5 Update release versions for the 2018.3 branch

        - 98f1b03 Merge pull request #51775 from garethgreenaway/merge-2017.7
            - 92ffe03 fixing lint
            - 73b601d Merge branch '2017.7' into merge-2017.7
            - e04f735 Merge pull request #51502 from ogd-software/51501-states-boto3_route53.py-fails-to-validate-ALIAS-A-records
            - e69ce9d Merge branch '2017.7' into 51501-states-boto3_route53.py-fails-to-validate-ALIAS-A-records
            - 5093406 Implement PEP8 E711 styling fix
            - 7640e90 Ensure boto3_route53 correctly validates existing ALIAS records
            - ff633b0 Ensure boto3_route53 survives attempts to validate ALIAS records
            - 9c128aa Merge pull request #51732 from s0undt3ch/features/nox-2017.7
            - 328989d Add initial nox configuration. Tell *tox*'ers to use *nox*'.
            - 99ce48d Merge pull request #51712 from dwoz/gemstestagain
            - 0d3b227 Fix ruby gems tests, again
            - 18452c4 Merge pull request #51528 from twangboy/backport_51471
            - 8c79f02 Merge branch '2017.7' into backport_51471
            - 20a7ee5 Backport 51471
            - ee80ce3 Merge pull request #51655 from garethgreenaway/49661_starting_salt_master_openssl
            - f647b95 Merge branch '2017.7' into 49661_starting_salt_master_openssl
            - 1831e64 Removing options from libcrypto.OPENSSL_init_crypto so it will simply use the defaults.
            - 8d0f801 removing salt.crypt from payload.py which is not used and causing salt-key to break.
            - a5a54c4 Removing unused import which is causing salt-master to not start when using openssl 1.1.1-1.
            - c9c082c Fix azurearm field list doc error
            - af0537f Add azure state and execution modules to doc index

- **PR** #52004: (chdamianos) Fixed comparison of *None* with constants (refs: #52030) @ *2019-03-06 17:41:52 UTC*
    - 01bcff0 Merge pull request #52004 from chdamianos/fix-constants-comparison
    - 6fd60af Fixed comparison of *None* with constants
- **PR** #51981: (bryceml) Fix typo in 2019.2.0 release notes @ *2019-03-05 23:59:33 UTC*
    - 8d6bb5d Merge pull request #51981 from bryceml/2019.2
    - ecf0ef0 Fix typo in 2019.2.0 release notes
        - a65e621 Adding an additional note warning that the file will not be changed because test=True, but could be changed by other states.
        - 6c0dcf2 Swapping pchanges for changes in file state.
- **ISSUE** #51825: (OrangeDog) schedule.disable doesn't work in 2019.2.0 (refs: #51855)

- **PR** #51855: (garethgreenaway) [2019.2] Global enable/disable was being ignored @ *2019-03-05 19:40:34 UTC*
  - c3105df Merge pull request #51855 from garethgreenaway/51825_scheduled_global_enabled
  - 301e773 Merge branch '51825_scheduled_global_enabled' of github.com:garethgreenaway/salt into 51825_scheduled_global_enabled
    - ae7ab06 Merge branch '2019.2' into 51825_scheduled_global_enabled
    - ff13833 Merge branch '2019.2' into 51825_scheduled_global_enabled
  - 9e7e4ed Fixing broken add_job test.
  - 72466a5 Global enable/disable was being ignored
- **ISSUE** #51745: (fayak) Systemd update 241 on archlinux breaks systemd.py version() function (refs: #51946)
- **PR** #51946: (Ethyling) Fix retrieve systemd version using regex @ *2019-03-05 19:20:19 UTC*
  - be28623 Merge pull request #51946 from Ethyling/fix-systemd-version
  - b557707 Add test for systemd version from git describe
  - 94809d0 Fix retrieve systemd version using regex
- **ISSUE** #51816: (jkrauz) pillar_ldap broken in 2019.2.0 (refs: #51964)
- **PR** #51964: (dwoz) [2019.2] Make sure ldap attrs are string types on python 2 @ *2019-03-05 19:18:30 UTC*
  - c310022 Merge pull request #51964 from dwoz/issue_51816
  - a879140 Merge branch '2019.2' into issue_51816
  - 0e61cf3 Fix linter errors/warnings
  - 171217a Revert debug logging
  - 8c641c6 make LDAP attr defaults string types on py2
- **PR** #51976: (s0undt3ch) [2019.2] Nox fixes @ *2019-03-05 18:56:49 UTC*
  - cb817f1 Merge pull request #51976 from s0undt3ch/features/nox-2019.2
  - 0b4e68c Lint fixes
  - 257b3fc Windows needs special treatment
  - b298da0 Requirements fixes
  - 4f45a7e We need a fixed winrm-fs so that dotfiles are also included
  - fa70af2 use kitchen-salt from my fork for now
- **PR** #51761: (sdodsley) Add new module to release notes for 2019.2.0 @ *2019-03-05 09:44:56 UTC*
  - **PR** #51681: (sdodsley) Add new module to release notes for 2019.2.0 (refs: #51761)
  - f867e6e Merge pull request #51761 from sdodsley/cheery_pick_fb_releasenotes
  - 80192c8 Add new module to release notes for 2019.2.0
- **PR** #51799: (s0undt3ch) Catch attribute error @ *2019-03-05 09:38:08 UTC*
  - 08e3956 Merge pull request #51799 from s0undt3ch/2019.2
  - 342244a Merge branch '2019.2' into 2019.2
  - 3e8a17e Catch attribute error
- **PR** #51810: (Ch3LL) Add 2019.2.1 release notes @ *2019-03-05 09:26:47 UTC*

  - ff5d7d6 Merge pull request #51810 from Ch3LL/2019.2.1_rn
  - aaee5fa Add 2019.2.1 release notes
- **ISSUE** #51824: (OrangeDog) schedule.present state not idempotent in 2019.2.0 (refs: #51849)
- **PR** #51849: (garethgreenaway) [2019.2] Fix to schedule.list function to filter out attributes that are None @ *2019-03-01 19:56:17 UTC*
  - **PR** #51647: (dwoz) [develop] increase batch test timeout on windows (refs: #51849)
  - 3732004 Merge pull request #51849 from garethgreenaway/51824_splay_breaking_schedule_present
  - a0af441 Merge branch '2019.2' into 51824_splay_breaking_schedule_present
- **PR** #51878: (Ch3LL) Add new terraform salt-ssh roster feature to release notes @ *2019-02-27 19:18:49 UTC*
  - 3fdb564 Merge pull request #51878 from Ch3LL/terraform_rn
  - 502d197 fix spelling error in release notes
  - 4d53b41 Add new terraform salt-ssh roster feature to release notes
- **PR** #51837: (stratusjerry) Update win_pkg.py @ *2019-02-26 16:51:35 UTC*
  - **PR** #49039: (stratusjerry) Update win_pkg.py (refs: #51836, #51837)
  - e63c872 Merge pull request #51837 from stratusjerry/backport_49039_2019.2
  - 531b23d Update win_pkg.py
  - 39b5645 Splay defaulting to None internally, broke schedule.present causing it to always report differences when a state is run. Updating the schedule.list function to check if an attribute is None and remove it.
- **PR** #51772: (Ch3LL) Update release versions for the 2019.2 branch @ *2019-02-25 14:16:40 UTC*
  - 27dd9fb Merge pull request #51772 from Ch3LL/doc_conf_2019
  - f28cc9b [2019.2] change build_type and release in doc/conf.py
  - 4c670e2 Update release versions for the 2019.2 branch
- **PR** #51776: (garethgreenaway) [2019.2] Merge forward from 2018.3 to 2019.2 @ *2019-02-24 22:08:58 UTC*
  - 45425a4 Merge pull request #51776 from garethgreenaway/merge-2018.3
  - 186306a reverting change in release notes, adding change to doc/ref/modules/all/index.rst.
  - 1ef140a Fixing lint.
  - 6173578 Fixing lint errors
  - 38dcab9 fixing lint
  - e37fc20 Merge branch '2018.3' into merge-2018.3
  - 7e3e71c Merge pull request #51756 from twangboy/fix_case_sensitive
    - 4c55040 Fix failing py3 tests
    - 64f45f8 Make recurse and directory case sensitive
  - e75fc1c Merge pull request #51747 from ymasson/fix_mysql_grants
    - f614dd7 Fix escaping for special characters
  - b1f7e85 Merge pull request #51387 from chrillux/make-binarydata-output-possible
    - 010393e Make binary data output possible

- 3475813 Merge pull request #51694 from assafShapira/2018.3
  - 895b97a Merge branch '2018.3' into 2018.3
  - bc2d27a fix minion bootstrapping issue "/usr/lib/python2.7/site-packages/salt/utils/cloud.py", line 472 Configuration value u'provider' needs to be set
- c7136cb Merge pull request #51738 from garethgreenaway/nftables_cleanup
  - 8201d1e Fixing lint.
  - d681064 Merge branch '2018.3' into nftables_cleanup
  - e37458e Fixing a couple tests.
  - ed1b743 Additional cleanup. Adding additional documentation for state module.
  - dc4afbb More updates to nftables module, state modules, and unit tests.
  - 3ec96e3 initial work to cleanup the nftables module, state module, and the unit tests.
- 2121049 Merge pull request #51733 from s0undt3ch/features/nox-2018.3
  - 97532c2 Add initial nox configuration. Tell *tox*'ers to use *nox*'.
- f4adf33 Merge pull request #51728 from gtmanfred/virtualnames
  - 61b4390 fix modulenames from virtualnames tests
- d681fb9 Merge pull request #51721 from dwoz/solarisipstests
  - 3263d31 Merge remote-tracking branch 'saltstack/2018.3' into solarisipstests
- fb0a538 Merge pull request #51676 from Ch3LL/merge-2018.3.4
  - 8111479 Merge branch '2018.3' into merge-2018.3.4
- e08f08d Merge pull request #50812 from gtmanfred/virtualnames
  - d59952f Merge branch '2018.3' into virtualnames
  - 33bb5bf fix use of virtualname
    - 2ca1253 Merge branch 'merge-2018.3.4' of github.com:Ch3LL/salt into merge-2018.3.4
    - 6d6910a Merge branch '2018.3' into merge-2018.3.4
    - b5a6265 Fix ruby gems tests, again
    - 05f2797 Merge branch '2018.3' into merge-2018.3.4
    - 9f0999f Merge branch '2018.3' into merge-2018.3.4
    - 139daa8 Merge branch '2018.3.4' into 2018.3
    - 9741289 Merge pull request #51646 from dwoz/batch_exit_2018.3.4
    - a8f25bb increase batch test timeout on windows
    - 9caafec Skip solarisips when not on solaris
- 31c6785 Merge pull request #51714 from dwoz/gemstestagain_2018.3
  - fab74bb Fix ruby gems tests, again
- 39aadfb Merge pull request #51689 from gtmanfred/2018.3
  - 8c35d51 fix import
  - 6a55cfdf specify minimum version of shade module

  - a475b70 Merge pull request #51469 from s0undt3ch/hotfix/fix-suse-locale-docker
    - 14f49b5 Don't prevent *get_locale* from working when running under docker
  - a59585d Merge pull request #51671 from Ch3LL/merge-2018.3
    - 64322db Fix is_windows utils call
    - a5c8df0 Fix pylint
    - 547889b Merge branch '2017.7' into '2018.3'
      - bcc13db Merge pull request #51562 from gilbrechbuhler/fix_rabbitmq_policy_change_check
      - ed2b1e1 Fix RabbitMQ policy definition update check
      - cafaa98 Merge pull request #51648 from dwoz/increase_wait
      - e2377a9 Merge branch '2017.7' into increase_wait
      - e3d28d9 Merge pull request #51643 from dwoz/batch_exit
      - 42d1d02 increase batch test timeout on windows
      - 7c2d7a4 Increase minion wait for slow boxes
      - b5ae53a Merge pull request #51631 from Ch3LL/lint-2017
      - c0aa4dc Fix linter by ignoring async await check.
      - 396622c Merge branch '2017.7' into lint-2017
      - ba8d0ea Merge pull request #51547 from s0undt3ch/2017.7
      - 8e009e0 Allow NOT to install pip dependencies
      - 30ce509 Merge pull request #51182 from lmf-mx/darwin-plist-update
      - 4297c0d Merge branch '2017.7' into darwin-plist-update
      - 68ac07f Merge pull request #51442 from dwoz/multi_master
      - 40cb4db Merge branch '2017.7' into multi_master
      - 2dc5171 Handle multi_master failover when daemonized
      - 8df083c Merge pull request #51608 from dwoz/wait_minions_2017.7
      - c55359f fix linter
      - 4702e22 Wait for minions to be pingable before starting tests
      - 5afa0a1 Merge branch '2017.7' into darwin-plist-update
      - f46e8be Fix service name in minion plist
      - 1da9cd9 Fix pylint on 2017.7
      - 39122ca Merge pull request #51589 from dwoz/script_fix_2017.7
      - 8697ce7 Disable pylint checks, only for 2017.7
      - e5972f5 Use the code directory instead of cwd for python path
  - b8764fd Merge pull request #51680 from Ch3LL/bp-50336
    - 3502dbb states.gpg: fix missing existing keys; modules.gpg: fix set trust level command
- **PR** #51734: (s0undt3ch) [2019.2] Add initial nox configuration. Tell *tox*'ers to use *nox*'. @ *2019-02-21 17:39:29 UTC*

  - 1894082 Merge pull request #51734 from s0undt3ch/features/nox-2019.2
  - 01b74c0 Add initial nox configuration. Tell *tox*'ers to use *nox*'.
- **PR** #51707: (isbm) Bugfix: pillar refresh @ *2019-02-21 15:12:49 UTC*
  - 74db589 Merge pull request #51707 from isbm/isbm-pillar-refresh-fix
  - 269ae76 Refresh matchers and beacons on pillar refresh
- **PR** #51674: (Ch3LL) [2019.2] Merge forward from 2018.3 to 2019.2 @ *2019-02-20 17:35:07 UTC*
  - 82cbd98 Merge pull request #51674 from Ch3LL/merge-2019.2
  - 4171271 Fix pylint, remove unused import
  - 3f14619 Remove skipif and change expected return for solarisips test
  - d3660d5 Merge branch '2019.2' into merge-2019.2
- **PR** #51715: (dwoz) [2019.2] Fix ruby gems tests, again @ *2019-02-19 21:44:21 UTC*
  - 7a82c65 Merge pull request #51715 from dwoz/gemstestagain_2019.2
  - 95ce288 Fix ruby gems tests, again
  - 043efa0 Skip solarisips when not on solaris
  - 7ed0d7d Fix ruby gems tests, again
  - b46eac3 Merge branch '2019.2' into merge-2019.2
- **PR** #51561: (isbm) SaltSSH: fix delay when creating thin TAR @ *2019-02-19 10:15:47 UTC*
  - 0bd2d6e Merge pull request #51561 from isbm/isbm-saltssh-thintar-delay-fix
  - 2b02975 Give up on sync for Py3 because of the way tests for py2 are written here
  - f79c81a Update UT mocking, adjusting for temporary file
  - 2f90054 Use temporary filename instead of output directly to the ”thin.tgz”
  - d841164 Copy over the result, cleanup afterwards
  - c6792ee Add a function that reserves temporary filename for further tarball generation
- **PR** #51678: (Ch3LL) [2019.2] Merge forward from 2019.2.0.rc1 to 2019.2 @ *2019-02-17 19:02:33 UTC*
  - 5f9764a Merge pull request #51678 from Ch3LL/merge-2019.2.0.rc
  - f8372ca Merge branch '2019.2' into merge-2019.2.0.rc
- **ISSUE** #51503: (garethhowell) smartos.image_present fails with ”does not exist” (refs: #51383)
- **ISSUE** #51351: (garethhowell) Exception using smartos.vm_present to create docker zone (refs: #51383)
- **PR** #51679: (Ch3LL) Backport #51383 into 2019.2 @ *2019-02-16 00:31:06 UTC*
  - **PR** #51383: (sjorge) imgadm module should deal with invalid images better (refs: #51679)
  - 2036c8a Merge pull request #51679 from Ch3LL/bp-51383
  - e4971fc imgadm module should deal with invalid images better
  - 58f2407 Merge branch '2019.2.0.rc1' into 2019.2
    - 6292f86 Revert ”Remove custom grains module from 2018.3 branch”
    - 92bd6b9 Fix salt.utils.is_windows call
    - ffa2f5f Merge branch '2018.3' into '2019.2'

    - 1168141 Add test for explicit lists
    - 84f5d63 Merge branch '2018.3' into fix_51566
    - 7376cb9 Handle explicit lists properly
    - 28fc070 Merge branch '2018.3' into 51266_schedule_enable_disable_break_save
    - 0760133 adding integration.scheduler.test_helpers to various files to by pass the test_module_name_source_match check.
    - 1552fba lint cleanup
    - 086066b Adding a test to ensure _get_schedule which is used by the save functionality works when there is an enabled attribute.
    - 1c6d4fb When looping through the schedule to remove hidden attributes, we should only do that if the item in question is a dictionary. It could be the attribute that determines if the entire scheudle is enabled or disable.
    - 5ed8eb6 Properly create the value for a "True" boolean element item
  - f1e29c8 Merge pull request #51548 from s0undt3ch/2018.3
    - 611065e Merge branch '2018.3' into 2018.3
  - 00a6246 Merge pull request #51622 from brejoc/2018.3-empty-job-workaround
    - d263410 Prevents crash when there is no job entry
    - 5342305 Allow NOT to install pip dependencies
  - fdb13a3 Merge pull request #51523 from lomeroe/solarisips_fixes
    - e8e91e3 Merge branch '2018.3' into solarisips_fixes
    - b7bfe17 lint fixes
    - cdaccf4 add tests to validate command being sent to cmd.run_all
    - eaa229d add unit test
    - 432428d Don't assume that each item in "pkgs" is a dict (as packed by pkg.installed state).
  - e3d5fbe Merge pull request #51577 from garethgreenaway/merge-2017.7
    - e060b97 Merge branch '2018.3' into merge-2017.7
    - 3eee038 Fixing a couple issues that did not merge properly.
    - 25b2ca6 Merge branch '2018.3' into merge-2017.7
    - c337fce Merge branch '2018.3' into merge-2017.7
    - f9d6828 Fixing missed merge.
    - a041775 Merge branch '2017.7' into merge-2017.7
    - 61889ba Merge pull request #51452 from terminalmage/bp-50963
    - 54d2e02 Merge branch '2017.7' into bp-50963
    - 0c989f0 Merge pull request #51437 from twangboy/fix_raise_2017.7
    - ecd1637 Merge branch '2017.7' into fix_raise_2017.7
    - f3c9cd4 Add missing raise statement

  - d06526c Allow for kwargs to be used in object initialization
  - 0e760b5 pip states: Use case-insensitive dictionaries for pip.list return
  - 5ca9f82 Add a CaseInsensitiveDict implementation
  - 2aaa9f9 pip.installed: Fix traceback when _find_key doesn't return a match
  - 67b7d28 Merge pull request #51370 from dwoz/setup_py_req_fix
  - e1e06a0 Fix python 3 path for shell test cases
  - 09cd5fc Merge branch '2017.7' into setup_py_req_fix
  - 0de189d Handle pipenv like version restrictions
  - e9b3d94 Merge pull request #51367 from dwoz/cloud_config_2017
  - 3f4c5a3e Merge branch 'cloud_config_2017' of github.com:dwoz/salt into cloud_config_2017
  - 8b8d41a Merge branch '2017.7' into cloud_config_2017
  - 7bb4ceb Fix python 3 path for shell test cases
  - a2bbf4d Fix linter issues
  - 004d9b8 Cloud provider and profile configs are merged
  - 3a21afa Coverage on windows chokes with the tox env var *COVERAGE_PROCESS_START*
  - 1c62e27 Switch required PyTest dependency
  - b80320d Merge pull request #51402 from dwoz/win_test_fix
  - 21359e6 Merge branch '2017.7' into win_test_fix
  - 1199530 Merge pull request #51397 from dwoz/gemstest
  - 43ac36e Use gems.github.com no longer exists, use gemcutter.org
  - bac652f Add testing path to run_script commands
  - f511ad2 Merge pull request #51227 from astronouth7303/doc-modules-additional-globals
  - cbe1e17 Merge branch '2017.7' into doc-modules-additional-globals
  - 2a9bf17 Merge pull request #51312 from s0undt3ch/features/tox-runtests
  - 3840af8 "Tell" coverage to track subprocesses.
  - f67a529 Remove unused imports
  - 15ab061 Show objects on assertion failure
  - 0281fc5 Don't fail the test because of order
  - 9a31be7 Don't call *.keys()* on dictionaries
  - 97ced3a Add *pytest-salt-from-filenames* to pytest requirements
  - 8d2c4d2 Remove duplicate dependency
  - 5eec144 Add *.coveragerc*
  - aa108d5 Run tests from tox, whether runtests or pytest
  - 80a3826 Update TODO
  - 1945c30 Document the client-defined dunders

- 5bb9b32 Merge pull request #51393 from garethgreenaway/various_documentation_fixes

        - 8bb7535 Merge branch '2018.3' into various_documentation_fixes
        - c15406a Merge branch '2018.3' into various_documentation_fixes
        - 33bb4e4 Merge branch '2018.3' into various_documentation_fixes
        - 3582f6e Fixing the underline.
        - a8f42a0 Various documentation fixes.
    - 884981f Merge pull request #51465 from ezh/50556
        - a3ee70c fix #50556 state.orchestrate_show_sls
    - 231d6e2 Merge pull request #51541 from bdrung/silence-linux_distribution-deprecation-warning
        - c4feea1 Merge branch '2018.3' into silence-linux_distribution-deprecation-warning
        - e1dcbb5 Silence linux_distribution deprecation warning
    - f87d5ec Merge pull request #51558 from bdrung/test-zypp-plugin
        - c34967d Merge branch '2018.3' into test-zypp-plugin
    - edb1093 Merge pull request #51609 from dwoz/wait_minions_2018.3
        - d794edb fix linter
        - d6720d2 Wait for minions to be pingable before starting tests
    - 8d79359 Merge pull request #51599 from terminalmage/bp-51510
        - ed194c7 grains: assign os_family Debian to Debian derivative TurnKey Linux
    - 24aa083 Merge pull request #51598 from terminalmage/add-grain-option-documentation
        - 4ee9440 Improve ec2 pillar documentation
        - 9c02104 Add link to metadata grain module docs
        - 997ce26 Add documentation for the metadata_server_grains config option
    - d89c489 Merge pull request #51491 from terminalmage/issue51268
        - 550e9ab Don't log shell warning if output_loglevel is quiet
        - 7678c28 Do not load zyppnotify file on module import
    - c6dfded Merge pull request #51588 from dwoz/script_fix_2018.3
        - cbac390 Use the code directory instead of cwd for python path

- **PR** #51658: (dwoz) [2019.2] Let memcopy make the null bytes, better py3 support @ *2019-02-15 05:42:37 UTC*
    - **PR** #51586: (garethgreenaway) [2019.2] Merge forward from 2018.3 to 2019.2 (refs: #51658)
    - 1ea6f4b Merge pull request #51658 from dwoz/pip_test_fix
    - c811a70 Let memcopy make the null bytes, better py3 support
- **PR** #51650: (dwoz) [2019.2] Increase minion wait for slow boxes @ *2019-02-14 16:31:59 UTC*
    - 22a04c1 Merge pull request #51650 from dwoz/increase_wait_2019.2
    - ad294f3 Merge branch '2019.2' into increase_wait_2019.2
- **PR** #51645: (dwoz) [2019.2] increase batch test timeout on windows @ *2019-02-14 16:29:26 UTC*
    - a0982f7 Merge pull request #51645 from dwoz/batch_exit_2019.2
    - 1a882d7 Merge branch '2019.2' into batch_exit_2019.2

- **PR** #51586: (garethgreenaway) [2019.2] Merge forward from 2018.3 to 2019.2 (refs: #51658) @ *2019-02-14 16:25:29 UTC*
  - 705a62d Merge pull request #51586 from garethgreenaway/merge-2018.3
  - 09fb3e7 Merge branch '2019.2' into merge-2018.3
  - 95c505a Merge branch '2019.2' into merge-2018.3
  - 4abd9d0 Merge branch '2019.2' into merge-2018.3
  - 6c99cb1 Merge branch '2018.3' into merge-2018.3
    - 41e25a6 Merge pull request #51580 from garethgreenaway/merge-2018.3.4
      - 84e15ce Fixing lint
      - e891b3f Merge branch '2018.3.4' into merge-2018.3.4
      - d0cad3e Merge pull request #51553 from twangboy/update_libsodium
      - 4177f64 Update url to libsodium for mac builds
      - 564a65a Merge pull request #51544 from twangboy/fix_test_ssh_2018.3.4
      - 7771632 Fix ssh on Windows
      - b4299a3 Merge pull request #51532 from frogunder/new_releasenotes
      - 09faf0b Merge branch '2018.3.4' into new_releasenotes
      - c6bfe53 2018.3.4 releasenotes
      - c37bdb7 Merge pull request #51534 from twangboy/fix_51309
      - 3ad95bc Convert data to string using salt util
      - 5b41af3 Merge pull request #51530 from garethgreenaway/48204_mysql_module_handle_mariadb_versions
      - cdf5298 Later versions of MariaDB still support "ALL PRIVILEGES"
      - d31c902 Updating the mysql module to handle MariDB versions.
      - f3f345c Merge pull request #51529 from frogunder/releasenotes
      - fb678ee fix escaped asterisks
      - 6a4f0da 2018.3.4 releasenotes
      - a37fb7d Merge pull request #51525 from twangboy/backport_51095_2018.3.4
      - b6acc92 Backport 51095
      - 602ddc8 Merge pull request #51520 from frogunder/man_pages
      - 0cbe3f8 Update man pages for 2018.3.4
      - 1f981c6 Merge pull request #51429 from yosnoop/replace-noclass-with-nocl-for-dig
      - 5231e73 Merge branch '2018.3.4' into replace-noclass-with-nocl-for-dig
      - 14e6fb7 In case the test machine can't resolve
      - 95e8a2f The +nocl is supported much wider than +noclass
      - a00d708 Test dig options for salt.utils.dns.lookup
      - 209ef32 Merge pull request #51441 from Ch3LL/bp-51366
      - 5bc466e Fix python 3 path for shell test cases

- 5351e5c Add testing path to run_script commands
- 2d8a364 Fix linter issues
- 9b8718a Cloud provider and profile configs are merged
- 90a8682 Merge pull request #51458 from twangboy/add_py2_warning
- 05522c0 Merge branch '2018.3.4' into add_py2_warning
- b492021 Merge pull request #51460 from twangboy/update_installer_mac_2018.3.4
- 3c92688 Merge branch '2018.3.4' into update_installer_mac_2018.3.4
- 892d98c Merge pull request #51471 from twangboy/fix_test_win_dns_client
- c9f6b01 Merge branch '2018.3.4' into fix_test_win_dns_client
- a05305d Merge pull request #51462 from ShantonRU/fix-insecure-sql-queries-in-mysql-module-1
- d3ef2cb Merge branch '2018.3.4' into fix-insecure-sql-queries-in-mysql-module-1
- f47dda6 Fix improper use of socket authentication in mysql.user_chpass
- ed62a2f Fix insecure SQL queries in mysql.user_chpass
- 33922c9 Fix the failing dns test on Windows
- 48936c2 Merge pull request #51445 from terminalmage/fix-custom-grains-traceback
- 191235d Remove custom grains module from 2018.3 branch
- 72fd1a2 Roll back icon change
- 7dd1704 Add welcome_py2.rtf
- c93e9e3 Add Py2 Warning to installer package
- b658900 Add Py2 Warning for Py2 Installer
- a880e42 Merge pull request #51438 from twangboy/fix_raise_2018.3.4
- 5830fad Add missing raise statement
- 28b898c Merge pull request #51432 from Ch3LL/bp-51324
- bd41ff0 Fixing various bits in x509 module and unit test to ensure tests are passing on python2 & python3
- 01717d2 Merge pull request #51377 from twangboy/fix_auditpol_2018.3.4
- 19e5181 Fix issue when directory doesn't exist
- 43a9d2f Merge pull request #51338 from Ch3LL/bp-51207
- 345ae67 Backport PR# 50771 to 2018.3 branch
- 3dcd11d Merge pull request #51337 from Ch3LL/bp-51170
- 4e85505 Merge branch '2018.3.4' into bp-51170
- 7656aa5 Merge pull request #51340 from Ch3LL/bp-51252
- e74a6c6 Fix py3 managed.file test failure
- 6f2c7cf Remoe un-needed log statement
- 824950c Fix 50221 regression test on Windows
- 1840af9 peserve newlines from pillar data for file.managed

    - e90ca1d Merge pull request #51290 from s0undt3ch/hotfix/fix-network
    - da3aace Merge branch '2018.3.4' into hotfix/fix-network
    - 04f16b8 Fix tests. We no longer get *ipaddress* instances back.
    - c3fa82a Fix minion start issue
    - c893dc4 Fix saltmod roster test
    - b61854f Roster defines the roster system not a file
    - 484bab4 Fix linter
    - 5e2db2f Honor roster file for ssh orchestrations
    - c8db7e3 Merge pull request #51317 from terminalmage/fix-pr-50417
    - 4be2891 Merge branch '2018.3.4' into fix-pr-50417
    - e246fdb Merge pull request #51311 from twangboy/fix_test_file.test_managed
    - f4177e0 Remove mode parameter on Windows
    - 4c4ded3 Fix regression in dynamic pillarenv
    - 40b20126 Merge pull request #51292 from Ch3LL/bp-51226
    - aba114e Merge branch '2018.3.4' into bp-51226
    - fc0bec5 Merge pull request #51295 from Ch3LL/bp-51279
    - 5c4a7a4 Merge branch '2018.3.4' into bp-51279
    - dacd1ea Merge pull request #51293 from Ch3LL/bp-51233-2
    - a155fd7 Accounting for when permissions are not returned from file.check_perms, eg. windows systems.
    - 53ba068 When test=True and there are permissions changes, report it.
    - d2eba77 Remove network.py patch
    - d431c71 Add __context__ support
    - de6c13d Handle spaces in fstab opts, similar fix to #39593
    - 1abffb2 Merge pull request #51278 from dwoz/issue51248
    - c614198 Use pillar roots validation method
    - 0d2b0c6 Fix linter warnings
    - 5b98895 Fix wart in pillar_roots validation
  - f7d50b1 Merge pull request #50784 from sathieu/dynamic_file_roots
    - 7ca2aa4 Allow dynamic file_roots
  - 5e840a5 Merge pull request #51527 from garethgreenaway/bp-51475
    - 801abf2 Fix Elasticsearch retuner
  - 1f6da6a Merge pull request #50921 from terminalmage/issue49894
    - a35c023 Don't use a decorator that assumes /etc/apt/sources.list.d exists
    - 6a62e79 Add integration test for architecture support
    - 67ae5a5 Add support for architectures for APT pkgrepo.managed states

- 3f17776 Actually, remove python-ldap. It needs system deps. Have salt-jenkins do it.
- afcb6bd Fix the *ldap* package name in requirements/tests.txt
- 588cb87 Merge pull request #51454 from terminalmage/fix-deprecation-warning
  - 529cce0 Fix deprecation warning in nested outputter
- 13de0b8 Merge pull request #50963 from terminalmage/issue50942
  - c84be3f Allow for kwargs to be used in object initialization
  - 2bf93fd pip states: Use case-insensitive dictionaries for pip.list return
  - 792f054 Add a CaseInsensitiveDict implementation
  - 1410164 pip.installed: Fix traceback when _find_key doesn't return a match
- 60953b7 Merge pull request #51366 from dwoz/cloud_config_merge
  - ae351eb Fix python 3 path for shell test cases
  - 48062c8 Merge branch '2018.3' into cloud_config_merge
  - eeea289 Add testing path to run_script commands
  - 542d857 Fix linter issues
  - a8af3ba Cloud provider and profile configs are merged
- 9ab2ec6 Coverage on windows chokes with the tox env var *COVERAGE_PROCESS_START*
- 4994c38 Switch required PyTest dependency
- 89710a7 Merge pull request #51401 from dwoz/run_script_win
  - 77fdf35 Add testing path to run_script commands
- 1438a62 Merge pull request #51389 from terminalmage/proxy-fixes
  - 3cec85e Normalize results if test proxy is enabled
- 8acd9e5 Merge pull request #51368 from s0undt3ch/hotfix/tests
  - f4e1692 Fix test
- ab60782 Merge pull request #51319 from terminalmage/issue51255
  - 04eb66b Merge branch '2018.3' into issue51255
- fdf2cf4 Merge pull request #51250 from yosnoop/fix-salt-utils-dns-lookup
  - 0ddfad1 Merge branch '2018.3' into fix-salt-utils-dns-lookup
  - 9fb4abe Merge branch '2018.3' into fix-salt-utils-dns-lookup
  - 67e4131 Merge branch '2018.3' into fix-salt-utils-dns-lookup
  - 9a34bcd Unit test for lookup with servers option
  - 9498fdc Fix _lookup_host to make it work when server specified
  - af867e1 Remove excessive whitespaces
  - 0d074a4 Fix a comment
  - 1363d2b Proper way to specify _server_ to query with _host_
  - 7b2facc Fix broken lookup in salt/utils/dns.py
- 73528a5 Merge pull request #51339 from dwoz/aws_role_backport

    - 156f532 Backport aws role support
  - 7908875 Merge pull request #51341 from Ch3LL/bp-51299
    - e3080f1 Add sleep before sending stop over UDP
  - 326425c Merge pull request #51352 from garethgreenaway/fixing_service_beacon_documentation
    - 021fe85 Fixing the documentation for the service beacon. If not options are provided for the service then there needs to be an empty dictionary.
  - 14a84e8 Merge pull request #51333 from Ch3LL/merge-2018.3
    - 27d7a89 Merge branch '2018.3' into merge-2018.3
  - 31b921f Merge pull request #51304 from terminalmage/issue51270
    - 36673fb Merge branch '2018.3' into issue51270
  - 2c3aef7 Merge pull request #51313 from s0undt3ch/features/tox-runtests-2018.3
    - 2eafc5c "Tell" coverage to track subprocesses.
    - f6babeb Remove unused imports
    - ff6824c Don't fail the test because of order
    - 4d12ccb Show objects on assertion failure
    - ee2f10a Add *pytest-salt-from-filenames* to pytest requirements
    - 4f4d019 Remove duplicate dependency
    - 1d4b9f5 Add *.coveragerc*
    - 78c6d68 Run tests from tox, whether runtests or pytest
    - c02757d gitfs: Fix use of deprecated pygit2 function
    - ae62ebc Merge branch '2017.7' into '2018.3'
    - 9309639 Merge pull request #51305 from s0undt3ch/2017.7
    - 09b20df Add 2017.7 codecov config
    - 4fa2a02 Merge pull request #51267 from ethframe/fix-file-directory
    - c108825 Fix missing file error in file.directory.
    - ad17ac5 Fix mocks to reflect changes to git.latest state
    - c817213 Don't try to run git.config_get_regexp from nonexistent cwd
    - f8c3e44 git.latest: add auth to merge/reset calls when LFS used with SSH auth
    - 4b11d6b increase batch test timeout on windows
    - a5af9c5 Increase minion wait for slow boxes

- **PR** #51549: (s0undt3ch) [2019.2] Allow NOT to install pip dependencies @ *2019-02-13 18:16:52 UTC*

- **PR** #51584: (dwoz) [2019.2] Use the code directory instead of cwd for python path @ *2019-02-12 18:43:46 UTC*
  - 1e0275e Merge pull request #51584 from dwoz/script_fixes
  - dbf4356 Use the code directory instead of cwd for python path
  - cd24006 Merge branch '2019.2' into merge-2019.2.0rc1
  - 6e55164 Merge branch '2019.2.0.rc1' into merge-2019.2.0rc1
    - ac73745 Merge branch '2019.2' into fix-string-format-index
- **PR** #51583: (dwoz) Add testing path to run_script commands @ *2019-02-11 21:38:51 UTC*
  - f446c52 Merge pull request #51583 from dwoz/scriptfix
  - e49ba86 Add testing path to run_script commands
  - 788f7e0 Fixed string format index out of range error
- **PR** #51405: (aplanas) Documentation: fix typo in "equivalent" @ *2019-02-01 21:11:12 UTC*
  - c3e27be Merge pull request #51405 from aplanas/backport_49669
  - 58279b4 Documentation: fix typo in "equivalent"
- **PR** #51406: (aplanas) states_pt3: fix rST link format @ *2019-02-01 21:10:43 UTC*
  - 5c26652 Merge pull request #51406 from aplanas/backport_49670
  - 204432d Merge branch '2019.2' into backport_49670
- **PR** #51426: (aplanas) mount: cache blkid information @ *2019-02-01 21:09:51 UTC*
  - fb70bd3 Merge pull request #51426 from aplanas/backport_51135
  - ac790a6 Merge branch '2019.2' into backport_51135
  - 66743d6 mount: cache blkid information
- **PR** #51425: (aplanas) cmdmod: add sysfs into the chroot @ *2019-02-01 21:09:00 UTC*
  - 2e8bf05 Merge pull request #51425 from aplanas/backport_51094
  - 9193106 cmdmod: add sysfs into the chroot
- **PR** #51419: (aplanas) file: update attributes for lsattr and chattr @ *2019-02-01 21:04:54 UTC*
  - d7a47f0 Merge pull request #51419 from aplanas/backport_50607

  - ab8a8b8 file: update attributes for lsattr and chattr
- **PR** #51414: (aplanas) service: SUSE is not based on sysvinit anymore @ *2019-02-01 21:02:33 UTC*
  - 7e020dd Merge pull request #51414 from aplanas/backport_50396
  - b5cff17 service: SUSE is not based on sysvinit anymore
- **PR** #51408: (aplanas) parted: fix the ordering of list command @ *2019-02-01 21:00:19 UTC*
  - **PR** #50473: (aplanas) parted: support variable length output for print (refs: #51408)
  - **PR** #49804: (aplanas) parted: fix the ordering of list command (refs: #51408)
  - 9f87dda Merge pull request #51408 from aplanas/backport_49804
  - 467daf2 parted: support variable length output for print
  - da2e632 parted: fix the ordering of list command
- **ISSUE** #50097: (aplanas) lowpkg.diff refers to a package name, but a package file is required (refs: #51410)
- **PR** #51410: (aplanas) Fix lowpkg.diff documentation and parameter name @ *2019-02-01 20:57:50 UTC*
  - 7e14499 Merge pull request #51410 from aplanas/backport_50126
  - d38622e Fix lowpkg.diff documentation and parameter name
    - e61a077 states_pt3: fix rST link format
- **PR** #51404: (aplanas) blockdev: fix url from comment @ *2019-01-30 20:05:54 UTC*
  - a16461b Merge pull request #51404 from aplanas/backport_49668
  - da2e30d blockdev: fix url from comment
- **PR** #51407: (aplanas) parted: fix _validate_partition_boundary @ *2019-01-30 20:05:02 UTC*
  - 756c367 Merge pull request #51407 from aplanas/backport_49803
  - b004b33 parted: fix _validate_partition_boundary
- **PR** #51435: (damianosSemmle) Fixed not raised exceptions @ *2019-01-30 18:32:57 UTC*
  - 1d45664 Merge pull request #51435 from damianosSemmle/fix-raise-exception
  - 7a9ff59 Fixed not raised exceptions
- **PR** #51336: (Ch3LL) [2019.2] Merge Forward from 2019.2.0.rc1 to 2019.2 @ *2019-01-27 23:55:08 UTC*
  - d4b9093 Merge pull request #51336 from Ch3LL/merge-2019.2.0rc1
  - 62a20b1 Remove unused import
  - 2284ea5 Merge branch '2019.2' into merge-2019.2.0rc1
  - 18bf236 Merge branch '2019.2.0.rc1' into 2019.2
- **PR** #51334: (Ch3LL) [2019.2] Merge forward from 2018.3 to 2019.2 @ *2019-01-27 23:49:32 UTC*
  - 02b43a0 Merge pull request #51334 from Ch3LL/merge-2019.2
  - 25ec653 Merge branch '2018.3' into '2019.2'
    - f62cc11 Merge pull request #51324 from garethgreenaway/1257_something_something_bytes_argh_python2
      - bd7072f Merge branch '2018.3' into 1257_something_something_bytes_argh_python2
    - b44cd84 Merge pull request #51323 from garethgreenaway/network_dns_check_test
      - 055eadc Merge branch '2018.3' into network_dns_check_test

- be57a0f Merge pull request #51321 from terminalmage/issue51256
    - d9c4462 Fix 500 error when using wheel_async
    - c847f54 Swap passed addr for string rather than ipaddress object.
    - 87f3972 removing another debugging log.
    - ad64efb Use MagicMock
    - 172ad2e removing debugging
    - 5812eae Adding a test to ensure dns_check works as expected.
    - 0e542c5 Fixing various bits in x509 module and unit test to ensure tests are passing on python2 & python3
- 85e7ac6 Merge pull request #51306 from s0undt3ch/2018.3
    - 5f0f296 Add 2018.3 codecov config
- 5a398a3 Merge pull request #51207 from twangboy/fix_test_pkg
    - d4ab6d8 Merge branch '2018.3' into fix_test_pkg
- 7a97cb4 Merge pull request #51252 from dwoz/issue-50221
    - f96828a Merge branch '2018.3' into issue-50221
- 253f5e4 Merge pull request #51264 from gtmanfred/2018.3
    - f3ebd32 Merge branch '2018.3' into 2018.3
- aacc047 Merge pull request #51274 from twangboy/fix_network
    - 344bf65 Fix tests. We no longer get *ipaddress* instances back.
    - 345aa5b Fix minion start issue
    - f553be7 tuples don't have pop
    - 55ea80e don't shadow builtin
    - 6148c50 an argument is not always needed to be passed to open a file
- 8a89cb2 Merge pull request #51279 from twangboy/backport_lgpo
    - 06b1545 Remove network.py patch
    - 2356f25 Add __context__ support
    - a5255f0 Merge remote-tracking branch 'saltstack/2018.3' into issue-50221
- 6796e65 Merge pull request #51276 from garethgreenaway/merge-2018.3
    - 44ddc43 Merge branch '2018.3' into merge-2018.3
- 0adde9b Merge pull request #51220 from sathieu/artifactory-classifier-2018.3
    - a85f146 fixes #31179 by appling the same logic as used in the nexus module
- f6a7cad Merge pull request #51225 from astronouth7303/loader-docs-2018.3
    - 6e7da95 Add the tokens system.
    - 7e2838c Add reference to the execution module docs
    - f30f9e8 Remove search system
    - f0cc183 Fileserver modules can be loaded from the fileserver.

    - 1a2f680 Merge pull request #51239 from garethgreenaway/51208_file_manage_escaped_double_quotes
        - 4251c0c Merge branch '2018.3' into 51208_file_manage_escaped_double_quotes
        - 6a9daa7 Merge branch '2018.3' into 51208_file_manage_escaped_double_quotes
        - 0bf468c Fixing lint. Using a constant instead of looking for the condition in the string.
        - a233dbc Ensuring we can handle a string that contains single quote + an escaped double quote.
    - d614127 Merge pull request #51261 from OrangeDog/patch-2
        - d809b9b Avoid double-counting errors and ignore test runs
        - 6ca7deb Remove unused host parameter and average/disaster keys
        - 2d44527 Just let zabbix_sender use the config file
        - 6404e2c Fix fallback command so it's actually run
        - b79a55a Fix KeyError in Zabbix returner
        - 0971035 Merge branch '2018.3' into merge-2018.3
        - 243dc06 Merge branch '2017.7' into merge-2018.3
        - acfb7d8 Update pytest requirements
        - c19479b Move all of PyTest requirements to its own requiremnts file
        - 39e633f Merge pull request #51246 from garethgreenaway/bp-50358
        - c33c558 Backport #50358 to 2017.7
        - c1ea10f Fix py3 managed.file test failure
        - 537114c Remoe un-needed log statement
        - ac978f0 Fix 50221 regression test on Windows
        - 65f38b5 peserve newlines from pillar data for file.managed
        - 464d813 Merge branch '2018.3' into fix_test_pkg
    - 276d621 Merge pull request #51197 from Ch3LL/tag_manager
        - b9a0705 Merge branch '2018.3' into tag_manager
        - 210238b Merge branch '2018.3' into tag_manager
        - 827d6c3 Merge branch '2018.3' into tag_manager
        - fcdfe69 Add Google Tag Manager to Docs
    - c8e70a9 Merge pull request #51206 from terminalmage/fix-reload
        - 8e23a6c Add missing import
        - 31ca7c6 Fix usage of reload for PY3 compatibility
    - 41ae390 Merge pull request #51231 from terminalmage/issue51056
        - 4a61477 Clarify documentation for the gitfs "all_saltenvs" config param
        - 0574476 Merge branch '2018.3' into fix_test_pkg
        - b91b2c6 Backport PR# 50771 to 2018.3 branch
- **PR** #51314: (s0undt3ch) [2019.2] Allow running runtests.py using tox @ *2019-01-25 18:56:01 UTC*

  - 95607d1 Merge pull request #51314 from s0undt3ch/features/tox-runtests-2019.2
  - 39fb981 ”Tell” coverage to track subprocesses.
  - f27589a Remove unused imports
  - 3000d20 Fix tests. We no longer get *ipaddress* instances back.
  - 8fcf235 Fix minion start issue
  - a26ba7f Don't fail the test because of order
  - 138ca2e Show objects on assertion failure
  - 840b3d2 Add *pytest-salt-from-filenames* to pytest requirements
  - 716bda4 Remove duplicate dependency
  - 6d62156 Add *.coveragerc*
  - 6bb56ce Run tests from tox, whether runtests or pytest
- **PR** #51307: (s0undt3ch) Add 2019.2 codecov config @ *2019-01-24 13:34:25 UTC*
  - b348034 Merge pull request #51307 from s0undt3ch/2019.2
  - 495aa5c Add 2019.2 codecov config
- **PR** #51280: (garethgreenaway) [2019.2] Merge forward from 2019.2.0rc1 to 2019.2 @ *2019-01-23 07:08:32 UTC*
  - d224096 Merge pull request #51280 from garethgreenaway/merge-2019.2-rc
  - e78ede2 Merge branch '2019.2' into merge-2019.2-rc
  - a425de6 Merge branch '2019.2.0.rc1' into merge-2019.2-rc
- **PR** #51277: (garethgreenaway) [2019.2] Merge forward from 2018.3 to 2019.2 @ *2019-01-23 07:01:29 UTC*
  - 8596ee4 Merge pull request #51277 from garethgreenaway/merge-2019.2
  - f05e754 Merge branch '2019.2' into merge-2019.2
- **ISSUE** #51273: (isbm) How to properly fix API? (refs: #51285)
- **PR** #51285: (garethgreenaway) [2019.2] Add metadata to accepted keyword arguments @ *2019-01-22 23:07:44 UTC*
  - 8cca51b Merge pull request #51285 from garethgreenaway/51273_metadata_auth_keyword_argument
  - bd82d80 Ensure metadata is an accepted keyword argument for authentication functions.
  - d0d5726 Merge branch '2018.3' into merge-2019.2
  - a6a9040 Merge pull request #51179 from terminalmage/fix-regex-chars
    - 9951b8d Fix possible oversight in nodegroup modifications
  - d5acd5b Merge pull request #51170 from dwoz/issue51158
    - b69c002 Fix saltmod roster test
    - 2594f24 Roster defines the roster system not a file
    - 05836b3 Merge branch '2018.3' into issue51158
    - bf47f6f Fix linter
    - 6223596 Honor roster file for ssh orchestrations
  - 5543a53 Update pytest requirements

  - f958df5 Move all of PyTest requirements to its own requiremnts file
  - 8f8ebbc Merge pull request #51226 from garethgreenaway/51195_handle_spaces_in_fstab_opts
    - 1902ce8 Merge branch '2018.3' into 51195_handle_spaces_in_fstab_opts
  - e3a9e99 Merge pull request #51233 from Ch3LL/bp-51105
    - eef49e8 Merge branch '2018.3' into bp-51105
  - e53e9b1 Merge pull request #51230 from Ch3LL/merge-2018.3
    - 0ef7675 Merge branch '2017.7' into '2018.3'
    - 4a12c5f Merge pull request #50852 from mirceaulinic/fix-capirca
      - fa91267 Merge branch '2017.7' into fix-capirca
      - 71913ff Merge branch '2017.7' into fix-capirca
      - 6fc3484 Lint?
      - 3d56750 Extra newline for lint
      - 5176cd8 Improve the Capirca and related modules for ACL config generation
    - 3f4759b Merge pull request #50923 from astronouth7303/patch-2
      - 4f631a6 Document {% include %}
    - 210e817 Merge pull request #51111 from s0undt3ch/2017.7
      - 08e0ae7 Update to salt-bootstrap v2019.01.08
      - c3520aa Accounting for when permissions are not returned from file.check_perms, eg. windows systems.
      - cd80548 When test=True and there are permissions changes, report it.
      - 89345eb Handle spaces in fstab opts, similar fix to #39593
- **ISSUE** #50538: (sjorge) salt.modules.pdbedit broken on Samba 4.9.x (refs: #50540, #51221)
- **PR** #51221: (Ch3LL) Backport #50538 into 2019.2 @ *2019-01-18 22:42:36 UTC*
  - **PR** #50540: (sjorge) Fix pdbedit module on samba 4.9 (Fixes #50538)
  - 0ccd5c3 Merge pull request #51221 from Ch3LL/bp-50540
  - 223e7c0 Merge branch '2019.2' into bp-50540
- **PR** #51232: (Ch3LL) [2019.2] Merge forward from 2018.3 to 2019.2 @ *2019-01-18 20:51:37 UTC*
  - 3edaf18 Merge pull request #51232 from Ch3LL/merge-2019.2
  - 3b966f3 Merge branch '2019.2' into merge-2019.2
  - ffe23fa Merge branch '2018.3' into '2019.2'
    - 26008ef Merge pull request #51212 from sathieu/file_roots_slash
      - b769f18 Allow slash in file_roots envs
      - f9437e2 Test for file_roots envs with slash leads to "No such file or directory"
    - 5916282 Merge pull request #51209 from garethgreenaway/bp-51124
      - 82acce4 Handle encoding when opening file for both py2/py3
    - 094bd33 Merge pull request #51184 from twangboy/fix_auditpol

    - 2e68d35 directly call cmd.run_all
- ac71922 Merge pull request #51191 from Ch3LL/bp-50918
    - 7300d84 Skip debian tests on Windows
    - 4622433 Fix *test_debian_ip* on Windows
- e7f53a3 Merge pull request #51144 from jgleissner/2018.3-azurearm-py3
    - 3178f1a msazure.py: remove unused imports
    - 99a4b9d azurearm: fix list_locations
    - aebe34b azurearm: fix show_instance function
    - d80669f msazure: fix object_to_dict for python 3
- 1206f92 Merge pull request #51171 from twangboy/fix_crypt
    - 6caa93b Add random sleep time to avoid overloading Windows
- a96deed Merge pull request #51174 from jpsv/2018.3
    - 055823e Update opsgenie.py
    - 501c8df Merge branch '2018.3' into 2018.3
    - 220aa8a Update opsgenie.py
    - 5dc21cc Update to from V1 API to V2
    - f93ce7c Update to V2 API
- 563d487 Merge pull request #51010 from amendlik/ldap-groups
    - cd336ed Merge branch '2018.3' into ldap-groups
    - 94f8ee4 Update unit tests for auth.ldap
    - 08e36d0 Allow unauthenticated bind for listing LDAP groups
- 6dc3752 Merge pull request #51112 from s0undt3ch/2018.3
    - 4f1d846 Update to salt-bootstrap v2019.01.08
- b19c990 Merge pull request #51097 from terminalmage/fix-keyerror-raise
    - a3c0b49 Fix poorly-written test
    - c0ff7b1 Fix more incorrect exception raises
    - f11dbcc Fix improper KeyError raise
- 8920a86 Merge pull request #51169 from twangboy/fix_git_state
    - f2d1180 More descriptive error when missing GitPython or PyGit2
- 58eede6 Merge pull request #51173 from dwoz/issue51160
    - 11cc7b3 Remove un-needed test
    - 0f87812 Merge develop, Revert exception handling
    - 7365a1a Pass bytes to idna
- 83c38c6 Revert ”wordsmithing”
- a40739c wordsmithing
- b348ace Make sure blackout tests clean up after themselves. Properly.

- 68a12d5 These should not be considered destructive tests
- 475404d fix docstring quote style
- 71c3574 Revert ”backport test improvements from develop”
- e32d219 backport test improvements from develop Bogus random test failures forklifted from develop at 414bfe61a4fbe6f84be32242924f23c7126c24d6
- 42654d8 socket.connect needs a tuple TypeError https://docs.python.org/2/library/socket.html RTFD ”Note This method has historically accepted a pair of parameters for AF_INET addresses instead of only a tuple. This was never intentional and is no longer available in Python 2.0 and later. ”
- 27254fc syntax error bad parentheses
- 24bb94f Don't ip_bracket addresses returned by check_dns.
- 02b825e expose error in tests
- 0a92c46 Need more detail on test failure
- 3574698 ip_address does not need str() and parse_host_port handles ipv6 or ipv4
- 7a6bc57 avoid TypeError by not constructing an ip_address from an ip_address

  - 6fcc4ad Merge branch '2018.3' into long-hostname
- 1424734 Merge pull request #51159 from rkrieger/fix-issue-51067
  - 1440ccf Prevent crash by testing for 'manufacturer' in osdata on OpenBSD
  - 1a4e307 Ignore exceptions when generating the minion ID
- 5e37326 Merge pull request #51146 from terminalmage/fix-vsphere-tuple-issue
  - 5d60022 Fix invalid assignment in vsphere module
- fad8621 Merge pull request #51154 from twangboy/auditpol
  - 9064376 Add support for Advanced Audit policies
- f7a100c Merge pull request #51151 from Ch3LL/bp_51061
  - ffdae27 When writing output to stdout we want to ensure that the data is a string not bytes. Under py2 the salt.utils.data.encode function results in a string but under py3 the result is a bytestring. Swapping out salt.utils.data.encode for salt.utils.stringutils.to_str.
- 3a50a57 Merge pull request #51150 from Ch3LL/bp-49508
  - 7ae53ad Do not silently ignore errors.
  - deb0134 Convert to string before sending via 'publish'.
  - 651c551 Use to_str salt.utils when writing to a file.
- 8bb589d Merge pull request #51152 from garethgreenaway/50433_handle_grants_better
  - f7caa4d Fixing lint
  - e8c8c0f Adding some tests to ensure "ALL PRIVILEGES" is handled correctly in 8.0 and 5.6
  - b4bfd9f Add additional grants. Adding logic to handle when ALL or ALL PRIVILEGES is passed for the grant, including some logic to handle the fact that the grants are split when show grants is run for a particular user.
  - 74edfd9 Fix pylint
  - 81a3d47 Merge branch '2017.7' into '2018.3'

        - 8a76a19 Merge pull request #50858 from jasonarewhy/bugfix-2017.7/ubuntu-networking-searchdomain
        - 3395a3d Merge branch '2017.7' into bugfix-2017.7/ubuntu-networking-searchdomain
        - 69d25aa update debian_ip test
        - a6b896c get searchdomain in Ubuntu 12+
    - dda1ebb Merge pull request #51133 from 5uper5hoot/issue-#50849
        - ec14e13 Fixes mysql server version comparison.
    - 9d4321d Merge pull request #50878 from max-arnold/output-docs
        - d7403da Fix profile outputter docs
    - ce87504 Merge pull request #51076 from OrangeDog/patch-1
        - 568e4fb Revert add -> check
        - 4d7ebe7 Typos in index_template_present documentation
    - d08abf4 Merge pull request #51081 from garethgreenaway/merge-2018.3
        - 027804a Merge branch '2018.3' into merge-2018.3
    - 335088b Merge pull request #51080 from garethgreenaway/50966_nxos_ensure_kwargs_list
    - 230a66b Merge branch '2018.3' into 50966_nxos_ensure_kwargs_list
    - 629dc25 Ensure kwargs is a list before we attempt to loop through. Similar fix to https://github.com/rallytime/salt/commit/430c462f34eb4eedf2384e06fbee8dc19b8026f6 in the proxy module.
    - a20791b Merge branch '2018.3' into merge-2018.3
    - 9386aab Merge branch '2017.7' into merge-2018.3
    - 998feca Merge pull request #51030 from terminalmage/issue38502
    - 6dbd81f Add unit test to ensure we don't diff bare repos
    - 3c4b243 Merge branch '2019.2' into bp-50540
- **PR** #51234: (KChandrashekhar) Added a note in Release notes about py 2.7 EOL @ *2019-01-18 15:53:51 UTC*
  - e6ab913 Merge pull request #51234 from KChandrashekhar/2019.2-docs
  - e4afc81 Addressing Megan's comment to fix the py2.7 deprecation message in release notes
  - 8ec0296 Added a note in Release notes about py 2.7 EOL
- **PR** #51198: (Ch3LL) [2019.2] Merge forward from 2019.2.0.rc1 to 2019.2 @ *2019-01-17 21:23:34 UTC*
  - 644ef8c Merge pull request #51198 from Ch3LL/merge-2019.2-rc
  - 810c611 Merge branch '2019.2.0.rc1' into 2019.2
  - 3f61e77 Fix pdbedit module on samba 4.9 (Fixes #50538)
- **PR** #51148: (Ch3LL) [2019.2] Merge forward from 2018.3 to 2019.2 @ *2019-01-14 22:49:02 UTC*
  - 12901c3 Merge pull request #51148 from Ch3LL/merge-2019.2
  - 1d7329a Fix pylint
  - 5271636 Fixes mysql server version comparison.
  - b53f171 Ensure kwargs is a list before we attempt to loop through. Similar fix to https://github.com/rallytime/salt/commit/430c462f34eb4eedf2384e06fbee8dc19b8026f6 in the proxy module.

  - d0f2d15 Revert add -> check
  - 437d8b5 Typos in index_template_present documentation
  - 3bf189e Add unit test to ensure we don't diff bare repos
  - 2f8e391 Fix profile outputter docs
- **PR** #51100: (dwoz) Fix typo in method name (2019.2) @ *2019-01-08 18:12:23 UTC*
  - 4c2d76d Merge pull request #51100 from dwoz/cloud_typo
  - 60f53d0 Fix typo in method name
- **PR** #51099: (terminalmage) Fix improper exception raises (2019.2) @ *2019-01-08 17:55:53 UTC*
  - 39b28f4 Merge pull request #51099 from terminalmage/fix-exception-raise
  - 2a25530 Fix improper exception raise
- **PR** #51084: (s0undt3ch) [fluorine] Cleanup the singleton instances map. @ *2019-01-07 22:03:29 UTC*
  - 8827193 Merge pull request #51084 from s0undt3ch/merge-singleton-last-ref-close-fluorine
  - 979fbac Merge branch '2019.2' into merge-singleton-last-ref-close-fluorine
  - 63f051a Merge branch '2019.2' into merge-singleton-last-ref-close-fluorine
  - bd6c46d Cleanup the singleton instances map.

33.2.66 Salt 2019.2.2 Release Notes

Version 2019.2.2 is a bugfix release for *2019.2.0*.

Statistics

- Total Merges: **26**
- Total Issue References: **12**
- Total PR References: **26**
- Contributors: **13** (Akm0d, Ch3LL, Oloremo, OrlandoArcapix, bryceml, dhiltonp, dwoz, frogunder, garethgreenaway, javierbertoli, pizzapanther, s0undt3ch, twangboy)

Changelog for v2019.2.1..v2019.2.2

Generated at: 2019-10-11 20:54:15 UTC

- **PR** #54919: (twangboy) Add missing docs for win_wusa state and module (2019.2.1) @ *2019-10-11 18:28:11 UTC*
  - 7d253bc Merge pull request #54919 from twangboy/update_docs
  - 57ff199 Add docs for win_wusa
- **ISSUE** #54941: (UtahDave) Pillar data is refreshed for EVERY salt command in 2019.2.1 and 2019.2.2 (refs: #54942)
- **PR** #54942: (dwoz) Fix for 54941 pillar_refresh regression @ *2019-10-11 18:27:31 UTC*
  - 2f817bc Merge pull request #54942 from dwoz/fix-54941
  - cb5d326 Add a test for 54941 using test.ping

  - 348d1c4 Add regression tests for issue 54941
  - 766f3ca Initial commit of a potential fix for 54941
- **PR** #54897: (bryceml) update version numbers to be correct @ *2019-10-05 01:59:14 UTC*
  - f783108 Merge pull request #54897 from bryceml/2019.2.1_fix_docs
  - e9a2a70 update version numbers to be correct
- **PR** #54894: (bryceml) 2019.2.1 fix docs @ *2019-10-04 22:31:26 UTC*
  - 3233663 Merge pull request #54894 from bryceml/2019.2.1_fix_docs
  - 2456aaa Porting PR #52948 to 2019.2.1
  - 94a1e3b Porting PR #52752 to 2019.2.1
  - c7b7474 modifying saltconf ads
  - d48057b add new saltconf ads
- **PR** #54858: (frogunder) remove in progress from releasenotes 2019.2.2 @ *2019-10-02 20:42:59 UTC*
  - 4b06eca Merge pull request #54858 from frogunder/releasenotes_remove2019.2.2
  - a697abd remove in progress from releasenotes 2019.2.2
- **PR** #54854: (frogunder) releasenotes 2019.2.2 @ *2019-10-02 18:58:21 UTC*
  - aaf2d1c Merge pull request #54854 from frogunder/release_notes_2019.2.2
  - a41dc59 Update 2019.2.2.rst
  - 9bea043 releasenotes 2019.2.2
- **PR** #54852: (frogunder) Update man pages for 2019.2.2 @ *2019-10-02 18:27:07 UTC*
  - 10d433f Merge pull request #54852 from frogunder/man_pages_2019.2.2
  - 92bc4b2 Update man pages for 2019.2.2
- **PR** #54845: (s0undt3ch) Remove debug print @ *2019-10-02 17:38:21 UTC*
  - 8ca6b20 Merge pull request #54845 from s0undt3ch/hotfix/event-return-fix-2019.2.1
  - 3937890 Remove debug print
- **ISSUE** #54755: (Reiner030) 2019.2.1/2019.2.0 pip failures even when not using pip (refs: #54826)
- **PR** #54826: (dwoz) Fix issue 54755 and add regression tests @ *2019-10-01 20:07:46 UTC*
  - 9e3914a Merge pull request #54826 from dwoz/issue_54755
  - 0bad9cb Handle locals and globals separately
  - bcbe9a2 Only purge pip when needed
  - d2f98ca Fix issue 54755 and add regression tests
- **PR** #54830: (frogunder) Add known issues to 2019.2.1 release notes @ *2019-10-01 16:23:30 UTC*
  - ba569d0 Merge pull request #54830 from frogunder/update_relasenotes_2019.2.1
  - 8cdb27b Update 2019.2.1.rst
  - 14f955c Add known issues to 2019.2.1 release notes
- **ISSUE** #54521: (Oloremo) [Regression] Failhard, batch and retcodes (refs: #54806)
- **PR** #54806: (Oloremo) [Regression] Batch with failhard fix @ *2019-10-01 14:51:47 UTC*

  - 433b6fa Merge pull request #54806 from Oloremo/failhard-batch-fix-2019.2.1
  - 6684793 Merge branch '2019.2.1' into failhard-batch-fix-2019.2.1
  - 3e0e928 Added tests for cli and runner
  - 2416516 Made batch work properly with failhard in cli and runner
- **ISSUE** #54820: (OrangeDog) schedule.present not idempotent when scheduler disabled (refs: #54828)
- **PR** #54828: (garethgreenaway) [2019.2.1] Fix global disabling code in scheduler @ *2019-10-01 09:27:49 UTC*
  - ed94aa5 Merge pull request #54828 from garethgreenaway/54820_fix_schedule_disabled_job_enabled_bug
  - be15a28 Rework code that handles individual jobs being disabled and scheduler being globally being disabled. Previously disabling the schedule would result in individual jobs being disabled when they were run through eval. This change does not change schedule items.
- **PR** #54778: (Akm0d) fix broken salt-cloud openstack query @ *2019-10-01 09:23:27 UTC*
  - 435b40c Merge pull request #54778 from Akm0d/master_openstack_query_fix
  - ba4ba2a fixed pylint errors in openstack test
  - d9a8517 Added openstack tests for openstack --query fix
  - 59214ad Fallback to image id if we don't have an image name
  - 3a42a4d fixed pylint error
  - 0074d18 created unit tests for openstack
  - 4255e3e Merge branch '2019.2.1' of https://github.com/saltstack/salt into HEAD
  - 1c2821b Return a configured provider, not a bool
  - c585550 fix broken salt-cloud openstack query
- **ISSUE** #54762: (margau) 2019.2.1: Breaks Minion-Master Communication (refs: #54823, #54784, #54807)
- **PR** #54823: (dhiltonp) ip_bracket can now accept ipv6 addresses with brackets @ *2019-10-01 01:13:34 UTC*
  - 93b1c4d Merge pull request #54823 from dhiltonp/maybe-bracket
  - faa1d98 ip_bracket can now accept ipv6 addresses with brackets
- **ISSUE** #54762: (margau) 2019.2.1: Breaks Minion-Master Communication (refs: #54823, #54784, #54807)
- **PR** #54807: (dwoz) Fix pip state pip >=10.0 and <=18.0 @ *2019-09-30 09:20:14 UTC*
  - **PR** #54772: (OrlandoArcapix) Fix import of pip modules (refs: #54807)
  - b61b30d Merge pull request #54807 from dwoz/patch-2
  - 664806b Add unit test for pip state fix
  - e637658 Revert change to pip version query
  - 42810a2 Fix import of pip modules
- **ISSUE** #54741: (kjkeane) Schedulers Fail to Run (refs: #54799)
- **PR** #54799: (garethgreenaway) Fix to scheduler when job without a time element is run with schedule.run_job @ *2019-09-30 00:19:43 UTC*
  - 4ee1ff6 Merge pull request #54799 from garethgreenaway/54741_run_job_fails_without_time_element
  - 44caa81 Merge branch '54741_run_job_fails_without_time_element' of github.com:garethgreenaway/salt into 54741_run_job_fails_without_time_element

    - 3ae4f75 Merge branch '2019.2.1' into 54741_run_job_fails_without_time_element
  - 8afd2d8 Removing extra, unnecessary code.
  - 549cfb8 Fixing test_run_job test to ensure the right data is being asserted. Updating unit/test_module_names.py to include integration.scheduler.test_run_job.
  - 7d716d6 Fixing lint.
  - ec68591 If a scheduled job does not contains a time element parameter then running that job with schedule.run_job fails with a traceback because data['run'] does not exist.
- **PR** #54785: (Ch3LL) Fix state.show_states when sls file missing in top file @ *2019-09-30 00:00:34 UTC*
  - b90c3f2 Merge pull request #54785 from Ch3LL/fix_show_states
  - 96540be Clean up files after state.show_states test
  - ad265ae Fix state.show_states when sls file missing
- **ISSUE** #54768: (paul-palmer) 2019.2.1 Some Jinja imports not found (refs: #54780)
- **ISSUE** #54765: (awerner) 2019.2.1: Jinja from import broken (refs: #54780)
- **PR** #54780: (dwoz) Fix masterless jinja imports @ *2019-09-29 22:12:48 UTC*
  - b9459e6 Merge pull request #54780 from dwoz/fix-masterless-jinja-imports
  - 5d873cc Merge branch '2019.2.1' into fix-masterless-jinja-imports
  - e901a83 Add regression tests for jinja import bug
  - 3925bb7 Fix broken jinja imports in masterless salt-call
- **ISSUE** #54776: (javierbertoli) Setting *ping_interval* in salt-minion's config (version 2019.2.1) prevents it from starting (refs: #54777)
- **PR** #54777: (javierbertoli) Fix minion's remove_periodic_callback() @ *2019-09-29 21:33:53 UTC*
  - 4c240e5 Merge pull request #54777 from netmanagers/2019.2.1
  - 459c790 Merge branch '2019.2.1' into 2019.2.1
- **PR** #54805: (bryceml) improve lint job @ *2019-09-29 21:24:05 UTC*
  - 83f8f5c Merge pull request #54805 from bryceml/2019.2.1_update_lint_salt
  - ffa4ed6 improve lint job
  - fa1a767 Merge branch '2019.2.1' into 2019.2.1
- **ISSUE** #54751: (jnmatlock) NXOS_API Proxy Minions Error KeyError: 'proxy.post_master_init' after upgrading to 2019.2.1 (refs: #54783)
- **PR** #54783: (garethgreenaway) Ensure metaproxy directory is included in sdist @ *2019-09-29 02:17:23 UTC*
  - 6b43fbe Merge pull request #54783 from garethgreenaway/54751_fixing_missing_metaproxy_directory
  - 67d9938 Merge branch '2019.2.1' into 54751_fixing_missing_metaproxy_directory
  - a35e609 Adding __init__.py to metaproxy directory so that metaproxy is included when running setup.py.
- **ISSUE** #54762: (margau) 2019.2.1: Breaks Minion-Master Communication (refs: #54823, #54784, #54807)
- **PR** #54784: (dhiltonp) fix dns_check to return uri-compatible ipv6 addresses, add tests @ *2019-09-28 08:36:51 UTC*
  - 7912b67 Merge pull request #54784 from dhiltonp/ipv46

  - 042a101 Merge branch '2019.2.1' into ipv46
- **PR** #54779: (frogunder) Add 2019.2.2 release notes @ *2019-09-27 17:45:46 UTC*
  - 2f94b44 Merge pull request #54779 from frogunder/releasenotes_2019.2.2
  - 67f564b Add 2019.2.2 release notes
  - ac6b54f Merge branch '2019.2.1' into ipv46
  - 93ebd09 update mock (py2) from 2.0.0 to 3.0.5
  - 37bcc4c fix dns_check to return uri-compatible ipv6 addresses, add tests
    - dd86c46 Merge pull request #1 from waynew/pull/54777-callback-typo
      - a57f7d0 Add tests
    - c19d0b0 Fix minion's remove_periodic_callback()
- **PR** #54731: (pizzapanther) Fix returners not loading properly @ *2019-09-26 17:24:27 UTC*
  - 46bec3c Merge pull request #54731 from pizzapanther/not-so-__new__-and-shiny
  - bdf24f4 Make sure we tests salt-master's *event_return* setting
  - 5499518 remove unnecessary import
  - 3f8a382 fix module import
  - 0746aa7 remove __new__ method since it was removed from parent class
- **PR** #54706: (bryceml) 2019.2.1 ruby @ *2019-09-23 16:00:27 UTC*
  - e2b86bf Merge pull request #54706 from bryceml/2019.2.1_ruby
  - 168a6c1 switch to ruby 2.6.3

33.2.67 Salt 2019.2.3 Release Notes

Version 2019.2.3 is a CVE-fix release for *2019.2.0*.

Security Fix

CVE-2019-17361

With the Salt NetAPI enabled in addition to having a SSH roster defined, unauthenticated access is possible when specifying the client as SSH. Additionally, when the raw_shell option is specified any arbitrary command may be run on the Salt master when specifying SSH options.

33.2.68 Salt 2019.2.4 Release Notes

Version 2019.2.4 is a CVE-fix release for *2019.2.0*.

Security Fix

CVE-2020-11651

An issue was discovered in SaltStack Salt before 2019.2.4 and 3000 before 3000.2. The salt-master process ClearFuncs class does not properly validate method calls. This allows a remote user to access some methods without authentication. These methods can be used to retrieve user tokens from the salt master and/or run arbitrary commands on salt minions.

CVE-2020-11652

An issue was discovered in SaltStack Salt before 2019.2.4 and 3000 before 3000.2. The salt-master process ClearFuncs class allows access to some methods that improperly sanitize paths. These methods allow arbitrary directory access to authenticated users.

Known Issue

Part of the fix for CVE-2020-11651 added better validation of the methods allowed to be called by remote clients. Both AESFuncs and ClearFuncs now have an explicit list of methods that can be called. The name of one of these whitlisted methods on AESFuncs had a typo. The _minion_runner method should be minion_runner (without the underscore prefix). This typo breaks the publish module's runner method. Calling runners, for example:

```
salt minion publish.runner manage.down
```

Will not work, and you will receive and empty reply from the salt master.

This will be addressed in the 3001 release of Salt set for mid-June 2020.

33.2.69 Salt 2019.2.5 Release Notes

Version 2019.2.5 is a bug-fix release for *2019.2.0*.

Statistics

- Total Merges: **2**
- Total Issue References: **2**
- Total PR References: **2**
- Contributors: **2** (dwoz, frogunder)

Changelog for v2019.2.4..v2019.2.5

Generated at: 2020-05-05 22:43:12 UTC

- **PR** #57096: (frogunder) Update man_pages 2019.2.5 @ *2020-05-05 22:10:46 UTC*
  - 6877b7259a Merge pull request #57096 from frogunder/man_pages_2019.2.5
  - 58ea351a59 Update man_pages 2019.2.5
- **ISSUE** #57027: (ecarson) [BUG] Master running 2019.2.4 or 3000.2 unable to synchronize files using saltutil.sync_all to 2017.7.1 minion due to CVE fix (refs: #57090)
- **ISSUE** #57016: (idontwanttosignin) [BUG] Requested method not exposed: minion_runner (refs: #57090)
- **PR** #57090: (dwoz) Address Issues in CVE Release @ *2020-05-05 22:09:25 UTC*

  - 8fe0f66f94 Merge pull request #57090 from dwoz/bugs_n_stuff
  - f3e8590bac Describe SEPs
  - aa1a9d340d Update hardening doc to mention 4505/4506
  - ca303f7c0c Add link to salt-announce to documentation
  - c63253ef9c Address issues in cve release

33.2.70 Salt 2019.2.6 Release Notes

Version 2019.2.6 is a CVE fix release for *2019.2.0*.

Fixed

- Prevent shell injections in netapi ssh client (cve-2020-16846)
- Prevent creating world readable private keys with the tls execution module. (cve-2020-17490)

33.2.71 Salt 2019.2.7 Release Notes

Version 2019.2.7 is a CVE fix release for *2019.2.0*.

Fixed

- Properly validate eauth credentials and tokens along with their ACLs. Prior to this change eauth was not properly validated when calling Salt ssh via the salt-api. Any value for 'eauth' or 'token' would allow a user to bypass authentication and make calls to Salt ssh. (CVE-2020-25592)

33.2.72 Salt 2019.2.8 Release Notes

Version 2019.2.8 is a bugfix release for *2019.2.0*.

Fixed

- Fixes salt-ssh authentication when using tty (#58922)

33.2.73 Salt 2018.3.0 Release Notes - Codename Oxygen

Warning: If you are using Jinja to dump lists or dictionaries in your SLS files, this will now cause errors in Python 2 since Jinja does not produce YAML-compatible output when strings in the data structures contain unicode types. The dictionary must be passed through a Jinja filter to produce YAML-compatible strings.

The below is an example of invalid SLS:

```
/etc/foo.conf:
  file.mangaged:
    - source: salt://foo.conf
    - template: jinja
    - defaults: {{ mydict }}
```

To make it valid, use either one of Salt's own `json` or `yaml` filters:

```
/etc/foo.conf:
  file.mangaged:
    - source: salt://foo.conf
    - template: jinja
    - defaults: {{ mydict | json }}
```

Unicode/Python 3 Compatibility Improvements

This release fixes a number of nagging issues with Unicode strings in Salt under Python 2 (ex. `'ascii' codec can't decode byte 0xd0`). For best results, use a UTF-8 locale (such as by setting the `LANG` environment variable to one which supports UTF-8. For example `en_US.UTF-8`, `de_DE.UTF-8`, `ru_RU.UTF-8`, `C.UTF-8`).

Additionally, a number of Python 3 compatibility fixes have been made, many of them having to do with file I/O and str/bytes mismatches.

We continue to work toward improving both Unicode and Python 3 compatibility and welcome any feedback.

Lots of Docker Improvements

Much Improved Support for Docker Networking

The REMOVED DURRING MODULE MIGRATION state has undergone a full rewrite, which includes the following improvements:

Full API Support for Network Management

The improvements made to input handling in the `docker_container.running` state for 2017.7.0 have now been expanded to `docker_network.present`. This brings with it full support for all tunable configuration arguments.

Custom Subnets

Custom subnets can now be configured. Both IPv4 and mixed IPv4/IPv6 networks are supported. See REMOVED DURRING MODULE MIGRATION for more information.

Network Configuration in `docker_container.running` States

A long-requested feature has finally been added! It is now possible to configure static IPv4/IPv6 addresses, as well as links and labels. See REMOVDE DURRING MODULE MIGRATION for more information.

Note: While the `containers` argument to `docker_network.present` will continue to be supported, it will no longer be the recommended way of ensuring that a container is attached to a network.

Improved Handling of Images from Custom Registries

Rather than attempting to parse the tag from the passed image name, Salt will now resolve that tag down to an image ID and use that ID instead.

Important: Due to this change, there are some backward-incompatible changes to image management. See below for a full list of these changes.

Backward-incompatible Changes to Docker Image Management

Passing image names to the following functions must now be done using separate `repository` and `tag` arguments:

- `docker.build`
- `docker.commit`
- `docker.import`
- `docker.load`
- `docker.tag`
- `docker.sls_build`

Additionally, the `tag` argument must now be explicitly passed to the `docker_image.present` state, unless the image is being pulled from a docker registry.

State and Execution Module Support for `docker run` Functionality

The `docker_container.running` state is good for containers which run services, but it is not as useful for cases in which the container only needs to run once. The `start` argument to `docker_container.running` can be set to `False` to prevent the container from being started again on a subsequent run, but for many use cases this is not sufficient. Therefore, the `docker.run_container` remote-execution function was added. When used on the Salt CLI, it will return information about the container, such as its name, ID, exit code, and any output it produces.

State support has also been added via the `docker_container.run` state. This state is modeled after the *`cmd.run`* state, and includes arguments like `onlyif`, `unless`, and `creates` to control whether or not the container is run.

Full API Support for `docker.logs`

This function now supports all of the functions that its Docker API counterpart does, allowing you to do things like include timestamps, and also suppress stdout/stderr, etc. in the return.

start Argument Added to `docker.create` Function

This removes the need to run `docker.start` separately when creating containers on the Salt CLI.

```
salt myminion docker.create image=foo/bar:baz command=/path/to/command␣
↪start=True
```

Use SaltSSH Minions like regular Master-Minions

The Master process can now also call SSH minions as if they were connected to the master using ZeroMQ. By setting `enable_ssh_minions: True` in the master config file, the master will create a Salt SSH client process which connects to the minion and returns the output for the `salt` CLI to use like a regular minion. This can be used anywhere the LocalClient is used.

Exceptions Raised for Authentication/Authorization Errors

When sending `publish` commands via `master.py` and `masterapi.py` and an authorization or authentication problem is encountered, Salt will now raise the appropriate exceptions instead of returning an empty string: `''`.

The reasoning behind this change is to make it easier to debug various scenarios surrounding authentication and authorization issues more effectively.

Comparison Operators in Package Installation

Salt now supports using comparison operators (e.g. `>=1.2.3`) when installing packages on minions which use *`yum/dnf`* or *`apt`*. This is supported both in the *`pkg.installed`* state and in the `pkg.install` remote execution function.

Master Tops Changes

When both *Master Tops* and a *Top File* produce SLS matches for a given minion, the matches were being merged in an unpredictable manner which did not preserve ordering. This has been changed. The top file matches now execute in the expected order, followed by any master tops matches that are not matched via a top file.

To make master tops matches execute first, followed by top file matches, set the new *`master_tops_first`* minion config option to `True`.

Several Jinja Filters Renamed

The following Jinja filters (originally added in 2017.7.0) have been renamed due to the fact that they were inaccurately named when initially added. The original names will be supported until the 3000 release of Salt.

- `rand_str` renamed to *`random_hash`*
- `jinja_decode_dict` renamed to `jinja_encode_dict`
- `jinja_decode_list` renamed to `jinja_encode_list`

Return Codes for Runner/Wheel Functions

When using *orchestration*, runner and wheel functions used to report a `True` result if the function ran to completion without raising an exception. It is now possible to set a return code in the `__context__` dictionary, allowing runner and wheel functions to report that they failed. Here's some example pseudocode:

```
def myrunner():
    ...
    # do stuff
    ...
    if some_error_condition:
        __context__["retcode"] = 1
    return result
```

Variable Update Intervals for Fileserver Backends

Prior to this release, fileservers would be updated as part of a dedicated "maintenance" process, in which various routine maintenance tasks were performed. This tied the update interval to the *`loop_interval`* config option, and also forced all fileservers to update at the same interval.

2018.3.0 adds the following configuration options for the various fileserver backends:

- *`roots_update_interval`*
- `azurefs_update_interval`
- *`gitfs_update_interval`*
- *`hgfs_update_interval`*
- *`minionfs_update_interval`*
- *`s3fs_update_interval`*
- *`svnfs_update_interval`*

These allow for update intervals to be set for each individual backend. The default value for each of these is 60 seconds.

In addition, for *GitFS* it is also possible to apply intervals to individual remotes. See *here* for examples.

Note: git_pillar does not yet support variable update intervals, this is targeted for the next feature release (2019.2.0).

LDAP via External Authentication Changes

In this release of Salt, if LDAP Bind Credentials are supplied, then these credentials will be used for all LDAP access except the first authentication when a job is submitted. The first authentication will use the user's credentials as passed on the CLI. This behavior is to accommodate certain two-factor authentication schemes where the authentication token can only be used once.

In previous releases the bind credentials would only be used to determine the LDAP user's existence and group membership. The user's LDAP credentials were used from then on.

Stormpath External Authentication Removed

Per Stormpath's announcement, their API will be shutting down on 8/17/2017 at noon PST so the Stormpath external authentication module has been removed.

https://stormpath.com/oktaplusstormpath

New (Proxy) Minion Configuration Options

To be able to connect the Minion to the Master using a certain source IP address or port, the following options have been added:

- *`source_interface_name`*
- *`source_address`*
- *`source_ret_port`*
- *`source_publish_port`*

`environment` config option renamed to `saltenv`

The *`environment`* config option predates referring to a salt fileserver environment as a **saltenv**. To pin a minion to a single environment for running states, one would use *`environment`*, but overriding that environment would be done with the `saltenv` argument. For consistency, *`environment`* is now simply referred to as *`saltenv`*. There are no plans to deprecate or remove *`environment`*, if used it will log a warning and its value will be used as *`saltenv`*.

`lock_saltenv` config option added

If set to `True`, this option will prevent a minion from allowing the `saltenv` argument to override the value set in *`saltenv`* when running states.

Failed Minions for State/Function Orchestration Jobs Added to Changes Dictionary

For orchestration jobs which run states (or run remote execution functions and also use a *fail function* to indicate success or failure), minions which have `False` results were previously included as a formatted string in the comment field of the return for that orchestration job. This made the failed returns difficult to *parse programatically*. The failed returns in these cases are now included in the changes dictionary, making for much easier parsing.

Grains

- `fc_wwn` - Show all fibre channel world wide port names for a host, must be enabled with *fibre_channel_grains*
- `iscsi_iqn` - Show the iSCSI IQN name for a host
- `swap_total` - Show the configured swap_total for Linux, *BSD, OS X and Solaris/SunOS
- `virtual`:
  - identifies reports KVM and VMM hypervisors when running an OpenBSD guest
  - for detecting Solaris Logical Domains (LDOMs) running on T-Series SPARC hardware. The `virtual_subtype` grain is populated as a list of domain roles.

Salt Minion Auto-discovery

Using auto-discovery, the Salt Minion now no longer needs to be configured against a specific DNS name or IP address of a Master.

For this feature Salt Master now requires port 4520 for UDP broadcast packets to be opened and the Salt Minion be able to send UDP packets to the same port.

Configuration

By default, automatic discovery is disabled.

> **Warning:** Due to the current limitations that will be changing in a future release, before you turn on auto-discovery, make sure your network is secured and trusted.

Auto-discovery is configured on Master and Minion. Both of them are configured via the `discovery` option as follows:

Master configuration

To use the default configuration, which accepts any minion, simply set `discovery` to True:

```
discovery: true
```

A sub-option called *mapping* allows auto-discovery to help find the proper Master. The mapping contains an arbitrary set of key/value pairs, which the Minion configuration can target. By default, no mappings are set.

Example:

```
discovery:
  mapping:
    description: SES 5.0
    node: 1
```

It is also possible to change the port used from the default of `4520`, by setting a `port` option under the Master's `discovery` configuration:

```
discovery:
  port: 4567
```

Note: When using a port number other than the default, the Minion's `discovery` configuration must *also* have a port specified, otherwise the Minion will still attempt to contact the Master on port `4520`.

Minion configuration

In addition to the `mapping` and `port` options, the following additional options are available to Minions:

- `attempts` - This option specifies how many broadcast requests should be sent to the network, waiting for any Master response. Each attempt takes a couple of seconds, so raising this value may result in a slower Minion startup. Note that, on a properly-configured network, autodiscovery should succeed on the first attempt. By default, this value is set to `3`.
- `match` - This option can be set to either `all` or `any`, and it determines how the values configured in `mapping` are matched. If set to `all`, then all of the key/value pairs in the Minion's `mapping` must match a given Master. If set to `any` (the default), then any match to a key/value mapping will constitute a match.

- `pause` - The interval in seconds between attempts (default: 5).
- `fibre_channel_grains` - Enables the `fc_wwn` grain. (Default: False)
- `iscsi_grains` - Enables the `iscsi_iqn` grain. (Default: False)

Connection to a type instead of DNS

By now each Minion was connecting to a Master by DNS or IP address. From now on it is possible also to connect to a _type_ of a Master. For example, in a network there are three different Masters, each corresponds for a particular niche or environment or specific role etc. The Minion is supposed to connect only to one of those Masters that is described appropriately.

To achieve such an effect, each `/etc/salt/master` configuration should have a `discovery` option, which should have a `mapping` element with arbitrary key/value pairs. The same configuration should be on the Minion, so then when mapping matches, Minion recognises Master as its connection target.

Example for Master configuration (`/etc/salt/master`):

```yaml
discovery:
  mapping:
    description: SES 5.0
    node: 1
```

The example above describes a system that is running a particular product, where `description` is an arbitrary key and `SES 5.0` is just a string. In order to match exactly this Master, the following configuration at Minion should be present:

```yaml
discovery:
  match: all  # Can be "all" or "any"
  mapping:
    description: SES 5.0
    node: 1
```

Notice `match` criteria is set to `all`. This would mean that from all found Masters select only that, which `description` is set to `SES 5.0` _and_ `node` is set to `1`. All other Masters will be ignored.

Limitations

This feature has a couple of _temporary_ limitations that are subject to change in the future:

- Only one Master on the network is supported. Currently the Minion cannot select which Master out of few the same to choose. This will change to choosing the Master that is least loaded.
- Minions will accept _any_ master that matches connection criteria without any particular security applied (priv/pub key check, signature, fingerprint etc). That implies that administrator is expected to know his network and make sure it is clean.

New Modules

- `salt.modules.purefa`

New NaCl Renderer

A new renderer has been added for encrypted data.

New support for Cisco UCS Chassis

The salt proxy minion now allows for control of Cisco USC chassis. See the `cimc` modules for details.

New support for Cassandra v3

The `cassandra_cql` module now supports Cassandra v3 which has changed its internal schema to define keyspaces and columns.

New salt-ssh roster

A new roster has been added that allows users to pull in a list of hosts for salt-ssh targeting from a `~/.ssh` configuration. For full details, please see the `sshconfig` roster.

New GitFS Features

Two new features which affect how GitFS maps branches/tags to fileserver environments (i.e. `saltenvs`) have been added:

1. It is now possible to completely turn off Salt's default mapping logic (aside from the mapping of the `base` saltenv). This can be triggered using the new *`gitfs_disable_saltenv_mapping`* config option.

   Note: When this is disabled, only the `base` saltenv and any configured using *per-saltenv configuration parameters* will be available.

2. The types of refs which Salt will use as saltenvs can now be controlled. In previous releases, branches and tags were both mapped as environments, and individual commit SHAs could be specified as saltenvs in states (and when caching files using *`cp.cache_file`*). Using the new *`gitfs_ref_types`* config option, the types of refs which are used as saltenvs can be restricted. This makes it possible to ignore all tags and use branches only, and also to keep SHAs from being made available as saltenvs.

Additional output modes

The `state_output` parameter now supports `full_id`, `changes_id` and `terse_id`. Just like `mixed_id`, these use the state ID as name in the highstate output. For more information on these output modes, see the docs for the *`Highstate Outputter`*.

Windows

Python Version

Python 2 Windows API was design when Windows did not support Unicode. Windows now supports Unicode however to keep backwards compatibility Python 2 Windows API has not been changed. Python 3 Windows API supports Unicode. Salt Python 3 installer is the recommend choice for users who need characters other than Non-ASCII (7bit) characters.

`pkg` Execution module changes

Significant changes have been made to the *win_pkg* execution module. Users should test this release against their existing package sls definition files. These changes are also in 2016.11.9 & 2017.7.3.

- `pkg.list_available` no longer defaults to refreshing the winrepo meta database.
- `pkg.install` without a `version` parameter no longer upgrades software if the software is already installed. Use `pkg.install version=latest` or in a state use `pkg.latest` to get the old behavior.
- `pkg.list_pkgs` now returns multiple versions if software installed more than once.
- `pkg.list_pkgs` now returns 'Not Found' when the version is not found instead of '(value not set)' which matches the contents of the sls definitions.
- `pkg.remove()` will wait up to 3 seconds (normally about a second) to detect changes in the registry after removing software, improving reporting of version changes.
- `pkg.remove()` can remove `latest` software, if `latest` is defined in sls definition.
- Documentation was update for the execution module to match the style in new versions, some corrections as well.
- All install/remove commands are prefix with cmd.exe shell and cmdmod is called with a command line string instead of a list. Some sls files in saltstack/salt-winrepo-ng expected the commands to be prefixed with cmd.exe (i.e. the use of &).
- Some execution module functions results, now behavour more like their Unix/Linux versions.

Installer

Changes to config handling

Behavior with existing configuration has changed. With previous windows installers the existing config was used and the master and minion id could be modified via the installer. It was problematic in that it didn't account for configuration that may be defined in the `minion.d` directory. This change gives you the option via a drop-down list to use one of the following:

- Default Config: Use the config that comes with the installer
- Existing Config: Use the current config without changes
- Custom Config: Select a custom config using the file picker

The existing config option will only be available if the installer detects an existing config. If there is an existing config, and you choose `Default` or `Custom`, the existing config will be deleted, including the `minion.d` directory, and replaced by your selection.

The `Default Config` and `Custom Config` options will allow you to modify the Master and the Minion ID. `Existing Config` will leave the existing configuration unchanged.

These settings can be defined on the command line using the following switches:

- `/default-config`
- `/custom-config=C:\Path\To\Custom\Config\minion`

If neither option is passed and there is an existing config, the default is to use the existing config. If there is no existing config (new install) the default config will be used.

Multi-master configuration

The installer now has the ability to apply a multi-master configuration either from the GUI or the command line. The `master` field in the GUI can accept either a single master or a comma-separated list of masters. The command-line switch (`/master=`) can accept the same.

Command-line help

The Windows installer will now display command-line help when a help switch (`/?`) is passed.

New utils module `salt.utils.pkg.win`

A new utils module has been added, which gathers information about windows installed software. This is currently not used by any salt execution module or state at this time. Users are encouraged to run this and report any issues. Running the command with the `detail` option will be useful for anyone developing windows package definitions. With salt installed in the default location the following command will print the help message.

```
chcp 65001
c:\salt\bin\python.exe c:\salt\bin\lib\site-packages\salt\utils\pkg\win.py
c:\salt\bin\python.exe c:\salt\bin\lib\site-packages\salt\utils\pkg\win.py
↪detail system
```

Salt Cloud Features

OpenStack Revamp

The OpenStack Driver has been rewritten mostly from scratch. Salt is now using the *shade driver <https://docs.openstack.org/shade/latest/>*.

With this, the `nova` driver is being deprecated.

`openstack driver`

There have also been several new modules and states added for managing OpenStack setups using shade as well.

`keystone` `keystone role grant` `keystone group` `keystone role` `keystone service` `keystone user` `keystone domain` `keystone project` `keystone endpoint` `glance` `glance_image` `neutron` `neutron subnet` `neutron secgroup` `neutron secgroup rule` `neutron network`

Pre-Flight Commands

Support has been added for specified ”preflight commands” to run on a VM before the deploy script is run. These must be defined as a list in a cloud configuration file. For example:

```
my-cloud-profile:
  provider: linode-config
  image: Ubuntu 16.04 LTS
  size: Linode 2048
  preflight_cmds:
    - whoami
    - echo 'hello world!'
```

These commands will run in sequence **before** the bootstrap script is executed.

New salt-cloud Grains

When salt-cloud creates a new minion, it will now add grain information to the minion configuration file, identifying the resources originally used to create it.

The generated grain information will appear similar to:

```
grains:
  salt-cloud:
    driver: ec2
    provider: my_ec2:ec2
    profile: ec2-web
```

The generation of salt-cloud grains can be suppressed by the option `enable_cloud_grains: 'False'` in the cloud configuration file.

Upgraded Saltify Driver

The salt-cloud Saltify driver is used to provision machines which are not controlled by a dedicated cloud supervisor (such as typical hardware machines) by pushing a salt-bootstrap command to them and accepting them on the salt master. Creation of a node has been its only function and no other salt-cloud commands were implemented.

With this upgrade, it can use the salt-api to provide advanced control, such as rebooting a machine, querying it along with conventional cloud minions, and, ultimately, disconnecting it from its master.

After disconnection from (”destroying” on) one master, a machine can be re-purposed by connecting to (”creating” on) a subsequent master.

New Vagrant Driver

The salt-cloud Vagrant driver brings virtual machines running in a limited environment, such as a programmer's workstation, under salt-cloud control. This can be useful for experimentation, instruction, or testing salt configurations.

Using salt-api on the master, and a salt-minion running on the host computer, the Vagrant driver can create (`vagrant up`), restart (`vagrant reload`), and destroy (`vagrant destroy`) VMs, as controlled by salt-cloud profiles which designate a `Vagrantfile` on the host machine.

The master can be a very limited machine, such as a Raspberry Pi, or a small VagrantBox VM.

Python PyWinRM Module

Versions of `pywinrm>=0.2.1` are finally able to disable validation of self signed certificates. *Here* for more information.

DigitalOcean

The DigitalOcean driver has been renamed to conform to the company name. The new driver name is `digitalocean`. The old name `digital_ocean` and a short one `do` will still be supported through virtual aliases, this is mostly cosmetic.

Azure Cloud

The azure sdk used for the `azurearm` cloud driver now depends on `azure-cli>=2.0.12`

New `saltclass` pillar/master_tops modules

This module clones the behaviour of reclass (http://reclass.pantsfullofunix.net/), without the need of an external app, and add several features to improve flexibility. Saltclass lets you define your nodes from simple `yaml` files (`.yml`) through hierarchical class inheritance with the possibility to override pillars down the tree.

Features

- Define your nodes through hierarchical class inheritance
- Reuse your reclass data with minimal modifications
  - applications => states
  - parameters => pillars
- Use Jinja templating in your yaml definitions
- Access to the following Salt objects in Jinja
  - `__opts__`
  - `__salt__`
  - `__grains__`
  - `__pillars__`
  - `minion_id`
- Chose how to merge or override your lists using ^ character (see examples)
- Expand variables ${} with possibility to escape them if needed \${} (see examples)
- Ignores missing node/class and will simply return empty without breaking the pillar module completely - will be logged

An example subset of data is available here: https://git.mauras.ch/salt/saltclass/src/branch/master/examples

Terms usable in yaml files	Description
classes	A list of classes that will be processed in order
states	A list of states that will be returned by master_tops function
pillars	A yaml dictionary that will be returned by the ext_pillar function
environment	Node saltenv that will be used by master_tops

A class consists of:

- zero or more parent classes
- zero or more states
- any number of pillars

A child class can override pillars from a parent class. A node definition is a class in itself with an added `environment` parameter for `saltenv` definition.

Class Names

Class names mimic salt way of defining states and pillar files. This means that `default.users` class name will correspond to one of these:

- `<saltclass_path>/classes/default/users.yml`
- `<saltclass_path>/classes/default/users/init.yml`

Saltclass Tree

A saltclass tree would look like this:

```
<saltclass_path>
├── classes
│   ├── app
│   │   ├── borgbackup.yml
│   │   └── ssh
│   │       └── server.yml
│   ├── default
│   │   ├── init.yml
│   │   ├── motd.yml
│   │   └── users.yml
│   ├── roles
│   │   ├── app.yml
│   │   └── nginx
│   │       ├── init.yml
│   │       └── server.yml
│   └── subsidiaries
│       ├── gnv.yml
│       ├── qls.yml
│       └── zrh.yml
└── nodes
    ├── geneva
    │   └── gnv.node1.yml
    ├── lausanne
```

(continues on next page)

(continued from previous page)

```
    │   ├── qls.node1.yml
    │   └── qls.node2.yml
    ├── node127.yml
    └── zurich
        ├── zrh.node1.yml
        ├── zrh.node2.yml
        └── zrh.node3.yml
```

Examples

`<saltclass_path>/nodes/lausanne/qls.node1.yml`

```
environment: base

classes:
{% for class in ['default'] %}
  - {{ class }}
{% endfor %}
  - subsidiaries.{{ __grains__['id'].split('.')[0] }}
```

`<saltclass_path>/classes/default/init.yml`

```
classes:
  - default.users
  - default.motd

states:
  - openssh

pillars:
  default:
    network:
      dns:
        srv1: 192.168.0.1
        srv2: 192.168.0.2
        domain: example.com
    ntp:
      srv1: 192.168.10.10
      srv2: 192.168.10.20
```

`<saltclass_path>/classes/subsidiaries/gnv.yml`

```
pillars:
  default:
    network:
      sub: Geneva
      dns:
        srv1: 10.20.0.1
        srv2: 10.20.0.2
        srv3: 192.168.1.1
        domain: gnv.example.com
    users:
```

(continues on next page)

(continued from previous page)

```
      adm1:
        uid: 1210
        gid: 1210
        gecos: 'Super user admin1'
        homedir: /srv/app/adm1
      adm3:
        uid: 1203
        gid: 1203
        gecos: 'Super user adm
```

Variable expansions:

Escaped variables are rendered as is - `${test}`

Missing variables are rendered as is - `${net:dns:srv2}`

```
pillars:
  app:
  config:
    dns:
      srv1: ${default:network:dns:srv1}
      srv2: ${net:dns:srv2}
    uri: https://application.domain/call?\${test}
    prod_parameters:
      - p1
      - p2
      - p3
  pkg:
    - app-core
    - app-backend
```

List override:

Not using ^ as the first entry will simply merge the lists

```
pillars:
  app:
    pkg:
      - ^
      - app-frontend
```

Known limitation

Currently you can't have both a variable and an escaped variable in the same string as the escaped one will not be correctly rendered - '${xx}' will stay as is instead of being rendered as '${xx}'

Lists of comments in state returns

State functions can now return a list of strings for the `comment` field, as opposed to only a single string. This is meant to ease writing states with multiple or multi-part comments.

Beacon configuration changes

In order to remain consistent and to align with other Salt components such as states, support for configuring beacons using dictionary based configuration has been deprecated in favor of list based configuration. All beacons have a validation function which will check the configuration for the correct format and only load if the validation passes.

avahi_announce

Old behavior:

```
beacons:
  avahi_announce:
    run_once: True
    servicetype: _demo._tcp
    port: 1234
    txt:
      ProdName: grains.productname
      SerialNo: grains.serialnumber
      Comments: 'this is a test'
```

New behavior:

```
beacons:
  avahi_announce:
    - run_once: True
    - servicetype: _demo._tcp
    - port: 1234
    - txt:
        ProdName: grains.productname
        SerialNo: grains.serialnumber
        Comments: 'this is a test'
```

bonjour_announce

Old behavior:

```
beacons:
  bonjour_announce:
    run_once: True
    servicetype: _demo._tcp
    port: 1234
    txt:
      ProdName: grains.productname
      SerialNo: grains.serialnumber
      Comments: 'this is a test'
```

New behavior:

```
beacons:
  bonjour_announce:
    - run_once: True
    - servicetype: _demo._tcp
    - port: 1234
    - txt:
        ProdName: grains.productname
        SerialNo: grains.serialnumber
        Comments: 'this is a test'
```

btmp

Old behavior:

```
beacons:
  btmp: {}
```

New behavior:

```
beacons:
  btmp: []
```

glxinfo

Old behavior:

```
beacons:
  glxinfo:
    user: frank
    screen_event: True
```

New behavior:

```
beacons:
  glxinfo:
    - user: frank
    - screen_event: True
```

haproxy

Old behavior:

```
beacons:
    haproxy:
        - www-backend:
            threshold: 45
            servers:
                - web1
```

(continues on next page)

(continued from previous page)

```
            - web2
    - interval: 120
```

New behavior:

```
beacons:
  haproxy:
    - backends:
        www-backend:
          threshold: 45
          servers:
            - web1
            - web2
    - interval: 120
```

inotify

Old behavior:

```
beacons:
  inotify:
    /path/to/file/or/dir:
        mask:
          - open
          - create
          - close_write
        recurse: True
        auto_add: True
        exclude:
          - /path/to/file/or/dir/exclude1
          - /path/to/file/or/dir/exclude2
          - /path/to/file/or/dir/regex[a-m]*$:
        regex: True
    coalesce: True
```

New behavior:

```
beacons:
  inotify:
    - files:
        /path/to/file/or/dir:
          mask:
            - open
            - create
            - close_write
          recurse: True
          auto_add: True
          exclude:
            - /path/to/file/or/dir/exclude1
            - /path/to/file/or/dir/exclude2
            - /path/to/file/or/dir/regex[a-m]*$:
```

(continues on next page)

(continued from previous page)

```
          regex: True
    - coalesce: True
```

journald

Old behavior:

```
beacons:
  journald:
    sshd:
      SYSLOG_IDENTIFIER: sshd
      PRIORITY: 6
```

New behavior:

```
beacons:
  journald:
    - services:
        sshd:
          SYSLOG_IDENTIFIER: sshd
          PRIORITY: 6
```

load

Old behavior:

```
beacons:
  load:
    1m:
      - 0.0
      - 2.0
    5m:
      - 0.0
      - 1.5
    15m:
      - 0.1
      - 1.0
    emitatstartup: True
    onchangeonly: False
```

New behavior:

```
beacons:
  load:
    - averages:
        1m:
          - 0.0
          - 2.0
        5m:
          - 0.0
```

(continues on next page)

(continued from previous page)

```
          - 1.5
        15m:
          - 0.1
          - 1.0
    - emitatstartup: True
    - onchangeonly: False
```

log

Old behavior:

```
beacons:
    log:
      file: <path>
      <tag>:
        regex: <pattern>
```

New behavior:

```
beacons:
    log:
      - file: <path>
      - tags:
          <tag>:
            regex: <pattern>
```

network_info

Old behavior:

```
beacons:
  network_info:
    - eth0:
        type: equal
        bytes_sent: 100000
        bytes_recv: 100000
        packets_sent: 100000
        packets_recv: 100000
        errin: 100
        errout: 100
        dropin: 100
        dropout: 100
```

New behavior:

```
beacons:
  network_info:
    - interfaces:
        eth0:
          type: equal
```

(continues on next page)

(continued from previous page)

```
          bytes_sent: 100000
          bytes_recv: 100000
          packets_sent: 100000
          packets_recv: 100000
          errin: 100
          errout: 100
          dropin: 100
          dropout: 100
```

network_settings

Old behavior:

```
beacons:
  network_settings:
    eth0:
      ipaddr:
      promiscuity:
        onvalue: 1
    eth1:
      linkmode:
```

New behavior:

```
beacons:
  network_settings:
    - interfaces:
        - eth0:
            ipaddr:
            promiscuity:
              onvalue: 1
        - eth1:
            linkmode:
```

proxy_example

Old behavior:

```
beacons:
  proxy_example:
    endpoint: beacon
```

New behavior:

```
beacons:
  proxy_example:
    - endpoint: beacon
```

ps

Old behavior:

```yaml
beacons:
  ps:
    - salt-master: running
    - mysql: stopped
```

New behavior:

```yaml
beacons:
  ps:
    - processes:
        salt-master: running
        mysql: stopped
```

salt_proxy

Old behavior:

```yaml
beacons:
  salt_proxy:
    - p8000: {}
    - p8001: {}
```

New behavior:

```yaml
beacons:
  salt_proxy:
    - proxies:
        p8000: {}
        p8001: {}
```

sensehat

Old behavior:

```yaml
beacons:
  sensehat:
    humidity: 70%
    temperature: [20, 40]
    temperature_from_pressure: 40
    pressure: 1500
```

New behavior:

```yaml
beacons:
  sensehat:
    - sensors:
        humidity: 70%
```

(continues on next page)

(continued from previous page)

```
        temperature: [20, 40]
        temperature_from_pressure: 40
        pressure: 1500
```

service

Old behavior:

```
beacons:
  service:
    salt-master:
    mysql:
```

New behavior:

```
beacons:
  service:
    - services:
        nginx:
            onchangeonly: True
            delay: 30
            uncleanshutdown: /run/nginx.pid
```

sh

Old behavior:

```
beacons:
  sh: {}
```

New behavior:

```
beacons:
  sh: []
```

status

Old behavior:

```
beacons:
  status: {}
```

New behavior:

```
beacons:
  status: []
```

telegram_bot_msg

Old behavior:

```yaml
beacons:
  telegram_bot_msg:
    token: "<bot access token>"
    accept_from:
      - "<valid username>"
    interval: 10
```

New behavior:

```yaml
beacons:
  telegram_bot_msg:
    - token: "<bot access token>"
    - accept_from:
      - "<valid username>"
    - interval: 10
```

twilio_txt_msg

Old behavior:

```yaml
beacons:
  twilio_txt_msg:
    account_sid: "<account sid>"
    auth_token: "<auth token>"
    twilio_number: "+15555555555"
    interval: 10
```

New behavior:

```yaml
beacons:
  twilio_txt_msg:
    - account_sid: "<account sid>"
    - auth_token: "<auth token>"
    - twilio_number: "+15555555555"
    - interval: 10
```

wtmp

Old behavior:

```yaml
beacons:
  wtmp: {}
```

New behavior:

```yaml
beacons:
  wtmp: []
```

New requisites available in state compiler

require_any

The use of `require_any` demands that one of the required states executes before the dependent state. The state containing the `require_any` requisite is defined as the dependent state. The states specified in the `require_any` statement are defined as the required states. If at least one of the required state's execution succeeds, the dependent state will then execute. If all of the executions by the required states fail, the dependent state will not execute.

watch_any

The state containing the `watch_any` requisite is defined as the watching state. The states specified in the `watch_any` statement are defined as the watched states. When the watched states execute, they will return a dictionary containing a key named "changes".

If the "result" of any of the watched states is `True`, the watching state *will execute normally*, and if all of them are `False`, the watching state will never run. This part of `watch` mirrors the functionality of the `require` requisite.

If the "result" of any of the watched states is `True` *and* the "changes" key contains a populated dictionary (changes occurred in the watched state), then the `watch` requisite can add additional behavior. This additional behavior is defined by the `mod_watch` function within the watching state module. If the `mod_watch` function exists in the watching state module, it will be called *in addition to* the normal watching state. The return data from the `mod_watch` function is what will be returned to the master in this case; the return data from the main watching function is discarded.

If the "changes" key contains an empty dictionary, the `watch` requisite acts exactly like the `require` requisite (the watching state will execute if "result" is `True`, and fail if "result" is `False` in the watched state).

onchanges_any

The `onchanges_any` requisite makes a state only apply one of the required states generates changes, and if one of the watched state's "result" is `True`. This can be a useful way to execute a post hook after changing aspects of a system.

onfail_any

The `onfail_any` requisite allows for reactions to happen strictly as a response to the failure of at least one other state. This can be used in a number of ways, such as executing a second attempt to set up a service or begin to execute a separate thread of states because of a failure.

The `onfail_any` requisite is applied in the same way as `require_any` and `watch_any`.

Basic Slots support in state compiler

Slots extend the state syntax and allows you to do things right before the state function is executed. So you can make a decision in the last moment right before a state is executed.

Slot syntax looks close to the simple python function call. Here is a simple example:

```
copy-some-file:
  file.copy:
```

(continues on next page)

(continued from previous page)

```
    - name: __slot__:salt:test.echo(text=/tmp/some_file)
    - source: __slot__:salt:test.echo(/etc/hosts)
```

Read more *here*.

Cryptographic layer changes

M2Crypto is coming back. We are making the crypto backend modular but in this release M2Crypto is enabled if it's importable by Python. If not Cryptodome or PyCrypto is used as it was in the previous releases. M2Crypto is used in the same way as PyCrypto so there would be no compatibility issues, different nodes could use different backends.

NaCL Module and Runner changes

In addition to argument changes in both the NaCL module and runner for future removal in the 3000 release, the default "box_type" has changed from `secretbox` to `sealedbox`. SecretBox is data encrypted using private key `sk` and Sealedbox is encrypted using public key `pk`.

`utils` functions reorganized into separate modules

The Salt utility functions from `salt.utils` (typically used by those developing extension modules for Salt) have been moved into different modules, grouped logically based on their functionality. The old function names will continue to work until the `3000` release of Salt (due around Q1 2019).

The renamed functions are:

- `salt.utils.appendproctitle`: use `salt.utils.process.appendproctitle` instead.
- `salt.utils.daemonize`: use `salt.utils.process.daemonize` instead.
- `salt.utils.daemonize_if`: use `salt.utils.process.daemonize_if` instead.
- `salt.utils.reinit_crypto`: use `salt.utils.crypt.reinit_crypto` instead.
- `salt.utils.pem_finger`: use `salt.utils.crypt.pem_finger` instead.
- `salt.utils.to_bytes`: use `salt.utils.stringutils.to_bytes` instead.
- `salt.utils.to_str`: use `salt.utils.stringutils.to_str` instead.
- `salt.utils.to_unicode`: use `salt.utils.stringutils.to_unicode` instead.
- `salt.utils.str_to_num`: use `salt.utils.stringutils.to_num` instead.
- `salt.utils.is_quoted`: use `salt.utils.stringutils.is_quoted` instead.
- `salt.utils.dequote`: use `salt.utils.stringutils.dequote` instead.
- `salt.utils.is_hex`: use `salt.utils.stringutils.is_hex` instead.
- `salt.utils.is_bin_str`: use `salt.utils.stringutils.is_bin_str` instead.
- `salt.utils.rand_string`: use `salt.utils.stringutils.random` instead.
- `salt.utils.contains_whitespace`: use `salt.utils.stringutils.contains_whitespace` instead.
- `salt.utils.build_whitespace_split_regex`: use `salt.utils.stringutils.build_whitespace_split_regex` instead.
- `salt.utils.expr_match`: use `salt.utils.stringutils.expr_match` instead.

- `salt.utils.check_whitelist_blacklist`: use `salt.utils.stringutils.check_whitelist_blacklist` instead.
- `salt.utils.check_include_exclude`: use `salt.utils.stringutils.check_include_exclude` instead.
- `salt.utils.print_cli`: use `salt.utils.stringutils.print_cli` instead.
- `salt.utils.clean_kwargs`: use `salt.utils.args.clean_kwargs` instead.
- `salt.utils.invalid_kwargs`: use `salt.utils.args.invalid_kwargs` instead.
- `salt.utils.shlex_split`: use `salt.utils.args.shlex_split` instead.
- `salt.utils.arg_lookup`: use `salt.utils.args.arg_lookup` instead.
- `salt.utils.argspec_report`: use `salt.utils.args.argspec_report` instead.
- `salt.utils.split_input`: use `salt.utils.args.split_input` instead.
- `salt.utils.test_mode`: use `salt.utils.args.test_mode` instead.
- `salt.utils.format_call`: use `salt.utils.args.format_call` instead.
- `salt.utils.which`: use `salt.utils.path.which` instead.
- `salt.utils.which_bin`: use `salt.utils.path.which_bin` instead.
- `salt.utils.path_join`: use `salt.utils.path.join` instead.
- `salt.utils.check_or_die`: use `salt.utils.path.check_or_die` instead.
- `salt.utils.sanitize_win_path_string`: use `salt.utils.path.sanitize_win_path` instead.
- `salt.utils.rand_str`: use `salt.utils.hashutils.random_hash` instead.
- `salt.utils.get_hash`: use `salt.utils.hashutils.get_hash` instead.
- `salt.utils.is_windows`: use `salt.utils.platform.is_windows` instead.
- `salt.utils.is_proxy`: use `salt.utils.platform.is_proxy` instead.
- `salt.utils.is_linux`: use `salt.utils.platform.is_linux` instead.
- `salt.utils.is_darwin`: use `salt.utils.platform.is_darwin` instead.
- `salt.utils.is_sunos`: use `salt.utils.platform.is_sunos` instead.
- `salt.utils.is_smartos`: use `salt.utils.platform.is_smartos` instead.
- `salt.utils.is_smartos_globalzone`: use `salt.utils.platform.is_smartos_globalzone` instead.
- `salt.utils.is_smartos_zone`: use `salt.utils.platform.is_smartos_zone` instead.
- `salt.utils.is_freebsd`: use `salt.utils.platform.is_freebsd` instead.
- `salt.utils.is_netbsd`: use `salt.utils.platform.is_netbsd` instead.
- `salt.utils.is_openbsd`: use `salt.utils.platform.is_openbsd` instead.
- `salt.utils.is_aix`: use `salt.utils.platform.is_aix` instead.
- `salt.utils.safe_rm`: use `salt.utils.files.safe_rm` instead.
- `salt.utils.is_empty`: use `salt.utils.files.is_empty` instead.
- `salt.utils.fopen`: use `salt.utils.files.fopen` instead.

- `salt.utils.flopen`: use `salt.utils.files.flopen` instead.
- `salt.utils.fpopen`: use `salt.utils.files.fpopen` instead.
- `salt.utils.rm_rf`: use `salt.utils.files.rm_rf` instead.
- `salt.utils.mkstemp`: use `salt.utils.files.mkstemp` instead.
- `salt.utils.istextfile`: use `salt.utils.files.is_text_file` instead.
- `salt.utils.is_bin_file`: use `salt.utils.files.is_binary` instead.
- `salt.utils.list_files`: use `salt.utils.files.list_files` instead.
- `salt.utils.safe_walk`: use `salt.utils.files.safe_walk` instead.
- `salt.utils.st_mode_to_octal`: use `salt.utils.files.st_mode_to_octal` instead.
- `salt.utils.normalize_mode`: use `salt.utils.files.normalize_mode` instead.
- `salt.utils.human_size_to_bytes`: use `salt.utils.files.human_size_to_bytes` instead.
- `salt.utils.backup_minion`: use `salt.utils.files.backup_minion` instead.
- `salt.utils.str_version_to_evr`: use `salt.utils.pkg.rpm.version_to_evr` instead.
- `salt.utils.parse_docstring`: use `salt.utils.doc.parse_docstring` instead.
- `salt.utils.compare_versions`: use `salt.utils.versions.compare` instead.
- `salt.utils.version_cmp`: use `salt.utils.versions.version_cmp` instead.
- `salt.utils.warn_until`: use `salt.utils.versions.warn_until` instead.
- `salt.utils.kwargs_warn_until`: use `salt.utils.versions.kwargs_warn_until` instead.
- `salt.utils.get_color_theme`: use `salt.utils.color.get_color_theme` instead.
- `salt.utils.get_colors`: use `salt.utils.color.get_colors` instead.
- `salt.utils.gen_state_tag`: use `salt.utils.state.gen_tag` instead.
- `salt.utils.search_onfail_requisites`: use `salt.utils.state.search_onfail_requisites` instead.
- `salt.utils.check_state_result`: use `salt.utils.state.check_result` instead.
- `salt.utils.get_user`: use `salt.utils.user.get_user` instead.
- `salt.utils.get_uid`: use `salt.utils.user.get_uid` instead.
- `salt.utils.get_specific_user`: use `salt.utils.user.get_specific_user` instead.
- `salt.utils.chugid`: use `salt.utils.user.chugid` instead.
- `salt.utils.chugid_and_umask`: use `salt.utils.user.chugid_and_umask` instead.
- `salt.utils.get_default_group`: use `salt.utils.user.get_default_group` instead.
- `salt.utils.get_group_list`: use `salt.utils.user.get_group_list` instead.
- `salt.utils.get_group_dict`: use `salt.utils.user.get_group_dict` instead.
- `salt.utils.get_gid_list`: use `salt.utils.user.get_gid_list` instead.
- `salt.utils.get_gid`: use `salt.utils.user.get_gid` instead.
- `salt.utils.enable_ctrl_logoff_handler`: use `salt.utils.win_functions.enable_ctrl_logoff_handler` instead.

- `salt.utils.traverse_dict`: use `salt.utils.data.traverse_dict` instead.
- `salt.utils.traverse_dict_and_list`: use `salt.utils.data.traverse_dict_and_list` instead.
- `salt.utils.filter_by`: use `salt.utils.data.filter_by` instead.
- `salt.utils.subdict_match`: use `salt.utils.data.subdict_match` instead.
- `salt.utils.substr_in_list`: use `salt.utils.data.substr_in_list` instead.
- `salt.utils.is_dictlist`: use `salt.utils.data.is_dictlist`.
- `salt.utils.repack_dictlist`: use `salt.utils.data.repack_dictlist` instead.
- `salt.utils.compare_dicts`: use `salt.utils.data.compare_dicts` instead.
- `salt.utils.compare_lists`: use `salt.utils.data.compare_lists` instead.
- `salt.utils.decode_dict`: use `salt.utils.data.encode_dict` instead.
- `salt.utils.decode_list`: use `salt.utils.data.encode_list` instead.
- `salt.utils.exactly_n`: use `salt.utils.data.exactly_n` instead.
- `salt.utils.exactly_one`: use `salt.utils.data.exactly_one` instead.
- `salt.utils.is_list`: use `salt.utils.data.is_list` instead.
- `salt.utils.is_iter`: use `salt.utils.data.is_iter` instead.
- `salt.utils.isorted`: use `salt.utils.data.sorted_ignorecase` instead.
- `salt.utils.is_true`: use `salt.utils.data.is_true` instead.
- `salt.utils.mysql_to_dict`: use `salt.utils.data.mysql_to_dict` instead.
- `salt.utils.simple_types_filter`: use `salt.utils.data.simple_types_filter` instead.
- `salt.utils.ip_bracket`: use `salt.utils.zeromq.ip_bracket` instead.
- `salt.utils.gen_mac`: use `salt.utils.network.gen_mac` instead.
- `salt.utils.mac_str_to_bytes`: use `salt.utils.network.mac_str_to_bytes` instead.
- `salt.utils.refresh_dns`: use `salt.utils.network.refresh_dns` instead.
- `salt.utils.dns_check`: use `salt.utils.network.dns_check` instead.
- `salt.utils.get_context`: use `salt.utils.stringutils.get_context` instead.
- `salt.utils.get_master_key`: use `salt.utils.master.get_master_key` instead.
- `salt.utils.get_values_of_matching_keys`: use `salt.utils.master.get_values_of_matching_keys` instead.
- `salt.utils.date_cast`: use `salt.utils.dateutils.date_cast` instead.
- `salt.utils.date_format`: use `salt.utils.dateutils.strftime` instead.
- `salt.utils.total_seconds`: use `salt.utils.dateutils.total_seconds` instead.
- `salt.utils.find_json`: use `salt.utils.json.find_json` instead.
- `salt.utils.import_json`: use `salt.utils.json.import_json` instead.
- `salt.utils.namespaced_function`: use `salt.utils.functools.namespaced_function` instead.
- `salt.utils.alias_function`: use `salt.utils.functools.alias_function` instead.

- `salt.utils.profile_func`: use `salt.utils.profile.profile_func` instead.
- `salt.utils.activate_profile`: use `salt.utils.profile.activate_profile` instead.
- `salt.utils.output_profile`: use `salt.utils.profile.output_profile` instead.

Deprecations

Configuration Option Deprecations

- The `requests_lib` configuration option has been removed. Please use `backend` instead.

Profitbricks Cloud Updated Dependency

The minimum version of the `profitbrick` python package for the `profitbricks` cloud driver has changed from 3.0.0 to 3.1.0.

Execution Module Deprecations

- The `blockdev` execution module has been removed. Its functions were merged with the *`disk`* module.
- The `lxc` execution module has been changed as follows:
  - The `dnsservers` option to `lxc.cloud_init_interface` no longer defaults to `4.4.4.4` and `8.8.8.8`.
  - The `dns_via_dhcp` option to `lxc.cloud_init_interface` now defaults to `True` instead of `False`.
- The *`win_psget`* module has been changed as follows:
  - The `psget.psversion` function was removed. Please use *`cmd.shell_info`* instead.
- The *`win_service`* module (which provides the `service` module on Windows platforms) has been changed as follows:
  - The `config` function was removed. Please use *`service.modify`* instead.
  - The following arguments to the *`service.create`* function have been renamed:
    - `binpath` has been renamed to `bin_path`
    - `depend` has been renamed to `dependencies`
    - `DisplayName` has been renamed to `display_name`
    - `error` has been renamed to `error_control`
    - `group` has been renamed to `load_order_group`
    - `obj` has been renamed to `account_name`
    - `password` has been renamed to `account_password`
    - `start` has been renamed to `start_type`
    - `type` has been renamed to `service_type`
- The *`nacl`* module has been changed as follows:
  - The following arguments have been renamed in the *`nacl.keygen`*, *`nacl.enc`*, and *`nacl.dec`*:

    - `key_file` has been renamed to `sk_file`
    - `key` has been renamed to `sk`

Runner Deprecations

- The *manage* runner has been changed as follows:
  - `root_user` argument was removed from the *manage.bootstrap* function. Please use `salt-ssh` roster entries for the host instead.
- The *nacl* runner has been changed as follows:
  - The following arguments have been renamed in the `nacl.keygen`, `nacl.enc`, and `nacl.dec`:
    - `key_file` has been renamed to `sk_file`
    - `key` has been renamed to `sk`

State Deprecations

- In the `archive` state, the `tar_options` and `zip_options` options were removed. Please use `options` instead.
- The `cmd` state had the following changes:
  - The `user` and `group` options were removed from the following functions (please use `runas` instead):
    - *cmd.run*
    - *cmd.script*
    - `cmd.wait`
    - `cmd.wait_script`
- In the *file* states, the `show_diff` option was removed in all states where it was previously supported. Please use `show_changes` instead.

Grain Deprecations

- For `smartos`, some grains have been deprecated. These grains will be removed in 3000:
  - The `hypervisor_uuid` grain has been replaced with `mdata:sdc:server_uuid`
  - The `datacenter` grain has been replaced with `mdata:sdc:datacenter_name`

Pillar Deprecations

The legacy configuration for `git_pillar` has been removed. Please use the new configuration for `git_pillar` which was added in 2015.8.0, which is documented *here*.

Utils Deprecations

- In `salt.utils.cloud`, the `fire_event` function now requires a `sock_dir` argument. It was previously optional.

Other Miscellaneous Deprecations

- In `version.py`, the `rc_info` function was removed. Please use `pre_info` instead.
- Warnings for moving away from the `env` option were removed. `saltenv` should be used instead. The removal of these warnings does not have a behavior change. Only the warning text was removed.

Minion Blackout

During a blackout, minions will not execute any remote execution commands, except for *`saltutil.refresh_pillar`*. Previously, support was added so that blackouts are enabled using a special pillar key, `minion_blackout` set to `True` and an optional pillar key `minion_blackout_whitelist` to specify additional functions that are permitted during blackout. This release adds support for using this feature in the grains as well, by using special grains keys `minion_blackout` and `minion_blackout_whitelist`.

Sentry Log Handler

Configuring sentry raven python client via `project`, `servers`, `public_key and ``secret_key` is deprecated and won't work with sentry clients > 3.0. Instead, the `dsn` config param must be used.

RAET transport

We haven't been doing development on RAET for quite some time and decided that 2018.3.0 is the time to announce the deprecation. RAET support will be removed in 3000. Please consider to move to `zeromq` or `tcp` transport instead of `raet`.

33.2.74 Salt 2018.3.1 Release Notes

Version 2018.3.1 is a bugfix release for *2018.3.0*.

Statistics

- Total Merges: **525**
- Total Issue References: **74**
- Total PR References: **255**
- Contributors: **55** (Ch3LL, DmitryKuzmenko, Giandom, Kimol, L4rS6, LukeCarrier, OrlandoArcapix, TamCore, The-Loeki, UtahDave, aesposito91, bbinet, bdrung, boltronics, bosatsu, clan, corywright, damon-atkins, dincamihai, dmurphy18, dnABic, douglasjreynolds, dwoz, edgan, ejparker12, esell, ezh, femnad, folti, garethgreenaway, gtmanfred, isbm, jasperla, johnj, mateiw, mcalmer, mirceaulinic, morganwillcock, opdude, pcn, pruiz, psagers, psyer, rallytime, robinro, s0undt3ch, samodid, shengis, skjaro, tankywoo, terminalmage, twangboy, vutny, yannj-fr, zmedico)

Warning: If you are using Jinja to dump lists or dictionaries in your SLS files, this will now cause errors in Python 2 since Jinja does not produce YAML-compatible output when strings in the data structures contain unicode types. The dictionary must be passed through a Jinja filter to produce YAML-compatible strings.

The below is an example of invalid SLS:

```
/etc/foo.conf:
  file.mangaged:
    - source: salt://foo.conf
    - template: jinja
    - defaults: {{ mydict }}
```

To make it valid, use either one of Salt's own `json` or `yaml` filters:

```
/etc/foo.conf:
  file.mangaged:
    - source: salt://foo.conf
    - template: jinja
    - defaults: {{ mydict | json }}
```

Tornado 5.0 Support for Python 2 Only

Tornado 5.0 moves to using asyncio for all python3 versions. Because of this and changes in asyncio between python 3.4 and 3.5 to only be able to use one ioloop, which requires some rearchitecting, support for tornado 5.0 and python3 versions of salt has been delayed to a later release.

For now, to use tornado 5.0, the python 2 version of salt must be used.

Changes to Slack Engine pillars

When using `groups_pillar_name` for the slack engine, the engine should be used as part of a salt-minion process running on the master. This will allow the minion to have pillars assigned to it, and will still allow the engine to create a LocalClient connection to the master ipc sockets to control environments.

Changes to Automatically Updating the Roster File

In `2018.3.0` salt-ssh was configured to automatically update the flat roster file if a minion was not found for salt-ssh. This was decided to be undesirable as a default. The `--skip-roster` flag has been removed and replaced with `--update-roster`, which will enable salt-ssh to add minions to the flat roster file. This behavior can also be enabled by setting `ssh_update_roster: True` in the master config file.

Changes to `file.blockreplace` State

The `append_newline` argument was added to this state. Additionally, to improve idempotence, if the string represented by `marker_end` is found in the middle of the line, the content preceding the marker will be removed when the block is replaced. This allows one to remove `append_newline: False` from the SLS and have the block properly replaced if the end of the content block is immediately followed by the `marker_end` (i.e. no newline before the marker).

Note: This will require changes to your SLS if your `marker_end` does not include the very beginning of the content you want to keep.

See the *file.blockreplace* state documentation for further information.

Changelog for v2018.3.0..v2018.3.1

Generated at: 2018-06-06 17:43:01 UTC

- **ISSUE** #47955: (frogunder) 2018.3.1 Creating Windows machine in Amazon using salt-cloud fails. (refs: #47989)
- **PR** #47998: (rallytime) Back-port #47989 to 2018.3.1 @ *2018-06-06 17:08:04 UTC*
  - **PR** #47989: (dwoz) Properly decode password from aws using m2crypto (refs: #47998)
  - 605463ca0d Merge pull request #47998 from rallytime/bp-47989
  - 1b7e9ac2d3 Lint fixes
  - 0545152ddd Properly decode password from aws using m2crypto
- **PR** #47965: (Ch3LL) Add PR 47924 from 2018.3 branch @ *2018-06-06 13:54:09 UTC*
  - dbc798ac68 Merge pull request #47965 from Ch3LL/gitpy_mac_3.1
  - bf608abd44 Catch all exceptions in git import for salt.utils.gitfs
- **PR** #47973: (terminalmage) salt.modules.testinframod: fix TypeError invoking types.FunctionType @ *2018-06-06 13:53:46 UTC*
  - 864d640633 Merge pull request #47973 from terminalmage/fix-testinfra
  - 4518c89484 Lint: Remove unused six import
  - c6816b2149 salt.modules.testinframod: fix TypeError invoking types.FunctionType
- **ISSUE** #47236: (MorphBonehunter) x509.private_key_managed broken after upgrade to 2018.3.0 (refs: #47957)
- **PR** #47967: (rallytime) Back-port #47957 to 2018.3.1 @ *2018-06-06 13:53:28 UTC*
  - **PR** #47957: (garethgreenaway) [2018.8] Ensure x509 passphrase is a string (refs: #47967)
  - 5ddcfff420 Merge pull request #47967 from rallytime/bp-47957
  - 9a55579af1 removing unnecessary change
  - 329b2e5956 Ensuring that when a passphrase is passed in, it is returned as a string from the passphrase callback.
- **PR** #47902: (Ch3LL) Remove In Progress for 2018.3.1 Release Notes @ *2018-05-30 18:26:49 UTC*
  - 9c964fdbce Merge pull request #47902 from Ch3LL/rn_in_progress
  - f560a151cd Remove In Progress for 2018.3.1 Release Notes
- **PR** #47897: (Ch3LL) Add changelog to 2018.3.1 release notes @ *2018-05-30 15:04:42 UTC*
  - ea7b4fdc08 Merge pull request #47897 from Ch3LL/rn_2018
  - e27ee273a7 Add == line to changelog line for release notes
  - 61e56d275d Add changelog to 2018.3.1 release notes
- **ISSUE** #47784: (jpsv) win_lgpo.py line 5368; AttributeError: 'OrderedDict' object has no attribute 'lower' (refs: #47848)

- **PR** #47848: (twangboy) Fix some major issues with the LGPO module @ *2018-05-30 13:37:32 UTC*
  - f15e636d5e Merge pull request #47848 from twangboy/fix_47784
  - 98facf8dc8 Remove log.debug statement in __virtual__
  - f037fa4064 Fix some major issues with the LGPO module
- **PR** #47881: (gtmanfred) quote python_version in requirements.txt @ *2018-05-29 21:12:05 UTC*
  - 92b8c4c08e Merge pull request #47881 from gtmanfred/2018.3.1
  - 3d874b5529 quote python_version in requirements.txt
- **PR** #47874: (gtmanfred) Tornado 5.0 is only supported on python 2 for now @ *2018-05-29 19:45:44 UTC*
  - 705bf8172d Merge pull request #47874 from gtmanfred/2018.3.1
  - 13f920415a add tornado5 note to 2018.3.1
  - aeacd2b749 allow tornado 5.0 to be installed only for python2
- **PR** #47820: (Ch3LL) Remove output_loglevel in mac_system module @ *2018-05-25 13:10:36 UTC*
  - 09e8c5f0cd Merge pull request #47820 from Ch3LL/mac_system
  - 362414e53b Remove output_loglevel in mac_system module
- **PR** #47798: (rallytime) Back-port #47776 to 2018.3.1 @ *2018-05-23 15:10:43 UTC*
  - **PR** #47776: (garethgreenaway) [2018.3] Fixes to failing _before_connect tests (refs: #47798)
  - 7e314c26c8 Merge pull request #47798 from rallytime/bp-47776
  - ae881547d2 Fixing unit.test_minion.MinionTestCase.test_beacons_before_connect and unit.test_minion.MinionTestCase.test_scheduler_before_connect.
- **PR** #47782: (rallytime) Back-port #47775 to 2018.3.1 @ *2018-05-22 20:56:37 UTC*
  - **PR** #47775: (gtmanfred) catch UnsupportedOperation with AssertionError (refs: #47782)
  - 9c610da0bc Merge pull request #47782 from rallytime/bp-47775
  - bab9c966c5 catch UnsupportedOperation with AssertionError
- **PR** #47770: (rallytime) Back-port #47769 to 2018.3.1 @ *2018-05-22 17:27:20 UTC*
  - **PR** #47769: (gtmanfred) skip test that breaks test suite (refs: #47770)
  - 4adf10b20b Merge pull request #47770 from rallytime/bp-47769
  - 3cfb95c7bc skip test that breaks test suite
- **PR** #47724: (terminalmage) 2 master_tops/ext_nodes fixes @ *2018-05-21 15:59:04 UTC*
  - bbe8e62a98 Merge pull request #47724 from terminalmage/master_tops_fixes
  - 48b8c5acd1 Merge branch '2018.3.1' into master_tops_fixes
  - 89b3070d4c Change deprecation warning to debug logging
  - ceb6e10f87 Fix spurious "Malformed request" error
- ISSUE #47484: (whytewolf) Windows: pkg.latest state not updating packages. (refs: #47702)
- **PR** #47739: (rallytime) Back-port #47702 to 2018.3.1 @ *2018-05-21 15:37:03 UTC*
  - **PR** #47702: (damon-atkins) State pkg.latest called win pkg.install with list of pkgs and the required versions (refs: #47739)
  - 97d6fe7434 Merge pull request #47739 from rallytime/bp-47702

  - f79da64bb0 Update is_windows path to use *platform*
  - f04b19b5b6 Ensure targeted_pkgs always contains value for non-windows.
  - 14659f9cad Adjusted based on feed back.
  - 9f18f7cdf5 Whitespace lint issues
  - 2a29b28ee6 pkg.install execution module on windows ensures the software package is installed when no version is specified, it does not upgrade the software to the latest. This is per the design. pkg.latest must provide the versions to install to pkg.install
- **PR** #47730: (rallytime) Back-port #47700 to 2018.3.1 @ *2018-05-21 15:36:16 UTC*
  - **PR** #47700: (yannj-fr) fix roots modification time check (refs: #47730)
  - cfbe0ba73e Merge pull request #47730 from rallytime/bp-47700
  - 9bc35b88ea fix roots modification time check
- **PR** #47727: (Ch3LL) Fix salt.utils.versions.warn_until spelling @ *2018-05-21 13:41:00 UTC*
  - 3614d3d83a Merge pull request #47727 from Ch3LL/spelling
  - 47a8de5b73 Fix salt.utils.versions.warn_until spelling
- **PR** #47736: (Ch3LL) mac_utils test: patch __salt__['cmd.run*'] @ *2018-05-21 13:38:59 UTC*
  - bb45cdaefe Merge pull request #47736 from Ch3LL/fix_util_mac_test
  - ee90c779a8 mac_utils test: patch __salt__['cmd.run*']
- **PR** #47641: (gtmanfred) fix _create_stream and tornado 5.0 @ *2018-05-18 14:25:36 UTC*
  - 43930f8bac Merge pull request #47641 from gtmanfred/2018.3.1
  - 037fd92f59 fix pylint
  - 75d42d8963 Fix last test for tornado
  - a046512287 allow using tornado 5.0
  - 05e651f038 fix _create_stream and tornado 5.0
- **ISSUE** #47532: (edgan) roster auto-add feature in salt-ssh-2018.3.0 (refs: #47541)
- **PR** #47541: (gtmanfred) switch skip-roster to update-roster @ *2018-05-18 13:29:50 UTC*
  - 9f926bcd1a Merge pull request #47541 from gtmanfred/2018.3
  - 8c5c780292 switch skip-roster to update-roster
- **PR** #47719: (rallytime) Back-port #47692 to 2018.3.1 @ *2018-05-18 13:22:02 UTC*
  - **PR** #47692: (dwoz) Default windows to m1.small for ec2-classic (refs: #47719)
  - a963f1b558 Merge pull request #47719 from rallytime/bp-47692
  - 1d9f247fb7 Default windows to m1.small for ec2-classic
- **PR** #47706: (Ch3LL) Add cmd._run_all_quiet to mac_utils and __utils__ in mac_service @ *2018-05-18 01:11:46 UTC*
  - c9108893ab Merge pull request #47706 from Ch3LL/mac_service_util
  - 3611af699f remove added space
  - 9921caa143 fix pylint
  - 317e41d3c0 use cmd._run_quiet and cmd._run_all_quiet instead of importing minion_mods in __salt__

  - a78652515a Add __salt__ to mac_utils and __utils__ in mac_service
- **PR** #47664: (rallytime) Back-port #47645 to 2018.3.1 @ *2018-05-15 18:25:27 UTC*
  - **PR** #47645: (Ch3LL) query the pip path for test test_issue_2087_missing_pip (refs: #47664)
  - fb3bf1ff3e Merge pull request #47664 from rallytime/bp-47645
  - 0a732d8e66 query the pip path for test test_issue_2087_missing_pip
- **PR** #47647: (rallytime) Back-port #47601 and #47643 to 2018.3.1 @ *2018-05-15 14:07:54 UTC*
  - **PR** #47643: (dwoz) Remove unwanted file (refs: #47647)
  - **PR** #47601: (dwoz) Skip tests when we can not use runas (refs: #47647)
  - 9039fee104 Merge pull request #47647 from rallytime/bp-47601-and-47643-2018.3.1
  - 7214fe17c8 Fix typo
  - 506dceed17 Remove unwanted file
  - b6a21dfda3 use ignore-undefined-variable
  - 2429f9fe8a Ignore pylint WindowsError
  - 2d63682fea Better doc string
  - ec2adff699 Skip tests when we can not use runas
- **PR** #47596: (rallytime) Back-port #47568 to 2018.3.1 @ *2018-05-10 22:09:09 UTC*
  - **PR** #47568: (terminalmage) salt.serializers.yaml/yamlex: remove invalid multi_constructor (refs: #47596)
  - 17b5265d95 Merge pull request #47596 from rallytime/bp-47568
  - ecf5dc8b9f Add exception logging on serialize/deserialize exceptions
  - 9659b19819 salt.serializers.yaml/yamlex: remove invalid multi_constructor
- **PR** #47595: (rallytime) Back-port #47569 to 2018.3.1 @ *2018-05-10 22:08:53 UTC*
  - **PR** #47569: (Ch3LL) Update salt.utils.path mock in virtual core test (refs: #47595)
  - c4c400f3e9 Merge pull request #47595 from rallytime/bp-47569
  - 0763f96458 update salt.utils.platform path for virt core test
  - 718252c1ef Update salt.utils.path mock in virtual core test
- **PR** #47599: (rallytime) Back-port #47570 to 2018.3.1 @ *2018-05-10 22:06:44 UTC*
  - **PR** #47570: (gtmanfred) Update dependency to msgpack (refs: #47599)
  - ec7de14be0 Merge pull request #47599 from rallytime/bp-47570
  - 9334c03da9 Update dependency to msgpack
- **PR** #47571: (rallytime) [2018.3.1] Update man pages @ *2018-05-10 16:21:57 UTC*
  - 2a10d92669 Merge pull request #47571 from rallytime/man-pages
  - ade5e9f664 [2018.3.1] Update man pages
- **PR** #47550: (pcn) Fixes a bad deletion I did that only surfaced in 2018.3 @ *2018-05-09 13:36:33 UTC*
  - 85284caaf9 Merge pull request #47550 from pcn/fix-disable-term-protect-in-2018.3
  - d58a56877c Fixes a bad deletion I did that only surfaced in 2018.3

- **ISSUE** #47553: (douglasjreynolds) Unicode version error in lxc (refs: #47554)
- **PR** #47554: (douglasjreynolds) Converted unicode str version to a LooseVersion; matching line 2080. @ *2018-05-09 13:34:13 UTC*
  - f9083ff77e Merge pull request #47554 from douglasjreynolds/lxc_unicode_fix
  - e6bce581c6 Converted unicode str version to _LooseVersion to match line 2080.
- **PR** #47518: (Ch3LL) Fix 47364: ensure we are not caching zfs.is_supported @ *2018-05-09 13:29:07 UTC*
  - fe4e79f1de Merge pull request #47518 from Ch3LL/zfs_support
  - d19fef963e remove unnecessary patch in zfs.is_supported test
  - 58c4f29f96 Fix 47364: ensure we are not caching zfs.is_supported
- **PR** #47159: (terminalmage) Fix for whitelist/blacklist checking for non-list iterables @ *2018-05-08 20:43:51 UTC*
  - 332e9f13a6 Merge pull request #47159 from terminalmage/whitelist_blacklist-iter-fix
  - ca936de372 Treat empty whitelist/blacklist as no whitelist/blacklist
  - bcccaf2621 Raise a TypeError when invalid input passed to check_whitelist_blacklist
  - 2ae510ff2b Fix comment in test
  - 17398efcf7 Fix for whitelist/blacklist checking for non-list iterables
- **PR** #47514: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ *2018-05-08 18:36:54 UTC*
  - 21809ddc02 Merge pull request #47514 from rallytime/merge-2018.3
  - e2616b605f Update the pip tests to use the parsing syntax generated in PR #47196
  - b13b59791f Remove double instance of adding *--format=json* in pip module
  - 2ad60c7e81 Lint: remove duplicate function in helpers.py
  - 75480158b3 Lint: cur_version should just be pip_version
  - 5565d5e9b1 Update old utils paths with new utils paths
  - 786076ac03 Merge branch '2017.7' into '2018.3'
    - 611ca1fc03 Merge pull request #47476 from gtmanfred/2017.7
      - 1f91a85587 specify cache dir for pip install
      - 99e150e09c check for kitchen-vagrant gem before loading windows tests
    - 7c3f2c56da Merge pull request #47412 from twangboy/fix_47125

  - 33c0644ac4 Credit Frank Spierings
- a545e55543 Merge pull request #47281 from Ch3LL/system_test
  - c9181a75a6 Add destructivetest decorator on tests
  - 0d0c8987fc Add win_system integration module tests
- b64d930df0 Merge pull request #47283 from Ch3LL/ntp_test
  - ced7f86546 Add windows ntp integration module tests
- 910aff910f Merge pull request #47314 from Ch3LL/net_mac_test
  - 67beb1451c Skip netstat test on macosx as its not supported
- 0549ef7c16 Merge pull request #47307 from rallytime/bp-47257
  - 6c5b2f92bc Role is not a list but a dictionary
- d6ff4689f6 Merge pull request #47312 from rallytime/update-bootstrap-release
  - 765cce06a2 Update bootstrap script to latest release: 2018.04.25
- e0765f5719 Merge pull request #47279 from dwoz/py3_build_fix
  - 21dc1bab91 Pep-8 line endings
  - 717abedaf7 Fix comman wart
  - 4100dcd64c Close might get called more than once

    - dbe671f943 Stop socket before queue on delete
    - 9587f5c69e Silence pylint import-error for six.moves
    - 4b0c7d3b34 Fix typo
    - 05adf7c2b1 Use six.moves for queue import
    - fe340778fa Gracefully shutdown worker threads
- 44f19b2f94 Merge pull request #47113 from jfindlay/iptables_state
    - 8bd08012ee modules,states.iptables support proto for policy ext
- b7a6206330 Merge pull request #47302 from Ch3LL/dead_code
    - daa68b4877 Add virtual grains test for core grains
    - a59dd2785d Remove dead code in core grains file for virt-what
- e29362acfc Merge pull request #47303 from baniobloom/bug_fix_doc
    - b97c9df5f3 added clarity on how to figure out what is the oldest supported main release branch
- 0d9d55e013 Merge pull request #47106 from DSRCorporation/bugs/tornado50
    - 39e403b18d Merge branch '2017.7' into bugs/tornado50
    - 6706b3a2d1 Run off of a temporary config
    - d6873800d5 Allow running pytest>=3.5.0
    - 2da3983740 Tornado 5.0 compatibility fixes
- 2e014f4746 Merge pull request #47271 from gtmanfred/amazon
    - 8a53908908 Do not load rh_service module when booted with systemd
    - e4d1d5bf11 Revert "support amazon linux 2 for service module"
- 599b0ed1e9 Merge pull request #47246 from cloudflare/fix-44847-2017.7
    - ad80028104 This way, we can pass flags such as `debug` into the state, but also `test`.
- 4e2e1f0719 Merge pull request #47220 from benediktwerner/fix-pip-2017.7
    - 0197c3e973 Fix pip test
    - 34bf66c09f Fix pip.installed with pip>=10.0.0
- 92e606251f Merge pull request #47272 from rallytime/reg-windows-codeowners
    - 9445af0185 Add windows tests and reg module/state to CODEOWNERS file for team-windows
- 9dca5c0221 Merge pull request #47252 from rallytime/codeowners-fixes
    - 204b6af92b Fix the matching patterns in the CODEOWNERS file to use fnmatch patterns
- 3de1bb49c8 Merge pull request #47177 from fpicot/fix_47173_pkg_normalize
    - 149f846f34 fix normalize parameter in pkg.installed
- 10e30515dc Merge pull request #47251 from Ch3LL/pub_fix_rn
    - fa4c2e6575 Update Docs to remove unnecessary + sign
- bb7850a431 Merge pull request #47249 from Ch3LL/pub_fix_rn
    - 24dea24b7e Add CVE number to 2016.3.6 Release

    - 56933eb0b2 Merge pull request #47227 from pruiz/pruiz/zfs-dataset-present-slow-2017.7
      - fded61f19b Fix issue #47225: avoid zfs.filesystem_present slowdown when dataset has lots of snapshots
    - 9825065048 Merge pull request #47167 from smitty42/vbox-skd-fix
      - 5de53139cd Merge branch '2017.7' into vbox-skd-fix
    - 976f031170 Merge pull request #47213 from dwoz/py3win
      - ad9c7f63f0 Fix coverate on py3 windows builds
      - 91252bac95 Adding updates for python3 compatibility and new virtualbox SDK version support.
    - cebcd6d069 Merge pull request #47197 from dwoz/testfix
      - 25803c9176 Move process target to top level module namespace
    - d4269c2b70 Merge pull request #47193 from Ch3LL/network_test
      - bbf9987c19 Add network module integration tests
    - c777248a78 Merge pull request #47189 from Ch3LL/autoruns
      - 6a88bedb7a Add autoruns to windows whitelist
      - e9e4d4af70 Add autoruns.list integration test for Windows
- **PR** #47403: (rallytime) Back-port #47356 to 2018.3 @ *2018-05-01 15:19:06 UTC*
  - **PR** #47356: (robinro) Fix sysctl translate (refs: #47403)
  - 4e6870305c Merge pull request #47403 from rallytime/bp-47356
  - 9b682bc48e Fix sysctl translate
- **PR** #47407: (terminalmage) Reduce severity of missing X_update_interval key @ *2018-05-01 15:18:46 UTC*
  - 7e0cdd6145 Merge pull request #47407 from terminalmage/update-interval-log
  - abc592bfff Reduce severity of missing X_update_interval key
- **ISSUE** #47042: (valentin2105) [ERROR] Unable to manage file: 'utf8' codec can't decode byte (refs: #47061)
- **PR** #47405: (terminalmage) Fix file.get_diff regression in 2018.3 branch @ *2018-05-01 15:16:46 UTC*
  - **PR** #47061: (terminalmage) Fix diffing binary files in file.get_diff (refs: #47405)
  - 1377942bcc Merge pull request #47405 from terminalmage/binary-diff
  - 89ddb08026 Use a lambda instead of defining a one-line function
  - b79ff04fda Remove no-longer-used enumerate
  - e03b865359 Add unit test for file.get_diff
  - 5bdc9e9bd5 Fix UnboundLocalError in file.get_diff
- **ISSUE** #47325: (robertodocampo) docker_container.running creates containers using the image ID as the image name (refs: #47367)
- **PR** #47367: (terminalmage) Start docker containers with image name instead of ID @ *2018-04-30 18:46:13 UTC*
  - c267e6083e Merge pull request #47367 from terminalmage/issue47325
  - 798134caa3 Add regression test for creating images with image name insead of ID
  - 4ed47e839c Start docker containers with image name instead of ID

- **ISSUE** #47006: (cedwards) marathon & fx2 grain modules cause master and minion failure (refs: #47401)
- **PR** #47401: (gtmanfred) fix proxy virtual checks for marathon and fx2 @ *2018-04-30 18:44:46 UTC*
  - 3bb00cbb55 Merge pull request #47401 from gtmanfred/proxy
  - 99f9231759 fix proxy virtual checks for marathon and fx2
- **PR** #47397: (rallytime) Add 2018.3.1 Release Notes @ *2018-04-30 14:44:38 UTC*
  - c160fe36ce Merge pull request #47397 from rallytime/2018.3.1-release-notes
  - 3b40cdad2a Add 2018.3.1 Release Notes
- **ISSUE** #45790: (bdarnell) Test with Tornado 5.0b1 (refs: #46066, #47106, #47433)
- **PR** #47374: (DmitryKuzmenko) tornado50 merge forward for 2018.3 @ *2018-04-29 16:29:12 UTC*
  - **PR** #47106: (DmitryKuzmenko) Tornado50 compatibility fixes (refs: #47374, #47368, #47433)
  - **PR** #46002: (isbm) Pyzmq 17.0.0 proper handling (refs: #47374, #47368)
  - 3400f829c4 Merge pull request #47374 from DSRCorporation/bugs/tornado50-2018.3
  - 400999c54f fix pylint
  - 47b6d409d1 add io_loop handling to runtests engine
  - fd074fdb7d use salt.utils.zeromq
  - 4ae33c5d9a Run off of a temporary config
  - 7938b4906e Allow running pytest>=3.5.0
  - 34058c181e Tornado 5.0 compatibility fixes
- **ISSUE** #47124: (mchugh19) Vault module problem in 2018.3.0 (refs: #47379)
- **PR** #47379: (dwoz) Properly encode messages when creating/validating signatures with m2crypto @ *2018-04-28 08:38:23 UTC*
  - 2afe4bee95 Merge pull request #47379 from dwoz/m2crypto_regression
  - 068f2d430d Always sign and verify bytes
  - 7810ebaba9 Add sign regression tests
  - f4441c3a1c Adding regression test for 47124
- **PR** #47277: (morganwillcock) Fix minion crash on NetBSD @ *2018-04-27 15:02:21 UTC*
  - 7390b72808 Merge pull request #47277 from morganwillcock/netbsdswap
  - 0bcb1a079a Merge branch '2018.3' into netbsdswap
  - 30478e8c9c Use swapctl for NetBSD
- **PR** #47320: (twangboy) Change from NSSM to SSM @ *2018-04-27 14:37:50 UTC*
  - 2b7c7ef704 Merge pull request #47320 from twangboy/win_ssm
  - 5549d83aae Use ssm instead of nssm
- **PR** #47308: (rallytime) Back-port #47287 to 2018.3 @ *2018-04-27 13:50:49 UTC*
  - **PR** #47287: (esell) convert unicode ssh pass to str for azure (refs: #47308)
  - b6df5facce Merge pull request #47308 from rallytime/bp-47287
  - 5f392a23fe convert unicode ssh pass to str for azure

- **ISSUE** #47324: (rlschilperoort) archive.extracted keep and/or keep_source not working (refs: #47332)
- **PR** #47332: (garethgreenaway) [2018.3] Removing duplicate code from state/archive.py @ *2018-04-27 13:12:51 UTC*
  - efa3aab800 Merge pull request #47332 from garethgreenaway/47324_archive_extracted_keep_keep_source
  - cc10bfec6b Removing redundant code which is prevening keep & keep_source from being set.
- **PR** #47326: (The-Loeki) Some Redis fixes @ *2018-04-26 17:12:47 UTC*
  - 245d62ca16 Merge pull request #47326 from The-Loeki/redis-cache-sockets
  - d86fbe5bdd redis_return: add unix_socket_path to docs
  - ee9f533765 redis_cache: document UNIX socket access
  - 5337558a5a redis_return: Let redis handle pool creation, add UNIX socket support
  - c90f83b0f9 redis_return: cluster_mode default to False in __virtual__ to prevent KeyError stacktraces
  - 71e3286829 redis_return: Fix code blocks in docs
  - e6605f1c78 redis_cache fix code blox in docs
  - 40e67747ee redis_cache: add socket to options
- **PR** #47319: (dwoz) Skip unix group tests on windows. @ *2018-04-26 15:59:35 UTC*
  - 27a438f0ff Merge pull request #47319 from dwoz/skip_tests
  - d9442d043e Skip tests not applicable to windows
- **PR** #47293: (dwoz) The grp module is not available on windows @ *2018-04-25 20:22:34 UTC*
  - 057f668788 Merge pull request #47293 from dwoz/win_build_fix
  - 0386216005 Fix sneaky indention
  - 082b8d0b3d Use salt.utils.platform
  - cc2538e08f The grp modules is not available on windows
- **ISSUE** #46862: (kivoli) Setting locale.system fails in 2018.3 (refs: #47280, #46869)
- **PR** #47280: (gtmanfred) make sure not to send invalid information @ *2018-04-25 17:46:45 UTC*
  - fff4f8c1a5 Merge pull request #47280 from gtmanfred/localectl
  - 7c212cbb2d fix pylint
  - 6754787e8e update localemod tests
  - 9075070573 make sure not to send invalid information
- **ISSUE** #46977: (gtmanfred) [2018.3.0] Backwards compatibility breaking change in 2018.3.0 (refs: #47038)
- **PR** #47038: (garethgreenaway) [2018.3] fix to fileclient.py @ *2018-04-25 14:57:04 UTC*
  - 205701dcbe Merge pull request #47038 from garethgreenaway/46977_fixing_fileclient_forward_compatibility
  - ba01d2133a Updating version.py to include Magnesium.
  - 10c823dd79 The _ext_nodes master function has been renamed to _master_tops. To ensure compatibility when using older Salt masters we continue to pass the function as _ext_nodes until the Magnesium release.
- **ISSUE** #47059: (OrlandoArcapix) Some states incorrectly return None instead of an empty dict when there are no changes (refs: #47060)

- **ISSUE** #46985: (OrlandoArcapix) grafana4_user.present and grafana4_org.present states not working in 2018.3.0 (refs: #47048)
- **PR** #47060: (OrlandoArcapix) Return an empty dict for 'changes' instead of 'None' @ *2018-04-25 14:55:24 UTC*
  - **PR** #47048: (OrlandoArcapix) Issue46985 fix grafana4 state (refs: #47060)
  - 89daf4fdc7 Merge pull request #47060 from OrlandoArcapix/Issue47059-return_dict_from_state
  - 5378e4fd07 Update grafana_datasource test to check for empty dict being returned on no changes, rather than None
  - f115452653 Return an empty dict for 'changes' instead of 'None'
- **ISSUE** #47089: (syphernl) UnicodeDecodeError: 'ascii' codec can't decode byte 0xc3 in position 404: ordinal not in range(128) (refs: #47153)
- **PR** #47153: (terminalmage) salt.modules.ssh: properly encode/decode I/O @ *2018-04-25 14:53:51 UTC*
  - 10cc0d312b Merge pull request #47153 from terminalmage/issue47089
  - bdb52797f8 salt.modules.ssh: properly encode/decode I/O
- **ISSUE** #47199: (tkaehn) Targeting by list (-L) broken for minions behind syndic? (refs: #47275)
- **PR** #47275: (terminalmage) Fix false failure events sent when using syndic @ *2018-04-25 13:56:47 UTC*
  - b5d64f1a70 Merge pull request #47275 from terminalmage/issue47199
  - 8012ad12f8 Fix false failure events sent when using syndic
- **ISSUE** #47267: (skjaro) Problem with beacon diskusage on windows platform in 2018.3 (refs: #47284)
- **PR** #47284: (skjaro) Fix beacon diskusage documentation for the new beahavior mentioned in issue #47267 @ *2018-04-25 13:52:30 UTC*
  - 6215a995d8 Merge pull request #47284 from skjaro/beacon_diskusage_doc_fix
  - fcc042aa5f Fix beacon documentation for the new beahavior mentioned in issue #47267
- **PR** #47291: (bosatsu) Fix proxy minion beacon doc @ *2018-04-25 13:42:36 UTC*
  - 3ef4fe6ed2 Merge pull request #47291 from bosatsu/fix-proxy-minion-beacon-doc
  - 01980b4c43 Fix topics/releases/2018.3.0.rst to include correct example of proxy_example beacon yaml configuration.
  - 9682e26eec Fix topics/proxyminion/beacon.rst to include correct example of salt_proxy beacon yaml configuration.
- **ISSUE** #47239: (bosatsu) Unable to load salt_proxy beacon on minion in 2018.3.0 (refs: #47255)
- **PR** #47255: (garethgreenaway) [2018.3] Fixes to salt_proxy beacon and beacon tests @ *2018-04-25 13:41:51 UTC*
  - ea2d68b865 Merge pull request #47255 from garethgreenaway/47239_fixes_to_salt_proxy_beacon
  - a2a8d78cb0 Fixing status beacon tests.
  - c87d6cae23 Ensure the salt_proxy is returning the correct tuple when the configuration is valid. Update various beacon unit tests to ensure they are testing the results of the validate function for a True result.
- **PR** #47292: (dwoz) Fix decorator wart @ *2018-04-25 04:25:23 UTC*
  - **PR** #47290: (dwoz) Run cache_master test in tmp dir (refs: #47292)
  - 19f9e8258f Merge pull request #47292 from dwoz/cp_fix_again
  - 7d045eb235 Fix decorator wart

- **PR** #47285: (dwoz) Fix reg grains test @ *2018-04-25 00:16:56 UTC*
    - da532aa1ac Merge pull request #47285 from dwoz/core_test_fix
    - 884f4c1829 Fix extra space
    - 8a9027c0c9 Fix reg grains test
- **PR** #47290: (dwoz) Run cache_master test in tmp dir (refs: #47292) @ *2018-04-24 23:37:21 UTC*
    - f591cff643 Merge pull request #47290 from dwoz/test_cp_fix
    - 5ff51affbd Run cache_master test in tmp dir
- **ISSUE** #47092: (syphernl) [2018.3.0] pkg.installed breaks with virtual packages (refs: #47250)
- **ISSUE** #38838: (Zorlin) Failing to remove nginx (refs: #44455)
- **PR** #47250: (terminalmage) Fix virtual package detection @ *2018-04-24 19:22:24 UTC*
    - **PR** #44455: (samodid) Fix for #38838 (refs: #47250)
    - 6d323aa8f0 Merge pull request #47250 from terminalmage/issue47092
    - b8630a70be Fix virtual package detection
- **ISSUE** #47225: (pruiz) zfs.filesystem_present takes forever on a dataset with lots (10k+) of snapshots (refs: #47228, #47227, #47226)
- **PR** #47228: (pruiz) Fix issue #47225: avoid zfs.filesystem_present slowdown when dataset has lots of snapshots (2018.3 branch) @ *2018-04-24 13:35:21 UTC*
    - **PR** #47226: (pruiz) Fix issue #47225: avoid zfs.filesystem_present slowdown when dataset has lots of snapshots (refs: #47228, #47227)
    - 428e915d6a Merge pull request #47228 from pruiz/pruiz/zfs-dataset-present-slow-2018.3
    - cfbf136ab2 Fix issue #47225: avoid zfs.filesystem_present slowdown when dataset has lots of snapshots
- **ISSUE** #46943: (Auha) Slack.Engine could not start (refs: #47262, #47109)
- **PR** #47262: (garethgreenaway) [2018.3] Fixes to targeting in Slack engine @ *2018-04-24 13:18:36 UTC*
    - 0b836106b9 Merge pull request #47262 from garethgreenaway/slack_engine_target_fix
    - bcdef641e8 Removing target and tgt_type from the cmdline that is passed along to Salt, the target is used else where and including it in the cmdline causes problem when it is passed along. Adding an additional test to ensure we are getting the right targt.
- **ISSUE** #47047: (Giandom) Pillars aren't evaluated when alias is passed in Slack Engine (refs: #47142)
- **PR** #47142: (garethgreenaway) [2018.3] pillar and output formatting fixes to Slack engine @ *2018-04-23 19:55:07 UTC*
    - 2ed4b38b02 Merge pull request #47142 from garethgreenaway/47047_passing_pillar_to_slack_aliases
    - 6f183e1d80 Initial commit for unit/engines/test_slack_engine
    - a2840fc230 Only include the rest of the cmdline if the cmd is an alias.
    - e846df7409 Fixing a bug when passing pillar values to aliases for the Slack engine. Cleaned up the formatting of the results, color codes don't translate well into Slack output. For any state runs, eg. highstate. apply, sls, we run the output through the highstate formater. For anything else run it though the yaml outputer. Running it though highstate causes errors when the output does match what the highstate output is expecting.
- **PR** #47245: (terminalmage) Ensure we pass hexid as bytes when zmq_filtering enabled @ *2018-04-23 16:54:57 UTC*

  - 42a0e655dc Merge pull request #47245 from terminalmage/zeromq-bytes
  - a7accc0548 Ensure we pass hexid as bytes when zmq_filtering enabled
- **PR** #47242: (aesposito91) PY3 fix for zeromq setsockopt @ *2018-04-23 16:38:09 UTC*
  - 73525d1460 Merge pull request #47242 from aesposito91/2018.3
  - b225351e6d Update napalm_syslog.py
- **ISSUE** #47117: (prashanthtuttu) Napalm / Capirca Issue (refs: #47241)
- **PR** #47241: (mirceaulinic) Fix the imports into the netacl execution and state modules @ *2018-04-23 14:56:32 UTC*
  - b78295aee9 Merge pull request #47241 from cloudflare/fix-47117
  - 26c5583264 #47117: fix the napalm imports in the netacl state module
  - 48396467c1 #47117: fix the napalm imports in the netacl execution module
- **PR** #47219: (garethgreenaway) [2018.3] Fixing a backward compatibility issue with vault module & runner @ *2018-04-23 14:10:19 UTC*
  - 88557ea991 Merge pull request #47219 from garethgreenaway/vault_backward_compatibility
  - 1758081ffe When using the vault module on a 2018.3 minion against a 2017.7 master, the 2018.3 minion is expecting a verify element in the results from the Salt runner on the master. The runner in 2017.7 did not include a verify element, which results in an error. This change accounts for this by using the default in 2018.3 which is not to verify if not configured.
- **PR** #47186: (dmurphy18) backport of issue 46933, updated ZFS handling to Salt 2018.3.x @ *2018-04-23 14:07:06 UTC*
  - 370feadbd2 Merge pull request #47186 from dmurphy18/zfs_backport_46933
  - 283359d315 Corrected typo in comma-seprated and 2018.3.0 -> 2018.3.1
  - b7f8d5a22f Replace use of Fluorine with 2018.3.0 for comma-separated warnings
  - 3f30ab2ed6 ZFS backport of 46933 to 2018.3.1
- **PR** #47217: (twangboy) Remove installation of pywin32 from setup.py @ *2018-04-23 13:32:54 UTC*
  - bf3a67d11b Merge pull request #47217 from twangboy/fix_setup
  - eb3d45bb08 Remove installation of pywin32 from setup.py
- **PR** #47195: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ *2018-04-20 19:25:30 UTC*
  - 8e21703f13 Merge pull request #47195 from rallytime/merge-2018.3
  - f90fd8c663 Test fix: file strings must be unicode in master config
  - bee4948df1 Lint: use full path for event utils function
  - 120c5446b7 Update old utils paths to new utils paths
  - 4718d31e53 Merge branch '2017.7' into '2018.3'
    - 65f344e371 Merge pull request #47184 from Ch3LL/status_test
      - 25a84428b8 Add status module integration modules tests for Windows
    - 965600ad6c Merge pull request #47163 from rallytime/jenkins-autodoc
      - 0039395017 Updage jenkins module autodocs to use jenkinsmod name instead
    - 0a43dde5fc Merge pull request #47185 from twangboy/add_tests

      - 345daa0423 Add additional integration tests to whitelist
    - 1a600bb9a4 Merge pull request #47172 from dwoz/cover_without_admin
      - cadd759727 Use warnings to warn user
      - 144c68e214 Allow non admin name based runs on windows
    - d5997d2301 Merge pull request #47110 from kstreee/fix-misusing-of-timeout
      - 0624aee0ed Fixes misusing of the timeout option.
    - 87ca2b4003 Merge pull request #40961 from terminalmage/issue40948
      - 6ba66cca41 Fix incorrect logic in exception check
      - fed5041c5f Make error more specific to aid in troubleshooting
      - 8c67ab53b4 Fix path in log message
      - 3198ca8b19 Make error more explicit when PKI dir not present for salt-call
    - f5e63584d4 Merge pull request #47134 from Ch3LL/user_win_test
      - e7c9bc4038 Add user integration tests for windows OS
    - da2f6a3fac Merge pull request #47131 from gtmanfred/cli
      - 1b1c29bf62 add __cli for master processes
    - 9b8e6ffb8c Merge pull request #47129 from rallytime/bp-47121
      - 11da526b21 add ImportError
      - bd0c23396c fix pip.req import error in pip 10.0.0
    - eb5ac51a48 Merge pull request #47102 from gtmanfred/2017.7
      - 3dc93b310b fix tests
      - 8497e08f8e fix pip module for 10.0.0
      - 4c07a3d1e9 fix other tests
      - b71e3d8a04 don't allow using no_use_wheel for pip 10.0.0 or newer
    - c1dc42e67e Merge pull request #47037 from twangboy/fix_dev_scripts
      - 990a24d7ed Fix build_env scripts

- **ISSUE** #46906: (whytewolf) Windows failure with PR 46541 (refs: #47168)
- **PR** #47168: (gtmanfred) fix metadata grain for py3 and windows @ *2018-04-20 19:07:50 UTC*
  - a56eb7e05d Merge pull request #47168 from gtmanfred/metadata
  - 396f7906e3 fix metadata grain for py3 and windows
- **ISSUE** #46918: (AmbicaY) napalm/capirca issue (refs: #47202)
- **PR** #47202: (mirceaulinic) Fix #46918: add the TTL field @ *2018-04-20 14:34:09 UTC*
  - 6135b76e2c Merge pull request #47202 from cloudflare/fix-46918
  - 1e74141cc0 Fix #46918
- **ISSUE** #47150: (srkunze) [Regression] ip_to_host and SSH._expand_target require missing reverse-lookup (refs: #47191)
- **PR** #47191: (terminalmage) salt-ssh: Do not attempt to match host/ip to minion ID if reverse lookup fails @ *2018-04-20 14:20:05 UTC*

  - 7f1115e611 Merge pull request #47191 from terminalmage/issue47150
  - 95a6f075cb Add debug logging when ip_to_host fails
  - 45696e622b salt-ssh: Do not attempt to match host/ip to minion ID if reverse lookup fails
- **PR** #47122: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ *2018-04-19 20:44:18 UTC*
  - 1947ffdf56 Merge pull request #47122 from rallytime/merge-2018.3
  - 878fa06134 Test fix: remove tornado testing lib from class
  - a40f007962 lint: get_context is in stringutils.py now
  - 3416e398c6 Update old utils paths references to use new paths
  - 94c2a12be6 Merge branch '2017.7' into '2018.3'
    - 6a4c0b8a1a Merge pull request #47108 from dwoz/async_test_fix
      - 3d85e30ce5 AsyncTestCase is required for AsyncEventPublisher
    - 03892eaf0b Merge pull request #47068 from cachedout/catch_value_error_socket_test
      - 7db5625632 Catch an operation on a closed socket in a test
    - 1ea2885ec2 Merge pull request #47065 from dwoz/jinja_test_fix
      - 673cd31c65 Merge branch '2017.7' into jinja_test_fix
    - 5293b5b5ca Merge pull request #47077 from dwoz/test_state_fix
      - 444da3f893 Fix py3 wart (chr vs bytesstring)
      - e8acca01c2 Fix failing state test by normalizing line endings
    - ca967de5da Merge pull request #47067 from gtmanfred/2017.7
      - f913a7859c use the recommended opennebula lookup method
    - 7fddad6cd9 Merge pull request #47064 from dwoz/roots_tests_fix
      - 25fd7c0694 fix py3 wart, encode os.linesep
      - d79f1a1961 Fix fileserver roots tests
    - 977c6939c4 Merge pull request #47069 from cachedout/match_timeout_arg
      - b8990f5258 Pass the timeout variable to the CLI when calling salt in tests
    - 2c4c19c622 Merge pull request #47074 from dwoz/ignore_artifacts
      - c3941efad0 Kitchn should ignore artifacts directory
    - c484c0bd71 Merge pull request #47055 from bloomberg/GH-47000
      - 8af3f5b874 GH-47000: add proper handling of full_return in cmd_subset
    - f3496030cc Merge pull request #47039 from twangboy/win_fix_winrm_script
      - 6635b9003f Fix winrm powershell script
      - 46fa2c04de Fix py3 os.linesep wart
      - 3c565d7e54 Use salt.utils.fopen
      - aa965310f1 Clean up cruft
      - efc9866580 Jinja test fixes
- **PR** #47162: (terminalmage) Partial backport of #47161 to 2018.3 branch @ *2018-04-19 19:28:47 UTC*

  - **PR** #47161: (terminalmage) Fix failing pillar unit test (refs: #47162)
  - 291cca7ed8 Merge pull request #47162 from terminalmage/bp-47161
  - d185f97a47 mocked file_roots and pillar_roots should be dicts
- **ISSUE** #47081: (sjorge) file.directory with recursion fails if there are non-ascii characters in the path (refs: #47165)
- **PR** #47165: (terminalmage) Make sure a str type is passed to os.walk @ *2018-04-19 14:59:16 UTC*
  - 2ee8006da3 Merge pull request #47165 from terminalmage/issue47081
  - 9e29acb477 Make sure a str type is passed to os.walk
- **PR** #47070: (terminalmage) Use decorators for temp files/dirs in test suite @ *2018-04-19 14:01:48 UTC*
  - 6257862bbb Merge pull request #47070 from terminalmage/with_tempdir
  - 048728d2b7 Remove unused imports
  - 879c557264 Use decorators for temp files/dirs in test suite
- **PR** #47155: (mcalmer) Fix patchinstall for yumpkg @ *2018-04-18 19:24:17 UTC*
  - b46365614b Merge pull request #47155 from mcalmer/fix-patchinstall
  - 382afba457 fix invalid string compare
  - 8c19368938 provide kwargs to pkg_resource.parse_targets required to detect advisory type
- **ISSUE** #47042: (valentin2105) [ERROR] Unable to manage file: 'utf8' codec can't decode byte (refs: #47061)
- **PR** #47061: (terminalmage) Fix diffing binary files in file.get_diff (refs: #47405) @ *2018-04-18 18:52:10 UTC*
  - 13ae1a2413 Merge pull request #47061 from terminalmage/issue47042
  - 87f6cefea3 Rewrite flaky utf8 state to make it easier to troubleshoot
  - df6e535f05 Fix diffing binary files in file.get_diff
- **PR** #47058: (terminalmage) Fix calls to file.lsattr when lsattr is not installed @ *2018-04-18 16:30:12 UTC*
  - cba0f13cd9 Merge pull request #47058 from terminalmage/lsattr
  - eeb067e910 Fix calls to file.lsattr when lsattr is not installed
- **ISSUE** #46929: (noelmcloughlin) 2018.3 regression file.managed.context parsing (refs: #47104)
- **PR** #47104: (terminalmage) yamlloader: Properly handle colons in inline dicts @ *2018-04-18 16:22:47 UTC*
  - b96ce23b3f Merge pull request #47104 from terminalmage/issue46929
  - 33bf6643cd Add additional test for plain scalars
  - 508659b682 yamlloader: Properly handle colons in inline dicts
- **ISSUE** #46887: (julientravelaer) ldap.managed broken with 2018.3.0 (refs: #47029)
- **ISSUE** #46859: (cheribral) pillar_ldap causing TypeError exceptions in python-ldap with unicode objects (refs: #47029)
- **PR** #47076: (terminalmage) pillar_ldap: Load config options as str types @ *2018-04-18 16:16:22 UTC*
  - **PR** #47029: (terminalmage) ldapmod.py/ldap3.py: Force modlist for search/modify/etc. to be str types (refs: #47076)
  - c12697b173 Merge pull request #47076 from terminalmage/issue46859
  - c06c859caf pillar_ldap: Load config options as str types

- **PR** #47107: (twangboy) Fix issues with reg state, add tests @ *2018-04-18 15:53:02 UTC*
  - 50bd885ec7 Merge pull request #47107 from twangboy/fix_46932
  - ae8ab2ab1a Fix tests for py3, enable tearDown
  - 3cf4ac1475 Add integration tests for reg state
  - cc259b146f Cast vdata to appropriate type in reg state
- **ISSUE** #46909: (epelc) Binary *contents_pillar* with file.managed raises UnicodeDecodeError (refs: #47041)
- **PR** #47041: (terminalmage) Force null bytes to be str types @ *2018-04-18 14:08:25 UTC*
  - d6c59696be Merge pull request #47041 from terminalmage/issue46909
  - e4182715be Special check specifically for bytes types
  - ee90dd5d95 Merge branch '2018.3' into issue46909
  - 0e99343a7f Use the same way of defining contents in both file.managed states
  - 5741d287b5 Move back to using null byte check for contents
  - 8e214c9fa9 file.managed: Add test to ensure binary contents work
  - 7b7dc94610 Use salt.utils.stringutils.is_binary to check if contents are binary
  - e3c969da81 PY3: Ensure binary contents work with file.managed
  - 5d98a8bedd Make salt.utils.stringutils.to_binary work for bytestrings
  - 1024000369 Force null bytes to be str types
- **PR** #47007: (twangboy) Fix some issues with the win_servermanager module @ *2018-04-17 20:57:04 UTC*
  - 9a9f6524f8 Merge pull request #47007 from twangboy/fix_46968
  - 432db7c6ec Lint: Remove unused import
  - 10341e8f8b Remove erroneous pop statement
  - 56582f293a Remove redundant try/except block from state`
  - 6ad2427279 Remove unnecessary try/except blocks
  - 92eeaa51bd Put some error checking in the shell command
- **ISSUE** #46943: (Auha) Slack.Engine could not start (refs: #47262, #47109)
- **PR** #47109: (garethgreenaway) [2018.3] fixes to Slack engine @ *2018-04-17 13:56:27 UTC*
  - a52137ee36 Merge pull request #47109 from garethgreenaway/46943_slack_engine_fixes
  - 02baa76595 Fixing a bug that occurred when a comment was added to a message sent to Slack by Salt. Also making *slack_engine:groups_pillar* optional.
- **PR** #47045: (tankywoo) Fix ba7d00f5 for gentoo pkg.installed method @ *2018-04-17 13:55:45 UTC*
  - 6c16a34c44 Merge pull request #47045 from tankywoo/fix-gentoo-pkg-installed
  - 551f4e10cf Fix ba7d00f5 for gentoo pkg.installed
- **PR** #47053: (clan) handle jinja error in <module> level @ *2018-04-16 22:47:54 UTC*
  - 86c7cfef56 Merge pull request #47053 from clan/jinja-error
  - a847466946 handle jinja error in <module> level
- **PR** #47062: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ *2018-04-16 19:58:32 UTC*

  - 7bfa608e9f Merge pull request #47062 from rallytime/merge-2018.3
  - 59f5880e72 lint fix
  - 1ddf8c584b Update old utils files to new new utils files path
  - 28a79ebba4 Merge branch '2017.7' into '2018.3'
    - 1700a10ebe Merge pull request #46326 from kstreee/fix-client-local
      - 0f358a9c9e Fixes a timing bug of saltnado's client local.
    - c3c00316c5 Merge pull request #46913 from lomeroe/2017_7-fix46877
      - 369a0645ed move exception for clarity
      - 32ce5bfda5 Use configparser serializer object to read psscript.ini and script.ini startup/shutdown script files.
    - 9e37cfc9d6 Merge pull request #47025 from terminalmage/fix-server_id-windows
      - cb0cf89ed3 Fix server_id grain in PY3 on Windows
    - 2e193cfb45 Merge pull request #47027 from rallytime/bp-44508
      - 8e72f362f4 Add priority field to support the latest capirca.
      - 112f92baab Add priority field to support the latest capirca.
    - 385fe2bc1e Merge pull request #47020 from rallytime/bp-46970
      - 9373dff52b Update test_pkgrepo.py
      - 13cf9eb5b1 Removing debugging.
      - a61a8593e5 Removing suse from pkgrepo comments tests. the pkgrepo functions in SUSE pkg module do not support comments.
- **PR** #47066: (terminalmage) Fix regression in handling of environment/saltenv @ *2018-04-16 19:57:12 UTC*
  - fa27e64a33 Merge pull request #47066 from terminalmage/issue46979
  - 5c4c0468ad Fix regression in handling of environment/saltenv
- **PR** #47051: (rallytime) Simplify LooseVersion check in __*virtual*__ check in mac_assistive module @ *2018-04-13 19:43:33 UTC*
  - 8761b81a69 Merge pull request #47051 from rallytime/fix-lint
  - d52b3689d9 Simplify LooseVersion check in __*virtual*__ check in mac_assistive module
- **PR** #47057: (corywright) Fix copy/paste typo in minionfs tutorial @ *2018-04-13 19:43:01 UTC*
  - bbb8018b55 Merge pull request #47057 from corywright/fix-minionfs-whitelist-docs
  - 9b7ee97d12 Fix copy/paste typo in minionfs tutorial
- **ISSUE** #46931: (anlutro) file.managed diff is switched when using template in salt-ssh 2018.3 (refs: #47046)
- **PR** #47046: (clan) switch order of file to be diffed @ *2018-04-13 13:40:13 UTC*
  - d5afa4a2c5 Merge pull request #47046 from clan/file_diff
  - bb58605c54 switch order of file to be diffed
- **ISSUE** #46985: (OrlandoArcapix) grafana4_user.present and grafana4_org.present states not working in 2018.3.0 (refs: #47048)
- **PR** #47048: (OrlandoArcapix) Issue46985 fix grafana4 state (refs: #47060) @ *2018-04-13 13:34:29 UTC*

  - ec9251ecd3 Merge pull request #47048 from OrlandoArcapix/Issue46985-fix-grafana4-state
  - 259d747414 Remove accidentally added copy of a file
  - 6c8c3da74d Return an empty dict instead of 'None' from grafana4 states
- **PR** #47017: (opdude) Don't encode a unicode string @ *2018-04-13 13:31:33 UTC*
  - d8c4c221cf Merge pull request #47017 from Unity-Technologies/hotfix/pip_windows
  - 838670f626 Don't encode a unicode string
- **ISSUE** #46917: (boltronics) mysql_grants.present broken with *database: somedatabase.** (refs: #46919)
- **PR** #47019: (rallytime) Back-port #46919 to 2018.3 @ *2018-04-12 19:43:01 UTC*
  - **PR** #46919: (boltronics) Replace failing is and is not tests with == and != (refs: #47019)
  - 5b7544eaa0 Merge pull request #47019 from rallytime/bp-46919
  - 6837d6c138 Replace failing is and is not tests with == and !=
- **ISSUE** #46887: (julientravelaer) ldap.managed broken with 2018.3.0 (refs: #47029)
- **ISSUE** #46859: (cheribral) pillar_ldap causing TypeError exceptions in python-ldap with unicode objects (refs: #47029)
- **PR** #47029: (terminalmage) ldapmod.py/ldap3.py: Force modlist for search/modify/etc. to be str types (refs: #47076) @ *2018-04-12 19:41:29 UTC*
  - ac2d54d78a Merge pull request #47029 from terminalmage/issue46859
  - ab6314247b ldapmod.py/ldap3.py: Force modlist for search/modify/etc. to be str types
  - 7691dee4ed Add to_str option to decode funcs
- **ISSUE** #46868: (tjyang) 2017.7.4 to 2018.3.0 upgrade issue: Salt request timed out. The master is not responding (refs: #46930)
- **PR** #46930: (dwoz) Clean up bad public key headers @ *2018-04-12 18:57:37 UTC*
  - e6e07720fa Merge pull request #46930 from dwoz/crptodomekeyfix
  - f2e484ed54 Merge branch '2018.3' into crptodomekeyfix
  - e1995a92ee Fix verify signature test
  - 0ba32118d9 Add test for bad public key without m2crypto
  - a44c356233 Clean up bad public key headers
- **ISSUE** #46951: (Giandom) Slack engine error using aliases: TypeError unhashable type (refs: #47008)
- **PR** #47008: (garethgreenaway) [2018.3] Fixing aliases in slack engine @ *2018-04-12 15:24:40 UTC*
  - 0e43becc12 Merge pull request #47008 from garethgreenaway/46951_fixing_slack_engine_aliases
  - dc2a72d44f Fixing aliases in slack engine
- **ISSUE** #46947: (Giandom) Slack engine groups error (refs: #47009)
- **PR** #47009: (garethgreenaway) [2018.3] fixes to slack engine documentation @ *2018-04-12 15:20:54 UTC*
  - c33de7c82d Merge pull request #47009 from garethgreenaway/46947_slack_documentation_update_catch_non_dicts
  - f0fadbb4ce Fixing indention for slack documentation. Updating try..except to ensure we catch when groups aren't dicts.
- **PR** #47023: (rallytime) Back-port #46997 to 2018.3 @ *2018-04-12 15:05:24 UTC*

  - **PR** #46997: (LukeCarrier) Fix repository (=> repository) typo in sls_build (refs: #47023)
  - **PR** #44638: (terminalmage) Many improvements to docker network and container states (refs: #46997)
  - 68d17c71f1 Merge pull request #47023 from rallytime/bp-46997
  - c2c60f4ffc Fix repository (=> repository) typo in sls_build
- **PR** #47026: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ *2018-04-12 14:39:41 UTC*
  - 9cf3c6406a Merge pull request #47026 from rallytime/merge-2018.3
  - ba70df9d62 Use msgpack utils for loads call, import msgpack for UnpackValueError
  - 34a478dfe5 Update old fopen path with new utils files path
  - 590c7fc13f Merge branch '2017.7' into '2018.3'
    - 8f994e7cf9 Merge pull request #46539 from jfoboss/patch-1
      - 6890122e41 Merge pull request #1 from twangboy/pull_46539
      - 19c3fadbe5 Fix unit test for win_ntp
      - 826a8d3099 Fixing #46504
    - 74d70e95a5 Merge pull request #46999 from gtmanfred/2017.7
      - 791af8f6ce switch pip test package
    - 8adaf7f526 Merge pull request #46023 from bloomberg/parallel-orch
      - 0ac0b3ca29 Merge branch '2017.7' into parallel-orch
    - 39d65a39cf Merge pull request #46613 from myinitialsarepm/fix_puppet.fact_and_puppet.facts
      - 44ecd13abc Update tests to use cmd.run_all
      - 7d7d40f541 Merge branch '2017.7' into fix_puppet.fact_and_puppet.facts
      - 0ce1520bd0 Merge branch '2017.7' into fix_puppet.fact_and_puppet.facts
      - 69e1f6f681 Fix puppet.fact and puppet.facts to use stdout.
      - 3d5e69600b address lint issues raised by @isbm
      - a9866c7a03 fix parallel mode py3 compatibility
      - 6d7730864a removing prereq from test orch
      - 6c8a25778f add integration test to runners/test_state to exercise parallel
      - 2c86f16b39 cherry-pick cdata KeyError prevention from #39832
      - 26a96e8933 record start/stop duration for parallel processes separately
      - e4844bdf2b revisit previous join() behavior in check_requisites
      - f00a359cdf join() parallel process instead of a recursive sleep
      - 6e7007a4dc add parallel support for orchestrations
- **PR** #47021: (garethgreenaway) [2018.3] Fixing integration.modules.test_state_jinja_filters.StateModuleJinjaFiltersTest.test_path_ @ *2018-04-12 13:12:39 UTC*
  - d3be828696 Merge pull request #47021 from garethgreenaway/920_state_module_jinja_filters_test_test_path_which
  - 2ccf2c5fe0 Fixing test_path_which to check that the filter is available rather than results.
- **PR** #47022: (corywright) Add auth.file module to auth documentation page @ *2018-04-11 21:11:10 UTC*

  - 66e8445b82 Merge pull request #47022 from corywright/add-auth-file-module-to-docs
  - bd0918fc40 Add auth.file module to auth documentation page
- **PR** #45774: (twangboy) Fix __virtual__ issue in mac_system.py @ *2018-04-11 14:26:13 UTC*
  - 12ecfdee93 Merge pull request #45774 from twangboy/mac_add_service_util
  - 5796696617 Fix tests for Py3
  - 7b40218790 Fix lint, remove sentence from docstring
  - 781880f0fc Add _available_services function for testing
  - 6080633613 Add assert_called_with
  - 1bf70b2033 Add more tests for available_services
  - b429fc3e74 Add tests for mac_utils
  - b5f67130cc Used *args and **kwargs
  - ed061617a2 Fix unicode_literal issue in mac_assistive
  - 82e17e5fc8 Fix args/kwargs
  - 455146500a Move some functions into mac_utils
  - 125586264b Add utilsmac_service.py
- **ISSUE** #46953: (cskowronnek) salt-cloud azurearm [ERROR] There was a profile error: Parameter 'subscription_id' must be str. (refs: #47012)
- **PR** #47012: (terminalmage) Azure: ensure subscription_id is a str type @ *2018-04-11 13:57:08 UTC*
  - 79347f108a Merge pull request #47012 from terminalmage/issue46953
  - 5192622a32 Azure: ensure subscription_id is a str type
- **PR** #46526: (Ch3LL) Add tests for new source_* minion options @ *2018-04-10 19:56:45 UTC*
  - 6503bf8dfa Merge pull request #46526 from Ch3LL/ip_conf
  - c01180ff47 Patch ZMQ versions for master_uri test
  - da38f332a5 Change comment and salt.utils.network import
  - e972ebdf1a Add for new source_* minion options
- **PR** #46993: (L4rS6) Fix: tuple instead of string @ *2018-04-10 17:07:59 UTC*
  - 03907d3fce Merge pull request #46993 from L4rS6/fix-broken-keystone-auth/2018.3
  - e33ba1b3d5 Fix: tuple instead of string
- **PR** #46990: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ *2018-04-10 17:07:33 UTC*
  - ffaee26540 Merge pull request #46990 from rallytime/merge-2018.3
  - ccc5bad2df Merge branch '2017.7' into merge-2018.3
    - ba5421d988 Merge pull request #46991 from gtmanfred/windows
      - 98588c1dc5 use saltstack salt-jenkins
  - 2f1cf3e511 Merge branch '2017.7' into '2018.3'
    - 00c4067585 Merge pull request #46975 from gtmanfred/windows
      - 1f69c0d7f8 make sure windows outputs xml junit files

            - 4a2ec1bbb3 support new versions of winrm-fs
            - b9efec8526 remove libnacl on windows
            - 2edd5eaf9e fix path
            - b03e272e44 windows work
        - 3cf2353e41 Merge pull request #46945 from vutny/doc-faq-fix-jinja
            - bfdf54e61d [DOC] Fix Jinja block in FAQ page
        - fc2f728665 Merge pull request #46925 from terminalmage/fix-file.patch-docstring
            - 97695657f0 Remove reference to directory support in file.patch state
        - eef6c518e1 Merge pull request #46900 from rallytime/bp-46801
            - 6a41e8b457 rename jenkins to jenkinsmod
        - 71839b0303 Merge pull request #46899 from rallytime/bp-45116
            - b92f908da4 fix adding parameters to http.query from sdb yaml
- **PR** #46339: (DmitryKuzmenko) SSH State test failures @ *2018-04-10 17:06:51 UTC*
    - a34b92ae82 Merge pull request #46339 from DSRCorporation/bugs/ssh_state_test_failures
    - bd98c49dc7 Merge branch '2018.3' into bugs/ssh_state_test_failures
    - 6fdc458a7f Increase timeout for run_run in ShellCase
    - 8e60cccdfb Give background task more chance to start.
    - e0b6878fac One more useful assert for better test results.
    - 92a6c43c73 More logging and assertion fixes. Extended ssh ops timeout.
    - 6ebdd17ac4 Advanced logging in the failing SSH State tests.
- **PR** #46989: (Ch3LL) Fix redis cache log debug line @ *2018-04-10 16:35:12 UTC*
    - 9924100c44 Merge pull request #46989 from Ch3LL/redis_log
    - 6160bc06c6 Fix redis cache log debug line
- **ISSUE** #46834: (oeuftete) strftime filter not found in 2018.3.0 (refs: #46848)
- **ISSUE** #46668: (anlutro) Jinja2 filter strftime stopped working in salt-ssh 2018.3 (refs: #46848, #46744)
- **PR** #46848: (garethgreenaway) [2018.8] salt-ssh jinja filters tests @ *2018-04-10 16:19:51 UTC*
    - c6431936cb Merge pull request #46848 from garethgreenaway/testing_jinja_filters_avaiable_via_salt_ssh
    - 5fcda3eff8 Merge branch '2018.3' into testing_jinja_filters_avaiable_via_salt_ssh
    - 0adfee9b11 Updating a couple tests. Fixing check_whitelist_blacklist to work with PY3 when non-iterables are passed. Adding warning about lst_avg results being wrong and future updates in Neon.
    - f3f42146ca Removing expected from strftime and hashsum tests since the results are always different and we are only concerned about the filter being available.
    - 860234c045 Fixing lint.
    - 0891c6b580 fixing docstring
    - c8945e4b2e cleaning up some imports.
    - 0599759e5b cleaning up some test doc strings.

  - dceda5eb88 Moving all jinja filter tests into support/jinja_filters.py. Updaitng integration/ssh/test_jinja_filters.py to use those tests. Adding integration/modules/test_state_jinja_filters.py to also use the common jinja filter tests.
  - 07d7e3ca01 Adding a new integration test and corresponding state files to test availability of jinja filters when using salt-ssh.
- **ISSUE** #46880: (liquidgecka) rabbitmq_policy broken in 2018.3.0 (refs: #46973)
- **PR** #46973: (rallytime) New "apply_to" kwarg in rabbitmq module should be added at the end @ *2018-04-10 14:42:32 UTC*
  - **PR** #41233: (dnABic) added parameter apply_to for rabbitmq policy (refs: #46973)
  - fbbcb7584c Merge pull request #46973 from rallytime/fix-46880
  - 8ce21f982c New "apply_to" kwarg in rabbitmq module should be added at the end
- **ISSUE** #46934: (d601) GPG encrypted binary data in pillars breaks in 2018.3.0 (refs: #46966)
- **PR** #46966: (terminalmage) Fix traceback when attempting to decode binary data to unicode @ *2018-04-10 14:08:35 UTC*
  - 58f59cfbff Merge pull request #46966 from terminalmage/issue46934
  - df43ffdb8f salt.payload.Serial: fix traceback when unpacking binary blob
  - 40a49358c9 gpg renderer: fix tranceback when decrypted ciphertext contains binary data
  - 17a88f6a71 Include exc_info in pillar render errors to aid in troubleshooting
- **ISSUE** #46881: (SynPrime) Cron.file - source file not found (refs: #46944)
- **PR** #46944: (garethgreenaway) [2018.3] cron.file with salt source URL @ *2018-04-10 13:34:03 UTC*
  - e33e792e2a Merge pull request #46944 from garethgreenaway/46881_Cron_file_source_file_not_found
  - 438aafeb03 Adding kwargs to calls into file module functions
  - 14d12b1d6b Remove unused imports. Gating tests so they do not run on Windows
  - 623d96f21a Adding dummy cron file for integration/states/test_cron
  - c8e01871d6 Adding an integration test to test cron.file.
  - ddc55d8f9b Fixing bug that made cron.file unable to use a file via a Salt URL.
- **PR** #46937: (gtmanfred) enable_ssh_minions does not work with subset yet @ *2018-04-07 02:54:56 UTC*
  - 08e8782f76 Merge pull request #46937 from gtmanfred/2018.3
  - 3fb75e903c enable_ssh_minions does not work with subset yet
- **PR** #46936: (gtmanfred) don't copy __pycache__ or .pyc files for kitchen @ *2018-04-06 19:15:46 UTC*
  - ac4e7cd73f Merge pull request #46936 from gtmanfred/2018.3
  - 91474878fa don't copy __pycache__ or .pyc files for kitchen
- **ISSUE** #46659: (stamak) [salt-cloud] [new oxygen openstack driver] no public_ips and floating_ips in salt-cloud output (refs: #46912)
- **PR** #46912: (gtmanfred) pull latest vm data after building for openstack shade driver @ *2018-04-06 13:46:42 UTC*
  - 8105fd9715 Merge pull request #46912 from gtmanfred/openstack
  - 5ef538f8ad pull latest vm data after building for openstack shade driver

- **PR** #46908: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ *2018-04-05 21:27:03 UTC*
  - 735ea12960 Merge pull request #46908 from rallytime/merge-2018.3
  - 102e966512 Remove redundant section in log setup
  - 177c686b52 Update old utils paths to new utils paths
  - 0a297e7319 Merge branch '2017.7' into '2018.3'
    - d0f5b43753 Merge pull request #44926 from frogunder/whitelisted_acl
      - 18e460fc30 Merge branch '2017.7' into whitelisted_acl
      - 1ad4d7d988 fix assert errors
      - e6a56016df update test
      - 19a2244cb7 whitelist_acl_test
    - 7d822f9cec Merge pull request #46464 from gtmanfred/orchestration
      - 637cdc6b7b fix pylint
      - 0151013ddb document *cli* option for cmd_subset
      - 4a3ed6607d add test for subset in orchestration
      - 3112359dd6 fix salt subset in orchestrator
    - 805ed1c964 Merge pull request #46879 from dwoz/cloudtestfix
      - dc54fc53c3 Fix multiple typos causing tests to fail
    - f70f6de282 Merge pull request #46647 from twangboy/win_fix_test_grains
      - c179388b0e Fix the tear down function in integration.modules.test_grains.GrainsAppendTestCase
    - 91c078ce12 Merge pull request #46756 from nages13/bugfix-grain-virtual_subtype
      - 781f5030a4 Merge branch 'bugfix-grain-virtual_subtype' of https://github.com/nages13/salt into bugfix-grain-virtual_subtype
      - cd1ac4b7f9 Merge branch '2017.7' into bugfix-grain-virtual_subtype
      - 0ace76c0e7 Merge branch '2017.7' into bugfix-grain-virtual_subtype
      - 9eb6f5c0d0 Merge branch '2017.7' into bugfix-grain-virtual_subtype
      - 73d6d9d365 Merge branch '2017.7' into bugfix-grain-virtual_subtype
      - a4a17eba6a Merge branch '2017.7' into bugfix-grain-virtual_subtype
      - bf5034dbdb Merge branch '2017.7' into bugfix-grain-virtual_subtype
      - 8d12770951 Merge branch '2017.7' into bugfix-grain-virtual_subtype
      - 7e704c0e81 Moved down container check code below hypervisors to validate containers type running in virtual environment. Fixes #46754 & #43405
      - 710f74c4a6 fix grains['virtual_subtype'] to show Docker on xen kernels
    - 058bbed221 Merge pull request #46799 from garethgreenaway/46762_prereq_shenanigans_tests
      - 13875e78cf Fixing documentation string for test.
      - 3d288c44d4 Fixing test documentation
      - 6cff02ef6a Adding tests for #46788

        - d9770bf3f8 Merge pull request #46867 from terminalmage/unicode-logging-normalization
          - 7652688e83 Backport string arg normalization to 2017.7 branch
        - 9eb98b1f6e Merge pull request #46770 from twangboy/fix_46433
          - 89af0a6222 Merge branch '2017.7' into fix_46433
          - 67b4697578 Remove unused import (ling)
          - 9302fa5ab0 Clean up code comments
          - b383b9b330 Change the order of SID Lookup
        - 9c776cffb7 Merge pull request #46839 from gtmanfred/tupletarget
          - 3b7208ce27 match tuple for targets as well
        - 7db251dc11 Merge pull request #46845 from rallytime/bp-46817
          - 36a0f6d8ca address filehandle/event leak in async run_job invocations
        - e3d17ab7bc Merge pull request #46847 from dwoz/missing-strdup
          - 55845f4846 strdup from libc is not available on windows
        - f2dd79f9c4 Merge pull request #46776 from gtmanfred/2017.7
          - edc1059ee0 fix shrinking list in for loop bug

- **PR** #46853: (terminalmage) Add back date_format filter @ *2018-04-05 20:33:50 UTC*
  - 9a47afc33b Merge pull request #46853 from terminalmage/date_format_filter
  - 266d13a665 Add back date_format filter
- **PR** #46882: (jasperla) Backport #46280 #46849 #46852 to 2018.3 @ *2018-04-05 14:29:12 UTC*
  - **PR** #46852: (jasperla) fix creating a nic tag on a link with double 0 in the MAC (refs: #46882)
  - **PR** #46849: (jasperla) Unbreak creating etherstubs on SmartOS (refs: #46882)
  - **PR** #46280: (jasperla) Remove unneeded checks for binaries in SmartOS modules (refs: #46882)
  - a064a3e695 Merge pull request #46882 from jasperla/smartos/backports
  - 47a66975ff fix creating a nic tag on a link with double 0 in the MAC
  - a3cb0e576e Unbreak creating etherstubs on SmartOS
  - e703254990 Remove unneeded checks for binaries in SmartOS modules
- **PR** #46873: (terminalmage) Attempt UTF-8 first when decoding/encoding @ *2018-04-05 14:16:28 UTC*
  - 4e5e291c99 Merge pull request #46873 from terminalmage/utf8-first
  - cf28eb74aa Don't log command when output_loglevel == 'quiet'
  - f59cee28db Remove hacky workarounds to get encode/decode tests to pass on Windows
  - 76e5d81bb4 Remove hacky workaround to get Windows to decode deserialized data properly
  - 0b5729e58a Remove hacky workaround to get git state/exec module to work properly on Windows
  - 22ff48518f Attempt UTF-8 first when decoding/encoding
- **ISSUE** #43499: (tyeapple) zmq setsockopt need to adapt python3 (refs: #46874)
- **PR** #46878: (terminalmage) Backport #46874 to 2018.3 @ *2018-04-05 13:26:04 UTC*

  - **PR** #46874: (johnj) Use bytestrings for PY3 compatibility when running setsockopt for zmq.SUBSCRIBE (refs: #46878)
  - 1518762465 Merge pull request #46878 from terminalmage/bp-46874
  - d9511d04d4 #43499, zmq setsockopt need to adapt python3
- **ISSUE** #46862: (kivoli) Setting locale.system fails in 2018.3 (refs: #47280, #46869)
- **PR** #46869: (gtmanfred) Always return dictionary for _localectl_status @ *2018-04-05 13:25:14 UTC*
  - 67894e3ee9 Merge pull request #46869 from gtmanfred/2018.3
  - 1496e985f7 fix pylint
  - 75425dfd20 fix tests for localemod
  - 2d7c7b5e33 Always return dictionary for _localectl_status
- **PR** #46870: (mirceaulinic) Correct the documentation for two new proxy modules @ *2018-04-04 21:48:41 UTC*
  - 58c8ff18e2 Merge pull request #46870 from cloudflare/proxy-doc
  - f4b6184476 Corect and add the cimc proxy module to autodoc
  - a99bc202b9 Correct & add Panos to autodoc
- **PR** #46729: (terminalmage) Performance improvement/error catching in expr_match @ *2018-04-04 20:25:57 UTC*
  - d7e4b9d755 Merge pull request #46729 from terminalmage/expr_match
  - 70cfafe299 Add test case
  - 250039b11f Restore original variable name
  - ae0f112a49 Log an exception when non-string val/expr passed to expr_match
  - dac42a672b Performance improvement/error catching in expr_match
- **PR** #46872: (terminalmage) Backport #46863 to 2018.3 @ *2018-04-04 19:04:40 UTC*
  - **PR** #46863: (TamCore) fixed top function which was broken since commit 002aa88a97e (refs: #46872)
  - e0b383afb5 Merge pull request #46872 from terminalmage/bp-46863
  - be284e5b99 Add skipIf when older mock present
  - db8faaee56 Add unit tests for ext_nodes master_tops module
  - ee437f7cbf fixed top function which was broken since commit 002aa88a97e
- **PR** #46850: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ *2018-04-04 18:07:44 UTC*
  - 5c76d98d1a Merge pull request #46850 from rallytime/merge-2018.3
  - a0fcd5c053 Fix test_cp failure: forgot to add tgt to test when @with_tempfile is present
  - d0202cab72 Resolve bad merge: there should only be one test_get_file_from_env_in_url test
  - e28f71b418 Lint: use full salt utils path
  - 4ad50bbdee Update old utils paths to new paths
  - 893196d3e6 Merge branch '2017.7' into '2018.3'
    - 1941426218 Merge pull request #46838 from gtmanfred/npm
      - bff61dd291 use http registry for npm
    - e544254e7b Merge pull request #46823 from rallytime/fix-42312

    - dafa820f93 Improve __virtual__ checks in sensehat module
  - 37f6d2de35 Merge pull request #46641 from skizunov/develop3
    - c624aa4827 Make LazyLoader thread safe
  - 989508b100 Merge pull request #46837 from rallytime/merge-2017.7
    - 8522c1d634 Merge branch '2016.11' into '2017.7'
    - 3e844ed1df Merge pull request #46739 from rallytime/2016.11_update_version_doc
    - 4d9fc5cc0f Update release versions for the 2016.11 branch
  - 307e7f35f9 Merge pull request #46740 from rallytime/2017.7_update_version_doc
    - 7edf98d224 Update 2018.3.0 information and move branch from ”latest” to ”previous”
    - 5336e866ac Update release versions for the 2017.7 branch
  - ebf5dd276f Merge pull request #46783 from twangboy/fix_46680
    - da5ce25ef3 Fix unit tests on Linux
    - b7f4f377cd Add space I removed
    - f1c68a09b5 Fix network.managed test=True on Windows
  - f652f25cc1 Merge pull request #46821 from rallytime/fix-mantest-failures
    - 209a8029c3 Fix the new test failures from the mantest changes
  - c460f62081 Merge pull request #46800 from lomeroe/2017_7-46627
    - 2bee383e9d correct create list item value names if the valuePrefix attribute does not exist on the list item, the value is the value name, other wise, the valuename a number with the valuePrefix prepended to it
  - df26f2641e Merge pull request #46675 from dwoz/inspectlib-tests
    - d39f4852d8 Handle non-zero status exception
    - 83c005802b Handle cases where git can not be found
    - 628b87d5c4 Skip test when git symlinks are not configured
  - 4083e7c460 Merge pull request #46815 from terminalmage/bp-46809
    - 71d5601507 Fix sharedsecret authentication
  - 3bac9717f4 Merge pull request #46769 from dwoz/wincloudtest
    - eabc234e5d Fix config override name
    - 5c22a0f88d Use aboslute imports
    - 810042710d Set default cloud test timeout back to 500 seconds
    - 5ac89ad307 Use winrm_verify_ssl option causing tests to pass
    - 71858a709c allow not verifying ssl winrm saltcloud
    - ba5f11476c Adding windows minion tests for salt cloud
  - f1be939763 Merge pull request #46786 from twangboy/fix_46757
    - b0053250ff Remove int(), just return -1
    - 7d56126d74 Fixes some lint
    - 49b3e937da Return int(-1) when pidfile contains invalid data

        - 89bf24b15c Merge pull request #46814 from terminalmage/bp-46772
            - a9f26f2ab8 avoid breaking if AutoRemove is not found
            - 97779c965d fix container removal if auto_remove was enabled
        - 5ea4ffbdb6 Merge pull request #46813 from terminalmage/event-debug-log
            - 5d6de3a2eb Get rid of confusing debug logging
        - e533b7182d Merge pull request #46766 from twangboy/win_fix_test_git
            - 5afc66452c Remove unused/redundant imports
            - 88fd72c52c Use with_tempfile decorator where possible
        - 69d450db84 Merge pull request #46778 from terminalmage/salt-jenkins-906
            - bbfd35d3ea Replace flaky SPM man test
        - c935ffb740 Merge pull request #46788 from garethgreenaway/46762_prereq_shenanigans
            - fa7aed6424 Ensure failed tags are added to self.pre.
        - 395b7f8fdc Merge pull request #46655 from dwoz/pyobjects-46350
            - 5aabd442f2 Fix up import and docstring syntax
            - 62d64c9230 Fix missing import

    - b7d39caa86 Merge branch '2017.7' into fix-add-saltenv-pillarenv-to-pillar-item
    - 25f1074a85 Add docstring for added parameters
    - 973bc13955 Merge branch '2017.7' into fix-add-saltenv-pillarenv-to-pillar-item
    - 164314a859 Merge branch '2017.7' into fix-add-saltenv-pillarenv-to-pillar-item
    - 267ae9f633 Fix missing saltenv and pillarenv in pillar.item
  - f776040e25 Merge pull request #46679 from vutny/doc-state-pkg
    - 4a730383bf [DOC] Correct examples in *pkg* state module
  - 47409eaa6e Merge pull request #46646 from twangboy/win_fix_test_local_cache
    - 8d93156604 Fix *unit.returners.test_local_cache* for Windows
  - 0c2dce0416 Merge pull request #46649 from terminalmage/issue46595
    - e82a1aa1ec Make server_id consistent on Python 3
  - 4e7466a21c Merge pull request #46588 from UtahDave/no_crash_winshell

  - b7842a1777 Update error message.
  - 95dfdb91ca Don't stacktrace when salt-ssh w/o saltwinshell
- 33af3cfc7c Merge pull request #46631 from rallytime/update-pillar-unit-tests
  - 0f728186aa Fix pillar unit test failures: file_roots and pillar_roots environments should be lists
- d329e7af78 Merge pull request #46640 from terminalmage/file.copy-docs
  - 480c5f8faa Clarify the docs for the file.copy state
- ff40590c06 Merge pull request #46642 from vutny/doc-cloud-index
  - 51e6aa54a1 [DOC] Unify cloud modules index header
- 83ed40c06a Merge pull request #46619 from rallytime/merge-2017.7
  - bcbddf5d07 Merge branch '2017.7.5' into '2017.7'
  - 19bb725698 Merge pull request #46612 from Ch3LL/7.5_rn
  - 6076bfa2ee Add changelog to 2017.7.5 release
  - 31c78aef11 Merge pull request #46572 from dmurphy18/update_xxxbuild
  - c87511570d Merge branch '2017.7.5' into update_xxxbuild
  - cdd768fa4d Merge pull request #46577 from gtmanfred/2017.7.5
  - 78cbf7b5cd Fix npm issue
  - c76f7eb028 enable debug logging on the minionlog
  - e6682c660c Merge pull request #46551 from terminalmage/salt-jenkins-885
  - 703b5e7e65 Change versionadded to show that 2018.3.0 will not have this function
  - 010d260d06 Rewrite failing Suse pkg integration test
  - f3f5dec239 zypper.py: fix version argument being ignored
  - 214f2d6ad3 Add pkg.list_repo_pkgs to zypper.py
  - 0a541613f2 Additon of -sa flag to allow for revision numbers other than -0 or -1
  - bd62699ccb Merge pull request #46563 from gtmanfred/2017.7.5
  - 8d5ab72983 virtualenv version too old for python3.6
  - 2916708124 Merge pull request #46561 from gtmanfred/2017.7.5
  - 2c39ac6dfb disable verbose
  - ee3bff6e32 Merge pull request #46537 from rallytime/bp-46529
  - 289c7a228f retry if there is a segfault
  - 1271536a89 Merge pull request #46519 from rallytime/man-pages-2017.7.5
  - 782a5584f5 Update man pages for 2017.7.5
- df12135439 Merge pull request #46584 from twangboy/lgpo-46568
  - 661017104b Detect disabled reg_multi_sz elements properly
- 2fd3aa487c Merge pull request #46624 from twangboy/win_fix_installer
  - fa0b0efe46 Fix some installer script inconsistencies

    - f038e3c452 Merge pull request #46571 from garethgreenaway/46552_onfail_and_require
      - 152c43c843 Accounting for a case when multiple onfails are used along with requires. Previously if you have multiple states using 'onfail' and two of those states using a 'require' against the first one state, the last two will run even if the 'onfail' isn't met because the 'require' is met because the first state returns true even though it didn't execute. This change adds an additional hidden variable that is used when checking requisities to determine if the state actually ran.
    - 2677330e19 Merge pull request #46520 from gtmanfred/2017.7
      - caefedc095 make sure utils is empty for pickling for windows
      - 2883548e6b pass utils to the scheduler for reloading in modules
    - 7bc3c2e588 Merge pull request #46531 from terminalmage/issue44299
      - b70c3389da Fix case where no comments specified
      - ce391c53f4 Add regression test for #44299
      - c3e36a6c94 Fix regression in yumpkg._parse_repo_file()
      - f0c79e3da3 Slight modification to salt.utils.pkg.rpm.combine_comments()
    - b80edb5d26 Merge pull request #46567 from dwoz/runtest-n-wart
      - 3b6901e19d Honor named tests when running integration suites
    - 1dcd22e767 Merge pull request #46580 from twangboy/win_update_docs_dism
      - d52b99d7a3 Clarify some issues with msu files in win_dism.py
    - 0a68c22332 Merge pull request #46541 from gtmanfred/metadata
      - 19bd1d9db5 handle user-data for metadata grains
- **ISSUE** #46668: (anlutro) Jinja2 filter strftime stopped working in salt-ssh 2018.3 (refs: #46848, #46744)
- **PR** #46744: (garethgreenaway) [2018.3] Ensure salt.utils.dateutils is available for templates via salt-ssh @ *2018-03-28 21:09:46 UTC*
  - ef68df7f3a Merge pull request #46744 from garethgreenaway/46668_jinja2_filter_strftime_unavailable
  - 0b30955c00 Including salt.utils.dateutils so various jinja_filters are available when using salt-ssh.

  - dd52368f90 Merge pull request #46639 from terminalmage/nacl-default-path
  - 2f7660fe35 Use the correct path for nacl certificates in Windows
- **PR** #46416: (dincamihai) Fix cp.push empty file @ *2018-03-26 17:52:47 UTC*
  - 2efef52a3e Merge pull request #46416 from dincamihai/fix-cp.push-empty-file
  - 536ba0fa1e Fix cp.push empty file
- **PR** #46643: (mcalmer) fix docker return @ *2018-03-26 15:52:31 UTC*
  - 84579e7652 Merge pull request #46643 from mcalmer/fix-docker-return
  - 3ceb63f607 fix checking test results
  - af64632bf3 add unit test for failed login
  - 0fc7989236 make it possible to use login, pull and push from module.run and detect errors
- **PR** #46650: (Ch3LL) Mirror libnacl imports in test from the nacl module @ *2018-03-26 14:48:40 UTC*
  - c67afbeb36 Merge pull request #46650 from Ch3LL/nacl_test
  - 9fef8bc431 Mirror libnacl imports in test from the nacl runner
  - f11d58a8e9 Mirror libnacl imports in test from the nacl module
- **PR** #46645: (terminalmage) Add Unicode / Python 3 update to 2018.3.0 release notes @ *2018-03-26 14:43:53 UTC*
  - 03b58a01cf Merge pull request #46645 from terminalmage/release-notes
  - 986c7bcdae Rewrite unicode/py3 section
  - 064bc83276 Add Unicode / Python 3 update to 2018.3.0 release notes
- **ISSUE** #46150: (whytewolf) With chocolately.version some packages don't work with check_remote=True (refs: #46661)
- **PR** #46661: (Kimol) Chocolatey - Lowered name of local and remote packages before comparing versions. @ *2018-03-26 14:35:39 UTC*
  - 308c9ddfc3 Merge pull request #46661 from Kimol/2018.3-fix_chocolatey_check_remote_packages
  - 52581e7918 Removed trailing whitespace
  - 123a86947c Chocolatey - Added lowering local packages for unifing both local and remote names to lowercase for comparison.
  - 4be1a991c2 Lowered name of available packages before comparing with local packages
- **PR** #46569: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 (refs: #46631) @ *2018-03-21 20:57:04 UTC*
  - 2e1f7c37f7 Merge pull request #46569 from rallytime/merge-2018.3

- 46ba72fb1c Fix pillar unit test failures: file_roots and pillar_roots environments should be lists
- fe2d46dd0c Better merge conflict resolution for setup.py windows changes
- 8886b61576 Update old utils paths to new paths
- 8d1e1e7f94 Merge branch '2017.7' into '2018.3'
  - 048b2ba3f6 Merge pull request #46547 from garethgreenaway/46427_service_module_cumulus
    - edd0b11447 Merge branch '2017.7' into 46427_service_module_cumulus
    - ea3c16080e Disable the *service* module on Cumulus since it is using systemd.
  - 98e3260b9a Merge pull request #46548 from Ch3LL/profit_test
    - db96c4e72e check for foo,bar username,password set in profitbrick config
  - 79f2a76609 Merge pull request #46549 from Ch3LL/dimension_test
    - bb338c464c Fix dimensionsdata test random_name call
  - 083846fe0e Merge pull request #46529 from gtmanfred/kitchen
    - 50d6e2c7be retry if there is a segfault
  - 5cc11129f1 Merge pull request #46511 from rallytime/bp-45769
    - a8ffceda53 Suppress boto WARNING during decode, reference: https://github.com/boto/boto/issues/2965
  - 0e90c8ca6f Merge pull request #46493 from terminalmage/issue46207
    - f06ff68f10 salt-call: don't re-use initial pillar if CLI overrides passed
  - b11a8fc8e0 Merge pull request #46450 from gtmanfred/salt_runner
    - 7974ff7264 load grains for salt.cmd runner
  - 22d753364b Merge pull request #46337 from gtmanfred/2017.7
    - d6d9e36359 add tests for names and listen/listen_in
    - 3f8e0db572 let listen_in work with names
    - 7161f4d4df fix listen to be able to handle names
  - b7191b8782 Merge pull request #46413 from meaksh/2017.7-explore-result-in-depth
    - 885751634e Add new unit test to check state.apply within module.run
    - 9f19ad5264 Rename and fix recursive method
    - 1476ace558 Fix Python3 and pylint issue
    - 726ca3044d Explore 'module.run' response to catch the 'result' in depth
  - 02a79a2014 Merge pull request #46496 from gtmanfred/kitchen
    - da002f78d0 include virtualenv path for py3 windows
    - fe2efe03ea remove duplicate setup
  - 5c4c182d75 Merge pull request #46330 from bdrung/fix_kubernetes_test_create_deployments
    - 5008c53c44 Fix ValueError for template in AppsV1beta1DeploymentSpec
  - c7e05d3ff4 Merge pull request #46482 from rongshengfang/fix-keyerror-in-instance_present
    - ed8c83e89a Fix KeyError in salt/states/boto_ec2.py when an EIP is being associated to an existing instance with the instance_present state.

- 573d51afec Merge pull request #46463 from terminalmage/mock-2.0
  - b958b4699c Update requirements files to depend on mock>=2.0.0
- a154d35fc7 Merge pull request #46422 from rallytime/bp-46300
  - 829dfde8e8 Change stringutils path to old utils path for 2017.7
  - 91db2e0782 Python 3 support
- 2afaca17a1 Merge pull request #46320 from mcalmer/warn-kubernetes
  - c493ced415 add warning about future config option change
- c7f95581e3 Merge pull request #46449 from bdrung/make-doc-theme-configurable
  - 4a5da2d144 Make documentation theme configurable
- 10ce0e9e20 Merge pull request #46162 from rallytime/team-suse-zypper-owner
  - 13a295a3b7 Add *pkg* and *snapper* to team-suse
  - 35c7b7b0d3 Add btrfs, xfs, yumpkg, and kubernetes file to team-suse
  - 485d777ac0 Add team-suse to CODEOWNERS file for zypper files
- cac096b311 Merge pull request #46434 from gtmanfred/highstate_return
  - d18f1a55a7 fix pylint
  - 9e2c3f7991 split return key value correctly
- 7dd71101ce Merge pull request #46455 from whytewolf/Issue_44452_unicode_cloud
  - 5fe474b1a8 .format remove fix for #44452
- 4c8d9026d3 Merge pull request #46428 from twangboy/win_fix_reqs
  - e7ab97cc17 Remove six as a hard dep for Salt
  - cc67e5c2ef Set six to 1.11.0
- e834d9a63b Merge pull request #46454 from gtmanfred/kitchen
  - b8ab8434a5 fix windows for kitchen
- 2886dca88f Merge pull request #46452 from gtmanfred/spm_cache_dir
  - 169cf7a4e2 make spm cache_dir instead of all cachedirs
- a188984cd9 Merge pull request #46446 from bdrung/fix-typos
  - 7e6e80be87 heat: Fix spelling mistake of environment
  - a3c54b50f6 Fix various spelling mistakes
- e35fc5263c Merge pull request #46309 from bdrung/dynamic-pillarenv
  - 584b451fd1 Support dynamic pillar_root environment
- 35fe9827fe Merge pull request #46430 from terminalmage/issue44032
  - f9f187e915 Improve reliability/idempotence of file.blockreplace state
- 2bad0a21c0 Merge pull request #46429 from twangboy/win_fix_snmp
  - 8995a9b8de Fix problem with __virtual__ in win_snmp
- 93a572f229 Merge pull request #46100 from jfindlay/resolv_scope
  - d5561bedaf tests.unit.grains.core add scoped IPv6 nameserver

      - 4e2e62d508 salt.utils.dns parse scope param for ipv6 servers
    - 5acc1d5c54 Merge pull request #46420 from bdrung/2017.7
      - e48c13d9e0 Fix SSH client exception if SSH is not found
    - ca6a76e317 Merge pull request #46379 from angeloudy/2017.7
      - 3acb59c74c Merge branch '2017.7' into 2017.7
      - d971e0c08b Fix indent
      - 269514683f Update http.py
      - 908c040ac3 Update http.py
      - 51ba3c135b Update http.py
      - 14aba24111 fix bytes-object required error in python 3
    - 73f9233557 Merge pull request #46404 from gtmanfred/kitchen
      - c56baa95a8 clone .git for the version tests
      - 3620611b5b fix unhold package for debian
      - 5219f7d2ba fix minion log path
    - ca28cfd4e4 Merge pull request #46310 from twangboy/win_update_installer_build
      - bcf8b19566 Update the installer build
    - decccbeca3 Merge pull request #46316 from twangboy/win_fix_dsc
      - 2042d33d59 Fix issues with the DSC module
- **PR** #46620: (rallytime) [2018.3] Merge 2018.3.0rc1 into 2018.3 @ *2018-03-20 22:45:00 UTC*
  - 8cdd56b9dc Merge pull request #46620 from rallytime/merge-2018.3.0rc1-into-2018.3
  - b03cda3cea Merge branch '2018.3.0rc1' into '2018.3'
- **PR** #46606: (Ch3LL) add autodoc topics for infoblox state modules @ *2018-03-19 21:35:46 UTC*
  - 2d2fe22ae2 Merge pull request #46606 from Ch3LL/infoblox_docs
  - 6eab6a7dc4 add autodoc topics for infoblox state modules
- **PR** #46540: (s0undt3ch) Some missing *isinstance* checks. @ *2018-03-15 16:17:19 UTC*
  - 1191d5b379 Merge pull request #46540 from s0undt3ch/2018.3
  - fa1d668774 Some missing *isinstance* checks. Committed again through a PR.
- **PR** #46513: (rallytime) [2018.3] Merge forward from 2018.3.0rc1 to 2018.3 @ *2018-03-15 15:58:59 UTC*
  - 5429438e4b Merge pull request #46513 from rallytime/merge-2018.3
  - aa760334a1 Merge branch '2018.3.0rc1' into '2018.3'
- **ISSUE** #43208: (mitar) Prevent user.present to change uid and gid of existing user (refs: #46502)
- **PR** #46502: (terminalmage) user.present: don't change uid/gid unless explicitly told to @ *2018-03-13 14:25:20 UTC*
  - 3e073c7e8a Merge pull request #46502 from terminalmage/issue43208
  - 4106840deb user.present: don't change uid/gid unless explicitly told to
- **PR** #46398: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ *2018-03-12 20:25:19 UTC*

- 7cdb00ca9c Merge pull request #46398 from rallytime/merge-2018.3
- d22e5ba442 Merge fix: return back *wb+* mode in *crypt.gen_keys*.
- c7dddaf8ce Lint: Use log variable, not logger.
- ca1860cd91 Use new get_umask function in mask calls in virt.py
- 19ec7b6de1 Update old utils paths with new utils paths
- d83727fdf9 Merge branch '2017.7' into '2018.3'
  - 95586678c3 Merge pull request #46394 from Ch3LL/mac_doc
    - 158add6661 change oxdownload to oxdownload-{python_version}
    - 21aa848c89 Add mac py2 and py3 packages to mac installation docs
  - 07b5d09ac1 Merge pull request #46338 from rallytime/fix-44831
    - 90771da999 Remove cmd.wait deprecation reference in docs
  - 3849e7a085 Merge pull request #46333 from danlsgiga/issue-42438
    - 3b13f37b44 Revert changes in the code and change docs instead
    - 38114a65d8 Fixes color parameter mismatch and handles 204 responses correctly
  - a8f2f1b063 Merge pull request #46322 from terminalmage/issue44935
    - 85ac6a9893 yamlify_arg: don't treat leading dashes as lists
  - da5c282cb2 Merge pull request #46327 from samilaine/fix-vmware-cloud-fqdn
    - 4b8dfb326f Modify the way a FQDN is handled in the vmware cloud provider.
  - 78c45d3786 Merge pull request #46318 from terminalmage/squelch-warnings
    - 5889b36646 Skip type-checking for several gitfs/git_pillar/winrepo params
  - bb0d6fc263 Merge pull request #46312 from gtmanfred/2017.7
    - 749ae580ed add module_dirs to salt ssh thin tarball
  - 88b5f7383d Merge pull request #46242 from redbaron4/fix-46127
    - 06dba51617 Make changes from review
    - 727ebe1056 Merge branch '2017.7' into fix-46127
    - 08d1ee8baf Fix Python3 test errors
    - aa9d709015 Pass env_vars to pip.freeze
  - a0716643e4 Merge pull request #46265 from Ch3LL/profit_cloud
    - d4893eab4c Add username/password to profitbricks conf for cloud tests
  - ed7bffa7e0 Merge pull request #46306 from rallytime/bp-46256
    - 6439bce4a8 Don't install msgpack 0.5.5
  - 8c2c4e3316 Merge pull request #46208 from terminalmage/audit-umask-usage
    - 9c92aadce8 Disable blacklisted-function check for legitimate uses
    - 58a11aaa26 Disable pylint check in salt-ssh shim
    - ecadf67659 Blacklist os.umask
    - 31b1d98fcb Replace direct use of os.umask with use of existing context manager

      - 82ce546e18 Prevent failed os.makedirs from leaving modified umask in place
    - 978e869490 Merge pull request #46293 from eliasp/2017.7-44624-py3-compat
      - 2e08b0d9c8 Fix Python3 comparison *TypeError* in *salt.modules.upstart*
    - bee4a66d0c Merge pull request #46264 from terminalmage/issue46128
      - 68000b7211 Fix incorrect merge conflict resolution
    - 1e0b3aa348 Merge pull request #46296 from vutny/doc-pillar-get
      - 1faa8331e1 [DOC] Add missing params to *pillar.get* docstring
    - c490a50452 Merge pull request #45874 from GwiYeong/2017.7-local-client-hotfix
      - 949aefc82b Merge branch '2017.7' into 2017.7-local-client-hotfix
      - 45d663f435 fix for local client timeout bug
    - 8e8a3a2897 Merge pull request #46261 from rallytime/merge-2017.7
      - 8256ae5ee5 Merge branch '2016.11' into '2017.7'
      - 140ef4d6b9 Merge pull request #46253 from rallytime/doc-banners
      - 07ed8c7db3 Update docbanner for SaltConf18
      - 9fe86ee520 Merge pull request #46179 from wedge-jarrad/cifs-remount-fix
      - 9ca25c4313 Add credentials and secretfile to mount.mounted mount_invisible_keys

- **PR** #46421: (bdrung) Skip SSHPasswordTests if ssh binary is not found @ *2018-03-09 16:21:02 UTC*
  - 9c089aa4de Merge pull request #46421 from bdrung/skip-ssh-tests-if-ssh-is-missing
  - 3d6f658309 Skip SSHPasswordTests if ssh binary is not found
- **PR** #46453: (bdrung) Fix various spelling mistakes in 2018.3 @ *2018-03-09 14:48:33 UTC*

- **PR** #46437: (terminalmage) Improve reliability/idempotence of file.blockreplace state (2018.3 branch) @ *2018-03-08 15:38:53 UTC*
  - **PR** #46430: (terminalmage) Improve reliability/idempotence of file.blockreplace state (refs: #46437)
  - a43d999fb8 Merge pull request #46437 from terminalmage/issue44032-2018.3
  - 4798187035 Improve reliability/idempotence of file.blockreplace state (2018.3 branch)
- **PR** #46328: (dincamihai) Fix openscap push @ *2018-03-07 17:51:41 UTC*
  - 0c66507aff Merge pull request #46328 from dincamihai/2018.3.0rc1
  - b5e508f339 Fix openscap push
- **PR** #46174: (twangboy) Fix a unicode issue with the git module on Windows @ *2018-03-06 18:53:53 UTC*
  - 82cb2ea5a0 Merge pull request #46174 from twangboy/win_fix_test_git_2
  - 80e3a47dd4 Add output_encoding argument to git state, and add docs
  - 661a0687ec Fix git utf-8 issues for Windows

- **PR** #46235: (twangboy) Fix *unit.modules.test_ssh* for Windows @ *2018-03-05 20:39:44 UTC*
  - 7690cf8564 Merge pull request #46235 from twangboy/win_fix_test_ssh
  - 9ea02d7045 Use write instead of writelines for Windows
- **PR** #46332: (terminalmage) Update the merge-forward docs to reference the 2018.3 branch @ *2018-03-05 19:39:56 UTC*
  - c4f366cdd9 Merge pull request #46332 from terminalmage/merge-forward-docs
  - 0411845cec Update the merge-forward docs to reference the 2018.3 branch
- **PR** #46307: (rallytime) [2018.3] Merge forward from 2018.3.0rc1 to 2018.3 @ *2018-03-03 12:56:07 UTC*
  - 241611aca5 Merge pull request #46307 from rallytime/merge-2018.3
  - c9fa21f62c Merge branch '2018.3.0rc1' into '2018.3'
- **PR** #46314: (terminalmage) Merge 2017.7 branch into 2018.3 @ *2018-03-03 12:54:27 UTC*
  - 30c34f0c62 Merge pull request #46314 from terminalmage/merge-2017.7-2018.3
  - 61ab47ee70 Merge branch '2017.7' into merge-2017.7-2018.3
    - 88a3166589 Merge pull request #46276 from terminalmage/issue44046
      - a14d4daf8c salt.utils.docker.translate_input: operate on deepcopy of kwargs
    - da60399b8f Merge pull request #46183 from oeuftete/fix-docker-container-running-host-config-ulimits
      - 5b09644429 Sort lists from Ulimits before comparing
      - 0b80f02226 Update old dockerng doc ref
    - 509429f08c Merge pull request #46260 from terminalmage/git_pillar
      - b1ce2501fd Normalize global git_pillar/winrepo config items
    - a97a3e6fb0 Merge pull request #46101 from jfindlay/openrc_ret
      - 2eef3c65a6 tests.unit.modules.gentoo_service add retcode arg
      - 81ec66fd8b modules.gentoo_service handle stopped retcode
    - 1a17593c05 Merge pull request #46254 from rallytime/enterprise-banner
      - f5fae3dedf Update enterprise banner
    - 8c50ff32bd Merge pull request #46250 from terminalmage/runner-docs
      - 91b4895087 Add documentation to the fileserver runner
    - 53067cca43 Merge pull request #46243 from racker-markh/fix-openstack-private-network-issue
      - 50c1e140f0 Don't check deny private_ips already in the original list of private_ips
    - 15405c8760 Merge pull request #46239 from terminalmage/issue46109
      - 586d8b0dcf archive.extracted: don't check source file when if_missing path exists
- **ISSUE** #33177: (robnagler) pillar.stack should not continue after errors (refs: #46287)
- **PR** #46287: (bbinet) Update PillarStack stack.py to latest upstream version @ *2018-03-02 21:39:52 UTC*
  - 194b0317ac Merge pull request #46287 from bbinet/upstream-pillarstack
  - b14b6f2c95 Update PillarStack stack.py to latest upstream version
- **PR** #46227: (Ch3LL) Mock file_client call in smtp return test @ *2018-02-28 22:12:22 UTC*

  - 7382654c70 Merge pull request #46227 from Ch3LL/smtp_file_client
  - 280dc9a2b6 Mock file_client call in smtp return test
- **PR** #46232: (rallytime) [2018.3] Merge forward from 2017.7 to 2018.3 @ *2018-02-28 19:16:37 UTC*
  - 123625213e Merge pull request #46232 from rallytime/merge-2018.3
  - 04f24c1794 Lint: fix from a bad merge
  - aad61c77bd Update old utils paths to new paths
  - 7243baf2c0 Merge branch '2017.7' into '2018.3'
    - 633e1208e4 Merge pull request #46221 from terminalmage/salt-jenkins-854
      - 0eb012659c Fix hanging tests in integration suite
    - 7917277345 Merge pull request #46214 from vutny/formulas-readme-formatting
      - d702846961 [DOC] Replace *note* rST block for GitHub
    - a2e099b744 Merge pull request #46203 from Ch3LL/7.5_release
      - 6ddf3246ce Add 2017.7.5 Release Notes File
    - 973b227818 Merge pull request #46201 from rallytime/merge-2017.7
      - 9ac2101baa Merge branch '2016.11' into '2017.7'
      - a4c5417d23 Merge pull request #46132 from rallytime/2016.11_update_version_doc
      - d2196b6df3 Update release versions for the 2016.11 branch
    - 89cf2e5061 Merge pull request #46139 from bdrung/os-grains
      - 0b445f2a37 tests: Add unit tests for _parse_os_release()
      - f6069b77ed Fix osfinger grain on Debian
      - 8dde55a761 tests: Add os_grains test cases for Debian
      - ff02ab9937 tests: Add Ubuntu 17.10 (artful) os_grains test case
      - 77d5356aba Fix incorrect oscodename grain on Ubuntu
      - 7e62dc9fd2 tests: Support reading os-release files from disk
      - a92ec0db1b Make _parse_os_release() always callable
      - eee1fe5b38 tests: Dissolve _run_ubuntu_os_grains_tests
      - 1d6ef731fe tests: Deduplicate _run_os_grains_tests()
    - c8c71e75ca Merge pull request #46133 from rallytime/2017.7_update_version_doc
      - 0ed338e643 Update release versions for the 2017.7 branch
    - 390d592aa6 Merge pull request #46185 from terminalmage/issue46124
      - 3b58dd0da0 gitfs: Fix detection of base env when its ref is also mapped to a different env
    - 705caa8cca Merge pull request #46148 from rallytime/merge-2017.7
      - 25deebf7a6 Merge branch '2017.7.3' into '2017.7'
      - b5b083fd26 Merge pull request #46074 from Ch3LL/update-7.4
      - 8d0eeeb059 Update 2017.7.4 Release Notes with new fixes
      - 32f3d00e44 Merge pull request #46066 from rallytime/pin-tornado

      - 6dc1a3b9dc Pin tornado version in requirements file
      - 85761ee650 Merge pull request #46036 from terminalmage/issue43769
      - e2140d9a84 Mock the ssh.key_is_encrypted utils func
      - 169924b3fe Move ssh.key_is_encrypted to a utils module temporarily
      - 54f4d78f7a Only keep ssh.py in the Windows installer
      - 5f04531e1b Keep ssh state and execution modules in the installer
      - f2b69f703d git.latest: Fix regression with identity file usage
    - 10a47dcbc4 Merge pull request #46137 from damon-atkins/2017.7_fix_ec2_pillar2
      - 99e7f6a7d3 update ec2 pillar arguments with better names
    - d74cb14557 Merge pull request #46145 from terminalmage/issue46004
      - 467ff841cd pillarenv argument should default to None and not the value from opts
      - 2a185855ea Better solution for fixing the opts munging in pillar.show_pillar runner
      - e2c4702e0c Update tests to reflect changes to the SaltCacheLoader
      - f9301fcc34 Document behavior when orchestration runnner invoked with non-orch states
      - 9644579cd0 Instantiate the SaltCacheLoader's fileclient in the __init__
      - f9a6c86e21 salt.runners.pillar.show_pillar: don't modify master opts
      - e0940a9fc4 Properly detect use of the state.orch alias and add orch jid to kwargs

- **ISSUE** #42932: (bobrik) cmd.run with bg: true doesn't fail properly (refs: #46172, #45932)
- **PR** #46172: (The-Loeki) cmdmod: reimplementation of #45932 for Oxygen @ *2018-02-28 19:14:26 UTC*
  - **PR** #45932: (The-Loeki) Fix cmd run_all bg error (refs: #46172)
  - **PR** #39980: (vutny) [2016.3] Allow using *bg* kwarg for *cmd.run* state function (refs: #46172, #45932)
  - 20d869c228 Merge pull request #46172 from The-Loeki/fix_cmd_run_all_bg_oxygen
  - 3ecf5018d0 Merge branch '2018.3' into fix_cmd_run_all_bg_oxygen
  - b5315e817b Merge branch '2018.3' into fix_cmd_run_all_bg_oxygen
  - beabf4f06b cmdmod: reimplementation of #45932 for Oxygen
- **PR** #46238: (terminalmage) Don't allow salt.utils.files.fopen() to open stdin/stdout/stderr @ *2018-02-28 19:08:23 UTC*

  - 99079fc442 Remove obsolete unicode handling in pkg.info_installed
- **PR** #46078: (rallytime) [oxygen] Merge forward from oxygen.rc1 to oxygen @ *2018-02-20 21:49:04 UTC*
  - 93dab45307 Merge pull request #46078 from rallytime/merge-oxygen
  - 2d0f81fd1b Merge branch 'oxygen.rc1' into 'oxygen'
- **ISSUE** #45938: (edgan) zookeeper.present state doesn't deal with an existing zode with no ACL specified (refs: #46043)
- **PR** #46071: (rallytime) Back-port #46043 to oxygen @ *2018-02-16 19:56:36 UTC*
  - **PR** #46043: (edgan) Allow zookeeper znode creation to not require an ACL (refs: #46071)
  - 8d99c3b8fe Merge pull request #46071 from rallytime/bp-46043
  - b82c8bd630 Allow zookeeper znode creation to not require an ACL
- **PR** #46056: (Ch3LL) Fix mac_assistive module not loading @ *2018-02-16 14:57:46 UTC*

  - 5a31422432 Merge pull request #46056 from Ch3LL/ver_mac
  - e44f5133c5 Fix mac_assistive module not loading
- **PR** #46041: (rallytime) [oxygen] Merge forward from 2017.7 to oxygen @ *2018-02-16 14:55:51 UTC*
  - cdca28f5da Merge pull request #46041 from rallytime/merge-oxygen
  - e060a74fd8 Merge branch '2017.7' into 'oxygen'
    - 07e5735471 Merge pull request #46016 from rallytime/bp-45826
      - 1916e5c4a4 Fix selinux.fcontext_policy_present for Centos 6
    - a1f4092811 Merge pull request #46015 from rallytime/bp-45785
      - ef6ffb1492 Resolve linting errors
      - 8047066c46 Remove unused import
      - 8f7c45935a Add tests for salt.modules.selinux.fcontext_get_policy
      - bafb7b4e6e Ensure parsed fields are stripped
      - a830a6e819 m/selinux.fcontext_get_policy allow long filespecs
    - 96097c037e Merge pull request #46012 from rallytime/bp-45462
      - 9f76836a6c emit port cli version, variants as separate args
    - 1279924f5f Merge pull request #45991 from terminalmage/fix-duplicate-extra-opts
      - 916766f651 yumpkg: Fix a couple issues with _get_extra_opts
    - 8b9adc258e Merge pull request #46017 from rallytime/merge-2017.7
      - a06645ce71 Merge branch '2017.7.3' into '2017.7'
      - 6d534c6e7e Merge pull request #46009 from Ch3LL/rn_7.4
      - ac0baf4b34 Add 2017.7.4 Release Notes with PRs
      - ca76a0b328 Merge pull request #45981 from gtmanfred/2017.7.3
      - 0d448457dc apparently local is not set by default
      - 2a92f4bc16 use local config for vault when masterless
      - 6530649dbc Merge pull request #45953 from rallytime/bp-45928-2017.7.3
      - 85363189d1 Fixing vault when used with pillar over salt-ssh
      - fb378cebb0 Merge pull request #45934 from rallytime/bp-45902
      - bb83e8b345 Add regression test for issue 45893
      - cdda66d759 Remove duplicated section in docstring and fix example
      - 4b6351cda6 Check the effective saltenv for cached archive
      - 0d74151c71 Merge pull request #45935 from rallytime/bp-45742
      - 6a0b5f7af3 Removed the chained copy
      - ad1150fad4 list.copy() is not compatible with python 2.7
    - d20ff89414 Merge pull request #45988 from rallytime/bp-45797
      - 953a400d79 follow symlinks
    - b18087cee0 Merge pull request #45711 from bdrung/fix-unicode-tests

    - b6181b5ed6 Fix Unicode tests when run with LC_ALL=POSIX
  - 5271fb1d40 Merge pull request #45878 from damon-atkins/2017.7_fix_ec2_pillar
    - 0e74025714 Merge branch '2017.7' into 2017.7_fix_ec2_pillar
    - b4d0b23891 py3 fix
    - 75d9e20d8a Add ignoring 'terminated', 'stopped' instances, to improve changes of a single match
    - 0093472a37 added tag_key_list and tag_key_sep to create ec2_tags_list
    - afb3968aa7 ec2_pillar could not find instance-id, resolved. add support to use any tag to compare minion id against.
  - cf367dbd04 Merge pull request #45942 from terminalmage/issue45679-2017.7
    - 89cbd72a0d Don't try to sort ports when translating docker input
    - 9cd47b39dd Fix incorrect translation of docker port_bindings -> ports
  - dae41de7a8 Merge pull request #45959 from rallytime/state-doc-update
    - 6f781cb95d A couple of grammar updates for the state compiler docs
  - 007214f7bf Merge pull request #45908 from DimensionDataResearch/fix/issue/45884
    - 1a75786b5a Fix linter warnings.
    - 82ec0b589c Revert to using salt.utils.cloud.is_public_ip.
    - 9b6b01873b Fix violations reported by flake8.
    - a2bc155c73 Use __utils__['cloud.'] instead of salt.cloud.utils.
    - 98907a32cb Ensure 'auth' parameter is correctly passed to dimensiondata driver.
