Interval to check for task result, see celery AsyncResult.get documentation, Default: 0.5

no_ack
see celery AsyncResult.get documentation. Default: True

raise_timeout
Raise timeout exception if waiting for task result times out. Default: False

config
Config dict for celery app, See celery documentation

26.6.29 salt.modules.chef

Execute chef in server or solo mode

`salt.modules.chef.`**`client`**`(`*whyrun=False*, *localmode=False*, *logfile=None*, ***kwargs*`)`

Execute a chef client run and return a dict with the stderr, stdout, return code, and pid.

CLI Example:

```
salt '*' chef.client server=https://localhost
```

server
The chef server URL

client_key
Set the client key file location

config
The configuration file to use

config-file-jail
Directory under which config files are allowed to be loaded (no client.rb or knife.rb outside this path will be loaded).

environment
Set the Chef Environment on the node

group
Group to set privilege to

json-attributes
Load attributes from a JSON file or URL

localmode
Point chef-client at local repository if True

log_level
Set the log level (debug, info, warn, error, fatal)

logfile
Set the log file location

node-name
The node name for this client

override-runlist
Replace current run list with specified items for a single run

pid
Set the PID file location, defaults to /tmp/chef-client.pid

run-lock-timeout
Set maximum duration to wait for another client run to finish, default is indefinitely.

runlist
Permanently replace current run list with specified items

user
User to set privilege to

validation_key
Set the validation key file location, used for registering new clients

whyrun
Enable whyrun mode when set to True

`salt.modules.chef.`**`solo`**`(`*whyrun=False*, *logfile=None*, ***kwargs*`)`

Execute a chef solo run and return a dict with the stderr, stdout, return code, and pid.

CLI Example:

```
salt '*' chef.solo override-runlist=test
```

config
The configuration file to use

environment
Set the Chef Environment on the node

group
Group to set privilege to

json-attributes
Load attributes from a JSON file or URL

log_level
Set the log level (debug, info, warn, error, fatal)

logfile
Set the log file location

node-name
The node name for this client

override-runlist
Replace current run list with specified items for a single run

recipe-url
Pull down a remote gzipped tarball of recipes and untar it to the cookbook cache

run-lock-timeout
Set maximum duration to wait for another client run to finish, default is indefinitely.

user
User to set privilege to

whyrun
Enable whyrun mode when set to True

26.6.30 salt.modules.chocolatey

A module that wraps calls to the Chocolatey package manager (http://chocolatey.org)

New in version 2014.1.0.

`salt.modules.chocolatey.`**`add_source`**(*name, source_location, username=None, password=None, priority=None*)

Instructs Chocolatey to add a source.

Parameters

- **name** (*str*) -- The name of the source to be added as a chocolatey repository.
- **source** (*str*) -- Location of the source you want to work with.
- **username** (*str*) -- Provide username for chocolatey sources that need authentication credentials.
- **password** (*str*) -- Provide password for chocolatey sources that need authentication credentials.
- **priority** (*int*) -- The priority order of this source as compared to other sources, lower is better. Defaults to 0 (no priority). All priorities above 0 will be evaluated first, then zero-based values will be evaluated in config file order.

CLI Example:

```
salt '*' chocolatey.add_source <source name> <source_location>
salt '*' chocolatey.add_source <source name> <source_location>⊠
↪priority=100
salt '*' chocolatey.add_source <source name> <source_location> user=<user>
↪ password=<password>
```

`salt.modules.chocolatey.`**`bootstrap`**(*force=False, source=None, version=None*)

Download and install the latest version of the Chocolatey package manager via the official bootstrap.

Chocolatey requires Windows PowerShell and the .NET v4.0 runtime. Depending on the host's version of Windows, chocolatey.bootstrap will attempt to ensure these prerequisites are met by downloading and executing the appropriate installers from Microsoft.

Note: If PowerShell is installed, you may have to restart the host machine for Chocolatey to work.

Note: If you're installing offline using the source parameter, the PowerShell and .NET requirements must already be met on the target. This shouldn't be a problem on Windows versions 2012/8 and later

---

Note: If you're installing chocolatey version 2.0+ the system requires .NET 4.8. Installing this requires a reboot, therefore this module will not automatically install .NET 4.8.

Parameters

- **`force`** (*bool*) -- Run the bootstrap process even if Chocolatey is found in the path.
- **`source`** (*str*) -- The location of the `.nupkg` file or `.ps1` file to run from an alternate location. This can be one of the following types of URLs:
  - salt://
  - http(s)://
  - ftp://
  - file:// - A local file on the system

  New in version 3001.
- **`version`** (*str*) -- The version of chocolatey to install. The latest version is installed if this value is `None`. Default is `None`

  New in version 3007.1.

Returns
The stdout of the Chocolatey installation script

Return type
str

CLI Example:

```
# To bootstrap Chocolatey
salt '*' chocolatey.bootstrap
salt '*' chocolatey.bootstrap force=True

# To bootstrap Chocolatey offline from a file on the salt master
salt '*' chocolatey.bootstrap source=salt://files/chocolatey.nupkg

# To bootstrap Chocolatey from a file on C:\Temp
salt '*' chocolatey.bootstrap source=C:\Temp\chocolatey.nupkg

# To bootstrap Chocolatey version 1.4.0
salt '*' chocolatey.bootstrap version=1.4.0
```

`salt.modules.chocolatey.`**`chocolatey_version`**(*refresh=False*)

Returns the version of Chocolatey installed on the minion.

Parameters
`refresh` (*bool*) -- Refresh the cached version of chocolatey

New in version 3007.1.

CLI Example:

```
salt '*' chocolatey.chocolatey_version
```

`salt.modules.chocolatey.`**`disable_source`**`(`*name*`)`

Instructs Chocolatey to disable a source.

Parameters

name (*str*) -- Name of the source repository to disable.

CLI Example:

```
salt '*' chocolatey.disable_source <name>
```

`salt.modules.chocolatey.`**`enable_source`**`(`*name*`)`

Instructs Chocolatey to enable a source.

Parameters

name (*str*) -- Name of the source repository to enable.

CLI Example:

```
salt '*' chocolatey.enable_source <name>
```

`salt.modules.chocolatey.`**`install`**`(`*name, version=None, source=None, force=False, pre_versions=False, install_args=None, override_args=False, force_x86=False, package_args=None, allow_multiple=False, execution_timeout=None*`)`

Instructs Chocolatey to install a package.

Parameters

- **name** (*str*) -- The name of the package to be installed. Only accepts a single argument. Required.
- **version** (*str*) -- Install a specific version of the package. Defaults to latest version. Default is `None`.
- **source** (*str*) -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed. Default is `None`.

  Alternate Sources:

  - cygwin
  - python
  - ruby
  - webpi
  - windowsfeatures
- **force** (*bool*) -- Reinstall the current version of an existing package. Do not use with `allow_multiple`. Default is `False`.
- **pre_versions** (*bool*) -- Include pre-release packages. Default is `False`.
- **install_args** (*str*) -- A list of install arguments you want to pass to the installation process, i.e. product key or feature list. Default is `None`.
- **override_args** (*bool*) -- Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to `False` install_args will be appended to the end of the default arguments. Default is `None`.

- **force_x86** (*bool*) -- Force x86 (32bit) installation on 64bit systems. Default is `False`.
- **package_args** (*str*) -- Arguments you want to pass to the package. Default is `None`.
- **allow_multiple** (*bool*) -- Allow multiple versions of the package to be installed. Do not use with `force`. Does not work with all packages. Default is `False`.

  New in version 2017.7.0.
- **execution_timeout** (*str*) -- Chocolatey execution timeout value you want to pass to the installation process. Default is `None`.

  New in version 2018.3.0.

Returns
The output of the `chocolatey` command

Return type
str

CLI Example:

```
salt '*' chocolatey.install <package name>
salt '*' chocolatey.install <package name> version=<package version>
salt '*' chocolatey.install <package name> install_args=<args> override_
↪args=True
```

`salt.modules.chocolatey.`**`install_cygwin`**(*name*, *install_args=None*, *override_args=False*)

Instructs Chocolatey to install a package via Cygwin.

Parameters

- **name** (*str*) -- The name of the package to be installed. Only accepts a single argument.
- **install_args** (*str*) -- A list of install arguments you want to pass to the installation process, i.e. product key or feature list
- **override_args** (*bool*) -- Set to `True` if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to `False` install_args will be appended to the end of the default arguments

CLI Example:

```
salt '*' chocolatey.install_cygwin <package name>
salt '*' chocolatey.install_cygwin <package name> install_args=<args>
↪override_args=True
```

`salt.modules.chocolatey.`**`install_gem`**(*name*, *version=None*, *install_args=None*, *override_args=False*)

Instructs Chocolatey to install a package via Ruby's Gems.

Parameters

- **name** (*str*) -- The name of the package to be installed. Only accepts a single argument.
- **version** (*str*) -- Install a specific version of the package. Defaults to the latest version available.
- **install_args** (*str*) -- A list of install arguments you want to pass to the installation process, i.e. product key or feature list
- **override_args** (*bool*) -- Set to `True` if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to `False` install_args will be appended to the end of the default arguments

CLI Example:

```
salt '*' chocolatey.install_gem <package name>
salt '*' chocolatey.install_gem <package name> version=<package version>
salt '*' chocolatey.install_gem <package name> install_args=<args>␣
↪override_args=True
```

`salt.modules.chocolatey.`**`install_missing`**(*name*, *version=None*, *source=None*)

Instructs Chocolatey to install a package if it doesn't already exist.

Changed in version 2014.7.0: If the minion has Chocolatey >= 0.9.8.24 installed, this function calls *`chocolatey.install`* instead, as `installmissing` is deprecated as of that version and will be removed in Chocolatey 1.0.

Parameters

- **`name`** (*str*) -- The name of the package to be installed. Only accepts a single argument.
- **`version`** (*str*) -- Install a specific version of the package. Defaults to the latest version available.
- **`source`** (*str*) -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed.

CLI Example:

```
salt '*' chocolatey.install_missing <package name>
salt '*' chocolatey.install_missing <package name> version=<package␣
↪version>
```

`salt.modules.chocolatey.`**`install_python`**(*name*, *version=None*, *install_args=None*, *override_args=False*)

Instructs Chocolatey to install a package via Python's easy_install.

Parameters

- **`name`** (*str*) -- The name of the package to be installed. Only accepts a single argument.
- **`version`** (*str*) -- Install a specific version of the package. Defaults to the latest version available.
- **`install_args`** (*str*) -- A list of install arguments you want to pass to the installation process, i.e. product key or feature list.
- **`override_args`** (*bool*) -- Set to `True` if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to `False` install_args will be appended to the end of the default arguments.

CLI Example:

```
salt '*' chocolatey.install_python <package name>
salt '*' chocolatey.install_python <package name> version=<package␣
↪version>
salt '*' chocolatey.install_python <package name> install_args=<args>␣
↪override_args=True
```

`salt.modules.chocolatey.`**`install_webpi`**(*name*, *install_args=None*, *override_args=False*)

Instructs Chocolatey to install a package via the Microsoft Web PI service.

Parameters

- **name** (*str*) -- The name of the package to be installed. Only accepts a single argument.
- **install_args** (*str*) -- A list of install arguments you want to pass to the installation process, i.e. product key or feature list.
- **override_args** (*bool*) -- Set to `True` if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to `False` install_args will be appended to the end of the default arguments.

CLI Example:

```
salt '*' chocolatey.install_webpi <package name>
salt '*' chocolatey.install_webpi <package name> install_args=<args>
↪override_args=True
```

`salt.modules.chocolatey.`**`install_windowsfeatures`**`(`*name*`)`

Instructs Chocolatey to install a Windows Feature via the Deployment Image Servicing and Management tool.

Parameters

name (*str*) -- The name of the feature to be installed. Only accepts a single argument.

CLI Example:

```
salt '*' chocolatey.install_windowsfeatures <package name>
```

`salt.modules.chocolatey.`**`list_`**`(`*narrow=None, all_versions=False, pre_versions=False, source=None, local_only=False, exact=False*`)`

Instructs Chocolatey to pull a vague package list from the repository.

Parameters

- **narrow** (*str*) -- Term used to narrow down results. Searches against name/description/tag. Default is None.
- **all_versions** (*bool*) -- Display all available package versions in results. Default is False.
- **pre_versions** (*bool*) -- Display pre-release packages in results. Default is False.
- **source** (*str*) -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed if None is passed. Default is None.
- **local_only** (*bool*) -- Only display packages that are installed locally. Default is False.
- **exact** (*bool*) -- Only display packages that match `narrow` exactly. Default is False.

  New in version 2017.7.0.

Returns

A dictionary of results.

Return type

dict

CLI Example:

```
salt '*' chocolatey.list <narrow>
salt '*' chocolatey.list <narrow> all_versions=True
```

`salt.modules.chocolatey.`**`list_sources`**`()`

Returns the list of installed sources.

CLI Example:

```
salt '*' chocolatey.list_sources
```

`salt.modules.chocolatey.`**`list_webpi`**`()`

Instructs Chocolatey to pull a full package list from the Microsoft Web PI repository.

Returns
List of webpi packages

Return type
str

CLI Example:

```
salt '*' chocolatey.list_webpi
```

`salt.modules.chocolatey.`**`list_windowsfeatures`**`()`

Instructs Chocolatey to pull a full package list from the Windows Features list, via the Deployment Image Servicing and Management tool.

Returns
List of Windows Features

Return type
str

CLI Example:

```
salt '*' chocolatey.list_windowsfeatures
```

`salt.modules.chocolatey.`**`unbootstrap`**`()`

Uninstall chocolatey from the system by doing the following:

- Delete the Chocolatey Directory
- Remove Chocolatey from the path
- Remove Chocolatey environment variables

New in version 3001.

Returns
A list of items that were removed, otherwise an empty list

Return type
list

CLI Example:

```
salt * chocolatey.unbootstrap
```

`salt.modules.chocolatey.`**`uninstall`**`(`*name*, *version=None*, *uninstall_args=None*, *override_args=False*, *force=False*`)`

Instructs Chocolatey to uninstall a package.

Parameters

- **`name`** (*`str`*) -- The name of the package to be uninstalled. Only accepts a single argument.

- **version** (*str*) -- Uninstalls a specific version of the package. Defaults to the latest version installed.
- **uninstall_args** (*str*) -- A list of uninstall arguments you want to pass to the uninstallation process, i.e. product key or feature list.
- **override_args** -- Set to `True` if you want to override the original uninstall arguments (for the native uninstaller) in the package and use your own. When this is set to `False` uninstall_args will be appended to the end of the default arguments.

CLI Example:

```
salt '*' chocolatey.uninstall <package name>
salt '*' chocolatey.uninstall <package name> version=<package version>
salt '*' chocolatey.uninstall <package name> version=<package version>
↪uninstall_args=<args> override_args=True
```

`salt.modules.chocolatey.`**`update`**(*name*, *source=None*, *pre_versions=False*)

Instructs Chocolatey to update packages on the system.

Parameters

- **name** (*str*) -- The name of the package to update, or "all" to update everything installed on the system.
- **source** (*str*) -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed.
- **pre_versions** (*bool*) -- Include pre-release packages in comparison. Defaults to `False`.

CLI Example:

```
salt "*" chocolatey.update all
salt "*" chocolatey.update <package name> pre_versions=True
```

`salt.modules.chocolatey.`**`upgrade`**(*name*, *version=None*, *source=None*, *force=False*, *pre_versions=False*, *install_args=None*, *override_args=False*, *force_x86=False*, *package_args=None*)

New in version 2016.3.4.

Instructs Chocolatey to upgrade packages on the system. (update is being deprecated). This command will install the package if not installed.

Parameters

- **name** (*str*) -- The name of the package to update, or "all" to update everything installed on the system.
- **version** (*str*) -- Install a specific version of the package. Defaults to latest version.
- **source** (*str*) -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed.
- **force** (*bool*) -- Reinstall the **same** version already installed.
- **pre_versions** (*bool*) -- Include pre-release packages in comparison. Defaults to `False`.
- **install_args** (*str*) -- A list of install arguments you want to pass to the installation process, i.e. product key or feature list.

- **override_args** (*bool*) -- Set to `True` if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to `False` install_args will be appended to the end of the default arguments.
- **force_x86** (*bool*) -- Force x86 (32bit) installation on 64bit systems. Defaults to `False`.
- **package_args** (*str*) -- A list of arguments you want to pass to the package.

Returns
Results of the `chocolatey` command

Return type
str

CLI Example:

```
salt "*" chocolatey.upgrade all
salt "*" chocolatey.upgrade <package name> pre_versions=True
```

`salt.modules.chocolatey.`**`version`**`(`*name*, *check_remote=False*, *source=None*, *pre_versions=False*`)`

Instructs Chocolatey to check an installed package version, and optionally compare it to one available from a remote feed.

Parameters

- **name** (*str*) -- The name of the package to check. Required.
- **check_remote** (*bool*) -- Get the version number of the latest package from the remote feed. Default is `False`.
- **source** (*str*) -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed. Default is `None`.
- **pre_versions** (*bool*) -- Include pre-release packages in comparison. Default is `False`.

Returns
A dictionary of currently installed software and versions

Return type
dict

CLI Example:

```
salt "*" chocolatey.version <package name>
salt "*" chocolatey.version <package name> check_remote=True
```

26.6.31 salt.modules.chronos

Module providing a simple management interface to a chronos cluster.

Currently this only works when run through a proxy minion.

New in version 2015.8.2.

`salt.modules.chronos.`**`has_job`**`(`*name*`)`

Return whether the given job is currently configured.

CLI Example:

```
salt chronos-minion-id chronos.has_job my-job
```

`salt.modules.chronos.`**`job`**`(`*name*`)`

Return the current server configuration for the specified job.

CLI Example:

```
salt chronos-minion-id chronos.job my-job
```

`salt.modules.chronos.`**`jobs`**`()`

Return a list of the currently installed job names.

CLI Example:

```
salt chronos-minion-id chronos.jobs
```

`salt.modules.chronos.`**`rm_job`**`(`*name*`)`

Remove the specified job from the server.

CLI Example:

```
salt chronos-minion-id chronos.rm_job my-job
```

`salt.modules.chronos.`**`update_job`**`(`*name, config*`)`

Update the specified job with the given configuration.

CLI Example:

```
salt chronos-minion-id chronos.update_job my-job '<config yaml>'
```

26.6.32 salt.modules.chroot

Module for chroot :maintainer: Alberto Planas <aplanas@suse.com> :maturity: new :depends: None :platform: Linux

`salt.modules.chroot.`**`apply_`**`(`*root, mods=None, **kwargs*`)`

Apply an state inside a chroot.

This function will call *chroot.highstate* or *chroot.sls* based on the arguments passed to this function. It exists as a more intuitive way of applying states.

root
Path to the chroot environment

For a formal description of the possible parameters accepted in this function, check *state.apply_* documentation.

CLI Example:

```
salt myminion chroot.apply /chroot
salt myminion chroot.apply /chroot stuff
salt myminion chroot.apply /chroot stuff pillar='{"foo": "bar"}'
```

`salt.modules.chroot.`**`call`**`(`*root, function, *args, **kwargs*`)`

Executes a Salt function inside a chroot environment.

The chroot does not need to have Salt installed, but Python is required.

root
Path to the chroot environment

function
Salt execution module function

CLI Example:

```
salt myminion chroot.call /chroot test.ping
salt myminion chroot.call /chroot ssh.set_auth_key user key=mykey
```

`salt.modules.chroot.`**`create`**(*root*)

Create a basic chroot environment.

Note that this environment is not functional. The caller needs to install the minimal required binaries, including Python if chroot.call is called.

root
Path to the chroot environment

CLI Example:

```
salt myminion chroot.create /chroot
```

`salt.modules.chroot.`**`exist`**(*root*)

Return True if the chroot environment is present.

root
Path to the chroot environment

CLI Example:

```
salt myminion chroot.exist /chroot
```

`salt.modules.chroot.`**`highstate`**(*root*, ***kwargs*)

Retrieve the state data from the salt master for this minion and execute it inside the chroot.

root
Path to the chroot environment

For a formal description of the possible parameters accepted in this function, check *state.highstate* documentation.

CLI Example:

```
salt myminion chroot.highstate /chroot
salt myminion chroot.highstate /chroot pillar='{"foo": "bar"}'
```

`salt.modules.chroot.`**`in_chroot`**()

Return True if the process is inside a chroot jail

New in version 3004.

CLI Example:

```
salt myminion chroot.in_chroot
```

`salt.modules.chroot.`**`sls`**(*root*, *mods*, *saltenv='base'*, *test=None*, *exclude=None*, ***kwargs*)

Execute the states in one or more SLS files inside the chroot.

root
Path to the chroot environment

saltenv
Specify a salt fileserver environment to be used when applying states

mods
List of states to execute

test
Run states in test-only (dry-run) mode

exclude
Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing `sls` or `id` keys. Glob-patterns may be used to match multiple states.

For a formal description of the possible parameters accepted in this function, check *state.sls* documentation.

CLI Example:

```
salt '*' chroot.sls /chroot stuff pillar='{"foo": "bar"}'
```

26.6.33 salt.modules.cloud

Salt-specific interface for calling Salt Cloud directly

`salt.modules.cloud.`**`action`**(*fun=None, cloudmap=None, names=None, provider=None, instance=None, **kwargs*)

Execute a single action on the given provider/instance

CLI Example:

```
salt minionname cloud.action start instance=myinstance
salt minionname cloud.action stop instance=myinstance
salt minionname cloud.action show_image provider=my-ec2-config image=ami-
↪1624987f
```

`salt.modules.cloud.`**`create`**(*provider, names, opts=None, **kwargs*)

Create an instance using Salt Cloud

CLI Example:

```
salt minionname cloud.create my-ec2-config myinstance image=ami-1624987f
↪size='t1.micro' ssh_username=ec2-user securitygroup=default delvol_on_
↪destroy=True
```

`salt.modules.cloud.`**`destroy`**(*names*)

Destroy the named VM(s)

CLI Example:

```
salt minionname cloud.destroy myinstance
```

`salt.modules.cloud.`**`full_query`**(*query_type='list_nodes_full'*)

List all available cloud provider data

CLI Example:

```
salt minionname cloud.full_query
```

salt.modules.cloud.**get_instance**(*name*, *provider=None*)

Return details on an instance.

Similar to the cloud action show_instance but returns only the instance details.

CLI Example:

```
salt minionname cloud.get_instance myinstance
```

SLS Example:

```
{{ salt['cloud.get_instance']('myinstance')['mac_address'] }}
```

salt.modules.cloud.**has_instance**(*name*, *provider=None*)

Return true if the instance is found on a provider

CLI Example:

```
salt minionname cloud.has_instance myinstance
```

salt.modules.cloud.**list_images**(*provider='all'*)

List cloud provider images for the given providers

CLI Example:

```
salt minionname cloud.list_images my-gce-config
```

salt.modules.cloud.**list_locations**(*provider='all'*)

List cloud provider locations for the given providers

CLI Example:

```
salt minionname cloud.list_locations my-gce-config
```

salt.modules.cloud.**list_sizes**(*provider='all'*)

List cloud provider sizes for the given providers

CLI Example:

```
salt minionname cloud.list_sizes my-gce-config
```

salt.modules.cloud.**map_run**(*path=None*, ***kwargs*)

Execute a salt cloud map file

Cloud Map data can be retrieved from several sources:

- a local file (provide the path to the file to the 'path' argument)
- a JSON-formatted map directly (provide the appropriately formatted to using the 'map_data' argument)
- the Salt Pillar (provide the map name of under 'pillar:cloud:maps' to the 'map_pillar' argument)

Note: Only one of these sources can be read at a time. The options are listed in their order of precedence.

CLI Examples:

```
salt minionname cloud.map_run /path/to/cloud.map
salt minionname cloud.map_run path=/path/to/cloud.map
salt minionname cloud.map_run map_pillar='<map_pillar>'
  .. versionchanged:: 2018.3.1
salt minionname cloud.map_run map_data='<actual map data>'
```

`salt.modules.cloud.`**`network_create`**(*provider*, *names*, ***kwargs*)

Create private network

CLI Example:

```
salt minionname cloud.network_create my-nova names=['salt'] cidr='192.168.
↪100.0/24'
```

`salt.modules.cloud.`**`network_list`**(*provider*)

List private networks

CLI Example:

```
salt minionname cloud.network_list my-nova
```

`salt.modules.cloud.`**`profile_`**(*profile*, *names*, *vm_overrides=None*, *opts=None*, ***kwargs*)

Spin up an instance using Salt Cloud

CLI Example:

```
salt minionname cloud.profile my-gce-config myinstance
```

`salt.modules.cloud.`**`query`**(*query_type='list_nodes'*)

List cloud provider data for all providers

CLI Examples:

```
salt minionname cloud.query
salt minionname cloud.query list_nodes_full
salt minionname cloud.query list_nodes_select
```

`salt.modules.cloud.`**`select_query`**(*query_type='list_nodes_select'*)

List selected nodes

CLI Example:

```
salt minionname cloud.select_query
```

`salt.modules.cloud.`**`virtual_interface_create`**(*provider*, *names*, ***kwargs*)

Attach private interfaces to a server

CLI Example:

```
salt minionname cloud.virtual_interface_create my-nova names=['salt-master
↪'] net_name='salt'
```

`salt.modules.cloud.`**`virtual_interface_list`**(*provider*, *names*, ***kwargs*)

List virtual interfaces on a server

CLI Example:

```
salt minionname cloud.virtual_interface_list my-nova names=['salt-master']
```

`salt.modules.cloud.`**`volume_attach`**(*provider*, *names*, ***kwargs*)

Attach volume to a server

CLI Example:

```
salt minionname cloud.volume_attach my-nova myblock server_name=myserver
↪device='/dev/xvdf'
```

`salt.modules.cloud.`**`volume_create`**(*provider*, *names*, ***kwargs*)

Create volume

CLI Example:

```
salt minionname cloud.volume_create my-nova myblock size=100 voltype=SSD
```

`salt.modules.cloud.`**`volume_delete`**(*provider*, *names*, ***kwargs*)

Delete volume

CLI Example:

```
salt minionname cloud.volume_delete my-nova myblock
```

`salt.modules.cloud.`**`volume_detach`**(*provider*, *names*, ***kwargs*)

Detach volume from a server

CLI Example:

```
salt minionname cloud.volume_detach my-nova myblock server_name=myserver
```

`salt.modules.cloud.`**`volume_list`**(*provider*)

List block storage volumes

CLI Example:

```
salt minionname cloud.volume_list my-nova
```

26.6.34 salt.modules.cmdmod

A module for shelling out.

Keep in mind that this module is insecure, in that it can give whomever has access to the master root execution access to all salt minions.

`salt.modules.cmdmod.`**`exec_code`**(*lang*, *code*, *cwd=None*, *args=None*, ***kwargs*)

Pass in two strings, the first naming the executable language, aka - python2, python3, ruby, perl, lua, etc. the second string containing the code you wish to execute. The stdout will be returned.

All parameters from `cmd.run_all` except python_shell can be used.

CLI Example:

```
salt '*' cmd.exec_code ruby 'puts "cheese"'
salt '*' cmd.exec_code ruby 'puts "cheese"' args='["arg1", "arg2"]' env='{
↪"FOO": "bar"}'
```

salt.modules.cmdmod.**exec_code_all**(*lang*, *code*, *cwd=None*, *args=None*, ***kwargs*)

Pass in two strings, the first naming the executable language, aka - python2, python3, ruby, perl, lua, etc. the second string containing the code you wish to execute. All cmd artifacts (stdout, stderr, retcode, pid) will be returned.

All parameters from `cmd.run_all` except python_shell can be used.

CLI Example:

```
salt '*' cmd.exec_code_all ruby 'puts "cheese"'
salt '*' cmd.exec_code_all ruby 'puts "cheese"' args='["arg1", "arg2"]'
↪env='{"FOO": "bar"}'
```

salt.modules.cmdmod.**has_exec**(*cmd*)

Returns true if the executable is available on the minion, false otherwise

CLI Example:

```
salt '*' cmd.has_exec cat
```

salt.modules.cmdmod.**powershell**(*cmd*, *cwd=None*, *stdin=None*, *runas=None*, *shell='powershell'*, *env=None*, *clean_env=False*, *template=None*, *rstrip=True*, *umask=None*, *output_encoding=None*, *output_loglevel='debug'*, *hide_output=False*, *timeout=None*, *reset_system_locale=True*, *ignore_retcode=False*, *saltenv=None*, *use_vt=False*, *password=None*, *depth=None*, *encode_cmd=False*, *success_retcodes=None*, *success_stdout=None*, *success_stderr=None*, ***kwargs*)

Execute the passed PowerShell command and return the output as a dictionary.

Other `cmd.*` functions (besides `cmd.powershell_all`) return the raw text output of the command. This function appends `| ConvertTo-JSON` to the command and then parses the JSON into a Python dictionary. If you want the raw textual result of your PowerShell command you should use `cmd.run` with the `shell=powershell` option.

For example:

```
salt '*' cmd.run '$PSVersionTable.CLRVersion' shell=powershell
salt '*' cmd.run 'Get-NetTCPConnection' shell=powershell
```

New in version 2016.3.0.

Warning: This passes the cmd argument directly to PowerShell without any further processing! Be absolutely sure that you have properly sanitized the command passed to this function and do not use untrusted inputs.

In addition to the normal `cmd.run` parameters, this command offers the `depth` parameter to change the Windows default depth for the `ConvertTo-JSON` powershell command. The Windows default is 2. If you need more depth, set that here.

Note: For some commands, setting the depth to a value greater than 4 greatly increases the time it takes for the command to return and in many cases returns useless data.

Parameters

- **cmd** (*str*) -- The powershell command to run.
- **cwd** (*str*) -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** (*str*) -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.
- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.
- **shell** (*str*) -- Specify an alternate shell. Defaults to "powershell". Can also use "pwsh" for powershell core if present on the system
- **python_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **env** (*dict*) -- Environment variables to be set prior to execution.

  Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

  ```
  salt myminion cmd.powershell 'some command' env='{"FOO":
  ↪"bar"}'
  ```

  Note: When using environment variables on Window's, case-sensitivity matters, i.e. Window's uses *Path* as opposed to *PATH* for other systems.
- **clean_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output_encoding** (*str*) -- Control the encoding used to decode the command's output.

  Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the *locale* line in the output of `test.versions_report`.

New in version 2018.3.0.

- **`output_loglevel`** (*`str`*) -- Control the loglevel at which the output from the command is logged to the minion log.

Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **`ignore_retcode`** (*`bool`*) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **`hide_output`** (*`bool`*) -- If `True`, suppress stdout and stderr in the return data.

Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

- **`timeout`** (*`int`*) -- A timeout in seconds for the executed process to return.
- **`use_vt`** (*`bool`*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- **`reset_system_locale`** (*`bool`*) -- Resets the system locale
- **`saltenv`** (*`str`*) -- The salt environment to use. Default is 'base'
- **`depth`** (*`int`*) -- The number of levels of contained objects to be included. Default is 2. Values greater than 4 seem to greatly increase the time it takes for the command to complete for some commands. eg: `dir`

  New in version 2016.3.4.
- **`encode_cmd`** (*`bool`*) -- Encode the command before executing. Use in cases where characters may be dropped or incorrectly converted when executed. Default is False.
- **`success_retcodes`** (*`list`*) --

  This parameter will allow a list of
  non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.
- **`success_stdout`** (*`list`*) --

  This parameter will allow a list of
  strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 3004.
- **`success_stderr`** (*`list`*) --

This parameter will allow a list of
strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **`stdin_raw_newlines`** (*`bool`*) --

False
If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

New in version 2019.2.0.

Returns

dict
A dictionary of data returned by the powershell command.

CLI Example:

```
salt '*' cmd.powershell "$PSVersionTable.CLRVersion"
```

`salt.modules.cmdmod.`**`powershell_all`**(*cmd, cwd=None, stdin=None, runas=None, shell='powershell', env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='debug', quiet=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv=None, use_vt=False, password=None, depth=None, encode_cmd=False, force_list=False, success_retcodes=None, success_stdout=None, success_stderr=None, **kwargs*)

Execute the passed PowerShell command and return a dictionary with a result field representing the output of the command, as well as other fields showing us what the PowerShell invocation wrote to `stderr`, the process id, and the exit code of the invocation.

This function appends `| ConvertTo-JSON` to the command before actually invoking powershell.

An unquoted empty string is not valid JSON, but it's very normal for the Powershell output to be exactly that. Therefore, we do not attempt to parse empty Powershell output (which would result in an exception). Instead we treat this as a special case and one of two things will happen:

- If the value of the `force_list` parameter is `True`, then the `result` field of the return dictionary will be an empty list.
- If the value of the `force_list` parameter is `False`, then the return dictionary **will not have a result key added to it**. We aren't setting `result` to `None` in this case, because `None` is the Python representation of "null" in JSON. (We likewise can't use `False` for the equivalent reason.)

If Powershell's output is not an empty string and Python cannot parse its content, then a `CommandExecutionError` exception will be raised.

If Powershell's output is not an empty string, Python is able to parse its content, and the type of the resulting Python object is other than `list` then one of two things will happen:

- If the value of the `force_list` parameter is `True`, then the `result` field will be a singleton list with the Python object as its sole member.
- If the value of the `force_list` parameter is `False`, then the value of `result` will be the unmodified Python object.

If Powershell's output is not an empty string, Python is able to parse its content, and the type of the resulting Python object is `list`, then the value of `result` will be the unmodified Python object. The `force_list` parameter has no effect in this case.

Note: An example of why the `force_list` parameter is useful is as follows: The Powershell command `dir x | Convert-ToJson` results in

- no output when x is an empty directory.
- a dictionary object when x contains just one item.
- a list of dictionary objects when x contains multiple items.

By setting `force_list` to `True` we will always end up with a list of dictionary items, representing files, no matter how many files x contains. Conversely, if `force_list` is `False`, we will end up with no `result` key in our return dictionary when x is an empty directory, and a dictionary object when x contains just one file.

If you want a similar function but with a raw textual result instead of a Python dictionary, you should use `cmd.run_all` in combination with `shell=powershell`.

The remaining fields in the return dictionary are described in more detail in the `Returns` section.

Example:

```
salt '*' cmd.run_all '$PSVersionTable.CLRVersion' shell=powershell
salt '*' cmd.run_all 'Get-NetTCPConnection' shell=powershell
```

New in version 2018.3.0.

Warning: This passes the cmd argument directly to PowerShell without any further processing! Be absolutely sure that you have properly sanitized the command passed to this function and do not use untrusted inputs.

In addition to the normal `cmd.run` parameters, this command offers the `depth` parameter to change the Windows default depth for the `ConvertTo-JSON` powershell command. The Windows default is 2. If you need more depth, set that here.

Note: For some commands, setting the depth to a value greater than 4 greatly increases the time it takes for the command to return and in many cases returns useless data.

Parameters

- **cmd** (*str*) -- The powershell command to run.
- **cwd** (*str*) -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** (*str*) -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also

use the `password` argument, and the target user account must be in the Administrators group.

- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.
- **shell** (*str*) -- Specify an alternate shell. Defaults to "powershell". Can also use "pwsh" for powershell core if present on the system
- **python_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **env** (*dict*) -- Environment variables to be set prior to execution.

Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.powershell_all 'some command' env='{"FOO
↪": "bar"}'
```

Note: When using environment variables on Window's, case-sensitivity matters, i.e. Window's uses *Path* as opposed to *PATH* for other systems.

- **clean_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output_encoding** (*str*) -- Control the encoding used to decode the command's output.

Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the *locale* line in the output of `test.versions_report`.

New in version 2018.3.0.

- **output_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged to the minion log.

Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **ignore_retcode** (*bool*) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.

- **timeout** (*int*) -- A timeout in seconds for the executed process to return.
- **use_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- **reset_system_locale** (*bool*) -- Resets the system locale
- **ignore_retcode** -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **saltenv** (*str*) -- The salt environment to use. Default is 'base'
- **depth** (*int*) -- The number of levels of contained objects to be included. Default is 2. Values greater than 4 seem to greatly increase the time it takes for the command to complete for some commands. eg: `dir`
- **encode_cmd** (*bool*) -- Encode the command before executing. Use in cases where characters may be dropped or incorrectly converted when executed. Default is False.
- **force_list** (*bool*) -- The purpose of this parameter is described in the preamble of this function's documentation. Default value is False.
- **success_retcodes** (*list*) --

  This parameter will allow a list of
  non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.
- **success_stdout** (*list*) --

  This parameter will allow a list of
  strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 3004.
- **success_stderr** (*list*) --

  This parameter will allow a list of
  strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 3004.
- **stdin_raw_newlines** (*bool*) --

  False
  If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

  New in version 2019.2.0.

Returns

A dictionary with the following entries:

result
For a complete description of this field, please refer to this function's preamble. **This key will not be added to the dictionary when force_list is False and Powershell's output is the empty string.**

stderr
What the PowerShell invocation wrote to `stderr`.

pid
The process id of the PowerShell invocation

retcode
This is the exit code of the invocation of PowerShell. If the final execution status (in PowerShell) of our command (with `| ConvertTo-JSON` appended) is `False` this should be non-0. Likewise if PowerShell exited with `$LASTEXITCODE` set to some non-0 value, then `retcode` will end up with this value.

Return type
dict

CLI Example:

```
salt '*' cmd.powershell_all "$PSVersionTable.CLRVersion"
```

CLI Example:

```
salt '*' cmd.powershell_all "dir mydirectory" force_list=True
```

`salt.modules.cmdmod.`**`retcode`**(*cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', python_shell=None, env=None, clean_env=False, template=None, umask=None, output_encoding=None, output_loglevel='debug', log_callback=None, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv=None, use_vt=False, password=None, success_retcodes=None, success_stdout=None, success_stderr=None, **kwargs*)

Execute a shell command and return the command's return code.

Parameters

- **cmd** (*str*) -- The command to run. ex: `ls -lart /home`
- **cwd** (*str*) -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** (*str*) -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

Warning: For versions 2018.3.3 and above on macosx while using runas, to pass special characters to the command you need to escape the characters on the shell.

Example:

```
cmd.retcode 'echo '\''h=\"baz\"'\''' runas=macuser
```

- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **group** (*str*) -- Group to run command as. Not currently supported on Windows.
- **shell** (*str*) -- Specify an alternate shell. Defaults to the system's default shell.
- **python_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **env** (*dict*) -- Environment variables to be set prior to execution.

  Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

  ```
  salt myminion cmd.retcode 'some command' env='{"FOO": "bar"}
  ↪'
  ```

  Note: When using environment variables on Window's, case-sensitivity matters, i.e. Window's uses *Path* as opposed to *PATH* for other systems.

- **clean_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output_encoding** (*str*) -- Control the encoding used to decode the command's output.

  Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the *locale* line in the output of `test.versions_report`.

  New in version 2018.3.0.

- **output_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged to the minion log.

Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **`ignore_retcode`** (*bool*) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **`timeout`** (*int*) -- A timeout in seconds for the executed process to return.
- **`use_vt`** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- **`success_retcodes`** (*list*) --

  This parameter will allow a list of
  non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.
- **`success_stdout`** (*list*) --

  This parameter will allow a list of
  strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 3004.
- **`success_stderr`** (*list*) --

  This parameter will allow a list of
  strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 3004.
- **`stdin_raw_newlines`** (*bool*) --

  False
  If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

  New in version 2019.2.0.

Return type
int

Return type
None

Returns
Return Code as an int or None if there was an exception.

CLI Example:

```
salt '*' cmd.retcode "file /bin/bash"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.retcode template=jinja "file {{grains.pythonpath[0]}}/python"
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

```
salt '*' cmd.retcode "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

`salt.modules.cmdmod.`**`run`**(*cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', python_shell=None, env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='debug', log_callback=None, hide_output=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv=None, use_vt=False, redirect_stderr=True, bg=False, password=None, encoded_cmd=False, raise_err=False, prepend_path=None, success_retcodes=None, success_stdout=None, success_stderr=None, **kwargs*)

Execute the passed command and return the output as a string

Parameters

- **cmd** (*str*) -- The command to run. ex: `ls -lart /home`
- **cwd** (*str*) -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** (*str*) -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running.

  > **Warning:** For versions 2018.3.3 and above on macosx while using runas, on linux while using run, to pass special characters to the command you need to escape the characters on the shell.
  >
  > Example:
  >
  > ```
  > cmd.run 'echo '\''h=\"baz\"'\''' runas=macuser
  > ```

- **group** (*str*) -- Group to run command as. Not currently supported on Windows.
- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.
- **shell** (*str*) -- Specify an alternate shell. Defaults to the system's default shell.
- **python_shell** (*bool*) -- If `False`, let python handle the positional arguments. Set to `True` to use shell features, such as pipes or redirection.
- **bg** (*bool*) -- If `True`, run command in background and do not await or deliver its results

New in version 2016.3.0.

- **env** (*dict*) -- Environment variables to be set prior to execution.

  Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

  ```
  salt myminion cmd.run 'some command' env='{"FOO": "bar"}'
  ```

  Note: When using environment variables on Window's, case-sensitivity matters, i.e. Window's uses *Path* as opposed to *PATH* for other systems.

- **clean_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **prepend_path** (*str*) -- $PATH segment to prepend (trailing ':' not necessary) to $PATH

  New in version 2018.3.0.

- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output_encoding** (*str*) -- Control the encoding used to decode the command's output.

  Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the *locale* line in the output of `test.versions_report`.

  New in version 2018.3.0.

- **output_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged to the minion log.

  Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **ignore_retcode** (*bool*) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **hide_output** (*bool*) -- If `True`, suppress stdout and stderr in the return data.

Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

- **`timeout`** (*int*) -- A timeout in seconds for the executed process to return.
- **`use_vt`** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- **`redirect_stderr`** (*bool*) -- If set to `True`, then stderr will be redirected to stdout. This is helpful for cases where obtaining both the retcode and output is desired. Default is `True`

  New in version 3006.9.
- **`encoded_cmd`** (*bool*) -- Specify if the supplied command is encoded. Only applies to shell 'powershell' and 'pwsh'.

  New in version 2018.3.0.

  Older versions of powershell seem to return raw xml data in the return. To avoid raw xml data in the return, prepend your command with the following before encoding:

  $ProgressPreference='SilentlyContinue'; <your command>

  The following powershell code block will encode the *Write-Output* command so that it will not have the raw xml data in the return:

```
# target string
$Command = '$ProgressPreference="SilentlyContinue"; Write-
↪Output "hello"'

# Convert to Base64 encoded string
$Encoded = [convert]::ToBase64String([System.Text.
↪encoding]::Unicode.GetBytes($command))

Write-Output $Encoded
```

- **`raise_err`** (*bool*) -- If `True` and the command has a nonzero exit code, a CommandExecutionError exception will be raised.

Warning: This function does not process commands through a shell unless the python_shell flag is set to True. This means that any shell-specific functionality such as 'echo' or the use of pipes, redirection or &&, should either be migrated to cmd.shell or have the python_shell=True flag set here.

The use of python_shell=True means that the shell will accept _any_ input including potentially malicious commands such as 'good_command;rm -rf /'. Be absolutely certain that you have sanitized your input prior to using python_shell=True

Parameters

- **`success_retcodes`** (*list*) --

  This parameter will allow a list of

  non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

- **`success_stdout`** (*list*) --

  This parameter will allow a list of
  strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 3004.

- **`success_stderr`** (*list*) --

  This parameter will allow a list of
  strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 3004.

- **`stdin_raw_newlines`** (*bool*) --

  False
  If `True`, Salt will not automatically convert the characters `\\n` present in the `stdin` value to newlines.

  New in version 2019.2.0.

- **`windows_codepage`** (*int*) --

  65001
  Only applies to Windows: the minion uses *C:WindowsSystem32chcp.com* to verify or set the code page before the command *cmd* is executed. Code page 65001 corresponds with UTF-8 and allows international localization of Windows.

  New in version 3002.

CLI Example:

```
salt '*' cmd.run "ls -l | awk '/foo/{print \\$2}'"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.run template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/
↪{print \\$2}'"
```

Specify an alternate shell with the shell parameter:

```
salt '*' cmd.run "Get-ChildItem C:\\ " shell='powershell'
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

```
salt '*' cmd.run "grep f" stdin='one\\ntwo\\nthree\\nfour\\nfive\\n'
```

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' cmd.run cmd='sed -e s/=/:/g'
```

`salt.modules.cmdmod.`**`run_all`**(*cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', python_shell=None, env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='debug', log_callback=None, hide_output=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv=None, use_vt=False, redirect_stderr=False, password=None, encoded_cmd=False, prepend_path=None, success_retcodes=None, success_stdout=None, success_stderr=None, **kwargs*)

Execute the passed command and return a dict of return data

Parameters

- **`cmd`** (*`str`*) -- The command to run. ex: `ls -lart /home`
- **`cwd`** (*`str`*) -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **`stdin`** (*`str`*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **`runas`** (*`str`*) -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

  Warning: For versions 2018.3.3 and above on macosx while using runas, to pass special characters to the command you need to escape the characters on the shell.

  Example:

  ```
  cmd.run_all 'echo '\''h=\"baz\"'\''' runas=macuser
  ```

- **`password`** (*`str`*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **`group`** (*`str`*) -- Group to run command as. Not currently supported on Windows.
- **`shell`** (*`str`*) -- Specify an alternate shell. Defaults to the system's default shell.
- **`python_shell`** (*`bool`*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **`env`** (*`dict`*) -- Environment variables to be set prior to execution.

  Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.run_all 'some command' env='{"FOO": "bar"}
↪'
```

Note: When using environment variables on Window's, case-sensitivity matters, i.e. Window's uses *Path* as opposed to *PATH* for other systems.

- **clean_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **prepend_path** (*str*) -- $PATH segment to prepend (trailing ':' not necessary) to $PATH

  New in version 2018.3.0.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output_encoding** (*str*) -- Control the encoding used to decode the command's output.

  Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the *locale* line in the output of `test.versions_report`.

  New in version 2018.3.0.
- **output_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged to the minion log.

  Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.
- **ignore_retcode** (*bool*) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **hide_output** (*bool*) -- If `True`, suppress stdout and stderr in the return data.

  Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

  New in version 2018.3.0.
- **timeout** (*int*) -- A timeout in seconds for the executed process to return.

- **use_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- **encoded_cmd** (*bool*) -- Specify if the supplied command is encoded. Only applies to shell 'powershell' and 'pwsh'.

  New in version 2018.3.0.

  Older versions of powershell seem to return raw xml data in the return. To avoid raw xml data in the return, prepend your command with the following before encoding:

  $ProgressPreference='SilentlyContinue'; <your command>

  The following powershell code block will encode the *Write-Output* command so that it will not have the raw xml data in the return:

```
# target string
$Command = '$ProgressPreference="SilentlyContinue"; Write-
↪Output "hello"'

# Convert to Base64 encoded string
$Encoded = [convert]::ToBase64String([System.Text.
↪encoding]::Unicode.GetBytes($command))

Write-Output $Encoded
```

- **redirect_stderr** (*bool*) -- If set to `True`, then stderr will be redirected to stdout. This is helpful for cases where obtaining both the retcode and output is desired, but it is not desired to have the output separated into both stdout and stderr.

  New in version 2015.8.2.

- **password** -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **bg** (*bool*) -- If `True`, run command in background and do not await or deliver its results

  New in version 2016.3.6.

- **success_retcodes** (*list*) --

  This parameter will allow a list of
  non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.

- **success_stdout** (*list*) --

  This parameter will allow a list of
  strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 3004.

- **success_stderr** (*list*) --

This parameter will allow a list of
strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **`stdin_raw_newlines`** (*bool*) --

False
If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

New in version 2019.2.0.

CLI Example:

```
salt '*' cmd.run_all "ls -l | awk '/foo/{print \$2}'"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.run_all template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/
↪{print \$2}'"
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

```
salt '*' cmd.run_all "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

`salt.modules.cmdmod.`**`run_bg`**(*cmd, cwd=None, runas=None, group=None, shell='/bin/sh', python_shell=None, env=None, clean_env=False, template=None, umask=None, timeout=None, output_encoding=None, output_loglevel='debug', log_callback=None, reset_system_locale=True, ignore_retcode=False, saltenv=None, password=None, prepend_path=None, success_retcodes=None, success_stdout=None, success_stderr=None, **kwargs*)

New in version 2016.3.0.

Execute the passed command in the background and return its PID

Note: If the init system is systemd and the backgrounded task should run even if the salt-minion process is restarted, prepend `systemd-run --scope` to the command. This will reparent the process in its own scope separate from salt-minion, and will not be affected by restarting the minion service.

Parameters

- **`cmd`** (*str*) -- The command to run. ex: `ls -lart /home`
- **`cwd`** (*str*) -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **`group`** (*str*) -- Group to run command as. Not currently supported on Windows.
- **`shell`** (*str*) -- Shell to execute under. Defaults to the system default shell.

- **`output_encoding`** (*str*) -- Control the encoding used to decode the command's output.

  Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the *locale* line in the output of *`test.versions_report`*.

  New in version 2018.3.0.

- **`output_loglevel`** (*str*) -- Control the loglevel at which the output from the command is logged to the minion log.

  Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **`ignore_retcode`** (*bool*) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.

- **`runas`** (*str*) -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

  Warning: For versions 2018.3.3 and above on macosx while using runas, to pass special characters to the command you need to escape the characters on the shell.

  Example:

  ```
  cmd.run_bg 'echo '\''h=\"baz\"'\''' runas=macuser
  ```

- **`password`** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **`shell`** -- Specify an alternate shell. Defaults to the system's default shell.

- **`python_shell`** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.

- **`env`** (*dict*) -- Environment variables to be set prior to execution.

  Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

  ```
  salt myminion cmd.run_bg 'some command' env='{"FOO": "bar"}'
  ```

Note: When using environment variables on Window's, case-sensitivity matters, i.e. Window's uses *Path* as opposed to *PATH* for other systems.

- **`clean_env`** (*`bool`*) -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **`prepend_path`** (*`str`*) -- $PATH segment to prepend (trailing ':' not necessary) to $PATH

  New in version 2018.3.0.
- **`template`** (*`str`*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **`umask`** (*`str`*) -- The umask (in octal) to use when running the command.
- **`timeout`** (*`int`*) -- A timeout in seconds for the executed process to return.

Warning: This function does not process commands through a shell unless the `python_shell` argument is set to `True`. This means that any shell-specific functionality such as 'echo' or the use of pipes, redirection or &&, should either be migrated to cmd.shell or have the python_shell=True flag set here.

The use of `python_shell=True` means that the shell will accept _any_ input including potentially malicious commands such as 'good_command;rm -rf /'. Be absolutely certain that you have sanitized your input prior to using `python_shell=True`.

Parameters

- **`success_retcodes`** (*`list`*) --

  This parameter will allow a list of
  non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.
- **`success_stdout`** (*`list`*) --

  This parameter will allow a list of
  strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 3004.
- **`success_stderr`** (*`list`*) --

  This parameter will allow a list of
  strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 3004.
- **`stdin_raw_newlines`** (*`bool`*) --

  False
  If `True`, Salt will not automatically convert the characters `\\n` present in the `stdin` value to newlines.

New in version 2019.2.0.

CLI Example:

```
salt '*' cmd.run_bg "fstrim-all"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.run_bg template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/
↪{print \\$2}'"
```

Specify an alternate shell with the shell parameter:

```
salt '*' cmd.run_bg "Get-ChildItem C:\\ " shell='powershell'
```

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' cmd.run_bg cmd='ls -lR / | sed -e s/=/:/g > /tmp/dontwait'
```

`salt.modules.cmdmod.`**`run_chroot`**(*root, cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', python_shell=True, binds=None, env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='quiet', log_callback=None, hide_output=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv=None, use_vt=False, bg=False, success_retcodes=None, success_stdout=None, success_stderr=None, **kwargs*)

New in version 2014.7.0.

This function runs *`cmd.run_all`* wrapped within a chroot, with dev and proc mounted in the chroot

Parameters

- **`root`** (*`str`*) -- Path to the root of the jail to use.
- **`stdin`** (*`str`*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.:
- **`runas`** (*`str`*) -- User to run script as.
- **`group`** (*`str`*) -- Group to run script as.
- **`shell`** (*`str`*) -- Shell to execute under. Defaults to the system default shell.
- **`cmd`** (*`str`*) -- The command to run. ex: `ls -lart /home`
- **`cwd`** (*`str`*) -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **`runas`** -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.
- **`shell`** -- Specify an alternate shell. Defaults to the system's default shell.

- **python_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **binds** (*list*) -- List of directories that will be exported inside the chroot with the bind option.

  New in version 3000.
- **env** (*dict*) -- Environment variables to be set prior to execution.

  Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

  ```
  salt myminion cmd.run_chroot 'some command' env='{"FOO":
  ↪"bar"}'
  ```

  Note: When using environment variables on Window's, case-sensitivity matters, i.e. Window's uses *Path* as opposed to *PATH* for other systems.
- **clean_env** (*dict*) -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output_encoding** (*str*) -- Control the encoding used to decode the command's output.

  Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the *locale* line in the output of `test.versions_report`.

  New in version 2018.3.0.
- **output_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged to the minion log.

  Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.
- **ignore_retcode** (*bool*) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.

- **`hide_output`** (*`bool`*) -- If `True`, suppress stdout and stderr in the return data.

  Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

  New in version 2018.3.0.

- **`timeout`** (*`int`*) -- A timeout in seconds for the executed process to return.
- **`use_vt`** (*`bool`*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- **`success_retcodes`** --

  This parameter will allow a list of
  non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.

- **`success_stdout`** (*`list`*) --

  This parameter will allow a list of
  strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 3004.

- **`success_stderr`** (*`list`*) --

  This parameter will allow a list of
  strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 3004.

Parar str stdin
A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

CLI Example:

```
salt '*' cmd.run_chroot /var/lib/lxc/container_name/rootfs 'sh /tmp/
↪bootstrap.sh'
```

`salt.modules.cmdmod.`**`run_stderr`**(*cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', python_shell=None, env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='debug', log_callback=None, hide_output=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv=None, use_vt=False, password=None, prepend_path=None, success_retcodes=None, success_stdout=None, success_stderr=None, **kwargs*)

Execute a command and only return the standard error

Parameters

- **cmd** (*str*) -- The command to run. ex: `ls -lart /home`
- **cwd** (*str*) -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** (*str*) -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

  Warning: For versions 2018.3.3 and above on macosx while using runas, to pass special characters to the command you need to escape the characters on the shell.

  Example:

  ```
  cmd.run_stderr 'echo '\''h=\"baz\"'\''' runas=macuser
  ```

- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **group** (*str*) -- Group to run command as. Not currently supported on Windows.
- **shell** (*str*) -- Specify an alternate shell. Defaults to the system's default shell.
- **python_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **env** (*dict*) -- Environment variables to be set prior to execution.

  Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

  ```
  salt myminion cmd.run_stderr 'some command' env='{"FOO":
  ↪"bar"}'
  ```

  Note: When using environment variables on Window's, case-sensitivity matters, i.e. Window's uses *Path* as opposed to *PATH* for other systems.

- **clean_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **prepend_path** (*str*) -- $PATH segment to prepend (trailing ':' not necessary) to $PATH

  New in version 2018.3.0.

- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.

- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output_encoding** (*str*) -- Control the encoding used to decode the command's output.

  Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the *locale* line in the output of `test.versions_report`.

  New in version 2018.3.0.

- **output_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged to the minion log.

  Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **ignore_retcode** (*bool*) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **hide_output** (*bool*) -- If `True`, suppress stdout and stderr in the return data.

  Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

  New in version 2018.3.0.

- **timeout** (*int*) -- A timeout in seconds for the executed process to return.
- **use_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- **success_retcodes** (*list*) --

  This parameter will allow a list of
  non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.

- **success_stdout** (*list*) --

  This parameter will allow a list of
  strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 3004.

- **success_stderr** (*list*) --

This parameter will allow a list of
strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **`stdin_raw_newlines`** (*`bool`*) --

False
If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

New in version 2019.2.0.

CLI Example:

```
salt '*' cmd.run_stderr "ls -l | awk '/foo/{print \$2}'"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.run_stderr template=jinja "ls -l /tmp/{{grains.id}} | awk '/
↪foo/{print \$2}'"
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

```
salt '*' cmd.run_stderr "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

`salt.modules.cmdmod.`**`run_stdout`**(*cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', python_shell=None, env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='debug', log_callback=None, hide_output=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv=None, use_vt=False, password=None, prepend_path=None, success_retcodes=None, success_stdout=None, success_stderr=None, **kwargs*)

Execute a command, and only return the standard out

Parameters

- **`cmd`** (*`str`*) -- The command to run. ex: `ls -lart /home`
- **`cwd`** (*`str`*) -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **`stdin`** (*`str`*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **`runas`** (*`str`*) -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

Warning: For versions 2018.3.3 and above on macosx while using runas, to pass special characters to the command you need to escape the characters on the shell.

Example:

```
cmd.run_stdout 'echo '\''h=\"baz\"'\''' runas=macuser
```

- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **group** (*str*) -- Group to run command as. Not currently supported on Windows.
- **shell** (*str*) -- Specify an alternate shell. Defaults to the system's default shell.
- **python_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **env** (*dict*) -- Environment variables to be set prior to execution.

Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.run_stdout 'some command' env='{"FOO":
↪"bar"}'
```

Note: When using environment variables on Window's, case-sensitivity matters, i.e. Window's uses *Path* as opposed to *PATH* for other systems.

- **clean_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **prepend_path** (*str*) -- $PATH segment to prepend (trailing ':' not necessary) to $PATH

  New in version 2018.3.0.

- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output_encoding** (*str*) -- Control the encoding used to decode the command's output.

Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the *locale* line in the output of *test.versions_report*.

New in version 2018.3.0.

- **output_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged to the minion log.

  Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **ignore_retcode** (*bool*) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **hide_output** (*bool*) -- If `True`, suppress stdout and stderr in the return data.

  Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

  New in version 2018.3.0.

- **timeout** (*int*) -- A timeout in seconds for the executed process to return.
- **use_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- **success_retcodes** (*list*) --

  This parameter will allow a list of
  non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.

- **success_stdout** (*list*) --

  This parameter will allow a list of
  strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 3004.

- **success_stderr** (*list*) --

  This parameter will allow a list of
  strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 3004.

- **stdin_raw_newlines** (*bool*) --

  False
  If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

  New in version 2019.2.0.

CLI Example:

```
salt '*' cmd.run_stdout "ls -l | awk '/foo/{print \$2}'"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.run_stdout template=jinja "ls -l /tmp/{{grains.id}} | awk '/
↪foo/{print \$2}'"
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

```
salt '*' cmd.run_stdout "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

`salt.modules.cmdmod.`**`script`**(*source, args=None, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', python_shell=None, env=None, template=None, umask=None, output_encoding=None, output_loglevel='debug', log_callback=None, hide_output=False, timeout=None, reset_system_locale=True, saltenv=None, use_vt=False, bg=False, password=None, success_retcodes=None, success_stdout=None, success_stderr=None, **kwargs*)

Download a script from a remote location and execute the script locally. The script can be located on the salt master file server or on an HTTP/FTP server.

The script will be executed directly, so it can be written in any available programming language.

Parameters

- **source** (*str*) -- The location of the script to download. If the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs
- **args** (*str*) -- String of command line args to pass to the script. Only used if no args are specified as part of the *name* argument. To pass a string containing spaces in YAML, you will need to doubly-quote it. Additionally, if you need to pass falsey values (e.g., "0", "", "False"), you should doubly-quote them to ensure they are correctly interpreted:

  ```
  salt myminion cmd.script salt://foo.sh "arg1 'arg two' arg3"
  salt myminion cmd.script salt://foo.sh "''0''"
  salt myminion cmd.script salt://foo.sh "''False''"
  ```

- **cwd** (*str*) -- The directory from which to execute the command. Defaults to the directory returned from Python's tempfile.mkstemp.
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** (*str*) -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

  Note: For Window's users, specifically Server users, it may be necessary to specify your runas user using the User Logon Name instead of the legacy logon name. Traditionally, logons would be in the following format.

  ```
  Domain/user
  ```

In the event this causes issues when executing scripts, use the UPN format which looks like the following.

```
user@domain.local
```

More information <https://github.com/saltstack/salt/issues/55080>

- **`password`** (*`str`*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.
- **`group`** (*`str`*) -- Group to run script as. Not currently supported on Windows.
- **`shell`** (*`str`*) -- Specify an alternate shell. Defaults to the system's default shell.
- **`python_shell`** (*`bool`*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **`bg`** (*`bool`*) -- If True, run script in background and do not await or deliver its results
- **`env`** (*`dict`*) -- Environment variables to be set prior to execution.

Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.script 'some command' env='{"FOO": "bar"}'
```

Note: When using environment variables on Window's, case-sensitivity matters, i.e. Window's uses *Path* as opposed to *PATH* for other systems.

- **`template`** (*`str`*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **`umask`** (*`str`*) -- The umask (in octal) to use when running the command.
- **`output_encoding`** (*`str`*) -- Control the encoding used to decode the command's output.

Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the *locale* line in the output of *`test.versions_report`*.

New in version 2018.3.0.

- **`output_loglevel`** (*`str`*) -- Control the loglevel at which the output from the command is logged to the minion log.

Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **`ignore_retcode`** (*`bool`*) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **`hide_output`** (*`bool`*) -- If `True`, suppress stdout and stderr in the return data.

  Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

  New in version 2018.3.0.
- **`timeout`** (*`int`*) -- If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill
- **`use_vt`** (*`bool`*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- **`success_retcodes`** (*`list`*) --

  This parameter will allow a list of
  non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.
- **`success_stdout`** (*`list`*) --

  This parameter will allow a list of
  strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 3004.
- **`success_stderr`** (*`list`*) --

  This parameter will allow a list of
  strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 3004.
- **`stdin_raw_newlines`** (*`bool`*) --

  False
  If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

  New in version 2019.2.0.

Returns
The return value of the script execution, including stdout, stderr, and the exit code. If the script returns a falsey string value, it should be doubly-quoted to ensure it is correctly interpreted by Salt.

CLI Example:

```
salt '*' cmd.script salt://scripts/runme.sh
salt '*' cmd.script salt://scripts/runme.sh 'arg1 arg2 "arg 3"'
salt '*' cmd.script salt://scripts/windows_task.ps1 args=' -Input c:\tmp\
↪infile.txt' shell='powershell'
```

```
salt '*' cmd.script salt://scripts/runme.sh stdin='one\ntwo\nthree\nfour\
↪nfive\n'
```

`salt.modules.cmdmod.`**`script_retcode`**(*source*, *args=None*, *cwd=None*, *stdin=None*, *runas=None*, *group=None*, *shell='/bin/sh'*, *python_shell=None*, *env=None*, *template='jinja'*, *umask=None*, *timeout=None*, *reset_system_locale=True*, *saltenv=None*, *output_encoding=None*, *output_loglevel='debug'*, *log_callback=None*, *use_vt=False*, *password=None*, *success_retcodes=None*, *success_stdout=None*, *success_stderr=None*, ***kwargs*)

Download a script from a remote location and execute the script locally. The script can be located on the salt master file server or on an HTTP/FTP server.

The script will be executed directly, so it can be written in any available programming language.

The script can also be formatted as a template, the default is jinja.

Only evaluate the script return code and do not block for terminal output

Parameters

- **source** (*str*) -- The location of the script to download. If the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs
- **args** (*str*) -- String of command line args to pass to the script. Only used if no args are specified as part of the *name* argument. To pass a string containing spaces in YAML, you will need to doubly-quote it: "arg1 'arg two' arg3"
- **cwd** (*str*) -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** (*str*) -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.
- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.
- **group** (*str*) -- Group to run script as. Not currently supported on Windows.
- **shell** (*str*) -- Specify an alternate shell. Defaults to the system's default shell.
- **python_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **env** (*dict*) -- Environment variables to be set prior to execution.

Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.script_retcode 'some command' env='{"FOO
↪": "bar"}'
```

Note: When using environment variables on Window's, case-sensitivity matters, i.e. Window's uses *Path* as opposed to *PATH* for other systems.

- **`template`** (*`str`*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **`umask`** (*`str`*) -- The umask (in octal) to use when running the command.
- **`output_encoding`** (*`str`*) -- Control the encoding used to decode the command's output.

  Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the *locale* line in the output of *`test.versions_report`*.

  New in version 2018.3.0.
- **`output_loglevel`** (*`str`*) -- Control the loglevel at which the output from the command is logged to the minion log.

  Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **`ignore_retcode`** (*`bool`*) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **`timeout`** (*`int`*) -- If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill
- **`use_vt`** (*`bool`*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- **`success_retcodes`** (*`list`*) --

  This parameter will allow a list of

  non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.
- **`success_stdout`** (*`list`*) --

This parameter will allow a list of
strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **`success_stderr`** (*`list`*) --

  This parameter will allow a list of
  strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 3004.

- **`stdin_raw_newlines`** (*`bool`*) --

  False
  If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

  New in version 2019.2.0.

CLI Example:

```
salt '*' cmd.script_retcode salt://scripts/runme.sh
salt '*' cmd.script_retcode salt://scripts/runme.sh 'arg1 arg2 "arg 3"'
salt '*' cmd.script_retcode salt://scripts/windows_task.ps1 args=' -Input␣
↪c:\tmp\infile.txt' shell='powershell'
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

```
salt '*' cmd.script_retcode salt://scripts/runme.sh stdin='one\ntwo\
↪nthree\nfour\nfive\n'
```

`salt.modules.cmdmod.`**`shell`**(*cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='debug', log_callback=None, hide_output=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv=None, use_vt=False, bg=False, password=None, prepend_path=None, success_retcodes=None, success_stdout=None, success_stderr=None, **kwargs*)

Execute the passed command and return the output as a string.

New in version 2015.5.0.

Parameters

- **`cmd`** (*`str`*) -- The command to run. ex: `ls -lart /home`
- **`cwd`** (*`str`*) -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **`stdin`** (*`str`*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

- **runas** (*str*) -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

  Warning: For versions 2018.3.3 and above on macosx while using runas, to pass special characters to the command you need to escape the characters on the shell.

  Example:

  ```
  cmd.shell 'echo '\''h=\"baz\"'\''' runas=macuser
  ```

- **group** (*str*) -- Group to run command as. Not currently supported on Windows.
- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **shell** (*int*) -- Shell to execute under. Defaults to the system default shell.
- **bg** (*bool*) -- If True, run command in background and do not await or deliver its results
- **env** (*dict*) -- Environment variables to be set prior to execution.

  Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

  ```
  salt myminion cmd.shell 'some command' env='{"FOO": "bar"}'
  ```

  Note: When using environment variables on Window's, case-sensitivity matters, i.e. Window's uses *Path* as opposed to *PATH* for other systems.

- **clean_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **prepend_path** (*str*) -- $PATH segment to prepend (trailing ':' not necessary) to $PATH

  New in version 2018.3.0.

- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output_encoding** (*str*) -- Control the encoding used to decode the command's output.

  Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the *locale* line in the output of `test.versions_report`.

New in version 2018.3.0.

- **`output_loglevel`** (*`str`*) -- Control the loglevel at which the output from the command is logged to the minion log.

  Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **`ignore_retcode`** (*`bool`*) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.
- **`hide_output`** (*`bool`*) -- If `True`, suppress stdout and stderr in the return data.

  Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

  New in version 2018.3.0.

- **`timeout`** (*`int`*) -- A timeout in seconds for the executed process to return.
- **`use_vt`** (*`bool`*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

Warning: This passes the cmd argument directly to the shell without any further processing! Be absolutely sure that you have properly sanitized the command passed to this function and do not use untrusted inputs.

Parameters

- **`success_retcodes`** (*`list`*) --

  This parameter will allow a list of
  non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.

- **`success_stdout`** (*`list`*) --

  This parameter will allow a list of
  strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 3004.

- **`success_stderr`** (*`list`*) --

This parameter will allow a list of
strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **`stdin_raw_newlines`** (*bool*) --

False
If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

New in version 2019.2.0.

CLI Example:

```
salt '*' cmd.shell "ls -l | awk '/foo/{print \$2}'"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.shell template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/
↪{print \$2}'"
```

Specify an alternate shell with the shell parameter:

```
salt '*' cmd.shell "Get-ChildItem C:\ " shell='powershell'
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

```
salt '*' cmd.shell "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' cmd.shell cmd='sed -e s/=/:/g'
```

`salt.modules.cmdmod.`**`shell_info`**(*shell*, *list_modules=False*)

New in version 2016.11.0.

Provides information about a shell or script languages which often use `#!`. The values returned are dependent on the shell or scripting languages all return the `installed`, `path`, `version`, `version_raw`

Parameters

- **`shell`** (*str*) -- Name of the shell. Support shells/script languages include
- **`bash`** --
- **`cmd`** --
- **`perl`** --
- **`php`** --
- **`powershell`** --
- **`python`** --

- **`zsh`** (*`ruby and`*) --
- **`list_modules`** (*`bool`*) -- True to list modules available to the shell.
- **`modules.`** (*`Currently only lists powershell`*) --

Returns
A dictionary of information about the shell

Return type
dict

```
{'version': '<2 or 3 numeric components dot-separated>',
 'version_raw': '<full version string>',
 'path': '<full path to binary>',
 'installed': <True, False or None>,
 '<attribute>': '<attribute value>'}
```

Note:

- `installed` is always returned, if `None` or `False` also returns error and may also return `stdout` for diagnostics.
- `version` is for use in determine if a shell/script language has a particular feature set, not for package management.
- The shell must be within the executable search path.

CLI Example:

```
salt '*' cmd.shell_info bash
salt '*' cmd.shell_info powershell
```

Codeauthor
Damon Atkins <https://github.com/damon-atkins>

`salt.modules.cmdmod.`**`shells`**`()`

Lists the valid shells on this system via the /etc/shells file

New in version 2015.5.0.

CLI Example:

```
salt '*' cmd.shells
```

`salt.modules.cmdmod.`**`tty`**`(`*device, echo=''*`)`

Echo a string to a specific tty

CLI Example:

```
salt '*' cmd.tty tty0 'This is a test'
salt '*' cmd.tty pts3 'This is a test'
```

`salt.modules.cmdmod.`**`which`**`(`*cmd*`)`

Returns the path of an executable available on the minion, None otherwise

CLI Example:

```
salt '*' cmd.which cat
```

`salt.modules.cmdmod.`**`which_bin`**`(`*cmds*`)`

Returns the first command found in a list of commands

CLI Example:

```
salt '*' cmd.which_bin '[pip2, pip, pip-python]'
```

26.6.35 salt.modules.config

Return config information

`salt.modules.config.`**`backup_mode`**`(`*backup=''*`)`

Return the backup mode

CLI Example:

```
salt '*' config.backup_mode
```

`salt.modules.config.`**`dot_vals`**`(`*value*`)`

Pass in a configuration value that should be preceded by the module name and a dot, this will return a list of all read key/value pairs

CLI Example:

```
salt '*' config.dot_vals host
```

`salt.modules.config.`**`gather_bootstrap_script`**`(`*bootstrap=None*`)`

Download the salt-bootstrap script, and return its location

bootstrap
URL of alternate bootstrap script

CLI Example:

```
salt '*' config.gather_bootstrap_script
```

`salt.modules.config.`**`get`**`(`*key, default='', delimiter=':', merge=None, omit_opts=False, omit_pillar=False, omit_master=False, omit_grains=False*`)`

New in version 0.14.0.

Attempt to retrieve the named value from the minion config file, pillar, grains or the master config. If the named value is not available, return the value specified by the `default` argument. If this argument is not specified, `default` falls back to an empty string.

Values can also be retrieved from nested dictionaries. Assume the below data structure:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the `apache` key, in the sub-dictionary corresponding to the `pkg` key, the following command can be used:

```
salt myminion config.get pkg:apache
```

The `:` (colon) is used to represent a nested dictionary level.

Changed in version 2015.5.0: The `delimiter` argument was added, to allow delimiters other than `:` to be used.

This function traverses these data stores in this order, returning the first match found:

- Minion configuration
- Minion's grains
- Minion's pillar data
- Master configuration (requires `pillar_opts` to be set to `True` in Minion config file in order to work)

This means that if there is a value that is going to be the same for the majority of minions, it can be configured in the Master config file, and then overridden using the grains, pillar, or Minion config file.

Adding config options to the Master or Minion configuration file is easy:

```
my-config-option: value
cafe-menu:
  - egg and bacon
  - egg sausage and bacon
  - egg and spam
  - egg bacon and spam
  - egg bacon sausage and spam
  - spam bacon sausage and spam
  - spam egg spam spam bacon and spam
  - spam sausage spam spam bacon spam tomato and spam
```

Note: Minion configuration options built into Salt (like those defined *here*) will *always* be defined in the Minion configuration and thus *cannot be overridden by grains or pillar data*. However, additional (user-defined) configuration options (as in the above example) will not be in the Minion configuration by default and thus can be overridden using grains/pillar data by leaving the option out of the minion config file.

Arguments

delimiter

New in version 2015.5.0.

Override the delimiter used to separate nested levels of a data structure.

merge

New in version 2015.5.0.

If passed, this parameter will change the behavior of the function so that, instead of traversing each data store above in order and returning the first match, the data stores are first merged together and then searched. The pillar data is merged into the master config data, then the grains are merged, followed by the Minion config data. The resulting data structure is then searched for a match. This allows for configurations to be more flexible.

Note: The merging described above does not mean that grain data will end up in the Minion's pillar data, or pillar data will end up in the master config data, etc. The data is just combined for the purposes of searching an amalgam of the different data stores.

The supported merge strategies are as follows:

- **recurse** - If a key exists in both dictionaries, and the new value is not a dictionary, it is replaced. Otherwise, the sub-dictionaries are merged together into a single dictionary, recursively on down, following the same criteria. For example:

  ```
  >>> dict1 = {'foo': {'bar': 1, 'qux': True},
               'hosts': ['a', 'b', 'c'],
               'only_x': None}
  >>> dict2 = {'foo': {'baz': 2, 'qux': False},
               'hosts': ['d', 'e', 'f'],
               'only_y': None}
  >>> merged
  {'foo': {'bar': 1, 'baz': 2, 'qux': False},
   'hosts': ['d', 'e', 'f'],
   'only_dict1': None,
   'only_dict2': None}
  ```

- **overwrite** - If a key exists in the top level of both dictionaries, the new value completely overwrites the old. For example:

  ```
  >>> dict1 = {'foo': {'bar': 1, 'qux': True},
               'hosts': ['a', 'b', 'c'],
               'only_x': None}
  >>> dict2 = {'foo': {'baz': 2, 'qux': False},
               'hosts': ['d', 'e', 'f'],
               'only_y': None}
  >>> merged
  {'foo': {'baz': 2, 'qux': False},
   'hosts': ['d', 'e', 'f'],
   'only_dict1': None,
   'only_dict2': None}
  ```

CLI Example:

```
salt '*' config.get pkg:apache
salt '*' config.get lxc.container_profile:centos merge=recurse
```

`salt.modules.config.`**`items`**`()`

Return the complete config from the currently running minion process. This includes defaults for values not set in the config file.

CLI Example:

```
salt '*' config.items
```

`salt.modules.config.`**`manage_mode`**`(`*mode*`)`

Return a mode value, normalized to a string

CLI Example:

```
salt '*' config.manage_mode
```

`salt.modules.config.`**`merge`**`(`*value, default='', omit_opts=False, omit_master=False, omit_pillar=False*`)`

Retrieves an option based on key, merging all matches.

Same as `option()` except that it merges all matches, rather than taking the first match.

CLI Example:

```
salt '*' config.merge schedule
```

salt.modules.config.**option**(*value*, *default=None*, *omit_opts=False*, *omit_grains=False*, *omit_pillar=False*, *omit_master=False*, *omit_all=False*, *wildcard=False*)

Returns the setting for the specified config value. The priority for matches is the same as in `config.get`, only this function does not recurse into nested data structures. Another difference between this function and `config.get` is that it comes with a set of "sane defaults". To view these, you can run the following command:

```
salt '*' config.option '*' omit_all=True wildcard=True
```

default
The default value if no match is found. If not specified, then the fallback default will be an empty string, unless `wildcard=True`, in which case the return will be an empty dictionary.

omit_opts
[False] Pass as `True` to exclude matches from the minion configuration file

omit_grains
[False] Pass as `True` to exclude matches from the grains

omit_pillar
[False] Pass as `True` to exclude matches from the pillar data

omit_master
[False] Pass as `True` to exclude matches from the master configuration file

omit_all
[True] Shorthand to omit all of the above and return matches only from the "sane defaults".

New in version 3000.

wildcard
[False] If used, this will perform pattern matching on keys. Note that this will also significantly change the return data. Instead of only a value being returned, a dictionary mapping the matched keys to their values is returned. For example, using `wildcard=True` with a `key` of `'foo.ba*` could return a dictionary like so:

```
{'foo.bar': True, 'foo.baz': False}
```

New in version 3000.

CLI Example:

```
salt '*' config.option redis.host
```

salt.modules.config.**valid_fileproto**(*uri*)

Returns a boolean value based on whether or not the URI passed has a valid remote file protocol designation

CLI Example:

```
salt '*' config.valid_fileproto salt://path/to/file
```

26.6.36 salt.modules.cp

Minion side functions for salt-cp

`salt.modules.cp.`**`cache_dest`**`(`*url*, *saltenv=None*`)`

New in version 3000.

Changed in version 3005: `saltenv` will use value from config if not explicitly set

Returns the expected cache path for the file, if cached using *`cp.cache_file`*.

Note: This only returns the _expected_ path, it does not tell you if the URL is really cached. To check if the URL is cached, use *`cp.is_cached`* instead.

CLI Examples:

```
salt '*' cp.cache_dest https://foo.com/bar.rpm
salt '*' cp.cache_dest salt://my/file
salt '*' cp.cache_dest salt://my/file saltenv=dev
```

`salt.modules.cp.`**`cache_dir`**`(`*path*, *saltenv=None*, *include_empty=False*, *include_pat=None*, *exclude_pat=None*`)`

Changed in version 3005: `saltenv` will use value from config if not explicitly set

Download and cache everything under a directory from the master

include_pat

[None] Glob or regex to narrow down the files cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

New in version 2014.7.0.

exclude_pat

[None] Glob or regex to exclude certain files from being cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

Note: If used with `include_pat`, files matching this pattern will be excluded from the subset of files defined by `include_pat`.

New in version 2014.7.0.

CLI Examples:

```
salt '*' cp.cache_dir salt://path/to/dir
salt '*' cp.cache_dir salt://path/to/dir include_pat='E@*.py$'
```

`salt.modules.cp.`**`cache_file`**`(`*path*, *saltenv=None*, *source_hash=None*, *verify_ssl=True*, *use_etag=False*`)`

Changed in version 3005: `saltenv` will use value from config if not explicitly set

Used to cache a single file on the Minion

Returns the location of the new cached file on the Minion

source_hash

If `name` is an http(s) or ftp URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the file if the cached copy matches the specified hash.

New in version 2018.3.0.

verify_ssl
If `False`, remote https file sources (`https://`) and source_hash will not attempt to validate the servers certificate. Default is True.

New in version 3002.

use_etag
If `True`, remote http/https file sources will attempt to use the ETag header to determine if the remote file needs to be downloaded. This provides a lightweight mechanism for promptly refreshing files changed on a web server without requiring a full hash comparison via the `source_hash` parameter.

New in version 3005.

CLI Example:

```
salt '*' cp.cache_file salt://path/to/file
```

There are two ways of defining the fileserver environment (a.k.a. `saltenv`) from which to cache the file. One is to use the `saltenv` parameter, and the other is to use a querystring syntax in the `salt://` URL. The below two examples are equivalent:

```
salt '*' cp.cache_file salt://foo/bar.conf saltenv=config
salt '*' cp.cache_file salt://foo/bar.conf?saltenv=config
```

If the path being cached is a `salt://` URI, and the path does not exist, then `False` will be returned.

Note: It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.

`salt.modules.cp.`**`cache_file_ssh`**(*path*, *saltenv=None*, *source_hash=None*, *verify_ssl=True*, *use_etag=False*)

This function is an alias of `cache_file`.

Changed in version 3005: `saltenv` will use value from config if not explicitly set

Used to cache a single file on the Minion

Returns the location of the new cached file on the Minion

source_hash
If `name` is an http(s) or ftp URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the file if the cached copy matches the specified hash.

New in version 2018.3.0.

verify_ssl
If `False`, remote https file sources (`https://`) and source_hash will not attempt to validate the servers certificate. Default is True.

New in version 3002.

use_etag
If `True`, remote http/https file sources will attempt to use the ETag header to determine if the remote file needs to be downloaded. This provides a lightweight mechanism for promptly refreshing files changed on a web server without requiring a full hash comparison via the `source_hash` parameter.

New in version 3005.

CLI Example:

```
salt '*' cp.cache_file salt://path/to/file
```

There are two ways of defining the fileserver environment (a.k.a. `saltenv`) from which to cache the file. One is to use the `saltenv` parameter, and the other is to use a querystring syntax in the `salt://` URL. The below two examples are equivalent:

```
salt '*' cp.cache_file salt://foo/bar.conf saltenv=config
salt '*' cp.cache_file salt://foo/bar.conf?saltenv=config
```

If the path being cached is a `salt://` URI, and the path does not exist, then `False` will be returned.

Note: It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.

`salt.modules.cp.`**`cache_files`**(*paths*, *saltenv=None*)

Changed in version 3005: `saltenv` will use value from config if not explicitly set

Used to gather many files from the Master, the gathered files will be saved in the minion cachedir reflective to the paths retrieved from the Master

CLI Example:

```
salt '*' cp.cache_files salt://pathto/file1,salt://pathto/file1
```

There are two ways of defining the fileserver environment (a.k.a. `saltenv`) from which to cache the files. One is to use the `saltenv` parameter, and the other is to use a querystring syntax in the `salt://` URL. The below two examples are equivalent:

```
salt '*' cp.cache_files salt://foo/bar.conf,salt://foo/baz.conf↩
↪saltenv=config
salt '*' cp.cache_files salt://foo/bar.conf?saltenv=config,salt://foo/baz.
↪conf?saltenv=config
```

The querystring method is less useful when all files are being cached from the same environment, but is a good way of caching files from multiple different environments in the same command. For example, the below command will cache the first file from the `config1` environment, and the second one from the `config2` environment.

```
salt '*' cp.cache_files salt://foo/bar.conf?saltenv=config1,salt://foo/
↪bar.conf?saltenv=config2
```

Note: It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.

`salt.modules.cp.`**`cache_local_file`**(*path*)

Cache a local file on the minion in the localfiles cache

CLI Example:

```
salt '*' cp.cache_local_file /etc/hosts
```

`salt.modules.cp.`**`cache_master`**(*saltenv=None*)

Changed in version 3005: `saltenv` will use value from config if not explicitly set

Retrieve all of the files on the master and cache them locally

CLI Example:

```
salt '*' cp.cache_master
```

`salt.modules.cp.`**`envs`**()

List available environments for fileserver

CLI Example:

```
salt '*' cp.envs
```

`salt.modules.cp.`**`get_dir`**(*path*, *dest*, *saltenv=None*, *template=None*, *gzip=None*, ***kwargs*)

Changed in version 3005: `saltenv` will use value from config if not explicitly set

Used to recursively copy a directory from the salt master

CLI Example:

```
salt '*' cp.get_dir salt://path/to/dir/ /minion/dest
```

get_dir supports the same template and gzip arguments as get_file.

`salt.modules.cp.`**`get_file`**(*path*, *dest*, *saltenv=None*, *makedirs=False*, *template=None*, *gzip=None*, ***kwargs*)

Changed in version 3005: `saltenv` will use value from config if not explicitly set

Changed in version 2018.3.0: `dest` can now be a directory

Used to get a single file from the salt master

CLI Example:

```
salt '*' cp.get_file salt://path/to/file /minion/dest
```

Template rendering can be enabled on both the source and destination file names like so:

```
salt '*' cp.get_file "salt://{{grains.os}}/vimrc" /etc/vimrc template=jinja
```

This example would instruct all Salt minions to download the vimrc from a directory with the same name as their os grain and copy it to /etc/vimrc

For larger files, the cp.get_file module also supports gzip compression. Because gzip is CPU-intensive, this should only be used in scenarios where the compression ratio is very high (e.g. pretty-printed JSON or YAML files).

Use the *gzip* named argument to enable it. Valid values are 1..9, where 1 is the lightest compression and 9 the heaviest. 1 uses the least CPU on the master (and minion), 9 uses the most.

There are two ways of defining the fileserver environment (a.k.a. `saltenv`) from which to retrieve the file. One is to use the `saltenv` parameter, and the other is to use a querystring syntax in the `salt://` URL. The below two examples are equivalent:

```
salt '*' cp.get_file salt://foo/bar.conf /etc/foo/bar.conf saltenv=config
salt '*' cp.get_file salt://foo/bar.conf?saltenv=config /etc/foo/bar.conf
```

Note: It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.

`salt.modules.cp.`**`get_file_str`**(*path*, *saltenv=None*)

Changed in version 3005: `saltenv` will use value from config if not explicitly set

Download a file from a URL to the Minion cache directory and return the contents of that file

Returns `False` if Salt was unable to cache a file from a URL.

CLI Example:

```
salt '*' cp.get_file_str salt://my/file
```

`salt.modules.cp.`**`get_template`**(*path*, *dest*, *template='jinja'*, *saltenv=None*, *makedirs=False*, ***kwargs*)

Changed in version 3005: `saltenv` will use value from config if not explicitly set

Render a file as a template before setting it down. Warning, order is not the same as in fileclient.cp for non breaking old API.

CLI Example:

```
salt '*' cp.get_template salt://path/to/template /minion/dest
```

`salt.modules.cp.`**`get_url`**(*path*, *dest=''*, *saltenv=None*, *makedirs=False*, *source_hash=None*)

Changed in version 3005: `saltenv` will use value from config if not explicitly set

Changed in version 2018.3.0: `dest` can now be a directory

Used to get a single file from a URL.

path

A URL to download a file from. Supported URL schemes are: `salt://`, `http://`, `https://`, `ftp://`, `s3://`, `swift://` and `file://` (local filesystem). If no scheme was specified, this is equivalent of using `file://`. If a `file://` URL is given, the function just returns absolute path to that file on a local filesystem. The function returns `False` if Salt was unable to fetch a file from a `salt://` URL.

dest

The default behaviour is to write the fetched file to the given destination path. If this parameter is omitted or set as empty string (`''`), the function places the remote file on the local filesystem inside the Minion cache directory and returns the path to that file.

Note: To simply return the file contents instead, set destination to `None`. This works with `salt://`, `http://`, `https://` and `file://` URLs. The files fetched by `http://` and `https://` will not be cached.

saltenv

Salt fileserver environment from which to retrieve the file. Ignored if `path` is not a `salt://` URL.

source_hash

If `path` is an http(s) or ftp URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the file if the cached copy matches the specified hash.

New in version 2018.3.0.

CLI Example:

```
salt '*' cp.get_url salt://my/file /tmp/this_file_is_mine
salt '*' cp.get_url http://www.slashdot.org /tmp/index.html
```

`salt.modules.cp.`**`hash_file`**(*path*, *saltenv=None*)

Changed in version 3005: `saltenv` will use value from config if not explicitly set

Return the hash of a file, to get the hash of a file on the salt master file server prepend the path with salt://<file on server> otherwise, prepend the file with / for a local file.

CLI Example:

```
salt '*' cp.hash_file salt://path/to/file
```

`salt.modules.cp.`**`hash_file_ssh`**(*path*, *saltenv=None*)

This function is an alias of `hash_file`.

> Changed in version 3005: `saltenv` will use value from config if not explicitly set
>
> Return the hash of a file, to get the hash of a file on the salt master file server prepend the path with salt://<file on server> otherwise, prepend the file with / for a local file.
>
> CLI Example:
>
> ```
> salt '*' cp.hash_file salt://path/to/file
> ```

`salt.modules.cp.`**`is_cached`**(*path*, *saltenv=None*)

Changed in version 3005: `saltenv` will use value from config if not explicitly set

Returns the full path to a file if it is cached locally on the minion otherwise returns a blank string

CLI Example:

```
salt '*' cp.is_cached salt://path/to/file
```

`salt.modules.cp.`**`list_master`**(*saltenv=None*, *prefix=''*)

Changed in version 3005: `saltenv` will use value from config if not explicitly set

List all of the files stored on the master

CLI Example:

```
salt '*' cp.list_master
```

`salt.modules.cp.`**`list_master_dirs`**(*saltenv=None*, *prefix=''*)

Changed in version 3005: `saltenv` will use value from config if not explicitly set

List all of the directories stored on the master

CLI Example:

```
salt '*' cp.list_master_dirs
```

`salt.modules.cp.`**`list_master_symlinks`**(*saltenv=None*, *prefix=''*)

Changed in version 3005: `saltenv` will use value from config if not explicitly set

List all of the symlinks stored on the master

CLI Example:

```
salt '*' cp.list_master_symlinks
```

`salt.modules.cp.`**`list_minion`**(*saltenv=None*)

Changed in version 3005: `saltenv` will use value from config if not explicitly set

List all of the files cached on the minion

CLI Example:

```
salt '*' cp.list_minion
```

`salt.modules.cp.`**`list_states`**(*saltenv=None*)

Changed in version 3005: `saltenv` will use value from config if not explicitly set

List all of the available state files in an environment

CLI Example:

```
salt '*' cp.list_states
```

`salt.modules.cp.`**`push`**(*path*, *keep_symlinks=False*, *upload_path=None*, *remove_source=False*)

WARNING Files pushed to the master will have global read permissions..

Push a file from the minion up to the master, the file will be saved to the salt master in the master's minion files cachedir (defaults to `/var/cache/salt/master/minions/minion-id/files`)

Since this feature allows a minion to push a file up to the master server it is disabled by default for security purposes. To enable, set `file_recv` to `True` in the master configuration file, and restart the master.

keep_symlinks
Keep the path value without resolving its canonical form

upload_path
Provide a different path inside the master's minion files cachedir

remove_source
Remove the source file on the minion

New in version 2016.3.0.

CLI Example:

```
salt '*' cp.push /etc/fstab
salt '*' cp.push /etc/system-release keep_symlinks=True
salt '*' cp.push /etc/fstab upload_path='/new/path/fstab'
salt '*' cp.push /tmp/filename remove_source=True
```

`salt.modules.cp.`**`push_dir`**(*path*, *glob=None*, *upload_path=None*)

Push a directory from the minion up to the master, the files will be saved to the salt master in the master's minion files cachedir (defaults to `/var/cache/salt/master/minions/minion-id/files`). It also has a glob for matching specific files using globbing.

New in version 2014.7.0.

Since this feature allows a minion to push files up to the master server it is disabled by default for security purposes. To enable, set `file_recv` to `True` in the master configuration file, and restart the master.

upload_path
Provide a different path and directory name inside the master's minion files cachedir

CLI Example:

```
salt '*' cp.push /usr/lib/mysql
salt '*' cp.push /usr/lib/mysql upload_path='/newmysql/path'
salt '*' cp.push_dir /etc/modprobe.d/ glob='*.conf'
```

`salt.modules.cp.`**`recv`**(*files*, *dest*)

Used with salt-cp, pass the files dict, and the destination.

This function receives small fast copy files from the master via salt-cp. It does not work via the CLI.

CLI Example:

```
salt '*' cp.recv
```

`salt.modules.cp.`**`recv_chunked`**(*dest*, *chunk*, *append=False*, *compressed=True*, *mode=None*)

This function receives files copied to the minion using `salt-cp` and is not intended to be used directly on the CLI.

CLI Example:

```
salt '*' cp.recv_chunked
```

`salt.modules.cp.`**`stat_file`**(*path*, *saltenv=None*, *octal=True*)

Changed in version 3005: `saltenv` will use value from config if not explicitly set

Return the permissions of a file, to get the permissions of a file on the salt master file server prepend the path with salt://<file on server> otherwise, prepend the file with / for a local file.

CLI Example:

```
salt '*' cp.stat_file salt://path/to/file
```

26.6.37 salt.modules.cron

Work with cron

Note: Salt does not escape cron metacharacters automatically. You should backslash-escape percent characters and any other metacharacters that might be interpreted incorrectly by the shell.

`salt.modules.cron.`**`get_entry`**(*user*, *identifier=None*, *cmd=None*)

Return the specified entry from user's crontab. identifier will be used if specified, otherwise will lookup cmd Either identifier or cmd should be specified.

user:
User's crontab to query

identifier:
Search for line with identifier

cmd:
Search for cron line with cmd

CLI Example:

```
salt '*' cron.get_entry root identifier=task1
```

`salt.modules.cron.`**`list_tab`**(*user*)

Return the contents of the specified user's crontab

CLI Example:

```
salt '*' cron.list_tab root
```

`salt.modules.cron.`**`ls`**(*user*)

This function is an alias of `list_tab`.

> Return the contents of the specified user's crontab
>
> CLI Example:
>
> ```
> salt '*' cron.list_tab root
> ```

`salt.modules.cron.`**`raw_cron`**(*user*)

Return the contents of the user's crontab

CLI Example:

```
salt '*' cron.raw_cron root
```

`salt.modules.cron.`**`rm`**(*user, cmd, minute=None, hour=None, daymonth=None, month=None, dayweek=None, identifier=None*)

This function is an alias of `rm_job`.

> Remove a cron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.
>
> CLI Example:
>
> ```
> salt '*' cron.rm_job root /usr/local/weekly
> salt '*' cron.rm_job root /usr/bin/foo dayweek=1
> ```

`salt.modules.cron.`**`rm_env`**(*user, name*)

Remove cron environment variable for a specified user.

CLI Example:

```
salt '*' cron.rm_env root MAILTO
```

`salt.modules.cron.`**`rm_job`**(*user, cmd, minute=None, hour=None, daymonth=None, month=None, dayweek=None, identifier=None*)

Remove a cron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

CLI Example:

```
salt '*' cron.rm_job root /usr/local/weekly
salt '*' cron.rm_job root /usr/bin/foo dayweek=1
```

`salt.modules.cron.`**`rm_special`**(*user, cmd, special=None, identifier=None*)

Remove a special cron job for a specified user.

CLI Example:

```
salt '*' cron.rm_special root /usr/bin/foo
```

`salt.modules.cron.`**`set_env`**(*user*, *name*, *value=None*)

Set up an environment variable in the crontab.

CLI Example:

```
salt '*' cron.set_env root MAILTO user@example.com
```

`salt.modules.cron.`**`set_job`**(*user*, *minute*, *hour*, *daymonth*, *month*, *dayweek*, *cmd*, *commented=False*, *comment=None*, *identifier=None*)

Sets a cron job up for a specified user.

CLI Example:

```
salt '*' cron.set_job root '*' '*' '*' '*' 1 /usr/local/weekly
```

`salt.modules.cron.`**`set_special`**(*user*, *special*, *cmd*, *commented=False*, *comment=None*, *identifier=None*)

Set up a special command in the crontab.

CLI Example:

```
salt '*' cron.set_special root @hourly 'echo foobar'
```

`salt.modules.cron.`**`write_cron_file`**(*user*, *path*)

Writes the contents of a file to a user's crontab

CLI Example:

```
salt '*' cron.write_cron_file root /tmp/new_cron
```

Changed in version 2015.8.9.

Note: Some OS' do not support specifying user via the *crontab* command i.e. (Solaris, AIX)

`salt.modules.cron.`**`write_cron_file_verbose`**(*user*, *path*)

Writes the contents of a file to a user's crontab and return error message on error

CLI Example:

```
salt '*' cron.write_cron_file_verbose root /tmp/new_cron
```

Changed in version 2015.8.9.

Note: Some OS' do not support specifying user via the *crontab* command i.e. (Solaris, AIX)

26.6.38 salt.modules.cryptdev

Salt module to manage Unix cryptsetup jobs and the crypttab file

New in version 2018.3.0.

`salt.modules.cryptdev.`**`active`**`()`

List existing device-mapper device details.

`salt.modules.cryptdev.`**`close`**`(`*name*`)`

Close a crypt device using `cryptsetup`.

CLI Example:

```
salt '*' cryptdev.close foo
```

`salt.modules.cryptdev.`**`crypttab`**`(`*config='/etc/crypttab'*`)`

List the contents of the crypttab

CLI Example:

```
salt '*' cryptdev.crypttab
```

`salt.modules.cryptdev.`**`open`**`(`*name, device, keyfile*`)`

Open a crypt device using `cryptsetup`. The `keyfile` must not be `None` or `'none'`, because `cryptsetup` will otherwise ask for the password interactively.

CLI Example:

```
salt '*' cryptdev.open foo /dev/sdz1 /path/to/keyfile
```

`salt.modules.cryptdev.`**`rm_crypttab`**`(`*name, config='/etc/crypttab'*`)`

Remove the named mapping from the crypttab. If the described entry does not exist, nothing is changed, but the command succeeds by returning `'absent'`. If a line is removed, it returns `'change'`.

CLI Example:

```
salt '*' cryptdev.rm_crypttab foo
```

`salt.modules.cryptdev.`**`set_crypttab`**`(`*name, device, password='none', options='', config='/etc/crypttab', test=False, match_on='name'*`)`

Verify that this device is represented in the crypttab, change the device to match the name passed, or add the name if it is not present.

CLI Example:

```
salt '*' cryptdev.set_crypttab foo /dev/sdz1 mypassword swap,size=256
```

26.6.39 salt.modules.data

Manage a local persistent data structure that can hold any arbitrary data specific to the minion

`salt.modules.data.`**`cas`**`(`*key*, *value*, *old_value*`)`

Check and set a value in the minion datastore

CLI Example:

```
salt '*' data.cas <key> <value> <old_value>
```

`salt.modules.data.`**`clear`**`()`

Clear out all of the data in the minion datastore, this function is destructive!

CLI Example:

```
salt '*' data.clear
```

`salt.modules.data.`**`dump`**`(`*new_data*`)`

Replace the entire datastore with a passed data structure

CLI Example:

```
salt '*' data.dump '{'eggs': 'spam'}'
```

`salt.modules.data.`**`get`**`(`*key*, *default=None*`)`

Get a (list of) value(s) from the minion datastore

New in version 2015.8.0.

CLI Example:

```
salt '*' data.get key
salt '*' data.get '["key1", "key2"]'
```

`salt.modules.data.`**`has_key`**`(`*key*`)`

Check if key is in the minion datastore

New in version 2015.8.0.

CLI Example:

```
salt '*' data.has_key <mykey>
```

`salt.modules.data.`**`items`**`()`

Get items from the minion datastore

New in version 2015.8.0.

CLI Example:

```
salt '*' data.items
```

`salt.modules.data.`**`keys`**`()`

Get all keys from the minion datastore

New in version 2015.8.0.

CLI Example:

```
salt '*' data.keys
```

`salt.modules.data.`**`load`**`()`

Return all of the data in the minion datastore

CLI Example:

```
salt '*' data.load
```

`salt.modules.data.`**`pop`**`(`*key, default=None*`)`

Pop (return & delete) a value from the minion datastore

New in version 2015.5.2.

CLI Example:

```
salt '*' data.pop <key> "there was no val"
```

`salt.modules.data.`**`update`**`(`*key, value*`)`

Update a key with a value in the minion datastore

CLI Example:

```
salt '*' data.update <key> <value>
```

`salt.modules.data.`**`values`**`()`

Get values from the minion datastore

New in version 2015.8.0.

CLI Example:

```
salt '*' data.values
```

26.6.40 salt.modules.debconfmod

Support for Debconf

`salt.modules.debconfmod.`**`get_selections`**`(`*fetchempty=True*`)`

Answers to debconf questions for all packages in the following format:

```
{'package': [['question', 'type', 'value'], ...]}
```

CLI Example:

```
salt '*' debconf.get_selections
```

`salt.modules.debconfmod.`**`set_`**`(`*package, question, type, value, *extra*`)`

Set answers to debconf questions for a package.

CLI Example:

```
salt '*' debconf.set <package> <question> <type> <value> [<value> ...]
```

`salt.modules.debconfmod.`**`set_file`**(*path*, *saltenv='base'*, ***kwargs*)

Set answers to debconf questions from a file.

CLI Example:

```
salt '*' debconf.set_file salt://pathto/pkg.selections
```

`salt.modules.debconfmod.`**`set_template`**(*path*, *template*, *context*, *defaults*, *saltenv='base'*, ***kwargs*)

Set answers to debconf questions from a template.

path
location of the file containing the package selections

template
template format

context
variables to add to the template environment

default
default values for the template environment

CLI Example:

```
salt '*' debconf.set_template salt://pathto/pkg.selections.jinja jinja
↪None None
```

`salt.modules.debconfmod.`**`show`**(*name*)

Answers to debconf questions for a package in the following format:

```
[['question', 'type', 'value'], ...]
```

If debconf doesn't know about a package, we return None.

CLI Example:

```
salt '*' debconf.show <package name>
```

26.6.41 salt.modules.debian_ip

The networking module for Debian-based distros

References:

- http://www.debian.org/doc/manuals/debian-reference/ch05.en.html

`salt.modules.debian_ip.`**`apply_network_settings`**(***settings*)

Apply global network configuration.

CLI Example:

```
salt '*' ip.apply_network_settings
```

`salt.modules.debian_ip.`**`build_bond`**(*iface*, ***settings*)

Create a bond script in /etc/modprobe.d with the passed settings and load the bonding kernel module.

CLI Example:

```
salt '*' ip.build_bond bond0 mode=balance-alb
```

`salt.modules.debian_ip.`**`build_interface`**`(`*iface, iface_type, enabled, **settings*`)`

Build an interface script for a network interface.

CLI Example:

```
salt '*' ip.build_interface eth0 eth <settings>
```

`salt.modules.debian_ip.`**`build_network_settings`**`(`***settings*`)`

Build the global network script.

CLI Example:

```
salt '*' ip.build_network_settings <settings>
```

`salt.modules.debian_ip.`**`build_routes`**`(`*iface, **settings*`)`

Add route scripts for a network interface using up commands.

CLI Example:

```
salt '*' ip.build_routes eth0 <settings>
```

`salt.modules.debian_ip.`**`down`**`(`*iface, iface_type*`)`

Shutdown a network interface

CLI Example:

```
salt '*' ip.down eth0 eth
```

`salt.modules.debian_ip.`**`get_bond`**`(`*iface*`)`

Return the content of a bond script

CLI Example:

```
salt '*' ip.get_bond bond0
```

`salt.modules.debian_ip.`**`get_interface`**`(`*iface*`)`

Return the contents of an interface script

CLI Example:

```
salt '*' ip.get_interface eth0
```

`salt.modules.debian_ip.`**`get_network_settings`**`()`

Return the contents of the global network script.

CLI Example:

```
salt '*' ip.get_network_settings
```

`salt.modules.debian_ip.`**`get_routes`**`(`*iface*`)`

Return the routes for the interface

CLI Example:

```
salt '*' ip.get_routes eth0
```

`salt.modules.debian_ip.`**`up`**`(`*iface*, *iface_type*`)`

Start up a network interface

CLI Example:

```
salt '*' ip.up eth0 eth
```

26.6.42 salt.modules.debian_service

Service support for Debian systems (uses update-rc.d and /sbin/service)

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *'service.start' is not available*), see *here*.

`salt.modules.debian_service.`**`available`**`(`*name*`)`

Returns `True` if the specified service is available, otherwise returns `False`.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.debian_service.`**`disable`**`(`*name*, ***kwargs*`)`

Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.debian_service.`**`disabled`**`(`*name*`)`

Return True if the named service is disabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.debian_service.`**`enable`**`(`*name*, ***kwargs*`)`

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.debian_service.`**`enabled`**`(`*name*, ***kwargs*`)`

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.debian_service.`**`force_reload`**`(`*name*`)`

Force-reload the named service

CLI Example:

```
salt '*' service.force_reload <service name>
```

`salt.modules.debian_service.`**`get_all`**`()`

Return all available boot services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.debian_service.`**`get_disabled`**`()`

Return a set of services that are installed but disabled

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.debian_service.`**`get_enabled`**`()`

Return a list of service that are enabled on boot

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.debian_service.`**`missing`**`(`*name*`)`

The inverse of service.available. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.debian_service.`**`reload_`**`(`*name*`)`

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.debian_service.`**`restart`**`(`*name*`)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.debian_service.`**`start`**`(`*name*`)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.debian_service.`**`status`**`(`*name*, *sig=None*`)`

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Parameters

- **name** (*str*) -- The name of the service to check
- **sig** (*str*) -- Signature to use to find the service via ps

Returns

True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type

bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

`salt.modules.debian_service.`**`stop`**`(`*name*`)`

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

26.6.43 salt.modules.debuild_pkgbuild

Debian Package builder system

New in version 2015.8.0.

This system allows for all of the components to build debs safely in chrooted environments. This also provides a function to generate debian repositories

This module implements the pkgbuild interface

`salt.modules.debuild_pkgbuild.`**`build`**`(`*runas*, *tgt*, *dest_dir*, *spec*, *sources*, *deps*, *env*, *template*, *saltenv='base'*, *log_dir='/var/log/salt/pkgbuild'*`)`

Given the package destination directory, the tarball containing debian files (e.g. control) and package sources, use pbuilder to safely build the platform package

CLI Example:

Debian

```
salt '*' pkgbuild.make_src_pkg deb-8-x86_64 /var/www/html
        https://raw.githubusercontent.com/saltstack/libnacl/master/pkg/
↪deb/python-libnacl.control
        https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.
↪tar.gz
```

This example command should build the libnacl package for Debian using pbuilder and place it in /var/www/html/ on the minion `salt.modules.debuild_pkgbuild.`**`make_repo`**(*repodir*, *keyid=None*, *env=None*, *use_passphrase=False*, *gnupghome='/etc/salt/gpgkeys'*, *runas='root'*, *timeout=15.0*)

Make a package repository and optionally sign it and packages present

Given the repodir (directory to create repository in), create a Debian repository and optionally sign it and packages present. This state is best used with onchanges linked to your package building states.

repodir

The directory to find packages that will be in the repository.

keyid

Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. This consists of the last 8 hex digits of the GPG key ID.

Utilizes Public and Private keys associated with keyid which have been loaded into the minion's Pillar data. Leverages gpg-agent and gpg-preset-passphrase for caching keys, etc. These pillar values are assumed to be filenames which are present in `gnupghome`. The pillar keys shown below have to match exactly.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```
gpg_pkg_priv_keyname: gpg_pkg_key.pem
gpg_pkg_pub_keyname: gpg_pkg_key.pub
```

env

Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository.

use_passphrase

[False] New in version 2016.3.0.

Use a passphrase with the signing key presented in `keyid`. Passphrase is received from Pillar data which could be passed on the command line with `pillar` parameter. For example:

```
pillar='{ "gpg_passphrase" : "my_passphrase" }'
```

gnupghome

[/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with `keyid`.

runas

[root] New in version 2016.3.0.

User to create the repository as, and optionally sign packages.

Note: Ensure the user has correct permissions to any files and directories which are to be utilized.

---

timeout

[15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

CLI Example:

```
salt '*' pkgbuild.make_repo /var/www/html
```

`salt.modules.debuild_pkgbuild.`**`make_src_pkg`**(*dest_dir*, *spec*, *sources*, *env=None*, *saltenv='base'*, *runas='root'*)

Create a platform specific source package from the given platform spec/control file and sources

CLI Example:

Debian

```
salt '*' pkgbuild.make_src_pkg /var/www/html/
        https://raw.githubusercontent.com/saltstack/libnacl/master/pkg/
↪deb/python-libnacl.control.tar.xz
        https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.
↪tar.gz
```

This example command should build the libnacl SOURCE package and place it in /var/www/html/ on the minion

dest_dir
Absolute path for directory to write source package

spec
Absolute path to spec file or equivalent

sources
Absolute path to source files to build source package from

env
[None] A list or dictionary of environment variables to be set prior to execution. Example:

```
- env:
    - DEB_BUILD_OPTIONS: 'nocheck'
```

> **Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.

saltenv: base

Salt environment variables

runas
[root] New in version 2019.2.1.

User to create the files and directories

Note: Ensure the user has correct permissions to any files and directories which are to be utilized.

26.6.44 salt.modules.defaults

Module to work with salt formula defaults files

`salt.modules.defaults.`**`deepcopy`**`(`*source*`)`

Allows deep copy of objects in formulas.

> By default, Python does not copy objects, it creates bindings between a target and an object.

It is more typical to use this in a templating language in formulas, instead of directly on the command-line.

`salt.modules.defaults.`**`get`**`(`*key*, *default=''*`)`

defaults.get is used much like pillar.get except that it will read a default value for a pillar from defaults.json or defaults.yaml files that are stored in the root of a salt formula.

CLI Example:

```
salt '*' defaults.get core:users:root
```

The defaults is computed from pillar key. The first entry is considered as the formula namespace.

For example, querying `core:users:root` will try to load `salt://core/defaults.yaml` and `salt://core/defaults.json`.

`salt.modules.defaults.`**`merge`**`(`*dest*, *src*, *merge_lists=False*, *in_place=True*, *convert_none=True*`)`

Allows deep merging of dicts in formulas.

merge_lists
[False] If True, it will also merge lists instead of replace their items.

in_place
[True] If True, it will merge into dest dict, if not it will make a new copy from that dict and return it.

convert_none
[True] If True, it will convert src and dest to empty dicts if they are None. If True and dest is None but in_place is True, raises TypeError. If False it will make a new copy from that dict and return it.

New in version 3005.

CLI Example:

```
salt '*' defaults.merge '{a: b}' '{d: e}'
```

It is more typical to use this in a templating language in formulas, instead of directly on the command-line.

`salt.modules.defaults.`**`update`**`(`*dest*, *defaults*, *merge_lists=True*, *in_place=True*, *convert_none=True*`)`

Allows setting defaults for group of data set e.g. group for nodes.

> This function is a combination of defaults.merge and defaults.deepcopy to avoid redundant in jinja.
>
> Example:

```
group01:
  defaults:
    enabled: True
    extra:
      - test
      - stage
  nodes:
    host01:
```

(continues on next page)

(continued from previous page)

```
      index: foo
      upstream: bar
    host02:
      index: foo2
      upstream: bar2
```

```
{% do salt['defaults.update'](group01.nodes, group01.defaults) %}
```

Each node will look like the following:

```
host01:
  enabled: True
  index: foo
  upstream: bar
  extra:
    - test
    - stage
```

merge_lists
[True] If True, it will also merge lists instead of replace their items.

in_place
[True] If True, it will merge into dest dict. if not it will make a new copy from that dict and return it.

convert_none
[True] If True, it will convert src and dest to empty dicts if they are None. If True and dest is None but in_place is True, raises TypeError. If False it will make a new copy from that dict and return it.

New in version 3005.

It is more typical to use this in a templating language in formulas, instead of directly on the command-line.

26.6.45 salt.modules.devinfo

Module for devinfo :maintainer: Alberto Planas <aplanas@suse.com> :maturity: new :depends: None :platform: Linux

`salt.modules.devinfo.`**`filter_`**(*udev_in=None*, *udev_ex=None*)

Returns a list of devices, filtered under udev keys.

udev_in
A dictionary of key:values that are expected in the device udev information

udev_ex
A dictionary of key:values that are not expected in the device udev information (excluded)

The key is a lower case string, joined by dots, that represent a path in the udev information dictionary. For example, 'e.id_bus' will represent the udev entry *udev['E']['ID_BUS']*

If the udev entry is a list, the algorithm will check that at least one item match one item of the value of the parameters.

Returns list of devices that match *udev_in* and do not match *udev_ex*.

CLI Example:

```
salt '*' devinfo.filter udev_in='{"e.id_bus": "ata"}'
```

`salt.modules.devinfo.`**`hwinfo`**`(`*items=None, short=True, listmd=False, devices=None*`)`

Probe for hardware

items
List of hardware items to inspect. Default ['bios', 'cpu', 'disk', 'memory', 'network', 'partition']

short
Show only a summary. Default True.

listmd
Report RAID devices. Default False.

devices
List of devices to show information from. Default None.

CLI Example:

```
salt '*' devinfo.hwinfo
salt '*' devinfo.hwinfo items='["disk"]' short=no
salt '*' devinfo.hwinfo items='["disk"]' short=no devices='["/dev/sda"]'
salt '*' devinfo.hwinfo devices=/dev/sda
```

26.6.46 salt.modules.devmap

Device-Mapper module

`salt.modules.devmap.`**`multipath_flush`**`(`*device*`)`

Device-Mapper Multipath flush

CLI Example:

```
salt '*' devmap.multipath_flush mpath1
```

`salt.modules.devmap.`**`multipath_list`**`()`

Device-Mapper Multipath list

CLI Example:

```
salt '*' devmap.multipath_list
```

26.6.47 salt.modules.dig

Compendium of generic DNS utilities. The 'dig' command line tool must be installed in order to use this module.

`salt.modules.dig.`**`A`**`(`*host, nameserver=None*`)`

Return the A record for `host`.

Always returns a list.

CLI Example:

```
salt ns1 dig.A www.google.com
```

`salt.modules.dig.`**`AAAA`**`(`*host*, *nameserver=None*`)`

Return the AAAA record for `host`.

Always returns a list.

CLI Example:

```
salt ns1 dig.AAAA www.google.com
```

`salt.modules.dig.`**`CNAME`**`(`*host*, *nameserver=None*`)`

Return the CNAME record for `host`.

New in version 3005.

CLI Example:

```
salt ns1 dig.CNAME mail.google.com
```

`salt.modules.dig.`**`MX`**`(`*domain*, *resolve=False*, *nameserver=None*`)`

Return a list of lists for the MX of `domain`.

If the `resolve` argument is True, resolve IPs for the servers.

It's limited to one IP, because although in practice it's very rarely a round robin, it is an acceptable configuration and pulling just one IP lets the data be similar to the non-resolved version. If you think an MX has multiple IPs, don't use the resolver here, resolve them in a separate step.

CLI Example:

```
salt ns1 dig.MX google.com
```

`salt.modules.dig.`**`NS`**`(`*domain*, *resolve=True*, *nameserver=None*`)`

Return a list of IPs of the nameservers for `domain`

If `resolve` is False, don't resolve names.

CLI Example:

```
salt ns1 dig.NS google.com
```

`salt.modules.dig.`**`PTR`**`(`*host*, *nameserver=None*`)`

New in version 3006.0.

Return the PTR record for `host`.

Always returns a list.

CLI Example:

```
salt ns1 dig.PTR 1.2.3.4
```

`salt.modules.dig.`**`SPF`**`(`*domain*, *record='SPF'*, *nameserver=None*`)`

Return the allowed IPv4 ranges in the SPF record for `domain`.

If record is `SPF` and the SPF record is empty, the TXT record will be searched automatically. If you know the domain uses TXT and not SPF, specifying that will save a lookup.

CLI Example:

```
salt ns1 dig.SPF google.com
```

`salt.modules.dig.`**`TXT`**`(`*host, nameserver=None*`)`

Return the TXT record for `host`.

Always returns a list.

CLI Example:

```
salt ns1 dig.TXT google.com
```

`salt.modules.dig.`**`a`**`(`*host, nameserver=None*`)`

Return the A record for `host`.

Always returns a list.

CLI Example:

```
salt ns1 dig.A www.google.com
```

`salt.modules.dig.`**`aaaa`**`(`*host, nameserver=None*`)`

Return the AAAA record for `host`.

Always returns a list.

CLI Example:

```
salt ns1 dig.AAAA www.google.com
```

`salt.modules.dig.`**`check_ip`**`(`*addr*`)`

Check if address is a valid IP. returns True if valid, otherwise False.

CLI Example:

```
salt ns1 dig.check_ip 127.0.0.1
salt ns1 dig.check_ip 1111:2222:3333:4444:5555:6666:7777:8888
```

`salt.modules.dig.`**`cname`**`(`*host, nameserver=None*`)`

Return the CNAME record for `host`.

New in version 3005.

CLI Example:

```
salt ns1 dig.CNAME mail.google.com
```

`salt.modules.dig.`**`mx`**`(`*domain, resolve=False, nameserver=None*`)`

Return a list of lists for the MX of `domain`.

If the `resolve` argument is True, resolve IPs for the servers.

It's limited to one IP, because although in practice it's very rarely a round robin, it is an acceptable configuration and pulling just one IP lets the data be similar to the non-resolved version. If you think an MX has multiple IPs, don't use the resolver here, resolve them in a separate step.

CLI Example:

```
salt ns1 dig.MX google.com
```

`salt.modules.dig.`**`ns`**(*domain*, *resolve=True*, *nameserver=None*)

Return a list of IPs of the nameservers for `domain`

If `resolve` is False, don't resolve names.

CLI Example:

```
salt ns1 dig.NS google.com
```

`salt.modules.dig.`**`ptr`**(*host*, *nameserver=None*)

New in version 3006.0.

Return the PTR record for `host`.

Always returns a list.

CLI Example:

```
salt ns1 dig.PTR 1.2.3.4
```

`salt.modules.dig.`**`spf`**(*domain*, *record='SPF'*, *nameserver=None*)

Return the allowed IPv4 ranges in the SPF record for `domain`.

If record is `SPF` and the SPF record is empty, the TXT record will be searched automatically. If you know the domain uses TXT and not SPF, specifying that will save a lookup.

CLI Example:

```
salt ns1 dig.SPF google.com
```

26.6.48 salt.modules.disk

Module for managing disks and blockdevices

`salt.modules.disk.`**`blkid`**(*device=None*, *token=None*)

Return block device attributes: UUID, LABEL, etc. This function only works on systems where blkid is available.

device
Device name from the system

token
Any valid token used for the search

CLI Example:

```
salt '*' disk.blkid
salt '*' disk.blkid /dev/sda
salt '*' disk.blkid token='UUID=6a38ee5-7235-44e7-8b22-816a403bad5d'
salt '*' disk.blkid token='TYPE=ext4'
```

`salt.modules.disk.`**`dump`**(*device*, *args=None*)

Return all contents of dumpe2fs for a specified device

device
The device path to dump.

args
A list of attributes to return. Returns all by default.

CLI Example:

```
salt '*' disk.dump /dev/sda1
```

`salt.modules.disk.`**`format_`**(*device*, *fs_type='ext4'*, *inode_size=None*, *lazy_itable_init=None*, *fat=None*, *force=False*)

Format a filesystem onto a device

New in version 2016.11.0.

device
The device in which to create the new filesystem

fs_type
The type of filesystem to create

inode_size
Size of the inodes

This option is only enabled for ext and xfs filesystems

lazy_itable_init
If enabled and the uninit_bg feature is enabled, the inode table will not be fully initialized by mke2fs. This speeds up filesystem initialization noticeably, but it requires the kernel to finish initializing the filesystem in the background when the filesystem is first mounted. If the option value is omitted, it defaults to 1 to enable lazy inode table zeroing.

This option is only enabled for ext filesystems

fat
FAT size option. Can be 12, 16 or 32, and can only be used on fat or vfat filesystems.

force
Force mke2fs to create a filesystem, even if the specified device is not a partition on a block special device. This option is only enabled for ext and xfs filesystems

This option is dangerous, use it with caution.

CLI Example:

```
salt '*' disk.format /dev/sdX1
```

`salt.modules.disk.`**`fstype`**(*device*)

Return the filesystem name of the specified device

New in version 2016.11.0.

device
The name of the device

CLI Example:

```
salt '*' disk.fstype /dev/sdX1
```

`salt.modules.disk.`**`get_fstype_from_path`**(*path*)

Return the filesystem type of the underlying device for a specified path.

New in version 3006.0.

path
The path for the function to evaluate.

CLI Example:

```
salt '*' disk.get_fstype_from_path /root
```

`salt.modules.disk.`**`hdparms`**`(`*disks*, *args='aAbBcCdgHiJkMmNnQrRuW'*`)`

Retrieve disk parameters.

New in version 2016.3.0.

disks
Single disk or list of disks to query.

args
Sequence of `hdparm` flags to fetch.

CLI Example:

```
salt '*' disk.hdparms /dev/sda
```

`salt.modules.disk.`**`hpa`**`(`*disks*, *size=None*`)`

Get/set Host Protected Area settings

T13 INCITS 346-2001 (1367D) defines the BEER (Boot Engineering Extension Record) and PARTIES (Protected Area Run Time Interface Extension Services), allowing for a Host Protected Area on a disk.

It's often used by OEMS to hide parts of a disk, and for overprovisioning SSD's

Warning: Setting the HPA might clobber your data, be very careful with this on active disks!

New in version 2016.3.0.

CLI Example:

```
salt '*' disk.hpa /dev/sda
salt '*' disk.hpa /dev/sda 5%
salt '*' disk.hpa /dev/sda 10543256
```

`salt.modules.disk.`**`inodeusage`**`(`*args=None*`)`

Return inode usage information for volumes mounted on this minion

args
Sequence of flags to pass to the `df` command.

CLI Example:

```
salt '*' disk.inodeusage
```

`salt.modules.disk.`**`iostat`**`(`*interval=1*, *count=5*, *disks=None*`)`

Gather and return (averaged) IO stats.

New in version 2016.3.0.

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' disk.iostat 1 5 disks=sda
```

`salt.modules.disk.`**`percent`**`(`*args=None*`)`

Return partition information for volumes mounted on this minion

args
Specify a single partition for which to return data.

CLI Example:

```
salt '*' disk.percent /var
```

`salt.modules.disk.`**`resize2fs`**`(`*device*`)`

Resizes the filesystem.

CLI Example:

```
salt '*' disk.resize2fs /dev/sda1
```

`salt.modules.disk.`**`smart_attributes`**`(`*dev, attributes=None, values=None*`)`

Fetch SMART attributes Providing attributes will deliver only requested attributes Providing values will deliver only requested values for attributes

Default is the Backblaze recommended set (https://www.backblaze.com/blog/hard-drive-smart-stats/): (5,187,188,197,198)

New in version 2016.3.0.

CLI Example:

```
salt '*' disk.smart_attributes /dev/sda
salt '*' disk.smart_attributes /dev/sda attributes=(5,187,188,197,198)
```

`salt.modules.disk.`**`tune`**`(`*device, **kwargs*`)`

Set attributes for the specified device

CLI Example:

```
salt '*' disk.tune /dev/sda1 read-ahead=1024 read-write=True
```

Valid options are: `read-ahead`, `filesystem-read-ahead`, `read-only`, `read-write`.

See the `blockdev(8)` manpage for a more complete description of these options.

`salt.modules.disk.`**`usage`**`(`*args=None*`)`

Return usage information for volumes mounted on this minion

args
Sequence of flags to pass to the `df` command.

Changed in version 2019.2.0: Default for SunOS changed to 1 kilobyte blocks

CLI Example:

```
salt '*' disk.usage
```

`salt.modules.disk.`**`wipe`**`(`*device*`)`

Remove the filesystem information

CLI Example:

```
salt '*' disk.wipe /dev/sda1
```

26.6.49 salt.modules.dnsutil

Compendium of generic DNS utilities.

Note: Some functions in the `dnsutil` execution module depend on `dig`.

`salt.modules.dnsutil.`**`A`**`(`*host*, *nameserver=None*`)`

Return the A record(s) for `host`.

Always returns a list.

CLI Example:

```
salt ns1 dnsutil.A www.google.com
```

`salt.modules.dnsutil.`**`AAAA`**`(`*host*, *nameserver=None*`)`

Return the AAAA record(s) for `host`.

Always returns a list.

New in version 2014.7.5.

CLI Example:

```
salt ns1 dnsutil.AAAA www.google.com
```

`salt.modules.dnsutil.`**`MX`**`(`*domain*, *resolve=False*, *nameserver=None*`)`

Return a list of lists for the MX of `domain`.

If the 'resolve' argument is True, resolve IPs for the servers.

It's limited to one IP, because although in practice it's very rarely a round robin, it is an acceptable configuration and pulling just one IP lets the data be similar to the non-resolved version. If you think an MX has multiple IPs, don't use the resolver here, resolve them in a separate step.

CLI Example:

```
salt ns1 dnsutil.MX google.com
```

`salt.modules.dnsutil.`**`NS`**`(`*domain*, *resolve=True*, *nameserver=None*`)`

Return a list of IPs of the nameservers for `domain`

If 'resolve' is False, don't resolve names.

CLI Example:

```
salt ns1 dnsutil.NS google.com
```

`salt.modules.dnsutil.`**`SPF`**`(`*domain*, *record='SPF'*, *nameserver=None*`)`

Return the allowed IPv4 ranges in the SPF record for `domain`.

If record is `SPF` and the SPF record is empty, the TXT record will be searched automatically. If you know the domain uses TXT and not SPF, specifying that will save a lookup.

CLI Example:

```
salt ns1 dnsutil.SPF google.com
```

`salt.modules.dnsutil.`**`check_ip`**(*ip_addr*)

Check that string ip_addr is a valid IP

CLI Example:

```
salt ns1 dnsutil.check_ip 127.0.0.1
```

`salt.modules.dnsutil.`**`hosts_append`**(*hostsfile='/etc/hosts', ip_addr=None, entries=None*)

Append a single line to the /etc/hosts file.

CLI Example:

```
salt '*' dnsutil.hosts_append /etc/hosts 127.0.0.1 ad1.yuk.co,ad2.yuk.co
```

`salt.modules.dnsutil.`**`hosts_remove`**(*hostsfile='/etc/hosts', entries=None*)

Remove a host from the /etc/hosts file. If doing so will leave a line containing only an IP address, then the line will be deleted. This function will leave comments and blank lines intact.

CLI Examples:

```
salt '*' dnsutil.hosts_remove /etc/hosts ad1.yuk.co
salt '*' dnsutil.hosts_remove /etc/hosts ad2.yuk.co,ad1.yuk.co
```

`salt.modules.dnsutil.`**`parse_hosts`**(*hostsfile='/etc/hosts', hosts=None*)

Parse /etc/hosts file.

CLI Example:

```
salt '*' dnsutil.parse_hosts
```

`salt.modules.dnsutil.`**`parse_zone`**(*zonefile=None, zone=None*)

Parses a zone file. Can be passed raw zone data on the API level.

CLI Example:

```
salt ns1 dnsutil.parse_zone /var/lib/named/example.com.zone
```

`salt.modules.dnsutil.`**`serial`**(*zone='', update=False*)

Return, store and update a dns serial for your zone files.

zone: a keyword for a specific zone

update: store an updated version of the serial in a grain

If `update` is False, the function will retrieve an existing serial or return the current date if no serial is stored. Nothing will be stored

If `update` is True, the function will set the serial to the current date if none exist or if the existing serial is for a previous date. If a serial for greater than the current date is already stored, the function will increment it.

This module stores the serial in a grain, you can explicitly set the stored value as a grain named `dnsserial_<zone_name>`.

CLI Example:

```
salt ns1 dnsutil.serial example.com
```

26.6.50 salt.modules.dpkg_lowpkg

Support for DEB packages

`salt.modules.dpkg_lowpkg.`**`bin_pkg_info`**`(`*path*, *saltenv='base'*`)`

New in version 2015.8.0.

Parses DEB metadata and returns a dictionary of information about the package (name, version, etc.).

path

Path to the file. Can either be an absolute path to a file on the minion, or a salt fileserver URL (e.g. `salt://path/to/file.deb`). If a salt fileserver URL is passed, the file will be cached to the minion so that it can be examined.

saltenv

[base] Salt fileserver environment from which to retrieve the package. Ignored if `path` is a local file path on the minion.

CLI Example:

```
salt '*' lowpkg.bin_pkg_info /root/foo-1.2.3-1ubuntu1_all.deb
salt '*' lowpkg.bin_pkg_info salt://foo-1.2.3-1ubuntu1_all.deb
```

`salt.modules.dpkg_lowpkg.`**`file_dict`**`(`**packages*, ***kwargs*`)`

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' lowpkg.file_dict hostname
salt '*' lowpkg.file_dict hostname mount
salt '*' lowpkg.file_dict
```

`salt.modules.dpkg_lowpkg.`**`file_list`**`(`**packages*, ***kwargs*`)`

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' lowpkg.file_list hostname
salt '*' lowpkg.file_list hostname mount
salt '*' lowpkg.file_list
```

`salt.modules.dpkg_lowpkg.`**`info`**`(`**packages*, ***kwargs*`)`

Returns a detailed summary of package information for provided package names. If no packages are specified, all packages will be returned.

New in version 2015.8.1.

packages

The names of the packages for which to return information.

failhard

Whether to throw an exception if none of the packages are installed. Defaults to True.

New in version 2016.11.3.

CLI Example:

```
salt '*' lowpkg.info
salt '*' lowpkg.info apache2 bash
salt '*' lowpkg.info 'php5*' failhard=false
```

`salt.modules.dpkg_lowpkg.`**`list_pkgs`**`(`**packages*, ***kwargs*`)`

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

External dependencies:

```
Virtual package resolution requires aptitude. Because this function
uses dpkg, virtual packages will be reported as not installed.
```

CLI Example:

```
salt '*' lowpkg.list_pkgs
salt '*' lowpkg.list_pkgs hostname
salt '*' lowpkg.list_pkgs hostname mount
```

`salt.modules.dpkg_lowpkg.`**`unpurge`**`(`**packages*`)`

Change package selection for each package specified to 'install'

CLI Example:

```
salt '*' lowpkg.unpurge curl
```

26.6.51 salt.modules.dummyproxy_pkg

Package support for the dummy proxy used by the test suite

`salt.modules.dummyproxy_pkg.`**`install`**`(`*name=None*, *refresh=False*, *fromrepo=None*, *pkgs=None*, *sources=None*, ***kwargs*`)`

`salt.modules.dummyproxy_pkg.`**`installed`**`(`*name*, *version=None*, *refresh=False*, *fromrepo=None*, *skip_verify=False*, *pkgs=None*, *sources=None*, ***kwargs*`)`

`salt.modules.dummyproxy_pkg.`**`list_pkgs`**`(`*versions_as_list=False*, ***kwargs*`)`

`salt.modules.dummyproxy_pkg.`**`remove`**`(`*name=None*, *pkgs=None*, ***kwargs*`)`

`salt.modules.dummyproxy_pkg.`**`upgrade`**`(`*name=None*, *pkgs=None*, *refresh=True*, *skip_verify=True*, *normalize=True*, ***kwargs*`)`

`salt.modules.dummyproxy_pkg.`**`version`**`(`**names*, ***kwargs*`)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

26.6.52 salt.modules.dummyproxy_service

Provide the service module for the dummy proxy used in integration tests

`salt.modules.dummyproxy_service.`**`enabled`**`(`*name*, *sig=None*`)`

Only the 'redbull' service is 'enabled' in the test

New in version 2016.11.3.

`salt.modules.dummyproxy_service.`**`get_all`**`()`

Return a list of all available services

New in version 2016.11.3.

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.dummyproxy_service.`**`list_`**`()`

Return a list of all available services.

New in version 2016.11.3.

CLI Example:

```
salt '*' service.list
```

`salt.modules.dummyproxy_service.`**`restart`**`(`*name*, *sig=None*`)`

Restart the specified service with dummy.

New in version 2016.11.3.

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.dummyproxy_service.`**`running`**`(`*name*, *sig=None*`)`

Return whether this service is running.

New in version 2016.11.3.

`salt.modules.dummyproxy_service.`**`start`**`(`*name*, *sig=None*`)`

Start the specified service on the dummy

New in version 2016.11.3.

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.dummyproxy_service.`**`status`**`(`*name*, *sig=None*`)`

Return the status for a service via dummy, returns a bool whether the service is running.

New in version 2016.11.3.

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.dummyproxy_service.`**`stop`**`(`*name*, *sig=None*`)`

Stop the specified service on the dummy

New in version 2016.11.3.

CLI Example:

```
salt '*' service.stop <service name>
```

26.6.53 salt.modules.environ

Support for getting and setting the environment variables of the current salt process.

`salt.modules.environ.`**`get`**`(`*key*, *default=''*`)`

Get a single salt process environment variable.

key

String used as the key for environment lookup.

default

If the key is not found in the environment, return this value. Default: ''

CLI Example:

```
salt '*' environ.get foo
salt '*' environ.get baz default=False
```

`salt.modules.environ.`**`has_value`**`(`*key*, *value=None*`)`

Determine whether the key exists in the current salt process environment dictionary. Optionally compare the current value of the environment against the supplied value string.

key

Must be a string. Used as key for environment lookup.

value:

Optional. If key exists in the environment, compare the current value with this value. Return True if they are equal.

CLI Example:

```
salt '*' environ.has_value foo
```

`salt.modules.environ.`**`item`**`(`*keys*, *default=''*`)`

Get one or more salt process environment variables. Returns a dict.

keys

Either a string or a list of strings that will be used as the keys for environment lookup.

default

If the key is not found in the environment, return this value. Default: ''

CLI Example:

```
salt '*' environ.item foo
salt '*' environ.item '[foo, baz]' default=None
```

salt.modules.environ.**items**()

Return a dict of the entire environment set for the salt process

CLI Example:

```
salt '*' environ.items
```

salt.modules.environ.**setenv**(*environ*, *false_unsets=False*, *clear_all=False*, *update_minion=False*, *permanent=False*)

Set multiple salt process environment variables from a dict. Returns a dict.

environ

Must be a dict. The top-level keys of the dict are the names of the environment variables to set. Each key's value must be a string or False. Refer to the 'false_unsets' parameter for behavior when a value set to False.

false_unsets

If a key's value is False and false_unsets is True, then the key will be removed from the salt processes environment dict entirely. If a key's value is False and false_unsets is not True, then the key's value will be set to an empty string. Default: False

clear_all

USE WITH CAUTION! This option can unset environment variables needed for salt to function properly. If clear_all is True, then any environment variables not defined in the environ dict will be deleted. Default: False

update_minion

If True, apply these environ changes to the main salt-minion process. If False, the environ changes will only affect the current salt subprocess. Default: False

permanent

On Windows minions this will set the environment variable in the registry so that it is always added as an environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in "HKLM" for this parameter. On all other minion types this will be ignored. Note: This will only take affect on applications opened after this has been set.

CLI Example:

```
salt '*' environ.setenv '{"foo": "bar", "baz": "quux"}'
salt '*' environ.setenv '{"a": "b", "c": False}' false_unsets=True
```

salt.modules.environ.**setval**(*key*, *val*, *false_unsets=False*, *permanent=False*)

Set a single salt process environment variable. Returns True on success.

key

The environment key to set. Must be a string.

val

The value to set. Must be a string or False. Refer to the 'false_unsets' parameter for behavior when set to False.

false_unsets

If val is False and false_unsets is True, then the key will be removed from the salt processes environment dict entirely. If val is False and false_unsets is not True, then the key's value will be set to an empty string. Default: False.

permanent

On Windows minions this will set the environment variable in the registry so that it is always added as an environment variable when applications open. If you want to set the variable to HKLM instead of

HKCU just pass in "HKLM" for this parameter. On all other minion types this will be ignored. Note: This will only take affect on applications opened after this has been set.

CLI Example:

```
salt '*' environ.setval foo bar
salt '*' environ.setval baz val=False false_unsets=True
salt '*' environ.setval baz bar permanent=True
salt '*' environ.setval baz bar permanent=HKLM
```

26.6.54 salt.modules.etcd_mod

Execution module to work with etcd

depends

- python-etcd or etcd3-py

Configuration

To work with an etcd server you must configure an etcd profile. The etcd config can be set in either the Salt Minion configuration file or in pillar:

```
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

It is technically possible to configure etcd without using a profile, but this is not considered to be a best practice, especially when multiple etcd servers or clusters are available.

```
etcd.host: 127.0.0.1
etcd.port: 4001
```

In order to choose whether to use etcd API v2 or v3, you can put the following configuration option in the same place as your etcd configuration. This option defaults to true, meaning you will use v2 unless you specify otherwise.

```
etcd.require_v2: True
```

When using API v3, there are some specific options available to be configured within your etcd profile. They are defaulted to the following...

```
etcd.encode_keys: False
etcd.encode_values: True
etcd.raw_keys: False
etcd.raw_values: False
etcd.unicode_errors: "surrogateescape"
```

`etcd.encode_keys` indicates whether you want to pre-encode keys using msgpack before adding them to etcd.

Note: If you set `etcd.encode_keys` to `True`, all recursive functionality will no longer work. This includes `tree` and `ls` and all other methods if you set `recurse`/`recursive` to `True`. This is due to the fact that when encoding with msgpack, keys like `/salt` and `/salt/stack` will have differing byte prefixes, and etcd v3 searches recursively using prefixes.

`etcd.encode_values` indicates whether you want to pre-encode values using msgpack before adding them to etcd. This defaults to `True` to avoid data loss on non-string values wherever possible.

`etcd.raw_keys` determines whether you want the raw key or a string returned.

`etcd.raw_values` determines whether you want the raw value or a string returned.

`etcd.unicode_errors` determines what you policy to follow when there are encoding/decoding errors.

Note: The etcd configuration can also be set in the Salt Master config file, but in order to use any etcd configurations defined in the Salt Master config, the *`pillar_opts`* must be set to `True`.

Be aware that setting `pillar_opts` to `True` has security implications as this makes all master configuration settings available in all minion's pillars.

`salt.modules.etcd_mod.`**`get_`**(*key*, *recurse=False*, *profile=None*, ***kwargs*)

New in version 2014.7.0.

Get a value from etcd, by direct path. Returns None on failure.

CLI Examples:

```
salt myminion etcd.get /path/to/key
salt myminion etcd.get /path/to/key profile=my_etcd_config
salt myminion etcd.get /path/to/key recurse=True profile=my_etcd_config
salt myminion etcd.get /path/to/key host=127.0.0.1 port=2379
```

`salt.modules.etcd_mod.`**`ls_`**(*path='/'*, *profile=None*, ***kwargs*)

New in version 2014.7.0.

Return all keys and dirs inside a specific path. Returns an empty dict on failure.

CLI Example:

```
salt myminion etcd.ls /path/to/dir/
salt myminion etcd.ls /path/to/dir/ profile=my_etcd_config
salt myminion etcd.ls /path/to/dir/ host=127.0.0.1 port=2379
```

`salt.modules.etcd_mod.`**`rm_`**(*key*, *recurse=False*, *profile=None*, ***kwargs*)

New in version 2014.7.0.

Delete a key from etcd. Returns True if the key was deleted, False if it was not and None if there was a failure.

CLI Example:

```
salt myminion etcd.rm /path/to/key
salt myminion etcd.rm /path/to/key profile=my_etcd_config
salt myminion etcd.rm /path/to/key host=127.0.0.1 port=2379
salt myminion etcd.rm /path/to/dir recurse=True profile=my_etcd_config
```

`salt.modules.etcd_mod.`**`set_`**(*key*, *value*, *profile=None*, *ttl=None*, *directory=False*, ***kwargs*)

New in version 2014.7.0.

Set a key in etcd by direct path. Optionally, create a directory or set a TTL on the key. Returns None on failure.

CLI Example:

```
salt myminion etcd.set /path/to/key value
salt myminion etcd.set /path/to/key value profile=my_etcd_config
salt myminion etcd.set /path/to/key value host=127.0.0.1 port=2379
salt myminion etcd.set /path/to/dir '' directory=True
salt myminion etcd.set /path/to/key value ttl=5
```

`salt.modules.etcd_mod.`**`tree`**(*path='/', profile=None, **kwargs*)

New in version 2014.7.0.

Recurse through etcd and return all values. Returns None on failure.

CLI Example:

```
salt myminion etcd.tree
salt myminion etcd.tree profile=my_etcd_config
salt myminion etcd.tree host=127.0.0.1 port=2379
salt myminion etcd.tree /path/to/keys profile=my_etcd_config
```

`salt.modules.etcd_mod.`**`update`**(*fields, path='', profile=None, **kwargs*)

New in version 2016.3.0.

Sets a dictionary of values in one call. Useful for large updates in syndic environments. The dictionary can contain a mix of formats such as:

```
{
  '/some/example/key': 'bar',
  '/another/example/key': 'baz'
}
```

Or it may be a straight dictionary, which will be flattened to look like the above format:

```
{
    'some': {
        'example': {
            'key': 'bar'
        }
    },
    'another': {
        'example': {
            'key': 'baz'
        }
    }
}
```

You can even mix the two formats and it will be flattened to the first format. Leading and trailing '/' will be removed.

Empty directories can be created by setting the value of the key to an empty dictionary.

The 'path' parameter will optionally set the root of the path to use.

CLI Example:

```
salt myminion etcd.update "{'/path/to/key': 'baz', '/another/key': 'bar'}"
salt myminion etcd.update "{'/path/to/key': 'baz', '/another/key': 'bar'}
↪" profile=my_etcd_config
```

(continues on next page)

(continued from previous page)

```
salt myminion etcd.update "{'/path/to/key': 'baz', '/another/key': 'bar'}
↪" host=127.0.0.1 port=2379
salt myminion etcd.update "{'/path/to/key': 'baz', '/another/key': 'bar'}
↪" path='/some/root'
```

`salt.modules.etcd_mod.`**`watch`**(*key*, *recurse=False*, *profile=None*, *timeout=0*, *index=None*, ***kwargs*)

New in version 2016.3.0.

Makes a best effort to watch for a key or tree change in etcd. Returns a dict containing the new key value (or None if the key was deleted), the modifiedIndex of the key, whether the key changed or not, the path to the key that changed and whether it is a directory or not.

If something catastrophic happens, returns {}

CLI Example:

```
salt myminion etcd.watch /path/to/key
salt myminion etcd.watch /path/to/key timeout=10
salt myminion etcd.watch /patch/to/key profile=my_etcd_config index=10
salt myminion etcd.watch /patch/to/key host=127.0.0.1 port=2379
```

26.6.55 salt.modules.ethtool

Module for running ethtool command

New in version 2016.3.0.

codeauthor
Krzysztof Pawlowski <msciciel@msciciel.eu>

maturity
new

depends
python-ethtool

platform
linux

`salt.modules.ethtool.`**`set_coalesce`**(*devname*, ***kwargs*)

Changes the coalescing settings of the specified network device

CLI Example:

```
salt '*' ethtool.set_coalesce <devname> [adaptive_rx=on|off] [adaptive_
↪tx=on|off] [rx_usecs=N] [rx_frames=N]
    [rx_usecs_irq=N] [rx_frames_irq=N] [tx_usecs=N] [tx_frames=N] [tx_
↪usecs_irq=N] [tx_frames_irq=N]
    [stats_block_usecs=N] [pkt_rate_low=N] [rx_usecs_low=N] [rx_frames_
↪low=N] [tx_usecs_low=N] [tx_frames_low=N]
    [pkt_rate_high=N] [rx_usecs_high=N] [rx_frames_high=N] [tx_usecs_
↪high=N] [tx_frames_high=N]
    [sample_interval=N]
```

`salt.modules.ethtool.`**`set_feature`**(*devname*, ***kwargs*)

New in version 3006.0.

Changes the feature parameters of the specified network device

CLI Example:

```
salt '*' ethtool.set_feature <devname> sg=off
```

`salt.modules.ethtool.`**`set_offload`**(*devname*, ***kwargs*)

Changes the offload parameters and other features of the specified network device

CLI Example:

```
salt '*' ethtool.set_offload <devname> tcp_segmentation_offload=on
```

`salt.modules.ethtool.`**`set_pause`**(*devname*, ***kwargs*)

New in version 3006.0.

Changes the pause parameters of the specified network device

CLI Example:

```
salt '*' ethtool.set_pause <devname> autoneg=off rx=off tx=off
```

`salt.modules.ethtool.`**`set_ring`**(*devname*, ***kwargs*)

Changes the rx/tx ring parameters of the specified network device

CLI Example:

```
salt '*' ethtool.set_ring <devname> [rx=N] [rx_mini=N] [rx_jumbo=N] [tx=N]
```

`salt.modules.ethtool.`**`show_coalesce`**(*devname*)

Queries the specified network device for coalescing information

CLI Example:

```
salt '*' ethtool.show_coalesce <devname>
```

`salt.modules.ethtool.`**`show_driver`**(*devname*)

Queries the specified network device for associated driver information

CLI Example:

```
salt '*' ethtool.show_driver <devname>
```

`salt.modules.ethtool.`**`show_features`**(*devname*)

New in version 3006.0.

Queries the specified network device for associated feature information

CLI Example:

```
salt '*' ethtool.show_features <devname>
```

`salt.modules.ethtool.`**`show_offload`**(*devname*)

Queries the specified network device for the state of protocol offload and other features

CLI Example:

```
salt '*' ethtool.show_offload <devname>
```

`salt.modules.ethtool.`**`show_pause`**`(`*devname*`)`

New in version 3006.0.

Queries the specified network device for associated pause information

CLI Example:

```
salt '*' ethtool.show_pause <devname>
```

`salt.modules.ethtool.`**`show_ring`**`(`*devname*`)`

Queries the specified network device for rx/tx ring parameter information

CLI Example:

```
salt '*' ethtool.show_ring <devname>
```

26.6.56 salt.modules.event

Use the *Salt Event System* to fire events from the master to the minion and vice-versa.

`salt.modules.event.`**`fire`**`(`*data*, *tag*`)`

Fire an event on the local minion event bus. Data must be formed as a dict.

CLI Example:

```
salt '*' event.fire '{"data":"my event data"}' 'tag'
```

`salt.modules.event.`**`fire_master`**`(`*data*, *tag*, *preload=None*`)`

Fire an event off up to the master server

CLI Example:

```
salt '*' event.fire_master '{"data":"my event data"}' 'tag'
```

`salt.modules.event.`**`send`**`(`*tag*, *data=None*, *preload=None*, *with_env=False*, *with_grains=False*, *with_pillar=False*, *with_env_opts=False*, ***kwargs*`)`

Send an event to the Salt Master

New in version 2014.7.0.

Parameters

- **`tag`** -- A tag to give the event. Use slashes to create a namespace for related events. E.g., `myco/build/buildserver1/start`, `myco/build/buildserver1/success`, `myco/build/buildserver1/failure`.
- **`data`** -- A dictionary of data to send in the event. This is free-form. Send any data points that are needed for whoever is consuming the event. Arguments on the CLI are interpreted as YAML so complex data structures are possible.
- **`with_env`** (Specify `True` to include all environment variables, or specify a list of strings of variable names to include.) -- Include environment variables from the current shell environment in the event data as `environ`.. This is a short-hand for working with systems that seed the environment with relevant data such as Jenkins.

- **`with_grains`** (Specify `True` to include all grains, or specify a list of strings of grain names to include.) -- Include grains from the current minion in the event data as `grains`.
- **`with_pillar`** (Specify `True` to include all Pillar values, or specify a list of strings of Pillar keys to include. It is a best-practice to only specify a relevant subset of Pillar data.) -- Include Pillar values from the current minion in the event data as `pillar`. Remember Pillar data is often sensitive data so be careful. This is useful for passing ephemeral Pillar values through an event. Such as passing the `pillar={}` kwarg in *`state.sls`* from the Master, through an event on the Minion, then back to the Master.
- **`with_env_opts`** (Specify `True` to include `saltenv` and `pillarenv` values or `False` to omit them.) -- Include `saltenv` and `pillarenv` set on minion at the moment when event is send into event data.
- **`kwargs`** -- Any additional keyword arguments passed to this function will be interpreted as key-value pairs and included in the event data. This provides a convenient alternative to YAML for simple values.

CLI Example:

```
salt-call event.send myco/mytag foo=Foo bar=Bar
salt-call event.send 'myco/mytag' '{foo: Foo, bar: Bar}'
```

26.6.57 salt.modules.extfs

Module for managing ext2/3/4 file systems

`salt.modules.extfs.`**`attributes`**(*device*, *args=None*)

Return attributes from dumpe2fs for a specified device

CLI Example:

```
salt '*' extfs.attributes /dev/sda1
```

`salt.modules.extfs.`**`blocks`**(*device*, *args=None*)

Return block and inode info from dumpe2fs for a specified device

CLI Example:

```
salt '*' extfs.blocks /dev/sda1
```

`salt.modules.extfs.`**`dump`**(*device*, *args=None*)

Return all contents of dumpe2fs for a specified device

CLI Example:

```
salt '*' extfs.dump /dev/sda1
```

`salt.modules.extfs.`**`mkfs`**(*device*, *fs_type*, *full_return=False*, ***kwargs*)

Create a file system on the specified device

full_return

[False] If `True`, the full `cmd.run_all` dictionary will be returned instead of just stdout/stderr text. Useful for setting the result of the `module.run` state.

CLI Example:

```
salt '*' extfs.mkfs /dev/sda1 fs_type=ext4 opts='acl,noexec'
```

Valid options are:

- **block_size**: 1024, 2048 or 4096
- **check**: check for bad blocks
- **direct**: use direct IO
- **ext_opts**: extended file system options (comma-separated)
- **fragment_size**: size of fragments
- **force**: setting force to True will cause mke2fs to specify the -F option twice (it is already set once); this is truly dangerous
- **blocks_per_group**: number of blocks in a block group
- **number_of_groups**: ext4 option for a virtual block group
- **bytes_per_inode**: set the bytes/inode ratio
- **inode_size**: size of the inode
- **journal**: set to True to create a journal (default on ext3/4)
- **journal_opts**: options for the fs journal (comma separated)
- **blocks_file**: read bad blocks from file
- **label**: label to apply to the file system
- **reserved**: percentage of blocks reserved for super-user
- **last_dir**: last mounted directory
- **test**: set to True to not actually create the file system (mke2fs -n)
- **number_of_inodes**: override default number of inodes
- **creator_os**: override ”creator operating system” field
- **opts**: mount options (comma separated)
- **revision**: set the filesystem revision (default 1)
- **super**: write superblock and group descriptors only
- **fs_type**: set the filesystem type (REQUIRED)
- **usage_type**: how the filesystem is going to be used
- **uuid**: set the UUID for the file system
- **cluster_size**: specify the size of cluster in bytes for file systems using the bigalloc feature
- **root_directory**: copy the contents of the given directory into the root directory of the file system
- **errors_behavior**: change the behavior of the kernel code when errors are detected

See the `mke2fs(8)` manpage for a more complete description of these options.

`salt.modules.extfs.`**`tune`**(*device*, *full_return=False*, ***kwargs*)

Set attributes for the specified device (using tune2fs)

full_return

[False] If `True`, the full `cmd.run_all` dictionary will be returned instead of just stdout/stderr text. Useful for setting the result of the `module.run` state.

CLI Example:

```
salt '*' extfs.tune /dev/sda1 force=True label=wildstallyns opts='acl,
↪noexec'
```

Valid options are:

- **max**: max mount count
- **count**: mount count
- **error**: error behavior
- **extended_opts**: extended options (comma separated)
- **force**: force, even if there are errors (set to True)
- **group**: group name or gid that can use the reserved blocks
- **interval**: interval between checks
- **journal**: set to True to create a journal (default on ext3/4)
- **journal_opts**: options for the fs journal (comma separated)
- **label**: label to apply to the file system
- **reserved_percentage**: percentage of blocks reserved for super-user
- **last_dir**: last mounted directory
- **opts**: mount options (comma separated)
- **feature**: set or clear a feature (comma separated)
- **mmp_check**: mmp check interval
- **reserved**: reserved blocks count
- **quota_opts**: quota options (comma separated)
- **time**: time last checked
- **user**: user or uid who can use the reserved blocks
- **uuid**: set the UUID for the file system

See the `mke2fs(8)` manpage for a more complete description of these options.

26.6.58 salt.modules.file

Manage information about regular files, directories, and special files on the minion, set/read user, group, mode, and data

class `salt.modules.file.`**`AttrChanges`**(*added, removed*)

`added`

Alias for field number 0

`removed`

Alias for field number 1

`salt.modules.file.`**`access`**`(`*path*, *mode*`)`

New in version 2014.1.0.

Test whether the Salt process has the specified access to the file. One of the following modes must be specified:

```
f: Test the existence of the path
r: Test the readability of the path
w: Test the writability of the path
x: Test whether the path can be executed
```

CLI Example:

```
salt '*' file.access /path/to/file f
salt '*' file.access /path/to/file x
```

`salt.modules.file.`**`append`**`(`*path*, **args*, ***kwargs*`)`

New in version 0.9.5.

Append text to the end of a file

path
path to file

***args**
strings to append to file

CLI Example:

```
salt '*' file.append /etc/motd \
        "With all thine offerings thou shalt offer salt." \
        "Salt is what makes things taste bad when it isn't in them."
```

Attention

If you need to pass a string to append and that string contains an equal sign, you **must** include the argument name, args. For example:

```
salt '*' file.append /etc/motd args='cheese=spam'

salt '*' file.append /etc/motd args="['cheese=spam','spam=cheese']"
```

`salt.modules.file.`**`apply_template_on_contents`**`(`*contents*, *template*, *context*, *defaults*, *saltenv*`)`

Return the contents after applying the templating engine

contents
template string

template
template format

context
Overrides default context variables passed to the template.

defaults
Default context passed to the template.

CLI Example:

```
salt '*' file.apply_template_on_contents \
    contents='This is a {{ template }} string.' \
    template=jinja \
    context="{}" defaults="{'template': 'cool'}" \
    saltenv=base
```

`salt.modules.file.`**`basename`**`(`*path*`)`

Returns the final component of a pathname

New in version 2015.5.0.

This can be useful at the CLI but is frequently useful when scripting.

```
{%- set filename = salt['file.basename'](source_file) %}
```

CLI Example:

```
salt '*' file.basename 'test/test.config'
```

`salt.modules.file.`**`blockreplace`**`(`*path, marker_start='#-- start managed zone --', marker_end='#-- end managed zone --', content='', append_if_not_found=False, prepend_if_not_found=False, backup='.bak', dry_run=False, show_changes=True, append_newline=False, insert_before_match=None, insert_after_match=None*`)`

New in version 2014.1.0.

Replace content of a text block in a file, delimited by line markers

A block of content delimited by comments can help you manage several lines entries without worrying about old entries removal.

Note: This function will store two copies of the file in-memory (the original version and the edited version) in order to detect changes and only edit the targeted file if necessary.

path
Filesystem path to the file to be edited

marker_start
The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output

marker_end
The line content identifying the end of the content block. As of versions 2017.7.5 and 2018.3.1, everything up to the text matching the marker will be replaced, so it's important to ensure that your marker includes the beginning of the text you wish to replace.

content
The content to be used between the two lines identified by marker_start and marker_stop.

append_if_not_found: False
If markers are not found and set to `True` then, the markers and content will be appended to the file.

prepend_if_not_found: False
If markers are not found and set to `True` then, the markers and content will be prepended to the file.

insert_before_match
If markers are not found, this parameter can be set to a regex which will insert the block before the first found occurrence in the file.

New in version 3001.

insert_after_match
If markers are not found, this parameter can be set to a regex which will insert the block after the first found occurrence in the file.

New in version 3001.

backup
The file extension to use for a backup of the file if any edit is made. Set to `False` to skip making a backup.

dry_run: False
If `True`, do not make any edits to the file and simply return the changes that *would* be made.

show_changes: True
Controls how changes are presented. If `True`, this function will return a unified diff of the changes made. If False, then it will return a boolean (`True` if any changes were made, otherwise `False`).

append_newline: False
Controls whether or not a newline is appended to the content block. If the value of this argument is `True` then a newline will be added to the content block. If it is `False`, then a newline will *not* be added to the content block. If it is `None` then a newline will only be added to the content block if it does not already end in a newline.

New in version 2016.3.4.

Changed in version 2017.7.5,2018.3.1: New behavior added when value is `None`.

Changed in version 2019.2.0: The default value of this argument will change to `None` to match the behavior of the `file.blockreplace state`

CLI Example:

```
salt '*' file.blockreplace /etc/hosts '#-- start managed zone foobar : DO NOT EDIT --' \
'#-- end managed zone foobar --' $'10.0.1.1 foo.foobar\n10.0.1.2 bar.foobar' True
```

`salt.modules.file.`**`chattr`**(**files*, ***kwargs*)

New in version 2018.3.0.

Change the attributes of files. This function accepts one or more files and the following options:

operator
Can be wither `add` or `remove`. Determines whether attributes should be added or removed from files

attributes
One or more of the following characters: `aAcCdDeijPsStTu`, representing attributes to add to/remove from files

version
a version number to assign to the file(s)

flags
One or more of the following characters: `RVf`, representing flags to assign to chattr (recurse, verbose, suppress most errors)

CLI Example:

```
salt '*' file.chattr foo1.txt foo2.txt operator=add attributes=ai
salt '*' file.chattr foo3.txt operator=remove attributes=i version=2
```

`salt.modules.file.`**`check_file_meta`**(*name, sfn, source, source_sum, user, group, mode, attrs, saltenv, contents=None, seuser=None, serole=None, setype=None, serange=None, verify_ssl=True, follow_symlinks=False, ignore_ordering=False, ignore_whitespace=False, ignore_comment_characters=None, new_file_diff=False*)

Check for the changes in the file metadata.

CLI Example:

```
salt '*' file.check_file_meta /etc/httpd/conf.d/httpd.conf None salt://
↪http/httpd.conf '{hash_type: 'md5', 'hsum': <md5sum>}' root root '755'
↪None base
```

Note: Supported hash types include sha512, sha384, sha256, sha224, sha1, and md5.

---

name
Path to file destination

sfn
Template-processed source file contents

source
URL to file source

source_sum
File checksum information as a dictionary

```
{hash_type: md5, hsum: <md5sum>}
```

user
Destination file user owner

group
Destination file group owner

mode
Destination file permissions mode

attrs
Destination file attributes

New in version 2018.3.0.

saltenv
Salt environment used to resolve source files

contents
File contents

seuser
selinux user attribute

New in version 3001.

serole
selinux role attribute

New in version 3001.

setype
selinux type attribute

New in version 3001.

serange
selinux range attribute

New in version 3001.

verify_ssl
If `False`, remote https file sources (`https://`) will not attempt to validate the servers certificate. Default is True.

New in version 3002.

follow_symlinks
If the desired path is a symlink, follow it and check the permissions of the file to which the symlink points.

New in version 3005.

ignore_ordering
If `True`, changes in line order will be ignored **ONLY** for the purposes of triggering watch/onchanges requisites. Changes will still be made to the file to bring it into alignment with requested state, and also reported during the state run. This behavior is useful for bringing existing application deployments under Salt configuration management without disrupting production applications with a service restart.

New in version 3007.0.

ignore_whitespace
If `True`, changes in whitespace will be ignored **ONLY** for the purposes of triggering watch/onchanges requisites. Changes will still be made to the file to bring it into alignment with requested state, and also reported during the state run. This behavior is useful for bringing existing application deployments under Salt configuration management without disrupting production applications with a service restart. Implies `ignore_ordering=True`

New in version 3007.0.

ignore_comment_characters
If set to a chacter string, the presence of changes *after* that string will be ignored in changes found in the file **ONLY** for the purposes of triggering watch/onchanges requisites. Changes will still be made to the file to bring it into alignment with requested state, and also reported during the state run. This behavior is useful for bringing existing application deployments under Salt configuration management without disrupting production applications with a service restart. Implies `ignore_ordering=True`

New in version 3007.0.

new_file_diff
If `True`, creation of new files will still show a diff in the changes return.

New in version 3008.0.

`salt.modules.file.`**`check_hash`**(*path*, *file_hash*)

Check if a file matches the given hash string

Returns `True` if the hash matches, otherwise `False`.

path
Path to a file local to the minion.

hash
The hash to check against the file specified in the `path` argument.

Changed in version 2016.11.4.

For this and newer versions the hash can be specified without an accompanying hash type (e.g. `e138491e9d5b97023cea823fe17bac22`), but for earlier releases it is necessary to also specify the hash type in the format `<hash_type>=<hash_value>` (e.g. `md5=e138491e9d5b97023cea823fe17bac22`).

CLI Example:

```
salt '*' file.check_hash /etc/fstab e138491e9d5b97023cea823fe17bac22
salt '*' file.check_hash /etc/fstab md5=e138491e9d5b97023cea823fe17bac22
```

`salt.modules.file.`**`check_managed`**`(`*name, source, source_hash, source_hash_name, user, group, mode, attrs, template, context, defaults, saltenv, contents=None, skip_verify=False, seuser=None, serole=None, setype=None, serange=None, follow_symlinks=False, **kwargs*`)`

Check to see what changes need to be made for a file

follow_symlinks
If the desired path is a symlink, follow it and check the permissions of the file to which the symlink points.

New in version 3005.

CLI Example:

```
salt '*' file.check_managed /etc/httpd/conf.d/httpd.conf salt://http/
↪httpd.conf '{hash_type: 'md5', 'hsum': <md5sum>}' root, root, '755'
↪jinja True None None base
```

`salt.modules.file.`**`check_managed_changes`**`(`*name, source, source_hash, source_hash_name, user, group, mode, attrs, template, context, defaults, saltenv, contents=None, skip_verify=False, keep_mode=False, seuser=None, serole=None, setype=None, serange=None, verify_ssl=True, follow_symlinks=False, ignore_ordering=False, ignore_whitespace=False, ignore_comment_characters=None, new_file_diff=False, **kwargs*`)`

Return a dictionary of what changes need to be made for a file

Changed in version 3001: selinux attributes added

verify_ssl
If `False`, remote https file sources (`https://`) and source_hash will not attempt to validate the servers certificate. Default is True.

New in version 3002.

follow_symlinks
If the desired path is a symlink, follow it and check the permissions of the file to which the symlink points.

New in version 3005.

ignore_ordering
If `True`, changes in line order will be ignored **ONLY** for the purposes of triggering watch/onchanges requisites. Changes will still be made to the file to bring it into alignment with requested state, and also reported during the state run. This behavior is useful for bringing existing application deployments under Salt configuration management without disrupting production applications with a service restart.

New in version 3007.0.

ignore_whitespace
If `True`, changes in whitespace will be ignored **ONLY** for the purposes of triggering watch/onchanges requisites. Changes will still be made to the file to bring it into alignment with requested state, and also reported during the state run. This behavior is useful for bringing existing application deployments under Salt configuration management without disrupting production applications with a service restart. Implies `ignore_ordering=True`

New in version 3007.0.

ignore_comment_characters
If set to a chacter string, the presence of changes *after* that string will be ignored in changes found in the file **ONLY** for the purposes of triggering watch/onchanges requisites. Changes will still be made to the file to bring it into alignment with requested state, and also reported during the state run. This behavior is useful for bringing existing application deployments under Salt configuration management without disrupting production applications with a service restart. Implies `ignore_ordering=True`

New in version 3007.0.

new_file_diff
If `True`, creation of new files will still show a diff in the changes return.

New in version 3008.0.

CLI Example:

```
salt '*' file.check_managed_changes /etc/httpd/conf.d/httpd.conf salt://
↪http/httpd.conf '{hash_type: 'md5', 'hsum': <md5sum>}' root, root, '755
↪' jinja True None None base
```

`salt.modules.file.`**`check_perms`**(*name, ret, user, group, mode, attrs=None, follow_symlinks=False, seuser=None, serole=None, setype=None, serange=None*)

Changed in version 3001: Added selinux options

Check the permissions on files, modify attributes and chown if needed. File attributes are only verified if lsattr(1) is installed.

CLI Example:

```
salt '*' file.check_perms /etc/sudoers '{}' root root 400 ai
```

Changed in version 2014.1.3: `follow_symlinks` option added

`salt.modules.file.`**`chgrp`**(*path, group*)

Change the group of a file

path
path to the file or directory

group
group owner

CLI Example:

```
salt '*' file.chgrp /etc/passwd root
```

`salt.modules.file.`**`chown`**`(`*path*, *user*, *group*`)`

Chown a file, pass the file the desired user and group

path
path to the file or directory

user
user owner

group
group owner

CLI Example:

```
salt '*' file.chown /etc/passwd root root
```

`salt.modules.file.`**`comment`**`(`*path*, *regex*, *char='#'*, *backup='.bak'*`)`

Deprecated since version 0.17.0: Use `replace()` instead.

Comment out specified lines in a file

path
The full path to the file to be edited

regex
A regular expression used to find the lines that are to be commented; this pattern will be wrapped in parenthesis and will move any preceding/trailing `^` or `$` characters outside the parenthesis (e.g., the pattern `^foo$` will be rewritten as `^(foo)$`)

char: **#**
The character to be inserted at the beginning of a line in order to comment it out

backup: **`.bak`**
The file will be backed up before edit with this file extension

> **Warning:** This backup will be overwritten each time `sed` / `comment` / `uncomment` is called. Meaning the backup will only be useful after the first invocation.

CLI Example:

```
salt '*' file.comment /etc/modules pcspkr
```

`salt.modules.file.`**`comment_line`**`(`*path*, *regex*, *char='#'*, *cmnt=True*, *backup='.bak'*`)`

Comment or Uncomment a line in a text file.

Parameters

- **`path`** -- string The full path to the text file.
- **`regex`** -- string A regex expression that begins with `^` that will find the line you wish to comment. Can be as simple as `^color =`
- **`char`** -- string The character used to comment a line in the type of file you're referencing. Default is #
- **`cmnt`** -- boolean True to comment the line. False to uncomment the line. Default is True.

- **backup** -- string The file extension to give the backup file. Default is `.bak` Set to False/None to not keep a backup.

Returns
boolean Returns True if successful, False if not

CLI Example:

The following example will comment out the `pcspkr` line in the `/etc/modules` file using the default `#` character and create a backup file named `modules.bak`

```
salt '*' file.comment_line '/etc/modules' '^pcspkr'
```

CLI Example:

The following example will uncomment the `log_level` setting in `minion` config file if it is set to either `warning`, `info`, or `debug` using the `#` character and create a backup file named `minion.bk`

```
salt '*' file.comment_line 'C:\salt\conf\minion' '^log_level:⊠
↪(warning|info|debug)' '#' False '.bk'
```

`salt.modules.file.`**`contains`**(*path*, *text*)

Deprecated since version 0.17.0: Use `search()` instead.

Return `True` if the file at `path` contains `text`

CLI Example:

```
salt '*' file.contains /etc/crontab 'mymaintenance.sh'
```

`salt.modules.file.`**`contains_glob`**(*path*, *glob_expr*)

Deprecated since version 0.17.0: Use `search()` instead.

Return `True` if the given glob matches a string in the named file

CLI Example:

```
salt '*' file.contains_glob /etc/foobar '*cheese*'
```

`salt.modules.file.`**`contains_regex`**(*path*, *regex*, *lchar=''*)

Deprecated since version 0.17.0: Use `search()` instead.

Return True if the given regular expression matches on any line in the text of a given file.

If the lchar argument (leading char) is specified, it will strip *lchar* from the left side of each line before trying to match

CLI Example:

```
salt '*' file.contains_regex /etc/crontab
```

`salt.modules.file.`**`copy`**(*src*, *dst*, *recurse=False*, *remove_existing=False*)

Copy a file or directory from source to dst

In order to copy a directory, the recurse flag is required, and will by default overwrite files in the destination with the same path, and retain all other existing files. (similar to cp -r on unix)

remove_existing will remove all files in the target directory, and then copy files from the source.

Note: The copy function accepts paths that are local to the Salt minion. This function does not support salt://, http://, or the other additional file paths that are supported by `states.file.managed` and `states.file.recurse`.

CLI Example:

```
salt '*' file.copy /path/to/src /path/to/dst
salt '*' file.copy /path/to/src_dir /path/to/dst_dir recurse=True
salt '*' file.copy /path/to/src_dir /path/to/dst_dir recurse=True remove_
↪existing=True
```

`salt.modules.file.`**`delete_backup`**(*path*, *backup_id*)

New in version 0.17.0.

Delete a previous version of a file that was backed up using Salt's *file state backup* system.

path

The path on the minion to check for backups

backup_id

The numeric id for the backup you wish to delete, as found using `file.list_backups`

CLI Example:

```
salt '*' file.delete_backup /var/cache/salt/minion/file_backup/home/foo/
↪bar/baz.txt 0
```

`salt.modules.file.`**`directory_exists`**(*path*)

Tests to see if path is a valid directory. Returns True/False.

CLI Example:

```
salt '*' file.directory_exists /etc
```

`salt.modules.file.`**`dirname`**(*path*)

Returns the directory component of a pathname

New in version 2015.5.0.

This can be useful at the CLI but is frequently useful when scripting.

```
{%- from salt['file.dirname'](tpldir) + '/vars.jinja' import parent_vars
↪%}
```

CLI Example:

```
salt '*' file.dirname 'test/path/filename.config'
```

`salt.modules.file.`**`diskusage`**(*path*)

Recursively calculate disk usage of path and return it in bytes

CLI Example:

```
salt '*' file.diskusage /path/to/check
```

`salt.modules.file.`**`extract_hash`**(*hash_fn*, *hash_type='sha256'*, *file_name=''*, *source=''*, *source_hash_name=None*)

Changed in version 2016.3.5: Prior to this version, only the `file_name` argument was considered for filename matches in the hash file. This would be problematic for cases in which the user was relying on a remote checksum file that they do not control, and they wished to use a different name for that file on the minion from the filename on the remote server (and in the checksum file). For example, managing `/tmp/myfile.tar.gz` when the remote file was at `https://mydomain.tld/different_name.tar.gz`. The *`file.managed`* state now also passes this function the source URI as well as the `source_hash_name` (if specified). In cases where `source_hash_name` is specified, it takes precedence over both the `file_name` and `source`. When it is not specified, `file_name` takes precedence over `source`. This allows for better capability for matching hashes.

Changed in version 2016.11.0: File name and source URI matches are no longer disregarded when `source_hash_name` is specified. They will be used as fallback matches if there is no match to the `source_hash_name` value.

This routine is called from the *`file.managed`* state to pull a hash from a remote file. Regular expressions are used line by line on the `source_hash` file, to find a potential candidate of the indicated hash type. This avoids many problems of arbitrary file layout rules. It specifically permits pulling hash codes from debian `*.dsc` files.

If no exact match of a hash and filename are found, then the first hash found (if any) will be returned. If no hashes at all are found, then `None` will be returned.

For example:

```
openerp_7.0-latest-1.tar.gz:
  file.managed:
    - name: /tmp/openerp_7.0-20121227-075624-1_all.deb
    - source: http://nightly.openerp.com/7.0/nightly/deb/openerp_7.0-
↪20121227-075624-1.tar.gz
    - source_hash: http://nightly.openerp.com/7.0/nightly/deb/openerp_7.0-
↪20121227-075624-1.dsc
```

CLI Example:

```
salt '*' file.extract_hash /path/to/hash/file sha512 /etc/foo
```

`salt.modules.file.`**`file_exists`**(*path*)

Tests to see if path is a valid file. Returns True/False.

CLI Example:

```
salt '*' file.file_exists /etc/passwd
```

`salt.modules.file.`**`find`**(*path*, **args*, ***kwargs*)

Approximate the Unix `find(1)` command and return a list of paths that meet the specified criteria.

The options include match criteria:

```
name    = path-glob                 # case sensitive
iname   = path-glob                 # case insensitive
regex   = path-regex                # case sensitive
iregex  = path-regex                # case insensitive
type    = file-types                # match any listed type
owner   = users                     # match any listed user
```

(continues on next page)

(continued from previous page)

```
group   = groups                     # match any listed group
size    = [+-]number[size-unit]      # default unit = byte
mtime   = interval                   # modified since date
grep    = regex                      # search file contents
```

and/or actions:

```
delete [= file-types]                # default type = 'f'
exec    = command [arg ...]          # where {} is replaced by pathname
print  [= print-opts]
```

and/or depth criteria:

```
maxdepth = maximum depth to transverse in path
mindepth = minimum depth to transverse before checking files or
↪directories
```

The default action is `print=path`

`path-glob`:

```
*                 = match zero or more chars
?                 = match any char
[abc]             = match a, b, or c
[!abc] or [^abc] = match anything except a, b, and c
[x-y]             = match chars x through y
[!x-y] or [^x-y] = match anything except chars x through y
{a,b,c}           = match a or b or c
```

`path-regex`: a Python Regex (regular expression) pattern to match pathnames

`file-types`: a string of one or more of the following:

```
a: all file types
b: block device
c: character device
d: directory
p: FIFO (named pipe)
f: plain file
l: symlink
s: socket
```

`users`: a space and/or comma separated list of user names and/or uids

`groups`: a space and/or comma separated list of group names and/or gids

`size-unit`:

```
b: bytes
k: kilobytes
m: megabytes
g: gigabytes
t: terabytes
```

interval:

```
[<num>w] [<num>d] [<num>h] [<num>m] [<num>s]

where:
    w: week
    d: day
    h: hour
    m: minute
    s: second
```

print-opts: a comma and/or space separated list of one or more of the following:

```
group: group name
md5:   MD5 digest of file contents
mode:  file permissions (as integer)
mtime: last modification time (as time_t)
name:  file basename
path:  file absolute path
size:  file size in bytes
type:  file type
owner: user name
```

CLI Examples:

```
salt '*' file.find / type=f name=\*.bak size=+10m
salt '*' file.find /var mtime=+30d size=+10m print=path,size,mtime
salt '*' file.find /var/log name=\*.[0-9] mtime=+30d size=+10m delete
```

`salt.modules.file.`**`get_devmm`**(*name*)

Get major/minor info from a device

CLI Example:

```
salt '*' file.get_devmm /dev/chr
```

`salt.modules.file.`**`get_diff`**(*file1*, *file2*, *saltenv='base'*, *show_filenames=True*, *show_changes=True*, *template=False*, *source_hash_file1=None*, *source_hash_file2=None*, *ignore_ordering=False*, *ignore_whitespace=False*, *ignore_comment_characters=None*)

Return unified diff of two files

file1

The first file to feed into the diff utility

Changed in version 2018.3.0: Can now be either a local or remote file. In earlier releases, thuis had to be a file local to the minion.

file2

The second file to feed into the diff utility

Changed in version 2018.3.0: Can now be either a local or remote file. In earlier releases, this had to be a file on the salt fileserver (i.e. `salt://somefile.txt`)

show_filenames: True

Set to `False` to hide the filenames in the top two lines of the diff.

show_changes: True

If set to `False`, and there are differences, then instead of a diff a simple message stating that show_changes is set to `False` will be returned.

template: False
Set to `True` if two templates are being compared. This is not useful except for within states, with the `obfuscate_templates` option set to `True`.

New in version 2018.3.0.

source_hash_file1
If `file1` is an http(s)/ftp URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the archive if the cached copy matches the specified hash.

New in version 2018.3.0.

source_hash_file2
If `file2` is an http(s)/ftp URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the archive if the cached copy matches the specified hash.

New in version 2018.3.0.

ignore_ordering
If `True`, changes in line order will be ignored **ONLY** for the purposes of triggering watch/onchanges requisites. Changes will still be made to the file to bring it into alignment with requested state, and also reported during the state run. This behavior is useful for bringing existing application deployments under Salt configuration management without disrupting production applications with a service restart.

New in version 3007.0.

ignore_whitespace
If `True`, changes in whitespace will be ignored **ONLY** for the purposes of triggering watch/onchanges requisites. Changes will still be made to the file to bring it into alignment with requested state, and also reported during the state run. This behavior is useful for bringing existing application deployments under Salt configuration management without disrupting production applications with a service restart. Implies `ignore_ordering=True`

New in version 3007.0.

ignore_comment_characters
If set to a chacter string, the presence of changes *after* that string will be ignored in changes found in the file **ONLY** for the purposes of triggering watch/onchanges requisites. Changes will still be made to the file to bring it into alignment with requested state, and also reported during the state run. This behavior is useful for bringing existing application deployments under Salt configuration management without disrupting production applications with a service restart. Implies `ignore_ordering=True`

New in version 3007.0.

CLI Examples:

```
salt '*' file.get_diff /home/fred/.vimrc salt://users/fred/.vimrc
salt '*' file.get_diff /tmp/foo.txt /tmp/bar.txt
```

`salt.modules.file.`**`get_gid`**(*path*, *follow_symlinks=True*)

Return the id of the group that owns a given file

path
file or directory of which to get the gid

follow_symlinks
indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_gid /etc/passwd
```

Changed in version 0.16.4: `follow_symlinks` option added

`salt.modules.file.`**`get_group`**(*path*, *follow_symlinks=True*)

Return the group that owns a given file

path
file or directory of which to get the group

follow_symlinks
indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_group /etc/passwd
```

Changed in version 0.16.4: `follow_symlinks` option added

`salt.modules.file.`**`get_hash`**(*path*, *form='sha256'*, *chunk_size=65536*)

Get the hash sum of a file

This is better than `get_sum` for the following reasons:

- It does not read the entire file into memory.
- **It does not return a string on error. The returned value of**
  `get_sum` cannot really be trusted since it is vulnerable to collisions: `get_sum(..., 'xyz') == 'Hash xyz not supported'`

path
path to the file or directory

form
desired sum format

chunk_size
amount to sum at once

CLI Example:

```
salt '*' file.get_hash /etc/shadow
```

`salt.modules.file.`**`get_managed`**(*name*, *template*, *source*, *source_hash*, *source_hash_name*, *user*, *group*, *mode*, *attrs*, *saltenv*, *context*, *defaults*, *skip_verify=False*, *verify_ssl=True*, *use_etag=False*, *source_hash_sig=None*, *signed_by_any=None*, *signed_by_all=None*, *keyring=None*, *gnupghome=None*, *ignore_ordering=False*, *ignore_whitespace=False*, *ignore_comment_characters=None*, *sig_backend='gpg'*, ***kwargs*)

Return the managed file data for file.managed

name
location where the file lives on the minion

template
template format

source
managed source file

source_hash
hash of the source file

source_hash_name
When `source_hash` refers to a remote file, this specifies the filename to look for in that file.

New in version 2016.3.5.

user
Owner of file

group
Group owner of file

mode
Permissions of file

attrs
Attributes of file

New in version 2018.3.0.

context
Variables to add to the template context

defaults
Default values of for context_dict

skip_verify
If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.0.

verify_ssl
If `False`, remote https file sources (`https://`) and source_hash will not attempt to validate the servers certificate. Default is True.

New in version 3002.

use_etag
If `True`, remote http/https file sources will attempt to use the ETag header to determine if the remote file needs to be downloaded. This provides a lightweight mechanism for promptly refreshing files changed on a web server without requiring a full hash comparison via the `source_hash` parameter.

New in version 3005.

source_hash_sig
When `source` is a remote file source, `source_hash` is a file, `skip_verify` is not true and `use_etag` is not true, ensure a valid signature exists on the source hash file. Set this to `true` for an inline (clearsigned) signature, or to a file URI retrievable by *:py:func:`cp.cache_file <salt.modules.cp.cache_file>* for a detached one.

New in version 3007.0.

signed_by_any
When verifying `source_hash_sig`, require at least one valid signature from one of a list of keys. By default, this is passed to *`gpg.verify`*, meaning a key is identified by its fingerprint.

New in version 3007.0.

signed_by_all
When verifying `source_hash_sig`, require a valid signature from each of the keys in this list. By default, this is passed to *`gpg.verify`*, meaning a key is identified by its fingerprint.

New in version 3007.0.

keyring

When verifying `source_hash_sig`, use this keyring.

New in version 3007.0.

gnupghome

When verifying `source_hash_sig`, use this GnuPG home.

New in version 3007.0.

ignore_ordering

If `True`, changes in line order will be ignored **ONLY** for the purposes of triggering watch/onchanges requisites. Changes will still be made to the file to bring it into alignment with requested state, and also reported during the state run. This behavior is useful for bringing existing application deployments under Salt configuration management without disrupting production applications with a service restart.

New in version 3007.0.

ignore_whitespace

If `True`, changes in whitespace will be ignored **ONLY** for the purposes of triggering watch/onchanges requisites. Changes will still be made to the file to bring it into alignment with requested state, and also reported during the state run. This behavior is useful for bringing existing application deployments under Salt configuration management without disrupting production applications with a service restart. Implies `ignore_ordering=True`

New in version 3007.0.

ignore_comment_characters

If set to a chacter string, the presence of changes *after* that string will be ignored in changes found in the file **ONLY** for the purposes of triggering watch/onchanges requisites. Changes will still be made to the file to bring it into alignment with requested state, and also reported during the state run. This behavior is useful for bringing existing application deployments under Salt configuration management without disrupting production applications with a service restart. Implies `ignore_ordering=True`

New in version 3007.0.

sig_backend

When verifying signatures, use this execution module as a backend. It must be compatible with the *`gpg.verify`* API. Defaults to `gpg`. All signature-related parameters are passed through.

New in version 3008.0.

CLI Example:

```
salt '*' file.get_managed /etc/httpd/conf.d/httpd.conf jinja salt://http/
↪httpd.conf '{hash_type: 'md5', 'hsum': <md5sum>}' None root root '755'
↪base None None
```

`salt.modules.file.`**`get_mode`**(*path*, *follow_symlinks=True*)

Return the mode of a file

path

file or directory of which to get the mode

follow_symlinks

indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_mode /etc/passwd
```

Changed in version 2014.1.0: `follow_symlinks` option added

`salt.modules.file.`**`get_selinux_context`**`(`*path*`)`

Get an SELinux context from a given path

CLI Example:

```
salt '*' file.get_selinux_context /etc/hosts
```

`salt.modules.file.`**`get_source_sum`**`(`*file_name='', source='', source_hash=None, source_hash_name=None, saltenv='base', verify_ssl=True, source_hash_sig=None, signed_by_any=None, signed_by_all=None, keyring=None, gnupghome=None, sig_backend='gpg'*`)`

New in version 2016.11.0.

Used by *`file.get_managed`* to obtain the hash and hash type from the parameters specified below.

file_name
Optional file name being managed, for matching with *`file.extract_hash`*.

source
Source file, as used in *`file`* and other states. If `source_hash` refers to a file containing hashes, then this filename will be used to match a filename in that file. If the `source_hash` is a hash expression, then this argument will be ignored.

source_hash
Hash file/expression, as used in *`file`* and other states. If this value refers to a remote URL or absolute path to a local file, it will be cached and *`file.extract_hash`* will be used to obtain a hash from it.

source_hash_name
Specific file name to look for when `source_hash` refers to a remote file, used to disambiguate ambiguous matches.

saltenv: base
Salt fileserver environment from which to retrieve the source_hash. This value will only be used when `source_hash` refers to a file on the Salt fileserver (i.e. one beginning with `salt://`).

verify_ssl
If `False`, remote https file sources (`https://`) and source_hash will not attempt to validate the servers certificate. Default is True.

New in version 3002.

source_hash_sig
When `source` is a remote file source and `source_hash` is a file, ensure a valid signature exists on the source hash file. Set this to `true` for an inline (clearsigned) signature, or to a file URI retrievable by *:py:func:`cp.cache_file <salt.modules.cp.cache_file>* for a detached one.

New in version 3007.0.

signed_by_any
When verifying `source_hash_sig`, require at least one valid signature from one of a list of keys. By default, this is passed to *`gpg.verify`*, meaning a key is identified by its fingerprint.

New in version 3007.0.

signed_by_all
When verifying `source_hash_sig`, require a valid signature from each of the keys in this list. By default, this is passed to *`gpg.verify`*, meaning a key is identified by its fingerprint.

New in version 3007.0.

keyring
When verifying `source_hash_sig`, use this keyring.

New in version 3007.0.

gnupghome
When verifying `source_hash_sig`, use this GnuPG home.

New in version 3007.0.

sig_backend
When verifying signatures, use this execution module as a backend. It must be compatible with the *gpg.verify* API. Defaults to `gpg`. All signature-related parameters are passed through.

New in version 3008.0.

CLI Example:

```
salt '*' file.get_source_sum /tmp/foo.tar.gz source=http://mydomain.tld/
↪foo.tar.gz source_hash=499ae16dcae71eeb7c3a30c75ea7a1a6
salt '*' file.get_source_sum /tmp/foo.tar.gz source=http://mydomain.tld/
↪foo.tar.gz source_hash=https://mydomain.tld/hashes.md5
salt '*' file.get_source_sum /tmp/foo.tar.gz source=http://mydomain.tld/
↪foo.tar.gz source_hash=https://mydomain.tld/hashes.md5 source_hash_
↪name=./dir2/foo.tar.gz
```

`salt.modules.file.`**`get_sum`**(*path*, *form='sha256'*)

Return the checksum for the given file. The following checksum algorithms are supported:

- md5
- sha1
- sha224
- sha256 **(default)**
- sha384
- sha512

path
path to the file or directory

form
desired sum format

CLI Example:

```
salt '*' file.get_sum /etc/passwd sha512
```

`salt.modules.file.`**`get_uid`**(*path*, *follow_symlinks=True*)

Return the id of the user that owns a given file

path
file or directory of which to get the uid

follow_symlinks
indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_uid /etc/passwd
```

Changed in version 0.16.4: `follow_symlinks` option added

`salt.modules.file.`**`get_user`**(*path*, *follow_symlinks=True*)

Return the user that owns a given file

path
: file or directory of which to get the user

follow_symlinks
: indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_user /etc/passwd
```

Changed in version 0.16.4: `follow_symlinks` option added

`salt.modules.file.`**`gid_to_group`**(*gid*)

Convert the group id to the group name on this system

gid
: gid to convert to a group name

CLI Example:

```
salt '*' file.gid_to_group 0
```

`salt.modules.file.`**`grep`**(*path*, *pattern*, **opts*)

Grep for a string in the specified file

Note: This function's return value is slated for refinement in future versions of Salt

Windows does not support the `grep` functionality.

path
: Path to the file to be searched

> **Note:** Globbing is supported (i.e. `/var/log/foo/*.log`, but if globbing is being used then the path should be quoted to keep the shell from attempting to expand the glob expression.

pattern
: Pattern to match. For example: `test`, or `a[0-5]`

opts
: Additional command-line flags to pass to the grep command. For example: `-v`, or `-i -B2`

> **Note:** The options should come after a double-dash (as shown in the examples below) to keep Salt's own argument parser from interpreting them.

CLI Example:

```
salt '*' file.grep /etc/passwd nobody
salt '*' file.grep /etc/sysconfig/network-scripts/ifcfg-eth0 ipaddr -- -i
salt '*' file.grep /etc/sysconfig/network-scripts/ifcfg-eth0 ipaddr -- -i
↪-B2
salt '*' file.grep "/etc/sysconfig/network-scripts/*" ipaddr -- -i -l
```

salt.modules.file.**group_to_gid**(*group*)

Convert the group to the gid on this system

group
group to convert to its gid

CLI Example:

```
salt '*' file.group_to_gid root
```

salt.modules.file.**is_blkdev**(*name*)

Check if a file exists and is a block device.

CLI Example:

```
salt '*' file.is_blkdev /dev/blk
```

salt.modules.file.**is_chrdev**(*name*)

Check if a file exists and is a character device.

CLI Example:

```
salt '*' file.is_chrdev /dev/chr
```

salt.modules.file.**is_fifo**(*name*)

Check if a file exists and is a FIFO.

CLI Example:

```
salt '*' file.is_fifo /dev/fifo
```

salt.modules.file.**is_hardlink**(*path*)

Check if the path is a hard link by verifying that the number of links is larger than 1

CLI Example:

```
salt '*' file.is_hardlink /path/to/link
```

salt.modules.file.**is_link**(*path*)

Check if the path is a symbolic link

CLI Example:

```
salt '*' file.is_link /path/to/link
```

salt.modules.file.**join**(**args*)

Return a normalized file system path for the underlying OS

New in version 2014.7.0.

This can be useful at the CLI but is frequently useful when scripting combining path variables:

```
{% set www_root = '/var' %}
{% set app_dir = 'myapp' %}

myapp_config:
  file:
    - managed
    - name: {{ salt['file.join'](www_root, app_dir, 'config.yaml') }}
```

CLI Example:

```
salt '*' file.join '/' 'usr' 'local' 'bin'
```

`salt.modules.file.`**`lchown`**(*path*, *user*, *group*)

Chown a file, pass the file the desired user and group without following symlinks.

path
path to the file or directory

user
user owner

group
group owner

CLI Example:

```
salt '*' file.chown /etc/passwd root root
```

`salt.modules.file.`**`line`**(*path*, *content=None*, *match=None*, *mode=None*, *location=None*, *before=None*, *after=None*, *show_changes=True*, *backup=False*, *quiet=False*, *indent=True*)

New in version 2015.8.0.

Line-focused editing of a file.

Note: `file.line` exists for historic reasons, and is not generally recommended. It has a lot of quirks. You may find `file.replace` to be more suitable.

`file.line` is most useful if you have single lines in a file (potentially a config file) that you would like to manage. It can remove, add, and replace a single line at a time.

path
Filesystem path to the file to be edited.

content
Content of the line. Allowed to be empty if `mode='delete'`.

match
Match the target line for an action by a fragment of a string or regular expression.

If neither `before` nor `after` are provided, and `match` is also `None`, match falls back to the `content` value.

mode
Defines how to edit a line. One of the following options is required:

- **ensure**
  If line does not exist, it will be added. If `before` and `after` are specified either zero lines, or

lines that contain the `content` line are allowed to be in between `before` and `after`. If there are lines, and none of them match then it will produce an error.

- **replace**
  If line already exists, the entire line will be replaced.
- **delete**
  Delete the line, if found.
- **insert**
  Nearly identical to `ensure`. If a line does not exist, it will be added.

  The differences are that multiple (and non-matching) lines are alloweed between `before` and `after`, if they are specified. The line will always be inserted right before `before`. `insert` also allows the use of `location` to specify that the line should be added at the beginning or end of the file.

Note: If `mode='insert'` is used, at least one of `location`, `before`, or `after` is required. If `location` is used, `before` and `after` are ignored.

location
In `mode='insert'` only, whether to place the `content` at the beginning or end of a the file. If `location` is provided, `before` and `after` are ignored. Valid locations:

- **start**
  Place the content at the beginning of the file.
- **end**
  Place the content at the end of the file.

before
Regular expression or an exact case-sensitive fragment of the string. Will be tried as **both** a regex **and** a part of the line. Must match **exactly** one line in the file. This value is only used in `ensure` and `insert` modes. The `content` will be inserted just before this line, with matching indentation unless `indent=False`.

after
Regular expression or an exact case-sensitive fragment of the string. Will be tried as **both** a regex **and** a part of the line. Must match **exactly** one line in the file. This value is only used in `ensure` and `insert` modes. The `content` will be inserted directly after this line, unless `before` is also provided. If `before` is not provided, indentation will match this line, unless `indent=False`.

show_changes
Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made. Default is `True`

Note: Using this option will store two copies of the file in-memory (the original version and the edited version) in order to generate the diff.

backup
Create a backup of the original file with the extension: "Year-Month-Day-Hour-Minutes-Seconds".

quiet
Do not raise any exceptions. E.g. ignore the fact that the file that is tried to be edited does not exist and nothing really happened.

indent
Keep indentation with the previous line. This option is not considered when the `delete` mode is specified. Default is `True`

CLI Example:

```
salt '*' file.line /etc/nsswitch.conf "networks:        files dns" after=
↪"hosts:.*?" mode='ensure'
```

Note: If an equal sign (=) appears in an argument to a Salt command, it is interpreted as a keyword argument in the format of `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' file.line /path/to/file content="CREATEMAIL_SPOOL=no" match=
↪"CREATE_MAIL_SPOOL=yes" mode="replace"
```

Examples:

Here's a simple config file.

```
[some_config]
# Some config file
# this line will go away

here=False
away=True
goodybe=away
```

```
salt \* file.line /some/file.conf mode=delete match=away
```

This will produce:

```
[some_config]
# Some config file

here=False
away=True
goodbye=away
```

If that command is executed 2 more times, this will be the result:

```
[some_config]
# Some config file

here=False
```

If we reset the file to its original state and run

```
salt \* file.line /some/file.conf mode=replace match=away content=here
```

Three passes will this state will result in this file:

```
[some_config]
# Some config file
here

here=False
here
here
```

Each pass replacing the first line found.

Given this file:

```
insert after me
something
insert before me
```

The following command

```
salt \* file.line /some/file.txt mode=insert after="insert after me"
↪before="insert before me" content=thrice
```

If that command is executed 3 times, the result will be:

```
insert after me
something
thrice
thrice
thrice
insert before me
```

If the mode is `ensure` instead, it will fail each time. To succeed, we need to remove the incorrect line between before and after:

```
insert after me
insert before me
```

With an ensure mode, this will insert `thrice` the first time and make no changes for subsequent calls. For something simple this is fine, but if you have instead blocks like this:

```
Begin SomeBlock
    foo = bar
End

Begin AnotherBlock
    another = value
End
```

And you try to use ensure this way:

```
salt \* file.line  /tmp/fun.txt mode="ensure" content="this = should be
↪my content" after="Begin SomeBlock" before="End"
```

This will fail because there are multiple `End` lines. Without that problem, it still would fail because there is a non-matching line, `foo = bar`. Ensure **only** allows either zero, or the matching line present to be present in between `before` and `after`.

`salt.modules.file.`**`link`**`(`*src*, *path*`)`

New in version 2014.1.0.

Create a hard link to a file

CLI Example:

```
salt '*' file.link /path/to/file /path/to/link
```

`salt.modules.file.`**`list_backup`**`(`*path*, *limit=None*`)`

This function is an alias of `list_backups`.

> New in version 0.17.0.
>
> Lists the previous versions of a file backed up using Salt's *file state backup* system.
>
> **path**
> The path on the minion to check for backups
>
> **limit**
> Limit the number of results to the most recent N backups
>
> CLI Example:
>
> ```
> salt '*' file.list_backups /foo/bar/baz.txt
> ```

`salt.modules.file.`**`list_backups`**`(`*path*, *limit=None*`)`

New in version 0.17.0.

Lists the previous versions of a file backed up using Salt's *file state backup* system.

path
The path on the minion to check for backups

limit
Limit the number of results to the most recent N backups

CLI Example:

```
salt '*' file.list_backups /foo/bar/baz.txt
```

`salt.modules.file.`**`list_backups_dir`**`(`*path*, *limit=None*`)`

Lists the previous versions of a directory backed up using Salt's *file state backup* system.

path
The directory on the minion to check for backups

limit
Limit the number of results to the most recent N backups

CLI Example:

```
salt '*' file.list_backups_dir /foo/bar/baz/
```

`salt.modules.file.`**`lsattr`**`(`*path*`)`

New in version 2018.3.0.

Changed in version 2018.3.1: If `lsattr` is not installed on the system, `None` is returned.

Changed in version 2018.3.4: If on `AIX`, `None` is returned even if in filesystem as lsattr on `AIX` is not the same thing as the linux version.

Obtain the modifiable attributes of the given file. If path is to a directory, an empty list is returned.

path
path to file to obtain attributes of. File/directory must exist.

CLI Example:

```
salt '*' file.lsattr foo1.txt
```

`salt.modules.file.`**`lstat`**(*path*)

New in version 2014.1.0.

Returns the lstat attributes for the given file or dir. Does not support symbolic links.

CLI Example:

```
salt '*' file.lstat /path/to/file
```

`salt.modules.file.`**`makedirs_`**(*path*, *user=None*, *group=None*, *mode=None*)

Ensure that the directory containing this path is available.

Note: The path must end with a trailing slash otherwise the directory/directories will be created up to the parent directory. For example if path is `/opt/code`, then it would be treated as `/opt/` but if the path ends with a trailing slash like `/opt/code/`, then it would be treated as `/opt/code/`.

CLI Example:

```
salt '*' file.makedirs /opt/code/
```

`salt.modules.file.`**`makedirs_perms`**(*name*, *user=None*, *group=None*, *mode='0755'*)

Taken and modified from os.makedirs to set user, group and mode for each directory created.

CLI Example:

```
salt '*' file.makedirs_perms /opt/code
```

`salt.modules.file.`**`manage_file`**(*name*, *sfn*, *ret*, *source*, *source_sum*, *user*, *group*, *mode*, *attrs*, *saltenv*, *backup*, *makedirs=False*, *template=None*, *show_changes=True*, *contents=None*, *dir_mode=None*, *follow_symlinks=True*, *skip_verify=False*, *keep_mode=False*, *encoding=None*, *encoding_errors='strict'*, *seuser=None*, *serole=None*, *setype=None*, *serange=None*, *verify_ssl=True*, *use_etag=False*, *signature=None*, *source_hash_sig=None*, *signed_by_any=None*, *signed_by_all=None*, *keyring=None*, *gnupghome=None*, *ignore_ordering=False*, *ignore_whitespace=False*, *ignore_comment_characters=None*, *new_file_diff=False*, *sig_backend='gpg'*, ***kwargs*)

Checks the destination against what was retrieved with get_managed and makes the appropriate modifications (if necessary).

name
The location of the file to be managed, as an absolute path.

sfn
location of cached file on the minion

This is the path to the file stored on the minion. This file is placed on the minion using cp.cache_file. If the hash sum of that file matches the source_sum, we do not transfer the file to the minion again.

This file is then grabbed and if it has template set, it renders the file to be placed into the correct place on the system using salt.files.utils.copyfile()

ret

The initial state return data structure. Pass in `None` to use the default structure.

source

The source file to download to the minion, this source file can be hosted on either the salt master server (`salt://`), the salt minion local file system (`/`), or on an HTTP or FTP server (`http(s)://`, `ftp://`).

Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials. (see s3.get state documentation) File retrieval from Openstack Swift object storage is supported via swift://container/object_path URLs, see swift.get documentation. For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs. If source is left blank or None (use ~ in YAML), the file will be created as an empty file and the content will not be managed. This is also the case when a file already exists and the source is undefined; the contents of the file will not be changed or managed. If source is left blank or None, please also set replaced to False to make your intention explicit.

If the file is hosted on a HTTP or FTP server then the source_hash argument is also required.

source_sum

sum hash for source

user

The user to own the file, this defaults to the user salt is running as on the minion

group

The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored

mode

The permissions to set on this file, e.g. `644`, `0775`, or `4664`.

The default mode for new files and directories corresponds to the umask of the salt process. The mode of existing files and directories will only be changed if `mode` is specified.

Note: This option is **not** supported on Windows.

attrs

The attributes to have on this file, e.g. `a`, `i`. The attributes can be any or a combination of the following characters: `aAcCdDeijPsStTu`.

Note: This option is **not** supported on Windows.

New in version 2018.3.0.

saltenv

Specify the environment from which to retrieve the file indicated by the `source` parameter. If not provided, this defaults to the environment from which the state is being executed.

Note: Ignored when the source file is from a non-`salt://` source..

backup

Overrides the default backup mode for this specific file. See *backup_mode documentation* for more details.

makedirs
If set to `True`, then the parent directories will be created to facilitate the creation of the named file. If `False`, and the parent directory of the destination file doesn't exist, the state will fail.

template
If this setting is applied, the named templating engine will be used to render the downloaded file. The following templates are supported:

- `cheetah`
- `genshi`
- *`jinja`*
- *`mako`*
- *`py`*
- `wempy`

Note: The template option is required when recursively applying templates.

---

show_changes
Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made. Default is `True`

Note: Using this option will store two copies of the file in-memory (the original version and the edited version) in order to generate the diff.

---

contents:
Specify the contents of the file. Cannot be used in combination with `source`. Ignores hashes and does not use a templating engine.

dir_mode
If directories are to be created, passing this option specifies the permissions for those directories. If this is not set, directories will be assigned permissions by adding the execute bit to the mode of the files.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

skip_verify: **False**
If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.0.

keep_mode: **False**
If `True`, and the `source` is a file from the Salt fileserver (or a local file on the minion), the mode of the destination file will be set to the mode of the source file.

Note: keep_mode does not work with salt-ssh.

As a consequence of how the files are transferred to the minion, and the inability to connect back to the master with salt-ssh, salt is unable to stat the file as it exists on the fileserver and thus cannot mirror the mode on the salt-ssh minion

---

encoding
If specified, then the specified encoding will be used. Otherwise, the file will be encoded using the system locale (usually UTF-8). See https://docs.python.org/3/library/codecs.html#standard-encodings for the list of available encodings.

New in version 2017.7.0.

encoding_errors: 'strict'
Default is ``'strict'``. See https://docs.python.org/2/library/codecs.html#codec-base-classes for the error handling schemes.

New in version 2017.7.0.

seuser
selinux user attribute

New in version 3001.

serange
selinux range attribute

New in version 3001.

setype
selinux type attribute

New in version 3001.

serange
selinux range attribute

New in version 3001.

verify_ssl
If `False`, remote https file sources (`https://`) will not attempt to validate the servers certificate. Default is True.

New in version 3002.

use_etag
If `True`, remote http/https file sources will attempt to use the ETag header to determine if the remote file needs to be downloaded. This provides a lightweight mechanism for promptly refreshing files changed on a web server without requiring a full hash comparison via the `source_hash` parameter.

New in version 3005.

signature
Ensure a valid signature exists on the selected `source` file. Set this to true for inline signatures, or to a file URI retrievable by *:py:func:`cp.cache_file <salt.modules.cp.cache_file>* for a detached one.

Note: A signature is only enforced directly after caching the file, before it is moved to its final destination. Existing target files (with the correct checksum) will neither be checked nor deleted.

It will be enforced regardless of source type and will be required on the final output, therefore this does not lend itself well when templates are rendered. The file will not be modified, meaning inline signatures are not removed.

New in version 3007.0.

source_hash_sig
When `source` is a remote file source, `source_hash` is a file, `skip_verify` is not true and `use_etag` is not true, ensure a valid signature exists on the source hash file. Set this to

`true` for an inline (clearsigned) signature, or to a file URI retrievable by *:py:func:`cp.cache_file <salt.modules.cp.cache_file>* for a detached one.

Note: A signature on the `source_hash` file is enforced regardless of changes since its contents are used to check if an existing file is in the correct state - but only for remote sources! As for `signature`, existing target files will not be modified, only the cached source_hash and source_hash_sig files will be removed.

New in version 3007.0.

signed_by_any
When verifying signatures either on the managed file or its source hash file, require at least one valid signature from one of a list of keys. By default, this is passed to `gpg.verify`, meaning a key is identified by its fingerprint.

New in version 3007.0.

signed_by_all
When verifying signatures either on the managed file or its source hash file, require a valid signature from each of the keys in this list. By default, this is passed to `gpg.verify`, meaning a key is identified by its fingerprint.

New in version 3007.0.

keyring
When verifying signatures, use this keyring.

New in version 3007.0.

gnupghome
When verifying signatures, use this GnuPG home.

New in version 3007.0.

ignore_ordering
If `True`, changes in line order will be ignored **ONLY** for the purposes of triggering watch/onchanges requisites. Changes will still be made to the file to bring it into alignment with requested state, and also reported during the state run. This behavior is useful for bringing existing application deployments under Salt configuration management without disrupting production applications with a service restart.

New in version 3007.0.

ignore_whitespace
If `True`, changes in whitespace will be ignored **ONLY** for the purposes of triggering watch/onchanges requisites. Changes will still be made to the file to bring it into alignment with requested state, and also reported during the state run. This behavior is useful for bringing existing application deployments under Salt configuration management without disrupting production applications with a service restart. Implies `ignore_ordering=True`

New in version 3007.0.

ignore_comment_characters
If set to a chacter string, the presence of changes *after* that string will be ignored in changes found in the file **ONLY** for the purposes of triggering watch/onchanges requisites. Changes will still be made to the file to bring it into alignment with requested state, and also reported during the state run. This behavior is useful for bringing existing application deployments under Salt configuration management without disrupting production applications with a service restart. Implies `ignore_ordering=True`

New in version 3007.0.

new_file_diff

If `True`, creation of new files will still show a diff in the changes return.

New in version 3008.0.

sig_backend

When verifying signatures, use this execution module as a backend. It must be compatible with the *`gpg.verify`* API. Defaults to `gpg`. All signature-related parameters are passed through.

New in version 3008.0.

CLI Example:

```
salt '*' file.manage_file /etc/httpd/conf.d/httpd.conf '' '{}' salt://
↪http/httpd.conf '{hash_type: 'md5', 'hsum': <md5sum>}' root root '755' '
↪' base ''
```

Changed in version 2014.7.0: `follow_symlinks` option added

`salt.modules.file.`**`mkdir`**(*dir_path, user=None, group=None, mode=None*)

Ensure that a directory is available.

CLI Example:

```
salt '*' file.mkdir /opt/jetty/context
```

`salt.modules.file.`**`mknod`**(*name, ntype, major=0, minor=0, user=None, group=None, mode='0600'*)

New in version 0.17.0.

Create a block device, character device, or fifo pipe. Identical to the gnu mknod.

CLI Examples:

```
salt '*' file.mknod /dev/chr c 180 31
salt '*' file.mknod /dev/blk b 8 999
salt '*' file.nknod /dev/fifo p
```

`salt.modules.file.`**`mknod_blkdev`**(*name, major, minor, user=None, group=None, mode='0660'*)

New in version 0.17.0.

Create a block device.

CLI Example:

```
salt '*' file.mknod_blkdev /dev/blk 8 999
```

`salt.modules.file.`**`mknod_chrdev`**(*name, major, minor, user=None, group=None, mode='0660'*)

New in version 0.17.0.

Create a character device.

CLI Example:

```
salt '*' file.mknod_chrdev /dev/chr 180 31
```

`salt.modules.file.`**`mknod_fifo`**(*name, user=None, group=None, mode='0660'*)

New in version 0.17.0.

Create a FIFO pipe.

CLI Example:

```
salt '*' file.mknod_fifo /dev/fifo
```

`salt.modules.file.`**`move`**(*src*, *dst*, *disallow_copy_and_unlink=False*)

Move a file or directory

disallow_copy_and_unlink

If `True`, the operation is offloaded to the `file.rename` execution module function. This will use `os.rename` underneath, which will fail in the event that `src` and `dst` are on different filesystems. If `False` (the default), `shutil.move` will be used in order to fall back on a "copy then unlink" approach, which is required for moving across filesystems.

New in version 3006.0.

CLI Example:

```
salt '*' file.move /path/to/src /path/to/dst
```

`salt.modules.file.`**`normpath`**(*path*)

Returns Normalize path, eliminating double slashes, etc.

New in version 2015.5.0.

This can be useful at the CLI but is frequently useful when scripting.

```
{%- from salt['file.normpath'](tpldir + '/../vars.jinja') import parent_
↪vars %}
```

CLI Example:

```
salt '*' file.normpath 'a/b/c/..'
```

`salt.modules.file.`**`open_files`**(*by_pid=False*)

Return a list of all physical open files on the system.

CLI Examples:

```
salt '*' file.open_files
salt '*' file.open_files by_pid=True
```

`salt.modules.file.`**`pardir`**()

Return the relative parent directory path symbol for underlying OS

New in version 2014.7.0.

This can be useful when constructing Salt Formulas.

```
{% set pardir = salt['file.pardir']() %}
{% set final_path = salt['file.join']('subdir', pardir, 'confdir') %}
```

CLI Example:

```
salt '*' file.pardir
```

`salt.modules.file.`**`patch`**(*originalfile*, *patchfile*, *options=''*, *dry_run=False*)

New in version 0.10.4.

Apply a patch to a file or directory.

Equivalent to:

```
patch <options> -i <patchfile> <originalfile>
```

Or, when a directory is patched:

```
patch <options> -i <patchfile> -d <originalfile> -p0
```

originalfile
The full path to the file or directory to be patched

patchfile
A patch file to apply to `originalfile`

options
Options to pass to patch.

Note: Windows now supports using patch as of 3004.

In order to use this function in Windows, please install the patch binary through your own means and ensure it's found in the system Path. If installing through git-for-windows, please select the optional "Use Git and optional Unix tools from the Command Prompt" option when installing Git.

CLI Example:

```
salt '*' file.patch /opt/file.txt /tmp/file.txt.patch

salt '*' file.patch C:\file1.txt C:\file3.patch
```

`salt.modules.file.`**`path_exists_glob`**(*path*)

Tests to see if path after expansion is a valid path (file or directory). Expansion allows usage of ? * and character ranges []. Tilde expansion is not supported. Returns True/False.

New in version 2014.7.0.

CLI Example:

```
salt '*' file.path_exists_glob /etc/pam*/pass*
```

`salt.modules.file.`**`prepend`**(*path*, **args*, ***kwargs*)

New in version 2014.7.0.

Prepend text to the beginning of a file

path
path to file

args
strings to prepend to the file

CLI Example:

```
salt '*' file.prepend /etc/motd \
        "With all thine offerings thou shalt offer salt." \
        "Salt is what makes things taste bad when it isn't in them."
```

Attention

If you need to pass a string to append and that string contains an equal sign, you **must** include the argument name, args. For example:

```
salt '*' file.prepend /etc/motd args='cheese=spam'

salt '*' file.prepend /etc/motd args="['cheese=spam','spam=cheese']"
```

`salt.modules.file.`**`psed`**(*path*, *before*, *after*, *limit=''*, *backup='.bak'*, *flags='gMS'*, *escape_all=False*, *multi=False*)

Deprecated since version 0.17.0: Use *`replace()`* instead.

Make a simple edit to a file (pure Python version)

Equivalent to:

```
sed <backup> <options> "/<limit>/ s/<before>/<after>/<flags> <file>"
```

path
The full path to the file to be edited

before
A pattern to find in order to replace with `after`

after
Text that will replace `before`

limit: `''`
An initial pattern to search for before searching for `before`

backup: `.bak`
The file will be backed up before edit with this file extension; **WARNING:** each time `sed/comment/uncomment` is called will overwrite this backup

flags: `gMS`

Flags to modify the search. Valid values are:

- `g`: Replace all occurrences of the pattern, not just the first.
- `I`: Ignore case.
- `L`: Make `\w`, `\W`, `\b`, `\B`, `\s` and `\S` dependent on the locale.
- `M`: Treat multiple lines as a single line.
- `S`: Make `.` match all characters, including newlines.
- `U`: Make `\w`, `\W`, `\b`, `\B`, `\d`, `\D`, `\s` and `\S` dependent on Unicode.
- `X`: Verbose (whitespace is ignored).

multi: `False`
If True, treat the entire file as a single line

Forward slashes and single quotes will be escaped automatically in the `before` and `after` patterns.

CLI Example:

```
salt '*' file.sed /etc/httpd/httpd.conf 'LogLevel warn' 'LogLevel info'
```

`salt.modules.file.`**`read`**(*path*, *binary=False*)

New in version 2017.7.0.

Return the content of the file.

Parameters

`binary` (*`bool`*) -- Whether to read and return binary data

CLI Example:

```
salt '*' file.read /path/to/file
```

`salt.modules.file.`**`readdir`**(*path*)

New in version 2014.1.0.

Return a list containing the contents of a directory

CLI Example:

```
salt '*' file.readdir /path/to/dir/
```

`salt.modules.file.`**`readlink`**(*path*, *canonicalize=False*)

New in version 2014.1.0.

Return the path that a symlink points to

Parameters

- **`path`** (*`str`*) -- The path to the symlink
- **`canonicalize`** (*`bool`*) -- Get the canonical path eliminating any symbolic links encountered in the path

Returns

The path that the symlink points to

Return type

str

Raises

- ***`SaltInvocationError`*** -- path is not absolute
- ***`SaltInvocationError`*** -- path is not a link
- ***`CommandExecutionError`*** -- error reading the symbolic link

CLI Example:

```
salt '*' file.readlink /path/to/link
```

`salt.modules.file.`**`remove`**(*path*, ***kwargs*)

Remove the named file. If a directory is supplied, it will be recursively deleted.

CLI Example:

```
salt '*' file.remove /tmp/foo
```

Changed in version 3000: The method now works on all types of file system entries, not just files, directories and symlinks.

`salt.modules.file.`**`remove_backup`**`(`*path*, *backup_id*`)`

This function is an alias of `delete_backup`.

New in version 0.17.0.

Delete a previous version of a file that was backed up using Salt's *file state backup* system.

path
The path on the minion to check for backups

backup_id
The numeric id for the backup you wish to delete, as found using *`file.list_backups`*

CLI Example:

```
salt '*' file.delete_backup /var/cache/salt/minion/file_backup/
↪home/foo/bar/baz.txt 0
```

`salt.modules.file.`**`rename`**`(`*src*, *dst*`)`

Rename a file or directory

CLI Example:

```
salt '*' file.rename /path/to/src /path/to/dst
```

`salt.modules.file.`**`replace`**`(`*path*, *pattern*, *repl*, *count=0*, *flags=8*, *bufsize=1*, *append_if_not_found=False*, *prepend_if_not_found=False*, *not_found_content=None*, *backup='.bak'*, *dry_run=False*, *search_only=False*, *show_changes=True*, *ignore_if_missing=False*, *preserve_inode=True*, *backslash_literal=False*`)`

New in version 0.17.0.

Replace occurrences of a pattern in a file. If `show_changes` is `True`, then a diff of what changed will be returned, otherwise a `True` will be returned when changes are made, and `False` when no changes are made.

This is a pure Python implementation that wraps Python's `sub()`.

path
Filesystem path to the file to be edited. If a symlink is specified, it will be resolved to its target.

pattern
A regular expression, to be matched using Python's `search()`.

repl
The replacement text

count: 0
Maximum number of pattern occurrences to be replaced. If count is a positive integer `n`, only `n` occurrences will be replaced, otherwise all occurrences will be replaced.

flags (list or int)
A list of flags defined in the `re` module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., `['IGNORECASE', 'MULTILINE']`. Optionally, `flags` may be an int, with a value corresponding to the XOR (`|`) of all the desired flags. Defaults to 8 (which supports 'MULTILINE').

bufsize (int or str)
How much of the file to buffer into memory at once. The default value `1` processes one line at a time. The special value `file` may be specified which will read the entire file into memory before processing.

append_if_not_found: False
New in version 2014.7.0.

If set to `True`, and pattern is not found, then the content will be appended to the file.

prepend_if_not_found: False
New in version 2014.7.0.

If set to `True` and pattern is not found, then the content will be prepended to the file.

not_found_content
New in version 2014.7.0.

Content to use for append/prepend if not found. If None (default), uses `repl`. Useful when `repl` uses references to group in pattern.

backup: **.bak**
The file extension to use for a backup of the file before editing. Set to `False` to skip making a backup.

dry_run: False
If set to `True`, no changes will be made to the file, the function will just return the changes that would have been made (or a `True`/`False` value if `show_changes` is set to `False`).

search_only: False
If set to true, this no changes will be performed on the file, and this function will simply return `True` if the pattern was matched, and `False` if not.

show_changes: True
If `True`, return a diff of changes made. Otherwise, return `True` if changes were made, and `False` if not.

Note: Using this option will store two copies of the file in memory (the original version and the edited version) in order to generate the diff. This may not normally be a concern, but could impact performance if used with large files.

ignore_if_missing: False
New in version 2015.8.0.

If set to `True`, this function will simply return `False` if the file doesn't exist. Otherwise, an error will be thrown.

preserve_inode: True
New in version 2015.8.0.

Preserve the inode of the file, so that any hard links continue to share the inode with the original filename. This works by *copying* the file, reading from the copy, and writing to the file at the original inode. If `False`, the file will be *moved* rather than copied, and a new file will be written to a new inode, but using the original filename. Hard links will then share an inode with the backup, instead (if using `backup` to create a backup copy).

backslash_literal: False
New in version 2016.11.7.

Interpret backslashes as literal backslashes for the repl and not escape characters. This will help when using append/prepend so that the backslashes are not interpreted for the repl on the second run of the state.

If an equal sign (`=`) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' file.replace /path/to/file pattern='=' repl=':'
salt '*' file.replace /path/to/file pattern="bind-address\s*=" repl='bind-
↪address:'
```

CLI Examples:

```
salt '*' file.replace /etc/httpd/httpd.conf pattern='LogLevel warn' repl=
↪'LogLevel info'
salt '*' file.replace /some/file pattern='before' repl='after' flags=
↪'[MULTILINE, IGNORECASE]'
```

`salt.modules.file.`**`restore_backup`**(*path*, *backup_id*)

New in version 0.17.0.

Restore a previous version of a file that was backed up using Salt's *file state backup* system.

path
The path on the minion to check for backups

backup_id
The numeric id for the backup you wish to restore, as found using `file.list_backups`

CLI Example:

```
salt '*' file.restore_backup /foo/bar/baz.txt 0
```

`salt.modules.file.`**`restorecon`**(*path*, *recursive=False*)

Reset the SELinux context on a given path

CLI Example:

```
salt '*' file.restorecon /home/user/.ssh/authorized_keys
```

`salt.modules.file.`**`rmdir`**(*path*, *recurse=False*, *verbose=False*, *older_than=None*)

New in version 2014.1.0.

Changed in version 3006.0: Changed return value for failure to a boolean.

Remove the specified directory. Fails if a directory is not empty.

recurse
When `recurse` is set to `True`, all empty directories within the path are pruned.

New in version 3006.0.

verbose
When `verbose` is set to `True`, a dictionary is returned which contains more information about the removal process.

New in version 3006.0.

older_than
When `older_than` is set to a number, it is used to determine the **number of days** which must have passed since the last modification timestamp before a directory will be allowed to be removed. Setting the value to 0 is equivalent to leaving it at the default of `None`.

New in version 3006.0.

CLI Example:

```
salt '*' file.rmdir /tmp/foo/
```

`salt.modules.file.`**`search`**(*path*, *pattern*, *flags=8*, *bufsize=1*, *ignore_if_missing=False*, *multiline=False*)

New in version 0.17.0.

Search for occurrences of a pattern in a file

Except for multiline, params are identical to *`replace()`*.

multiline

If true, inserts 'MULTILINE' into `flags` and sets `bufsize` to 'file'.

New in version 2015.8.0.

CLI Example:

```
salt '*' file.search /etc/crontab 'mymaintenance.sh'
```

`salt.modules.file.`**`sed`**(*path*, *before*, *after*, *limit=''*, *backup='.bak'*, *options='-r -e'*, *flags='g'*, *escape_all=False*, *negate_match=False*)

Deprecated since version 0.17.0: Use *`replace()`* instead.

Make a simple edit to a file

Equivalent to:

```
sed <backup> <options> "/<limit>/ s/<before>/<after>/<flags> <file>"
```

path

The full path to the file to be edited

before

A pattern to find in order to replace with `after`

after

Text that will replace `before`

limit: **`''`**

An initial pattern to search for before searching for `before`

backup: **`.bak`**

The file will be backed up before edit with this file extension; **WARNING**: each time `sed`/`comment`/`uncomment` is called will overwrite this backup

options: **`-r -e`**

Options to pass to sed

flags: **`g`**

Flags to modify the sed search; e.g., `i` for case-insensitive pattern matching

negate_match: **False**

Negate the search command (`!`)

New in version 0.17.0.

Forward slashes and single quotes will be escaped automatically in the `before` and `after` patterns.

CLI Example:

```
salt '*' file.sed /etc/httpd/httpd.conf 'LogLevel warn' 'LogLevel info'
```

`salt.modules.file.`**`sed_contains`**(*path*, *text*, *limit=''*, *flags='g'*)

Deprecated since version 0.17.0: Use `search()` instead.

Return True if the file at `path` contains `text`. Utilizes sed to perform the search (line-wise search).

Note: the `p` flag will be added to any flags you pass in.

CLI Example:

```
salt '*' file.contains /etc/crontab 'mymaintenance.sh'
```

`salt.modules.file.`**`seek_read`**(*path*, *size*, *offset*)

New in version 2014.1.0.

Seek to a position on a file and read it

path
path to file

seek
amount to read at once

offset
offset to start into the file

CLI Example:

```
salt '*' file.seek_read /path/to/file 4096 0
```

`salt.modules.file.`**`seek_write`**(*path*, *data*, *offset*)

New in version 2014.1.0.

Seek to a position on a file and write to it

path
path to file

data
data to write to file

offset
position in file to start writing

CLI Example:

```
salt '*' file.seek_write /path/to/file 'some data' 4096
```

`salt.modules.file.`**`set_mode`**(*path*, *mode*)

Set the mode of a file

path
file or directory of which to set the mode

mode
mode to set the path to

CLI Example:

```
salt '*' file.set_mode /etc/passwd 0644
```

`salt.modules.file.`**`set_selinux_context`**(*path*, *user=None*, *role=None*, *type=None*, *range=None*, *persist=False*)

Changed in version 3001: Added persist option

Set a specific SELinux label on a given path

CLI Example:

```
salt '*' file.set_selinux_context path <user> <role> <type> <range>
salt '*' file.set_selinux_context /etc/yum.repos.d/epel.repo system_u
↪object_r system_conf_t s0
```

`salt.modules.file.`**`source_list`**(*source*, *source_hash*, *saltenv*)

Check the source list and return the source to use

CLI Example:

```
salt '*' file.source_list salt://http/httpd.conf '{hash_type: 'md5', 'hsum
↪': <md5sum>}' base
```

`salt.modules.file.`**`stats`**(*path*, *hash_type=None*, *follow_symlinks=True*)

Return a dict containing the stats for a given file

CLI Example:

```
salt '*' file.stats /etc/passwd
```

`salt.modules.file.`**`statvfs`**(*path*)

New in version 2014.1.0.

Perform a statvfs call against the filesystem that the file resides on

CLI Example:

```
salt '*' file.statvfs /path/to/file
```

`salt.modules.file.`**`symlink`**(*src*, *path*, *force=False*, *atomic=False*, *follow_symlinks=True*)

Create a symbolic link (symlink, soft link) to a file

Parameters

- **`src`** (*`str`*) -- The path to a file or directory
- **`path`** (*`str`*) -- The path to the link. Must be an absolute path
- **`force`** (*`bool`*) -- Overwrite an existing symlink with the same name .. versionadded:: 3005
- **`atomic`** (*`bool`*) -- Use atomic file operations to create the symlink .. versionadded:: 3006.0
- **`follow_symlinks`** (*`bool`*) -- If set to `False`, use `os.path.lexists()` for existence checks instead of `os.path.exists()`. .. versionadded:: 3007.0

Returns

`True` if successful, otherwise raises `CommandExecutionError`

Return type

bool

CLI Example:

```
salt '*' file.symlink /path/to/file /path/to/link
```

`salt.modules.file.`**`touch`**`(`*name*, *atime=None*, *mtime=None*`)`

New in version 0.9.5.

Just like the `touch` command, create a file if it doesn't exist or simply update the atime and mtime if it already does.

atime:
Access time in Unix epoch time. Set it to 0 to set atime of the file with Unix date of birth. If this parameter isn't set, atime will be set with current time.

mtime:
Last modification in Unix epoch time. Set it to 0 to set mtime of the file with Unix date of birth. If this parameter isn't set, mtime will be set with current time.

CLI Example:

```
salt '*' file.touch /var/log/emptyfile
```

`salt.modules.file.`**`truncate`**`(`*path*, *length*`)`

New in version 2014.1.0.

Seek to a position on a file and delete everything after that point

path
path to file

length
offset into file to truncate

CLI Example:

```
salt '*' file.truncate /path/to/file 512
```

`salt.modules.file.`**`uid_to_user`**`(`*uid*`)`

Convert a uid to a user name

uid
uid to convert to a username

CLI Example:

```
salt '*' file.uid_to_user 0
```

`salt.modules.file.`**`uncomment`**`(`*path*, *regex*, *char='#'*, *backup='.bak'*`)`

Deprecated since version 0.17.0: Use *`replace()`* instead.

Uncomment specified commented lines in a file

path
The full path to the file to be edited

regex
A regular expression used to find the lines that are to be uncommented. This regex should not include the comment character. A leading ^ character will be stripped for convenience (for easily switching between comment() and uncomment()).

char: **#**
The character to remove in order to uncomment a line

backup: **`.bak`**
The file will be backed up before edit with this file extension; **WARNING**: each time `sed`/`comment`/`uncomment` is called will overwrite this backup

CLI Example:

```
salt '*' file.uncomment /etc/hosts.deny 'ALL: PARANOID'
```

`salt.modules.file.`**`user_to_uid`**(*user*)

Convert user name to a uid

user
user name to convert to its uid

CLI Example:

```
salt '*' file.user_to_uid root
```

`salt.modules.file.`**`write`**(*path*, **args*, ***kwargs*)

New in version 2014.7.0.

Write text to a file, overwriting any existing contents.

path
path to file

args
strings to write to the file

CLI Example:

```
salt '*' file.write /etc/motd \
        "With all thine offerings thou shalt offer salt."
```

Attention

If you need to pass a string to append and that string contains an equal sign, you **must** include the argument name, args. For example:

```
salt '*' file.write /etc/motd args='cheese=spam'

salt '*' file.write /etc/motd args="['cheese=spam','spam=cheese']"
```

26.6.59 salt.modules.firewalld

Support for firewalld.

New in version 2015.2.0.

`salt.modules.firewalld.`**`add_interface`**(*zone*, *interface*, *permanent=True*)

Bind an interface to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.add_interface zone eth0
```

salt.modules.firewalld.**add_masquerade**(*zone=None*, *permanent=True*)

Enable masquerade on a zone. If zone is omitted, default zone will be used.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.add_masquerade
```

To enable masquerade on a specific zone

```
salt '*' firewalld.add_masquerade dmz
```

salt.modules.firewalld.**add_port**(*zone*, *port*, *permanent=True*, *force_masquerade=False*)

Allow specific ports in a zone.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.add_port internal 443/tcp
```

force_masquerade
when a zone is created ensure masquerade is also enabled on that zone.

salt.modules.firewalld.**add_port_fwd**(*zone*, *src*, *dest*, *proto='tcp'*, *dstaddr=''*, *permanent=True*, *force_masquerade=False*)

Add port forwarding.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.add_port_fwd public 80 443 tcp
```

force_masquerade
when a zone is created ensure masquerade is also enabled on that zone.

salt.modules.firewalld.**add_rich_rule**(*zone*, *rule*, *permanent=True*)

Add a rich rule to a zone

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.add_rich_rule zone 'rule'
```

salt.modules.firewalld.**add_service**(*service*, *zone=None*, *permanent=True*)

Add a service for zone. If zone is omitted, default zone will be used.

CLI Example:

```
salt '*' firewalld.add_service ssh
```

To assign a service to a specific zone:

```
salt '*' firewalld.add_service ssh my_zone
```

`salt.modules.firewalld.`**`add_service_port`**`(`*service, port*`)`

Add a new port to the specified service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.add_service_port zone 80
```

`salt.modules.firewalld.`**`add_service_protocol`**`(`*service, protocol*`)`

Add a new protocol to the specified service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.add_service_protocol zone ssh
```

`salt.modules.firewalld.`**`add_source`**`(`*zone, source, permanent=True*`)`

Bind a source to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.add_source zone 192.168.1.0/24
```

`salt.modules.firewalld.`**`allow_icmp`**`(`*zone, icmp, permanent=True*`)`

Allow a specific ICMP type on a zone

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.allow_icmp zone echo-reply
```

`salt.modules.firewalld.`**`block_icmp`**`(`*zone, icmp, permanent=True*`)`

Block a specific ICMP type on a zone

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.block_icmp zone echo-reply
```

`salt.modules.firewalld.`**`default_zone`**`()`

Print default zone for connections and interfaces

CLI Example:

```
salt '*' firewalld.default_zone
```

`salt.modules.firewalld.`**`delete_service`**`(`*name, restart=True*`)`

Delete an existing service

CLI Example:

```
salt '*' firewalld.delete_service my_service
```

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False

```
salt '*' firewalld.delete_service my_service False
```

`salt.modules.firewalld.`**`delete_zone`**`(`*zone*, *restart=True*`)`

Delete an existing zone

CLI Example:

```
salt '*' firewalld.delete_zone my_zone
```

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False

```
salt '*' firewalld.delete_zone my_zone False
```

`salt.modules.firewalld.`**`get_icmp_types`**`(`*permanent=True*`)`

Print predefined icmptypes

CLI Example:

```
salt '*' firewalld.get_icmp_types
```

`salt.modules.firewalld.`**`get_interfaces`**`(`*zone*, *permanent=True*`)`

List interfaces bound to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.get_interfaces zone
```

`salt.modules.firewalld.`**`get_masquerade`**`(`*zone=None*, *permanent=True*`)`

Show if masquerading is enabled on a zone. If zone is omitted, default zone will be used.

CLI Example:

```
salt '*' firewalld.get_masquerade zone
```

`salt.modules.firewalld.`**`get_rich_rules`**`(`*zone*, *permanent=True*`)`

List rich rules bound to a zone

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.get_rich_rules zone
```

`salt.modules.firewalld.`**`get_service_ports`**`(`*service*`)`

List ports of a service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.get_service_ports zone
```

`salt.modules.firewalld.`**`get_service_protocols`**`(`*service*`)`

List protocols of a service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.get_service_protocols zone
```

`salt.modules.firewalld.`**`get_services`**`(`*permanent=True*`)`

Print predefined services

CLI Example:

```
salt '*' firewalld.get_services
```

`salt.modules.firewalld.`**`get_sources`**`(`*zone*, *permanent=True*`)`

List sources bound to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.get_sources zone
```

`salt.modules.firewalld.`**`get_zones`**`(`*permanent=True*`)`

Print predefined zones

CLI Example:

```
salt '*' firewalld.get_zones
```

`salt.modules.firewalld.`**`list_all`**`(`*zone=None*, *permanent=True*`)`

List everything added for or enabled in a zone

CLI Example:

```
salt '*' firewalld.list_all
```

List a specific zone

```
salt '*' firewalld.list_all my_zone
```

`salt.modules.firewalld.`**`list_icmp_block`**`(`*zone*, *permanent=True*`)`

List ICMP blocks on a zone

New in version 2015.8.0.

CLI Example:

```
salt '*' firewlld.list_icmp_block zone
```

`salt.modules.firewalld.`**`list_port_fwd`**`(`*zone*, *permanent=True*`)`

List port forwarding

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.list_port_fwd public
```

`salt.modules.firewalld.`**`list_ports`**`(`*zone, permanent=True*`)`

List all ports in a zone.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.list_ports
```

`salt.modules.firewalld.`**`list_services`**`(`*zone=None, permanent=True*`)`

List services added for zone as a space separated list. If zone is omitted, default zone will be used.

CLI Example:

```
salt '*' firewalld.list_services
```

List a specific zone

```
salt '*' firewalld.list_services my_zone
```

`salt.modules.firewalld.`**`list_zones`**`(`*permanent=True*`)`

List everything added for or enabled in all zones

CLI Example:

```
salt '*' firewalld.list_zones
```

`salt.modules.firewalld.`**`make_permanent`**`()`

Make current runtime configuration permanent.

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.make_permanent
```

`salt.modules.firewalld.`**`new_service`**`(`*name, restart=True*`)`

Add a new service

CLI Example:

```
salt '*' firewalld.new_service my_service
```

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False

```
salt '*' firewalld.new_service my_service False
```

`salt.modules.firewalld.`**`new_zone`**`(`*zone, restart=True*`)`

Add a new zone

CLI Example:

```
salt '*' firewalld.new_zone my_zone
```

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False

```
salt '*' firewalld.new_zone my_zone False
```

`salt.modules.firewalld.`**`reload_rules`**`()`

Reload the firewall rules, which makes the permanent configuration the new runtime configuration without losing state information.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.reload_rules
```

`salt.modules.firewalld.`**`remove_interface`**`(`*zone, interface, permanent=True*`)`

Remove an interface bound to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.remove_interface zone eth0
```

`salt.modules.firewalld.`**`remove_masquerade`**`(`*zone=None, permanent=True*`)`

Remove masquerade on a zone. If zone is omitted, default zone will be used.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.remove_masquerade
```

To remove masquerade on a specific zone

```
salt '*' firewalld.remove_masquerade dmz
```

`salt.modules.firewalld.`**`remove_port`**`(`*zone, port, permanent=True*`)`

Remove a specific port from a zone.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.remove_port internal 443/tcp
```

`salt.modules.firewalld.`**`remove_port_fwd`**`(`*zone, src, dest, proto='tcp', dstaddr='', permanent=True*`)`

Remove Port Forwarding.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.remove_port_fwd public 80 443 tcp
```

`salt.modules.firewalld.`**`remove_rich_rule`**`(`*zone, rule, permanent=True*`)`

Add a rich rule to a zone

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.remove_rich_rule zone 'rule'
```

`salt.modules.firewalld.`**`remove_service`**`(`*service, zone=None, permanent=True*`)`

Remove a service from zone. This option can be specified multiple times. If zone is omitted, default zone will be used.

CLI Example:

```
salt '*' firewalld.remove_service ssh
```

To remove a service from a specific zone

```
salt '*' firewalld.remove_service ssh dmz
```

`salt.modules.firewalld.`**`remove_service_port`**`(`*service, port*`)`

Remove a port from the specified service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.remove_service_port zone 80
```

`salt.modules.firewalld.`**`remove_service_protocol`**`(`*service, protocol*`)`

Remove a protocol from the specified service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.remove_service_protocol zone ssh
```

`salt.modules.firewalld.`**`remove_source`**`(`*zone, source, permanent=True*`)`

Remove a source bound to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.remove_source zone 192.168.1.0/24
```

`salt.modules.firewalld.`**`set_default_zone`**`(`*zone*`)`

Set default zone

CLI Example:

```
salt '*' firewalld.set_default_zone damian
```

`salt.modules.firewalld.`**`version`**`()`

Return version from firewall-cmd

CLI Example:

```
salt '*' firewalld.version
```

26.6.60 salt.modules.git

Support for the Git SCM

`salt.modules.git.`**`add`**(*cwd*, *filename*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*)

Changed in version 2015.8.0: The `--verbose` command line argument is now implied

Interface to git-add(1)

cwd
The path to the git checkout

filename
The location of the file/directory to add, relative to `cwd`

opts
Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts
Any additional options to add to git command itself (not the `add` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.add /path/to/repo foo/bar.py
salt myminion git.add /path/to/repo foo/bar.py opts='--dry-run'
```

`salt.modules.git.`**`archive`**(*cwd*, *output*, *rev='HEAD'*, *prefix=None*, *git_opts=''*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*, ***kwargs*)

Changed in version 2015.8.0: Returns `True` if successful, raises an error if not.

Interface to git-archive(1), exports a tarball/zip file of the repository

cwd
The path to be archived

Note: `git archive` permits a partial archive to be created. Thus, this path does not need to be the root of the git repository. Only the files within the directory specified by `cwd` (and its subdirectories) will be in the resulting archive. For example, if there is a git checkout at `/tmp/foo`, then passing `/tmp/foo/bar` as the `cwd` will result in just the files underneath `/tmp/foo/bar` to be exported as an archive.

---

output
The path of the archive to be created

overwrite
[False] Unless set to `True`, Salt will over overwrite an existing archive at the path specified by the `output` argument.

New in version 2015.8.0.

rev
[HEAD] The revision from which to create the archive

format
Manually specify the file format of the resulting archive. This argument can be omitted, and `git archive` will attempt to guess the archive type (and compression) from the filename. `zip`, `tar`, `tar.gz`, and `tgz` are extensions that are recognized automatically, and git can be configured to support other archive types with the addition of git configuration keys.

See the git-archive(1) manpage explanation of the `--format` argument (as well as the `CONFIGURATION` section of the manpage) for further information.

New in version 2015.8.0.

prefix
Prepend `<prefix>` to every filename in the archive. If unspecified, the name of the directory at the top level of the repository will be used as the prefix (e.g. if `cwd` is set to `/foo/bar/baz`, the prefix will be `baz`, and the resulting archive will contain a top-level directory by that name).

Note: The default behavior if the `--prefix` option for `git archive` is not specified is to not prepend a prefix, so Salt's behavior differs slightly from `git archive` in this respect. Use `prefix=''` to create an archive with no prefix.

Changed in version 2015.8.0: The behavior of this argument has been changed slightly. As of this version, it is necessary to include the trailing slash when specifying a prefix, if the prefix is intended to create a top-level directory.

git_opts
Any additional options to add to git command itself (not the `archive` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.archive /path/to/repo /path/to/archive.tar
```

`salt.modules.git.`**`branch`**(*cwd*, *name=None*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*)

Interface to git-branch(1)

cwd
The path to the git checkout

name
Name of the branch on which to operate. If not specified, the current branch will be assumed.

opts
Any additional options to add to the command line, in a single string

---

Note: To create a branch based on something other than HEAD, pass the name of the revision as `opts`. If the revision is in the format `remotename/branch`, then this will also set the remote tracking branch.

Additionally, on the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

git_opts
Any additional options to add to git command itself (not the `branch` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
# Set remote tracking branch
salt myminion git.branch /path/to/repo mybranch opts='--set-upstream-to=origin/mybranch'
# Create new branch
salt myminion git.branch /path/to/repo mybranch upstream/somebranch
# Delete branch
salt myminion git.branch /path/to/repo mybranch opts='-d'
# Rename branch (2015.8.0 and later)
salt myminion git.branch /path/to/repo newbranch opts='-m oldbranch'
```

`salt.modules.git.`**`checkout`**(*cwd, rev=None, force=False, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None*)

Interface to git-checkout(1)

cwd
The path to the git checkout

opts
Any additional options to add to the command line, in a single string

---

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

git_opts
Any additional options to add to git command itself (not the `checkout` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

rev
The remote branch or revision to checkout.

Changed in version 2015.8.0: Optional when using `-b` or `-B` in `opts`.

force
[False] Force a checkout even if there might be overwritten changes

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
# Checking out local local revisions
salt myminion git.checkout /path/to/repo somebranch user=jeff
salt myminion git.checkout /path/to/repo opts='testbranch -- conf/file1⊠
↪file2'
salt myminion git.checkout /path/to/repo rev=origin/mybranch opts='--track
↪'
# Checking out remote revision into new branch
salt myminion git.checkout /path/to/repo upstream/master opts='-b⊠
↪newbranch'
```

(continues on next page)

(continued from previous page)

```
# Checking out current revision into new branch (2015.8.0 and later)
salt myminion git.checkout /path/to/repo opts='-b newbranch'
```

`salt.modules.git.clone`(*cwd*, *url=None*, *name=None*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *identity=None*, *https_user=None*, *https_pass=None*, *ignore_retcode=False*, *saltenv='base'*, *output_encoding=None*)

Interface to git-clone(1)

cwd

Location of git clone

Changed in version 2015.8.0: If `name` is passed, then the clone will be made *within* this directory.

url

The URL of the repository to be cloned

Changed in version 2015.8.0: Argument renamed from `repository` to `url`

name

Optional alternate name for the top-level directory to be created by the clone

New in version 2015.8.0.

opts

Any additional options to add to the command line, in a single string

git_opts

Any additional options to add to git command itself (not the `clone` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user

User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity

Path to a private key to use for ssh URLs

Warning: Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

Changed in version 2016.3.0.

https_user
Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

New in version 2015.5.0.

https_pass
Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

New in version 2015.5.0.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

saltenv
The default salt environment to pull sls files from

New in version 2016.3.1.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.clone /path/to/repo_parent_dir git://github.com/
↪saltstack/salt.git
```

`salt.modules.git.`**`commit`**(*cwd*, *message*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *filename=None*, *ignore_retcode=False*, *output_encoding=None*)

Interface to git-commit(1)

cwd
The path to the git checkout

message
Commit message

opts
Any additional options to add to the command line, in a single string. These opts will be added to the end of the git command being run.

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

The `-m` option should not be passed here, as the commit message will be defined by the `message` argument.

---

git_opts
Any additional options to add to git command itself (not the `commit` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

filename
The location of the file/directory to commit, relative to `cwd`. This argument is optional, and can be used to commit a file without first staging it.

Note: This argument only works on files which are already tracked by the git repository.

New in version 2015.8.0.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.commit /path/to/repo 'The commit message'
salt myminion git.commit /path/to/repo 'The commit message' filename=foo/
↪bar.py
```

`salt.modules.git.`**`config_get`**(*key*, *cwd=None*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*, ***kwargs*)

Get the value of a key in the git configuration file

key
The name of the configuration key to get

Changed in version 2015.8.0: Argument renamed from `setting_name` to `key`

cwd
The path to the git checkout

Changed in version 2015.8.0: Now optional if `global` is set to `True`

global
[False] If `True`, query the global git configuration. Otherwise, only the local git configuration will be queried.

New in version 2015.8.0.

all
[False] If `True`, return a list of all values set for `key`. If the key does not exist, `None` will be returned.

New in version 2015.8.0.

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.config_get user.name cwd=/path/to/repo
salt myminion git.config_get user.email global=True
salt myminion git.config_get core.gitproxy cwd=/path/to/repo all=True
```

`salt.modules.git.`**`config_get_regex`**`(`*key*, *value_regex=None*, *cwd=None*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*, ***kwargs*`)`

This function is an alias of `config_get_regexp`.

New in version 2015.8.0.

Get the value of a key or keys in the git configuration file using regexes for more flexible matching. The return data is a dictionary mapping keys to lists of values matching the `value_regex`. If no values match, an empty dictionary will be returned.

key
Regex on which key names will be matched

value_regex
If specified, return all values matching this regex. The return data will be a dictionary mapping keys to lists of values matching the regex.

Important: Only values matching the `value_regex` will be part of the return data. So, if `key` matches a multivar, then it is possible that not all of the values will be returned. To get all values set for a multivar, simply omit the `value_regex` argument.

---

cwd
The path to the git checkout

global
[False] If `True`, query the global git configuration. Otherwise, only the local git configuration will be queried.

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
# Matches any values for key 'foo.bar'
salt myminion git.config_get_regexp /path/to/repo foo.bar
# Matches any value starting with 'baz' set for key 'foo.bar'
salt myminion git.config_get_regexp /path/to/repo foo.bar 'baz.*'
# Matches any key starting with 'user.'
salt myminion git.config_get_regexp '^user\.' global=True
```

`salt.modules.git.`**`config_get_regexp`**(*key*, *value_regex=None*, *cwd=None*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*, ***kwargs*)

New in version 2015.8.0.

Get the value of a key or keys in the git configuration file using regexes for more flexible matching. The return data is a dictionary mapping keys to lists of values matching the `value_regex`. If no values match, an empty dictionary will be returned.

key
Regex on which key names will be matched

value_regex
If specified, return all values matching this regex. The return data will be a dictionary mapping keys to lists of values matching the regex.

Important: Only values matching the `value_regex` will be part of the return data. So, if `key` matches a multivar, then it is possible that not all of the values will be returned. To get all values set for a multivar, simply omit the `value_regex` argument.

---

cwd
The path to the git checkout

global
[False] If `True`, query the global git configuration. Otherwise, only the local git configuration will be queried.

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
# Matches any values for key 'foo.bar'
salt myminion git.config_get_regexp /path/to/repo foo.bar
# Matches any value starting with 'baz' set for key 'foo.bar'
salt myminion git.config_get_regexp /path/to/repo foo.bar 'baz.*'
# Matches any key starting with 'user.'
salt myminion git.config_get_regexp '^user\.' global=True
```

`salt.modules.git.`**`config_set`**(*key*, *value=None*, *multivar=None*, *cwd=None*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*, ***kwargs*)

Changed in version 2015.8.0: Return the value(s) of the key being set

Set a key in the git configuration file

cwd
The path to the git checkout. Must be an absolute path, or the word `global` to indicate that a global key should be set.

Changed in version 2014.7.0: Made `cwd` argument optional if `is_global=True`

key
The name of the configuration key to set

Changed in version 2015.8.0: Argument renamed from `setting_name` to `key`

value
The value to set for the specified key. Incompatible with the `multivar` argument.

Changed in version 2015.8.0: Argument renamed from `setting_value` to `value`

add
[False] Add a value to a key, creating/updating a multivar

New in version 2015.8.0.

multivar
Set a multivar all at once. Values can be comma-separated or passed as a Python list. Incompatible with the `value` argument.

New in version 2015.8.0.

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

global
[False] If `True`, set a global variable

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.config_set user.email me@example.com cwd=/path/to/repo
salt myminion git.config_set user.email foo@bar.com global=True
```

`salt.modules.git.`**`config_unset`**(*key*, *value_regex=None*, *cwd=None*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*, ***kwargs*)

New in version 2015.8.0.

Unset a key in the git configuration file

cwd
The path to the git checkout. Must be an absolute path, or the word `global` to indicate that a global key should be unset.

key
The name of the configuration key to unset

value_regex
Regular expression that matches exactly one key, used to delete a single value from a multivar. Ignored if `all` is set to `True`.

all
[False] If `True` unset all values for a multivar. If `False`, and `key` is a multivar, an error will be raised.

global
[False] If `True`, unset set a global variable. Otherwise, a local variable will be unset.

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.config_unset /path/to/repo foo.bar
salt myminion git.config_unset /path/to/repo foo.bar all=True
```

`salt.modules.git.`**`current_branch`**(*cwd*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*)

Returns the current branch name of a local checkout. If HEAD is detached, return the SHA1 of the revision which is currently checked out.

cwd
The path to the git checkout

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.current_branch /path/to/repo
```

`salt.modules.git.`**`describe`**(*cwd*, *rev='HEAD'*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*)

Returns the git-describe(1) string (or the SHA1 hash if there are no tags) for the given revision.

cwd
The path to the git checkout

rev
[HEAD] The revision to describe

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.describe /path/to/repo
salt myminion git.describe /path/to/repo develop
```

`salt.modules.git.`**`diff`**(*cwd*, *item1=None*, *item2=None*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *no_index=False*, *cached=False*, *paths=None*, *output_encoding=None*)

New in version 2015.8.12,2016.3.3,2016.11.0.

Interface to git-diff(1)

cwd
The path to the git checkout

item1 and item2
Revision(s) to pass to the `git diff` command. One or both of these arguments may be ignored if some of the options below are set to `True`. When `cached` is `False`, and no revisions are passed to this function, then the current working tree will be compared against the index (i.e. unstaged changes). When two revisions are passed, they will be compared to each other.

opts
Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts
Any additional options to add to git command itself (not the `diff` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

no_index
[False] When it is necessary to diff two files in the same repo against each other, and not diff two different revisions, set this option to `True`. If this is left `False` in these instances, then a normal `git diff` will be performed against the index (i.e. unstaged changes), and files in the `paths` option will be used to narrow down the diff output.

Note: Requires Git 1.5.1 or newer. Additionally, when set to `True`, `item1` and `item2` will be ignored.

cached
[False] If `True`, compare staged changes to `item1` (if specified), otherwise compare them to the most recent commit.

Note: `item2` is ignored if this option is is set to `True`.

---

paths
File paths to pass to the `git diff` command. Can be passed as a comma-separated list or a Python list.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
# Perform diff against the index (staging area for next commit)
salt myminion git.diff /path/to/repo
# Compare staged changes to the most recent commit
salt myminion git.diff /path/to/repo cached=True
# Compare staged changes to a specific revision
salt myminion git.diff /path/to/repo mybranch cached=True
# Perform diff against the most recent commit (includes staged changes)
salt myminion git.diff /path/to/repo HEAD
# Diff two commits
salt myminion git.diff /path/to/repo abcdef1 aabbccd
# Diff two commits, only showing differences in the specified paths
salt myminion git.diff /path/to/repo abcdef1 aabbccd paths=path/to/file1,
↪path/to/file2
# Diff two files with one being outside the working tree
salt myminion git.diff /path/to/repo no_index=True paths=path/to/file1,/
↪absolute/path/to/file2
```

`salt.modules.git.`**`discard_local_changes`**`(`*cwd*, *path='.'*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*`)`

New in version 2019.2.0.

Runs a `git checkout -- <path>` from the directory specified by `cwd`.

cwd
The path to the git checkout

path
path relative to cwd (defaults to `.`)

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password
Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

CLI Example:

```
salt myminion git.discard_local_changes /path/to/repo
salt myminion git.discard_local_changes /path/to/repo path=foo
```

`salt.modules.git.`**`fetch`**(*cwd*, *remote=None*, *force=False*, *refspecs=None*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *identity=None*, *ignore_retcode=False*, *saltenv='base'*, *output_encoding=None*)

Changed in version 2015.8.2: Return data is now a dictionary containing information on branches and tags that were added/updated

Interface to git-fetch(1)

cwd
The path to the git checkout

remote
Optional remote name to fetch. If not passed, then git will use its default behavior (as detailed in git-fetch(1)).

New in version 2015.8.0.

force
Force the fetch even when it is not a fast-forward.

New in version 2015.8.0.

refspecs
Override the refspec(s) configured for the remote with this argument. Multiple refspecs can be passed, comma-separated.

New in version 2015.8.0.

opts
Any additional options to add to the command line, in a single string

---

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

git_opts
Any additional options to add to git command itself (not the `fetch` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity
Path to a private key to use for ssh URLs

> **Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

Changed in version 2016.3.0.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

saltenv
The default salt environment to pull sls files from

New in version 2016.3.1.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

> **Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.fetch /path/to/repo upstream
salt myminion git.fetch /path/to/repo identity=/root/.ssh/id_rsa
```

`salt.modules.git.`**`init`**(*cwd, bare=False, template=None, separate_git_dir=None, shared=None, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None*)

Interface to git-init(1)

cwd
The path to the directory to be initialized

bare

[False] If `True`, init a bare repository

New in version 2015.8.0.

template

Set this argument to specify an alternate template directory

New in version 2015.8.0.

separate_git_dir

Set this argument to specify an alternate `$GIT_DIR`

New in version 2015.8.0.

shared

Set sharing permissions on git repo. See git-init(1) for more details.

New in version 2015.8.0.

opts

Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts

Any additional options to add to git command itself (not the `init` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user

User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode

[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.init /path/to/repo
# Init a bare repo (before 2015.8.0)
salt myminion git.init /path/to/bare/repo.git opts='--bare'
# Init a bare repo (2015.8.0 and later)
salt myminion git.init /path/to/bare/repo.git bare=True
```

`salt.modules.git.`**`is_worktree`**(*cwd*, *user=None*, *password=None*, *output_encoding=None*)

New in version 2015.8.0.

This function will attempt to determine if `cwd` is part of a worktree by checking its `.git` to see if it is a file containing a reference to another gitdir.

cwd
path to the worktree to be removed

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.is_worktree /path/to/repo
```

`salt.modules.git.`**`list_branches`**(*cwd*, *remote=False*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*)

New in version 2015.8.0.

Return a list of branches

cwd
The path to the git checkout

remote
[False] If `True`, list remote branches. Otherwise, local branches will be listed.

Warning: This option will only return remote branches of which the local checkout is aware, use *`git.fetch`* to update remotes.

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.list_branches /path/to/repo
salt myminion git.list_branches /path/to/repo remote=True
```

`salt.modules.git.`**`list_tags`**(*cwd*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*)

New in version 2015.8.0.

Return a list of tags

cwd
The path to the git checkout

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.list_tags /path/to/repo
```

`salt.modules.git.`**`list_worktrees`**`(`*cwd*, *stale=False*, *user=None*, *password=None*, *output_encoding=None*, ***kwargs*`)`

New in version 2015.8.0.

Returns information on worktrees

Changed in version 2015.8.4: Version 2.7.0 added the `list` subcommand to git-worktree(1) which provides a lot of additional information. The return data has been changed to include this information, even for pre-2.7.0 versions of git. In addition, if a worktree has a detached head, then any tags which point to the worktree's HEAD will be included in the return data.

Note: By default, only worktrees for which the worktree directory is still present are returned, but this can be changed using the `all` and `stale` arguments (described below).

---

cwd
The path to the git checkout

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

all
[False] If `True`, then return all worktrees tracked under $GIT_DIR/worktrees, including ones for which the gitdir is no longer present.

stale
[False] If `True`, return *only* worktrees whose gitdir is no longer present.

Note: Only one of `all` and `stale` can be set to `True`.

---

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.list_worktrees /path/to/repo
salt myminion git.list_worktrees /path/to/repo all=True
salt myminion git.list_worktrees /path/to/repo stale=True
```

`salt.modules.git.`**`ls_remote`**(*cwd=None*, *remote='origin'*, *ref=None*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *identity=None*, *https_user=None*, *https_pass=None*, *ignore_retcode=False*, *output_encoding=None*, *saltenv='base'*)

Interface to git-ls-remote(1). Returns the upstream hash for a remote reference.

cwd
The path to the git checkout. Optional (and ignored if present) when `remote` is set to a URL instead of a remote name.

remote
[origin] The name of the remote to query. Can be the name of a git remote (which exists in the git checkout defined by the `cwd` parameter), or the URL of a remote repository.

Changed in version 2015.8.0: Argument renamed from `repository` to `remote`

ref
The name of the ref to query. Optional, if not specified, all refs are returned. Can be a branch or tag name, or the full name of the reference (for example, to get the hash for a Github pull request number 1234, `ref` can be set to `refs/pull/1234/head`

Changed in version 2015.8.0: Argument renamed from `branch` to `ref`

Changed in version 2015.8.4: Defaults to returning all refs instead of master.

opts
Any additional options to add to the command line, in a single string

New in version 2015.8.0.

git_opts
Any additional options to add to git command itself (not the `ls-remote` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity
Path to a private key to use for ssh URLs

> **Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

Changed in version 2016.3.0.

https_user
Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

New in version 2015.5.0.

https_pass
Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

New in version 2015.5.0.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

saltenv
The default salt environment to pull sls files from

New in version 2016.3.1.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

> **Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.ls_remote /path/to/repo origin master
salt myminion git.ls_remote remote=https://mydomain.tld/repo.git␣
↪ref=mytag opts='--tags'
```

`salt.modules.git.`**`merge`**(*cwd, rev=None, opts='', git_opts='', user=None, password=None, identity=None, ignore_retcode=False, output_encoding=None, **kwargs*)

Interface to git-merge(1)

cwd
The path to the git checkout

rev
Revision to merge into the current branch. If not specified, the remote tracking branch will be merged.

New in version 2015.8.0.

opts
Any additional options to add to the command line, in a single string

---

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

git_opts
Any additional options to add to git command itself (not the `merge` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity
Path to a private key to use for ssh URLs. Salt will not attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input. Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`.

Note: For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

New in version 2018.3.5,2019.2.1,3000.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
# Fetch first...
salt myminion git.fetch /path/to/repo
# ... then merge the remote tracking branch
```

(continues on next page)

(continued from previous page)

```
salt myminion git.merge /path/to/repo
# .. or merge another rev
salt myminion git.merge /path/to/repo rev=upstream/foo
```

`salt.modules.git.`**`merge_base`**(*cwd, refs=None, octopus=False, is_ancestor=False, independent=False, fork_point=None, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None, **kwargs*)

New in version 2015.8.0.

Interface to git-merge-base(1).

cwd
The path to the git checkout

refs
Any refs/commits to check for a merge base. Can be passed as a comma-separated list or a Python list.

all
[False] Return a list of all matching merge bases. Not compatible with any of the below options except for `octopus`.

octopus
[False] If `True`, then this function will determine the best common ancestors of all specified commits, in preparation for an n-way merge. See here for a description of how these bases are determined.

Set `all` to `True` with this option to return all computed merge bases, otherwise only the "best" will be returned.

is_ancestor
[False] If `True`, then instead of returning the merge base, return a boolean telling whether or not the first commit is an ancestor of the second commit.

Note: This option requires two commits to be passed.

Changed in version 2015.8.2: Works properly in git versions older than 1.8.0, where the `--is-ancestor` CLI option is not present.

independent
[False] If `True`, this function will return the IDs of the refs/commits passed which cannot be reached by another commit.

fork_point
If passed, then this function will return the commit where the commit diverged from the ref specified by `fork_point`. If no fork point is found, `None` is returned.

Note: At most one commit is permitted to be passed if a `fork_point` is specified. If no commits are passed, then `HEAD` is assumed.

opts
Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

This option should not be necessary unless new CLI arguments are added to git-merge-base(1) and are not yet supported in Salt.

---

git_opts
Any additional options to add to git command itself (not the `merge-base` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] if `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.merge_base /path/to/repo HEAD upstream/mybranch
salt myminion git.merge_base /path/to/repo 8f2e542,4ad8cab,cdc9886
↪octopus=True
salt myminion git.merge_base /path/to/repo refs=8f2e542,4ad8cab,cdc9886
↪independent=True
salt myminion git.merge_base /path/to/repo refs=8f2e542,4ad8cab is_
↪ancestor=True
salt myminion git.merge_base /path/to/repo fork_point=upstream/master
salt myminion git.merge_base /path/to/repo refs=mybranch fork_
↪point=upstream/master
```

`salt.modules.git.`**`merge_tree`**(*cwd, ref1, ref2, base=None, user=None, password=None, ignore_retcode=False, output_encoding=None*)

New in version 2015.8.0.

Interface to git-merge-tree(1), shows the merge results and conflicts from a 3-way merge without touching the index.

cwd
The path to the git checkout

ref1
First ref/commit to compare

ref2
Second ref/commit to compare

base
The base tree to use for the 3-way-merge. If not provided, then *git.merge_base* will be invoked on `ref1` and `ref2` to determine the merge base to use.

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] if `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.merge_tree /path/to/repo HEAD upstream/dev
salt myminion git.merge_tree /path/to/repo HEAD upstream/dev base=aaf3c3d
```

`salt.modules.git.`**`pull`**`(`*cwd, opts='', git_opts='', user=None, password=None, identity=None, ignore_retcode=False, saltenv='base', output_encoding=None*`)`

Interface to git-pull(1)

cwd
The path to the git checkout

opts
Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts
Any additional options to add to git command itself (not the `pull` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity
Path to a private key to use for ssh URLs

Warning: Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

Changed in version 2016.3.0.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

saltenv
The default salt environment to pull sls files from

New in version 2016.3.1.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.pull /path/to/repo opts='--rebase origin master'
```

`salt.modules.git.`**`push`**(*cwd, remote=None, ref=None, opts='', git_opts='', user=None, password=None, identity=None, ignore_retcode=False, saltenv='base', output_encoding=None, **kwargs*)

Interface to git-push(1)

cwd
The path to the git checkout

remote
Name of the remote to which the ref should being pushed

New in version 2015.8.0.

ref
[master] Name of the ref to push

Note: Being a refspec, this argument can include a colon to define local and remote ref names.

opts
Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts
Any additional options to add to git command itself (not the `push` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity
Path to a private key to use for ssh URLs

Warning: Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

Changed in version 2016.3.0.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

saltenv

The default salt environment to pull sls files from

New in version 2016.3.1.

output_encoding

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
# Push master as origin/master
salt myminion git.push /path/to/repo origin master
# Push issue21 as upstream/develop
salt myminion git.push /path/to/repo upstream issue21:develop
# Delete remote branch 'upstream/temp'
salt myminion git.push /path/to/repo upstream :temp
```

`salt.modules.git.`**`rebase`**(*cwd*, *rev='master'*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*)

Interface to git-rebase(1)

cwd

The path to the git checkout

rev

[master] The revision to rebase onto the current branch

opts

Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts

Any additional options to add to git command itself (not the `rebase` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user

User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.rebase /path/to/repo master
salt myminion git.rebase /path/to/repo 'origin master'
salt myminion git.rebase /path/to/repo origin/master opts='--onto
↪newbranch'
```

`salt.modules.git.`**`remote_get`**(*cwd*, *remote='origin'*, *user=None*, *password=None*, *redact_auth=True*, *ignore_retcode=False*, *output_encoding=None*)

Get the fetch and push URL for a specific remote

cwd
The path to the git checkout

remote
[origin] Name of the remote to query

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

redact_auth
[True] Set to `False` to include the username/password if the remote uses HTTPS Basic Auth. Otherwise, this information will be redacted.

Warning: Setting this to `False` will not only reveal any HTTPS Basic Auth that is configured, but the return data will also be written to the job cache. When possible, it is recommended to use SSH for authentication.

New in version 2015.5.6.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.remote_get /path/to/repo
salt myminion git.remote_get /path/to/repo upstream
```

`salt.modules.git.`**`remote_refs`**`(`*url*, *heads=False*, *tags=False*, *user=None*, *password=None*, *identity=None*, *https_user=None*, *https_pass=None*, *ignore_retcode=False*, *output_encoding=None*, *saltenv='base'*, ***kwargs*`)`

New in version 2015.8.0.

Return the remote refs for the specified URL by running `git ls-remote`.

url
URL of the remote repository

filter
Optionally provide a ref name to `git ls-remote`. This can be useful to make this function run faster on repositories with many branches/tags.

New in version 2019.2.0.

heads
[False] Restrict output to heads. Can be combined with `tags`.

tags
[False] Restrict output to tags. Can be combined with `heads`.

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity
Path to a private key to use for ssh URLs

Warning: Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

Changed in version 2016.3.0.

https_user
Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

https_pass
Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

saltenv
The default salt environment to pull sls files from

New in version 2016.3.1.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

> **Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.remote_refs https://github.com/saltstack/salt.git
salt myminion git.remote_refs https://github.com/saltstack/salt.git filter=develop
```

`salt.modules.git.`**`remote_set`**(*cwd*, *url*, *remote='origin'*, *user=None*, *password=None*, *https_user=None*, *https_pass=None*, *push_url=None*, *push_https_user=None*, *push_https_pass=None*, *ignore_retcode=False*, *output_encoding=None*)

cwd
The path to the git checkout

url
Remote URL to set

remote
[origin] Name of the remote to set

push_url
If unset, the push URL will be identical to the fetch URL.

New in version 2015.8.0.

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

https_user
Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

New in version 2015.5.0.

https_pass
Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

New in version 2015.5.0.

push_https_user
Set HTTP Basic Auth user for `push_url`. Ignored if `push_url` is unset. Only accepted for HTTPS URLs.

New in version 2015.8.0.

push_https_pass
Set HTTP Basic Auth password for `push_url`. Ignored if `push_url` is unset. Only accepted for HTTPS URLs.

New in version 2015.8.0.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.remote_set /path/to/repo git@github.com:user/repo.git
salt myminion git.remote_set /path/to/repo git@github.com:user/repo.git␣
↪remote=upstream
salt myminion git.remote_set /path/to/repo https://github.com/user/repo.
↪git remote=upstream push_url=git@github.com:user/repo.git
```

`salt.modules.git.`**`remotes`**(*cwd, user=None, password=None, redact_auth=True, ignore_retcode=False, output_encoding=None*)

Get fetch and push URLs for each remote in a git checkout

cwd
The path to the git checkout

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

redact_auth
[True] Set to `False` to include the username/password for authenticated remotes in the return data. Otherwise, this information will be redacted.

> **Warning**: Setting this to `False` will not only reveal any HTTPS Basic Auth that is configured, but the return data will also be written to the job cache. When possible, it is recommended to use SSH for authentication.

New in version 2015.5.6.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

> **Note**: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.remotes /path/to/repo
```

`salt.modules.git.`**`reset`**(*cwd*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *identity=None*, *ignore_retcode=False*, *output_encoding=None*)

Interface to git-reset(1), returns the stdout from the git command

cwd
The path to the git checkout

opts
Any additional options to add to the command line, in a single string

> **Note**: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts
Any additional options to add to git command itself (not the `reset` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

> **Note**: This is only supported in git 1.7.2 and newer.

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity
Path to a private key to use for ssh URLs. Salt will not attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input. Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`.

Note: For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

New in version 2018.3.5,2019.2.1,3000.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
# Soft reset to a specific commit ID
salt myminion git.reset /path/to/repo ac3ee5c
# Hard reset
salt myminion git.reset /path/to/repo opts='--hard origin/master'
```

`salt.modules.git.`**`rev_parse`**(*cwd*, *rev=None*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*)

New in version 2015.8.0.

Interface to git-rev-parse(1)

cwd
The path to the git checkout

rev
Revision to parse. See the SPECIFYING REVISIONS section of the git-rev-parse(1) manpage for details on how to format this argument.

This argument is optional when using the options in the *Options for Files* section of the git-rev-parse(1) manpage.

opts
Any additional options to add to the command line, in a single string

git_opts
Any additional options to add to git command itself (not the `rev-parse` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
# Get the full SHA1 for HEAD
salt myminion git.rev_parse /path/to/repo HEAD
# Get the short SHA1 for HEAD
salt myminion git.rev_parse /path/to/repo HEAD opts='--short'
# Get the develop branch's upstream tracking branch
salt myminion git.rev_parse /path/to/repo 'develop@{upstream}' opts='--
↪abbrev-ref'
# Get the SHA1 for the commit corresponding to tag v1.2.3
salt myminion git.rev_parse /path/to/repo 'v1.2.3^{commit}'
# Find out whether or not the repo at /path/to/repo is a bare repository
salt myminion git.rev_parse /path/to/repo opts='--is-bare-repository'
```

`salt.modules.git.`**`revision`**(*cwd*, *rev='HEAD'*, *short=False*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*)

Returns the SHA1 hash of a given identifier (hash, branch, tag, HEAD, etc.)

cwd
The path to the git checkout

rev
[HEAD] The revision

short
[False] If `True`, return an abbreviated SHA1 git hash

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.revision /path/to/repo mybranch
```

`salt.modules.git.`**`rm_`**(*cwd*, *filename*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*)

Interface to git-rm(1)

cwd
The path to the git checkout

filename
The location of the file/directory to remove, relative to `cwd`

Note: To remove a directory, `-r` must be part of the `opts` parameter.

opts
Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts
Any additional options to add to git command itself (not the `rm` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.rm /path/to/repo foo/bar.py
salt myminion git.rm /path/to/repo foo/bar.py opts='--dry-run'
salt myminion git.rm /path/to/repo foo/baz opts='-r'
```

`salt.modules.git.`**`stash`**(*cwd, action='save', opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None*)

Interface to git-stash(1), returns the stdout from the git command

cwd
The path to the git checkout

opts
Any additional options to add to the command line, in a single string. Use this to complete the `git stash` command by adding the remaining arguments (i.e. `'save <stash comment>'`, `'apply stash@{2}'`, `'show'`, etc.). Omitting this argument will simply run `git stash`.

git_opts
Any additional options to add to git command itself (not the `stash` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode

[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.stash /path/to/repo save opts='work in progress'
salt myminion git.stash /path/to/repo apply opts='stash@{1}'
salt myminion git.stash /path/to/repo drop opts='stash@{1}'
salt myminion git.stash /path/to/repo list
```

`salt.modules.git.`**`status`**(*cwd*, *user=None*, *password=None*, *ignore_retcode=False*, *output_encoding=None*)

Changed in version 2015.8.0: Return data has changed from a list of lists to a dictionary

Returns the changes to the repository

cwd

The path to the git checkout

user

User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode

[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.status /path/to/repo
```

salt.modules.git.**submodule**(*cwd*, *command*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *identity=None*, *ignore_retcode=False*, *saltenv='base'*, *output_encoding=None*, ***kwargs*)

Changed in version 2015.8.0: Added the `command` argument to allow for operations other than `update` to be run on submodules, and deprecated the `init` argument. To do a submodule update with `init=True` moving forward, use `command=update opts='--init'`

Interface to git-submodule(1)

cwd
The path to the submodule

command
Submodule command to run, see *git-submodule(1) <git submodule>* for more information. Any additional arguments after the command (such as the URL when adding a submodule) must be passed in the `opts` parameter.

New in version 2015.8.0.

opts
Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts
Any additional options to add to git command itself (not the `submodule` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

init
[False] If `True`, ensures that new submodules are initialized

Deprecated since version 2015.8.0: Pass `init` as the `command` parameter, or include `--init` in the `opts` param with `command` set to update.

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity
Path to a private key to use for ssh URLs

Warning: Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

Changed in version 2016.3.0.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

saltenv
The default salt environment to pull sls files from

New in version 2016.3.1.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
# Update submodule and ensure it is initialized (before 2015.8.0)
salt myminion git.submodule /path/to/repo/sub/repo init=True
# Update submodule and ensure it is initialized (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo update opts='--init'

# Rebase submodule (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo update opts='--rebase'

# Add submodule (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo add opts='https://
↪mydomain.tld/repo.git'

# Unregister submodule (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo deinit
```

`salt.modules.git.`**`symbolic_ref`**(*cwd, ref, value=None, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None*)

New in version 2015.8.0.

Interface to git-symbolic-ref(1)

cwd
The path to the git checkout

ref
Symbolic ref to read/modify

value
If passed, then the symbolic ref will be set to this value and an empty string will be returned.

If not passed, then the ref to which `ref` points will be returned, unless `--delete` is included in `opts` (in which case the symbolic ref will be deleted).

opts
Any additional options to add to the command line, in a single string

git_opts
Any additional options to add to git command itself (not the `symbolic-refs` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
# Get ref to which HEAD is pointing
salt myminion git.symbolic_ref /path/to/repo HEAD
# Set/overwrite symbolic ref 'FOO' to local branch 'foo'
salt myminion git.symbolic_ref /path/to/repo FOO refs/heads/foo
# Delete symbolic ref 'FOO'
salt myminion git.symbolic_ref /path/to/repo FOO opts='--delete'
```

`salt.modules.git.`**`tag`**(*cwd, name, ref='HEAD', message=None, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None*)

New in version 2018.3.4.

Interface to git-tag(1), adds and removes tags.

cwd
The path to the main git checkout or a linked worktree

name
Name of the tag

ref
[HEAD] Which ref to tag (defaults to local clone's HEAD)

> **Note:** This argument is ignored when either `-d` or `--delete` is present in the `opts` passed to this function.

message
Optional message to include with the tag. If provided, an annotated tag will be created.

opts
Any additional options to add to the command line, in a single string

> **Note:** Additionally, on the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts
Any additional options to add to git command itself (not the `worktree` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

> **Note:** This is only supported in git 1.7.2 and newer.

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password
Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

> **Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

CLI Example:

```
# Create an non-annotated tag
salt myminion git.tag /path/to/repo v1.2
# Create an annotated tag
salt myminion git.tag /path/to/repo v1.2 message='Version 1.2'
```

(continues on next page)

(continued from previous page)

```
# Delete the tag
salt myminion git.tag /path/to/repo v1.2 opts='-d'
```

`salt.modules.git.`**`version`**`(`*versioninfo=False*`)`

New in version 2015.8.0.

Returns the version of Git installed on the minion

versioninfo
[False] If `True`, return the version in a versioninfo list (e.g. `[2, 5, 0]`)

CLI Example:

```
salt myminion git.version
```

`salt.modules.git.`**`worktree_add`**`(`*cwd, worktree_path, ref=None, reset_branch=None, force=None, detach=False, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None, **kwargs*`)`

New in version 2015.8.0.

Interface to git-worktree(1), adds a worktree

cwd
The path to the git checkout

worktree_path
Path to the new worktree. Can be either absolute, or relative to `cwd`.

branch
Name of new branch to create. If omitted, will be set to the basename of the `worktree_path`. For example, if the `worktree_path` is `/foo/bar/baz`, then `branch` will be `baz`.

ref
Name of the ref on which to base the new worktree. If omitted, then `HEAD` is use, and a new branch will be created, named for the basename of the `worktree_path`. For example, if the `worktree_path` is `/foo/bar/baz` then a new branch `baz` will be created, and pointed at `HEAD`.

reset_branch
[False] If `False`, then git-worktree(1) will fail to create the worktree if the targeted branch already exists. Set this argument to `True` to reset the targeted branch to point at `ref`, and checkout the newly-reset branch into the new worktree.

force
[False] By default, git-worktree(1) will not permit the same branch to be checked out in more than one worktree. Set this argument to `True` to override this.

opts
Any additional options to add to the command line, in a single string

---

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` to avoid causing errors with Salt's own argument parsing.

All CLI options for adding worktrees as of Git 2.5.0 are already supported by this function as of Salt 2015.8.0, so using this argument is unnecessary unless new CLI arguments are added to git-worktree(1) and are not yet supported in Salt.

---

git_opts
Any additional options to add to git command itself (not the `worktree` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.worktree_add /path/to/repo/main ../hotfix ref=origin/
↪master
salt myminion git.worktree_add /path/to/repo/main ../hotfix
↪branch=hotfix21 ref=v2.1.9.3
```

`salt.modules.git.`**`worktree_prune`**(*cwd, dry_run=False, verbose=True, expire=None, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None*)

New in version 2015.8.0.

Interface to git-worktree(1), prunes stale worktree administrative data from the gitdir

cwd
The path to the main git checkout or a linked worktree

dry_run
[False] If `True`, then this function will report what would have been pruned, but no changes will be made.

verbose
[True] Report all changes made. Set to `False` to suppress this output.

expire
Only prune unused worktree data older than a specific period of time. The date format for this parameter is described in the documentation for the `gc.pruneWorktreesExpire` config param in the git-config(1) manpage.

opts
Any additional options to add to the command line, in a single string

---

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` to avoid causing errors with Salt's own argument parsing.

All CLI options for pruning worktrees as of Git 2.5.0 are already supported by this function as of Salt 2015.8.0, so using this argument is unnecessary unless new CLI arguments are added to git-worktree(1) and are not yet supported in Salt.

---

git_opts
Any additional options to add to git command itself (not the `worktree` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password
> Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.worktree_prune /path/to/repo
salt myminion git.worktree_prune /path/to/repo dry_run=True
salt myminion git.worktree_prune /path/to/repo expire=1.day.ago
```

`salt.modules.git.`**`worktree_rm`**(*cwd*, *user=None*, *output_encoding=None*)

New in version 2015.8.0.

Recursively removes the worktree located at `cwd`, returning `True` if successful. This function will attempt to determine if `cwd` is actually a worktree by invoking *`git.is_worktree`*. If the path does not correspond to a worktree, then an error will be raised and no action will be taken.

Warning: There is no undoing this action. Be **VERY** careful before running this function.

cwd
Path to the worktree to be removed

user
Used for path expansion when `cwd` is not an absolute path. By default, when `cwd` is not absolute, the path will be assumed to be relative to the home directory of the user under which the minion is running. Setting this option will change the home directory from which path expansion is performed.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.worktree_rm /path/to/worktree
```

26.6.61 salt.modules.gpg

Manage GPG keychains, add keys, create keys, retrieve keys from keyservers. Sign, encrypt, sign plus encrypt and verify text and files.

New in version 2015.5.0.

Note: The `python-gnupg` library and `gpg` binary are required to be installed. Be aware that the alternate `gnupg` and `pretty-bad-protocol` libraries are not supported.

Changed in version 3008.0: When `gnupghome` is not set explicitly, this module now tries to respect a custom `GNUPGHOME` environmental variable. If a `user` is not passed, the current process' environment is queried, otherwise the user's configured shell environment is taken as a reference in the same way the `cmd` modules operate.

`class` `salt.modules.gpg.`**`FixedVerify`**(*gpg*)

This is a workaround for https://github.com/vsajip/python-gnupg/issues/214. It ensures invalid or otherwise unverified signatures are not merged into sig_info in any way.

https://github.com/vsajip/python-gnupg/commit/ee94a7ecc1a86484c9f02337e2bbdd05fd32b383

handle_status(*key*, *value*)

Handle status messages from the *gpg* child process. These are lines of the format

[GNUPG:] <key> <value>

Parameters

- **key** (*str*) -- Identifies what the status message is.
- **value** (*str*) -- Identifies additional data, which differs depending on the key.

salt.modules.gpg.**create_key**(*key_type='RSA'*, *key_length=1024*, *name_real='Autogenerated Key'*, *name_comment='Generated by SaltStack'*, *name_email=None*, *subkey_type=None*, *subkey_length=None*, *expire_date=None*, *use_passphrase=False*, *user=None*, *gnupghome=None*, *keyring=None*)

Create a key in the GPG keychain

Note: GPG key generation requires *a lot* of entropy and randomness. Difficult to do over a remote connection, consider having another process available which is generating randomness for the machine. Also especially difficult on virtual machines, consider the rng-tools package.

The create_key process takes awhile so increasing the timeout may be necessary, e.g. -t 15.

key_type
The type of the primary key to generate. It must be capable of signing. 'RSA' or 'DSA'.

key_length
The length of the primary key in bits.

name_real
The real name of the user identity which is represented by the key.

name_comment
A comment to attach to the user id.

name_email
An email address for the user.

subkey_type
The type of the secondary key to generate.

subkey_length
The length of the secondary key in bits.

expire_date
The expiration date for the primary and any secondary key. You can specify an ISO date, A number of days/weeks/months/years, an epoch value, or 0 for a non-expiring key.

use_passphrase
Whether to use a passphrase with the signing key. The passphrase is retrieved from the Pillar key `gpg_passphrase`.

user
Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

gnupghome
Specify the location where the GPG keyring and related files are stored.

keyring
Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```
salt -t 15 '*' gpg.create_key
```

`salt.modules.gpg.`**`decrypt`**`(`*user=None, text=None, filename=None, output=None, use_passphrase=False, gnupghome=None, bare=False, keyring=None*`)`

Decrypt a message or a file

user
Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

text
The encrypted text to decrypt.

filename
The path of the encrypted file to decrypt.

output
Instead of printing to standard out, write the output to this path.

use_passphrase
Whether to use a passphrase with the signing key. The passphrase is retrieved from Pillar value `gpg_passphrase`.

gnupghome
Specify the location where the GPG keyring and related files are stored.

bare
If `True`, return the (armored) decrypted block as a string without the standard comment/res dict.

keyring
Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```
salt '*' gpg.decrypt filename='/path/to/important.file.gpg'

salt '*' gpg.decrypt filename='/path/to/important.file.gpg' use_
↪passphrase=True
```

`salt.modules.gpg.`**`delete_key`**`(`*keyid=None, fingerprint=None, delete_secret=False, user=None, gnupghome=None, use_passphrase=True, keyring=None*`)`

Delete a key from the GPG keychain.

keyid
The keyid of the key to be deleted.

fingerprint
The fingerprint of the key to be deleted.

delete_secret
Whether to delete a corresponding secret key prior to deleting the public key. Secret keys must be deleted before deleting any corresponding public keys.

user
Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

gnupghome
Specify the location where the GPG keyring and related files are stored.

use_passphrase
Whether to use a passphrase with the signing key. The passphrase is retrieved from the Pillar key `gpg_passphrase`. Note that this defaults to True here, contrary to the rest of the module functions that provide this parameter.

New in version 3003.

keyring
Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```
salt '*' gpg.delete_key keyid=3FAD9F1E

salt '*' gpg.delete_key
↪fingerprint=53C96788253E58416D20BCD352952C84C3252192

salt '*' gpg.delete_key keyid=3FAD9F1E user=username

salt '*' gpg.delete_key keyid=3FAD9F1E user=username delete_secret=True
```

`salt.modules.gpg.`**`encrypt`**(*user=None, recipients=None, text=None, filename=None, output=None, sign=None, use_passphrase=False, always_trust=False, gnupghome=None, bare=False, keyring=None*)

Encrypt a message or a file

user
Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

recipients
The key ID, fingerprint, user ID or email address associated with the recipients key can be used.

text
The text to encrypt.

filename
The path of the file to encrypt.

output
Instead of printing to standard out, write the output to this path.

sign
Whether to sign, in addition to encrypt, the data. `True` to use default key or fingerprint to specify a different key to sign with.

use_passphrase
Whether to use a passphrase with the signing key. The passphrase is retrieved from the Pillar key `gpg_passphrase`.

always_trust
Skip key validation and assume that used keys are fully trusted.

New in version 3006.0.

gnupghome
Specify the location where the GPG keyring and related files are stored.

bare
If `True`, return the (armored) encrypted block as a string without the standard comment/res dict.

keyring
Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```
salt '*' gpg.encrypt text='Hello there.  How are you?'
↪recipients=recipient@example.com

salt '*' gpg.encrypt filename='/path/to/important.file'
↪recipients=recipient@example.com

salt '*' gpg.encrypt filename='/path/to/important.file' sign=True use_
↪passphrase=True \
                     recipients=recipient@example.com
```

`salt.modules.gpg.`**`export_key`**(*keyids=None*, *secret=False*, *user=None*, *gnupghome=None*, *use_passphrase=False*, *output=None*, *bare=False*, *keyring=None*)

Export a key from the GPG keychain

keyids
The key ID(s) of the key(s) to be exported. Can be specified as a comma separated string or a list. Anything which GnuPG itself accepts to identify a key for example, the key ID, fingerprint, user ID or email address could be used.

secret
Export the secret key identified by the `keyids` information passed.

user
Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

gnupghome
Specify the location where the GPG keyring and related files are stored.

use_passphrase
Whether to use a passphrase to export the secret key. The passphrase is retrieved from the Pillar key `gpg_passphrase`.

New in version 3003.

output
Instead of printing to standard out, write the output to this path.

New in version 3006.0.

bare
If `True`, return the (armored) exported key block as a string without the standard comment/res dict.

New in version 3006.0.

keyring
Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```
salt '*' gpg.export_key keyids=3FAD9F1E

salt '*' gpg.export_key keyids=3FAD9F1E secret=True

salt '*' gpg.export_key keyids="['3FAD9F1E','3FBD8F1E']" user=username
```

`salt.modules.gpg.`**`get_key`**`(`*keyid=None, fingerprint=None, user=None, gnupghome=None, keyring=None*`)`

Get a key from the GPG keychain

keyid
The key ID (short or long) of the key to be retrieved.

fingerprint
The fingerprint of the key to be retrieved.

user
Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

gnupghome
Specify the location where the GPG keyring and related files are stored.

keyring
Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```
salt '*' gpg.get_key keyid=3FAD9F1E

salt '*' gpg.get_key fingerprint=53C96788253E58416D20BCD352952C84C3252192

salt '*' gpg.get_key keyid=3FAD9F1E user=username
```

`salt.modules.gpg.`**`get_secret_key`**`(`*keyid=None, fingerprint=None, user=None, gnupghome=None, keyring=None*`)`

Get a secret key from the GPG keychain

keyid
The key ID (short or long) of the key to be retrieved.

fingerprint
The fingerprint of the key to be retrieved.

user
Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

gnupghome
Specify the location where the GPG keyring and related files are stored.

keyring
Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```
salt '*' gpg.get_secret_key keyid=3FAD9F1E

salt '*' gpg.get_secret_key␣
↪fingerprint=53C96788253E58416D20BCD352952C84C3252192

salt '*' gpg.get_secret_key keyid=3FAD9F1E user=username
```

`salt.modules.gpg.`**`import_key`**(*text=None*, *filename=None*, *user=None*, *gnupghome=None*, *keyring=None*, *select=None*)

Import a key from text or a file

text
The text containing the key to import.

filename
The path of the file containing the key to import.

user
Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

gnupghome
Specify the location where the GPG keyring and related files are stored.

keyring
Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

select
Limit imported keys to a (list of) known identifier(s). This can be anything which GnuPG uses to identify keys like fingerprints, key IDs or email addresses.

New in version 3008.0.

CLI Example:

```
salt '*' gpg.import_key text='-----BEGIN PGP PUBLIC KEY BLOCK-----\n ... -
↪----END PGP PUBLIC KEY BLOCK-----'
salt '*' gpg.import_key filename='/path/to/public-key-file'
```

`salt.modules.gpg.`**`list_keys`**(*user=None*, *gnupghome=None*, *keyring=None*)

List keys in GPG keychain

user
Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

gnupghome
Specify the location where the GPG keyring and related files are stored.

keyring
Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```
salt '*' gpg.list_keys
```

`salt.modules.gpg.`**`list_secret_keys`**(*user=None*, *gnupghome=None*, *keyring=None*)

List secret keys in GPG keychain

user
: Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

gnupghome
: Specify the location where the GPG keyring and related files are stored.

keyring
: Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```
salt '*' gpg.list_secret_keys
```

`salt.modules.gpg.`**`read_key`**(*path=None*, *text=None*, *fingerprint=None*, *keyid=None*, *user=None*, *gnupghome=None*)

New in version 3008.0.

Read key(s) from the filesystem or a string.

CLI Example:

```
salt '*' gpg.read_key /tmp/my-shiny-key.asc
```

path
: The path to the key file to read. Either this or `text` is required.

text
: The string to read the key from. Either this or `path` is required.

Note: Requires python-gnupg v0.5.1.

fingerprint
: Only return key information if it matches this fingerprint.

keyid
: Only return key information if it matches this keyid.

user
: Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

gnupghome
: Specify the location where the GPG keyring and related files are stored.

Important: This can accidentally decrypt data on GnuPG versions below 2.1 if the file is not a keyring.

`salt.modules.gpg.`**`receive_keys`**(*keyserver=None, keys=None, user=None, gnupghome=None, keyring=None*)

Receive key(s) from keyserver and add them to the keychain

keyserver
Keyserver to use for searching for GPG keys, defaults to keys.openpgp.org

keys
The keyID(s) to retrieve from the keyserver. Can be specified as a comma separated string or a list.

user
Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

gnupghome
Specify the location where the GPG keyring and related files are stored.

keyring
Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```
salt '*' gpg.receive_keys keys='3FAD9F1E'

salt '*' gpg.receive_keys keys="['3FAD9F1E','3FBD9F2E']"

salt '*' gpg.receive_keys keys=3FAD9F1E user=username
```

`salt.modules.gpg.`**`search_keys`**(*text, keyserver=None, user=None, gnupghome=None*)

Search for keys on a keyserver

text
Text to search the keyserver for, e.g. email address, keyID or fingerprint.

keyserver
Keyserver to use for searching for GPG keys, defaults to keys.openpgp.org.

user
Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

gnupghome
Specify the location where the GPG keyring and related files are stored.

New in version 3007.0.

CLI Example:

```
salt '*' gpg.search_keys user@example.com

salt '*' gpg.search_keys user@example.com keyserver=keyserver.ubuntu.com

salt '*' gpg.search_keys user@example.com keyserver=keyserver.ubuntu.com
↪user=username
```

`salt.modules.gpg.`**`sign`**(*user=None, keyid=None, text=None, filename=None, output=None, use_passphrase=False, gnupghome=None, keyring=None*)

Sign a message or a file

user
Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

keyid
The keyid of the key to use for signing, defaults to the first key in the secret keyring.

text
The text to sign.

filename
The path of the file to sign.

output
Instead of printing to standard out, write the output to this path.

use_passphrase
Whether to use a passphrase with the signing key. The passphrase is retrieved from the Pillar key `gpg_passphrase`.

gnupghome
Specify the location where the GPG keyring and related files are stored.

keyring
Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```
salt '*' gpg.sign text='Hello there.  How are you?'

salt '*' gpg.sign filename='/path/to/important.file'

salt '*' gpg.sign filename='/path/to/important.file' use_passphrase=True
```

`salt.modules.gpg.`**`trust_key`**(*keyid=None, fingerprint=None, trust_level=None, user=None, gnupghome=None, keyring=None*)

Set the trust level for a key in the GPG keychain

keyid
The keyid of the key to set the trust level for.

fingerprint
The fingerprint of the key to set the trust level for.

trust_level
The trust level to set for the specified key, must be one of the following: expired, unknown, not_trusted, marginally, fully, ultimately

user
Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

gnupghome
Specify the location where the GPG keyring and related files are stored.

New in version 3007.0.

keyring
Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```
salt '*' gpg.trust_key keyid='3FAD9F1E' trust_level='marginally'
salt '*' gpg.trust_key fingerprint=
↪'53C96788253E58416D20BCD352952C84C3252192' trust_level='not_trusted'
salt '*' gpg.trust_key keys=3FAD9F1E trust_level='ultimately' user=
↪'username'
```

`salt.modules.gpg.`**`verify`**(*text=None, user=None, filename=None, gnupghome=None, signature=None, trustmodel=None, signed_by_any=None, signed_by_all=None, keyring=None*)

Verify a message or a file

text
The text to verify.

filename
The path of the file to verify.

user
Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

gnupghome
Specify the location where the GPG keyring and related files are stored.

signature
Specify the path of a detached signature.

New in version 2018.3.0.

trustmodel

Explicitly define the used trust model. One of:

- pgp
- classic
- tofu
- tofu+pgp
- direct
- always
- auto

New in version 2019.2.0.

signed_by_any
A list of key fingerprints from which any valid signature will mark verification as passed. If none of the provided keys signed the data, verification will fail. Optional. Note that this does not take into account trust.

New in version 3007.0.

signed_by_all
A list of key fingerprints whose signatures are required for verification to pass. If a single provided key did not sign the data, verification will fail. Optional. Note that this does not take into account trust.

New in version 3007.0.

keyring
Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```
salt '*' gpg.verify text='Hello there.  How are you?'
salt '*' gpg.verify filename='/path/to/important.file'
salt '*' gpg.verify filename='/path/to/important.file' trustmodel=direct
```

26.6.62 salt.modules.grains

Return/control aspects of the grains data

Grains set or altered with this module are stored in the 'grains' file on the minions. By default, this file is located at: `/etc/salt/grains`

Note: This does **NOT** override any grains set in the minion config file.

`salt.modules.grains.`**`append`**`(`*key*, *val*, *convert=False*, *delimiter=':'*`)`

New in version 0.17.0.

Append a value to a list in the grains config file. If the grain doesn't exist, the grain key is added and the value is appended to the new grain as a list item.

key
The grain key to be appended to

val
The value to append to the grain key

convert
If convert is True, convert non-list contents into a list. If convert is False and the grain contains non-list contents, an error is given. Defaults to False.

delimiter
The key can be a nested dict key. Use this parameter to specify the delimiter you use, instead of the default `:`. You can now append values to a list in nested dictionary grains. If the list doesn't exist at this level, it will be created.

New in version 2014.7.6.

CLI Example:

```
salt '*' grains.append key val
```

`salt.modules.grains.`**`delkey`**`(`*key*, *force=False*`)`

New in version 2017.7.0.

Remove a grain completely from the grain system, this will remove the grain key and value

key
The grain key from which to delete the value.

force
Force remove the grain even when it is a mapped value. Defaults to False

CLI Example:

```
salt '*' grains.delkey key
```

`salt.modules.grains.`**`delval`**(*key*, *destructive=False*, *force=False*)

New in version 0.17.0.

Delete a grain value from the grains config file. This will just set the grain value to `None`. To completely remove the grain, run `grains.delkey` or pass `destructive=True` to `grains.delval`.

key
The grain key from which to delete the value.

destructive
Delete the key, too. Defaults to False.

force
Force remove the grain even when it is a mapped value. Defaults to False

CLI Example:

```
salt '*' grains.delval key
```

`salt.modules.grains.`**`equals`**(*key*, *value*)

Used to make sure the minion's grain key/value matches.

Returns `True` if matches otherwise `False`.

New in version 2017.7.0.

CLI Example:

```
salt '*' grains.equals fqdn <expected_fqdn>
salt '*' grains.equals systemd:version 219
```

`salt.modules.grains.`**`fetch`**(*key*, *default=''*, *delimiter=':'*, *ordered=True*)

Attempt to retrieve the named value from grains, if the named value is not available return the passed default. The default return is an empty string.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in grains looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the apache key in the pkg dict this key can be passed:

```
pkg:apache
```

Parameters

- **`delimiter`** -- Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

  New in version 2014.7.0.

- **`ordered`** -- Outputs an ordered dict if applicable (default: True)

  New in version 2016.11.0.

CLI Example:

```
salt '*' grains.get pkg:apache
salt '*' grains.get abc::def|ghi delimiter='|'
```

`salt.modules.grains.`**`filter_by`**(*lookup_dict, grain='os_family', merge=None, default='default', base=None*)

New in version 0.17.0.

Look up the given grain in a given dictionary for the current OS and return the result

Although this may occasionally be useful at the CLI, the primary intent of this function is for use in Jinja to make short work of creating lookup tables for OS-specific data. For example:

```
{% set apache = salt['grains.filter_by']({
    'Debian': {'pkg': 'apache2', 'srv': 'apache2'},
    'RedHat': {'pkg': 'httpd', 'srv': 'httpd'},
}, default='Debian') %}

myapache:
  pkg.installed:
    - name: {{ apache.pkg }}
  service.running:
    - name: {{ apache.srv }}
```

Values in the lookup table may be overridden by values in Pillar. An example Pillar to override values in the example above could be as follows:

```
apache:
  lookup:
    pkg: apache_13
    srv: apache
```

The call to `filter_by()` would be modified as follows to reference those Pillar values:

```
{% set apache = salt['grains.filter_by']({
    ...
}, merge=salt['pillar.get']('apache:lookup')) %}
```

Parameters

- **`lookup_dict`** -- A dictionary, keyed by a grain, containing a value or values relevant to systems matching that grain. For example, a key could be the grain for an OS and the value could the name of a package on that particular OS.

  Changed in version 2016.11.0: The dictionary key could be a globbing pattern. The function will return the corresponding `lookup_dict` value where grain value matches the pattern. For example:

  ```
  # this will render 'got some salt' if Minion ID begins from
  ↪'salt'
  salt '*' grains.filter_by '{salt*: got some salt, default:
  ↪salt is not here}' id
  ```

- **`grain`** -- The name of a grain to match with the current system's grains. For example, the value of the ”os_family” grain for the current system could be used to pull values from the `lookup_dict` dictionary.

Changed in version 2016.11.0: The grain value could be a list. The function will return the `lookup_dict` value for a first found item in the list matching one of the `lookup_dict` keys.

- **`merge`** -- A dictionary to merge with the results of the grain selection from `lookup_dict`. This allows Pillar to override the values in the `lookup_dict`. This could be useful, for example, to override the values for non-standard package names such as when using a different Python version from the default Python version provided by the OS (e.g., `python26-mysql` instead of `python-mysql`).
- **`default`** -- default lookup_dict's key used if the grain does not exists or if the grain value has no match on lookup_dict. If unspecified the value is "default".

  New in version 2014.1.0.
- **`base`** -- A lookup_dict key to use for a base dictionary. The grain-selected `lookup_dict` is merged over this and then finally the `merge` dictionary is merged. This allows common values for each case to be collected in the base and overridden by the grain selection dictionary and the merge dictionary. Default is unset.

  New in version 2015.5.0.

CLI Example:

```
salt '*' grains.filter_by '{Debian: Debheads rule, RedHat: I love my hat}'
# this one will render {D: {E: I, G: H}, J: K}
salt '*' grains.filter_by '{A: B, C: {D: {E: F, G: H}}}' 'xxx' '{D: {E: I}
↪, J: K}' 'C'
# next one renders {A: {B: G}, D: J}
salt '*' grains.filter_by '{default: {A: {B: C}, D: E}, F: {A: {B: G}},
↪H: {D: I}}' 'xxx' '{D: J}' 'F' 'default'
# next same as above when default='H' instead of 'F' renders {A: {B: C},
↪D: J}
```

`salt.modules.grains.`**`get`**(*key*, *default=''*, *delimiter=':'*, *ordered=True*)

Attempt to retrieve the named value from grains, if the named value is not available return the passed default. The default return is an empty string.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in grains looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the apache key in the pkg dict this key can be passed:

```
pkg:apache
```

Parameters

- **`delimiter`** -- Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

  New in version 2014.7.0.
- **`ordered`** -- Outputs an ordered dict if applicable (default: True)

  New in version 2016.11.0.

CLI Example:

```
salt '*' grains.get pkg:apache
salt '*' grains.get abc::def|ghi delimiter='|'
```

`salt.modules.grains.`**`has_value`**`(`*key*`)`

Determine whether a key exists in the grains dictionary.

Given a grains dictionary that contains the following structure:

```
{'pkg': {'apache': 'httpd'}}
```

One would determine if the apache key in the pkg dict exists by:

```
pkg:apache
```

CLI Example:

```
salt '*' grains.has_value pkg:apache
```

`salt.modules.grains.`**`item`**`(`**args, **kwargs*`)`

Return one or more grains

CLI Example:

```
salt '*' grains.item os
salt '*' grains.item os osrelease oscodename
```

Sanitized CLI Example:

```
salt '*' grains.item host sanitize=True
```

`salt.modules.grains.`**`items`**`(`*sanitize=False*`)`

Return all of the minion's grains

CLI Example:

```
salt '*' grains.items
```

Sanitized CLI Example:

```
salt '*' grains.items sanitize=True
```

`salt.modules.grains.`**`ls`**`()`

Return a list of all available grains

CLI Example:

```
salt '*' grains.ls
```

`salt.modules.grains.`**`remove`**`(`*key, val, delimiter=':'*`)`

New in version 0.17.0.

Remove a value from a list in the grains config file

key

The grain key to remove.

val

The value to remove.

delimiter
The key can be a nested dict key. Use this parameter to specify the delimiter you use, instead of the default `:`. You can now append values to a list in nested dictionary grains. If the list doesn't exist at this level, it will be created.

New in version 2015.8.2.

CLI Example:

```
salt '*' grains.remove key val
```

`salt.modules.grains.`**`set`**(*key*, *val=''*, *force=False*, *destructive=False*, *delimiter=':'*)

Set a key to an arbitrary value. It is used like setval but works with nested keys.

This function is conservative. It will only overwrite an entry if its value and the given one are not a list or a dict. The `force` parameter is used to allow overwriting in all cases.

New in version 2015.8.0.

Parameters

- **`force`** -- Force writing over existing entry if given or existing values are list or dict. Defaults to False.
- **`destructive`** -- If an operation results in a key being removed, delete the key, too. Defaults to False.
- **`delimiter`** -- Specify an alternate delimiter to use when traversing a nested dict, the default being `:`

CLI Example:

```
salt '*' grains.set 'apps:myApp:port' 2209
salt '*' grains.set 'apps:myApp' '{port: 2209}'
```

`salt.modules.grains.`**`setval`**(*key*, *val*, *destructive=False*, *refresh_pillar=True*)

Set a grains value in the grains config file

key
The grain key to be set.

val
The value to set the grain key to.

destructive
If an operation results in a key being removed, delete the key, too. Defaults to False.

refresh_pillar
Whether pillar will be refreshed. Defaults to True.

CLI Example:

```
salt '*' grains.setval key val
salt '*' grains.setval key "{'sub-key': 'val', 'sub-key2': 'val2'}"
```

`salt.modules.grains.`**`setvals`**(*grains*, *destructive=False*, *refresh_pillar=True*)

Set new grains values in the grains config file

destructive
If an operation results in a key being removed, delete the key, too. Defaults to False.

refresh_pillar
Whether pillar will be refreshed. Defaults to True.

CLI Example:

```
salt '*' grains.setvals "{'key1': 'val1', 'key2': 'val2'}"
```

26.6.63 salt.modules.groupadd

Manage groups on Linux, OpenBSD and NetBSD

Important: If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to *'group.info' is not available*), see *here*.

`salt.modules.groupadd.`**`add`**(*name*, *gid=None*, *system=False*, *root=None*, *non_unique=False*, *local=False*)

Changed in version 3006.0.

Add the specified group

name
Name of the new group

gid
Use GID for the new group

system
Create a system account

root
Directory to chroot into

non_unique
Allow creating groups with duplicate (non-unique) GIDs

New in version 3006.0.

local
Specifically add the group locally rather than through remote providers (e.g. LDAP)

New in version 3007.0.

CLI Example:

```
salt '*' group.add foo 3456
```

`salt.modules.groupadd.`**`adduser`**(*name*, *username*, *root=None*)

Add a user in the group.

name
Name of the group to modify

username
Username to add to the group

root
Directory to chroot into

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

`salt.modules.groupadd.`**`chgid`**`(`*name, gid, root=None, non_unique=False*`)`

Changed in version 3006.0.

Change the gid for a named group

name
Name of the group to modify

gid
Change the group ID to GID

root
Directory to chroot into

non_unique
Allow modifying groups with duplicate (non-unique) GIDs

New in version 3006.0.

CLI Example:

```
salt '*' group.chgid foo 4376
```

`salt.modules.groupadd.`**`delete`**`(`*name, root=None, local=False*`)`

Remove the named group

name
Name group to delete

root
Directory to chroot into

local (Only on systems with lgroupdel available):
Ensure the group account is removed locally ignoring global account management (default is False).

New in version 3007.0.

CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.groupadd.`**`deluser`**`(`*name, username, root=None*`)`

Remove a user from the group.

name
Name of the group to modify

username
Username to delete from the group

root
Directory to chroot into

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.

`salt.modules.groupadd.`**`getent`**`(`*refresh=False, root=None*`)`

Return info on all groups

refresh
Force a refresh of group information

root
Directory to chroot into

CLI Example:

```
salt '*' group.getent
```

`salt.modules.groupadd.`**`info`**`(`*name, root=None*`)`

Return information about a group

name
Name of the group

root
Directory to chroot into

CLI Example:

```
salt '*' group.info foo
```

`salt.modules.groupadd.`**`members`**`(`*name, members_list, root=None*`)`

Replaces members of the group with a provided list.

name
Name of the group to modify

members_list
Username list to set into the group

root
Directory to chroot into

CLI Example:

```
salt '*' group.members foo 'user1,user2,user3,...'
```

Replaces a membership list for a local group 'foo'.
foo:x:1234:user1,user2,user3,...

26.6.64 salt.modules.hashutil

A collection of hashing and encoding functions

`salt.modules.hashutil.`**`base64_b64decode`**`(`*instr*`)`

Decode a base64-encoded string using the "modern" Python interface

New in version 2016.3.0.

CLI Example:

```
salt '*' hashutil.base64_b64decode 'Z2V0IHNhbHRlZA=='
```

`salt.modules.hashutil.`**`base64_b64encode`**(*instr*)

Encode a string as base64 using the "modern" Python interface.

Among other possible differences, the "modern" encoder does not include newline ('n') characters in the encoded output.

New in version 2016.3.0.

CLI Example:

```
salt '*' hashutil.base64_b64encode 'get salted'
```

`salt.modules.hashutil.`**`base64_decodefile`**(*instr, outfile*)

Decode a base64-encoded string and write the result to a file

New in version 2016.3.0.

CLI Example:

```
salt '*' hashutil.base64_decodefile instr='Z2V0IHNhbHRlZAo=' outfile='/
↪path/to/binary_file'
```

`salt.modules.hashutil.`**`base64_decodestring`**(*instr*)

Decode a base64-encoded byte-like object using the "modern" Python interface

New in version 3000.

CLI Example:

```
salt '*' hashutil.base64_decodestring instr='Z2V0IHNhbHRlZAo='
```

`salt.modules.hashutil.`**`base64_encodefile`**(*fname*)

Read a file from the file system and return as a base64 encoded string

New in version 2016.3.0.

Pillar example:

```
path:
  to:
    data: |
      {{ salt['hashutil.base64_encodefile']('/path/to/binary_file') |
↪indent(6) }}
```

The *`file.decode`* state function can be used to decode this data and write it to disk.

CLI Example:

```
salt '*' hashutil.base64_encodefile /path/to/binary_file
```

`salt.modules.hashutil.`**`base64_encodestring`**(*instr*)

Encode a byte-like object as base64 using the "modern" Python interface.

Among other possible differences, the "modern" encoder includes a newline ('n') character after every 76 characters and always at the end of the encoded byte-like object.

New in version 3000.

CLI Example:

```
salt '*' hashutil.base64_encodestring 'get salted'
```

`salt.modules.hashutil.`**`digest`**`(`*instr*, *checksum='md5'*`)`

Return a checksum digest for a string

instr

A string

checksum

`[md5]` The hashing algorithm to use to generate checksums. Valid options: md5, sha256, sha512.

CLI Example:

```
salt '*' hashutil.digest 'get salted'
```

`salt.modules.hashutil.`**`digest_file`**`(`*infile*, *checksum='md5'*`)`

Return a checksum digest for a file

infile

A file path

checksum

`[md5]` The hashing algorithm to use to generate checksums. Wraps the *`hashutil.digest`* execution function.

CLI Example:

```
salt '*' hashutil.digest_file /path/to/file
```

`salt.modules.hashutil.`**`github_signature`**`(`*string*, *shared_secret*, *challenge_hmac*`)`

Verify a challenging hmac signature against a string / shared-secret for github webhooks.

New in version 2017.7.0.

Returns a boolean if the verification succeeded or failed.

CLI Example:

```
salt '*' hashutil.github_signature '{"ref":....} ' 'shared secret'
↪'sha1=bc6550fc290acf5b42283fa8deaf55cea0f8c206'
```

`salt.modules.hashutil.`**`hmac_compute`**`(`*string*, *shared_secret*`)`

New in version 3000.

Compute a HMAC SHA256 digest using a string and secret.

CLI Example:

```
salt '*' hashutil.hmac_compute 'get salted' 'shared secret'
```

`salt.modules.hashutil.`**`hmac_signature`**`(`*string*, *shared_secret*, *challenge_hmac*`)`

Verify a challenging hmac signature against a string / shared-secret

New in version 2014.7.0.

Returns a boolean if the verification succeeded or failed.

CLI Example:

```
salt '*' hashutil.hmac_signature 'get salted' 'shared secret'
↪'eBWf9bstXg+NiP5AOwppB5HMvZiYMPzEM9W5YMm/AmQ='
```

salt.modules.hashutil.**md5_digest**(*instr*)

Generate an md5 hash of a given string

New in version 2014.7.0.

CLI Example:

```
salt '*' hashutil.md5_digest 'get salted'
```

salt.modules.hashutil.**sha256_digest**(*instr*)

Generate an sha256 hash of a given string

New in version 2014.7.0.

CLI Example:

```
salt '*' hashutil.sha256_digest 'get salted'
```

salt.modules.hashutil.**sha512_digest**(*instr*)

Generate an sha512 hash of a given string

New in version 2014.7.0.

CLI Example:

```
salt '*' hashutil.sha512_digest 'get salted'
```

26.6.65 salt.modules.highstate_doc

This module renders highstate configuration into a more human readable format.

How it works:

highstate or lowstate data is parsed with a *processor* this defaults to *highstate_doc.processor_markdown*. The processed data is passed to a *jinja* template that builds up the document content.

configuration: Pillar

```
# the following defaults can be overridden
highstate_doc.config:

    # list of regex of state names to ignore in `highstate_doc.process_
↪lowstates`
    filter_id_regex:
        - '.*!doc_skip$'

    # list of regex of state functions to ignore in `highstate_doc.process_
↪lowstates`
    filter_state_function_regex:
        - 'file.accumulated'

    # dict of regex to replace text after `highstate_doc.render`. (remove
↪passwords)
```

(continues on next page)

(continued from previous page)

```
    text_replace_regex:
        'password:.*^': '[PASSWORD]'

    # limit size of files that can be included in doc (10000 bytes)
    max_render_file_size: 10000

    # advanced option to set a custom lowstate processor
    processor: highstate_doc.processor_markdown
```

State example

```
{{sls}} note:
    highstate_doc.note:
        - name: example
        - order: 0
        - contents: |
            example `highstate_doc.note`
            ------------------
            This state does not do anything to the system! It is only used by
↪a `processor`
            you can use `requisites` and `order` to move your docs around the
↪rendered file.

{{sls}} a file we don't want in the doc !doc_skip:
    file.managed:
        - name: /root/passwords
        - contents: 'password: sadefgq34y45h56q'
        # also could use `highstate_doc.config: text_replace_regex` to replace
        # password string. `password:.*^': '[PASSWORD]`
```

To create the help document build a State that uses *highstate_doc.render*. For performance it's advised to not included this state in your *top.sls* file.

```
# example `salt://makereadme.sls`
make helpfile:
    file.managed:
        - name: /root/README.md
        - contents: {{salt.highstate_doc.render()|json}}
        - show_diff: {{opts['test']}}
        - mode: '0640'
        - order: last
```

Run our *makereadme.sls* state to create */root/README.md*.

```
# first ensure `highstate` return without errors or changes
salt-call state.highstate
salt-call state.apply makereadme
# or if you don't want the extra `make helpfile` state
salt-call --out=newline_values_only salt.highstate_doc.render > /root/README.
↪md ; chmod 0600 /root/README.md
```

Creating a document collection

From the master we can run the following script to creates a collection of all your minion documents.

```
salt '*' state.apply makereadme
```

```
#!/bin/python
import os
import salt.client
s = salt.client.LocalClient()
# NOTE: because of issues with `cp.push` use `highstate_doc.read_file`
o = s.cmd('*', 'highstate_doc.read_file', ['/root/README.md'])
for m in o:
    d = o.get(m)
    if d and not d.endswith('is not available.'):
        # mkdir m
        #directory = os.path.dirname(file_path)
        if not os.path.exists(m):
            os.makedirs(m)
        with open(m + '/README.md','wb') as f:
            f.write(d)
        print('ADDED: ' + m + '/README.md')
```

Once the master has a collection of all the README files. You can use pandoc to create HTML versions of the markdown.

```
# process all the readme.md files to readme.html
if which pandoc; then echo "Found pandoc"; else echo "** Missing pandoc";
↪exit 1; fi
if which gs; then echo "Found gs"; else echo "** Missing gs(ghostscript)";
↪exit 1; fi
readme_files=$(find $dest -type f -path "*/README.md" -print)
for f in $readme_files ; do
    ff=${f#$dest/}
    minion=${ff%%/*}
    echo "process: $dest/${minion}/$(basename $f)"
    cat $dest/${minion}/$(basename $f) |             pandoc --standalone --
↪from markdown_github --to html             --include-in-header $dest/style.
↪html             > $dest/${minion}/$(basename $f).html
done
```

It is also nice to put the help files in source control.

> # git init git add -A git commit -am 'updated docs' git push -f

Other hints

If you wish to customize the document format:

```
# you could also create a new `processor` for perhaps reStructuredText
# highstate_doc.config:
#     processor: doc_custom.processor_rst

# example `salt://makereadme.jinja`
"""
{{opts['id']}}
==========================================

{# lowstates is set from highstate_doc.render() #}
{# if lowstates is missing use salt.highstate_doc.process_lowstates() #}
{% for s in lowstates %}
{{s.id}}
-----------------------------------------------------------------
{{s.function}}

{{s.markdown.requisite}}
{{s.markdown.details}}

{%- endfor %}
"""

# example `salt://makereadme.sls`
{% import_text "makereadme.jinja" as makereadme %}
{{sls}} or:
    file.managed:
        - name: /root/README_other.md
        - contents: {{salt.highstate_doc.render(jinja_template_
↪text=makereadme)|json}}
        - mode: '0640'
```

HTACCESS
--------

``':{PLAIN}.*': ':{PLAIN}XXXXXXX'``
```

`salt.modules.highstate_doc.`**`markdown_basic_jinja_template`**`(`***kwargs*`)`

Return text for a simple markdown jinja template

This function can be used from the *highstate_doc.render* modules *jinja_template_function* option.

`salt.modules.highstate_doc.`**`markdown_default_jinja_template`**`(`***kwargs*`)`

Return text for a markdown jinja template that included a header

This function can be used from the *highstate_doc.render* modules *jinja_template_function* option.

`salt.modules.highstate_doc.`**`markdown_full_jinja_template`**`(`***kwargs*`)`

Return text for an advanced markdown jinja template

This function can be used from the *highstate_doc.render* modules *jinja_template_function* option.

`salt.modules.highstate_doc.`**`process_lowstates`**`(`***kwargs*`)`

return processed lowstate data that was not blacklisted

render_module_function is used to provide your own. defaults to from_lowstate

`salt.modules.highstate_doc.`**`processor_markdown`**`(`*lowstate_item, config, **kwargs*`)`

Takes low state data and returns a dict of processed data that is by default used in a jinja template when rendering a markdown highstate_doc.

This *lowstate_item_markdown* given a lowstate item, returns a dict like:

```
vars:       # the raw lowstate_item that was processed
id:         # the 'id' of the state.
id_full:    # combo of the state type and id "state: id"
state:      # name of the salt state module
function:   # name of the state function
name:       # value of 'name:' passed to the salt state module
state_function:    # the state name and function name
markdown:          # text data to describe a state
    requisites:    # requisite like [watch_in, require_in]
    details:       # state name, parameters and other details like file␣
↪contents
```

`salt.modules.highstate_doc.`**`read_file`**(*name*)

output the contents of a file:

this is a workaround if the cp.push module does not work. https://github.com/saltstack/salt/issues/37133

help the master output the contents of a document that might be saved on the minions filesystem.

```
#!/bin/python
import os
import salt.client
s = salt.client.LocalClient()
o = s.cmd('*', 'highstate_doc.read_file', ['/root/README.md'])
for m in o:
    d = o.get(m)
    if d and not d.endswith('is not available.'):
        # mkdir m
        #directory = os.path.dirname(file_path)
        if not os.path.exists(m):
            os.makedirs(m)
        with open(m + '/README.md','wb') as fin:
            fin.write(d)
        print('ADDED: ' + m + '/README.md')
```

`salt.modules.highstate_doc.`**`render`**(*jinja_template_text=None, jinja_template_function='highstate_doc.markdown_default_jinja_template', **kwargs*)

Render highstate to a text format (default Markdown)

if *jinja_template_text* is not set, *jinja_template_function* is used.

jinja_template_text: jinja text that the render uses to create the document. jinja_template_function: a salt module call that returns template text.

Options

highstate_doc.markdown_basic_jinja_template highstate_doc.markdown_default_jinja_template highstate_doc.markdown_full_jinja_template

26.6.66 salt.modules.hosts

Manage the information in the hosts file

`salt.modules.hosts.`**`add_host`**`(`*ip*, *alias*`)`

Add a host to an existing entry, if the entry is not in place then create it with the given host

CLI Example:

```
salt '*' hosts.add_host <ip> <alias>
```

`salt.modules.hosts.`**`get_alias`**`(`*ip*`)`

Return the list of aliases associated with an ip

Aliases (host names) are returned in the order in which they appear in the hosts file. If there are no aliases associated with the IP, an empty list is returned.

CLI Example:

```
salt '*' hosts.get_alias <ip addr>
```

`salt.modules.hosts.`**`get_ip`**`(`*host*`)`

Return the ip associated with the named host

CLI Example:

```
salt '*' hosts.get_ip <hostname>
```

`salt.modules.hosts.`**`has_pair`**`(`*ip*, *alias*`)`

Return true if the alias is set

CLI Example:

```
salt '*' hosts.has_pair <ip> <alias>
```

`salt.modules.hosts.`**`list_hosts`**`()`

Return the hosts found in the hosts file in this format:

```
{'<ip addr>': ['alias1', 'alias2', ...]}
```

CLI Example:

```
salt '*' hosts.list_hosts
```

`salt.modules.hosts.`**`rm_host`**`(`*ip*, *alias*`)`

Remove a host entry from the hosts file

CLI Example:

```
salt '*' hosts.rm_host <ip> <alias>
```

`salt.modules.hosts.`**`set_comment`**`(`*ip*, *comment*`)`

Set the comment for a host to an existing entry, if the entry is not in place then return False

CLI Example:

```
salt '*' hosts.set_comment <ip> <comment>
```

`salt.modules.hosts.`**`set_host`**`(`*ip*, *alias*, *comment=None*`)`

Set the host entry in the hosts file for the given ip, this will overwrite any previous entry for the given ip

Changed in version 2016.3.0: If `alias` does not include any host names (it is the empty string or contains only whitespace), all entries for the given IP address are removed.

CLI Example:

```
salt '*' hosts.set_host <ip> <alias>
```

26.6.67 salt.modules.http

Module for making various web calls. Primarily designed for webhooks and the like, but also useful for basic http testing.

New in version 2015.5.0.

`salt.modules.http.`**`query`**`(`*url*, ***kwargs*`)`

New in version 2015.5.0.

Query a resource, and decode the return data

Passes through all the parameters described in the *`utils.http.query function`*:

`salt.utils.http.`**`query`**`(`*url, method='GET', params=None, data=None, data_file=None, header_dict=None, header_list=None, header_file=None, username=None, password=None, auth=None, decode=False, decode_type='auto', status=False, headers=False, text=False, cookies=None, cookie_jar=None, cookie_format='lwp', persist_session=False, session_cookie_jar=None, data_render=False, data_renderer=None, header_render=False, header_renderer=None, template_dict=None, test=False, test_url=None, node='minion', port=80, opts=None, backend=None, ca_bundle=None, verify_ssl=None, cert=None, text_out=None, headers_out=None, decode_out=None, stream=False, streaming_callback=None, header_callback=None, handle=False, agent='Salt/3008.0+0na.13ac7a3', hide_fields=None, raise_error=True, formdata=False, formdata_fieldname=None, formdata_filename=None, decode_body=True, **kwargs*`)`

Query a resource, and decode the return data

raise_error

[True] If `False`, and if a connection cannot be made, the error will be suppressed and the body of the return will simply be `None`.

CLI Example:

```
salt '*' http.query http://somelink.com/
salt '*' http.query http://somelink.com/ method=POST             params='{
↪"key1": "val1", "key2": "val2"}'
salt '*' http.query http://somelink.com/ method=POST             data='
↪<xml>somecontent</xml>'
```

`salt.modules.http.`**`update_ca_bundle`**`(`*target=None*, *source=None*, *merge_files=None*`)`

Update the local CA bundle file from a URL

New in version 2015.5.0.

CLI Example:

```
salt '*' http.update_ca_bundle
salt '*' http.update_ca_bundle target=/path/to/cacerts.pem
salt '*' http.update_ca_bundle source=https://example.com/cacerts.pem
```

If the `target` is not specified, it will be pulled from the `ca_cert` configuration variable available to the minion. If it cannot be found there, it will be placed at `<<FILE_ROOTS>>/cacerts.pem`.

If the `source` is not specified, it will be pulled from the `ca_cert_url` configuration variable available to the minion. If it cannot be found, it will be downloaded from the cURL website, using an http (not https) URL. USING THE DEFAULT URL SHOULD BE AVOIDED!

`merge_files` may also be specified, which includes a string or list of strings representing a file or files to be appended to the end of the CA bundle, once it is downloaded.

CLI Example:

```
salt '*' http.update_ca_bundle merge_files=/path/to/mycert.pem
```

`salt.modules.http.`**`wait_for_successful_query`**(*url*, *wait_for=300*, ***kwargs*)

Query a resource until a successful response, and decode the return data

CLI Example:

```
salt '*' http.wait_for_successful_query http://somelink.com/ wait_for=160↩
↪request_interval=1
```

26.6.68 salt.modules.idem

Idem Support

This module provides access to idem execution modules

New in version 3002.

`salt.modules.idem.`**`exec_`**(*path*, *acct_file=None*, *acct_key=None*, *acct_profile=None*, **args*, ***kwargs*)

Call an idem execution module

path
The idem path of the idem execution module to run

acct_file
Path to the acct file used in generating idem ctx parameters. Defaults to the value in the ACCT_FILE environment variable.

acct_key
Key used to decrypt the acct file. Defaults to the value in the ACCT_KEY environment variable.

acct_profile
Name of the profile to add to idem's ctx.acct parameter. Defaults to the value in the ACCT_PROFILE environment variable.

args
Any positional arguments to pass to the idem exec function

kwargs
Any keyword arguments to pass to the idem exec function

CLI Example:

```
salt '*' idem.exec test.ping
```

Maturity
new

Depends
acct, pop, pop-config, idem

Platform
all

26.6.69 salt.modules.incron

Work with incron

`salt.modules.incron.`**`list_tab`**`(`*user*`)`

Return the contents of the specified user's incrontab

CLI Example:

```
salt '*' incron.list_tab root
```

`salt.modules.incron.`**`ls`**`(`*user*`)`

This function is an alias of `list_tab`.

Return the contents of the specified user's incrontab

CLI Example:

```
salt '*' incron.list_tab root
```

`salt.modules.incron.`**`raw_incron`**`(`*user*`)`

Return the contents of the user's incrontab

CLI Example:

```
salt '*' incron.raw_incron root
```

`salt.modules.incron.`**`raw_system_incron`**`()`

Return the contents of the system wide incrontab

CLI Example:

```
salt '*' incron.raw_system_incron
```

`salt.modules.incron.`**`rm`**`(`*user, path, mask, cmd*`)`

This function is an alias of `rm_job`.

Remove a incron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

CLI Example:

```
salt '*' incron.rm_job root /path
```

`salt.modules.incron.`**`rm_job`**`(`*user, path, mask, cmd*`)`

Remove a incron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

CLI Example:

```
salt '*' incron.rm_job root /path
```

`salt.modules.incron.`**`set_job`**`(`*user, path, mask, cmd*`)`

Sets an incron job up for a specified user.

CLI Example:

```
salt '*' incron.set_job root '/root' 'IN_MODIFY' 'echo "$$ $@ $# $% $&"'
```

`salt.modules.incron.`**`write_incron_file`**`(`*user, path*`)`

Writes the contents of a file to a user's incrontab

CLI Example:

```
salt '*' incron.write_incron_file root /tmp/new_incron
```

`salt.modules.incron.`**`write_incron_file_verbose`**`(`*user, path*`)`

Writes the contents of a file to a user's incrontab and return error message on error

CLI Example:

```
salt '*' incron.write_incron_file_verbose root /tmp/new_incron
```

26.6.70 salt.modules.ini_manage

Edit ini files

maintainer
<akilesh1597@gmail.com>

maturity
new

depends
re

platform
all

(for example /etc/sysctl.conf)

`salt.modules.ini_manage.`**`get_ini`**`(`*file_name, separator='=', encoding=None*`)`

Retrieve the whole structure from an ini file and return it as a dictionary.

Parameters

- **`file_name`** (`str`) -- The full path to the ini file.
- **`separator`** (`str`) -- The character used to separate keys and values. Standard ini files use the "=" character. The default is =.

  New in version 2016.11.0.

- **encoding** (*str*) -- A string value representing encoding of the target ini file. If `None` is passed, it uses the system default which is likely `utf-8`. Default is `None`

  New in version 3006.6.

Returns

A dictionary containing the sections along with the values and
names contained in each section

Return type
dict

API Example:

```
import salt.client
with salt.client.get_local_client() as sc:
    sc.cmd('target', 'ini.get_ini', [path_to_ini_file])
```

CLI Example:

```
salt '*' ini.get_ini /path/to/ini
```

`salt.modules.ini_manage.`**`get_option`**(*file_name*, *section*, *option*, *separator='='*, *encoding=None*)

Get value of a key from a section in an ini file. Returns `None` if no matching key was found.

Parameters

- **file_name** (*str*) -- The full path to the ini file.
- **section** (*str*) -- A string value representing the section of the ini that the option is in. If the option is not in a section, leave this empty.
- **option** (*str*) -- A string value representing the option to search for.
- **separator** (*str*) -- The character used to separate keys and values. Standard ini files use the "=" character. The default is `=`.

  New in version 2016.11.0.
- **encoding** (*str*) -- A string value representing encoding of the target ini file. If `None` is passed, it uses the system default which is likely `utf-8`. Default is `None`

  New in version 3006.6.

Returns

The value as defined in the ini file, or None if empty or not
found

Return type
str

API Example:

```
import salt.client
with salt.client.get_local_client() as sc:
    sc.cmd('target', 'ini.get_option', [path_to_ini_file, section_name,
↪option])
```

CLI Example:

```
salt '*' ini.get_option /path/to/ini section_name option_name
```

`salt.modules.ini_manage.`**`get_section`**(*file_name*, *section*, *separator='='*, *encoding=None*)

Retrieve a section from an ini file. Returns the section as a dictionary. If the section is not found, an empty dictionary is returned.

Parameters

- **`file_name`** (*`str`*) -- The full path to the ini file.
- **`section`** (*`str`*) -- A string value representing name of the section to search for.
- **`separator`** (*`str`*) -- The character used to separate keys and values. Standard ini files use the "=" character. The default is =.

  New in version 2016.11.0.
- **`encoding`** (*`str`*) -- A string value representing encoding of the target ini file. If `None` is passed, it uses the system default which is likely `utf-8`. Default is `None`

  New in version 3006.6.

Returns

A dictionary containing the names and values of all items in the
section of the ini file. If the section is not found, an empty dictionary is returned

Return type
dict

API Example:

```
import salt.client
with salt.client.get_local_client() as sc:
    sc.cmd('target', 'ini.get_section', [path_to_ini_file, section_name])
```

CLI Example:

```
salt '*' ini.get_section /path/to/ini section_name
```

`salt.modules.ini_manage.`**`remove_option`**(*file_name*, *section*, *option*, *separator='='*, *encoding=None*)

Remove a key/value pair from a section in an ini file. Returns the value of the removed key, or `None` if nothing was removed.

Parameters

- **`file_name`** (*`str`*) -- The full path to the ini file.
- **`section`** (*`str`*) -- A string value representing the section of the ini that the option is in. If the option is not in a section, leave this empty.
- **`option`** (*`str`*) -- A string value representing the option to search for.
- **`separator`** (*`str`*) -- The character used to separate keys and values. Standard ini files use the "=" character. The default is =.

  New in version 2016.11.0.
- **`encoding`** (*`str`*) -- A string value representing encoding of the target ini file. If `None` is passed, it uses the system default which is likely `utf-8`. Default is `None`

  New in version 3006.6.

Returns

A string value representing the option that was removed or `None`
if nothing was removed

Return type
str

API Example:

```
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.remove_option', [path_to_ini_file, section_name,
↪option])
```

CLI Example:

```
salt '*' ini.remove_option /path/to/ini section_name option_name
```

`salt.modules.ini_manage.`**`remove_section`**(*file_name*, *section*, *separator='='*, *encoding=None*)

Remove a section in an ini file. Returns the removed section as a dictionary, or `None` if nothing is removed.

Parameters

- **`file_name`** (*str*) -- The full path to the ini file.
- **`section`** (*str*) -- A string value representing the name of the section search for.
- **`separator`** (*str*) -- The character used to separate keys and values. Standard ini files use the "=" character. The default is =.

  New in version 2016.11.0.
- **`encoding`** (*str*) -- A string value representing encoding of the target ini file. If `None` is passed, it uses the system default which is likely `utf-8`. Default is `None`

  New in version 3006.6.

Returns

A dictionary containing the names and values of all items in the
section that was removed or `None` if nothing was removed

Return type
dict

API Example:

```
import salt.client
with  salt.client.get_local_client() as sc:
    sc.cmd('target', 'ini.remove_section', [path_to_ini_file, section_
↪name])
```

CLI Example:

```
salt '*' ini.remove_section /path/to/ini section_name
```

`salt.modules.ini_manage.`**`set_option`**(*file_name*, *sections=None*, *separator='='*, *encoding=None*, *no_spaces=False*)

Edit an ini file, replacing one or more sections. Returns a dictionary containing the changes made.

Parameters

- **file_name** (*str*) -- The full path to the ini file.
- **sections** (*dict*) -- A dictionary representing the sections to be edited in the ini file. The keys are the section names and the values are a dictionary containing the options. If the ini file does not contain sections the keys and values represent the options. The default is `None`.
- **separator** (*str*) -- The character used to separate keys and values. Standard ini files use the "=" character. The default is `=`.

  New in version 2016.11.0.
- **encoding** (*str*) -- A string value representing encoding of the target ini file. If `None` is passed, it uses the system default which is likely `utf-8`. Default is `None`

  New in version 3006.6.
- **no_spaces** (*bool*) -- A bool value that specifies that the key/value separator will be wrapped with spaces. This parameter was added to have the ability to not wrap the separator with spaces. Default is `False`, which maintains backwards compatibility.

  > **Warning:** This will affect all key/value pairs in the ini file, not just the specific value being set.

  New in version 3006.10.

Returns
A dictionary representing the changes made to the ini file

Return type
dict

API Example:

```
import salt.client
with salt.client.get_local_client() as sc:
    sc.cmd(
        'target', 'ini.set_option', ['path_to_ini_file', '{"section_to_
↪change": {"key": "value"}}']
    )
```

CLI Example:

```
salt '*' ini.set_option /path/to/ini '{section_foo: {key: value}}'
```

26.6.71 salt.modules.iosconfig

Cisco IOS configuration manipulation helpers

New in version 2019.2.0.

This module provides a collection of helper functions for Cisco IOS style configuration manipulation. This module does not have external dependencies and can be used from any Proxy or regular Minion.

`salt.modules.iosconfig.`**`clean`**(*config=None, path=None, saltenv='base'*)

Return a clean version of the config, without any special signs (such as `!` as an individual line) or empty lines, but just lines with significant value in the configuration of the network device.

config
The configuration sent as text. This argument is ignored when `path` is configured.

path
Absolute or remote path from where to load the configuration text. This argument allows any URI supported by *cp.get_url*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

saltenv: `base`
Salt fileserver environment from which to retrieve the file. Ignored if `path` is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.clean path=salt://path/to/my/config.txt
salt '*' iosconfig.clean path=https://bit.ly/2mAdq7z
```

`salt.modules.iosconfig.`**`diff_text`**`(`*candidate_config=None, candidate_path=None, running_config=None, running_path=None, saltenv='base'*`)`

Return the diff, as text, between the candidate and the running config.

candidate_config
The candidate configuration sent as text. This argument is ignored when `candidate_path` is set.

candidate_path
Absolute or remote path from where to load the candidate configuration text. This argument allows any URI supported by *cp.get_url*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

running_config
The running configuration sent as text. This argument is ignored when `running_path` is set.

running_path
Absolute or remote path from where to load the running configuration text. This argument allows any URI supported by *cp.get_url*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

saltenv: `base`
Salt fileserver environment from which to retrieve the file. Ignored if `candidate_path` or `running_path` is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.diff_text candidate_path=salt://path/to/candidate.cfg␣
↪running_path=salt://path/to/running.cfg
```

`salt.modules.iosconfig.`**`diff_tree`**`(`*candidate_config=None, candidate_path=None, running_config=None, running_path=None, saltenv='base'*`)`

Return the diff, as Python dictionary, between the candidate and the running configuration.

candidate_config
The candidate configuration sent as text. This argument is ignored when `candidate_path` is set.

candidate_path
Absolute or remote path from where to load the candidate configuration text. This argument allows any URI supported by *cp.get_url*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

running_config
The running configuration sent as text. This argument is ignored when `running_path` is set.

running_path
Absolute or remote path from where to load the running configuration text. This argument allows any URI supported by *cp.get_url*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

saltenv: `base`
Salt fileserver environment from which to retrieve the file. Ignored if `candidate_path` or `running_path` is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.diff_tree candidate_path=salt://path/to/candidate.cfg␣
↪running_path=salt://path/to/running.cfg
```

`salt.modules.iosconfig.`**`merge_diff`**`(`*initial_config=None, initial_path=None, merge_config=None, merge_path=None, saltenv='base'*`)`

Return the merge diff, as text, after merging the merge config into the initial config.

initial_config
The initial configuration sent as text. This argument is ignored when `initial_path` is set.

initial_path
Absolute or remote path from where to load the initial configuration text. This argument allows any URI supported by *`cp.get_url`*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

merge_config
The config to be merged into the initial config, sent as text. This argument is ignored when `merge_path` is set.

merge_path
Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by *`cp.get_url`*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

saltenv: `base`
Salt fileserver environment from which to retrieve the file. Ignored if `initial_path` or `merge_path` is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.merge_diff initial_path=salt://path/to/running.cfg␣
↪merge_path=salt://path/to/merge.cfg
```

`salt.modules.iosconfig.`**`merge_text`**`(`*initial_config=None, initial_path=None, merge_config=None, merge_path=None, saltenv='base'*`)`

Return the merge result of the `initial_config` with the `merge_config`, as plain text.

initial_config
The initial configuration sent as text. This argument is ignored when `initial_path` is set.

initial_path
Absolute or remote path from where to load the initial configuration text. This argument allows any URI supported by *`cp.get_url`*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

merge_config
The config to be merged into the initial config, sent as text. This argument is ignored when `merge_path` is set.

merge_path
Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by *`cp.get_url`*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

saltenv: `base`
Salt fileserver environment from which to retrieve the file. Ignored if `initial_path` or `merge_path` is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.merge_text initial_path=salt://path/to/running.cfg␣
↪merge_path=salt://path/to/merge.cfg
```

`salt.modules.iosconfig.`**`merge_tree`**(*initial_config=None*, *initial_path=None*, *merge_config=None*, *merge_path=None*, *saltenv='base'*)

Return the merge tree of the `initial_config` with the `merge_config`, as a Python dictionary.

initial_config
The initial configuration sent as text. This argument is ignored when `initial_path` is set.

initial_path
Absolute or remote path from where to load the initial configuration text. This argument allows any URI supported by *`cp.get_url`*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

merge_config
The config to be merged into the initial config, sent as text. This argument is ignored when `merge_path` is set.

merge_path
Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by *`cp.get_url`*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

saltenv: **`base`**
Salt fileserver environment from which to retrieve the file. Ignored if `initial_path` or `merge_path` is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.merge_tree initial_path=salt://path/to/running.cfg␣
↪merge_path=salt://path/to/merge.cfg
```

`salt.modules.iosconfig.`**`tree`**(*config=None*, *path=None*, *with_tags=False*, *saltenv='base'*)

Transform Cisco IOS style configuration to structured Python dictionary. Depending on the value of the `with_tags` argument, this function may provide different views, valuable in different situations.

config
The configuration sent as text. This argument is ignored when `path` is configured.

path
Absolute or remote path from where to load the configuration text. This argument allows any URI supported by *`cp.get_url`*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

with_tags: **`False`**
Whether this function should return a detailed view, with tags.

saltenv: **`base`**
Salt fileserver environment from which to retrieve the file. Ignored if `path` is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.tree path=salt://path/to/my/config.txt
salt '*' iosconfig.tree path=https://bit.ly/2mAdq7z
```

26.6.72 salt.modules.ipset

Support for ipset

`salt.modules.ipset.`**`add`**`(`*name=None, entry=None, family='ipv4', **kwargs*`)`

Append an entry to the specified set.

CLI Example:

```
salt '*' ipset.add name 192.168.1.26

salt '*' ipset.add name 192.168.0.3,AA:BB:CC:DD:EE:FF
```

`salt.modules.ipset.`**`check`**`(`*name=None, entry=None, family='ipv4'*`)`

Check that an entry exists in the specified set.

name

The ipset name

entry

An entry in the ipset. This parameter can be a single IP address, a range of IP addresses, or a subnet block. Example:

```
192.168.0.1
192.168.0.2-192.168.0.19
192.168.0.0/25
```

family

IP protocol version: ipv4 or ipv6

CLI Example:

```
salt '*' ipset.check name '192.168.0.1 comment "Hello"'
```

`salt.modules.ipset.`**`check_set`**`(`*name=None, family='ipv4'*`)`

Check that given ipset set exists.

New in version 2014.7.0.

CLI Example:

```
salt '*' ipset.check_set name
```

`salt.modules.ipset.`**`delete`**`(`*name=None, entry=None, family='ipv4', **kwargs*`)`

Delete an entry from the specified set.

CLI Example:

```
salt '*' ipset.delete name 192.168.0.3,AA:BB:CC:DD:EE:FF
```

`salt.modules.ipset.`**`delete_set`**`(`*name=None, family='ipv4'*`)`

New in version 2014.7.0.

Delete ipset set.

CLI Example:

```
salt '*' ipset.delete_set custom_set

IPv6:
salt '*' ipset.delete_set custom_set family=ipv6
```

`salt.modules.ipset.`**`flush`**(*name=None, family='ipv4'*)

Flush entries in the specified set, Flush all sets if set is not specified.

CLI Example:

```
salt '*' ipset.flush

salt '*' ipset.flush set

IPv6:
salt '*' ipset.flush

salt '*' ipset.flush set
```

`salt.modules.ipset.`**`list_sets`**(*family='ipv4'*)

New in version 2014.7.0.

List all ipset sets.

CLI Example:

```
salt '*' ipset.list_sets
```

`salt.modules.ipset.`**`new_set`**(*name=None, set_type=None, family='ipv4', comment=False, **kwargs*)

New in version 2014.7.0.

Create new custom set

CLI Example:

```
salt '*' ipset.new_set custom_set list:set

salt '*' ipset.new_set custom_set list:set comment=True

IPv6:
salt '*' ipset.new_set custom_set list:set family=ipv6
```

`salt.modules.ipset.`**`rename_set`**(*name=None, new_set=None, family='ipv4'*)

New in version 2014.7.0.

Delete ipset set.

CLI Example:

```
salt '*' ipset.rename_set custom_set new_set=new_set_name

IPv6:
salt '*' ipset.rename_set custom_set new_set=new_set_name family=ipv6
```

`salt.modules.ipset.`**`test`**(*name=None, entry=None, family='ipv4', **kwargs*)

Test if an entry is in the specified set.

CLI Example:

```
salt '*' ipset.test name 192.168.0.2

IPv6:
salt '*' ipset.test name fd81:fc56:9ac7::/48
```

`salt.modules.ipset.`**`version`**`()`

Return version from ipset --version

CLI Example:

```
salt '*' ipset.version
```

26.6.73 salt.modules.iptables

Support for iptables

Configuration Options

The following options can be set in the minion config, grains, pillar, or master config. The configuration is read using *`config.get`*.

- `iptables.save_filters`: List of REGEX strings to FILTER OUT matching lines

  This is useful for filtering out chains, rules, etc that you do not wish to persist, such as ephemeral Docker rules.

  The default is to not filter out anything.

```
iptables.save_filters:
  - "-j CATTLE_PREROUTING"
  - "-j DOCKER"
  - "-A POSTROUTING"
  - "-A CATTLE_POSTROUTING"
  - "-A FORWARD"
```

`salt.modules.iptables.`**`append`**`(`*table='filter', chain=None, rule=None, family='ipv4'*`)`

Append a rule to the specified table/chain.

This function accepts a rule in a standard iptables command format,
starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' iptables.append filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'

IPv6:
salt '*' iptables.append filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
    family=ipv6
```

`salt.modules.iptables.`**`build_rule`**(*table='filter', chain=None, command=None, position='', full=None, family='ipv4', **kwargs*)

Build a well-formatted iptables rule based on kwargs. A *table* and *chain* are not required, unless *full* is True.

If *full* is *True*, then *table*, *chain* and *command* are required. *command* may be specified as either a short option ('I') or a long option (*--insert*). This will return the iptables command, exactly as it would be used from the command line.

If a position is required (as with *-I* or *-D*), it may be specified as *position*. This will only be useful if *full* is True.

If *state* is passed, it will be ignored, use *connstate*. If *connstate* is passed in, it will automatically be changed to *state*.

To pass in jump options that doesn't take arguments, pass in an empty string.

Note: Whereas iptables will accept `-p`, `--proto[c[o[l]]]` as synonyms of `--protocol`, if `--proto` appears in an iptables command after the appearance of `-m policy`, it is interpreted as the `--proto` option of the policy extension (see the iptables-extensions(8) man page).

CLI Examples:

```
salt '*' iptables.build_rule match=state \
    connstate=RELATED,ESTABLISHED jump=ACCEPT

salt '*' iptables.build_rule filter INPUT command=I position=3 \
    full=True match=state connstate=RELATED,ESTABLISHED jump=ACCEPT

salt '*' iptables.build_rule filter INPUT command=A \
    full=True match=state connstate=RELATED,ESTABLISHED \
    source='127.0.0.1' jump=ACCEPT

.. Invert Rules
salt '*' iptables.build_rule filter INPUT command=A \
    full=True match=state connstate=RELATED,ESTABLISHED \
    source='!127.0.0.1' jump=ACCEPT

salt '*' iptables.build_rule filter INPUT command=A \
    full=True match=state connstate=RELATED,ESTABLISHED \
    destination='not 127.0.0.1' jump=ACCEPT

IPv6:
salt '*' iptables.build_rule match=state \
    connstate=RELATED,ESTABLISHED jump=ACCEPT \
    family=ipv6
salt '*' iptables.build_rule filter INPUT command=I position=3 \
    full=True match=state connstate=RELATED,ESTABLISHED jump=ACCEPT \
    family=ipv6
```

`salt.modules.iptables.`**`check`**(*table='filter', chain=None, rule=None, family='ipv4'*)

Check for the existence of a rule in the table and chain

This function accepts a rule in a standard iptables command format,
starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' iptables.check filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'

IPv6:
salt '*' iptables.check filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
    family=ipv6
```

`salt.modules.iptables.`**`check_chain`**`(`*table='filter', chain=None, family='ipv4'*`)`

New in version 2014.1.0.

Check for the existence of a chain in the table

CLI Example:

```
salt '*' iptables.check_chain filter INPUT

IPv6:
salt '*' iptables.check_chain filter INPUT family=ipv6
```

`salt.modules.iptables.`**`delete`**`(`*table, chain=None, position=None, rule=None, family='ipv4'*`)`

Delete a rule from the specified table/chain, specifying either the rule
in its entirety, or the rule's position in the chain.

This function accepts a rule in a standard iptables command format,
starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:

```
salt '*' iptables.delete filter INPUT position=3
salt '*' iptables.delete filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'

IPv6:
salt '*' iptables.delete filter INPUT position=3 family=ipv6
salt '*' iptables.delete filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
    family=ipv6
```

`salt.modules.iptables.`**`delete_chain`**`(`*table='filter', chain=None, family='ipv4'*`)`

New in version 2014.1.0.

Delete custom chain to the specified table.

CLI Example:

```
salt '*' iptables.delete_chain filter CUSTOM_CHAIN

IPv6:
salt '*' iptables.delete_chain filter CUSTOM_CHAIN family=ipv6
```

`salt.modules.iptables.`**`flush`**`(`*table='filter', chain='', family='ipv4'*`)`

Flush the chain in the specified table, flush all chains in the specified table if not specified chain.

CLI Example:

```
salt '*' iptables.flush filter INPUT

IPv6:
salt '*' iptables.flush filter INPUT family=ipv6
```

`salt.modules.iptables.`**`get_policy`**`(`*table='filter', chain=None, family='ipv4'*`)`

Return the current policy for the specified table/chain

CLI Example:

```
salt '*' iptables.get_policy filter INPUT

IPv6:
salt '*' iptables.get_policy filter INPUT family=ipv6
```

`salt.modules.iptables.`**`get_rules`**`(`*family='ipv4'*`)`

Return a data structure of the current, in-memory rules

CLI Example:

```
salt '*' iptables.get_rules

IPv6:
salt '*' iptables.get_rules family=ipv6
```

`salt.modules.iptables.`**`get_saved_policy`**`(`*table='filter', chain=None, conf_file=None, family='ipv4'*`)`

Return the current policy for the specified table/chain

CLI Examples:

```
salt '*' iptables.get_saved_policy filter INPUT
salt '*' iptables.get_saved_policy filter INPUT \
    conf_file=/etc/iptables.saved

IPv6:
salt '*' iptables.get_saved_policy filter INPUT family=ipv6
salt '*' iptables.get_saved_policy filter INPUT \
    conf_file=/etc/iptables.saved family=ipv6
```

`salt.modules.iptables.`**`get_saved_rules`**`(`*conf_file=None, family='ipv4'*`)`

Return a data structure of the rules in the conf file

CLI Example:

```
salt '*' iptables.get_saved_rules

IPv6:
salt '*' iptables.get_saved_rules family=ipv6
```

`salt.modules.iptables.`**`insert`**`(`*table='filter', chain=None, position=None, rule=None, family='ipv4'*`)`

Insert a rule into the specified table/chain, at the specified position.

This function accepts a rule in a standard iptables command format,

starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

If the position specified is a negative number, then the insert will be
performed counting from the end of the list. For instance, a position of -1 will insert the rule as the second to last rule. To insert a rule in the last position, use the append function instead.

CLI Examples:

```
salt '*' iptables.insert filter INPUT position=3 \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'

IPv6:
salt '*' iptables.insert filter INPUT position=3 \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
    family=ipv6
```

`salt.modules.iptables.`**`new_chain`**`(`*table='filter', chain=None, family='ipv4'*`)`

New in version 2014.1.0.

Create new custom chain to the specified table.

CLI Example:

```
salt '*' iptables.new_chain filter CUSTOM_CHAIN

IPv6:
salt '*' iptables.new_chain filter CUSTOM_CHAIN family=ipv6
```

`salt.modules.iptables.`**`save`**`(`*filename=None, family='ipv4'*`)`

Save the current in-memory rules to disk

CLI Example:

```
salt '*' iptables.save /etc/sysconfig/iptables

IPv6:
salt '*' iptables.save /etc/sysconfig/iptables family=ipv6
```

`salt.modules.iptables.`**`set_policy`**`(`*table='filter', chain=None, policy=None, family='ipv4'*`)`

Set the current policy for the specified table/chain

CLI Example:

```
salt '*' iptables.set_policy filter INPUT ACCEPT

IPv6:
salt '*' iptables.set_policy filter INPUT ACCEPT family=ipv6
```

`salt.modules.iptables.`**`version`**`(`*family='ipv4'*`)`

Return version from iptables --version

CLI Example:

```
salt '*' iptables.version

IPv6:
salt '*' iptables.version family=ipv6
```

26.6.74 salt.modules.iwtools

Support for Wireless Tools for Linux

`salt.modules.iwtools.`**`list_interfaces`**`(`*style=None*`)`

List all of the wireless interfaces

CLI Example:

```
salt minion iwtools.list_interfaces
```

`salt.modules.iwtools.`**`scan`**`(`*iface*, *style=None*`)`

List networks on a wireless interface

CLI Examples:

```
salt minion iwtools.scan wlp3s0
salt minion iwtools.scan wlp3s0 list
```

`salt.modules.iwtools.`**`set_mode`**`(`*iface*, *mode*`)`

List networks on a wireless interface

CLI Example:

```
salt minion iwtools.set_mode wlp3s0 Managed
```

26.6.75 salt.modules.jinja

Module for checking jinja maps and verifying the result of loading JSON/YAML files

New in version 3000.

`salt.modules.jinja.`**`import_json`**`(`*path*`)`

Loads JSON data from the specified path

CLI Example:

```
salt myminion jinja.import_json myformula/foo.json
```

`salt.modules.jinja.`**`import_yaml`**`(`*path*`)`

Loads YAML data from the specified path

CLI Example:

```
salt myminion jinja.import_yaml myformula/foo.yaml
```

`salt.modules.jinja.`**`load_map`**`(`*path*, *value*`)`

Loads the map at the specified path, and returns the specified value from that map.

CLI Example:

```
# Assuming the map is loaded in your formula SLS as follows:
#
# {% from "myformula/map.jinja" import myformula with context %}
#
# the following syntax can be used to load the map and check the
```

(continues on next page)

(continued from previous page)

```
# results:
salt myminion jinja.load_map myformula/map.jinja myformula
```

26.6.76 salt.modules.junos

Module to interact with Junos devices.

maturity
new

dependencies
junos-eznc, jxmlease

Note: Those who wish to use junos-eznc (PyEZ) version >= 2.1.0, must use the latest salt code from github until the next release.

Refer to `junos` for information on connecting to junos proxy.

class `salt.modules.junos.`**`HandleFileCopy`**(*path*, ***kwargs*)

To figure out proper path either from proxy local file system or proxy cache or on master. If required, then only copy from master to proxy

`salt.modules.junos.`**`cli`**(*command=None*, ***kwargs*)

Executes the CLI commands and returns the output in specified format. (default is text) The output can also be stored in a file.

command (required)
The command to execute on the Junos CLI

format
[text] Format in which to get the CLI output (either `text` or `xml`)

dev_timeout
[30] The NETCONF RPC timeout (in seconds)

dest
Destination file where the RPC output is stored. Note that the file will be stored on the proxy minion. To push the files to the master use `cp.push`.

CLI Examples:

```
salt 'device_name' junos.cli 'show system commit'
salt 'device_name' junos.cli 'show system alarms' format=xml dest=/home/
↪user/cli_output.txt
```

`salt.modules.junos.`**`commit`**(***kwargs*)

To commit the changes loaded in the candidate configuration.

dev_timeout
[30] The NETCONF RPC timeout (in seconds)

comment
Provide a comment for the commit

confirm
Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.

sync
[False] When `True`, on dual control plane systems, requests that the candidate configuration on one control plane be copied to the other control plane, checked for correct syntax, and committed on both Routing Engines.

force_sync
[False] When `True`, on dual control plane systems, force the candidate configuration on one control plane to be copied to the other control plane.

full
When `True`, requires all the daemons to check and evaluate the new configuration.

detail
When `True`, return commit detail

CLI Examples:

```
salt 'device_name' junos.commit comment='Commiting via saltstack'
↪detail=True
salt 'device_name' junos.commit dev_timeout=60 confirm=10
salt 'device_name' junos.commit sync=True dev_timeout=90
```

salt.modules.junos.**commit_check**()

Perform a commit check on the configuration

CLI Example:

```
salt 'device_name' junos.commit_check
```

salt.modules.junos.**diff**(***kwargs*)

Returns the difference between the candidate and the current configuration

id
[0] The rollback ID value (0-49)

d_id
[0] The rollback ID value (0-49)

CLI Example:

```
salt 'device_name' junos.diff d_id=3
```

NOTE: Because of historical reasons and the internals of the Salt state compiler, there are three possible sources of the rollback ID--the positional argument, and the *id* and *d_id* kwargs. The precedence of the arguments are *id* (positional), *id* (kwarg), *d_id* (kwarg). In other words, if all three are passed, only the positional argument will be used. A warning is logged if more than one is passed.

salt.modules.junos.**dir_copy**(*source, dest, force=False, **kwargs*)

Copy a directory and recursively its contents from source to dest.

Note: This function only works on the Juniper native minion

Parameters:

source : Directory to use as the source

dest : Directory in which to place the source and its contents.

force : This function will not copy identical files unless *force* is *True*

New in version 3003.

CLI Example:

```
salt 'device_name' junos.dir_copy /etc/salt/pki re1:/
```

This will take the *pki* directory, its absolute path and copy it and its contents to routing engine 1 root directory. The result will be *re1:/etc/salt/pki/<files and dirs in /etc/salt/pki*.

`salt.modules.junos.`**`facts`**`()`

Displays the facts gathered during the connection. These facts are also stored in Salt grains.

CLI Example:

```
salt 'device_name' junos.facts
```

`salt.modules.junos.`**`facts_refresh`**`()`

Reload the facts dictionary from the device. Usually only needed if, the device configuration is changed by some other actor. This function will also refresh the facts stored in the salt grains.

CLI Example:

```
salt 'device_name' junos.facts_refresh
```

`salt.modules.junos.`**`file_compare`**`(`*file1*, *file2*, ***kwargs*`)`

Compare two files and return a dictionary indicating if they are different.

Dictionary includes *success* key. If False, one or more files do not exist or some other error occurred.

Under the hood, this uses the junos CLI command *file compare files ...*

Note: This function only works on Juniper native minions

New in version 3003.

CLI Example:

```
salt junos-router junos.file_compare /var/tmp/backup1/cmt.script /var/tmp/
↪backup2/cmt.script

junos-router:
    identical:
        False
    success:
        True
```

`salt.modules.junos.`**`file_copy`**`(`*src*, *dest*`)`

Copies the file from the local device to the junos device

Note: This function does not work on Juniper native minions

---

src
The source path where the file is kept.

dest
The destination path on the where the file will be copied

New in version 3001.

CLI Example:

```
salt 'device_name' junos.file_copy /home/m2/info.txt info_copy.txt
```

salt.modules.junos.**fsentry_exists**(*dir*, ***kwargs*)

Returns a dictionary indicating if *dir* refers to a file or a non-file (generally a directory) in the file system, or if there is no file by that name.

Note: This function only works on Juniper native minions

New in version 3003.

CLI Example:

```
salt junos-router junos.fsentry_exists /var/log

junos-router:
    is_dir:
        True
    exists:
        True
```

salt.modules.junos.**get_table**(*table*, *table_file*, *path=None*, *target=None*, *key=None*, *key_items=None*, *filters=None*, *table_args=None*)

New in version 3001.

Retrieve data from a Junos device using Tables/Views

table (required)
Name of PyEZ Table

table_file (required)
YAML file that has the table specified in table parameter

path:
Path of location of the YAML file. defaults to op directory in jnpr.junos.op

target:
if command need to run on FPC, can specify fpc target

key:
To overwrite key provided in YAML

key_items:
To select only given key items

filters:
To select only filter for the dictionary from columns

table_args:
key/value pair which should render Jinja template command or are passed as args to rpc call in op table

CLI Example:

```
salt 'device_name' junos.get_table RouteTable routes.yml
salt 'device_name' junos.get_table EthPortTable ethport.yml table_args='{
↪"interface_name": "ge-3/2/2"}'
salt 'device_name' junos.get_table EthPortTable ethport.yml salt://tables
```

salt.modules.junos.**install_config**(*path=None*, ***kwargs*)

Installs the given configuration file into the candidate configuration. Commits the changes if the commit checks or throws an error.

path (required)
Path where the configuration/template file is present. If the file has a `.conf` extension, the content is treated as text format. If the file has a `.xml` extension, the content is treated as XML format. If the file has a `.set` extension, the content is treated as Junos OS `set` commands.

mode
[exclusive] The mode in which the configuration is locked. Can be one of `private`, `dynamic`, `batch`, `exclusive`, `ephemeral`

dev_timeout
[30] Set NETCONF RPC timeout. Can be used for commands which take a while to execute.

overwrite
[False] Set to `True` if you want this file is to completely replace the configuration file. Sets action to override

Note: This option cannot be used if **format** is ”set”.

replace
[False] Specify whether the configuration file uses `replace:` statements. If `True`, only those statements under the `replace` tag will be changed.

merge
[False] If set to `True` will set the load-config action to merge. the default load-config action is 'replace' for xml/json/text config

format
Determines the format of the contents

update
[False] Compare a complete loaded configuration against the candidate configuration. For each hierarchy level or configuration object that is different in the two configurations, the version in the loaded configuration replaces the version in the candidate configuration. When the configuration is later committed, only system processes that are affected by the changed configuration elements parse the new configuration. This action is supported from PyEZ 2.1.

comment
Provide a comment for the commit

confirm
Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.

diffs_file
Path to the file where the diff (difference in old configuration and the committed configuration) will be stored. Note that the file will be stored on the proxy minion. To push the files to the master use:

py:func:*cp.push <salt.modules.cp.push>*.

template_vars

Variables to be passed into the template processing engine in addition to those present in pillar, the minion configuration, grains, etc. You may reference these variables in your template like so:

```
{{ template_vars["var_name"] }}
```

CLI Examples:

```
salt 'device_name' junos.install_config 'salt://production/network/
↪routers/config.set'
salt 'device_name' junos.install_config 'salt://templates/replace_config.
↪conf' replace=True comment='Committed via SaltStack'
salt 'device_name' junos.install_config 'salt://my_new_configuration.conf
↪' dev_timeout=300 diffs_file='/salt/confs/old_config.conf'⊠
↪overwrite=True
salt 'device_name' junos.install_config 'salt://syslog_template.conf'⊠
↪template_vars='{"syslog_host": "10.180.222.7"}'
```

`salt.modules.junos.`**`install_os`**(*path=None*, ***kwargs*)

Installs the given image on the device. After the installation is complete the device is rebooted, if reboot=True is given as a keyworded argument.

path (required)

Path where the image file is present on the proxy minion

remote_path

[/var/tmp] If the value of path is a file path on the local (Salt host's) filesystem, then the image is copied from the local filesystem to the :remote_path: directory on the target Junos device. The default is `/var/tmp`. If the value of :path: or is a URL, then the value of :remote_path: is unused.

dev_timeout

[1800] The NETCONF RPC timeout (in seconds). This argument was added since most of the time the "package add" RPC takes a significant amount of time. So this :timeout: value will be used in the context of the SW installation process. Defaults to 30 minutes (30*60=1800 seconds)

timeout

[1800] Alias to dev_timeout for backward compatibility

reboot

[False] Whether to reboot after installation

no_copy

[False] If `True` the software package will not be SCP'd to the device

bool validate:

When `True` this method will perform a config validation against the new image

bool issu: False

When `True` allows unified in-service software upgrade (ISSU) feature enables you to upgrade between two different Junos OS releases with no disruption on the control plane and with minimal disruption of traffic.

bool nssu: False

When `True` allows nonstop software upgrade (NSSU) enables you to upgrade the software running on a Juniper Networks EX Series Virtual Chassis or a Juniper Networks EX Series Ethernet Switch with redundant Routing Engines with a single command and minimal disruption to network traffic.

bool all_re: True

When True (default), executes the software install on all Routing Engines of the Junos device. When False, execute the software install only on the current Routing Engine.

New in version 3001.

Note: Any additional keyword arguments specified are passed down to PyEZ sw.install() as is. Please refer to below URl for PyEZ sw.install() documentation: https://pyez.readthedocs.io/en/latest/jnpr.junos.utils.html#jnpr.junos.utils.sw.SW.install

---

CLI Examples:

```
salt 'device_name' junos.install_os 'salt://images/junos_image.tgz'
↪reboot=True
salt 'device_name' junos.install_os 'salt://junos_16_1.tgz' dev_
↪timeout=300
```

`salt.modules.junos.`**`load`**(*path=None*, ***kwargs*)

Loads the configuration from the file provided onto the device.

path (required)

Path where the configuration/template file is present. If the file has a `.conf` extension, the content is treated as text format. If the file has a `.xml` extension, the content is treated as XML format. If the file has a `.set` extension, the content is treated as Junos OS `set` commands.

overwrite

[False] Set to `True` if you want this file is to completely replace the configuration file. Sets action to override

---

Note: This option cannot be used if **format** is ”set”.

---

replace

[False] Specify whether the configuration file uses `replace:` statements. If `True`, only those statements under the `replace` tag will be changed.

merge

[False] If set to `True` will set the load-config action to merge. the default load-config action is 'replace' for xml/json/text config

update

[False] Compare a complete loaded configuration against the candidate configuration. For each hierarchy level or configuration object that is different in the two configurations, the version in the loaded configuration replaces the version in the candidate configuration. When the configuration is later committed, only system processes that are affected by the changed configuration elements parse the new configuration. This action is supported from PyEZ 2.1.

format

Determines the format of the contents

template_vars

Variables to be passed into the template processing engine in addition to those present in pillar, the minion configuration, grains, etc. You may reference these variables in your template like so:

```
{{ template_vars["var_name"] }}
```

CLI Examples:

```
salt 'device_name' junos.load 'salt://production/network/routers/config.
↪set'

salt 'device_name' junos.load 'salt://templates/replace_config.conf'␣
↪replace=True

salt 'device_name' junos.load 'salt://my_new_configuration.conf'␣
↪overwrite=True

salt 'device_name' junos.load 'salt://syslog_template.conf' template_vars=
↪'{"syslog_host": "10.180.222.7"}'
```

`salt.modules.junos.`**`lock`**`()`

Attempts an exclusive lock on the candidate configuration. This is a non-blocking call.

Note: When locking, it is important to remember to call *`junos.unlock`* once finished. If locking during orchestration, remember to include a step in the orchestration job to unlock.

CLI Example:

```
salt 'device_name' junos.lock
```

`salt.modules.junos.`**`ping`**`(`*dest_ip=None*, ***kwargs*`)`

Send a ping RPC to a device

dest_ip
The IP of the device to ping

dev_timeout
[30] The NETCONF RPC timeout (in seconds)

rapid
[False] When `True`, executes ping at 100pps instead of 1pps

ttl
Maximum number of IP routers (IP hops) allowed between source and destination

routing_instance
Name of the routing instance to use to send the ping

interface
Interface used to send traffic

count
[5] Number of packets to send

CLI Examples:

```
salt 'device_name' junos.ping '8.8.8.8' count=5
salt 'device_name' junos.ping '8.8.8.8' ttl=1 rapid=True
```

`salt.modules.junos.`**`rollback`**`(`***kwargs*`)`

Roll back the last committed configuration changes and commit

id
[0] The rollback ID value (0-49)

d_id
[0] The rollback ID value (0-49)

dev_timeout
[30] The NETCONF RPC timeout (in seconds)

comment
Provide a comment for the commit

confirm
Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.

diffs_file
Path to the file where the diff (difference in old configuration and the committed configuration) will be stored. Note that the file will be stored on the proxy minion. To push the files to the master use `cp.push`.

CLI Example:

```
salt 'device_name' junos.rollback 10
```

NOTE: Because of historical reasons and the internals of the Salt state compiler, there are three possible sources of the rollback ID--the positional argument, and the *id* and *d_id* kwargs. The precedence of the arguments are *id* (positional), *id* (kwarg), *d_id* (kwarg). In other words, if all three are passed, only the positional argument will be used. A warning is logged if more than one is passed.

`salt.modules.junos.`**`routing_engine`**`(`***kwargs*`)`

Returns a dictionary containing the routing engines on the device and their status (Master, Disabled, Backup).

Under the hood parses the result of *show chassis routing-engine*

New in version 3003.

CLI Example:

```
salt junos-router junos.routing_engine

junos-router:
    backup:
      - re1:
    master:
      re0:
    success:
      True
```

Returns *success: False* if the device does not appear to have multiple routing engines.

`salt.modules.junos.`**`rpc`**`(`*cmd=None*, *dest=None*, ***kwargs*`)`

This function executes the RPC provided as arguments on the junos device. The returned data can be stored in a file.

cmd
The RPC to be executed

dest
Destination file where the RPC output is stored. Note that the file will be stored on the proxy minion. To push the files to the master use `cp.push`.

format
[xml] The format in which the RPC reply is received from the device

dev_timeout
[30] The NETCONF RPC timeout (in seconds)

filter
Used with the `get-config` RPC to get specific configuration

terse
[False] Amount of information you want

interface_name
Name of the interface to query

CLI Example:

```
salt 'device' junos.rpc get_config dest=/var/log/config.txt format=text
↪filter='<configuration><system/></configuration>'
salt 'device' junos.rpc get-interface-information dest=/home/user/
↪interface.xml interface_name='lo0' terse=True
salt 'device' junos.rpc get-chassis-inventory
```

`salt.modules.junos.`**`rpc_file_list`**(*path*, ***kwargs*)

Use the Junos RPC interface to get a list of files and return them as a structure dictionary.

New in version 3003.

CLI Example:

```
salt junos-router junos.rpc_file_list /var/local/salt/etc

junos-router:
    files:
        directory:
            directory-name:
                /var/local/salt/etc
            file-information:
                |_
                  file-directory:
                      file-name:
                          pki
                |_
                  file-name:
                      proxy
                |_
                  file-directory:
                      file-name:
                          proxy.d
        total-file-blocks:
            10
        total-files:
            1
success:
    True
```

`salt.modules.junos.`**`set_hostname`**(*hostname=None*, ***kwargs*)

Set the device's hostname

hostname
The name to be set

comment
Provide a comment to the commit

dev_timeout
[30] The NETCONF RPC timeout (in seconds)

confirm
Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.

CLI Example:

```
salt 'device_name' junos.set_hostname salt-device
```

`salt.modules.junos.`**`shutdown`**`(`*`**kwargs`*`)`

Shut down (power off) or reboot a device running Junos OS. This includes all Routing Engines in a Virtual Chassis or a dual Routing Engine system.

Note: One of `shutdown` or `reboot` must be set to `True` or no action will be taken.

shutdown
[False] Set this to `True` if you want to shutdown the machine. This is a safety mechanism so that the user does not accidentally shutdown the junos device.

reboot
[False] If `True`, reboot instead of shutting down

at
Used when rebooting, to specify the date and time the reboot should take place. The value of this option must match the JunOS CLI reboot syntax.

in_min
Used when shutting down. Specify the delay (in minutes) before the device will be shut down.

CLI Examples:

```
salt 'device_name' junos.shutdown reboot=True
salt 'device_name' junos.shutdown shutdown=True in_min=10
salt 'device_name' junos.shutdown shutdown=True
```

`salt.modules.junos.`**`unlock`**`()`

Unlocks the candidate configuration.

CLI Example:

```
salt 'device_name' junos.unlock
```

`salt.modules.junos.`**`zeroize`**`()`

Resets the device to default factory settings

Note: In case of non-root user, proxy_reconnect will not be able to re-connect to the device as zeroize will delete the local user's configuration. For more details on zeroize functionality, please refer https://www.juniper.net/documentation/en_US/junos/topics/reference/command-summary/request-system-zeroize.html

CLI Example:

```
salt 'device_name' junos.zeroize
```

26.6.77 salt.modules.kernelpkg_linux_apt

Manage Linux kernel packages on APT-based systems

`salt.modules.kernelpkg_linux_apt.`**`active`**`()`

Return the version of the running kernel.

CLI Example:

```
salt '*' kernelpkg.active
```

`salt.modules.kernelpkg_linux_apt.`**`cleanup`**`(`*keep_latest=True*`)`

Remove all unused kernel packages from the system.

keep_latest
[True] In the event that the active kernel is not the latest one installed, setting this to True will retain the latest kernel package, in addition to the active one. If False, all kernel packages other than the active one will be removed.

CLI Example:

```
salt '*' kernelpkg.cleanup
```

`salt.modules.kernelpkg_linux_apt.`**`latest_available`**`()`

Return the version of the latest kernel from the package repositories.

CLI Example:

```
salt '*' kernelpkg.latest_available
```

`salt.modules.kernelpkg_linux_apt.`**`latest_installed`**`()`

Return the version of the latest installed kernel.

CLI Example:

```
salt '*' kernelpkg.latest_installed
```

Note: This function may not return the same value as `active()` if a new kernel has been installed and the system has not yet been rebooted. The `needs_reboot()` function exists to detect this condition.

`salt.modules.kernelpkg_linux_apt.`**`list_installed`**`()`

Return a list of all installed kernels.

CLI Example:

```
salt '*' kernelpkg.list_installed
```

`salt.modules.kernelpkg_linux_apt.`**`needs_reboot`**`()`

Detect if a new kernel version has been installed but is not running. Returns True if a new kernel is installed, False otherwise.

CLI Example:

```
salt '*' kernelpkg.needs_reboot
```

`salt.modules.kernelpkg_linux_apt.`**`remove`**(*release*)

Remove a specific version of the kernel.

release
The release number of an installed kernel. This must be the entire release number as returned by *`list_installed()`*, not the package name.

CLI Example:

```
salt '*' kernelpkg.remove 4.4.0-70-generic
```

`salt.modules.kernelpkg_linux_apt.`**`upgrade`**(*reboot=False*, *at_time=None*)

Upgrade the kernel and optionally reboot the system.

reboot
[False] Request a reboot if a new kernel is available.

at_time
[immediate] Schedule the reboot at some point in the future. This argument is ignored if `reboot=False`. See *`reboot()`* for more details on this argument.

CLI Example:

```
salt '*' kernelpkg.upgrade
salt '*' kernelpkg.upgrade reboot=True at_time=1
```

Note: An immediate reboot often shuts down the system before the minion has a chance to return, resulting in errors. A minimal delay (1 minute) is useful to ensure the result is delivered to the master.

`salt.modules.kernelpkg_linux_apt.`**`upgrade_available`**()

Detect if a new kernel version is available in the repositories. Returns True if a new kernel is available, False otherwise.

CLI Example:

```
salt '*' kernelpkg.upgrade_available
```

26.6.78 salt.modules.kernelpkg_linux_yum

Manage Linux kernel packages on YUM-based systems

`salt.modules.kernelpkg_linux_yum.`**`active`**()

Return the version of the running kernel.

CLI Example:

```
salt '*' kernelpkg.active
```

`salt.modules.kernelpkg_linux_yum.`**`cleanup`**(*keep_latest=True*)

Remove all unused kernel packages from the system.

keep_latest
[True] In the event that the active kernel is not the latest one installed, setting this to True will retain the latest kernel package, in addition to the active one. If False, all kernel packages other than the active one will be removed.

CLI Example:

```
salt '*' kernelpkg.cleanup
```

`salt.modules.kernelpkg_linux_yum.`**`latest_available`**`()`

Return the version of the latest kernel from the package repositories.

CLI Example:

```
salt '*' kernelpkg.latest_available
```

`salt.modules.kernelpkg_linux_yum.`**`latest_installed`**`()`

Return the version of the latest installed kernel.

CLI Example:

```
salt '*' kernelpkg.latest_installed
```

Note: This function may not return the same value as *`active()`* if a new kernel has been installed and the system has not yet been rebooted. The *`needs_reboot()`* function exists to detect this condition.

`salt.modules.kernelpkg_linux_yum.`**`list_installed`**`()`

Return a list of all installed kernels.

CLI Example:

```
salt '*' kernelpkg.list_installed
```

`salt.modules.kernelpkg_linux_yum.`**`needs_reboot`**`()`

Detect if a new kernel version has been installed but is not running. Returns True if a new kernel is installed, False otherwise.

CLI Example:

```
salt '*' kernelpkg.needs_reboot
```

`salt.modules.kernelpkg_linux_yum.`**`remove`**`(`*release*`)`

Remove a specific version of the kernel.

release
The release number of an installed kernel. This must be the entire release number as returned by *`list_installed()`*, not the package name.

CLI Example:

```
salt '*' kernelpkg.remove 3.10.0-327.el7
```

`salt.modules.kernelpkg_linux_yum.`**`upgrade`**`(`*reboot=False, at_time=None*`)`

Upgrade the kernel and optionally reboot the system.

reboot
[False] Request a reboot if a new kernel is available.

at_time
[immediate] Schedule the reboot at some point in the future. This argument is ignored if `reboot=False`. See *`reboot()`* for more details on this argument.

CLI Example:

```
salt '*' kernelpkg.upgrade
salt '*' kernelpkg.upgrade reboot=True at_time=1
```

Note: An immediate reboot often shuts down the system before the minion has a chance to return, resulting in errors. A minimal delay (1 minute) is useful to ensure the result is delivered to the master.

`salt.modules.kernelpkg_linux_yum.`**`upgrade_available`**`()`

Detect if a new kernel version is available in the repositories. Returns True if a new kernel is available, False otherwise.

CLI Example:

```
salt '*' kernelpkg.upgrade_available
```

26.6.79 salt.modules.key

Functions to view the minion's public key information

`salt.modules.key.`**`finger`**`(`*hash_type=None*`)`

Return the minion's public key fingerprint

hash_type
The hash algorithm used to calculate the fingerprint

CLI Example:

```
salt '*' key.finger
```

`salt.modules.key.`**`finger_master`**`(`*hash_type=None*`)`

Return the fingerprint of the master's public key on the minion.

hash_type
The hash algorithm used to calculate the fingerprint

CLI Example:

```
salt '*' key.finger_master
```

26.6.80 salt.modules.keyboard

Module for managing keyboards on supported POSIX-like systems using systemd, or such as Redhat, Debian and Gentoo.

`salt.modules.keyboard.`**`get_sys`**`()`

Get current system keyboard setting

CLI Example:

```
salt '*' keyboard.get_sys
```

salt.modules.keyboard.**get_x**()

Get current X keyboard setting

CLI Example:

```
salt '*' keyboard.get_x
```

salt.modules.keyboard.**set_sys**(*layout*)

Set current system keyboard setting

CLI Example:

```
salt '*' keyboard.set_sys dvorak
```

salt.modules.keyboard.**set_x**(*layout*)

Set current X keyboard setting

CLI Example:

```
salt '*' keyboard.set_x dvorak
```

26.6.81 salt.modules.kmod

Module to manage Linux kernel modules

salt.modules.kmod.**available**()

Return a list of all available kernel modules

CLI Example:

```
salt '*' kmod.available
```

salt.modules.kmod.**check_available**(*mod*)

Check to see if the specified kernel module is available

CLI Example:

```
salt '*' kmod.check_available kvm
```

salt.modules.kmod.**is_loaded**(*mod*)

Check to see if the specified kernel module is loaded

CLI Example:

```
salt '*' kmod.is_loaded kvm
```

salt.modules.kmod.**load**(*mod*, *persist=False*)

Load the specified kernel module

mod
Name of module to add

persist
Write module to /etc/modules to make it load on system reboot

CLI Example:

```
salt '*' kmod.load kvm
```

`salt.modules.kmod.`**`lsmod`**`()`

Return a dict containing information about currently loaded modules

CLI Example:

```
salt '*' kmod.lsmod
```

`salt.modules.kmod.`**`mod_list`**`(`*only_persist=False*`)`

Return a list of the loaded module names

only_persist
Only return the list of loaded persistent modules

CLI Example:

```
salt '*' kmod.mod_list
```

`salt.modules.kmod.`**`remove`**`(`*mod, persist=False, comment=True*`)`

Remove the specified kernel module

mod
Name of module to remove

persist
Also remove module from /etc/modules

comment
If persist is set don't remove line from /etc/modules but only comment it

CLI Example:

```
salt '*' kmod.remove kvm
```

26.6.82 salt.modules.linux_acl

Support for Linux File Access Control Lists

The Linux ACL module requires the *getfacl* and *setfacl* binaries.

`salt.modules.linux_acl.`**`delfacl`**`(`*acl_type, acl_name='', *args, **kwargs*`)`

Remove specific FACL from the specified file(s)

CLI Examples:

```
salt '*' acl.delfacl user myuser /tmp/house/kitchen
salt '*' acl.delfacl default:group mygroup /tmp/house/kitchen
salt '*' acl.delfacl d:u myuser /tmp/house/kitchen
salt '*' acl.delfacl g myuser /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.delfacl user myuser /tmp/house/kitchen recursive=True
```

`salt.modules.linux_acl.`**`getfacl`**`(`**args, **kwargs*`)`

Return (extremely verbose) map of FACLs on specified file(s)

CLI Examples:

```
salt '*' acl.getfacl /tmp/house/kitchen
salt '*' acl.getfacl /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.getfacl /tmp/house/kitchen /tmp/house/livingroom recursive=True
```

salt.modules.linux_acl.**modfacl**(*acl_type*, *acl_name=''*, *perms=''*, **args*, ***kwargs*)

Add or modify a FACL for the specified file(s)

CLI Examples:

```
salt '*' acl.modfacl user myuser rwx /tmp/house/kitchen
salt '*' acl.modfacl default:group mygroup rx /tmp/house/kitchen
salt '*' acl.modfacl d:u myuser 7 /tmp/house/kitchen
salt '*' acl.modfacl g mygroup 0 /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.modfacl user myuser rwx /tmp/house/kitchen recursive=True
salt '*' acl.modfacl user myuser rwx /tmp/house/kitchen raise_err=True
```

salt.modules.linux_acl.**version**()

Return facl version from getfacl --version

CLI Example:

```
salt '*' acl.version
```

salt.modules.linux_acl.**wipefacls**(**args*, ***kwargs*)

Remove all FACLs from the specified file(s)

CLI Examples:

```
salt '*' acl.wipefacls /tmp/house/kitchen
salt '*' acl.wipefacls /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.wipefacls /tmp/house/kitchen /tmp/house/livingroom recursive=True
```

26.6.83 salt.modules.linux_ip

The networking module for Non-RH/Deb Linux distros

salt.modules.linux_ip.**down**(*iface*, *iface_type=None*)

Shutdown a network interface

CLI Example:

```
salt '*' ip.down eth0
```

salt.modules.linux_ip.**get_interface**(*iface*)

Return the contents of an interface script

CLI Example:

```
salt '*' ip.get_interface eth0
```

`salt.modules.linux_ip.`**`get_routes`**`(`*iface=None*`)`

Return the current routing table

CLI Examples:

```
salt '*' ip.get_routes
salt '*' ip.get_routes eth0
```

`salt.modules.linux_ip.`**`up`**`(`*iface*, *iface_type=None*`)`

Start up a network interface

CLI Example:

```
salt '*' ip.up eth0
```

26.6.84 salt.modules.linux_lvm

Support for Linux LVM2

`salt.modules.linux_lvm.`**`fullversion`**`()`

Return all version info from lvm version

CLI Example:

```
salt '*' lvm.fullversion
```

`salt.modules.linux_lvm.`**`lvcreate`**`(`*lvname*, *vgname*, *size=None*, *extents=None*, *snapshot=None*, *pv=None*, *thinvolume=False*, *thinpool=False*, *force=False*, ***kwargs*`)`

Create a new logical volume, with option for which physical volume to be used

CLI Examples:

```
salt '*' lvm.lvcreate new_volume_name     vg_name size=10G
salt '*' lvm.lvcreate new_volume_name     vg_name extents=100 pv=/dev/sdb
salt '*' lvm.lvcreate new_snapshot        vg_name snapshot=volume_name⊠
↪size=3G
```

New in version 0.12.0.

Support for thin pools and thin volumes

CLI Examples:

```
salt '*' lvm.lvcreate new_thinpool_name   vg_name               size=20G⊠
↪thinpool=True
salt '*' lvm.lvcreate new_thinvolume_name vg_name/thinpool_name size=10G⊠
↪thinvolume=True
```

`salt.modules.linux_lvm.`**`lvdisplay`**`(`*lvname=''*, *quiet=False*`)`

Return information about the logical volume(s)

lvname
logical device name

quiet
if the logical volume is not present, do not show any error

CLI Examples:

```
salt '*' lvm.lvdisplay
salt '*' lvm.lvdisplay /dev/vg_myserver/root
```

`salt.modules.linux_lvm.`**`lvextend`**(*size=None*, *lvpath=None*, *extents=None*, *force=False*, *resizefs=False*)

Increase a logical volume to specific size.

CLI Examples:

```
salt '*' lvm.lvextend +12M /dev/mapper/vg1-test
salt '*' lvm.lvextend lvpath=/dev/mapper/vg1-test extents=+100%FREE
```

`salt.modules.linux_lvm.`**`lvremove`**(*lvname*, *vgname*, *force=True*)

Remove a given existing logical volume from a named existing volume group

CLI Example:

```
salt '*' lvm.lvremove lvname vgname force=True
```

`salt.modules.linux_lvm.`**`lvresize`**(*size=None*, *lvpath=None*, *extents=None*, *force=False*, *resizefs=False*)

Resize a logical volume to specific size.

CLI Examples:

```
salt '*' lvm.lvresize +12M /dev/mapper/vg1-test
salt '*' lvm.lvresize lvpath=/dev/mapper/vg1-test extents=+100%FREE
```

`salt.modules.linux_lvm.`**`pvcreate`**(*devices*, *override=True*, *force=True*, ***kwargs*)

Set a physical device to be used as an LVM physical volume

override
Skip devices, if they are already LVM physical volumes

CLI Examples:

```
salt mymachine lvm.pvcreate /dev/sdb1,/dev/sdb2
salt mymachine lvm.pvcreate /dev/sdb1 dataalignmentoffset=7s
```

`salt.modules.linux_lvm.`**`pvdisplay`**(*pvname=''*, *real=False*, *quiet=False*)

Return information about the physical volume(s)

pvname
physical device name

real
dereference any symlinks and report the real device

New in version 2015.8.7.

quiet
if the physical volume is not present, do not show any error

CLI Examples:

```
salt '*' lvm.pvdisplay
salt '*' lvm.pvdisplay /dev/md0
```

`salt.modules.linux_lvm.`**`pvremove`**(*devices*, *override=True*, *force=True*)

Remove a physical device being used as an LVM physical volume

override
Skip devices, if they are already not used as LVM physical volumes

CLI Examples:

```
salt mymachine lvm.pvremove /dev/sdb1,/dev/sdb2
```

`salt.modules.linux_lvm.`**`pvresize`**(*devices*, *override=True*, *force=True*)

Resize a LVM physical volume to the physical device size

override
Skip devices, if they are already not used as LVM physical volumes

CLI Examples:

```
salt mymachine lvm.pvresize /dev/sdb1,/dev/sdb2
```

`salt.modules.linux_lvm.`**`version`**()

Return LVM version from lvm version

CLI Example:

```
salt '*' lvm.version
```

`salt.modules.linux_lvm.`**`vgcreate`**(*vgname*, *devices*, *force=False*, ***kwargs*)

Create an LVM volume group

CLI Examples:

```
salt mymachine lvm.vgcreate my_vg /dev/sdb1,/dev/sdb2
salt mymachine lvm.vgcreate my_vg /dev/sdb1 clustered=y
```

`salt.modules.linux_lvm.`**`vgdisplay`**(*vgname=''*, *quiet=False*)

Return information about the volume group(s)

vgname
volume group name

quiet
if the volume group is not present, do not show any error

CLI Examples:

```
salt '*' lvm.vgdisplay
salt '*' lvm.vgdisplay nova-volumes
```

`salt.modules.linux_lvm.`**`vgextend`**(*vgname*, *devices*, *force=False*)

Add physical volumes to an LVM volume group

CLI Examples:

```
salt mymachine lvm.vgextend my_vg /dev/sdb1,/dev/sdb2
salt mymachine lvm.vgextend my_vg /dev/sdb1
```

`salt.modules.linux_lvm.`**`vgremove`**`(`*vgname, force=True*`)`

Remove an LVM volume group

CLI Examples:

```
salt mymachine lvm.vgremove vgname
salt mymachine lvm.vgremove vgname force=True
```

26.6.85 salt.modules.linux_service

If Salt's OS detection does not identify a different virtual service module, the minion will fall back to using this basic module, which simply wraps sysvinit scripts.

`salt.modules.linux_service.`**`available`**`(`*name*`)`

Returns `True` if the specified service is available, otherwise returns `False`.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.linux_service.`**`get_all`**`()`

Return a list of all available services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.linux_service.`**`missing`**`(`*name*`)`

The inverse of service.available. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.linux_service.`**`reload_`**`(`*name*`)`

Refreshes config files by calling service reload. Does not perform a full restart.

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.linux_service.`**`restart`**`(`*name*`)`

Restart the specified service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.linux_service.`**`run`**`(`*name, action*`)`

Run the specified service with an action.

New in version 2015.8.1.

name
Service name.

action
Action name (like start, stop, reload, restart).

CLI Example:

```
salt '*' service.run apache2 reload
salt '*' service.run postgresql initdb
```

`salt.modules.linux_service.`**`start`**`(`*name*`)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.linux_service.`**`status`**`(`*name*, *sig=None*`)`

Return the status for a service. If the name contains globbing, a dict mapping service name to PID or empty string is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Parameters

- **`name`** (*`str`*) -- The name of the service to check
- **`sig`** (*`str`*) -- Signature to use to find the service via ps

Returns
PID if running, empty otherwise dict: Maps service name to PID if running, empty string otherwise

Return type
string

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

`salt.modules.linux_service.`**`stop`**`(`*name*`)`

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

26.6.86 salt.modules.linux_shadow

Manage the shadow file on Linux systems

Important: If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to *'shadow.info' is not available*), see *here*.

`salt.modules.linux_shadow.`**`default_hash`**`()`

Returns the default hash used for unset passwords

CLI Example:

```
salt '*' shadow.default_hash
```

`salt.modules.linux_shadow.`**`del_password`**(*name*, *root=None*)

New in version 2014.7.0.

Delete the password from name user

name
User to delete

root
Directory to chroot into

CLI Example:

```
salt '*' shadow.del_password username
```

`salt.modules.linux_shadow.`**`gen_password`**(*password*, *crypt_salt=None*, *algorithm='sha512'*)

New in version 2014.7.0.

Generate hashed password

Note: When called this function is called directly via remote-execution, the password argument may be displayed in the system's process list. This may be a security risk on certain systems.

password
Plaintext password to be hashed.

crypt_salt
Crpytographic salt. If not given, a random 8-character salt will be generated.

algorithm
The following hash algorithms are supported:

- md5
- blowfish (not in mainline glibc, only available in distros that add it)
- sha256
- sha512 (default)

CLI Example:

```
salt '*' shadow.gen_password 'I_am_password'
salt '*' shadow.gen_password 'I_am_password' crypt_salt='I_am_salt'
↪algorithm=sha256
```

`salt.modules.linux_shadow.`**`info`**(*name*, *root=None*)

Return information for the specified user

name
User to get the information for

root
Directory to chroot into

CLI Example:

```
salt '*' shadow.info root
```

`salt.modules.linux_shadow.`**`list_users`**`(`*root=None*`)`

New in version 2018.3.0.

Return a list of all shadow users

root
Directory to chroot into

CLI Example:

```
salt '*' shadow.list_users
```

`salt.modules.linux_shadow.`**`lock_password`**`(`*name*, *root=None*`)`

New in version 2016.11.0.

Lock the password from specified user

name
User to lock

root
Directory to chroot into

CLI Example:

```
salt '*' shadow.lock_password username
```

`salt.modules.linux_shadow.`**`set_date`**`(`*name*, *date*, *root=None*`)`

Sets the value for the date the password was last changed to days since the epoch (January 1, 1970). See man chage.

name
User to modify

date
Date the password was last changed

root
Directory to chroot into

CLI Example:

```
salt '*' shadow.set_date username 0
```

`salt.modules.linux_shadow.`**`set_expire`**`(`*name*, *expire*, *root=None*`)`

Changed in version 2014.7.0.

Sets the value for the date the account expires as days since the epoch (January 1, 1970). Using a value of -1 will clear expiration. See man chage.

name
User to modify

date
Date the account expires

root
Directory to chroot into

CLI Example:

```
salt '*' shadow.set_expire username -1
```

`salt.modules.linux_shadow.`**`set_inactdays`**(*name*, *inactdays*, *root=None*)

Set the number of days of inactivity after a password has expired before the account is locked. See man chage.

name
User to modify

inactdays
Set password inactive after this number of days

root
Directory to chroot into

CLI Example:

```
salt '*' shadow.set_inactdays username 7
```

`salt.modules.linux_shadow.`**`set_maxdays`**(*name*, *maxdays*, *root=None*)

Set the maximum number of days during which a password is valid. See man chage.

name
User to modify

maxdays
Maximum number of days during which a password is valid

root
Directory to chroot into

CLI Example:

```
salt '*' shadow.set_maxdays username 90
```

`salt.modules.linux_shadow.`**`set_mindays`**(*name*, *mindays*, *root=None*)

Set the minimum number of days between password changes. See man chage.

name
User to modify

mindays
Minimum number of days between password changes

root
Directory to chroot into

CLI Example:

```
salt '*' shadow.set_mindays username 7
```

`salt.modules.linux_shadow.`**`set_password`**(*name*, *password*, *use_usermod=False*, *root=None*)

Set the password for a named user. The password must be a properly defined hash. A password hash can be generated with `gen_password()`.

name
User to set the password

password
Password already hashed

use_usermod
Use usermod command to better compatibility

root
Directory to chroot into

CLI Example:

```
salt '*' shadow.set_password root '$1$UYCIxa628.9qXjpQCjM4a..'
```

`salt.modules.linux_shadow.`**`set_warndays`**`(`*name*, *warndays*, *root=None*`)`

Set the number of days of warning before a password change is required. See man chage.

name
User to modify

warndays
Number of days of warning before a password change is required

root
Directory to chroot into

CLI Example:

```
salt '*' shadow.set_warndays username 7
```

`salt.modules.linux_shadow.`**`unlock_password`**`(`*name*, *root=None*`)`

New in version 2016.11.0.

Unlock the password from name user

name
User to unlock

root
Directory to chroot into

CLI Example:

```
salt '*' shadow.unlock_password username
```

26.6.87 salt.modules.linux_sysctl

Module for viewing and modifying sysctl parameters

`salt.modules.linux_sysctl.`**`assign`**`(`*name*, *value*`)`

Assign a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.assign net.ipv4.ip_forward 1
```

`salt.modules.linux_sysctl.`**`default_config`**`()`

Linux hosts using systemd 207 or later ignore `/etc/sysctl.conf` and only load from `/etc/sysctl.d/*.conf`. This function will do the proper checks and return a default config file which will be valid for the Minion. Hosts running systemd >= 207 will use `/etc/sysctl.d/99-salt.conf`.

CLI Example:

```
salt -G 'kernel:Linux' sysctl.default_config
```

`salt.modules.linux_sysctl.`**`get`**(*name*)

Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get net.ipv4.ip_forward
```

`salt.modules.linux_sysctl.`**`persist`**(*name*, *value*, *config=None*)

Assign and persist a simple sysctl parameter for this minion. If `config` is not specified, a sensible default will be chosen using *`sysctl.default_config`*.

CLI Example:

```
salt '*' sysctl.persist net.ipv4.ip_forward 1
```

`salt.modules.linux_sysctl.`**`show`**(*config_file=False*)

Return a list of sysctl parameters for this minion

config: Pull the data from the system configuration file
instead of the live data.

CLI Example:

```
salt '*' sysctl.show
```

26.6.88 salt.modules.localemod

Module for managing locales on POSIX-like systems.

`salt.modules.localemod.`**`avail`**(*locale*)

Check if a locale is available.

New in version 2014.7.0.

CLI Example:

```
salt '*' locale.avail 'en_US.UTF-8'
```

`salt.modules.localemod.`**`gen_locale`**(*locale*, ***kwargs*)

Generate a locale. Options:

New in version 2014.7.0.

Parameters

`locale` -- Any locale listed in /usr/share/i18n/locales or /usr/share/i18n/SUPPORTED for Debian and Gentoo based distributions, which require the charmap to be specified as part of the locale when generating it.

verbose

Show extra warnings about errors that are normally ignored.

CLI Example:

```
salt '*' locale.gen_locale en_US.UTF-8
salt '*' locale.gen_locale 'en_IE.UTF-8 UTF-8'    # Debian/Gentoo only
```

`salt.modules.localemod.`**`get_locale`**`()`

Get the current system locale

CLI Example:

```
salt '*' locale.get_locale
```

`salt.modules.localemod.`**`list_avail`**`()`

Lists available (compiled) locales

CLI Example:

```
salt '*' locale.list_avail
```

`salt.modules.localemod.`**`set_locale`**`(`*locale*`)`

Sets the current system locale

CLI Example:

```
salt '*' locale.set_locale 'en_US.UTF-8'
```

26.6.89 salt.modules.locate

Module for using the locate utilities

`salt.modules.locate.`**`locate`**`(`*pattern, database='', limit=0, **kwargs*`)`

Performs a file lookup. Valid options (and their defaults) are:

```
basename=False
count=False
existing=False
follow=True
ignore=False
nofollow=False
wholename=True
regex=False
database=<locate's default database>
limit=<integer, not set by default>
```

See the manpage for `locate(1)` for further explanation of these options.

CLI Example:

```
salt '*' locate.locate
```

`salt.modules.locate.`**`stats`**`()`

Returns statistics about the locate database

CLI Example:

```
salt '*' locate.stats
```

`salt.modules.locate.`**`updatedb`**`()`

Updates the locate database

CLI Example:

```
salt '*' locate.updatedb
```

`salt.modules.locate.`**`version`**`()`

Returns the version of locate

CLI Example:

```
salt '*' locate.version
```

26.6.90 salt.modules.logmod

On-demand logging

New in version 2017.7.0.

The sole purpose of this module is logging messages in the (proxy) minion. It comes very handy when debugging complex Jinja templates, for example:

```
{%- for var in range(10) %}
  {%- do salt["log.info"](var) -%}
{%- endfor %}
```

CLI Example:

```
salt '*' log.error "Please don't do that, this module is not for CLI use!"
```

`salt.modules.logmod.`**`critical`**`(`*message*`)`

Log message at level CRITICAL.

`salt.modules.logmod.`**`debug`**`(`*message*`)`

Log message at level DEBUG.

`salt.modules.logmod.`**`error`**`(`*message*`)`

Log message at level ERROR.

`salt.modules.logmod.`**`exception`**`(`*message*`)`

Log message at level EXCEPTION.

`salt.modules.logmod.`**`info`**`(`*message*`)`

Log message at level INFO.

`salt.modules.logmod.`**`warning`**`(`*message*`)`

Log message at level WARNING.

26.6.91 salt.modules.logrotate

Module for managing logrotate.

`salt.modules.logrotate.`**`get`**(*key*, *value=None*, *conf_file='/etc/logrotate.conf'*)

Get the value for a specific configuration line.

Parameters

- **`key`** (*`str`*) -- The command or stanza block to configure.
- **`value`** (*`str`*) -- The command value or command of the block specified by the key parameter.
- **`conf_file`** (*`str`*) -- The logrotate configuration file.

Returns

The value for a specific configuration line.

Return type

bool|int|str

CLI Example:

```
salt '*' logrotate.get rotate

salt '*' logrotate.get /var/log/wtmp rotate /etc/logrotate.conf
```

`salt.modules.logrotate.`**`set_`**(*key*, *value*, *setting=None*, *conf_file='/etc/logrotate.conf'*)

Set a new value for a specific configuration line.

Parameters

- **`key`** (*`str`*) -- The command or block to configure.
- **`value`** (*`str`*) -- The command value or command of the block specified by the key parameter.
- **`setting`** (*`str`*) -- The command value for the command specified by the value parameter.
- **`conf_file`** (*`str`*) -- The logrotate configuration file.

Returns

A boolean representing whether all changes succeeded.

Return type

bool

CLI Example:

```
salt '*' logrotate.set rotate 2
```

Can also be used to set a single value inside a multiline configuration block. For instance, to change rotate in the following block:

```
/var/log/wtmp {
    monthly
    create 0664 root root
    rotate 1
}
```

Use the following command:

```
salt '*' logrotate.set /var/log/wtmp rotate 2
```

This module also has the ability to scan files inside an include directory, and make changes in the appropriate file.

`salt.modules.logrotate.`**`show_conf`**`(`*conf_file='/etc/logrotate.conf'*`)`

Show parsed configuration

Parameters
`conf_file` (*`str`*) -- The logrotate configuration file.

Returns
The parsed configuration.

Return type
dict

CLI Example:

```
salt '*' logrotate.show_conf
```

26.6.92 salt.modules.mac_assistive

This module allows you to manage assistive access on macOS minions with 10.9+

New in version 2016.3.0.

```
salt '*' assistive.install /usr/bin/osascript
```

`class` `salt.modules.mac_assistive.`**`TccDB`**`(`*path=None*`)`

`disable``(`*app_id*`)`

`enable``(`*app_id*`)`

`enabled``(`*app_id*`)`

`install``(`*app_id, enable=True*`)`

`installed``(`*app_id*`)`

`remove``(`*app_id*`)`

`salt.modules.mac_assistive.`**`enable_`**`(`*app_id, enabled=True*`)`

Enable or disable an existing assistive access application.

app_id
The bundle ID or command to set assistive access status.

enabled
Sets enabled or disabled status. Default is `True`.

CLI Example:

```
salt '*' assistive.enable /usr/bin/osascript
salt '*' assistive.enable com.smileonmymac.textexpander enabled=False
```

`salt.modules.mac_assistive.`**`enabled`**`(`*app_id*`)`

Check if a bundle ID or command is listed in assistive access and enabled.

app_id
The bundle ID or command to retrieve assistive access status.

CLI Example:

```
salt '*' assistive.enabled /usr/bin/osascript
salt '*' assistive.enabled com.smileonmymac.textexpander
```

`salt.modules.mac_assistive.`**`install`**`(`*app_id, enable=True, tries=3, wait=10*`)`

Install a bundle ID or command as being allowed to use assistive access.

app_id
The bundle ID or command to install for assistive access.

enabled
Sets enabled or disabled status. Default is `True`.

tries
How many times to try and write to a read-only tcc. Default is `True`.

wait
Number of seconds to wait between tries. Default is `10`.

CLI Example:

```
salt '*' assistive.install /usr/bin/osascript
salt '*' assistive.install com.smileonmymac.textexpander
```

`salt.modules.mac_assistive.`**`installed`**`(`*app_id*`)`

Check if a bundle ID or command is listed in assistive access. This will not check to see if it's enabled.

app_id
The bundle ID or command to check installed status.

CLI Example:

```
salt '*' assistive.installed /usr/bin/osascript
salt '*' assistive.installed com.smileonmymac.textexpander
```

`salt.modules.mac_assistive.`**`remove`**`(`*app_id*`)`

Remove a bundle ID or command as being allowed to use assistive access.

app_id
The bundle ID or command to remove from assistive access list.

CLI Example:

```
salt '*' assistive.remove /usr/bin/osascript
salt '*' assistive.remove com.smileonmymac.textexpander
```

26.6.93 salt.modules.mac_brew_pkg

Homebrew for macOS

It is recommended for the `salt-minion` to have the `HOMEBREW_PREFIX` environment variable set.

This will ensure that Salt uses the correct path for the `brew` binary.

Typically, this is set to `/usr/local` for Intel Macs and `/opt/homebrew` for Apple Silicon Macs.

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see *here*.

`salt.modules.mac_brew_pkg.`**`available_version`**`(`**names, options, **kwargs*`)`

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation

Currently chooses stable versions, falling back to devel if that does not exist.

options

List of string with additional options to pass to brew. Useful to remove ambiguous packages that can conflict between formulae and casks.

New in version 3008.0.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
salt '*' pkg.latest_version <package name> options='["--cask"]'
```

`salt.modules.mac_brew_pkg.`**`hold`**`(`*name=None, pkgs=None, sources=None, **kwargs*`)`

Set package in 'hold' state, meaning it will not be upgraded.

New in version 3001.

name

The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.hold <package name>
```

pkgs

A list of packages to hold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

`salt.modules.mac_brew_pkg.`**`homebrew_prefix`**`()`

Returns the full path to the homebrew prefix.

CLI Example:

```
salt '*' pkg.homebrew_prefix
```

`salt.modules.mac_brew_pkg.`**`info_installed`**`(`**names*, ***kwargs*`)`

Return the information of the named package(s) installed on the system.

New in version 2016.3.1.

names
The names of the packages for which to return information.

options
List of string with additional options to pass to brew. Useful to remove ambiguous packages that can conflict between formulae and casks.

New in version 3008.0.

CLI Example:

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> options='["--cask"]'
```

`salt.modules.mac_brew_pkg.`**`install`**`(`*name=None*, *pkgs=None*, *taps=None*, *options=None*, ***kwargs*`)`

Install the passed package(s) with `brew install`

name
The name of the formula to be installed. Note that this parameter is ignored if "pkgs" is passed.

CLI Example:

```
salt '*' pkg.install <package name>
```

taps
Unofficial GitHub repos to use when updating and installing formulas.

CLI Example:

```
salt '*' pkg.install <package name> tap='<tap>'
salt '*' pkg.install zlib taps='homebrew/dupes'
salt '*' pkg.install php54 taps='["josegonzalez/php", "homebrew/dupes
↪"]'
```

options
Options to pass to brew. Only applies to initial install. Due to how brew works, modifying chosen options requires a full uninstall followed by a fresh install. Note that if "pkgs" is used, all options will be passed to all packages. Unrecognized options for a package will be silently ignored by brew. It can also be used to avoid conflicts between formulae and casks.

CLI Example:

```
salt '*' pkg.install <package name> tap='<tap>'
salt '*' pkg.install php54 taps='["josegonzalez/php", "homebrew/dupes
↪"]' options='["--with-fpm"]'
salt '*' pkg.install cdalvaro/tap/salt options='["--cask"]'
```

Multiple Package Installation Options:

pkgs
A list of formulas to install. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo","bar"]'
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install 'package package package'
```

`salt.modules.mac_brew_pkg.`**`latest_version`**(**names*, *options=None*, ***kwargs*)

Return the latest version of the named package available for upgrade or installation

Currently chooses stable versions, falling back to devel if that does not exist.

options

List of string with additional options to pass to brew. Useful to remove ambiguous packages that can conflict between formulae and casks.

New in version 3008.0.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
salt '*' pkg.latest_version <package name> options='["--cask"]'
```

`salt.modules.mac_brew_pkg.`**`list_pkgs`**(*versions_as_list=False*, ***kwargs*)

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.mac_brew_pkg.`**`list_upgrades`**(*refresh=True*, *include_casks=False*, *options=None*, ***kwargs*)

Check whether or not an upgrade is available for all packages

refresh

Update the Homebrew's package repository before listing upgrades.

include_casks

Whether to include casks in the list of upgrades.

options

List of string with additional options to pass to brew. Useful to remove ambiguous packages that can conflict between formulae and casks.

New in version 3008.0.

CLI Example:

```
salt '*' pkg.list_upgrades
salt '*' pkg.list_upgrades include_casks=True
salt '*' pkg.list_upgrades include_casks=True options='["--greedy"]'
```

`salt.modules.mac_brew_pkg.`**`pin`**`(`*name=None, pkgs=None, sources=None, **kwargs*`)`

Set package in 'hold' state, meaning it will not be upgraded.

New in version 3001.

name

The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.hold <package name>
```

pkgs

A list of packages to hold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

`salt.modules.mac_brew_pkg.`**`refresh_db`**`(`***kwargs*`)`

Update the homebrew package repository.

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.mac_brew_pkg.`**`remove`**`(`*name=None, pkgs=None, options=None, **kwargs*`)`

Removes packages with `brew uninstall`.

name

The name of the package to be deleted.

Multiple Package Options:

pkgs

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

options

List of string with additional options to pass to brew. Useful to remove ambiguous packages that can conflict between formulae and casks.

New in version 3008.0.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
salt '*' pkg.remove pkgs='["foo", "bar"]' options='["--cask"]'
```

`salt.modules.mac_brew_pkg.`**`unhold`**`(`*name=None, pkgs=None, sources=None, **kwargs*`)`

Set package current in 'hold' state to install state, meaning it will be upgraded.

New in version 3001.

name

The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.unhold <package name>
```

pkgs

A list of packages to unhold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

`salt.modules.mac_brew_pkg.`**`unpin`**(*name=None*, *pkgs=None*, *sources=None*, ***kwargs*)

Set package current in 'hold' state to install state, meaning it will be upgraded.

New in version 3001.

name

The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.unhold <package name>
```

pkgs

A list of packages to unhold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

`salt.modules.mac_brew_pkg.`**`upgrade`**(*refresh=True*, ***kwargs*)

Upgrade outdated, unpinned brews.

refresh

Fetch the newest version of Homebrew and all formulae from GitHub before installing.

Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.mac_brew_pkg.`**`upgrade_available`**(*pkg*, ***kwargs*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.mac_brew_pkg.`**`version`**`(`**names*, ***kwargs*`)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3>
```

26.6.94 salt.modules.mac_desktop

macOS implementations of various commands in the "desktop" interface

`salt.modules.mac_desktop.`**`get_output_volume`**`()`

Get the output volume (range 0 to 100)

CLI Example:

```
salt '*' desktop.get_output_volume
```

`salt.modules.mac_desktop.`**`lock`**`()`

Lock the desktop session

CLI Example:

```
salt '*' desktop.lock
```

`salt.modules.mac_desktop.`**`say`**`(`**words*`)`

Say some words.

words
The words to execute the say command with.

CLI Example:

```
salt '*' desktop.say <word0> <word1> ... <wordN>
```

`salt.modules.mac_desktop.`**`screensaver`**`()`

Launch the screensaver.

CLI Example:

```
salt '*' desktop.screensaver
```

`salt.modules.mac_desktop.`**`set_output_volume`**`(`*volume*`)`

Set the volume of sound.

volume
The level of volume. Can range from 0 to 100.

CLI Example:

```
salt '*' desktop.set_output_volume <volume>
```

26.6.95 salt.modules.mac_group

Manage groups on Mac OS 10.7+

`salt.modules.mac_group.`**`add`**`(`*name*, *gid=None*, ***kwargs*`)`

Changed in version 3006.0.

Add the specified group

name
Name of the new group

gid
Use GID for the new group

CLI Example:

```
salt '*' group.add foo 3456
```

`salt.modules.mac_group.`**`adduser`**`(`*group*, *name*`)`

Add a user in the group.

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

`salt.modules.mac_group.`**`chgid`**`(`*name*, *gid*`)`

Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

`salt.modules.mac_group.`**`delete`**`(`*name*`)`

Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.mac_group.`**`deluser`**`(`*group*, *name*`)`

Remove a user from the group

New in version 2016.3.0.

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.

`salt.modules.mac_group.`**`getent`**`(`*refresh=False*`)`

Return info on all groups

CLI Example:

```
salt '*' group.getent
```

`salt.modules.mac_group.`**`info`**`(`*name*`)`

Return information about a group

CLI Example:

```
salt '*' group.info foo
```

`salt.modules.mac_group.`**`members`**`(`*name, members_list*`)`

Replaces members of the group with a provided list.

New in version 2016.3.0.

CLI Example:

```
salt '*' group.members foo 'user1,user2,user3,...'
```

Replaces a membership list for a local group 'foo'.

26.6.96 salt.modules.mac_keychain

Install certificates into the keychain on Mac OS

New in version 2016.3.0.

`salt.modules.mac_keychain.`**`get_default_keychain`**`(`*user=None, domain='user'*`)`

Get the default keychain

user

The user to check the default keychain of

domain

The domain to use valid values are user|system|common|dynamic, the default is user

CLI Example:

```
salt '*' keychain.get_default_keychain
```

`salt.modules.mac_keychain.`**`get_friendly_name`**`(`*cert, password, legacy=False*`)`

Get the friendly name of the given certificate

cert

The certificate to install

password

The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

Note: The password given here will show up as plaintext in the returned job info.

legacy

Assume legacy format for certificate.

CLI Example:

```
salt '*' keychain.get_friendly_name /tmp/test.p12 test123

salt '*' keychain.get_friendly_name /tmp/test.p12 test123 legacy=True
```

salt.modules.mac_keychain.**get_hash**(*name*, *password=None*)

Returns the hash of a certificate in the keychain.

name
The name of the certificate (which you can get from keychain.get_friendly_name) or the location of a p12 file.

password
The password that is used in the certificate. Only required if your passing a p12 file. Note: This will be outputted to logs

CLI Example:

```
salt '*' keychain.get_hash /tmp/test.p12 test123
```

salt.modules.mac_keychain.**install**(*cert*, *password*, *keychain='/Library/Keychains/System.keychain'*, *allow_any=False*, *keychain_password=None*)

Install a certificate

cert
The certificate to install

password
The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section.

Note: The password given here will show up as plaintext in the job returned info.

keychain
The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain

allow_any
Allow any application to access the imported certificate without warning

keychain_password
If your keychain is likely to be locked pass the password and it will be unlocked before running the import

Note: The password given here will show up as plaintext in the returned job info.

CLI Example:

```
salt '*' keychain.install test.p12 test123
```

salt.modules.mac_keychain.**list_certs**(*keychain='/Library/Keychains/System.keychain'*)

List all of the installed certificates

keychain
The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain

CLI Example:

```
salt '*' keychain.list_certs
```

salt.modules.mac_keychain.**set_default_keychain**(*keychain*, *domain='user'*, *user=None*)

Set the default keychain

keychain
The location of the keychain to set as default

domain
The domain to use valid values are user|system|common|dynamic, the default is user

user
The user to set the default keychain as

CLI Example:

```
salt '*' keychain.set_keychain /Users/fred/Library/Keychains/login.
↪keychain
```

`salt.modules.mac_keychain.`**`uninstall`**`(`*cert_name, keychain='/Library/Keychains/System.keychain', keychain_password=None*`)`

Uninstall a certificate from a keychain

cert_name
The name of the certificate to remove

keychain
The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain

keychain_password
If your keychain is likely to be locked pass the password and it will be unlocked before running the import

Note: The password given here will show up as plaintext in the returned job info.

CLI Example:

```
salt '*' keychain.install test.p12 test123
```

`salt.modules.mac_keychain.`**`unlock_keychain`**`(`*keychain, password*`)`

Unlock the given keychain with the password

keychain
The keychain to unlock

password
The password to use to unlock the keychain.

Note: The password given here will show up as plaintext in the returned job info.

CLI Example:

```
salt '*' keychain.unlock_keychain /tmp/test.p12 test123
```

26.6.97 salt.modules.mac_pkgutil

Installer support for macOS.

Installer is the native .pkg/.mpkg package manager for macOS.

`salt.modules.mac_pkgutil.`**`forget`**`(`*package_id*`)`

New in version 2016.3.0.

Remove the receipt data about the specified package. Does not remove files.

> **Warning:** DO NOT use this command to fix broken package design

Parameters
package_id (*str*) -- The name of the package to forget

Returns
True if successful, otherwise False

Return type
bool

CLI Example:

```
salt '*' pkgutil.forget com.apple.pkg.gcc4.2Leo
```

`salt.modules.mac_pkgutil.`**`install`**`(`*source, package_id*`)`

Install a .pkg from an URI or an absolute path.

Parameters

- **source** (*str*) -- The path to a package.
- **package_id** (*str*) -- The package ID

Returns
True if successful, otherwise False

Return type
bool

CLI Example:

```
salt '*' pkgutil.install source=/vagrant/build_essentials.pkg package_
↪id=com.apple.pkg.gcc4.2Leo
```

`salt.modules.mac_pkgutil.`**`is_installed`**`(`*package_id*`)`

Returns whether a given package id is installed.

Returns
True if installed, otherwise False

Return type
bool

CLI Example:

```
salt '*' pkgutil.is_installed com.apple.pkg.gcc4.2Leo
```

`salt.modules.mac_pkgutil.`**`list_`**`()`

List the installed packages.

Returns
A list of installed packages

Return type
list

CLI Example:

```
salt '*' pkgutil.list
```

26.6.98 salt.modules.mac_portspkg

Support for MacPorts under macOS.

This module has some caveats.

1. Updating the database of available ports is quite resource-intensive. However, *refresh=True* is the default for all operations that need an up-to-date copy of available ports. Consider *refresh=False* when you are sure no db update is needed.

2. In some cases MacPorts doesn't always realize when another copy of itself is running and will gleefully tromp all over the available ports database. This makes MacPorts behave in undefined ways until a fresh complete copy is retrieved.

Because of 1 and 2 it is possible to get the salt-minion into a state where *salt mac-machine pkg./something/* won't want to return. Use

salt-run jobs.active

on the master to check for potentially long-running calls to *port*.

Finally, ports database updates are always handled with *port selfupdate* as opposed to *port sync*. This makes sense in the MacPorts user community but may confuse experienced Linux admins as Linux package managers don't upgrade the packaging software when doing a package database update. In other words *salt mac-machine pkg.refresh_db* is more like *apt-get update; apt-get upgrade dpkg apt-get* than simply *apt-get update*.

`salt.modules.mac_portspkg.`**`available_version`**`(`**names*, ***kwargs*`)`

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation

Options:

refresh
Update ports with `port selfupdate`

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

`salt.modules.mac_portspkg.`**`install`**`(`*name=None*, *refresh=False*, *pkgs=None*, ***kwargs*`)`

Install the passed package(s) with `port install`

name
The name of the formula to be installed. Note that this parameter is ignored if ”pkgs” is passed.

CLI Example:

```
salt '*' pkg.install <package name>
```

version
Specify a version to pkg to install. Ignored if pkgs is specified.

Note: Remember that versions that contain a single . will be interpreted as numbers and must be double-quoted. For example, version `3006.10` will be rendered as `3006.1`. To pass `3006.10` you'll need to use double-quotes. `version="'3006.10'"`

CLI Example:

```
salt '*' pkg.install <package name>
salt '*' pkg.install git-core version='1.8.5.5'
```

variant

Specify a variant to pkg to install. Ignored if pkgs is specified.

CLI Example:

```
salt '*' pkg.install <package name>
salt '*' pkg.install git-core version='1.8.5.5' variant='+credential_
↪osxkeychain+doc+pcre'
```

Multiple Package Installation Options:

pkgs

A list of formulas to install. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo","bar"]'
salt '*' pkg.install pkgs='["foo@1.2","bar"]'
salt '*' pkg.install pkgs='["foo@1.2+ssl","bar@2.3"]'
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install 'package package package'
```

`salt.modules.mac_portspkg.`**`latest_version`**`(`**names, **kwargs*`)`

Return the latest version of the named package available for upgrade or installation

Options:

refresh

Update ports with `port selfupdate`

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

`salt.modules.mac_portspkg.`**`list_pkgs`**`(`*versions_as_list=False, **kwargs*`)`

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.mac_portspkg.`**`list_upgrades`**(*refresh=True*, ***kwargs*)

Check whether or not an upgrade is available for all packages

Options:

refresh
Update ports with `port selfupdate`

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.mac_portspkg.`**`refresh_db`**(***kwargs*)

Update ports with `port selfupdate`

CLI Example:

```
salt mac pkg.refresh_db
```

`salt.modules.mac_portspkg.`**`remove`**(*name=None*, *pkgs=None*, ***kwargs*)

Removes packages with `port uninstall`.

name
The name of the package to be deleted.

Multiple Package Options:

pkgs
A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.mac_portspkg.`**`upgrade`**(*refresh=True*, ***kwargs*)

Run a full upgrade using MacPorts 'port upgrade outdated'

Options:

refresh
Update ports with `port selfupdate`

Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

salt.modules.mac_portspkg.**upgrade_available**(*pkg*, *refresh=True*, ***kwargs*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.mac_portspkg.**version**(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3>
```

26.6.99 salt.modules.mac_power

Module for editing power settings on macOS

New in version 2016.3.0.

salt.modules.mac_power.**get_computer_sleep**()

Display the amount of idle time until the computer sleeps.

Returns
A string representing the sleep settings for the computer

Return type
str

CLI Example:

```
salt '*' power.get_computer_sleep
```

salt.modules.mac_power.**get_display_sleep**()

Display the amount of idle time until the display sleeps.

Returns
A string representing the sleep settings for the displey

Return type
str

CLI Example:

```
salt '*' power.get_display_sleep
```

salt.modules.mac_power.**get_harddisk_sleep**()

Display the amount of idle time until the hard disk sleeps.

Returns
A string representing the sleep settings for the hard disk

Return type
str

CLI Example:

```
salt '*' power.get_harddisk_sleep
```

`salt.modules.mac_power.`**`get_restart_freeze`**`()`

Displays whether 'restart on freeze' is on or off if supported

Returns
A string value representing the "restart on freeze" settings

Return type
string

CLI Example:

```
salt '*' power.get_restart_freeze
```

`salt.modules.mac_power.`**`get_restart_power_failure`**`()`

Displays whether 'restart on power failure' is on or off if supported

Returns
A string value representing the "restart on power failure" settings

Return type
string

CLI Example:

```
salt '*' power.get_restart_power_failure
```

`salt.modules.mac_power.`**`get_sleep`**`()`

Displays the amount of idle time until the machine sleeps. Settings for Computer, Display, and Hard Disk are displayed.

Returns
A dictionary containing the sleep status for Computer, Display, and Hard Disk

Return type
dict

CLI Example:

```
salt '*' power.get_sleep
```

`salt.modules.mac_power.`**`get_sleep_on_power_button`**`()`

Displays whether 'allow power button to sleep computer' is on or off if supported

Returns
A string value representing the "allow power button to sleep computer" settings

Return type
string

CLI Example:

```
salt '*' power.get_sleep_on_power_button
```

`salt.modules.mac_power.`**`get_wake_on_modem`**`()`

Displays whether 'wake on modem' is on or off if supported

Returns
A string value representing the "wake on modem" settings

Return type
str

CLI Example:

```
salt '*' power.get_wake_on_modem
```

`salt.modules.mac_power.`**`get_wake_on_network`**`()`

Displays whether 'wake on network' is on or off if supported

Returns
A string value representing the "wake on network" settings

Return type
string

CLI Example:

```
salt '*' power.get_wake_on_network
```

`salt.modules.mac_power.`**`set_computer_sleep`**`(`*minutes*`)`

Set the amount of idle time until the computer sleeps. Pass "Never" of "Off" to never sleep.

Parameters
`minutes` -- Can be an integer between 1 and 180 or "Never" or "Off"

Ptype
int, str

Returns
True if successful, False if not

Return type
bool

CLI Example:

```
salt '*' power.set_computer_sleep 120
salt '*' power.set_computer_sleep off
```

`salt.modules.mac_power.`**`set_display_sleep`**`(`*minutes*`)`

Set the amount of idle time until the display sleeps. Pass "Never" of "Off" to never sleep.

Parameters
`minutes` -- Can be an integer between 1 and 180 or "Never" or "Off"

Ptype
int, str

Returns
True if successful, False if not

Return type
bool

CLI Example:

```
salt '*' power.set_display_sleep 120
salt '*' power.set_display_sleep off
```

`salt.modules.mac_power.`**`set_harddisk_sleep`**(*minutes*)

Set the amount of idle time until the harddisk sleeps. Pass "Never" of "Off" to never sleep.

Parameters
`minutes` -- Can be an integer between 1 and 180 or "Never" or "Off"

Ptype
int, str

Returns
True if successful, False if not

Return type
bool

CLI Example:

```
salt '*' power.set_harddisk_sleep 120
salt '*' power.set_harddisk_sleep off
```

`salt.modules.mac_power.`**`set_restart_freeze`**(*enabled*)

Specifies whether the server restarts automatically after a system freeze. This setting doesn't seem to be editable. The command completes successfully but the setting isn't actually updated. This is probably a macOS. The functions remains in case they ever fix the bug.

Parameters
`enabled` (*`bool`*) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns
True if successful, False if not

Return type
bool

CLI Example:

```
salt '*' power.set_restart_freeze True
```

`salt.modules.mac_power.`**`set_restart_power_failure`**(*enabled*)

Set whether or not the computer will automatically restart after a power failure.

Parameters
`enabled` (*`bool`*) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns
True if successful, False if not

Return type
bool

CLI Example:

```
salt '*' power.set_restart_power_failure True
```

`salt.modules.mac_power.`**`set_sleep`**`(`*minutes*`)`

Sets the amount of idle time until the machine sleeps. Sets the same value for Computer, Display, and Hard Disk. Pass "Never" or "Off" for computers that should never sleep.

Parameters
`minutes` -- Can be an integer between 1 and 180 or "Never" or "Off"

Ptype
int, str

Returns
True if successful, False if not

Return type
bool

CLI Example:

```
salt '*' power.set_sleep 120
salt '*' power.set_sleep never
```

`salt.modules.mac_power.`**`set_sleep_on_power_button`**`(`*enabled*`)`

Set whether or not the power button can sleep the computer.

Parameters
`enabled` (*bool*) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns
True if successful, False if not

Return type
bool

CLI Example:

```
salt '*' power.set_sleep_on_power_button True
```

`salt.modules.mac_power.`**`set_wake_on_modem`**`(`*enabled*`)`

Set whether or not the computer will wake from sleep when modem activity is detected.

Parameters
`enabled` (*bool*) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns
True if successful, False if not

Return type
bool

CLI Example:

```
salt '*' power.set_wake_on_modem True
```

`salt.modules.mac_power.`**`set_wake_on_network`**`(`*enabled*`)`

Set whether or not the computer will wake from sleep when network activity is detected.

Parameters
`enabled` (*bool*) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns
True if successful, False if not

Return type
bool

CLI Example:

```
salt '*' power.set_wake_on_network True
```

26.6.100 salt.modules.mac_service

The service module for macOS

New in version 2016.3.0.

This module has support for services in the following locations.

```
/System/Library/LaunchDaemons/
/System/Library/LaunchAgents/
/Library/LaunchDaemons/
/Library/LaunchAgents/

# As of version "2019.2.0" support for user-specific services were added.
/Users/foo/Library/LaunchAgents/
```

Note: As of the 2019.2.0 release, if a service is located in a `LaunchAgent` path and a `runas` user is NOT specified, the current console user will be used to properly interact with the service.

Note: As of the 3002 release, if a service name of `salt-minion` is passed this module will convert it over to it's macOS equivalent name, in this case to `com.saltstack.salt.minion`. This is true for `salt-master` `salt-api`, and `salt-syndic` as well.

`salt.modules.mac_service.`**`available`**`(`*name*`)`

Check that the given service is available.

Parameters
`name` (*`str`*) -- The name of the service

Returns
True if the service is available, otherwise False

Return type
bool

CLI Example:

```
salt '*' service.available com.openssh.sshd
```

`salt.modules.mac_service.`**`disable`**`(`*name*, *runas=None*`)`

Disable a launchd service. Raises an error if the service fails to be disabled

Parameters

- **`name`** (*`str`*) -- Service label, file name, or full path

- **runas** (*str*) -- User to run launchctl commands

Returns
`True` if successful or if the service is already disabled

Return type
bool

CLI Example:

```
salt '*' service.disable org.cups.cupsd
```

`salt.modules.mac_service.`**`disabled`**`(`*name*, *runas=None*, *domain='system'*`)`

Check if the specified service is not enabled. This is the opposite of `service.enabled`

Parameters

- **name** (*str*) -- The name to look up
- **runas** (*str*) -- User to run launchctl commands
- **domain** (*str*) -- domain to check for disabled services. Default is system.

Returns
True if the specified service is NOT enabled, otherwise False

Return type
bool

CLI Example:

```
salt '*' service.disabled org.cups.cupsd
```

`salt.modules.mac_service.`**`enable`**`(`*name*, *runas=None*`)`

Enable a launchd service. Raises an error if the service fails to be enabled

Parameters

- **name** (*str*) -- Service label, file name, or full path
- **runas** (*str*) -- User to run launchctl commands

Returns
`True` if successful or if the service is already enabled

Return type
bool

CLI Example:

```
salt '*' service.enable org.cups.cupsd
```

`salt.modules.mac_service.`**`enabled`**`(`*name*, *runas=None*`)`

Check if the specified service is enabled (not disabled, capable of being loaded/bootstrapped).

Note: Previously this function would see if the service is loaded via `launchctl list` to determine if the service is enabled. This was not an accurate way to do so. The new behavior checks to make sure its not disabled to determine the status. Please use `service.loaded` for the previous behavior.

Parameters

- **name** (*str*) -- The name of the service to look up.
- **runas** (*str*) -- User to run launchctl commands.

Returns
True if the specified service enabled, otherwise False

Return type
bool

CLI Example:

```
salt '*' service.enabled org.cups.cupsd
```

`salt.modules.mac_service.`**`get_all`**(*runas=None*)

Return a list of services that are enabled or available. Can be used to find the name of a service.

Parameters
runas (*str*) -- User to run launchctl commands

Returns
A list of all the services available or enabled

Return type
list

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.mac_service.`**`get_enabled`**(*runas=None*)

Return a list of all services that are enabled. Can be used to find the name of a service.

Parameters
runas (*str*) -- User to run launchctl commands

Returns
A list of all the services enabled on the system

Return type
list

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.mac_service.`**`launchctl`**(*sub_cmd*, **args*, ***kwargs*)

Run a launchctl command and raise an error if it fails

Parameters

- **sub_cmd** (*str*) -- Sub command supplied to launchctl
- **args** (*tuple*) -- Tuple containing additional arguments to pass to launchctl
- **kwargs** (*dict*) -- Dictionary containing arguments to pass to `cmd.run_all`
- **return_stdout** (*bool*) -- A keyword argument. If true return the stdout of the launchctl command

Returns
`True` if successful, raise `CommandExecutionError` if not, or the stdout of the launchctl command if requested

Return type
bool, str

CLI Example:

```
salt '*' service.launchctl debug org.cups.cupsd
```

`salt.modules.mac_service.`**`list_`**`(`*name=None*, *runas=None*`)`

Run launchctl list and return the output

Parameters

- **name** (*str*) -- The name of the service to list
- **runas** (*str*) -- User to run launchctl commands

Returns
If a name is passed returns information about the named service, otherwise returns a list of all services and pids

Return type
str

CLI Example:

```
salt '*' service.list
salt '*' service.list org.cups.cupsd
```

`salt.modules.mac_service.`**`loaded`**`(`*name*, *runas=None*`)`

Check if the specified service is loaded.

Parameters

- **name** (*str*) -- The name of the service to look up
- **runas** (*str*) -- User to run launchctl commands

Returns
`True` if the specified service is loaded, otherwise `False`

Return type
bool

CLI Example:

```
salt '*' service.loaded org.cups.cupsd
```

`salt.modules.mac_service.`**`missing`**`(`*name*`)`

The inverse of service.available Check that the given service is not available.

Parameters
name (*str*) -- The name of the service

Returns
True if the service is not available, otherwise False

Return type
bool

CLI Example:

```
salt '*' service.missing com.openssh.sshd
```

`salt.modules.mac_service.`**`restart`**`(`*name, runas=None*`)`

Unloads and reloads a launchd service. Raises an error if the service fails to reload

Parameters

- **name** (*str*) -- Service label, file name, or full path
- **runas** (*str*) -- User to run launchctl commands

Returns
`True` if successful

Return type
bool

CLI Example:

```
salt '*' service.restart org.cups.cupsd
```

`salt.modules.mac_service.`**`show`**`(`*name*`)`

Show properties of a launchctl service

Parameters
name (*str*) -- Service label, file name, or full path

Returns
The service information if the service is found

Return type
dict

CLI Example:

```
salt '*' service.show org.cups.cupsd  # service label
salt '*' service.show org.cups.cupsd.plist  # file name
salt '*' service.show /System/Library/LaunchDaemons/org.cups.cupsd.plist
↪# full path
```

`salt.modules.mac_service.`**`start`**`(`*name, runas=None*`)`

Start a launchd service. Raises an error if the service fails to start

Note: To start a service in macOS the service must be enabled first. Use `service.enable` to enable the service.

Parameters

- **name** (*str*) -- Service label, file name, or full path
- **runas** (*str*) -- User to run launchctl commands

Returns
`True` if successful or if the service is already running

Return type
bool

CLI Example:

```
salt '*' service.start org.cups.cupsd
```

`salt.modules.mac_service.`**`status`**`(`*name*, *sig=None*, *runas=None*`)`

Return the status for a service.

Note: Previously this function would return a PID for a running service with a PID or 'loaded' for a loaded service without a PID. This was changed to have better parity with other service modules that return True/False.

Parameters

- **`name`** (*`str`*) -- Used to find the service from launchctl. Can be the service Label, file name, or path to the service file. (normally a plist)
- **`sig`** (*`str`*) -- Find the service with status.pid instead. Note that `name` must still be provided.
- **`runas`** (*`str`*) -- User to run launchctl commands.

Returns

True if running, otherwise False.

Return type

str

CLI Example:

```
salt '*' service.status cups
```

`salt.modules.mac_service.`**`stop`**`(`*name*, *runas=None*`)`

Stop a launchd service. Raises an error if the service fails to stop

---

Note: Though `service.stop` will unload a service in macOS, the service will start on next boot unless it is disabled. Use `service.disable` to disable the service

---

Parameters

- **`name`** (*`str`*) -- Service label, file name, or full path
- **`runas`** (*`str`*) -- User to run launchctl commands

Returns

`True` if successful or if the service is already stopped

Return type

bool

CLI Example:

```
salt '*' service.stop org.cups.cupsd
```

26.6.101 salt.modules.mac_shadow

Manage macOS local directory passwords and policies

New in version 2016.3.0.

Note that it is usually better to apply password policies through the creation of a configuration profile.

`salt.modules.mac_shadow.`**`del_password`**`(`*name*`)`

Deletes the account password

Parameters
name (*str*) -- The user name of the account

Returns
True if successful, otherwise False

Return type
bool

Raises
CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.del_password username
```

`salt.modules.mac_shadow.`**`get_account_created`**`(`*name*`)`

Get the date/time the account was created

Parameters
name (*str*) -- The username of the account

Returns
The date/time the account was created (yyyy-mm-dd hh:mm:ss) or 0 if the value is not defined

Return type
str

Raises
CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_account_created admin
```

`salt.modules.mac_shadow.`**`get_change`**`(`*name*`)`

Gets the date on which the password expires

Parameters
name (*str*) -- The name of the user account

Returns
The date the password will expire

Return type
str

Raises
CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_change username
```

`salt.modules.mac_shadow.`**`get_expire`**(*name*)

Gets the date on which the account expires

Parameters
name (*str*) -- The name of the user account

Returns
The date the account expires

Return type
str

Raises
CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_expire username
```

`salt.modules.mac_shadow.`**`get_last_change`**(*name*)

Get the date/time the account was changed

Parameters
name (*str*) -- The username of the account

Returns
The date/time the account was modified (yyyy-mm-dd hh:mm:ss) or 0 if the value is not defined

Return type
str

Raises
CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_last_change admin
```

`salt.modules.mac_shadow.`**`get_login_failed_count`**(*name*)

Get the number of failed login attempts

Parameters
name (*str*) -- The username of the account

Returns
The number of failed login attempts. 0 may mean there are no failed login attempts or the value is not defined

Return type
str

Raises
CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_login_failed_count admin
```

`salt.modules.mac_shadow.`**`get_login_failed_last`**`(`*name*`)`

Get the date/time of the last failed login attempt

Parameters

name (*str*) -- The username of the account

Returns

The date/time of the last failed login attempt on this account (yyyy-mm-dd hh:mm:ss) or 0 if the value is not defined

Return type

str

Raises

CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_login_failed_last admin
```

`salt.modules.mac_shadow.`**`get_maxdays`**`(`*name*`)`

Get the maximum age of the password

Parameters

name (*str*) -- The username of the account

Returns

The maximum age of the password in days

Return type

int

Raises

CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_maxdays admin 90
```

`salt.modules.mac_shadow.`**`info`**`(`*name*`)`

Return information for the specified user

Parameters

name (*str*) -- The username

Returns

A dictionary containing the user's shadow information

Return type

dict

CLI Example:

```
salt '*' shadow.info admin
```

`salt.modules.mac_shadow.`**`set_change`**`(`*name, date*`)`

Sets the date on which the password expires. The user will be required to change their password. Format is mm/dd/yyyy

Parameters

- **name** (*str*) -- The name of the user account

- **date** (*date*) -- The date the password will expire. Must be in mm/dd/yyyy format.

Returns
True if successful, otherwise False

Return type
bool

Raises
CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.set_change username 09/21/2016
```

`salt.modules.mac_shadow.`**`set_expire`**`(`*name*, *date*`)`

Sets the date on which the account expires. The user will not be able to login after this date. Date format is mm/dd/yyyy

Parameters

- **name** (*str*) -- The name of the user account
- **date** (*datetime*) -- The date the account will expire. Format must be mm/dd/yyyy.

Returns
True if successful, False if not

Return type
bool

Raises
CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.set_expire username 07/23/2015
```

`salt.modules.mac_shadow.`**`set_inactdays`**`(`*name*, *days*`)`

Set the number if inactive days before the account is locked. Not available in macOS

Parameters

- **name** (*str*) -- The user name
- **days** (*int*) -- The number of days

Returns
Will always return False until macOS supports this feature.

Return type
bool

CLI Example:

```
salt '*' shadow.set_inactdays admin 90
```

`salt.modules.mac_shadow.`**`set_maxdays`**`(`*name*, *days*`)`

Set the maximum age of the password in days

Parameters

- **name** (*str*) -- The username of the account

- **days** (*int*) -- The maximum age of the account in days

Returns
True if successful, False if not

Return type
bool

Raises
CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.set_maxdays admin 90
```

salt.modules.mac_shadow.**set_mindays**(*name*, *days*)

Set the minimum password age in days. Not available in macOS.

Parameters

- **name** (*str*) -- The user name
- **days** (*int*) -- The number of days

Returns
Will always return False until macOS supports this feature.

Return type
bool

CLI Example:

```
salt '*' shadow.set_mindays admin 90
```

salt.modules.mac_shadow.**set_password**(*name*, *password*)

Set the password for a named user (insecure, the password will be in the process list while the command is running)

Parameters

- **name** (*str*) -- The name of the local user, which is assumed to be in the local directory service
- **password** (*str*) -- The plaintext password to set

Returns
True if successful, otherwise False

Return type
bool

Raises
CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' mac_shadow.set_password macuser macpassword
```

salt.modules.mac_shadow.**set_warndays**(*name*, *days*)

Set the number of days before the password expires that the user will start to see a warning. Not available in macOS

Parameters

- **name** (*str*) -- The user name
- **days** (*int*) -- The number of days

Returns
Will always return False until macOS supports this feature.

Return type
bool

CLI Example:

```
salt '*' shadow.set_warndays admin 90
```

26.6.102 salt.modules.mac_softwareupdate

Support for the softwareupdate command on MacOS.

`salt.modules.mac_softwareupdate.`**`download`**`(`*name*`)`

Download a named update so that it can be installed later with the `update` or `update_all` functions

Parameters
name (*str*) -- The update to download.

Returns
True if successful, otherwise False

Return type
bool

CLI Example:

```
salt '*' softwareupdate.download <update name>
```

`salt.modules.mac_softwareupdate.`**`download_all`**`(`*recommended=False, restart=True*`)`

Download all available updates so that they can be installed later with the `update` or `update_all` functions. It returns a list of updates that are now downloaded.

Parameters

- **recommended** (*bool*) -- If set to True, only install the recommended updates. If set to False (default) all updates are installed.
- **restart** (*bool*) -- Set this to False if you do not want to install updates that require a restart. Default is True

Returns
A list containing all downloaded updates on the system.

Return type
list

CLI Example:

```
salt '*' softwareupdate.download_all
```

`salt.modules.mac_softwareupdate.`**`get_catalog`**`()`

New in version 2016.3.0.

Get the current catalog being used for update lookups. Will return a url if a custom catalog has been specified. Otherwise the word 'Default' will be returned

Returns
The catalog being used for update lookups

Return type
str

CLI Example:

```
salt '*' softwareupdates.get_catalog
```

`salt.modules.mac_softwareupdate.`**`ignore`**`(`*name*`)`

Ignore a specific program update. When an update is ignored the '-' and version number at the end will be omitted, so "SecUpd2014-001-1.0" becomes "SecUpd2014-001". It will be removed automatically if present. An update is successfully ignored when it no longer shows up after list_updates.

Parameters
`name` -- The name of the update to add to the ignore list.

Ptype
str

Returns
True if successful, False if not

Return type
bool

CLI Example:

```
salt '*' softwareupdate.ignore <update-name>
```

`salt.modules.mac_softwareupdate.`**`list_available`**`(`*recommended=False*, *restart=False*, *shut_down=False*`)`

List all available updates.

Parameters

- **`recommended`** (*`bool`*) -- Show only recommended updates.
- **`restart`** (*`bool`*) -- Show only updates that require a restart.

Returns
Returns a dictionary containing the updates

Return type
dict

CLI Example:

```
salt '*' softwareupdate.list_available
```

`salt.modules.mac_softwareupdate.`**`list_downloads`**`()`

Return a list of all updates that have been downloaded locally.

Returns
A list of updates that have been downloaded

Return type
list

CLI Example:

```
salt '*' softwareupdate.list_downloads
```

salt.modules.mac_softwareupdate.**list_ignored**()

List all updates that have been ignored. Ignored updates are shown without the '-' and version number at the end, this is how the softwareupdate command works.

Returns
The list of ignored updates

Return type
list

CLI Example:

```
salt '*' softwareupdate.list_ignored
```

salt.modules.mac_softwareupdate.**reset_catalog**()

New in version 2016.3.0.

Reset the Software Update Catalog to the default.

Returns
True if successful, False if not

Return type
bool

CLI Example:

```
salt '*' softwareupdates.reset_catalog
```

salt.modules.mac_softwareupdate.**reset_ignored**()

Make sure the ignored updates are not ignored anymore, returns a list of the updates that are no longer ignored.

Returns
True if the list was reset, Otherwise False

Return type
bool

CLI Example:

```
salt '*' softwareupdate.reset_ignored
```

salt.modules.mac_softwareupdate.**schedule_enable**(*enable*)

Enable/disable automatic update scheduling.

Parameters
enable -- True/On/Yes/1 to turn on automatic updates. False/No/Off/0 to turn off automatic updates. If this value is empty, the current status will be returned.

Type
bool str

Returns
True if scheduling is enabled, False if disabled

Return type
bool

CLI Example:

```
salt '*' softwareupdate.schedule_enable on|off
```

`salt.modules.mac_softwareupdate.`**`schedule_enabled`**`()`

Check the status of automatic update scheduling.

Returns
True if scheduling is enabled, False if disabled

Return type
bool

CLI Example:

```
salt '*' softwareupdate.schedule_enabled
```

`salt.modules.mac_softwareupdate.`**`set_catalog`**`(`*url*`)`

New in version 2016.3.0.

Set the Software Update Catalog to the URL specified

Parameters
`url` (*`str`*) -- The url to the update catalog

Returns
True if successful, False if not

Return type
bool

CLI Example:

```
salt '*' softwareupdates.set_catalog http://swupd.local:8888/index.
↪sucatalog
```

`salt.modules.mac_softwareupdate.`**`update`**`(`*name*`)`

Install a named update.

Parameters
`name` (*`str`*) -- The name of the of the update to install.

Returns
True if successfully updated, otherwise False

Return type
bool

CLI Example:

```
salt '*' softwareupdate.update <update-name>
```

`salt.modules.mac_softwareupdate.`**`update_all`**`(`*recommended=False*, *restart=True*`)`

Install all available updates. Returns a dictionary containing the name of the update and the status of its installation.

Parameters

- **`recommended`** (*`bool`*) -- If set to True, only install the recommended updates. If set to False (default) all updates are installed.
- **`restart`** (*`bool`*) -- Set this to False if you do not want to install updates that require a restart. Default is True

Returns
A dictionary containing the updates that were installed and the status of its installation. If no updates were installed an empty dictionary is returned.

Return type
dict

CLI Example:

```
salt '*' softwareupdate.update_all
```

`salt.modules.mac_softwareupdate.`**`update_available`**`(`*name*`)`

Check whether or not an update is available with a given name.

Parameters
name (*str*) -- The name of the update to look for

Returns
True if available, False if not

Return type
bool

CLI Example:

```
salt '*' softwareupdate.update_available <update-name>
salt '*' softwareupdate.update_available "<update with whitespace>"
```

26.6.103 salt.modules.mac_sysctl

Module for viewing and modifying sysctl parameters

`salt.modules.mac_sysctl.`**`assign`**`(`*name*, *value*`)`

Assign a single sysctl parameter for this minion

name
The name of the sysctl value to edit.

value
The sysctl value to apply.

CLI Example:

```
salt '*' sysctl.assign net.inet.icmp.icmplim 50
```

`salt.modules.mac_sysctl.`**`get`**`(`*name*`)`

Return a single sysctl parameter for this minion

name
The name of the sysctl value to display.

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

`salt.modules.mac_sysctl.`**`persist`**`(`*name*, *value*, *config='/etc/sysctl.conf'*, *apply_change=False*`)`

Assign and persist a simple sysctl parameter for this minion

name
The name of the sysctl value to edit.

value
The sysctl value to apply.

config
The location of the sysctl configuration file.

apply_change
Default is False; Default behavior only creates or edits the sysctl.conf file. If apply is set to True, the changes are applied to the system.

CLI Example:

```
salt '*' sysctl.persist net.inet.icmp.icmplim 50
salt '*' sysctl.persist coretemp_load NO config=/etc/sysctl.conf
```

`salt.modules.mac_sysctl.`**`show`**`(`*config_file=False*`)`

Return a list of sysctl parameters for this minion

config: Pull the data from the system configuration file
instead of the live data.

CLI Example:

```
salt '*' sysctl.show
```

26.6.104 salt.modules.mac_system

System module for sleeping, restarting, and shutting down the system on Mac OS X

New in version 2016.3.0.

Warning: Using this module will enable `atrun` on the system if it is disabled.

`salt.modules.mac_system.`**`get_boot_arch`**`()`

Get the kernel architecture setting from `com.apple.Boot.plist`

Returns
A string value representing the boot architecture setting

Return type
str

CLI Example:

```
salt '*' system.get_boot_arch
```

`salt.modules.mac_system.`**`get_computer_name`**`()`

Gets the computer name

Returns
The computer name

Return type
str

CLI Example:

```
salt '*' system.get_computer_name
```

salt.modules.mac_system.**get_disable_keyboard_on_lock**()

Get whether or not the keyboard should be disabled when the X Serve enclosure lock is engaged.

Returns
True if disable keyboard on lock is on, False if off

Return type
bool

CLI Example:

```
salt '*' system.get_disable_keyboard_on_lock
```

salt.modules.mac_system.**get_remote_events**()

Displays whether remote apple events are on or off.

Returns
True if remote apple events are on, False if off

Return type
bool

CLI Example:

```
salt '*' system.get_remote_events
```

salt.modules.mac_system.**get_remote_login**()

Displays whether remote login (SSH) is on or off.

Returns
True if remote login is on, False if off

Return type
bool

CLI Example:

```
salt '*' system.get_remote_login
```

salt.modules.mac_system.**get_restart_delay**()

Get the number of seconds after which the computer will start up after a power failure.

Returns
A string value representing the number of seconds the system will delay restart after power loss

Return type
str

CLI Example:

```
salt '*' system.get_restart_delay
```

salt.modules.mac_system.**get_startup_disk**()

Displays the current startup disk

Returns
The current startup disk

Return type
str

CLI Example:

```
salt '*' system.get_startup_disk
```

`salt.modules.mac_system.`**`get_subnet_name`**`()`

Gets the local subnet name

Returns
The local subnet name

Return type
str

CLI Example:

```
salt '*' system.get_subnet_name
```

`salt.modules.mac_system.`**`halt`**`(`*at_time=None*`)`

Halt a running system

Parameters
`at_time` (*`str`*) -- Any valid *at* expression. For example, some valid at expressions could be:

- noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes

Note: If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: '"14:00"'

CLI Example:

```
salt '*' system.halt
salt '*' system.halt 'now + 10 minutes'
```

`salt.modules.mac_system.`**`list_startup_disks`**`()`

List all valid startup disks on the system.

Returns
A list of valid startup disks

Return type
list

CLI Example:

```
salt '*' system.list_startup_disks
```

`salt.modules.mac_system.`**`restart`**`(`*at_time=None*`)`

Restart the system

Parameters

`at_time` (*`str`*) -- Any valid *at* expression. For example, some valid at expressions could be:

- noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes

Note: If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: '"14:00"'

CLI Example:

```
salt '*' system.restart
salt '*' system.restart '12:00 PM fri'
```

`salt.modules.mac_system.`**`set_boot_arch`**`(`*arch='default'*`)`

Set the kernel to boot in 32 or 64 bit mode on next boot.

Note: When this function fails with the error `changes to kernel architecture failed to save!`, then the boot arch is not updated. This is either an Apple bug, not available on the test system, or a result of system files being locked down in macOS (SIP Protection).

Parameters

`arch` (*`str`*) -- A string representing the desired architecture. If no value is passed, default is assumed. Valid values include:

- i386
- x86_64
- default

Returns

True if successful, False if not

Return type

bool

CLI Example:

```
salt '*' system.set_boot_arch i386
```

`salt.modules.mac_system.`**`set_computer_name`**`(`*name*`)`

Set the computer name

Parameters
name (*str*) -- The new computer name

Returns
True if successful, False if not

Return type
bool

CLI Example:

```
salt '*' system.set_computer_name "Mike's Mac"
```

`salt.modules.mac_system.`**`set_disable_keyboard_on_lock`**`(`*enable*`)`

Get whether or not the keyboard should be disabled when the X Serve enclosure lock is engaged.

Parameters
enable (*bool*) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns
True if successful, False if not

Return type
bool

CLI Example:

```
salt '*' system.set_disable_keyboard_on_lock False
```

`salt.modules.mac_system.`**`set_remote_events`**`(`*enable*`)`

Set whether the server responds to events sent by other computers (such as AppleScripts)

Parameters
enable (*bool*) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns
True if successful, False if not

Return type
bool

CLI Example:

```
salt '*' system.set_remote_events On
```

`salt.modules.mac_system.`**`set_remote_login`**`(`*enable*`)`

Set the remote login (SSH) to either on or off.

Parameters
enable (*bool*) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns
True if successful, False if not

Return type
bool

CLI Example:

```
salt '*' system.set_remote_login True
```

`salt.modules.mac_system.`**`set_restart_delay`**(*seconds*)

Set the number of seconds after which the computer will start up after a power failure.

Warning: This command fails with the following error:

`Error, IOServiceOpen returned 0x10000003`

The setting is not updated. This is an apple bug. It seems like it may only work on certain versions of Mac Server X. This article explains the issue in more detail, though it is quite old.

http://lists.apple.com/archives/macos-x-server/2006/Jul/msg00967.html

Parameters
seconds (*int*) -- The number of seconds. Must be a multiple of 30

Returns
True if successful, False if not

Return type
bool

CLI Example:

```
salt '*' system.set_restart_delay 180
```

`salt.modules.mac_system.`**`set_startup_disk`**(*path*)

Set the current startup disk to the indicated path. Use `system.list_startup_disks` to find valid startup disks on the system.

Parameters
path (*str*) -- The valid startup disk path

Returns
True if successful, False if not

Return type
bool

CLI Example:

```
salt '*' system.set_startup_disk /System/Library/CoreServices
```

`salt.modules.mac_system.`**`set_subnet_name`**(*name*)

Set the local subnet name

Parameters
name (*str*) -- The new local subnet name

Note: Spaces are changed to dashes. Other special characters are removed.

Returns
True if successful, False if not

Return type
bool

CLI Example:

```
The following will be set as 'Mikes-Mac'
salt '*' system.set_subnet_name "Mike's Mac"
```

`salt.modules.mac_system.`**`shutdown`**(*at_time=None*)

Shutdown the system

Parameters
`at_time` (*`str`*) -- Any valid *at* expression. For example, some valid at expressions could be:

- noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes

Note: If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: '"14:00"'

CLI Example:

```
salt '*' system.shutdown
salt '*' system.shutdown 'now + 1 hour'
```

`salt.modules.mac_system.`**`sleep`**(*at_time=None*)

Sleep the system. If a user is active on the system it will likely fail to sleep.

Parameters
`at_time` (*`str`*) -- Any valid *at* expression. For example, some valid at expressions could be:

- noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes

Note: If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: '"14:00"'

CLI Example:

```
salt '*' system.sleep
salt '*' system.sleep '10:00 PM'
```

26.6.105 salt.modules.mac_timezone

Module for editing date/time settings on macOS

New in version 2016.3.0.

`salt.modules.mac_timezone.`**`get_date`**`()`

Displays the current date

Returns
the system date

Return type
str

CLI Example:

```
salt '*' timezone.get_date
```

`salt.modules.mac_timezone.`**`get_hwclock`**`()`

Get current hardware clock setting (UTC or localtime)

CLI Example:

```
salt '*' timezone.get_hwclock
```

`salt.modules.mac_timezone.`**`get_offset`**`()`

Displays the current time zone offset

Returns
The current time zone offset

Return type
str

CLI Example:

```
salt '*' timezone.get_offset
```

`salt.modules.mac_timezone.`**`get_time`**`()`

Get the current system time.

Returns
The current time in 24 hour format

Return type
str

CLI Example:

```
salt '*' timezone.get_time
```

`salt.modules.mac_timezone.`**`get_time_server`**`()`

Display the currently set network time server.

Returns
the network time server

Return type
str

CLI Example:

```
salt '*' timezone.get_time_server
```

`salt.modules.mac_timezone.`**`get_using_network_time`**`()`

Display whether network time is on or off

Returns
True if network time is on, False if off

Return type
bool

CLI Example:

```
salt '*' timezone.get_using_network_time
```

`salt.modules.mac_timezone.`**`get_zone`**`()`

Displays the current time zone

Returns
The current time zone

Return type
str

CLI Example:

```
salt '*' timezone.get_zone
```

`salt.modules.mac_timezone.`**`get_zonecode`**`()`

Displays the current time zone abbreviated code

Returns
The current time zone code

Return type
str

CLI Example:

```
salt '*' timezone.get_zonecode
```

`salt.modules.mac_timezone.`**`list_zones`**`()`

Displays a list of available time zones. Use this list when setting a time zone using `timezone.set_zone`

Returns
a list of time zones

Return type
list

CLI Example:

```
salt '*' timezone.list_zones
```

`salt.modules.mac_timezone.`**`set_date`**`(`*date*`)`

Set the current month, day, and year

Parameters

date (*str*) -- The date to set. Valid date formats are:

- %m:%d:%y
- %m:%d:%Y
- %m/%d/%y
- %m/%d/%Y

Returns

True if successful, False if not

Return type

bool

Raises

SaltInvocationError on Invalid Date format

Raises

CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_date 1/13/2016
```

`salt.modules.mac_timezone.`**`set_hwclock`**`(`*clock*`)`

Sets the hardware clock to be either UTC or localtime

CLI Example:

```
salt '*' timezone.set_hwclock UTC
```

`salt.modules.mac_timezone.`**`set_time`**`(`*time*`)`

Sets the current time. Must be in 24 hour format.

Parameters

time (*str*) -- The time to set in 24 hour format. The value must be double quoted. ie: '"17:46"'

Returns

True if successful, False if not

Return type

bool

Raises

SaltInvocationError on Invalid Time format

Raises

CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_time '"17:34"'
```

`salt.modules.mac_timezone.`**`set_time_server`**`(`*time_server='time.apple.com'*`)`

Designates a network time server. Enter the IP address or DNS name for the network time server.

Parameters
`time_server` -- IP or DNS name of the network time server. If nothing is passed the time server will be set to the macOS default of 'time.apple.com'

Type
str

Returns
True if successful, False if not

Return type
bool

Raises
CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_time_server time.acme.com
```

`salt.modules.mac_timezone.`**`set_using_network_time`**`(`*enable*`)`

Set whether network time is on or off.

Parameters
`enable` -- True to enable, False to disable. Can also use 'on' or 'off'

Type
str bool

Returns
True if successful, False if not

Return type
bool

Raises
CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_using_network_time True
```

`salt.modules.mac_timezone.`**`set_zone`**`(`*time_zone*`)`

Set the local time zone. Use `timezone.list_zones` to list valid time_zone arguments

Parameters
`time_zone` (`str`) -- The time zone to apply

Returns
True if successful, False if not

Return type
bool

Raises
SaltInvocationError on Invalid Timezone

Raises
CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_zone America/Denver
```

`salt.modules.mac_timezone.`**`zone_compare`**`(`*time_zone*`)`

Compares the given timezone name with the system timezone name.

Returns
True if they are the same, False if not

Return type
bool

CLI Example:

```
salt '*' timezone.zone_compare America/Boise
```

26.6.106 salt.modules.mac_user

Manage users on Mac OS 10.7+

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to *'user.info' is not available*), see *here*.

`salt.modules.mac_user.`**`add`**`(`*name, uid=None, gid=None, groups=None, home=None, shell=None, fullname=None, createhome=True, **kwargs*`)`

Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

`salt.modules.mac_user.`**`chfullname`**`(`*name, fullname*`)`

Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo 'Foo Bar'
```

`salt.modules.mac_user.`**`chgid`**`(`*name, gid*`)`

Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

`salt.modules.mac_user.`**`chgroups`**`(`*name, groups, append=False*`)`

Change the groups to which the user belongs. Note that the user's primary group does not have to be one of the groups passed, membership in the user's primary group is automatically assumed.

groups
Groups to which the user should belong, can be passed either as a python list or a comma-separated string

append
Instead of removing user from groups not included in the `groups` parameter, just add user to any groups for which they are not members

CLI Example:

```
salt '*' user.chgroups foo wheel,root
```

`salt.modules.mac_user.`**`chhome`**(*name*, *home*, ***kwargs*)

Change the home directory of the user

CLI Example:

```
salt '*' user.chhome foo /Users/foo
```

`salt.modules.mac_user.`**`chshell`**(*name*, *shell*)

Change the default shell of the user

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

`salt.modules.mac_user.`**`chuid`**(*name*, *uid*)

Change the uid for a named user

CLI Example:

```
salt '*' user.chuid foo 4376
```

`salt.modules.mac_user.`**`delete`**(*name*, *remove=False*, *force=False*)

Remove a user from the minion

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

`salt.modules.mac_user.`**`disable_auto_login`**()

New in version 2016.3.0.

Disables auto login on the machine

Returns
`True` if successful, otherwise `False`

Return type
bool

CLI Example:

```
salt '*' user.disable_auto_login
```

`salt.modules.mac_user.`**`enable_auto_login`**(*name*, *password*)

New in version 2016.3.0.

Configures the machine to auto login with the specified user

Parameters

- **`name`** (`str`) -- The user account use for auto login

- **password** (*str*) -- The password to user for auto login

  New in version 2017.7.3.

Returns
True if successful, otherwise False

Return type
bool

CLI Example:

```
salt '*' user.enable_auto_login stevej
```

`salt.modules.mac_user.`**`get_auto_login`**`()`

New in version 2016.3.0.

Gets the current setting for Auto Login

Returns
If enabled, returns the user name, otherwise returns False

Return type
str, bool

CLI Example:

```
salt '*' user.get_auto_login
```

`salt.modules.mac_user.`**`getent`**`(`*refresh=False*`)`

Return the list of all info for all users

CLI Example:

```
salt '*' user.getent
```

`salt.modules.mac_user.`**`info`**`(`*name*`)`

Return user information

CLI Example:

```
salt '*' user.info root
```

`salt.modules.mac_user.`**`list_groups`**`(`*name*`)`

Return a list of groups the named user belongs to.

name

The name of the user for which to list groups. Starting in Salt 2016.11.0, all groups for the user, including groups beginning with an underscore will be listed.

Changed in version 2016.11.0.

CLI Example:

```
salt '*' user.list_groups foo
```

`salt.modules.mac_user.`**`list_users`**`()`

Return a list of all users

CLI Example:

```
salt '*' user.list_users
```

`salt.modules.mac_user.`**`primary_group`**(*name*)

Return the primary group of the named user

New in version 2016.3.0.

CLI Example:

```
salt '*' user.primary_group saltadmin
```

`salt.modules.mac_user.`**`rename`**(*name*, *new_name*)

Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```

26.6.107 salt.modules.mac_xattr

This module allows you to manage extended attributes on files or directories

```
salt '*' xattr.list /path/to/file
```

`salt.modules.mac_xattr.`**`clear`**(*path*)

Causes the all attributes on the file/directory to be removed

Parameters
`path` (*`str`*) -- The file(s) to get attributes from

Returns
True if successful, otherwise False

Raises
CommandExecutionError on file not found or any other unknown error

CLI Example:

```
salt '*' xattr.delete /path/to/file "com.test.attr"
```

`salt.modules.mac_xattr.`**`delete`**(*path*, *attribute*)

Removes the given attribute from the file

Parameters

- **`path`** (*`str`*) -- The file(s) to get attributes from
- **`attribute`** (*`str`*) -- The attribute name to be deleted from the file/directory

Returns
True if successful, otherwise False

Return type
bool

Raises
CommandExecutionError on file not found, attribute not found, and any other unknown error

CLI Example:

```
salt '*' xattr.delete /path/to/file "com.test.attr"
```

`salt.modules.mac_xattr.`**`list_`**(*path*, ***kwargs*)

List all of the extended attributes on the given file/directory

Parameters

- **`path`** (*`str`*) -- The file(s) to get attributes from
- **`hex`** (*`bool`*) -- Return the values with forced hexadecimal values

Returns

A dictionary containing extended attributes and values for the given file

Return type

dict

Raises

CommandExecutionError on file not found or any other unknown error

CLI Example:

```
salt '*' xattr.list /path/to/file
salt '*' xattr.list /path/to/file hex=True
```

`salt.modules.mac_xattr.`**`read`**(*path*, *attribute*, ***kwargs*)

Read the given attributes on the given file/directory

Parameters

- **`path`** (*`str`*) -- The file to get attributes from
- **`attribute`** (*`str`*) -- The attribute to read
- **`hex`** (*`bool`*) -- Return the values with forced hexadecimal values

Returns

A string containing the value of the named attribute

Return type

str

Raises

CommandExecutionError on file not found, attribute not found, and any other unknown error

CLI Example:

```
salt '*' xattr.read /path/to/file com.test.attr
salt '*' xattr.read /path/to/file com.test.attr hex=True
```

`salt.modules.mac_xattr.`**`write`**(*path*, *attribute*, *value*, ***kwargs*)

Causes the given attribute name to be assigned the given value

Parameters

- **`path`** (*`str`*) -- The file(s) to get attributes from
- **`attribute`** (*`str`*) -- The attribute name to be written to the file/directory
- **`value`** (*`str`*) -- The value to assign to the given attribute
- **`hex`** (*`bool`*) -- Set the values with forced hexadecimal values

Returns
True if successful, otherwise False

Return type
bool

Raises
CommandExecutionError on file not found or any other unknown error

CLI Example:

```
salt '*' xattr.write /path/to/file "com.test.attr" "value"
```

26.6.108 salt.modules.macdefaults

Set defaults settings on macOS.

This module uses defaults cli under the hood to import and export defaults on macOS.

However, it uses the plistlib package to handle the conversion between the defaults output and Python dictionaries. It is also used to create the plist files to import the defaults.

Read plistlib documentation for more information on how the conversion is done: https://docs.python.org/3/library/plistlib.html

`salt.modules.macdefaults.`**`cast_value_to_vtype`**`(`*value*, *vtype*`)`

Convert the value to the specified vtype. If the value cannot be converted, a ValueError is raised.

CLI Example:

```
salt '*' macdefaults.cast_value_to_vtype "1.35" "float"

salt '*' macdefaults.cast_value_to_vtype "2024-06-23T09:33:44Z" "date"

salt '*' macdefaults.cast_value_to_vtype "737720347.089987" "date"
```

value
The value to be converted

vtype
The type to convert the value to. Valid types are string, int[eger], float, bool[ean], date, data, array, array-add, dict, dict-add

Raises
`ValueError` -- When the value cannot be converted to the specified type

Returns
The converted value

New in version 3008.0.

`salt.modules.macdefaults.`**`delete`**`(`*domain*, *key*, *user=None*, *key_separator=None*`)`

Delete a default from the system

CLI Example:

```
salt '*' macdefaults.delete com.apple.CrashReporter DialogType

salt '*' macdefaults.delete NSGlobalDomain ApplePersistence

salt '*' macdefaults.delete NSGlobalDomain key.with.dots key_separator='.'
```

domain
The name of the domain to delete from

key
The key of the given domain to delete. It can be a nested key separated by *key_separator*.

key_separator
The separator to use when splitting the key into a list of keys. If None, the key will not be split (Default).

New in version 3008.0.

user
The user to delete the defaults with

`salt.modules.macdefaults.`**`read`**(*domain*, *key*, *user=None*, *key_separator=None*)

Read a default from the system

CLI Example:

```
salt '*' macdefaults.read NSGlobalDomain ApplePersistence

salt '*' macdefaults.read NSGlobalDomain key.with.dots-subKey key_
↪separator="-"

salt '*' macdefaults.read com.apple.Dock persistent-apps.1.title-data.
↪file-label key_separator='.'
```

domain
The name of the domain to read from

key
The key of the given domain to read from. It can be a nested key/index separated by *key_separator*.

key_separator
The separator to use when splitting the key into a list of keys. If None, the key will not be split (Default).

New in version 3008.0.

user
The user to read the defaults from

Returns
The current value for the given key, or None if the key does not exist.

`salt.modules.macdefaults.`**`write`**(*domain*, *key*, *value*, *vtype=None*, *user=None*, *key_separator=None*, *dict_merge=False*, *array_add=False*, *type=None*)

Write a default to the system

CLI Example:

```
salt '*' macdefaults.write com.apple.Finder⊠
↪DownloadsFolderListViewSettingsVersion 1

salt '*' macdefaults.write com.apple.Finder ComputerViewSettings.
↪CustomViewStyle "icnv" key_separator='.'

salt '*' macdefaults.write com.apple.Dock lastShowIndicatorTime 737720347.
↪089987 vtype=date

salt '*' macdefaults.write NSGlobalDomain com.apple.sound.beep.sound "/
↪System/Library/Sounds/Blow.aiff"
```

domain
The name of the domain to write to

key
The key of the given domain to write to. It can be a nested key/index separated by *key_separator*.

key_separator
The separator to use when splitting the key into a list of keys. If None, the key will not be split (Default).

New in version 3008.0.

value
The value to write to the given key. Dates should be in the format 'YYYY-MM-DDTHH:MM:SSZ'

vtype
The type of value to be written.

Valid types are string, int[eger], float, bool[ean], date and data.

dict and array are also valid types but are only used for validation.

dict-add and array-add are supported too. They will behave as their counterparts dict and array but will set their corresponding sibling options dict_merge and array_add to True.

This parameter is optional. It will be used to cast the values to the specified type before writing them to the system. If not provided, the type will be inferred from the value.

Useful when writing values such as dates or binary data.

type
Deprecated! Use vtype instead type collides with Python's built-in type() function This parameter will be removed in 3009

user
The user to write the defaults to

dict_merge
Merge the value into the existing dictionary. If current value is not a dictionary this option will be ignored. This option will be set to True if vtype is dict-add.

New in version 3008.0.

array_add
Append the value to the array. If current value is not a list this option will be ignored. This option will be set to True if vtype is array-add.

New in version 3008.0.

Raises

- **`KeyError`** -- When the key is not found in the domain
- **`IndexError`** -- When the key is not a valid array index

26.6.109 salt.modules.macpackage

Install pkg, dmg and .app applications on macOS minions.

`salt.modules.macpackage.`**`get_mpkg_ids`**`(`*mpkg*`)`

Attempt to get the package IDs from a mounted .mpkg file

Parameters

`mpkg` (*`str`*) -- The location of the mounted mpkg file

Returns

List of package IDs

Return type

list

CLI Example:

```
salt '*' macpackage.get_mpkg_ids /dev/disk2
```

`salt.modules.macpackage.`**`get_pkg_id`**`(`*pkg*`)`

Attempt to get the package ID from a .pkg file

Parameters

`pkg` (*`str`*) -- The location of the pkg file

Returns

List of all of the package IDs

Return type

list

CLI Example:

```
salt '*' macpackage.get_pkg_id /tmp/test.pkg
```

`salt.modules.macpackage.`**`install`**`(`*pkg, target='LocalSystem', store=False, allow_untrusted=False*`)`

Install a pkg file

Parameters

- **`pkg`** (*`str`*) -- The package to install
- **`target`** (*`str`*) -- The target in which to install the package to
- **`store`** (*`bool`*) -- Should the package be installed as if it was from the store?
- **`allow_untrusted`** (*`bool`*) -- Allow the installation of untrusted packages?

Returns

A dictionary containing the results of the installation

Return type

dict

CLI Example:

```
salt '*' macpackage.install test.pkg
```

`salt.modules.macpackage.`**`install_app`**`(`*app*, *target='/Applications/'*`)`

Install an app file by moving it into the specified Applications directory

Parameters

- **app** (*str*) -- The location of the .app file
- **target** (*str*) -- The target in which to install the package to Default is "/Applications/"

Returns

The results of the rsync command

Return type

str

CLI Example:

```
salt '*' macpackage.install_app /tmp/tmp.app /Applications/
```

`salt.modules.macpackage.`**`installed_pkgs`**`()`

Return the list of installed packages on the machine

Returns

List of installed packages

Return type

list

CLI Example:

```
salt '*' macpackage.installed_pkgs
```

`salt.modules.macpackage.`**`mount`**`(`*dmg*`)`

Attempt to mount a dmg file to a temporary location and return the location of the pkg file inside

Parameters

dmg (*str*) -- The location of the dmg file to mount

Returns

Tuple containing the results of the command along with the mount
point

Return type

tuple

CLI Example:

```
salt '*' macpackage.mount /tmp/software.dmg
```

`salt.modules.macpackage.`**`uninstall_app`**`(`*app*`)`

Uninstall an app file by removing it from the Applications directory

Parameters

app (*str*) -- The location of the .app file

Returns

True if successful, otherwise False

Return type
bool

CLI Example:

```
salt '*' macpackage.uninstall_app /Applications/app.app
```

`salt.modules.macpackage.`**`unmount`**`(`*mountpoint*`)`

Attempt to unmount a dmg file from a temporary location

Parameters
`mountpoint` (*`str`*) -- The location of the mount point

Returns
The results of the hdutil detach command

Return type
str

CLI Example:

```
salt '*' macpackage.unmount /dev/disk2
```

26.6.110 salt.modules.match

The match module allows for match routines to be run and determine target specs

`salt.modules.match.`**`compound`**`(`*tgt, minion_id=None*`)`

Return True if the minion ID matches the given compound target

minion_id
Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.compound 'L@cheese,foo and *'
```

`salt.modules.match.`**`data`**`(`*tgt*`)`

Return True if the minion matches the given data target

CLI Example:

```
salt '*' match.data 'spam:eggs'
```

`salt.modules.match.`**`filter_by`**`(`*lookup, tgt_type='compound', minion_id=None, merge=None, merge_lists=False, default='default'*`)`

Return the first match in a dictionary of target patterns

New in version 2014.7.0.

CLI Example:

```
salt '*' match.filter_by '{foo*: Foo!, bar*: Bar!}' minion_id=bar03
```

Pillar Example:

```
# Filter the data for the current minion into a variable:
{% set roles = salt['match.filter_by']({
    'web*': ['app', 'caching'],
    'db*': ['db'],
}, minion_id=grains['id'], default='web*') %}

# Make the filtered data available to Pillar:
roles: {{ roles | yaml() }}
```

`salt.modules.match.`**`glob`**(*tgt*, *minion_id=None*)

Return True if the minion ID matches the given glob target

minion_id

Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.glob '*'
```

`salt.modules.match.`**`grain`**(*tgt*, *delimiter=':'*)

Return True if the minion matches the given grain target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.grain 'os:Ubuntu'
salt '*' match.grain 'ipv6|2001:db8::ff00:42:8329' delimiter='|'
```

delimiter

Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

delim

Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

`salt.modules.match.`**`grain_pcre`**(*tgt*, *delimiter=':'*)

Return True if the minion matches the given grain_pcre target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.grain_pcre 'os:Fedo.*'
salt '*' match.grain_pcre 'ipv6|2001:.*' delimiter='|'
```

delimiter

Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

delim

Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

`salt.modules.match.`**`ifelse`**(**args, tgt_type='compound', minion_id=None, merge=None, merge_lists=False*)

New in version 3006.0.

Evaluate each pair of arguments up to the last one as a (matcher, value) tuple, returning `value` if matched. If none match, returns the last argument.

The `ifelse` function is like a multi-level if-else statement. It was inspired by CFEngine's `ifelse` function which in turn was inspired by Oracle's `DECODE` function. It must have an odd number of arguments (from 1 to N). The last argument is the default value, like the `else` clause in standard programming languages. Every pair of arguments before the last one are evaluated as a pair. If the first one evaluates true then the second one is returned, as if you had used the first one in a compound match expression. Boolean values can also be used as the first item in a pair, as it will be translated to a match that will always match ("*") or never match ("SALT_IFELSE_MATCH_NOTHING") a target system.

This is essentially another way to express the `filter_by` functionality in way that's familiar to CFEngine or Oracle users. Consider using `filter_by` unless this function fits your workflow.

CLI Example:

```
salt '*' match.ifelse 'foo*' 'Foo!' 'bar*' 'Bar!' minion_id=bar03
```

`salt.modules.match.`**`ipcidr`**(*tgt*)

Return True if the minion matches the given ipcidr target

CLI Example:

```
salt '*' match.ipcidr '192.168.44.0/24'
```

delimiter Pillar Example:

```
'172.16.0.0/12':
  - match: ipcidr
  - nodeclass: internal
```

`salt.modules.match.`**`list_`**(*tgt, minion_id=None*)

Return True if the minion ID matches the given list target

minion_id

Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.list 'server1,server2'
```

`salt.modules.match.`**`pcre`**(*tgt, minion_id=None*)

Return True if the minion ID matches the given pcre target

minion_id

Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.pcre '.*'
```

`salt.modules.match.`**`pillar`**(*tgt*, *delimiter=':'*)

Return True if the minion matches the given pillar target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.pillar 'cheese:foo'
salt '*' match.pillar 'clone_url|https://github.com/saltstack/salt.git' delimiter='|'
```

delimiter

Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

delim

Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

`salt.modules.match.`**`pillar_pcre`**(*tgt*, *delimiter=':'*)

Return True if the minion matches the given pillar_pcre target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.pillar_pcre 'cheese:(swiss|american)'
salt '*' match.pillar_pcre 'clone_url|https://github\.com/.*\.git' delimiter='|'
```

delimiter

Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

delim

Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

`salt.modules.match.`**`search_by`**(*lookup*, *tgt_type='compound'*, *minion_id=None*)

Search a dictionary of target strings for matching targets

This is the inverse of *`match.filter_by`* and allows matching values instead of matching keys. A minion can be matched by multiple entries.

New in version 2017.7.0.

CLI Example:

```
salt '*' match.search_by '{web: [node1, node2], db: [node2, node]}'
```

Pillar Example:

```
{% set roles = salt['match.search_by']({
    'web': ['G@os_family:Debian not nodeX'],
    'db': ['L@node2,node3 and G@datacenter:west'],
    'caching': ['node3', 'node4'],
}) %}

# Make the filtered data available to Pillar:
roles: {{ roles | yaml() }}
```

26.6.111 salt.modules.mdadm_raid

Salt module to manage RAID arrays with mdadm

`salt.modules.mdadm_raid.`**`add`**`(`*name*, *device*`)`

Add new device to RAID array.

CLI Example:

```
salt '*' raid.add /dev/md0 /dev/sda1
```

`salt.modules.mdadm_raid.`**`assemble`**`(`*name*, *devices*, *test_mode=False*, ***kwargs*`)`

Assemble a RAID device.

CLI Examples:

```
salt '*' raid.assemble /dev/md0 ['/dev/xvdd', '/dev/xvde']
```

Note: Adding `test_mode=True` as an argument will print out the mdadm command that would have been run.

name
The name of the array to assemble.

devices
The list of devices comprising the array to assemble.

kwargs
Optional arguments to be passed to mdadm.

returns

test_mode=True:
Prints out the full command.

test_mode=False (Default):
Executes command on the host(s) and prints out the mdadm output.

For more info, read the `mdadm` manpage.

`salt.modules.mdadm_raid.`**`create`**`(`*name*, *level*, *devices*, *metadata='default'*, *test_mode=False*, ***kwargs*`)`

Create a RAID device.

Changed in version 2014.7.0.

Warning: Use with CAUTION, as this function can be very destructive if not used properly!

CLI Examples:

```
salt '*' raid.create /dev/md0 level=1 chunk=256 devices="['/dev/xvdd', '/
↪dev/xvde']" test_mode=True
```

Note: Adding `test_mode=True` as an argument will print out the mdadm command that would have been run.

name
: The name of the array to create.

level
: The RAID level to use when creating the raid.

devices
: A list of devices used to build the array.

metadata
: Version of metadata to use when creating the array.

kwargs
: Optional arguments to be passed to mdadm.

returns

- **test_mode=True**:
  Prints out the full command.
- **test_mode=False (Default)**:
  Executes command on remote the host(s) and Prints out the mdadm output.

Note: It takes time to create a RAID array. You can check the progress in "resync_status:" field of the results from the following command:

```
salt '*' raid.detail /dev/md0
```

For more info, read the `mdadm(8)` manpage

`salt.modules.mdadm_raid.`**`destroy`**`(`*device*`)`

Destroy a RAID device.

WARNING This will zero the superblock of all members of the RAID array..

CLI Example:

```
salt '*' raid.destroy /dev/md0
```

`salt.modules.mdadm_raid.`**`detail`**`(`*device='/dev/md0'*`)`

Show detail for a specified RAID device

CLI Example:

```
salt '*' raid.detail '/dev/md0'
```

`salt.modules.mdadm_raid.`**`examine`**`(`*device, quiet=False*`)`

Show detail for a specified RAID component device

device
Device to examine, that is part of the RAID

quiet
If the device is not part of the RAID, do not show any error

CLI Example:

```
salt '*' raid.examine '/dev/sda1'
```

`salt.modules.mdadm_raid.`**`list_`**`()`

List the RAID devices.

CLI Example:

```
salt '*' raid.list
```

`salt.modules.mdadm_raid.`**`save_config`**`()`

Save RAID configuration to config file.

Same as: mdadm --detail --scan >> /etc/mdadm/mdadm.conf

Fixes this issue with Ubuntu REF: http://askubuntu.com/questions/209702/why-is-my-raid-dev-md1-showing-up-as-dev-md126-is-mdadm-conf-being-ignored

CLI Example:

```
salt '*' raid.save_config
```

`salt.modules.mdadm_raid.`**`stop`**`()`

Shut down all arrays that can be shut down (i.e. are not currently in use).

CLI Example:

```
salt '*' raid.stop
```

26.6.112 salt.modules.mine

The function cache system allows for data to be stored on the master so it can be easily read by other minions

`salt.modules.mine.`**`delete`**`(`*fun*`)`

Remove specific function contents of minion.

Parameters
fun (*str*) -- The name of the function.

Return type
bool

Returns
True on success.

CLI Example:

```
salt '*' mine.delete 'network.interfaces'
```

`salt.modules.mine.`**`flush`**`()`

Remove all mine contents of minion.

Return type
bool

Returns
True on success

CLI Example:

```
salt '*' mine.flush
```

`salt.modules.mine.`**`get`**`(`*tgt, fun, tgt_type='glob', exclude_minion=False*`)`

Get data from the mine.

Parameters

- **`tgt`** (*`str`*) -- Target whose mine data to get.
- **`fun`** (*`str or list`*) -- Function to get the mine data of. You can specify multiple functions to retrieve using either a list or a comma-separated string of functions.
- **`tgt_type`** (*`str`*) -- Default `glob`. Target type to use with `tgt`. See *Targeting Minions* for more information. Note that all pillar matches, whether using the compound matching system or the pillar matching system, will be exact matches, with globbing disabled.
- **`exclude_minion`** (*`bool`*) -- Excludes the current minion from the result set.

CLI Example:

```
salt '*' mine.get '*' network.interfaces
salt '*' mine.get 'os:Fedora' network.interfaces grain
salt '*' mine.get 'G@os:Fedora and S@192.168.5.0/24' network.ipaddrs⊠
↪compound
```

See also:

Retrieving Mine data from Pillar and Orchestrate

This execution module is intended to be executed on minions. Master-side operations such as Pillar or Orchestrate that require Mine data should use the *`Mine Runner module`* instead; it can be invoked from a Pillar SLS file using the *`saltutil.runner`* module. For example:

```
{% set minion_ips = salt['saltutil.runner']('mine.get',
    tgt='*',
    fun='network.ip_addrs',
    tgt_type='glob') %}
```

`salt.modules.mine.`**`get_docker`**`(`*interfaces=None, cidrs=None, with_container_id=False*`)`

Changed in version 2017.7.8,2018.3.3: When *`docker.update_mine`* is set to `False` for a given minion, no mine data will be populated for that minion, and thus none will be returned for it.

Changed in version 2019.2.0: *`docker.update_mine`* now defaults to `False`

Get all mine data for `docker.ps` and run an aggregation routine. The `interfaces` parameter allows for specifying the network interfaces from which to select IP addresses. The `cidrs` parameter allows for specifying a list of subnets which the IP address must match.

with_container_id
Boolean, to expose container_id in the list of results

New in version 2015.8.2.

CLI Example:

```
salt '*' mine.get_docker
salt '*' mine.get_docker interfaces='eth0'
salt '*' mine.get_docker interfaces='["eth0", "eth1"]'
salt '*' mine.get_docker cidrs='107.170.147.0/24'
salt '*' mine.get_docker cidrs='["107.170.147.0/24", "172.17.42.0/24"]'
salt '*' mine.get_docker interfaces='["eth0", "eth1"]' cidrs='["107.170.
↪147.0/24", "172.17.42.0/24"]'
```

`salt.modules.mine.`**`send`**(*name*, **args*, ***kwargs*)

Send a specific function and its result to the salt mine. This gets stored in either the local cache, or the salt master's cache.

Parameters
`name` (*`str`*) -- Name of the function to add to the mine.

The following pameters are extracted from kwargs if present:

Parameters

- **`mine_function`** (*`str`*) -- The name of the execution_module.function to run and whose value will be stored in the salt mine. Defaults to `name`.
- **`allow_tgt`** (*`str`*) -- Targeting specification for ACL. Specifies which minions are allowed to access this function. Please note both your master and minion need to be on, at least, version 3000 for this to work properly.
- **`allow_tgt_type`** (*`str`*) -- Type of the targeting specification. This value will be ignored if `allow_tgt` is not specified. Please note both your master and minion need to be on, at least, version 3000 for this to work properly.

Remaining args and kwargs will be passed on to the function to run.

Return type
bool

Returns
Whether executing the function and storing the information was successful.

Changed in version 3000: Added `allow_tgt`- and `allow_tgt_type`-parameters to specify which minions are allowed to access this function. See *Targeting Minions* for more information about targeting.

CLI Example:

```
salt '*' mine.send network.ip_addrs interface=eth0
salt '*' mine.send eth0_ip_addrs mine_function=network.ip_addrs␣
↪interface=eth0
salt '*' mine.send eth0_ip_addrs mine_function=network.ip_addrs␣
↪interface=eth0 allow_tgt='G@grain:value' allow_tgt_type=compound
```

`salt.modules.mine.`**`update`**(*clear=False*, *mine_functions=None*)

Call the configured functions and send the data back up to the master. The functions to be called are merged from the master config, pillar and minion config under the option *mine_functions*:

```
mine_functions:
  network.ip_addrs:
    - eth0
  disk.usage: []
```

This function accepts the following arguments:

Parameters

- **`clear`** (*`bool`*) -- Default: `False` Specifies whether updating will clear the existing values (`True`), or whether it will update them (`False`).
- **`mine_functions`** (*`dict`*) -- Update (or clear, see `clear`) the mine data on these functions only. This will need to have the structure as defined on https://docs.saltproject.io/en/latest/topics/mine/index.html#mine-functions

  This feature can be used when updating the mine for functions that require a refresh at different intervals than the rest of the functions specified under *mine_functions* in the minion/master config or pillar. A potential use would be together with the *scheduler*, for example:

  ```
  schedule:
    lldp_mine_update:
      function: mine.update
      kwargs:
          mine_functions:
            net.lldp: []
      hours: 12
  ```

  In the example above, the mine for *net.lldp* would be refreshed every 12 hours, while *network.ip_addrs* would continue to be updated as specified in *mine_interval*.

The function cache will be populated with information from executing these functions

CLI Example:

```
salt '*' mine.update
```

`salt.modules.mine.`**`valid`**()

List valid entries in mine configuration.

CLI Example:

```
salt '*' mine.valid
```

26.6.113 salt.modules.minion

Module to provide information about minions

`salt.modules.minion.`**`kill`**`(`*timeout=15*`)`

Kill the salt minion.

timeout
int seconds to wait for the minion to die.

If you have a monitor that restarts `salt-minion` when it dies then this is a great way to restart after a minion upgrade.

CLI Example:

```
salt minion[12] minion.kill

minion1:
    ----------
    killed:
        7874
    retcode:
        0
minion2:
    ----------
    killed:
        29071
    retcode:
        0
```

The result of the salt command shows the process ID of the minions and the results of a kill signal to the minion in as the `retcode` value: `0` is success, anything else is a failure.

`salt.modules.minion.`**`list_`**`()`

Return a list of accepted, denied, unaccepted and rejected keys. This is the same output as *salt-key -L*

CLI Example:

```
salt 'master' minion.list
```

`salt.modules.minion.`**`restart`**`()`

Kill and restart the salt minion.

The configuration key `minion_restart_command` is an argv list for the command to restart the minion. If `minion_restart_command` is not specified or empty then the `argv` of the current process will be used.

if the configuration value `minion_restart_command` is not set and the `-d` (daemonize) argument is missing from `argv` then the minion *will* be killed but will *not* be restarted and will require the parent process to perform the restart. This behavior is intended for managed salt minion processes.

CLI Example:

```
salt minion[12] minion.restart

minion1:
    ----------
    comment:
        - Restart using process argv:
        -     /home/omniture/install/bin/salt-minion
        -     -d
        -     -c
        -     /home/omniture/install/etc/salt
    killed:
        10070
    restart:
        ----------
        stderr:
        stdout:
    retcode:
        0
minion2:
    ----------
    comment:
        - Using configuration minion_restart_command:
        -     /home/omniture/install/bin/salt-minion
        -     --not-an-option
        -     -d
        -     -c
        -     /home/omniture/install/etc/salt
        - Restart failed
    killed:
        10896
    restart:
        ----------
        stderr:
            Usage: salt-minion

            salt-minion: error: no such option: --not-an-option
        stdout:
    retcode:
        64
```

The result of the command shows the process ID of `minion1` that is shutdown (killed) and the results of the restart. If there is a failure in the restart it will be reflected in a non-zero `retcode` and possibly output in the `stderr` and/or `stdout` values along with addition information in the `comment` field as is demonstrated with `minion2`.

26.6.114 salt.modules.mod_random

Provides access to randomness generators.

New in version 2014.7.0.

`salt.modules.mod_random.`**`get_str`**(*length=20, chars=None, lowercase=True, uppercase=True, digits=True, punctuation=True, whitespace=False, printable=False*)

New in version 2014.7.0.

Changed in version 3004: Changed the default character set used to include symbols and implemented arguments to control the used character set.

Returns a random string of the specified length.

length
[20] Any valid number of bytes.

chars
[None] New in version 3004.

String with any character that should be used to generate random string.

This argument supersedes all other character controlling arguments.

lowercase
[True] New in version 3004.

Use lowercase letters in generated random string. (see `string.ascii_lowercase`)

This argument is superseded by chars.

uppercase
[True] New in version 3004.

Use uppercase letters in generated random string. (see `string.ascii_uppercase`)

This argument is superseded by chars.

digits
[True] New in version 3004.

Use digits in generated random string. (see `string.digits`)

This argument is superseded by chars.

printable
[False] New in version 3004.

Use printable characters in generated random string and includes lowercase, uppercase, digits, punctuation and whitespace. (see `string.printable`)

It is disabled by default as includes whitespace characters which some systems do not handle well in passwords. This argument also supersedes all other classes because it includes them.

This argument is superseded by chars.

punctuation
[True] New in version 3004.

Use punctuation characters in generated random string. (see `string.punctuation`)

This argument is superseded by chars.

whitespace
[False] New in version 3004.

Use whitespace characters in generated random string. (see `string.whitespace`)

It is disabled by default as some systems do not handle whitespace characters in passwords well.

This argument is superseded by chars.

CLI Example:

```
salt '*' random.get_str 128
salt '*' random.get_str 128 chars='abc123.!()'
salt '*' random.get_str 128 lowercase=False whitespace=True
```

`salt.modules.mod_random.`**`hash`**(*value*, *algorithm='sha512'*)

New in version 2014.7.0.

Encodes a value with the specified encoder.

value
The value to be hashed.

algorithm
[sha512] The algorithm to use. May be any valid algorithm supported by hashlib.

CLI Example:

```
salt '*' random.hash 'I am a string' md5
```

`salt.modules.mod_random.`**`rand_int`**(*start=1*, *end=10*, *seed=None*)

Returns a random integer number between the start and end number.

New in version 2015.5.3.

start
[1] Any valid integer number

end
[10] Any valid integer number

seed :
Optional hashable object

Changed in version 2019.2.0: Added seed argument. Will return the same result when run with the same seed.

CLI Example:

```
salt '*' random.rand_int 1 10
```

`salt.modules.mod_random.`**`sample`**(*value*, *size*, *seed=None*)

Return a given sample size from a list. By default, the random number generator uses the current system time unless given a seed value.

New in version 3005.

value
A list to e used as input.

size
The sample size to return.

seed
Any value which will be hashed as a seed for random.

CLI Example:

```
salt '*' random.sample '["one", "two"]' 1 seed="something"
```

`salt.modules.mod_random.`**`seed`**(*range=10*, *hash=None*)

Returns a random number within a range. Optional hash argument can be any hashable object. If hash is omitted or None, the id of the minion is used.

New in version 2015.8.0.

hash: None
Any hashable object.

range: 10
Any valid integer number

CLI Example:

```
salt '*' random.seed 10 hash=None
```

`salt.modules.mod_random.`**`shadow_hash`**(*crypt_salt=None*, *password=None*, *algorithm='sha512'*)

Generates a salted hash suitable for /etc/shadow.

crypt_salt
[None] Salt to be used in the generation of the hash. If one is not provided, a random salt will be generated.

password
[None] Value to be salted and hashed. If one is not provided, a random password will be generated.

algorithm
[sha512] Hash algorithm to use.

CLI Example:

```
salt '*' random.shadow_hash 'My5alT' 'MyP@asswd' md5
```

`salt.modules.mod_random.`**`shuffle`**(*value*, *seed=None*)

Return a shuffled copy of an input list. By default, the random number generator uses the current system time unless given a seed value.

New in version 3005.

value
A list to be used as input.

seed
Any value which will be hashed as a seed for random.

CLI Example:

```
salt '*' random.shuffle '["one", "two"]' seed="something"
```

`salt.modules.mod_random.`**`str_encode`**(*value*, *encoder='base64'*)

New in version 2014.7.0.

value
The value to be encoded.

encoder
[base64] The encoder to use on the subsequent string.

CLI Example:

```
salt '*' random.str_encode 'I am a new string' base64
```

26.6.115 salt.modules.mount

Salt module to manage Unix mounts and the fstab file

`salt.modules.mount.`**`active`**`(`*extended=False*`)`

List the active mounts.

CLI Example:

```
salt '*' mount.active
```

`salt.modules.mount.`**`automaster`**`(`*config='/etc/auto_salt'*`)`

List the contents of the auto master

CLI Example:

```
salt '*' mount.automaster
```

`salt.modules.mount.`**`delete_mount_cache`**`(`*real_name*`)`

New in version 2018.3.0.

Provide information if the path is mounted

CLI Example:

```
salt '*' mount.delete_mount_cache /mnt/share
```

`salt.modules.mount.`**`filesystems`**`(`*config='/etc/filesystems'*`)`

New in version 2018.3.3.

List the contents of the filesystems

CLI Example:

```
salt '*' mount.filesystems
```

`salt.modules.mount.`**`fstab`**`(`*config='/etc/fstab'*`)`

Changed in version 2016.3.2.

List the contents of the fstab

CLI Example:

```
salt '*' mount.fstab
```

`salt.modules.mount.`**`get_device_from_path`**`(`*path*`)`

Return the underlying device for a specified path.

New in version 3006.0.

path
The path for the function to evaluate.

CLI Example:

```
salt '*' mount.get_device_from_path /
```

`salt.modules.mount.`**`get_mount_from_path`**`(`*path*`)`

Return the mount providing a specified path.

New in version 3006.0.

path
The path for the function to evaluate.

CLI Example:

```
salt '*' mount.get_mount_from_path /opt/some/nested/path
```

`salt.modules.mount.`**`is_fuse_exec`**`(`*cmd*`)`

Returns true if the command passed is a fuse mountable application.

CLI Example:

```
salt '*' mount.is_fuse_exec sshfs
```

`salt.modules.mount.`**`is_mounted`**`(`*name*`)`

New in version 2014.7.0.

Provide information if the path is mounted

CLI Example:

```
salt '*' mount.is_mounted /mnt/share
```

`salt.modules.mount.`**`mount`**`(`*name, device=False, mkmnt=False, fstype='', opts='defaults', user=None, util='mount'*`)`

Mount a device

CLI Example:

```
salt '*' mount.mount /mnt/foo /dev/sdz1 True
```

`salt.modules.mount.`**`read_mount_cache`**`(`*name*`)`

New in version 2018.3.0.

Provide information if the path is mounted

CLI Example:

```
salt '*' mount.read_mount_cache /mnt/share
```

`salt.modules.mount.`**`remount`**`(`*name, device, mkmnt=False, fstype='', opts='defaults', user=None*`)`

Attempt to remount a device, if the device is not already mounted, mount is called

CLI Example:

```
salt '*' mount.remount /mnt/foo /dev/sdz1 True
```

`salt.modules.mount.`**`rm_automaster`**`(`*name, device, config='/etc/auto_salt'*`)`

Remove the mount point from the auto_master

CLI Example:

```
salt '*' mount.rm_automaster /mnt/foo /dev/sdg
```

`salt.modules.mount.`**`rm_filesystems`**`(`*name, device, config='/etc/filesystems'*`)`

New in version 2018.3.3.

Remove the mount point from the filesystems

CLI Example:

```
salt '*' mount.rm_filesystems /mnt/foo /dev/sdg
```

`salt.modules.mount.`**`rm_fstab`**`(`*name, device, config='/etc/fstab'*`)`

Changed in version 2016.3.2.

Remove the mount point from the fstab

CLI Example:

```
salt '*' mount.rm_fstab /mnt/foo /dev/sdg
```

`salt.modules.mount.`**`rm_vfstab`**`(`*name, device, config='/etc/vfstab'*`)`

New in version 2016.3.2.

Remove the mount point from the vfstab

CLI Example:

```
salt '*' mount.rm_vfstab /mnt/foo /device/c0t0d0p0
```

`salt.modules.mount.`**`set_automaster`**`(`*name, device, fstype, opts='', config='/etc/auto_salt', test=False, not_change=False, **kwargs*`)`

Verify that this mount is represented in the auto_salt, change the mount to match the data passed, or add the mount if it is not present.

CLI Example:

```
salt '*' mount.set_automaster /mnt/foo /dev/sdz1 ext4
```

`salt.modules.mount.`**`set_filesystems`**`(`*name, device, vfstype, opts='-', mount='true', config='/etc/filesystems', test=False, match_on='auto', not_change=False, **kwargs*`)`

New in version 2018.3.3.

Verify that this mount is represented in the filesystems, change the mount to match the data passed, or add the mount if it is not present on AIX

If the entry is found via *match_on* and *not_change* is True, the current line will be preserved.

> Provide information if the path is mounted
>
> **Parameters**
>
> - **`name`** -- The name of the mount point where the device is mounted.
> - **`device`** -- The device that is being mounted.

- **vfstype** -- The file system that is used (AIX has two fstypes, fstype and vfstype - similar to Linux fstype)
- **opts** -- Additional options used when mounting the device.
- **mount** -- Mount if not mounted, default True.
- **config** -- Configuration file, default /etc/filesystems.
- **match** -- File systems type to match on, default auto

CLI Example:

```
salt '*' mount.set_filesystems /mnt/foo /dev/sdz1 jfs2
```

`salt.modules.mount.`**`set_fstab`**(*name*, *device*, *fstype*, *opts='defaults'*, *dump=0*, *pass_num=0*, *config='/etc/fstab'*, *test=False*, *match_on='auto'*, *not_change=False*, ***kwargs*)

Verify that this mount is represented in the fstab, change the mount to match the data passed, or add the mount if it is not present.

If the entry is found via *match_on* and *not_change* is True, the current line will be preserved.

CLI Example:

```
salt '*' mount.set_fstab /mnt/foo /dev/sdz1 ext4
```

`salt.modules.mount.`**`set_vfstab`**(*name*, *device*, *fstype*, *opts='-'*, *device_fsck='-'*, *pass_fsck='-'*, *mount_at_boot='yes'*, *config='/etc/vfstab'*, *test=False*, *match_on='auto'*, *not_change=False*, ***kwargs*)

New in version 2016.3.2.

Verify that this mount is represented in the fstab, change the mount to match the data passed, or add the mount if it is not present.

If the entry is found via *match_on* and *not_change* is True, the current line will be preserved.

CLI Example:

```
salt '*' mount.set_vfstab /mnt/foo /device/c0t0d0p0 ufs
```

`salt.modules.mount.`**`swapoff`**(*name*)

Deactivate a named swap mount

Changed in version 2016.3.2.

CLI Example:

```
salt '*' mount.swapoff /root/swapfile
```

`salt.modules.mount.`**`swapon`**(*name*, *priority=None*)

Activate a swap disk

Changed in version 2016.3.2.

CLI Example:

```
salt '*' mount.swapon /root/swapfile
```

`salt.modules.mount.`**`swaps`**`()`

Return a dict containing information on active swap

Changed in version 2016.3.2.

CLI Example:

```
salt '*' mount.swaps
```

`salt.modules.mount.`**`umount`**`(`*name*, *device=None*, *user=None*, *util='mount'*, *lazy=False*`)`

Attempt to unmount a device by specifying the directory it is mounted on

CLI Example:

```
salt '*' mount.umount /mnt/foo
```

New in version 2015.5.0.

```
salt '*' mount.umount /mnt/foo /dev/xvdc1
```

`salt.modules.mount.`**`vfstab`**`(`*config='/etc/vfstab'*`)`

New in version 2016.3.2.

List the contents of the vfstab

CLI Example:

```
salt '*' mount.vfstab
```

`salt.modules.mount.`**`write_mount_cache`**`(`*real_name*, *device*, *mkmnt*, *fstype*, *mount_opts*`)`

New in version 2018.3.0.

Provide information if the path is mounted

Parameters

- **`real_name`** -- The real name of the mount point where the device is mounted.
- **`device`** -- The device that is being mounted.
- **`mkmnt`** -- Whether or not the mount point should be created.
- **`fstype`** -- The file system that is used.
- **`mount_opts`** -- Additional options used when mounting the device.

Returns

Boolean if message was sent successfully.

CLI Example:

```
salt '*' mount.write_mount_cache /mnt/share /dev/sda1 False ext4 defaults,
↪nosuid
```

26.6.116 salt.modules.mysql

Module to provide MySQL compatibility to salt.

depends

- Python module: MySQLdb, mysqlclient, or PyMYSQL

configuration
In order to connect to MySQL, certain configuration is required in either the relevant minion config (/etc/salt/minion), or pillar.

Some sample configs might look like:

```
mysql.host: 'localhost'
mysql.port: 3306
mysql.user: 'root'
mysql.pass: ''
mysql.db: 'mysql'
mysql.unix_socket: '/tmp/mysql.sock'
mysql.charset: 'utf8'
```

You can also use a defaults file:

```
mysql.default_file: '/etc/mysql/debian.cnf'
```

Changed in version 2014.1.0: 'charset' connection argument added. This is a MySQL charset, not a python one.

Changed in version 0.16.2: Connection arguments from the minion config file can be overridden on the CLI by using the arguments defined `here`. Additionally, it is now possible to setup a user with no password.

`salt.modules.mysql.`**`alter_db`**`(`*name*, *character_set=None*, *collate=None*, ***connection_args*`)`

Modify database using `ALTER DATABASE %(dbname)s CHARACTER SET %(charset)s COLLATE %(collation)s;` query.

CLI Example:

```
salt '*' mysql.alter_db testdb charset='latin1'
```

`salt.modules.mysql.`**`db_check`**`(`*name*, *table=None*, ***connection_args*`)`

Repairs the full database or just a given table

CLI Example:

```
salt '*' mysql.db_check dbname
salt '*' mysql.db_check dbname dbtable
```

`salt.modules.mysql.`**`db_create`**`(`*name*, *character_set=None*, *collate=None*, ***connection_args*`)`

Adds a databases to the MySQL server.

name
The name of the database to manage

character_set
The character set, if left empty the MySQL default will be used

collate
The collation, if left empty the MySQL default will be used

CLI Example:

```
salt '*' mysql.db_create 'dbname'
salt '*' mysql.db_create 'dbname' 'utf8' 'utf8_general_ci'
```

`salt.modules.mysql.`**`db_exists`**`(`*name*, ***connection_args*`)`

Checks if a database exists on the MySQL server.

CLI Example:

```
salt '*' mysql.db_exists 'dbname'
```

`salt.modules.mysql.`**`db_get`**`(`*name*, ***connection_args*`)`

Return a list of databases of a MySQL server using the output from the `SELECT DEFAULT_CHARACTER_SET_NAME, DEFAULT_COLLATION_NAME FROM INFORMATION_SCHEMA.SCHEMATA WHERE SCHEMA_NAME='dbname';` query.

CLI Example:

```
salt '*' mysql.db_get test
```

`salt.modules.mysql.`**`db_list`**`(`***connection_args*`)`

Return a list of databases of a MySQL server using the output from the `SHOW DATABASES` query.

CLI Example:

```
salt '*' mysql.db_list
```

`salt.modules.mysql.`**`db_optimize`**`(`*name*, *table=None*, ***connection_args*`)`

Optimizes the full database or just a given table

CLI Example:

```
salt '*' mysql.db_optimize dbname
```

`salt.modules.mysql.`**`db_remove`**`(`*name*, ***connection_args*`)`

Removes a databases from the MySQL server.

CLI Example:

```
salt '*' mysql.db_remove 'dbname'
```

`salt.modules.mysql.`**`db_repair`**`(`*name*, *table=None*, ***connection_args*`)`

Repairs the full database or just a given table

CLI Example:

```
salt '*' mysql.db_repair dbname
```

`salt.modules.mysql.`**`db_tables`**`(`*name*, ***connection_args*`)`

Shows the tables in the given MySQL database (if exists)

CLI Example:

```
salt '*' mysql.db_tables 'database'
```

`salt.modules.mysql.`**`file_query`**`(`*database, file_name, **connection_args*`)`

Run an arbitrary SQL query from the specified file and return the the number of affected rows.

New in version 2017.7.0.

database

database to run script inside

file_name

File name of the script. This can be on the minion, or a file that is reachable by the fileserver

CLI Example:

```
salt '*' mysql.file_query mydb file_name=/tmp/sqlfile.sql
salt '*' mysql.file_query mydb file_name=salt://sqlfile.sql
```

Return data:

```
{'query time': {'human': '39.0ms', 'raw': '0.03899'}, 'rows affected': 1L}
```

`salt.modules.mysql.`**`free_slave`**`(`***connection_args*`)`

Frees a slave from its master. This is a WIP, do not use.

CLI Example:

```
salt '*' mysql.free_slave
```

`salt.modules.mysql.`**`get_master_status`**`(`***connection_args*`)`

Retrieves the master status from the minion.

Returns:

```
{'host.domain.com': {'Binlog_Do_DB': '',
                 'Binlog_Ignore_DB': '',
                 'File': 'mysql-bin.000021',
                 'Position': 107}}
```

CLI Example:

```
salt '*' mysql.get_master_status
```

`salt.modules.mysql.`**`get_slave_status`**`(`***connection_args*`)`

Retrieves the slave status from the minion.

Returns:

```
{'host.domain.com': {'Connect_Retry': 60,
               'Exec_Master_Log_Pos': 107,
               'Last_Errno': 0,
               'Last_Error': '',
               'Last_IO_Errno': 0,
               'Last_IO_Error': '',
               'Last_SQL_Errno': 0,
               'Last_SQL_Error': '',
               'Master_Host': 'comet.scion-eng.com',
               'Master_Log_File': 'mysql-bin.000021',
```

(continues on next page)

(continued from previous page)

```
                'Master_Port': 3306,
                'Master_SSL_Allowed': 'No',
                'Master_SSL_CA_File': '',
                'Master_SSL_CA_Path': '',
                'Master_SSL_Cert': '',
                'Master_SSL_Cipher': '',
                'Master_SSL_Key': '',
                'Master_SSL_Verify_Server_Cert': 'No',
                'Master_Server_Id': 1,
                'Master_User': 'replu',
                'Read_Master_Log_Pos': 107,
                'Relay_Log_File': 'klo-relay-bin.000071',
                'Relay_Log_Pos': 253,
                'Relay_Log_Space': 553,
                'Relay_Master_Log_File': 'mysql-bin.000021',
                'Replicate_Do_DB': '',
                'Replicate_Do_Table': '',
                'Replicate_Ignore_DB': '',
                'Replicate_Ignore_Server_Ids': '',
                'Replicate_Ignore_Table': '',
                'Replicate_Wild_Do_Table': '',
                'Replicate_Wild_Ignore_Table': '',
                'Seconds_Behind_Master': 0,
                'Skip_Counter': 0,
                'Slave_IO_Running': 'Yes',
                'Slave_IO_State': 'Waiting for master to send event',
                'Slave_SQL_Running': 'Yes',
                'Until_Condition': 'None',
                'Until_Log_File': '',
                'Until_Log_Pos': 0}}
```

CLI Example:

```
salt '*' mysql.get_slave_status
```

`salt.modules.mysql.`**`grant_add`**(*grant*, *database*, *user*, *host='localhost'*, *grant_option=False*, *escape=True*, *ssl_option=False*, ***connection_args*)

Adds a grant to the MySQL server.

For database, make sure you specify database.table or database.*

CLI Example:

```
salt '*' mysql.grant_add             'SELECT,INSERT,UPDATE,...' 'database.
↪*' 'frank' 'localhost'
```

`salt.modules.mysql.`**`grant_exists`**(*grant*, *database*, *user*, *host='localhost'*, *grant_option=False*, *escape=True*, ***connection_args*)

Checks to see if a grant exists in the database

CLI Example:

```
salt '*' mysql.grant_exists             'SELECT,INSERT,UPDATE,...'
↪'database.*' 'frank' 'localhost'
```

`salt.modules.mysql.`**`grant_revoke`**`(`*grant, database, user, host='localhost', grant_option=False, escape=True, **connection_args*`)`

Removes a grant from the MySQL server.

CLI Example:

```
salt '*' mysql.grant_revoke          'SELECT,INSERT,UPDATE' 'database.*
↪' 'frank' 'localhost'
```

`salt.modules.mysql.`**`plugin_add`**`(`*name, soname=None, **connection_args*`)`

Add a plugina.

CLI Example:

```
salt '*' mysql.plugin_add auth_socket
```

`salt.modules.mysql.`**`plugin_remove`**`(`*name, **connection_args*`)`

Remove a plugin.

CLI Example:

```
salt '*' mysql.plugin_remove auth_socket
```

`salt.modules.mysql.`**`plugin_status`**`(`*name, **connection_args*`)`

Return the status of a plugin.

CLI Example:

```
salt '*' mysql.plugin_status auth_socket
```

`salt.modules.mysql.`**`plugins_list`**`(`***connection_args*`)`

Return a list of plugins and their status from the `SHOW PLUGINS` query.

CLI Example:

```
salt '*' mysql.plugins_list
```

`salt.modules.mysql.`**`processlist`**`(`***connection_args*`)`

Retrieves the processlist from the MySQL server via "SHOW FULL PROCESSLIST".

Returns: a list of dicts, with each dict representing a process:

```
{'Command': 'Query',
'Host': 'localhost',
'Id': 39,
'Info': 'SHOW FULL PROCESSLIST',
'Rows_examined': 0,
'Rows_read': 1,
'Rows_sent': 0,
'State': None,
'Time': 0,
'User': 'root',
'db': 'mysql'}
```

CLI Example:

```
salt '*' mysql.processlist
```

salt.modules.mysql.**query**(*database*, *query*, ***connection_args*)

Run an arbitrary SQL query and return the results or the number of affected rows.

CLI Example:

```
salt '*' mysql.query mydb "UPDATE mytable set myfield=1 limit 1"
```

Return data:

```
{'query time': {'human': '39.0ms', 'raw': '0.03899'}, 'rows affected': 1L}
```

CLI Example:

```
salt '*' mysql.query mydb "SELECT id,name,cash from users limit 3"
```

Return data:

```
{'columns': ('id', 'name', 'cash'),
    'query time': {'human': '1.0ms', 'raw': '0.001'},
    'results': ((1L, 'User 1', Decimal('110.000000')),
                (2L, 'User 2', Decimal('215.636756')),
                (3L, 'User 3', Decimal('0.040000'))),
    'rows returned': 3L}
```

CLI Example:

```
salt '*' mysql.query mydb 'INSERT into users values (null,"user 4", 5)'
```

Return data:

```
{'query time': {'human': '25.6ms', 'raw': '0.02563'}, 'rows affected': 1L}
```

CLI Example:

```
salt '*' mysql.query mydb 'DELETE from users where id = 4 limit 1'
```

Return data:

```
{'query time': {'human': '39.0ms', 'raw': '0.03899'}, 'rows affected': 1L}
```

Jinja Example: Run a query on `mydb` and use row 0, column 0's data.

```
{{ salt['mysql.query']('mydb', 'SELECT info from mytable limit 1')[
↪'results'][0][0] }}
```

salt.modules.mysql.**quote_identifier**(*identifier*, *for_grants=False*)

Return an identifier name (column, table, database, etc) escaped for MySQL

This means surrounded by "`" character and escaping this character inside. It also means doubling the '%' character for MySQLdb internal usage.

Parameters

- **`identifier`** -- the table, column or database identifier

- **`for_grants`** -- is False by default, when using database names on grant queries you should set it to True to also escape "_" and "%" characters as requested by MySQL. Note that theses characters should only be escaped when requesting grants on the database level (*my_%db.**) but not for table level grants (*my_%db*.`foo`)

CLI Example:

```
salt '*' mysql.quote_identifier 'foo`bar'
```

`salt.modules.mysql.`**`showglobal`**`(`***connection_args*`)`

Retrieves the show global variables from the minion.

Returns::
show global variables full dict

CLI Example:

```
salt '*' mysql.showglobal
```

`salt.modules.mysql.`**`showvariables`**`(`***connection_args*`)`

Retrieves the show variables from the minion.

Returns::
show variables full dict

CLI Example:

```
salt '*' mysql.showvariables
```

`salt.modules.mysql.`**`slave_lag`**`(`***connection_args*`)`

Return the number of seconds that a slave SQL server is lagging behind the master, if the host is not a slave it will return -1. If the server is configured to be a slave for replication but slave IO is not running then -2 will be returned. If there was an error connecting to the database or checking the slave status, -3 will be returned.

CLI Example:

```
salt '*' mysql.slave_lag
```

`salt.modules.mysql.`**`status`**`(`***connection_args*`)`

Return the status of a MySQL server using the output from the `SHOW STATUS` query.

CLI Example:

```
salt '*' mysql.status
```

`salt.modules.mysql.`**`tokenize_grant`**`(`*grant*`)`

External wrapper function :param grant: :return: dict

CLI Example:

```
salt '*' mysql.tokenize_grant           "GRANT SELECT, INSERT ON testdb.
↪* TO 'testuser'@'localhost'"
```

`salt.modules.mysql.`**`user_chpass`**`(`*user, host='localhost', password=None, password_hash=None, allow_passwordless=False, unix_socket=None, password_column=None, **connection_args*`)`

Change password for a MySQL user

host
Host for which this user/password combo applies

password
The password to set for the new user. Will take precedence over the `password_hash` option if both are specified.

password_hash
The password in hashed form. Be sure to quote the password because YAML doesn't like the `*`. A password hash can be obtained from the mysql command-line client like so:

```
mysql> SELECT PASSWORD('mypass');
+-------------------------------------------+
| PASSWORD('mypass')                        |
+-------------------------------------------+
| *6C8989366EAF75BB670AD8EA7A7FC1176A95CEF4 |
+-------------------------------------------+
1 row in set (0.00 sec)
```

allow_passwordless
If `True`, then `password` and `password_hash` can be omitted (or set to `None`) to permit a passwordless login.

New in version 0.16.2: The `allow_passwordless` option was added.

CLI Examples:

```
salt '*' mysql.user_chpass frank localhost newpassword
salt '*' mysql.user_chpass frank localhost password_hash='hash'
salt '*' mysql.user_chpass frank localhost allow_passwordless=True
```

`salt.modules.mysql.`**`user_create`**(*user, host='localhost', password=None, password_hash=None, allow_passwordless=False, unix_socket=False, password_column=None, auth_plugin='mysql_native_password', **connection_args*)

Creates a MySQL user

host
Host for which this user/password combo applies

password
The password to use for the new user. Will take precedence over the `password_hash` option if both are specified.

password_hash
The password in hashed form. Be sure to quote the password because YAML doesn't like the `*`. A password hash can be obtained from the mysql command-line client like so:

```
mysql> SELECT PASSWORD('mypass');
+-------------------------------------------+
| PASSWORD('mypass')                        |
+-------------------------------------------+
| *6C8989366EAF75BB670AD8EA7A7FC1176A95CEF4 |
+-------------------------------------------+
1 row in set (0.00 sec)
```

allow_passwordless
If `True`, then `password` and `password_hash` can be omitted (or set to `None`) to permit a passwordless login.

unix_socket
If `True` and allow_passwordless is `True` then will be used unix_socket auth plugin.

password_column
The password column to use in the user table.

auth_plugin
The authentication plugin to use, default is to use the mysql_native_password plugin.

New in version 0.16.2: The `allow_passwordless` option was added.

CLI Examples:

```
salt '*' mysql.user_create 'username' 'hostname' 'password'
salt '*' mysql.user_create 'username' 'hostname' password_hash='hash'
salt '*' mysql.user_create 'username' 'hostname' allow_passwordless=True
```

`salt.modules.mysql.`**`user_exists`**(*user*, *host='localhost'*, *password=None*, *password_hash=None*, *passwordless=False*, *unix_socket=False*, *password_column=None*, ***connection_args*)

Checks if a user exists on the MySQL server. A login can be checked to see if passwordless login is permitted by omitting `password` and `password_hash`, and using `passwordless=True`.

New in version 0.16.2: The `passwordless` option was added.

CLI Example:

```
salt '*' mysql.user_exists 'username' 'hostname' 'password'
salt '*' mysql.user_exists 'username' 'hostname' password_hash='hash'
salt '*' mysql.user_exists 'username' passwordless=True
salt '*' mysql.user_exists 'username' password_column='authentication_
↪string'
```

`salt.modules.mysql.`**`user_grants`**(*user*, *host='localhost'*, ***connection_args*)

Shows the grants for the given MySQL user (if it exists)

CLI Example:

```
salt '*' mysql.user_grants 'frank' 'localhost'
```

`salt.modules.mysql.`**`user_info`**(*user*, *host='localhost'*, ***connection_args*)

Get full info on a MySQL user

CLI Example:

```
salt '*' mysql.user_info root localhost
```

`salt.modules.mysql.`**`user_list`**(***connection_args*)

Return a list of users on a MySQL server

CLI Example:

```
salt '*' mysql.user_list
```

`salt.modules.mysql.`**`user_remove`**(*user*, *host='localhost'*, ***connection_args*)

Delete MySQL user

CLI Example:

```
salt '*' mysql.user_remove frank localhost
```

`salt.modules.mysql.`**`verify_login`**`(`*user*, *password=None*, ***connection_args*`)`

Attempt to login using the provided credentials. If successful, return true. Otherwise, return False.

CLI Example:

```
salt '*' mysql.verify_login root password
```

`salt.modules.mysql.`**`version`**`(`***connection_args*`)`

Return the version of a MySQL server using the output from the `SELECT VERSION()` query.

CLI Example:

```
salt '*' mysql.version
```

26.6.117 salt.modules.nacl

This module helps include encrypted passwords in pillars, grains and salt state files.

depends
PyNaCl, https://github.com/pyca/pynacl

This is often useful if you wish to store your pillars in source control or share your pillar data with others that you trust. I don't advise making your pillars public regardless if they are encrypted or not.

When generating keys and encrypting passwords use --local when using salt-call for extra security. Also consider using just the salt runner nacl when encrypting pillar passwords.

configuration
The following configuration defaults can be define (pillar or config files) Avoid storing private keys in pillars! Ensure master does not have *pillar_opts=True*:

```
# cat /etc/salt/master.d/nacl.conf
nacl.config:
    # NOTE: `key` and `key_file` have been renamed to `sk`, `sk_
↪file`
    # also `box_type` default changed from secretbox to sealedbox.
    box_type: sealedbox                     (default)
    sk_file: /etc/salt/pki/master/nacl      (default)
    pk_file: /etc/salt/pki/master/nacl.pub  (default)
    sk: None
    pk: None
```

Usage can override the config defaults:

```
salt-call nacl.enc sk_file=/etc/salt/pki/master/nacl pk_file=/etc/
↪salt/pki/master/nacl.pub
```

The nacl lib uses 32byte keys, these keys are base64 encoded to make your life more simple. To generate your *sk_file* and *pk_file* use:

```
salt-call --local nacl.keygen sk_file=/etc/salt/pki/master/nacl
# or if you want to work without files.
salt-call --local nacl.keygen
```

(continues on next page)

(continued from previous page)

```
local:
    ----------
    pk:
        /kfGX7PbWeu099702PBbKWLpG/9p06IQRswkdWHCDk0=
    sk:
        SVWut5SqNpuPeNzb1b9y6b2eXg2PLIog43GBzp48Sow=
```

Now with your keypair, you can encrypt data:

You have two option, *sealedbox* or *secretbox*.

SecretBox is data encrypted using private key *pk*. Sealedbox is encrypted using public key *pk*.

Recommend using Sealedbox because the one way encryption permits developers to encrypt data for source control but not decrypt. Sealedbox only has one key that is for both encryption and decryption.

```
salt-call --local nacl.enc asecretpass pk=/kfGX7PbWeu099702PBbKWLpG/
↪9p06IQRswkdWHCDk0=
tqXzeIJnTAM9Xf0mdLcpEdklMbfBGPj2oTKmlgrm3S1DTVVHNnh9h8mU1GKllGq/
↪+cYsk6m5WhGdk58=
```

To decrypt the data:

```
salt-call --local nacl.dec data=
↪'tqXzeIJnTAM9Xf0mdLcpEdklMbfBGPj2oTKmlgrm3S1DTVVHNnh9h8mU1GKllGq/
↪+cYsk6m5WhGdk58='         sk='SVWut5SqNpuPeNzb1b9y6b2eXg2PLIog43GBzp48Sow='
```

When the keys are defined in the master config you can use them from the nacl runner without extra parameters:

```
# cat /etc/salt/master.d/nacl.conf
nacl.config:
    sk_file: /etc/salt/pki/master/nacl
    pk: 'cTIqXwnUiD1ulg4kXsbeCE7/NoeKEzd4nLeYcCFpd9k='
```

```
salt-run nacl.enc 'asecretpass'
salt-run nacl.dec data=
↪'tqXzeIJnTAM9Xf0mdLcpEdklMbfBGPj2oTKmlgrm3S1DTVVHNnh9h8mU1GKllGq/
↪+cYsk6m5WhGdk58='
```

```
# a salt developers minion could have pillar data that includes a nacl public
↪key
nacl.config:
    pk: '/kfGX7PbWeu099702PBbKWLpG/9p06IQRswkdWHCDk0='
```

The developer can then use a less-secure system to encrypt data.

```
salt-call --local nacl.enc apassword
```

Pillar files can include protected data that the salt master decrypts:

```
pillarexample:
    user: root
    password1: {{salt.nacl.dec('DRB7Q6/X5gGSRCTpZyxS6hlbWj0llUA+uaVyvou3vJ4=
↪')|json}}
```

(continues on next page)

(continued from previous page)

```
    cert_key: {{salt.nacl.dec_file('/srv/salt/certs/example.com/key.nacl
↪')|json}}
    cert_key2: {{salt.nacl.dec_file('salt:///certs/example.com/key.nacl
↪')|json}}
```

Larger files like certificates can be encrypted with:

```
salt-call nacl.enc_file /tmp/cert.crt out=/tmp/cert.nacl
# or more advanced
cert=$(cat /tmp/cert.crt)
salt-call --out=newline_values_only nacl.enc_pub data="$cert" > /tmp/cert.nacl
```

In pillars rended with jinja be sure to include *|json* so line breaks are encoded:

```
cert: "{{salt.nacl.dec('S2uogToXkgENz9...085KYt')|json}}"
```

In states rendered with jinja it is also good pratice to include *|json*:

```
{{sls}} private key:
    file.managed:
        - name: /etc/ssl/private/cert.key
        - mode: 700
        - contents: "{{pillar['pillarexample']['cert_key']|json}}"
```

Optional small program to encrypt data without needing salt modules.

```
#!/bin/python3
import sys, base64, nacl.public
pk = base64.b64decode('YOURPUBKEY')
b = nacl.public.SealedBox(pk)
data = sys.stdin.buffer.read()
print(base64.b64encode(b.encrypt(data)).decode())
```

```
echo 'apassword' | nacl_enc.py
```

`salt.modules.nacl.`**`dec`**(*data*, ***kwargs*)

Alias to *{box_type}_decrypt*

box_type: secretbox, sealedbox(default)

`salt.modules.nacl.`**`dec_file`**(*name*, *out=None*, ***kwargs*)

This is a helper function to decrypt a file and return its contents.

You can provide an optional output file using *out*

name can be a local file or when not using *salt-run* can be a url like *salt://*, *https://* etc.

CLI Examples:

```
salt-run nacl.dec_file name=/tmp/id_rsa.nacl
salt-call nacl.dec_file name=salt://crt/mycert.nacl out=/tmp/id_rsa
salt-run nacl.dec_file name=/tmp/id_rsa.nacl box_type=secretbox
↪ sk_file=/etc/salt/pki/master/nacl.pub
```

`salt.modules.nacl.`**`enc`**`(`*data*, ***kwargs*`)`

Alias to *{box_type}_encrypt*

box_type: secretbox, sealedbox(default)

`salt.modules.nacl.`**`enc_file`**`(`*name*, *out=None*, ***kwargs*`)`

This is a helper function to encrypt a file and return its contents.

You can provide an optional output file using *out*

name can be a local file or when not using *salt-run* can be a url like *salt://*, *https://* etc.

CLI Examples:

```
salt-run nacl.enc_file name=/tmp/id_rsa
salt-call nacl.enc_file name=salt://crt/mycert out=/tmp/cert
salt-run nacl.enc_file name=/tmp/id_rsa box_type=secretbox             sk_
↪file=/etc/salt/pki/master/nacl.pub
```

`salt.modules.nacl.`**`keygen`**`(`*sk_file=None*, *pk_file=None*, ***kwargs*`)`

Use PyNaCl to generate a keypair.

If no *sk_file* is defined return a keypair.

If only the *sk_file* is defined *pk_file* will use the same name with a postfix *.pub*.

When the *sk_file* is already existing, but *pk_file* is not. The *pk_file* will be generated using the *sk_file*.

CLI Examples:

```
salt-call nacl.keygen
salt-call nacl.keygen sk_file=/etc/salt/pki/master/nacl
salt-call nacl.keygen sk_file=/etc/salt/pki/master/nacl pk_file=/etc/salt/
↪pki/master/nacl.pub
salt-call --local nacl.keygen
```

`salt.modules.nacl.`**`sealedbox_decrypt`**`(`*data*, ***kwargs*`)`

Decrypt data using a secret key that was encrypted using a public key with *nacl.sealedbox_encrypt*.

CLI Examples:

```
salt-call nacl.sealedbox_decrypt pEXHQM6cuaF7A=
salt-call --local nacl.sealedbox_decrypt data='pEXHQM6cuaF7A=' sk_file=/
↪etc/salt/pki/master/nacl
salt-call --local nacl.sealedbox_decrypt data='pEXHQM6cuaF7A=' sk=
↪'YmFkcGFzcwo='
```

`salt.modules.nacl.`**`sealedbox_encrypt`**`(`*data*, ***kwargs*`)`

Encrypt data using a public key generated from *nacl.keygen*. The encryptd data can be decrypted using *nacl.sealedbox_decrypt* only with the secret key.

CLI Examples:

```
salt-run nacl.sealedbox_encrypt datatoenc
salt-call --local nacl.sealedbox_encrypt datatoenc pk_file=/etc/salt/pki/
↪master/nacl.pub
salt-call --local nacl.sealedbox_encrypt datatoenc pk=
↪'vrwQF7cNiNAVQVAiS3bvcbJUnF0cN6fU9YTZD9mBfzQ='
```

salt.modules.nacl.**secretbox_decrypt**(*data*, **kwargs)

Decrypt data that was encrypted using *nacl.secretbox_encrypt* using the secret key that was generated from *nacl.keygen*.

CLI Examples:

```
salt-call nacl.secretbox_decrypt pEXHQM6cuaF7A=
salt-call --local nacl.secretbox_decrypt data='pEXHQM6cuaF7A=' sk_file=/
↪etc/salt/pki/master/nacl
salt-call --local nacl.secretbox_decrypt data='pEXHQM6cuaF7A=' sk=
↪'YmFkcGFzcwo='
```

salt.modules.nacl.**secretbox_encrypt**(*data*, **kwargs)

Encrypt data using a secret key generated from *nacl.keygen*. The same secret key can be used to decrypt the data using *nacl.secretbox_decrypt*.

CLI Examples:

```
salt-run nacl.secretbox_encrypt datatoenc
salt-call --local nacl.secretbox_encrypt datatoenc sk_file=/etc/salt/pki/
↪master/nacl
salt-call --local nacl.secretbox_encrypt datatoenc sk='YmFkcGFzcwo='
```

26.6.118 salt.modules.napalm_bgp

NAPALM BGP

Manages BGP configuration on network devices and provides statistics.

codeauthor
Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

maturity
new

depends
napalm

platform
unix

Dependencies

- `napalm proxy minion`

New in version 2016.11.0.

salt.modules.napalm_bgp.**config**(*group=None*, *neighbor=None*, **kwargs)

Provides the BGP configuration on the device.

Parameters

- **group** -- Name of the group selected to display the configuration.
- **neighbor** -- IP Address of the neighbor to display the configuration. If the group parameter is not specified, the neighbor setting will be ignored.

Returns
A dictionary containing the BGP configuration from the network device. The keys of the main dictionary are the group names.

Each group has the following properties:

- type (string)
- description (string)
- apply_groups (string list)
- multihop_ttl (int)
- multipath (True/False)
- local_address (string)
- local_as (int)
- remote_as (int)
- import_policy (string)
- export_policy (string)
- remove_private_as (True/False)
- prefix_limit (dictionary)
- neighbors (dictionary)

Each neighbor in the dictionary of neighbors provides:

- description (string)
- import_policy (string)
- export_policy (string)
- local_address (string)
- local_as (int)
- remote_as (int)
- authentication_key (string)
- prefix_limit (dictionary)
- route_reflector_client (True/False)
- nhs (True/False)

CLI Example:

```
salt '*' bgp.config # entire BGP config
salt '*' bgp.config PEERS-GROUP-NAME # provides detail only about BGP␣
↪group PEERS-GROUP-NAME
salt '*' bgp.config PEERS-GROUP-NAME 172.17.17.1 # provides details only␣
↪about BGP neighbor 172.17.17.1,
# configured in the group PEERS-GROUP-NAME
```

Output Example:

```
{
    'PEERS-GROUP-NAME':{
        'type'          : 'external',
        'description'   : 'Here we should have a nice description',
        'apply_groups'  : ['BGP-PREFIX-LIMIT'],
        'import_policy' : 'PUBLIC-PEER-IN',
        'export_policy' : 'PUBLIC-PEER-OUT',
        'remove_private': True,
        'multipath'     : True,
        'multihop_ttl'  : 30,
        'neighbors'     : {
            '192.168.0.1': {
                'description'   : 'Facebook [CDN]',
                'prefix_limit'  : {
                    'inet': {
                        'unicast': {
                            'limit': 100,
                            'teardown': {
                                'threshold' : 95,
                                'timeout'   : 5
                            }
                        }
                    }
                }
                'peer-as'        : 32934,
                'route_reflector': False,
                'nhs'            : True
            },
            '172.17.17.1': {
                'description'   : 'Twitter [CDN]',
                'prefix_limit'  : {
                    'inet': {
                        'unicast': {
                            'limit': 500,
                            'no-validate': 'IMPORT-FLOW-ROUTES'
                        }
                    }
                }
                'peer_as'        : 13414
                'route_reflector': False,
                'nhs'            : False
            }
        }
    }
}
```

`salt.modules.napalm_bgp.`**`neighbors`**(*neighbor=None*, ***kwargs*)

Provides details regarding the BGP sessions configured on the network device.

Parameters

`neighbor` -- IP Address of a specific neighbor.

Returns

A dictionary with the statistics of the all/selected BGP neighbors. Outer dictionary keys represent the VRF name. Keys of inner dictionary represent the AS numbers, while the values are lists of dictionaries, having the following keys:

- up (True/False)
- local_as (int)
- remote_as (int)
- local_address (string)
- routing_table (string)
- local_address_configured (True/False)
- local_port (int)
- remote_address (string)
- remote_port (int)
- multihop (True/False)
- multipath (True/False)
- remove_private_as (True/False)
- import_policy (string)
- export_policy (string)
- input_messages (int)
- output_messages (int)
- input_updates (int)
- output_updates (int)
- messages_queued_out (int)
- connection_state (string)
- previous_connection_state (string)
- last_event (string)
- suppress_4byte_as (True/False)
- local_as_prepend (True/False)
- holdtime (int)
- configured_holdtime (int)
- keepalive (int)
- configured_keepalive (int)
- active_prefix_count (int)
- received_prefix_count (int)
- accepted_prefix_count (int)
- suppressed_prefix_count (int)
- advertised_prefix_count (int)
- flap_count (int)

CLI Example:

```
salt '*' bgp.neighbors  # all neighbors
salt '*' bgp.neighbors 172.17.17.1  # only session with BGP neighbor(s)␣
↪172.17.17.1
```

Output Example:

```
{
    'default': {
        8121: [
            {
                'up'                        : True,
                'local_as'                  : 13335,
                'remote_as'                 : 8121,
                'local_address'             : '172.101.76.1',
                'local_address_configured'  : True,
                'local_port'                : 179,
                'remote_address'            : '192.247.78.0',
                'router_id'                 : '192.168.0.1',
                'remote_port'               : 58380,
                'multihop'                  : False,
                'import_policy'             : '4-NTT-TRANSIT-IN',
                'export_policy'             : '4-NTT-TRANSIT-OUT',
                'input_messages'            : 123,
                'output_messages'           : 13,
                'input_updates'             : 123,
                'output_updates'            : 5,
                'messages_queued_out'       : 23,
                'connection_state'          : 'Established',
                'previous_connection_state' : 'EstabSync',
                'last_event'                : 'RecvKeepAlive',
                'suppress_4byte_as'         : False,
                'local_as_prepend'          : False,
                'holdtime'                  : 90,
                'configured_holdtime'       : 90,
                'keepalive'                 : 30,
                'configured_keepalive'      : 30,
                'active_prefix_count'       : 132808,
                'received_prefix_count'     : 566739,
                'accepted_prefix_count'     : 566479,
                'suppressed_prefix_count'   : 0,
                'advertise_prefix_count'    : 0,
                'flap_count'                : 27
            }
        ]
    }
}
```

26.6.119 salt.modules.napalm_formula

NAPALM Formula helpers

New in version 2019.2.0.

This is an Execution Module providing helpers for various NAPALM formulas, e.g., napalm-interfaces-formula, napalm-bgp-formula, napalm-ntp-formula etc., meant to provide various helper functions to make the templates more readable.

`salt.modules.napalm_formula.`**`container_path`**`(`*model*, *key=None*, *container=None*, *delim=':'*`)`

Return the list of all the possible paths in a container, down to the `config` container. This function can be used to verify that the `model` is a Python object correctly structured and respecting the OpenConfig hierarchy.

model
The OpenConfig-structured object to inspect.

delim: `:`
The key delimiter. In particular cases, it is indicated to use `//` as `:` might be already used in various cases, e.g., IPv6 addresses, interface name (e.g., Juniper QFX series), etc.

CLI Example:

```
salt '*' napalm_formula.container_path "{'interfaces': {'interface': {
↪'Ethernet1': {'config': {'name': 'Ethernet1'}}}}}"
```

The example above would return a list with the following element: `interfaces:interface:Ethernet1:config` which is the only possible path in that hierarchy.

Other output examples:

```
- interfaces:interface:Ethernet1:config
- interfaces:interface:Ethernet1:subinterfaces:subinterface:0:config
- interfaces:interface:Ethernet2:config
```

`salt.modules.napalm_formula.`**`defaults`**`(`*model*, *defaults_*, *delim='//'*, *flipped_merge=False*`)`

Apply the defaults to a Python dictionary having the structure as described in the OpenConfig standards.

model
The OpenConfig model to apply the defaults to.

defaults
The dictionary of defaults. This argument must equally be structured with respect to the OpenConfig standards.

For ease of use, the keys of these support glob matching, therefore we don't have to provide the defaults for each entity but only for the entity type. See an example below.

delim: `//`
The key delimiter to use. Generally, `//` should cover all the possible cases, and you don't need to override this value.

flipped_merge: `False`
Whether should merge the model into the defaults, or the defaults into the model. Default: `False` (merge the model into the defaults, i.e., any defaults would be overridden by the values from the `model`).

CLI Example:

```
salt '*' napalm_formula.defaults "{'interfaces': {'interface': {'Ethernet1
↪': {'config': {'name': 'Ethernet1'}}}}}" "{'interfaces': {'interface': {
↪'*': {'config': {'enabled': True}}}}}"
```

As one can notice in the example above, the `*` corresponds to the interface name, therefore, the defaults will be applied on all the interfaces.

`salt.modules.napalm_formula.`**`dictupdate`**(*dest*, *upd*, *recursive_update=True*, *merge_lists=False*)

Recursive version of the default dict.update

Merges upd recursively into dest

If recursive_update=False, will use the classic dict.update, or fall back on a manual merge (helpful for non-dict types like `FunctionWrapper`).

If `merge_lists=True`, will aggregate list object types instead of replace. The list in `upd` is added to the list in `dest`, so the resulting list is `dest[key] + upd[key]`. This behaviour is only activated when `recursive_update=True`. By default `merge_lists=False`.

`salt.modules.napalm_formula.`**`render_field`**(*dictionary*, *field*, *prepend=None*, *append=None*, *quotes=False*, ***opts*)

Render a field found under the `field` level of the hierarchy in the `dictionary` object. This is useful to render a field in a Jinja template without worrying that the hierarchy might not exist. For example if we do the following in Jinja: `{{ interfaces.interface.Ethernet5.config.description }}` for the following object: `{'interfaces': {'interface': {'Ethernet1': {'config': {'enabled': True}}}}}` it would error, as the `Ethernet5` key does not exist. With this helper, we can skip this and avoid existence checks. This must be however used with care.

dictionary
    The dictionary to traverse.

field
    The key name or part to traverse in the `dictionary`.

prepend: **`None`**
    The text to prepend in front of the text. Usually, we need to have the name of the field too when generating the configuration.

append: **`None`**
    Text to append at the end.

quotes: **`False`**
    Whether should wrap the text around quotes.

CLI Example:

```
salt '*' napalm_formula.render_field "{'enabled': True}" enabled
# This would return the value of the ``enabled`` leaf key
salt '*' napalm_formula.render_field "{'enabled': True}" description
# This would not error
```

Jinja usage example:

```
{%- set config = {'enabled': True, 'description': 'Interface description'}
↪ %}
{{ salt.napalm_formula.render_field(config, 'description', quotes=True) }}
```

The example above would be rendered on Arista / Cisco as:

```
description "Interface description"
```

While on Junos (the semicolon is important to be added, otherwise the configuration won't be accepted by Junos):

```
description "Interface description";
```

`salt.modules.napalm_formula.`**`render_fields`**(*dictionary*, **fields*, ***opts*)

This function works similarly to *`render_field`* but for a list of fields from the same dictionary, rendering, indenting and distributing them on separate lines.

dictionary
The dictionary to traverse.

fields
A list of field names or paths in the dictionary.

indent: **`0`**
The indentation to use, prepended to the rendered field.

separator: **`\n`**
The separator to use between fields.

CLI Example:

```
salt '*' napalm_formula.render_fields "{'mtu': 68, 'description':
↪'Interface description'}" mtu description
```

Jinja usage example:

```
{%- set config={'mtu': 68, 'description': 'Interface description'} %}
{{ salt.napalm_formula.render_fields(config, 'mtu', 'description',␣
↪quotes=True) }}
```

The Jinja example above would generate the following configuration:

```
mtu "68"
description "Interface description"
```

`salt.modules.napalm_formula.`**`setval`**(*key*, *val*, *dict_=None*, *delim=':'*)

Set a value under the dictionary hierarchy identified under the key. The target 'foo/bar/baz' returns the dictionary hierarchy {'foo': {'bar': {'baz': {}}}}.

Note: Currently this doesn't work with integers, i.e. cannot build lists dynamically.

CLI Example:

```
salt '*' formula.setval foo:baz:bar True
```

`salt.modules.napalm_formula.`**`traverse`**(*data*, *key*, *default=None*, *delimiter=':'*)

Traverse a dict or list using a colon-delimited (or otherwise delimited, using the `delimiter` param) target string. The target `foo:bar:0` will return `data['foo']['bar'][0]` if this value exists, and will otherwise return the dict in the default argument. Function will automatically determine the target type. The target `foo:bar:0` will return data['foo']['bar'][0] if data like `{'foo':{'bar':['baz']}}` , if data like `{'foo':{'bar':{'0':'baz'}}}` then `return data['foo']['bar']['0']`

CLI Example:

```
salt '*' napalm_formula.traverse "{'foo': {'bar': {'baz': True}}}"␣
↪foo:baz:bar
```

26.6.120 salt.modules.napalm_mod

NAPALM helpers

Helpers for the NAPALM modules.

New in version 2017.7.0.

`salt.modules.napalm_mod.`**`alive`**(***kwargs*)

Returns the alive status of the connection layer. The output is a dictionary under the usual dictionary output of the NAPALM modules.

CLI Example:

```
salt '*' napalm.alive
```

Output Example:

```
result: True
out:
    is_alive: False
comment: ''
```

`salt.modules.napalm_mod.`**`call`**(*method*, **args*, ***kwargs*)

Execute arbitrary methods from the NAPALM library. To see the expected output, please consult the NAPALM documentation.

Note: This feature is not recommended to be used in production. It should be used for testing only!

CLI Example:

```
salt '*' napalm.call get_lldp_neighbors
salt '*' napalm.call get_firewall_policies
salt '*' napalm.call get_bgp_config group='my-group'
```

`salt.modules.napalm_mod.`**`compliance_report`**(*filepath=None*, *string=None*, *renderer='jinja|yaml'*, ***kwargs*)

Return the compliance report.

filepath

The absolute path to the validation file.

Changed in version 2019.2.0.

Beginning with release codename `2019.2.0`, this function has been enhanced, to be able to leverage the multi-engine template rendering of Salt, besides the possibility to retrieve the file source from remote systems, the URL schemes supported being:

- `salt://`

- `http://` and `https://`
- `ftp://`
- `s3://`
- `swift:/`

Or on the local file system (on the Minion).

Note: The rendering result does not necessarily need to be YAML, instead it can be any format interpreted by Salt's rendering pipeline (including pure Python).

---

string

New in version 2019.2.0.

The compliance report send as inline string, to be used as the file to send through the renderer system. Note, not all renderer modules can work with strings; the 'py' renderer requires a file, for example.

renderer: **`jinja|yaml`**

New in version 2019.2.0.

The renderer pipe to send the file through; this is overridden by a "she-bang" at the top of the file.

kwargs

Changed in version 2019.2.0.

Keyword args to pass to Salt's compile_template() function.

CLI Example:

```
salt '*' napalm.compliance_report ~/validate.yml
salt '*' napalm.compliance_report salt://path/to/validator.sls
```

Validation File Example (pure YAML):

```
- get_facts:
    os_version: 4.17

- get_interfaces_ip:
    Management1:
      ipv4:
        10.0.2.14:
          prefix_length: 24
        _mode: strict
```

Validation File Example (as Jinja + YAML):

```
- get_facts:
    os_version: {{ grains.version }}
- get_interfaces_ip:
    Loopback0:
      ipv4:
        {{ grains.lo0.ipv4 }}:
          prefix_length: 24
        _mode: strict
- get_bgp_neighbors: {{ pillar.bgp.neighbors }}
```

Output Example:

```
device1:
    ----------
    comment:
    out:
        ----------
        complies:
            False
        get_facts:
            ----------
            complies:
                False
            extra:
            missing:
            present:
                ----------
                os_version:
                    ----------
                    actual_value:
                        15.1F6-S1.4
                    complies:
                        False
                    nested:
                        False
        get_interfaces_ip:
            ----------
            complies:
                False
            extra:
            missing:
                - Management1
            present:
                ----------
        skipped:
    result:
        True
```

`salt.modules.napalm_mod.`**`config_diff_text`**(*source1='candidate', candidate_path=None, source2='running', running_path=None*)

New in version 2019.2.0.

Return the diff, as text, between the two different configuration sources. The sources can be either specified using the `source1` and `source2` arguments when retrieving from the managed network device.

source1: `candidate`
The source from where to retrieve the configuration to be compared with. Available options: `candidate`, `running`, `startup`. Default: `candidate`.

candidate_path
Absolute or remote path from where to load the candidate configuration text. This argument allows any URI supported by *`cp.get_url`*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

source2: `running`
The source from where to retrieve the configuration to compare with. Available options: `candidate`, `running`, `startup`. Default: `running`.

running_path

Absolute or remote path from where to load the running configuration text. This argument allows any URI supported by *cp.get_url*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

saltenv: `base`
Salt fileserver environment from which to retrieve the file. Ignored if `candidate_path` or `running_path` is not a `salt://` URL.

CLI Example:

```
salt '*' napalm.config_diff_text
salt '*' napalm.config_diff_text candidate_path=https://bit.ly/2mAdq7z
# Would compare the running config with the configuration available at
# https://bit.ly/2mAdq7z
```

`salt.modules.napalm_mod.`**`config_diff_tree`**(*source1='candidate', candidate_path=None, source2='running', running_path=None*)

New in version 2019.2.0.

Return the diff, as Python dictionary, between two different sources. The sources can be either specified using the `source1` and `source2` arguments when retrieving from the managed network device.

source1: `candidate`
The source from where to retrieve the configuration to be compared with. Available options: `candidate`, `running`, `startup`. Default: `candidate`.

candidate_path
Absolute or remote path from where to load the candidate configuration text. This argument allows any URI supported by *cp.get_url*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

source2: `running`
The source from where to retrieve the configuration to compare with. Available options: `candidate`, `running`, `startup`. Default: `running`.

running_path
Absolute or remote path from where to load the running configuration text. This argument allows any URI supported by *cp.get_url*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

saltenv: `base`
Salt fileserver environment from which to retrieve the file. Ignored if `candidate_path` or `running_path` is not a `salt://` URL.

CLI Example:

```
salt '*' napalm.config_diff_text
salt '*' napalm.config_diff_text candidate_path=https://bit.ly/2mAdq7z
# Would compare the running config with the configuration available at
# https://bit.ly/2mAdq7z
```

CLI Example:

```
salt '*' napalm.config_diff_tree
salt '*' napalm.config_diff_tree running startup
```

`salt.modules.napalm_mod.`**`config_filter_lines`**(*parent_regex, child_regex, source='running'*)

New in version 2019.2.0.

Return a list of detailed matches, for the configuration blocks (parent-child relationship) whose parent respects the regular expressions configured via the `parent_regex` argument, and the child matches the `child_regex` regular expression. The result is a list of dictionaries with the following keys:

- `match`: a boolean value that tells whether `child_regex` matched any children lines.
- `parent`: the parent line (as text).
- `child`: the child line (as text). If no child line matched, this field will be `None`.

Note: This function is only available only when the underlying library ciscoconfparse is installed. See `ciscoconfparse module` for more details.

---

parent_regex
The regular expression to match the parent configuration lines against.

child_regex
The regular expression to match the child configuration lines against.

source: **`running`**
The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

CLI Example:

```
salt '*' napalm.config_filter_lines '^interface' 'ip address'
salt '*' napalm.config_filter_lines '^interface' 'shutdown'
↪source=candidate
```

`salt.modules.napalm_mod.`**`config_find_lines`**(*regex*, *source='running'*)

New in version 2019.2.0.

Return the configuration lines that match the regular expressions from the `regex` argument. The configuration is read from the network device interrogated.

regex
The regular expression to match the configuration lines against.

source: **`running`**
The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

CLI Example:

```
salt '*' napalm.config_find_lines '^interface Ethernet1\d'
```

`salt.modules.napalm_mod.`**`config_lines_w_child`**(*parent_regex*, *child_regex*, *source='running'*)

New in version 2019.2.0.

Return the configuration lines that match the regular expressions from the `parent_regex` argument, having child lines matching `child_regex`. The configuration is read from the network device interrogated.

Note: This function is only available only when the underlying library ciscoconfparse is installed. See `ciscoconfparse module` for more details.

---

parent_regex
The regular expression to match the parent configuration lines against.

child_regex
The regular expression to match the child configuration lines against.

source: `running`
The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

CLI Example:

```
salt '*' napalm.config_lines_w_child '^interface' 'ip address'
salt '*' napalm.config_lines_w_child '^interface' 'shutdown'␣
↪source=candidate
```

`salt.modules.napalm_mod.`**`config_lines_wo_child`**(*parent_regex*, *child_regex*, *source='running'*)

New in version 2019.2.0.

Return the configuration lines that match the regular expressions from the `parent_regex` argument, having the child lines *not* matching `child_regex`. The configuration is read from the network device interrogated.

Note: This function is only available only when the underlying library ciscoconfparse is installed. See `ciscoconfparse module` for more details.

---

parent_regex
The regular expression to match the parent configuration lines against.

child_regex
The regular expression to match the child configuration lines against.

source: `running`
The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

CLI Example:

```
salt '*' napalm.config_lines_wo_child '^interface' 'ip address'
salt '*' napalm.config_lines_wo_child '^interface' 'shutdown'␣
↪source=candidate
```

`salt.modules.napalm_mod.`**`config_merge_diff`**(*source='running'*, *merge_config=None*, *merge_path=None*, *saltenv='base'*)

New in version 2019.2.0.

Return the merge diff, as text, after merging the merge config into the configuration source requested (without loading the config on the device).

source: `running`
The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

merge_config
The config to be merged into the initial config, sent as text. This argument is ignored when `merge_path` is set.

merge_path
Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by *`cp.get_url`*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

saltenv: `base`
Salt fileserver environment from which to retrieve the file. Ignored if `merge_path` is not a `salt://` URL.

CLI Example:

```
salt '*' napalm.config_merge_diff merge_path=salt://path/to/merge.cfg
```

`salt.modules.napalm_mod.`**`config_merge_text`**(*source='running', merge_config=None, merge_path=None, saltenv='base'*)

New in version 2019.2.0.

Return the merge result of the configuration from `source` with the merge configuration, as plain text (without loading the config on the device).

source: `running`
The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

merge_config
The config to be merged into the initial config, sent as text. This argument is ignored when `merge_path` is set.

merge_path
Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by *`cp.get_url`*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

saltenv: `base`
Salt fileserver environment from which to retrieve the file. Ignored if `merge_path` is not a `salt://` URL.

CLI Example:

```
salt '*' napalm.config_merge_text merge_path=salt://path/to/merge.cfg
```

`salt.modules.napalm_mod.`**`config_merge_tree`**(*source='running', merge_config=None, merge_path=None, saltenv='base'*)

New in version 2019.2.0.

Return the merge tree of the `initial_config` with the `merge_config`, as a Python dictionary.

source: `running`
The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

merge_config
The config to be merged into the initial config, sent as text. This argument is ignored when `merge_path` is set.

merge_path
Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by *`cp.get_url`*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

saltenv: `base`
Salt fileserver environment from which to retrieve the file. Ignored if `merge_path` is not a `salt://` URL.

CLI Example:

```
salt '*' napalm.config_merge_tree merge_path=salt://path/to/merge.cfg
```

`salt.modules.napalm_mod.`**`config_tree`**(*source='running'*, *with_tags=False*)

New in version 2019.2.0.

Transform Cisco IOS style configuration to structured Python dictionary. Depending on the value of the `with_tags` argument, this function may provide different views, valuable in different situations.

source: **`running`**
The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

with_tags: **`False`**
Whether this function should return a detailed view, with tags.

CLI Example:

```
salt '*' napalm.config_tree
```

`salt.modules.napalm_mod.`**`junos_call`**(*fun*, **args*, ***kwargs*)

New in version 2019.2.0.

Execute an arbitrary function from the `junos execution module`. To check what `args` and `kwargs` you must send to the function, please consult the appropriate documentation.

fun
The name of the function. E.g., `set_hostname`.

args
List of arguments to send to the `junos` function invoked.

kwargs
Dictionary of key-value arguments to send to the `juno` function invoked.

CLI Example:

```
salt '*' napalm.junos_fun cli 'show system commit'
```

`salt.modules.napalm_mod.`**`junos_cli`**(*command*, *format=None*, *dev_timeout=None*, *dest=None*, ***kwargs*)

New in version 2019.2.0.

Execute a CLI command and return the output in the specified format.

command
The command to execute on the Junos CLI.

format: **`text`**
Format in which to get the CLI output (either `text` or `xml`).

dev_timeout: **`30`**
The NETCONF RPC timeout (in seconds).

dest
Destination file where the RPC output is stored. Note that the file will be stored on the Proxy Minion. To push the files to the Master, use `cp.push`.

CLI Example:

```
salt '*' napalm.junos_cli 'show lldp neighbors'
```

`salt.modules.napalm_mod.`**`junos_commit`**`(`*`**kwargs`*`)`

New in version 2019.2.0.

Commit the changes loaded in the candidate configuration.

dev_timeout: `30`
The NETCONF RPC timeout (in seconds).

comment
Provide a comment for the commit.

confirm
Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.

sync: `False`
When `True`, on dual control plane systems, requests that the candidate configuration on one control plane be copied to the other control plane, checked for correct syntax, and committed on both Routing Engines.

force_sync: `False`
When `True`, on dual control plane systems, force the candidate configuration on one control plane to be copied to the other control plane.

full
When `True`, requires all the daemons to check and evaluate the new configuration.

detail
When `True`, return commit detail.

CLI Examples:

```
salt '*' napalm.junos_commit comment='Commitiing via Salt' detail=True
salt '*' napalm.junos_commit dev_timeout=60 confirm=10
salt '*' napalm.junos_commit sync=True dev_timeout=90
```

`salt.modules.napalm_mod.`**`junos_copy_file`**`(`*`src, dst, **kwargs`*`)`

New in version 2019.2.0.

Copies the file on the remote Junos device.

src
The source file path. This argument accepts the usual Salt URIs (e.g., `salt://`, `http://`, `https://`, `s3://`, `ftp://`, etc.).

dst
The destination path on the device where to copy the file.

CLI Example:

```
salt '*' napalm.junos_copy_file https://example.com/junos.cfg /var/tmp/
↪myjunos.cfg
```

`salt.modules.napalm_mod.`**`junos_facts`**`(`*`**kwargs`*`)`

New in version 2019.2.0.

The complete list of Junos facts collected by `junos-eznc`.

CLI Example:

```
salt '*' napalm.junos_facts
```

`salt.modules.napalm_mod.`**`junos_install_os`**(*path=None*, ***kwargs*)

New in version 2019.2.0.

Installs the given image on the device.

path
The image file source. This argument supports the following URIs:

- Absolute path on the Minion.
- `salt://` to fetch from the Salt fileserver.
- `http://` and `https://`
- `ftp://`
- `swift:/`
- `s3://`

dev_timeout: `30`
The NETCONF RPC timeout (in seconds)

reboot: `False`
Whether to reboot the device after the installation is complete.

no_copy: `False`
If `True` the software package will not be copied to the remote device.

CLI Example:

```
salt '*' napalm.junos_install_os salt://images/junos_16_1.tgz reboot=True
```

`salt.modules.napalm_mod.`**`junos_rpc`**(*cmd=None*, *dest=None*, *format=None*, ***kwargs*)

New in version 2019.2.0.

Execute an RPC request on the remote Junos device.

cmd
The RPC request to the executed. To determine the RPC request, you can check the from the command line of the device, by executing the usual command followed by `| display xml rpc`, e.g., `show lldp neighbors | display xml rpc`.

dest
Destination file where the RPC output is stored. Note that the file will be stored on the Proxy Minion. To push the files to the Master, use `cp.push` Execution function.

format: `xml`
The format in which the RPC reply is received from the device.

dev_timeout: `30`
The NETCONF RPC timeout.

filter
Used with the `get-config` RPC request to filter out the config tree.

terse: `False`
Whether to return terse output.

Note: Some RPC requests may not support this argument.

interface_name
Name of the interface to query.

CLI Example:

```
salt '*' napalm.junos_rpc get-lldp-neighbors-information
salt '*' napalm.junos_rpc get-config <configuration><system><ntp/></
↪system></configuration>
```

`salt.modules.napalm_mod.`**`netmiko_args`**`(`***kwargs*`)`

New in version 2019.2.0.

Return the key-value arguments used for the authentication arguments for the netmiko module.

When running in a non-native NAPALM driver (e.g., `panos`, *f5*`, `mos` - either from https://github.com/napalm-automation-community or defined in user's own environment, one can specify the Netmiko device type (the `device_type` argument) via the `netmiko_device_type_map` configuration option / Pillar key, e.g.,

```
netmiko_device_type_map:
  f5: f5_ltm
  dellos10: dell_os10
```

The configuration above defines the mapping between the NAPALM `os` Grain and the Netmiko `device_type`, e.g., when the NAPALM Grain is `f5`, it would use the `f5_ltm` SSH Netmiko driver to execute commands over SSH on the remote network device.

CLI Example:

```
salt '*' napalm.netmiko_args
```

`salt.modules.napalm_mod.`**`netmiko_call`**`(`*method*, **args*, ***kwargs*`)`

New in version 2019.2.0.

Execute an arbitrary Netmiko method, passing the authentication details from the existing NAPALM connection.

method
The name of the Netmiko method to execute.

args
List of arguments to send to the Netmiko method specified in `method`.

kwargs
Key-value arguments to send to the execution function specified in `method`.

CLI Example:

```
salt '*' napalm.netmiko_call send_command 'show version'
```

`salt.modules.napalm_mod.`**`netmiko_commands`**`(`**commands*, ***kwargs*`)`

New in version 2019.2.0.

Invoke one or more commands to be executed on the remote device, via Netmiko. Returns a list of strings, with the output from each command.

commands
A list of commands to be executed.

expect_string
Regular expression pattern to use for determining end of output. If left blank will default to being based on router prompt.

delay_factor: **`1`**
Multiplying factor used to adjust delays (default: `1`).

max_loops: **`500`**
Controls wait time in conjunction with delay_factor. Will default to be based upon self.timeout.

auto_find_prompt: **`True`**
Whether it should try to auto-detect the prompt (default: `True`).

strip_prompt: **`True`**
Remove the trailing router prompt from the output (default: `True`).

strip_command: **`True`**
Remove the echo of the command from the output (default: `True`).

normalize: **`True`**
Ensure the proper enter is sent at end of command (default: `True`).

use_textfsm: **`False`**
Process command output through TextFSM template (default: `False`).

CLI Example:

```
salt '*' napalm.netmiko_commands 'show version' 'show interfaces'
```

`salt.modules.napalm_mod.`**`netmiko_config`**`(*config_commands, **kwargs)`

New in version 2019.2.0.

Load a list of configuration commands on the remote device, via Netmiko.

> **Warning:** Please remember that `netmiko` does not have any rollback safeguards and any configuration change will be directly loaded into the running config if the platform doesn't have the concept of `candidate` config.
>
> On Junos, or other platforms that have this capability, the changes will not be loaded into the running config, and the user must set the `commit` argument to `True` to transfer the changes from the candidate into the running config before exiting.

config_commands
A list of configuration commands to be loaded on the remote device.

config_file
Read the configuration commands from a file. The file can equally be a template that can be rendered using the engine of choice (see `template_engine`).

This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`

  - `swift://`

exit_config_mode: `True`
  Determines whether or not to exit config mode after complete.

delay_factor: `1`
  Factor to adjust delays.

max_loops: `150`
  Controls wait time in conjunction with delay_factor (default: `150`).

strip_prompt: `False`
  Determines whether or not to strip the prompt (default: `False`).

strip_command: `False`
  Determines whether or not to strip the command (default: `False`).

config_mode_command
  The command to enter into config mode.

commit: `False`
  Commit the configuration changes before exiting the config mode. This option is by default disabled, as many platforms don't have this capability natively.

CLI Example:

```
salt '*' napalm.netmiko_config 'set system ntp peer 1.2.3.4' commit=True
salt '*' napalm.netmiko_config https://bit.ly/2sgljCB
```

`salt.modules.napalm_mod.`**`netmiko_fun`**(*fun*, **args*, ***kwargs*)

New in version 2019.2.0.

Call an arbitrary function from the `Netmiko` module, passing the authentication details from the existing NAPALM connection.

fun
  The name of the function from the `Netmiko` to invoke.

args
  List of arguments to send to the execution function specified in `fun`.

kwargs
  Key-value arguments to send to the execution function specified in `fun`.

CLI Example:

```
salt '*' napalm.netmiko_fun send_command 'show version'
```

`salt.modules.napalm_mod.`**`netmiko_multi_call`**(**methods*, ***kwargs*)

New in version 2019.2.0.

Execute a list of arbitrary Netmiko methods, passing the authentication details from the existing NAPALM connection.

methods
  List of dictionaries with the following keys:

  - `name`: the name of the Netmiko function to invoke.
  - `args`: list of arguments to send to the `name` method.
  - `kwargs`: key-value arguments to send to the `name` method.

CLI Example:

```
salt '*' napalm.netmiko_multi_call "{'name': 'send_command', 'args': [
↪'show version']}" "{'name': 'send_command', 'args': ['show interfaces']}
↪"
```

`salt.modules.napalm_mod.`**`nxos_api_config`**`(`*commands=None, config_file=None, template_engine='jinja', context=None, defaults=None, saltenv='base', **kwargs*`)`

New in version 2019.2.0.

Configures the Nexus switch with the specified commands, via the NX-API.

commands
The list of configuration commands to load on the Nexus switch.

Note: This argument is ignored when `config_file` is specified.

---

config_file
The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`
- `https://`
- `ftp:/`
- `s3:/`
- `swift://`

template_engine: **`jinja`**
The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file without attempting to render, set this argument to `None`.

context: **`None`**
Variables to add to the template context.

defaults: **`None`**
Default values of the `context` dict.

saltenv: **`base`**
Salt fileserver environment from which to retrieve the file. Ignored if `config_file` is not a `salt://` URL.

CLI Example:

```
salt '*' napalm.nxos_api_config 'spanning-tree mode mstp'
salt '*' napalm.nxos_api_config config_file=https://bit.ly/2LGLcDy
↪context="{'servers': ['1.2.3.4']}"
```

`salt.modules.napalm_mod.`**`nxos_api_rpc`**`(`*commands, method='cli', **kwargs*`)`

New in version 2019.2.0.

Execute an arbitrary RPC request via the Nexus API.

commands
The RPC commands to be executed.

method: `cli`
The type of the response, i.e., raw text (`cli_ascii`) or structured document (`cli`). Defaults to `cli` (structured data).

CLI Example:

```
salt '*' napalm.nxos_api_rpc 'show version'
```

`salt.modules.napalm_mod.`**`nxos_api_show`**(*commands*, *raw_text=True*, ***kwargs*)

New in version 2019.2.0.

Execute one or more show (non-configuration) commands.

commands
The commands to be executed.

raw_text: `True`
Whether to return raw text or structured data.

CLI Example:

```
salt '*' napalm.nxos_api_show 'show version'
salt '*' napalm.nxos_api_show 'show bgp sessions' 'show processes' raw_
↪text=False
```

`salt.modules.napalm_mod.`**`pyeapi_call`**(*method*, **args*, ***kwargs*)

New in version 2019.2.0.

Invoke an arbitrary method from the `pyeapi` library. This function forwards the existing connection details to the `pyeapi.run_commands` execution function.

method
The name of the `pyeapi` method to invoke.

kwargs
Key-value arguments to send to the `pyeapi` method.

CLI Example:

```
salt '*' napalm.pyeapi_call run_commands 'show version' encoding=text
salt '*' napalm.pyeapi_call get_config as_string=True
```

`salt.modules.napalm_mod.`**`pyeapi_config`**(*commands=None*, *config_file=None*, *template_engine='jinja'*, *context=None*, *defaults=None*, *saltenv='base'*, ***kwargs*)

New in version 2019.2.0.

Configures the Arista switch with the specified commands, via the `pyeapi` library. This function forwards the existing connection details to the `pyeapi.run_commands` execution function.

commands
The list of configuration commands to load on the Arista switch.

Note: This argument is ignored when `config_file` is specified.

---

config_file
The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`
- `https://`
- `ftp:/`
- `s3:/`
- `swift://`

template_engine: `jinja`
The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file without attempting to render, set this argument to `None`.

context: `None`
Variables to add to the template context.

defaults: `None`
Default values of the `context` dict.

saltenv: `base`
Salt fileserver environment from which to retrieve the file. Ignored if `config_file` is not a `salt://` URL.

CLI Example:

```
salt '*' napalm.pyeapi_config 'ntp server 1.2.3.4'
```

`salt.modules.napalm_mod.`**`pyeapi_nxos_api_args`**`(`***prev_kwargs*`)`

New in version 2019.2.0.

Return the key-value arguments used for the authentication arguments for the `pyeapi execution module`.

CLI Example:

```
salt '*' napalm.pyeapi_nxos_api_args
```

`salt.modules.napalm_mod.`**`pyeapi_run_commands`**`(`**commands, **kwargs*`)`

Execute a list of commands on the Arista switch, via the `pyeapi` library. This function forwards the existing connection details to the `pyeapi.run_commands` execution function.

commands
A list of commands to execute.

encoding: `json`
The requested encoding of the command output. Valid values for encoding are `json` (default) or `text`.

CLI Example:

```
salt '*' napalm.pyeapi_run_commands 'show version' encoding=text
salt '*' napalm.pyeapi_run_commands 'show ip bgp neighbors'
```

`salt.modules.napalm_mod.`**`reconnect`**`(`*force=False, **kwargs*`)`

Reconnect the NAPALM proxy when the connection is dropped by the network device. The connection can be forced to be restarted using the `force` argument.

Note: This function can be used only when running proxy minions.

CLI Example:

```
salt '*' napalm.reconnect
salt '*' napalm.reconnect force=True
```

`salt.modules.napalm_mod.`**`rpc`**(*command*, ***kwargs*)

New in version 2019.2.0.

This is a wrapper to execute RPC requests on various network operating systems supported by NAPALM, invoking the following functions for the NAPALM native drivers:

- *`napalm.junos_rpc`* for `junos`
- *`napalm.pyeapi_run_commands`* for `eos`
- *`napalm.nxos_api_rpc`* for `nxos`
- *`napalm.netmiko_commands`* for `ios`, `iosxr`, and `nxos_ssh`

command
The RPC command to execute. This depends on the nature of the operating system.

kwargs
Key-value arguments to be sent to the underlying Execution function.

The function capabilities are extensible in the user environment via the `napalm_rpc_map` configuration option / Pillar, e.g.,

```
napalm_rpc_map:
  f5: napalm.netmiko_commands
  panos: panos.call
```

The mapping above reads: when the NAPALM `os` Grain is `f5`, then call `napalm.netmiko_commands` for RPC requests.

By default, if the user does not specify any map, non-native NAPALM drivers will invoke the `napalm.netmiko_commands` Execution function.

CLI Example:

```
salt '*' napalm.rpc 'show version'
salt '*' napalm.rpc get-interfaces
```

`salt.modules.napalm_mod.`**`scp_get`**(*remote_path*, *local_path=''*, *recursive=False*, *preserve_times=False*, ***kwargs*)

New in version 2019.2.0.

Transfer files and directories from remote network device to the localhost of the Minion.

Note: This function is only available only when the underlying library scp is installed. See *`scp module`* for more details.

---

remote_path
Path to retrieve from remote host. Since this is evaluated by scp on the remote host, shell wildcards and environment variables may be used.

recursive: `False`
Transfer files and directories recursively.

preserve_times: `False`
Preserve `mtime` and `atime` of transferred files and directories.

passphrase
Used for decrypting private keys.

pkey
An optional private key to use for authentication.

key_filename
The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.

timeout
An optional timeout (in seconds) for the TCP connect.

socket_timeout: `10`
The channel socket timeout in seconds.

buff_size: `16384`
The size of the SCP send buffer.

allow_agent: `True`
Set to `False` to disable connecting to the SSH agent.

look_for_keys: `True`
Set to `False` to disable searching for discoverable private key files in `~/.ssh/`

banner_timeout
An optional timeout (in seconds) to wait for the SSH banner to be presented.

auth_timeout
An optional timeout (in seconds) to wait for an authentication response.

auto_add_policy: `False`
Automatically add the host to the `known_hosts`.

CLI Example:

```
salt '*' napalm.scp_get /var/tmp/file /tmp/file auto_add_policy=True
```

`salt.modules.napalm_mod.`**`scp_put`**(*files*, *remote_path=None*, *recursive=False*, *preserve_times=False*, *saltenv='base'*, ***kwargs*)

New in version 2019.2.0.

Transfer files and directories to remote network device.

Note: This function is only available only when the underlying library scp is installed. See *scp module* for more details.

files
A single path or a list of paths to be transferred.

remote_path
The path on the remote device where to store the files.

recursive: `True`
Transfer files and directories recursively.

preserve_times: `False`
Preserve `mtime` and `atime` of transferred files and directories.

saltenv: `base`
The name of the Salt environment. Ignored when `files` is not a `salt://` URL.

hostname
The hostname of the remote device.

port: `22`
The port of the remote device.

username
The username required for SSH authentication on the device.

password
Used for password authentication. It is also used for private key decryption if `passphrase` is not given.

passphrase
Used for decrypting private keys.

pkey
An optional private key to use for authentication.

key_filename
The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.

timeout
An optional timeout (in seconds) for the TCP connect.

socket_timeout: `10`
The channel socket timeout in seconds.

buff_size: `16384`
The size of the SCP send buffer.

allow_agent: `True`
Set to `False` to disable connecting to the SSH agent.

look_for_keys: `True`
Set to `False` to disable searching for discoverable private key files in `~/.ssh/`

banner_timeout
An optional timeout (in seconds) to wait for the SSH banner to be presented.

auth_timeout
An optional timeout (in seconds) to wait for an authentication response.

auto_add_policy: `False`
Automatically add the host to the `known_hosts`.

CLI Example:

```
salt '*' napalm.scp_put /path/to/file /var/tmp/file auto_add_policy=True
```

26.6.121 salt.modules.napalm_netacl

NAPALM ACL

Generate and load ACL (firewall) configuration on network devices.

New in version 2017.7.0.

codeauthor
Mircea Ulinic <ping@mirceaulinic.net>

maturity
new

depends
capirca, napalm

platform
unix

Dependencies

The firewall configuration is generated by Capirca.

To install Capirca, execute: `pip install capirca`.

To be able to load configuration on network devices, it requires NAPALM library to be installed: `pip install napalm`. Please check Installation for complete details.

`salt.modules.napalm_netacl.`**`get_filter_pillar`**(*filter_name*, *pillar_key='acl'*, *pillarenv=None*, *saltenv=None*)

Helper that can be used inside a state SLS, in order to get the filter configuration given its name.

filter_name
The name of the filter.

pillar_key
The root key of the whole policy config.

pillarenv
Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv
Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

`salt.modules.napalm_netacl.`**`get_term_pillar`**(*filter_name*, *term_name*, *pillar_key='acl'*, *pillarenv=None*, *saltenv=None*)

Helper that can be used inside a state SLS, in order to get the term configuration given its name, under a certain filter uniquely identified by its name.

filter_name
The name of the filter.

term_name
The name of the term.

pillar_key: `acl`
The root key of the whole policy config. Default: `acl`.

pillarenv
Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv
Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

`salt.modules.napalm_netacl.`**`load_filter_config`**(*filter_name, filter_options=None, terms=None, prepend=True, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=True, only_lower_merge=False, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d', test=False, commit=True, debug=False, **kwargs*)

Generate and load the configuration of a policy filter.

Note: The order of the terms is very important. The configuration loaded on the device respects the order defined in the `terms` and/or inside the pillar.

When merging the `terms` with the pillar data, consider the `prepend` argument to make sure the order is correct!

---

filter_name
The name of the policy filter.

filter_options
Additional filter options. These options are platform-specific. See the complete list of options.

terms
List of terms for this policy filter. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

prepend: **`True`**
When `merge_pillar` is set as `True`, the final list of terms generated by merging the terms from `terms` with those defined in the pillar (if any): new terms are prepended at the beginning, while existing ones will preserve the position. To add the new terms at the end of the list, set this argument to `False`.

pillar_key: **`acl`**
The key in the pillar containing the default attributes values. Default: `acl`.

pillarenv
Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv
Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

merge_pillar: **`True`**
Merge the CLI variables with the pillar. Default: `True`.

The merge logic depends on the `prepend` argument and the CLI has higher priority than the pillar.

only_lower_merge: **`False`**
Specify if it should merge only the terms fields. Otherwise it will try to merge also filters fields. Default: `False`. This option requires `merge_pillar`, otherwise it is ignored.

revision_id
Add a comment in the filter config having the description for the changes applied.

revision_no
The revision count.

revision_date: `True`
Boolean flag: display the date when the filter configuration was generated. Default: `True`.

revision_date_format: `%Y/%m/%d`
The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

test: `False`
Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: `True`
Commit? Default: `True`.

debug: `False`
Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

The output is a dictionary having the same form as *net.load_config*.

CLI Example:

```
salt 'edge01.bjm01' netacl.load_filter_config my-filter pillar_key=netacl
↪debug=True
```

Output Example:

```
edge01.bjm01:
    ----------
    already_configured:
        False
    comment:
    diff:
        [edit firewall]
        +    family inet {
        +        /*
        +         ** $Date: 2017/03/22 $
        +         **
        +         */
        +        filter my-filter {
        +            interface-specific;
        +            term my-term {
        +                from {
        +                    source-port [ 1234 1235 ];
        +                }
        +                then {
        +                    reject;
        +                }
        +            }
        +            term my-other-term {
        +                from {
        +                    protocol tcp;
        +                    source-port 5678-5680;
        +                }
```

(continues on next page)

(continued from previous page)

```
        +                then accept;
        +            }
        +        }
        +    }
    loaded_config:
        firewall {
            family inet {
                replace:
                /*
                ** $Date: 2017/03/22 $
                **
                */
                filter my-filter {
                    interface-specific;
                    term my-term {
                        from {
                            source-port [ 1234 1235 ];
                        }
                        then {
                            reject;
                        }
                    }
                    term my-other-term {
                        from {
                            protocol tcp;
                            source-port 5678-5680;
                        }
                        then accept;
                    }
                }
            }
        }
    result:
        True
```

The filter configuration has been loaded from the pillar, having the following structure:

```
netacl:
  - my-filter:
      terms:
        - my-term:
            source_port:
             - 1234
             - 1235
            action: reject
        - my-other-term:
            source_port:
              - - 5678
                - 5680
            protocol: tcp
            action: accept
```

`salt.modules.napalm_netacl.`**`load_policy_config`**(*filters=None*, *prepend=True*, *pillar_key='acl'*, *pillarenv=None*, *saltenv=None*, *merge_pillar=True*, *only_lower_merge=False*, *revision_id=None*, *revision_no=None*, *revision_date=True*, *revision_date_format='%Y/%m/%d'*, *test=False*, *commit=True*, *debug=False*, ***kwargs*)

Generate and load the configuration of the whole policy.

Note: The order of the filters and their terms is very important. The configuration loaded on the device respects the order defined in the `filters` and/or inside the pillar.

When merging the `filters` with the pillar data, consider the `prepend` argument to make sure the order is correct!

---

filters
List of filters for this policy. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

prepend: `True`
When `merge_pillar` is set as `True`, the final list of filters generated by merging the filters from `filters` with those defined in the pillar (if any): new filters are prepended at the beginning, while existing ones will preserve the position. To add the new filters at the end of the list, set this argument to `False`.

pillar_key: `acl`
The key in the pillar containing the default attributes values. Default: `acl`.

pillarenv
Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv
Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

merge_pillar: `True`
Merge the CLI variables with the pillar. Default: `True`.

The merge logic depends on the `prepend` argument and the CLI has higher priority than the pillar.

only_lower_merge: `False`
Specify if it should merge only the filters and terms fields. Otherwise it will try to merge everything at the policy level. Default: `False`. This option requires `merge_pillar`, otherwise it is ignored.

revision_id
Add a comment in the policy config having the description for the changes applied.

revision_no
The revision count.

revision_date: `True`
Boolean flag: display the date when the policy configuration was generated. Default: `True`.

revision_date_format: `%Y/%m/%d`
The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

test: `False`
Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: `True`
Commit? Default: `True`.

debug: `False`
Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

The output is a dictionary having the same form as *net.load_config*.

CLI Example:

```
salt 'edge01.flw01' netacl.load_policy_config debug=True
```

Output Example:

```
edge01.flw01:
    ----------
    already_configured:
        False

The policy configuration has been loaded from the pillar, having the following structure:

```
acl:
  - my-filter:
      terms:
        - my-term:
            source_port:
             - 1234
             - 1235
            protocol:
              - tcp
              - udp
            source_address: 1.2.3.4
            action: reject
        - my-other-term:
            source_port:
              - [5678, 5680]
            protocol: tcp
            action: accept
  - block-icmp:
      terms:
        - first-term:
            protocol:
              - icmp
            action: reject
```

`salt.modules.napalm_netacl.`**`load_term_config`**(*filter_name, term_name, filter_options=None, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=True, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d', test=False, commit=True, debug=False, source_service=None, destination_service=None, **term_fields*)

Generate and load the configuration of a policy term.

filter_name
The name of the policy filter.

term_name
The name of the term.

filter_options
Additional filter options. These options are platform-specific. See the complete list of options.

pillar_key: **`acl`**
The key in the pillar containing the default attributes values. Default: `acl`. If the pillar contains the following structure:

```
firewall:
  - my-filter:
      terms:
        - my-term:
            source_port: 1234
            source_address:
                - 1.2.3.4/32
                - 5.6.7.8/32
```

The `pillar_key` field would be specified as `firewall`.

pillarenv
Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv
Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

merge_pillar: `True`
Merge the CLI variables with the pillar. Default: `True`.

The properties specified through the CLI have higher priority than the pillar.

revision_id
Add a comment in the term config having the description for the changes applied.

revision_no
The revision count.

revision_date: `True`
Boolean flag: display the date when the term configuration was generated. Default: `True`.

revision_date_format: `%Y/%m/%d`
The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

test: `False`
Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: `True`
Commit? Default: `True`.

debug: `False`
Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

source_service
A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a source_port and protocol.

As this module is available on Unix platforms only, it reads the IANA port assignment from /etc/services.

If the user requires additional shortcuts to be referenced, they can add entries under /etc/services, which can be managed using the *`file state`*.

destination_service
A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a destination_port and protocol. Allows the same options as `source_service`.

term_fields
Term attributes. To see what fields are supported, please consult the list of supported keywords. Some platforms have a few other optional keywords.

Note: The following fields are accepted (some being platform-specific):

- action
- address
- address_exclude
- comment
- counter
- expiration
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging
- log_name
- loss_priority
- option
- policer
- port
- precedence
- principals
- protocol
- protocol_except
- qos
- pan_application
- routing_instance
- source_address
- source_address_exclude
- source_port
- source_prefix
- verbatim
- packet_length
- fragment_offset

- hop_limit
- icmp_type
- ether_type
- traffic_class_count
- traffic_type
- translated
- dscp_set
- dscp_match
- dscp_except
- next_ip
- flexible_match_range
- source_prefix_except
- destination_prefix_except
- vpn
- source_tag
- destination_tag
- source_interface
- destination_interface
- flattened
- flattened_addr
- flattened_saddr
- flattened_daddr
- priority

Note: The following fields can be also a single value and a list of values:

- action
- address
- address_exclude
- comment
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging

- option
- port
- precedence
- principals
- protocol
- protocol_except
- pan_application
- source_address
- source_address_exclude
- source_port
- source_prefix
- verbatim
- icmp_type
- ether_type
- traffic_type
- dscp_match
- dscp_except
- flexible_match_range
- source_prefix_except
- destination_prefix_except
- source_tag
- destination_tag
- source_service
- destination_service

Example: `destination_address` can be either defined as:

```
destination_address: 172.17.17.1/24
```

or as a list of destination IP addresses:

```
destination_address:
    - 172.17.17.1/24
    - 172.17.19.1/24
```

or a list of services to be matched:

```
source_service:
    - ntp
    - snmp
    - ldap
    - bgpd
```

Note: The port fields `source_port` and `destination_port` can be used as above to select either a single value, either a list of values, but also they can select port ranges. Example:

```
source_port:
    - - 1000
      - 2000
    - - 3000
      - 4000
```

With the configuration above, the user is able to select the 1000-2000 and 3000-4000 source port ranges.

The output is a dictionary having the same form as *net.load_config*.

CLI Example:

```
salt 'edge01.bjm01' netacl.load_term_config filter-name term-name source_
↪address=1.2.3.4 destination_address=5.6.7.8 action=accept test=True␣
↪debug=True
```

Output Example:

```
edge01.bjm01:
    ----------
    already_configured:
        False
    comment:
        Configuration discarded.
    diff:
        [edit firewall]
        +    family inet {
        +        /*

                replace:
                /*
                ** $Date: 2017/03/22 $
                **
                */
                filter filter-name {
                    interface-specific;
                    term term-name {
                        from {
                            source-address {
                                1.2.3.4/32;
                            }
                            destination-address {
                                5.6.7.8/32;
                            }
                        }
                        then accept;
                    }
                }
            }
        }
    result:
        True
```

26.6.122 salt.modules.napalm_network

NAPALM Network

Basic methods for interaction with the network device through the virtual proxy 'napalm'.

codeauthor
Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

maturity
new

depends
napalm

platform
unix

Dependencies

- `napalm proxy minion`

New in version 2016.11.0.

Changed in version 2017.7.0.

`salt.modules.napalm_network.`**`arp`**(*interface='', ipaddr='', macaddr='', **kwargs*)

NAPALM returns a list of dictionaries with details of the ARP entries.

Parameters

- **`interface`** -- interface name to filter on
- **`ipaddr`** -- IP address to filter on
- **`macaddr`** -- MAC address to filter on

Returns

List of the entries in the ARP table

CLI Example:

```
salt '*' net.arp
salt '*' net.arp macaddr='5c:5e:ab:da:3c:f0'
```

Example output:

```
[
    {
        'interface' : 'MgmtEth0/RSP0/CPU0/0',
        'mac'       : '5c:5e:ab:da:3c:f0',
        'ip'        : '172.17.17.1',
        'age'       : 1454496274.84
    },
    {
        'interface': 'MgmtEth0/RSP0/CPU0/0',
        'mac'       : '66:0e:94:96:e0:ff',
        'ip'        : '172.17.17.2',
        'age'       : 1435641582.49
    }
]
```

`salt.modules.napalm_network.`**`blockreplace`**(*marker_start, marker_end, content='', append_if_not_found=False, prepend_if_not_found=False, show_changes=True, append_newline=False, source='running', path=None, test=False, commit=True, debug=False, replace=True*)

New in version 2019.2.0.

Replace content of the configuration source, delimited by the line markers.

A block of content delimited by comments can help you manage several lines without worrying about old entries removal.

marker_start

The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output.

marker_end
The line content identifying a line as the end of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output.

content
The content to be used between the two lines identified by `marker_start` and `marker_stop`.

append_if_not_found: **`False`**
If markers are not found and set to True then, the markers and content will be appended to the file.

prepend_if_not_found: **`False`**
If markers are not found and set to True then, the markers and content will be prepended to the file.

append_newline: **`False`**
Controls whether or not a newline is appended to the content block. If the value of this argument is `True` then a newline will be added to the content block. If it is `False`, then a newline will not be added to the content block. If it is `None` then a newline will only be added to the content block if it does not already end in a newline.

show_changes: **`True`**
Controls how changes are presented. If `True`, this function will return the of the changes made. If `False`, then it will return a boolean (`True` if any changes were made, otherwise False).

source: **`running`**
The configuration source. Choose from: `running`, `candidate`, or `startup`. Default: `running`.

path: **`None`**
Save the temporary configuration to a specific path, then read from there. This argument is optional, can be used when you prefers a particular location of the temporary file.

test: **`False`**
Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: **`True`**
Commit the configuration changes? Default: `True`.

debug: **`False`**
Debug mode. Will insert a new key in the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

replace: **`True`**
Load and replace the configuration. Default: `True`.

CLI Example:

```
salt '*' net.blockreplace 'ntp' 'interface' ''
```

`salt.modules.napalm_network.`**`cancel_commit`**`(`*jid*`)`

New in version 2019.2.0.

Cancel a commit scheduled to be executed via the `commit_in` and `commit_at` arguments from the *`net.load_template`* or *`net.load_config`* execution functions. The commit ID is displayed when the commit is scheduled via the functions named above.

CLI Example:

```
salt '*' net.cancel_commit 20180726083540640360
```

`salt.modules.napalm_network.`**`cli`**`(`**commands*, ***kwargs*`)`

Returns a dictionary with the raw output of all commands passed as arguments.

commands
List of commands to be executed on the device.

textfsm_parse: **`False`**
Try parsing the outputs using the TextFSM templates.

New in version 2018.3.0.

Note: This option can be also specified in the minion configuration file or pillar as `napalm_cli_textfsm_parse`.

---

textfsm_path
The path where the TextFSM templates can be found. This option implies the usage of the TextFSM index file. `textfsm_path` can be either absolute path on the server, either specified using the following URL mschemes: `file://`, `salt://`, `http://`, `https://`, `ftp://`, `s3://`, `swift://`.

New in version 2018.3.0.

Note: This needs to be a directory with a flat structure, having an index file (whose name can be specified using the `index_file` option) and a number of TextFSM templates.

Note: This option can be also specified in the minion configuration file or pillar as `textfsm_path`.

---

textfsm_template
The path to a certain the TextFSM template. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the template from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

New in version 2018.3.0.

textfsm_template_dict
A dictionary with the mapping between a command and the corresponding TextFSM path to use to extract the data. The TextFSM paths can be specified as in `textfsm_template`.

New in version 2018.3.0.

Note: This option can be also specified in the minion configuration file or pillar as `napalm_cli_textfsm_template_dict`.

---

platform_grain_name: **`os`**
The name of the grain used to identify the platform name in the TextFSM index file. Default: `os`.

New in version 2018.3.0.

Note: This option can be also specified in the minion configuration file or pillar as `textfsm_platform_grain`.

platform_column_name: **`Platform`**
The column name used to identify the platform, exactly as specified in the TextFSM index file. Default: `Platform`.

New in version 2018.3.0.

Note: This is field is case sensitive, make sure to assign the correct value to this option, exactly as defined in the index file.

Note: This option can be also specified in the minion configuration file or pillar as `textfsm_platform_column_name`.

index_file: **`index`**
The name of the TextFSM index file, under the `textfsm_path`. Default: `index`.

New in version 2018.3.0.

Note: This option can be also specified in the minion configuration file or pillar as `textfsm_index_file`.

saltenv: **`base`**
Salt fileserver environment from which to retrieve the file. Ignored if `textfsm_path` is not a `salt://` URL.

New in version 2018.3.0.

include_empty: **`False`**
Include empty files under the `textfsm_path`.

New in version 2018.3.0.

include_pat
Glob or regex to narrow down the files cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

New in version 2018.3.0.

exclude_pat
Glob or regex to exclude certain files from being cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

New in version 2018.3.0.

Note: If used with `include_pat`, files matching this pattern will be excluded from the subset of files defined by `include_pat`.

CLI Example:

```
salt '*' net.cli "show version" "show chassis fan"
```

CLI Example with TextFSM template:

```
salt '*' net.cli textfsm_parse=True textfsm_path=salt://textfsm/
```

Example output:

```
{
    'show version and haiku':  'Hostname: re0.edge01.arn01
                                  Model: mx480
                                  Junos: 13.3R6.5
                                    Help me, Obi-Wan
                                    I just saw Episode Two
                                    You're my only hope
                                 ',
    'show chassis fan' :   'Item                      Status   RPM    ☒
↪Measurement
                              Top Rear Fan              OK       3840   ☒
↪Spinning at intermediate-speed
                              Bottom Rear Fan           OK       3840   ☒
↪Spinning at intermediate-speed
                              Top Middle Fan            OK       3900   ☒
↪Spinning at intermediate-speed
                              Bottom Middle Fan         OK       3840   ☒
↪Spinning at intermediate-speed
                              Top Front Fan             OK       3810   ☒
↪Spinning at intermediate-speed
                              Bottom Front Fan          OK       3840   ☒
↪Spinning at intermediate-speed
                             '
}
```

Example output with TextFSM parsing:

```
{
  "comment": "",
  "result": true,
  "out": {
    "sh ver": [
      {
        "kernel": "9.1S3.5",
        "documentation": "9.1S3.5",
        "boot": "9.1S3.5",
        "crypto": "9.1S3.5",
        "chassis": "",
        "routing": "9.1S3.5",
        "base": "9.1S3.5",
        "model": "mx960"
      }
    ]
  }
}
```

`salt.modules.napalm_network.`**`commit`**`(`*inherit_napalm_device=None*, ***kwargs*`)`

Commits the configuration changes made on the network device.

CLI Example:

```
salt '*' net.commit
```

`salt.modules.napalm_network.`**`compare_config`**`(`*inherit_napalm_device=None*, ***kwargs*`)`

Returns the difference between the running config and the candidate config.

CLI Example:

```
salt '*' net.compare_config
```

`salt.modules.napalm_network.`**`config`**`(`*source=None*, ***kwargs*`)`

New in version 2017.7.0.

Return the whole configuration of the network device. By default, it will return all possible configuration sources supported by the network device. At most, there will be:

- running config
- startup config
- candidate config

To return only one of the configurations, you can use the `source` argument.

source

Which configuration type you want to display, default is all of them.

Options:

- running
- candidate
- startup

Returns

The object returned is a dictionary with the following keys:

- running (string): Representation of the native running configuration.
- **candidate (string): Representation of the native candidate configuration.** If the device doesn't differentiate between running and startup configuration this will an empty string.
- **startup (string): Representation of the native startup configuration.** If the device doesn't differentiate between running and startup configuration this will an empty string.

CLI Example:

```
salt '*' net.config
salt '*' net.config source=candidate
```

`salt.modules.napalm_network.`**`config_changed`**`(`*inherit_napalm_device=None*, ***kwargs*`)`

Will prompt if the configuration has been changed.

Returns
A tuple with a boolean that specifies if the config was changed on the device. And a string that provides more details of the reason why the configuration was not changed.

CLI Example:

```
salt '*' net.config_changed
```

`salt.modules.napalm_network.`**`config_control`**(*inherit_napalm_device=None*, ***kwargs*)

Will check if the configuration was changed. If differences found, will try to commit. In case commit unsuccessful, will try to rollback.

Returns
A tuple with a boolean that specifies if the config was changed/committed/rollbacked on the device. And a string that provides more details of the reason why the configuration was not committed properly.

CLI Example:

```
salt '*' net.config_control
```

`salt.modules.napalm_network.`**`confirm_commit`**(*jid*)

New in version 2019.2.0.

Confirm a commit scheduled to be reverted via the `revert_in` and `revert_at` arguments from the *`net.load_template`* or *`net.load_config`* execution functions. The commit ID is displayed when the commit confirmed is scheduled via the functions named above.

CLI Example:

```
salt '*' net.confirm_commit 20180726083540640360
```

`salt.modules.napalm_network.`**`connected`**(***kwargs*)

Specifies if the connection to the device succeeded.

CLI Example:

```
salt '*' net.connected
```

`salt.modules.napalm_network.`**`discard_config`**(*inherit_napalm_device=None*, ***kwargs*)

Discards the changes applied.

CLI Example:

```
salt '*' net.discard_config
```

`salt.modules.napalm_network.`**`environment`**(***kwargs*)

Returns the environment of the device.

CLI Example:

```
salt '*' net.environment
```

Example output:

```
{
    'fans': {
```

(continues on next page)

(continued from previous page)

```
        'Bottom Rear Fan': {
            'status': True
        },
        'Bottom Middle Fan': {
            'status': True
        },
        'Top Middle Fan': {
            'status': True
        },
        'Bottom Front Fan': {
            'status': True
        },
        'Top Front Fan': {
            'status': True
        },
        'Top Rear Fan': {
            'status': True
        }
    },
    'memory': {
        'available_ram': 16349,
        'used_ram': 4934
    },
    'temperature': {
       'FPC 0 Exhaust A': {
            'is_alert': False,
            'temperature': 35.0,
            'is_critical': False
        }
    },
    'cpu': {
        '1': {
            '%usage': 19.0
        },
        '0': {
            '%usage': 35.0
        }
    }
}
```

`salt.modules.napalm_network.`**`facts`**`(`*`**kwargs`*`)`

Returns characteristics of the network device. :return: a dictionary with the following keys:

- uptime - Uptime of the device in seconds.
- vendor - Manufacturer of the device.
- model - Device model.
- hostname - Hostname of the device
- fqdn - Fqdn of the device
- os_version - String with the OS version running on the device.
- serial_number - Serial number of the device

- interface_list - List of the interfaces of the device

CLI Example:

```
salt '*' net.facts
```

Example output:

```
{
    'os_version': '13.3R6.5',
    'uptime': 10117140,
    'interface_list': [
        'lc-0/0/0',
        'pfe-0/0/0',
        'pfh-0/0/0',
        'xe-0/0/0',
        'xe-0/0/1',
        'xe-0/0/2',
        'xe-0/0/3',
        'gr-0/0/10',
        'ip-0/0/10'
    ],
    'vendor': 'Juniper',
    'serial_number': 'JN131356FBFA',
    'model': 'MX480',
    'hostname': 're0.edge05.syd01',
    'fqdn': 're0.edge05.syd01'
}
```

`salt.modules.napalm_network.`**`interfaces`**`(`*`**kwargs`*`)`

Returns details of the interfaces on the device.

Returns

Returns a dictionary of dictionaries. The keys for the first dictionary will be the interfaces in the devices.

CLI Example:

```
salt '*' net.interfaces
```

Example output:

```
{
    'Management1': {
        'is_up': False,
        'is_enabled': False,
        'description': '',
        'last_flapped': -1,
        'speed': 1000,
        'mac_address': 'dead:beef:dead',
    },
    'Ethernet1':{
        'is_up': True,
        'is_enabled': True,
        'description': 'foo',
```

(continues on next page)

(continued from previous page)

```
        'last_flapped': 1429978575.1554043,
        'speed': 1000,
        'mac_address': 'beef:dead:beef',
    }
}
```

`salt.modules.napalm_network.`**`ipaddrs`**`(`***kwargs*`)`

Returns IP addresses configured on the device.

Returns

A dictionary with the IPv4 and IPv6 addresses of the interfaces. Returns all configured IP addresses on all interfaces as a dictionary of dictionaries. Keys of the main dictionary represent the name of the interface. Values of the main dictionary represent are dictionaries that may consist of two keys 'ipv4' and 'ipv6' (one, both or none) which are themselvs dictionaries with the IP addresses as keys.

CLI Example:

```
salt '*' net.ipaddrs
```

Example output:

```
{
    'FastEthernet8': {
        'ipv4': {
            '10.66.43.169': {
                'prefix_length': 22
            }
        }
    },
    'Loopback555': {
        'ipv4': {
            '192.168.1.1': {
                'prefix_length': 24
            }
        },
        'ipv6': {
            '1::1': {
                'prefix_length': 64
            },
            '2001:DB8:1::1': {
                'prefix_length': 64
            },
            'FE80::3': {
                'prefix_length': 'N/A'
            }
        }
    }
}
```

`salt.modules.napalm_network.`**`lldp`**`(`*interface='', **kwargs*`)`

Returns a detailed view of the LLDP neighbors.

Parameters

interface -- interface name to filter on

Returns
A dictionary with the LLDL neighbors. The keys are the interfaces with LLDP activated on.

CLI Example:

```
salt '*' net.lldp
salt '*' net.lldp interface='TenGigE0/0/0/8'
```

Example output:

```
{
    'TenGigE0/0/0/8': [
        {
            'parent_interface': 'Bundle-Ether8',
            'interface_description': 'TenGigE0/0/0/8',
            'remote_chassis_id': '8c60.4f69.e96c',
            'remote_system_name': 'switch',
            'remote_port': 'Eth2/2/1',
            'remote_port_description': 'Ethernet2/2/1',
            'remote_system_description': 'Cisco Nexus Operating System␣
↪(NX-OS) Software 7.1(0)N1(1a)
                  TAC support: http://www.cisco.com/tac
                  Copyright (c) 2002-2015, Cisco Systems, Inc. All rights␣
↪reserved.',
            'remote_system_capab': 'B, R',
            'remote_system_enable_capab': 'B'
        }
    ]
}
```

`salt.modules.napalm_network.`**`load_config`**(*filename=None, text=None, test=False, commit=True, debug=False, replace=False, commit_in=None, commit_at=None, revert_in=None, revert_at=None, commit_jid=None, inherit_napalm_device=None, saltenv='base', **kwargs*)

Applies configuration changes on the device. It can be loaded from a file or from inline string. If you send both a filename and a string containing the configuration, the file has higher precedence.

By default this function will commit the changes. If there are no changes, it does not commit and the flag `already_configured` will be set as `True` to point this out.

To avoid committing the configuration, set the argument `test` to `True` and will discard (dry run).

To keep the changes but not commit, set `commit` to `False`.

To replace the config, set `replace` to `True`.

filename
Path to the file containing the desired configuration. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the template from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`

- `swift://`

Changed in version 2018.3.0.

text
String containing the desired configuration. This argument is ignored when `filename` is specified.

test: False
Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: True
Commit? Default: `True`.

debug: False
Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

New in version 2016.11.2.

replace: False
Load and replace the configuration. Default: `False`.

New in version 2016.11.2.

commit_in: `None`
Commit the changes in a specific number of minutes / hours. Example of accepted formats: `5` (commit in 5 minutes), `2m` (commit in 2 minutes), `1h` (commit the changes in 1 hour)`, `5h30m` (commit the changes in 5 hours and 30 minutes).

Note: This feature works on any platforms, as it does not rely on the native features of the network operating system.

Note: After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the *`net.cancel_commit`* execution function, using the commit ID returned by this function.

Warning: Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

commit_at: `None`
Commit the changes at a specific time. Example of accepted formats: `1am` (will commit the changes at the next 1AM), `13:20` (will commit at 13:20), `1:20am`, etc.

Note: This feature works on any platforms, as it does not rely on the native features of the network operating system.

Note: After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the *`net.cancel_commit`* execution function, using the commit ID returned by this function.

Warning: Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

revert_in: `None`

Commit and revert the changes in a specific number of minutes / hours. Example of accepted formats: `5` (revert in 5 minutes), `2m` (revert in 2 minutes), `1h` (revert the changes in 1 hour)`, `5h30m` (revert the changes in 5 hours and 30 minutes).

Note: To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

Warning: This works on any platform, regardless if they have or don't have native capabilities to confirming a commit. However, please be *very* cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don't have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

revert_at: `None`

Commit and revert the changes at a specific time. Example of accepted formats: `1am` (will commit and revert the changes at the next 1AM), `13:20` (will commit and revert at 13:20), `1:20am`, etc.

Note: To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

Warning: This works on any platform, regardless if they have or don't have native capabilities to confirming a commit. However, please be *very* cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don't have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

saltenv: **`base`**
Specifies the Salt environment name.

New in version 2018.3.0.

Returns
a dictionary having the following keys:

- result (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- loaded_config (str): the configuration loaded on the device. Requires `debug` to be set as `True`
- diff (str): returns the config changes applied

CLI Example:

```
salt '*' net.load_config text='ntp peer 192.168.0.1'
salt '*' net.load_config filename='/absolute/path/to/your/file'
salt '*' net.load_config filename='/absolute/path/to/your/file' test=True
salt '*' net.load_config filename='/absolute/path/to/your/file'
↪commit=False
```

Example output:

```
{
    'comment': 'Configuration discarded.',
    'already_configured': False,
    'result': True,
    'diff': '[edit interfaces xe-0/0/5]+   description "Adding a
↪description";'
}
```

`salt.modules.napalm_network.`**`load_template`**(*template_name=None, template_source=None, context=None, defaults=None, template_engine='jinja', saltenv='base', template_hash=None, template_hash_name=None, skip_verify=False, test=False, commit=True, debug=False, replace=False, commit_in=None, commit_at=None, revert_in=None, revert_at=None, inherit_napalm_device=None, **template_vars*)

Renders a configuration template (default: Jinja) and loads the result on the device.

By default this function will commit the changes. If there are no changes, it does not commit, discards he config and the flag `already_configured` will be set as `True` to point this out.

To avoid committing the configuration, set the argument `test` to `True` and will discard (dry run).

To preserve the changes, set `commit` to `False`. However, this is recommended to be used only in exceptional cases when there are applied few consecutive states and/or configuration changes. Otherwise the user might forget that the config DB is locked and the candidate config buffer is not cleared/merged in the running config.

To replace the config, set `replace` to `True`.

template_name
Identifies path to the template source. The template can be either stored on the local machine, either remotely. The recommended location is under the `file_roots` as specified in the master config file. For example, let's suppose the `file_roots` is configured as:

```
file_roots:
  base:
    - /etc/salt/states
```

Placing the template under `/etc/salt/states/templates/example.jinja`, it can be used as `salt://templates/example.jinja`. Alternatively, for local files, the user can specify the absolute path. If remotely, the source can be retrieved via `http`, `https` or `ftp`.

Examples:

- `salt://my_template.jinja`
- `/absolute/path/to/my_template.jinja`
- `http://example.com/template.cheetah`
- `https:/example.com/template.mako`
- `ftp://example.com/template.py`

Changed in version 2019.2.0: This argument can now support a list of templates to be rendered. The resulting configuration text is loaded at once, as a single configuration chunk.

template_source: **None**
Inline config template to be rendered and loaded on the device.

template_hash: **None**
Hash of the template file. Format: `{hash_type: 'md5', 'hsum': <md5sum>}`

New in version 2016.11.2.

context: **None**
Overrides default context variables passed to the template.

New in version 2019.2.0.

template_hash_name: **None**
When `template_hash` refers to a remote file, this specifies the filename to look for in that file.

New in version 2016.11.2.

saltenv: **`base`**
Specifies the template environment. This will influence the relative imports inside the templates.

New in version 2016.11.2.

template_engine: jinja
The following templates engines are supported:

- `cheetah`
- `genshi`
- *`jinja`*
- *`mako`*
- *`py`*

- `wempy`

New in version 2016.11.2.

skip_verify: True
If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.11.2.

test: False
Dry run? If set to `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: True
Commit? (default: `True`)

debug: False
Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw result after the template was rendered.

New in version 2016.11.2.

replace: False
Load and replace the configuration.

New in version 2016.11.2.

commit_in: `None`
Commit the changes in a specific number of minutes / hours. Example of accepted formats: `5` (commit in 5 minutes), `2m` (commit in 2 minutes), `1h` (commit the changes in 1 hour)`, `5h30m` (commit the changes in 5 hours and 30 minutes).

Note: This feature works on any platforms, as it does not rely on the native features of the network operating system.

Note: After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the *`net.cancel_commit`* execution function, using the commit ID returned by this function.

Warning: Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

commit_at: `None`
Commit the changes at a specific time. Example of accepted formats: `1am` (will commit the changes at the next 1AM), `13:20` (will commit at 13:20), `1:20am`, etc.

Note: This feature works on any platforms, as it does not rely on the native features of the network operating system.

Note: After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the *`net.cancel_commit`* execution function, using the commit ID returned by this function.

Warning: Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

revert_in: **`None`**

Commit and revert the changes in a specific number of minutes / hours. Example of accepted formats: `5` (revert in 5 minutes), `2m` (revert in 2 minutes), `1h` (revert the changes in 1 hour)`, `5h30m` (revert the changes in 5 hours and 30 minutes).

Note: To confirm the commit, and prevent reverting the changes, you will have to execute the *`net.confirm_commit`* function, using the commit ID returned by this function.

Warning: This works on any platform, regardless if they have or don't have native capabilities to confirming a commit. However, please be *very* cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don't have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

revert_at: **`None`**

Commit and revert the changes at a specific time. Example of accepted formats: `1am` (will commit and revert the changes at the next 1AM), `13:20` (will commit and revert at 13:20), `1:20am`, etc.

Note: To confirm the commit, and prevent reverting the changes, you will have to execute the *`net.confirm_commit`* function, using the commit ID returned by this function.

Warning: This works on any platform, regardless if they have or don't have native capabilities to confirming a commit. However, please be *very* cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don't have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

> Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

defaults: None
Default variables/context passed to the template.

New in version 2016.11.2.

template_vars
Dictionary with the arguments/context to be used when the template is rendered.

Note: Do not explicitly specify this argument. This represents any other variable that will be sent to the template rendering system. Please see the examples below!

Note: It is more recommended to use the `context` argument to avoid conflicts between CLI arguments and template variables.

Returns
a dictionary having the following keys:

- result (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- loaded_config (str): the configuration loaded on the device, after rendering the template. Requires `debug` to be set as `True`
- diff (str): returns the config changes applied

The template can use variables from the `grains`, `pillar` or `opts`, for example:

```
{% set router_model = grains.get('model') -%}
{% set router_vendor = grains.get('vendor') -%}
{% set os_version = grains.get('version') -%}
{% set hostname = pillar.get('proxy', {}).get('host') -%}
{% if router_vendor|lower == 'juniper' %}
system {
    host-name {{hostname}};
}
{% elif router_vendor|lower == 'cisco' %}
hostname {{hostname}}
{% endif %}
```

CLI Examples:

```
salt '*' net.load_template set_ntp_peers peers=[192.168.0.1]  # uses
↪NAPALM default templates

# inline template:
salt -G 'os:junos' net.load_template template_source='system { host-name {
↪{host_name}}; }'         host_name='MX480.lab'

# inline template using grains info:
salt -G 'os:junos' net.load_template         template_source='system {
↪host-name {{grains.model}}.lab; }'
# if the device is a MX480, the command above will set the hostname as:
↪MX480.lab

# inline template using pillar data:
salt -G 'os:junos' net.load_template template_source='system { host-name {
↪{pillar.proxy.host}}; }'

salt '*' net.load_template https://bit.ly/2OhSgqP hostname=example  #
↪will commit
salt '*' net.load_template https://bit.ly/2OhSgqP hostname=example
↪test=True  # dry run

salt '*' net.load_template salt://templates/example.jinja debug=True  #
↪Using the salt:// URI

# render a mako template:
salt '*' net.load_template salt://templates/example.mako template_
↪engine=mako debug=True

# render remote template
salt -G 'os:junos' net.load_template http://bit.ly/2fReJg7 test=True
↪debug=True peers=['192.168.0.1']
salt -G 'os:ios' net.load_template http://bit.ly/2gKOj20 test=True
↪debug=True peers=['192.168.0.1']

# render multiple templates at once
salt '*' net.load_template "['https://bit.ly/2OhSgqP', 'salt://templates/
↪example.jinja']" context="{'hostname': 'example'}"
```

Example output:

```
{
    'comment': '',
    'already_configured': False,
    'result': True,
    'diff': '[edit system]+  host-name edge01.bjm01',
    'loaded_config': 'system { host-name edge01.bjm01; }''
}
```

`salt.modules.napalm_network.`**`mac`**(*address='', interface='', vlan=0, **kwargs*)

Returns the MAC Address Table on the device.

Parameters

- **`address`** -- MAC address to filter on
- **`interface`** -- Interface name to filter on
- **`vlan`** -- VLAN identifier

Returns

A list of dictionaries representing the entries in the MAC Address Table

CLI Example:

```
salt '*' net.mac
salt '*' net.mac vlan=10
```

Example output:

```
[
    {
        'mac'       : '00:1c:58:29:4a:71',
        'interface' : 'xe-3/0/2',
        'static'    : False,
        'active'    : True,
        'moves'     : 1,
        'vlan'      : 10,
        'last_move' : 1454417742.58
    },
    {
        'mac'       : '8c:60:4f:58:e1:c1',
        'interface' : 'xe-1/0/1',
        'static'    : False,
        'active'    : True,
        'moves'     : 2,
        'vlan'      : 42,
        'last_move' : 1453191948.11
    }
]
```

`salt.modules.napalm_network.`**`optics`**`(`*`**kwargs`*`)`

New in version 2017.7.0.

Fetches the power usage on the various transceivers installed on the network device (in dBm), and returns a view that conforms with the OpenConfig model openconfig-platform-transceiver.yang.

Returns

Returns a dictionary where the keys are as listed below:

- **intf_name (unicode)**
  - **physical_channels**
    - **channels (list of dicts)**
      - index (int)
      - **state**

        input_power

          instant (float)

          avg (float)

min (float)

max (float)

output_power

instant (float)

avg (float)

min (float)

max (float)

laser_bias_current

instant (float)

avg (float)

min (float)

max (float)

CLI Example:

```
salt '*' net.optics
```

`salt.modules.napalm_network.`**`patch`**(*patchfile*, *options=''*, *saltenv='base'*, *source_hash=None*, *show_changes=True*, *source='running'*, *path=None*, *test=False*, *commit=True*, *debug=False*, *replace=True*)

New in version 2019.2.0.

Apply a patch to the configuration source, and load the result into the running config of the device.

patchfile
A patch file to apply to the configuration source.

options
Options to pass to patch.

source_hash
If the patch file (specified via the `patchfile` argument) is an HTTP(S) or FTP URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the file if the cached copy matches the specified hash.

show_changes: **`True`**
Controls how changes are presented. If `True`, this function will return the of the changes made. If `False`, then it will return a boolean (`True` if any changes were made, otherwise False).

source: **`running`**
The configuration source. Choose from: `running`, `candidate`, or `startup`. Default: `running`.

path: **`None`**
Save the temporary configuration to a specific path, then read from there. This argument is optional, can the user prefers a particular location of the temporary file.

test: **`False`**
Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: **`True`**
Commit the configuration changes? Default: `True`.

debug: **`False`**
Debug mode. Will insert a new key in the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

replace: **`True`**
Load and replace the configuration. Default: `True`.

CLI Example:

```
salt '*' net.patch https://example.com/running_config.patch
```

`salt.modules.napalm_network.`**`ping`**(*destination*, *source=None*, *ttl=None*, *timeout=None*, *size=None*, *count=None*, *vrf=None*, ***kwargs*)

Executes a ping on the network device and returns a dictionary as a result.

destination
Hostname or IP address of remote host

source
Source address of echo request

ttl
IP time-to-live value (IPv6 hop-limit value) (1..255 hops)

timeout
Maximum wait time after sending final packet (seconds)

size
Size of request packets (0..65468 bytes)

count
Number of ping requests to send (1..2000000000 packets)

vrf
VRF (routing instance) for ping attempt

New in version 2016.11.4.

CLI Example:

```
salt '*' net.ping 8.8.8.8
salt '*' net.ping 8.8.8.8 ttl=3 size=65468
salt '*' net.ping 8.8.8.8 source=127.0.0.1 timeout=1 count=100
```

`salt.modules.napalm_network.`**`replace_pattern`**(*pattern*, *repl*, *count=0*, *flags=8*, *bufsize=1*, *append_if_not_found=False*, *prepend_if_not_found=False*, *not_found_content=None*, *search_only=False*, *show_changes=True*, *backslash_literal=False*, *source=None*, *path=None*, *test=False*, *replace=True*, *debug=False*, *commit=True*)

New in version 2019.2.0.

Replace occurrences of a pattern in the configuration source. If `show_changes` is `True`, then a diff of what changed will be returned, otherwise a `True` will be returned when changes are made, and `False` when no changes are made. This is a pure Python implementation that wraps Python's `sub()`.

pattern
A regular expression, to be matched using Python's `search()`.

repl
The replacement text.

count: `0`
Maximum number of pattern occurrences to be replaced. If count is a positive integer `n`, only `n` occurrences will be replaced, otherwise all occurrences will be replaced.

flags (list or int): `8`
A list of flags defined in the `re` module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., `['IGNORECASE', 'MULTILINE']`. Optionally, `flags` may be an int, with a value corresponding to the XOR (`|`) of all the desired flags. Defaults to 8 (which supports 'MULTILINE').

bufsize (int or str): `1`
How much of the configuration to buffer into memory at once. The default value `1` processes one line

at a time. The special value `file` may be specified which will read the entire file into memory before processing.

append_if_not_found: `False`
If set to `True`, and pattern is not found, then the content will be appended to the file.

prepend_if_not_found: `False`
If set to `True` and pattern is not found, then the content will be prepended to the file.

not_found_content
Content to use for append/prepend if not found. If None (default), uses `repl`. Useful when `repl` uses references to group in pattern.

search_only: `False`
If set to true, this no changes will be performed on the file, and this function will simply return `True` if the pattern was matched, and `False` if not.

show_changes: `True`
If `True`, return a diff of changes made. Otherwise, return `True` if changes were made, and `False` if not.

backslash_literal: `False`
Interpret backslashes as literal backslashes for the repl and not escape characters. This will help when using append/prepend so that the backslashes are not interpreted for the repl on the second run of the state.

source: `running`
The configuration source. Choose from: `running`, `candidate`, or `startup`. Default: `running`.

path
Save the temporary configuration to a specific path, then read from there.

test: `False`
Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: `True`
Commit the configuration changes? Default: `True`.

debug: `False`
Debug mode. Will insert a new key in the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

replace: `True`
Load and replace the configuration. Default: `True`.

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' net.replace_pattern "bind-address\s*=" "bind-address:"
```

CLI Example:

```
salt '*' net.replace_pattern PREFIX-LIST_NAME new-prefix-list-name
salt '*' net.replace_pattern bgp-group-name new-bgp-group-name count=1
```

`salt.modules.napalm_network.`**`rollback`**(*inherit_napalm_device=None*, ***kwargs*)

Rollbacks the configuration.

CLI Example:

```
salt '*' net.rollback
```

`salt.modules.napalm_network.`**`save_config`**(*source=None*, *path=None*)

New in version 2019.2.0.

Save the configuration to a file on the local file system.

source: `running`
The configuration source. Choose from: `running`, `candidate`, `startup`. Default: `running`.

path
Absolute path to file where to save the configuration. To push the files to the Master, use *`cp.push`* Execution function.

CLI Example:

```
salt '*' net.save_config source=running
```

`salt.modules.napalm_network.`**`traceroute`**(*destination*, *source=None*, *ttl=None*, *timeout=None*, *vrf=None*, ***kwargs*)

Calls the method traceroute from the NAPALM driver object and returns a dictionary with the result of the traceroute command executed on the device.

destination
Hostname or address of remote host

source
Source address to use in outgoing traceroute packets

ttl
IP maximum time-to-live value (or IPv6 maximum hop-limit value)

timeout
Number of seconds to wait for response (seconds)

vrf
VRF (routing instance) for traceroute attempt

New in version 2016.11.4.

CLI Example:

```
salt '*' net.traceroute 8.8.8.8
salt '*' net.traceroute 8.8.8.8 source=127.0.0.1 ttl=5 timeout=1
```

26.6.123 salt.modules.napalm_ntp

NAPALM NTP

Manages NTP on network devices.

codeauthor
Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

maturity
new

depends
napalm

platform
unix

Dependencies

- `NAPALM proxy minion`
- *`NET basic features`*

See also:

`NTP peers management state`

New in version 2016.11.0.

`salt.modules.napalm_ntp.`**`delete_peers`**`(`**peers*, ***options*`)`

Removes NTP peers configured on the device.

Parameters

- **`peers`** -- list of IP Addresses/Domain Names to be removed as NTP peers
- **`(bool)`** (*`commit`*) -- discard loaded config. By default `test` is False (will not dicard the changes)
- **`(bool)`** -- commit loaded config. By default `commit` is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the `commit` option. For a dry run, use the `test` argument.

CLI Example:

```
salt '*' ntp.delete_peers 8.8.8.8 time.apple.com
salt '*' ntp.delete_peers 172.17.17.1 test=True  # only displays the diff
salt '*' ntp.delete_peers 192.168.0.1 commit=False  # preserves the
↪changes, but does not commit
```

`salt.modules.napalm_ntp.`**`delete_servers`**`(`**servers*, ***options*`)`

Removes NTP servers configured on the device.

Parameters

- **`servers`** -- list of IP Addresses/Domain Names to be removed as NTP servers
- **`(bool)`** (*`commit`*) -- discard loaded config. By default `test` is False (will not dicard the changes)
- **`(bool)`** -- commit loaded config. By default `commit` is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the `commit` option. For dry run use the `test` argument.

CLI Example:

```
salt '*' ntp.delete_servers 8.8.8.8 time.apple.com
salt '*' ntp.delete_servers 172.17.17.1 test=True  # only displays the
↪diff
salt '*' ntp.delete_servers 192.168.0.1 commit=False  # preserves the
↪changes, but does not commit
```

`salt.modules.napalm_ntp.`**`peers`**`(`***kwargs*`)`

Returns a list the NTP peers configured on the network device.

Returns

configured NTP peers as list.

CLI Example:

```
salt '*' ntp.peers
```

Example output:

```
[
    '192.168.0.1',
    '172.17.17.1',
    '172.17.17.2',
    '2400:cb00:6:1024::c71b:840a'
]
```

`salt.modules.napalm_ntp.`**`servers`**`(`***kwargs*`)`

Returns a list of the configured NTP servers on the device.

CLI Example:

```
salt '*' ntp.servers
```

Example output:

```
[
    '192.168.0.1',
    '172.17.17.1',
    '172.17.17.2',
    '2400:cb00:6:1024::c71b:840a'
]
```

`salt.modules.napalm_ntp.`**`set_peers`**`(`**peers*, ***options*`)`

Configures a list of NTP peers on the device.

Parameters

- **`peers`** -- list of IP Addresses/Domain Names
- **`(bool)`** (*`test`*) -- discard loaded config. By default `test` is False (will not dicard the changes)

Commit commit (bool)

commit loaded config. By default `commit` is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the *commit* option. For dry run use the *test* argument.

CLI Example:

```
salt '*' ntp.set_peers 192.168.0.1 172.17.17.1 time.apple.com
salt '*' ntp.set_peers 172.17.17.1 test=True  # only displays the diff
salt '*' ntp.set_peers 192.168.0.1 commit=False  # preserves the changes,
↪but does not commit
```

`salt.modules.napalm_ntp.`**`set_servers`**`(`**servers*, ***options*`)`

Configures a list of NTP servers on the device.

Parameters

- **`servers`** -- list of IP Addresses/Domain Names
- **`(bool)`** (*`test`*) -- discard loaded config. By default `test` is False (will not dicard the changes)

Commit commit (bool)

commit loaded config. By default `commit` is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the *commit* option. For dry run use the *test* argument.

CLI Example:

```
salt '*' ntp.set_servers 192.168.0.1 172.17.17.1 time.apple.com
salt '*' ntp.set_servers 172.17.17.1 test=True  # only displays the diff
salt '*' ntp.set_servers 192.168.0.1 commit=False  # preserves the␣
↪changes, but does not commit
```

`salt.modules.napalm_ntp.`**`stats`**`(`*peer=None*, ***kwargs*`)`

Returns a dictionary containing synchronization details of the NTP peers.

Parameters

`peer` -- Returns only the details of a specific NTP peer.

Returns

a list of dictionaries, with the following keys:

- remote
- referenceid
- synchronized
- stratum
- type
- when
- hostpoll
- reachability
- delay
- offset
- jitter

CLI Example:

```
salt '*' ntp.stats
```

Example output:

```
[
    {
        'remote'          : '188.114.101.4',
        'referenceid'     : '188.114.100.1',
        'synchronized'    : True,
        'stratum'         : 4,
        'type'            : '-',
        'when'            : '107',
        'hostpoll'        : 256,
        'reachability'    : 377,
        'delay'           : 164.228,
        'offset'          : -13.866,
        'jitter'          : 2.695
    }
]
```

26.6.124 salt.modules.napalm_probes

NAPALM Probes

Manages RPM/SLA probes on the network device.

`Probes configuration management state`

New in version 2016.11.0.

`salt.modules.napalm_probes.`**`config`**`(`*`**kwargs`*`)`

Returns the configuration of the RPM probes.

Returns
A dictionary containing the configuration of the RPM/SLA probes.

CLI Example:

```
salt '*' probes.config
```

Output Example:

```
{
    'probe1':{
        'test1': {
            'probe_type'   : 'icmp-ping',
            'target'       : '192.168.0.1',
            'source'       : '192.168.0.2',
            'probe_count'  : 13,
            'test_interval': 3
        },
        'test2': {
            'probe_type'   : 'http-ping',
            'target'       : '172.17.17.1',
            'source'       : '192.17.17.2',
            'probe_count'  : 5,
            'test_interval': 60
        }
```

(continues on next page)

(continued from previous page)

```
    }
}
```

`salt.modules.napalm_probes.`**`delete_probes`**(*probes*, *test=False*, *commit=True*, ***kwargs*)

Removes RPM/SLA probes from the network device. Calls the configuration template 'delete_probes' from the NAPALM library, providing as input a rich formatted dictionary with the configuration details of the probes to be removed from the configuration of the device.

Parameters

- **`probes`** -- Dictionary with a similar format as the output dictionary of the function config(), where the details are not necessary.
- **`test`** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **`commit`** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises

`MergeConfigException` -- If there is an error on the configuration sent.

Returns

A dictionary having the following keys:

- result (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already_configured* flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

Input example:

```
probes = {
    'existing_probe':{
        'existing_test1': {},
        'existing_test2': {}
    }
}
```

`salt.modules.napalm_probes.`**`results`**(***kwargs*)

Provides the results of the measurements of the RPM/SLA probes.

:return a dictionary with the results of the probes.

CLI Example:

```
salt '*' probes.results
```

Output example:

```
{
    'probe1':  {
        'test1': {
            'last_test_min_delay'   : 63.120,
            'global_test_min_delay' : 62.912,
```

(continues on next page)

(continued from previous page)

```
                'current_test_avg_delay': 63.190,
                'global_test_max_delay' : 177.349,
                'current_test_max_delay': 63.302,
                'global_test_avg_delay' : 63.802,
                'last_test_avg_delay'   : 63.438,
                'last_test_max_delay'   : 65.356,
                'probe_type'            : 'icmp-ping',
                'rtt'                   : 63.138,
                'last_test_loss'        : 0,
                'round_trip_jitter'     : -59.0,
                'target'                : '192.168.0.1',
                'source'                : '192.168.0.2',
                'probe_count'           : 15,
                'current_test_min_delay': 63.138
            },
            'test2': {
                'last_test_min_delay'   : 176.384,
                'global_test_min_delay' : 169.226,
                'current_test_avg_delay': 177.098,
                'global_test_max_delay' : 292.628,
                'current_test_max_delay': 180.055,
                'global_test_avg_delay' : 177.959,
                'last_test_avg_delay'   : 177.178,
                'last_test_max_delay'   : 184.671,
                'probe_type'            : 'icmp-ping',
                'rtt'                   : 176.449,
                'last_test_loss'        : 0,
                'round_trip_jitter'     : -34.0,
                'target'                : '172.17.17.1',
                'source'                : '172.17.17.2',
                'probe_count'           : 15,
                'current_test_min_delay': 176.402
            }
        }
}
```

`salt.modules.napalm_probes.`**`schedule_probes`**(*probes*, *test=False*, *commit=True*, ***kwargs*)

Will schedule the probes. On Cisco devices, it is not enough to define the probes, it is also necessary to schedule them.

This function calls the configuration template `schedule_probes` from the NAPALM library, providing as input a rich formatted dictionary with the names of the probes and the tests to be scheduled.

Parameters

- **`probes`** -- Dictionary with a similar format as the output dictionary of the function config(), where the details are not necessary.
- **`test`** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **`commit`** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises

MergeConfigException -- If there is an error on the configuration sent.

Returns

a dictionary having the following keys:

- result (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already_configured* flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

Input example:

```
probes = {
    'new_probe':{
        'new_test1': {},
        'new_test2': {}
    }
}
```

`salt.modules.napalm_probes.`**`set_probes`**(*probes*, *test=False*, *commit=True*, ***kwargs*)

Configures RPM/SLA probes on the device. Calls the configuration template 'set_probes' from the NAPALM library, providing as input a rich formatted dictionary with the configuration details of the probes to be configured.

Parameters

- **probes** -- Dictionary formatted as the output of the function config()
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises

MergeConfigException -- If there is an error on the configuration sent.

Return a dictionary having the following keys

- result (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already_configured* flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

Input example - via state/script:

```
probes = {
    'new_probe':{
        'new_test1': {
            'probe_type'   : 'icmp-ping',
            'target'       : '192.168.0.1',
            'source'       : '192.168.0.2',
            'probe_count'  : 13,
            'test_interval': 3
        },
        'new_test2': {
```

(continues on next page)

(continued from previous page)

```
                'probe_type'    : 'http-ping',
                'target'        : '172.17.17.1',
                'source'        : '192.17.17.2',
                'probe_count'   : 5,
                'test_interval': 60
            }
        }
}
set_probes(probes)
```

CLI Example - to push changes on the fly (not recommended):

```
salt 'junos_minion' probes.set_probes "{'new_probe':{'new_test1':{'probe_
↪type':'icmp-ping',             'target':'192.168.0.1','source':'192.168.
↪0.2','probe_count':13,'test_interval':3}}}" test=True
```

Output example - for the CLI example above:

```
junos_minion:
    ----------
    already_configured:
        False
    comment:
        Configuration discarded.
    diff:
        [edit services rpm]
             probe transit { ... }
        +    probe new_probe {
        +        test new_test1 {
        +            probe-type icmp-ping;
        +            target address 192.168.0.1;
        +            probe-count 13;
        +            test-interval 3;
        +            source-address 192.168.0.2;
        +        }
        +    }
    result:
        True
```

26.6.125 salt.modules.napalm_route

NAPALM Route

Retrieves route details from network devices.

codeauthor
: Mircea Ulinic <ping@mirceaulinic.net>

maturity
: new

depends
: napalm

platform
unix

Dependencies

- `NAPALM proxy minion`

New in version 2016.11.0.

`salt.modules.napalm_route.`**`show`**(*destination*, *protocol=None*, ***kwargs*)

Displays all details for a certain route learned via a specific protocol. If the protocol is not specified, will return all possible routes.

Note: This function return the routes from the RIB. In case the destination prefix is too short, there may be too many routes matched. Therefore in cases of devices having a very high number of routes it may be necessary to adjust the prefix length and request using a longer prefix.

destination
destination prefix.

protocol (optional)
protocol used to learn the routes to the destination.

Changed in version 2017.7.0.

CLI Example:

```
salt 'my_router' route.show 172.16.0.0/25
salt 'my_router' route.show 172.16.0.0/25 bgp
```

Output example:

```
{
    '172.16.0.0/25': [
        {
            'protocol': 'BGP',
            'last_active': True,
            'current_active': True,
            'age': 1178693,
            'routing_table': 'inet.0',
            'next_hop': '192.168.0.11',
            'outgoing_interface': 'xe-1/1/1.100',
            'preference': 170,
            'selected_next_hop': False,
            'protocol_attributes': {
                'remote_as': 65001,
                'metric': 5,
                'local_as': 13335,
                'as_path': '',
                'remote_address': '192.168.0.11',
                'metric2': 0,
                'local_preference': 0,
                'communities': [
                    '0:2',
```

(continues on next page)

(continued from previous page)

                'remote_address': '192.168.0.17',
                'metric2': 0,
                'local_preference': 0,
                'communities': [
                    '0:3',
                    'no-export'
                ],
                'preference2': -1
            },
            'inactive_reason': 'Not Best in its group - Router ID'
        }
    ]
}
```

26.6.126 salt.modules.napalm_snmp

NAPALM SNMP

Manages SNMP on network devices.

codeauthor
Mircea Ulinic <ping@mirceaulinic.net>

maturity
new

depends
napalm

platform
unix

Dependencies

- `NAPALM proxy minion`
- *NET basic features*

See also:

SNMP configuration management state

New in version 2016.11.0.

`salt.modules.napalm_snmp.`**`config`**`(`*`**kwargs`*`)`

Returns the SNMP configuration

CLI Example:

```
salt '*' snmp.config
```

`salt.modules.napalm_snmp.`**`remove_config`**`(`*`chassis_id=None, community=None, contact=None, location=None, test=False, commit=True, **kwargs`*`)`

Removes a configuration element from the SNMP configuration.

Parameters

- **`chassis_id`** -- (optional) Chassis ID
- **`community`** -- (optional) A dictionary having the following optional keys:

- acl (if any policy / ACL need to be set)
- mode: rw or ro. Default: ro

Parameters

- **`contact`** -- Contact details
- **`location`** -- Location
- **`test`** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **`commit`** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises

`MergeConfigException` -- If there is an error on the configuration sent.

Returns

A dictionary having the following keys:

- result (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already_configured* flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

CLI Example:

```
salt '*' snmp.remove_config community='abcd'
```

`salt.modules.napalm_snmp.`**`update_config`**`(`*`chassis_id=None, community=None, contact=None, location=None, test=False, commit=True, **kwargs`*`)`

Updates the SNMP configuration.

Parameters

- **`chassis_id`** -- (optional) Chassis ID
- **`community`** -- (optional) A dictionary having the following optional keys:

- acl (if any policy / ACL need to be set)
- mode: rw or ro. Default: ro

Parameters

- **`contact`** -- Contact details
- **`location`** -- Location
- **`test`** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **`commit`** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises

`MergeConfigException` -- If there is an error on the configuration sent.

Return a dictionary having the following keys

- result (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already_configured* flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

CLI Example:

```
salt 'edge01.lon01' snmp.update_config location="Greenwich, UK" test=True
```

Output example (for the CLI example above):

```
edge01.lon01:
    ----------
    already_configured:
        False
    comment:
        Configuration discarded.
    diff:
        [edit snmp]
        -   location "London, UK";
        +   location "Greenwich, UK";
    result:
        True
```

26.6.127 salt.modules.napalm_users

NAPALM Users

Manages the configuration of the users on network devices.

`Users management state`

New in version 2016.11.0.

`salt.modules.napalm_users.`**`config`**`(`***kwargs*`)`

Returns the configuration of the users on the device

CLI Example:

```
salt '*' users.config
```

Output example:

```
{
    'mircea': {
        'level': 15,
        'password': '$1$0P70xKPa$4jt5/10cBTckk6I/w/',

        ]
    }
}
```

`salt.modules.napalm_users.`**`delete_users`**(*users*, *test=False*, *commit=True*, ***kwargs*)

Removes users from the configuration of network devices.

Parameters

- **`users`** -- Dictionary formatted as the output of the function config()
- **`test`** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **`commit`** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises

`MergeConfigException` -- If there is an error on the configuration sent.

Return a dictionary having the following keys

- result (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already_configured* flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

CLI Example:

```
salt '*' users.delete_users "{'mircea': {}}"
```

`salt.modules.napalm_users.`**`set_users`**(*users*, *test=False*, *commit=True*, ***kwargs*)

Configures users on network devices.

Parameters

- **`users`** -- Dictionary formatted as the output of the function config()
- **`test`** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **`commit`** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises

`MergeConfigException` -- If there is an error on the configuration sent.

Return a dictionary having the following keys

- result (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already_configured* flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

CLI Example:

```
salt '*' users.set_users "{'mircea': {}}"
```

26.6.128 salt.modules.napalm_yang_mod

NAPALM YANG

NAPALM YANG basic operations.

New in version 2017.7.0.

`salt.modules.napalm_yang_mod.`**`compliance_report`**`(`*data*, **models*, ***kwargs*`)`

Return the compliance report using YANG objects.

data
Dictionary structured with respect to the models referenced.

models
A list of models to be used when generating the config.

filepath
The absolute path to the validation file.

CLI Example:

```
salt '*' napalm_yang.compliance_report {} models.openconfig_interfaces␣
↪filepath=~/validate.yml
```

Output Example:

```
{
  "skipped": [],
  "complies": true,
  "get_interfaces_ip": {
    "missing": [],
    "complies": true,
    "present": {
      "ge-0/0/0.0": {
        "complies": true,
        "nested": true
      }
    },
    "extra": []
  }
}
```

`salt.modules.napalm_yang_mod.`**`diff`**`(`*candidate*, *running*, **models*`)`

Returns the difference between two configuration entities structured according to the YANG model.

Note: This function is recommended to be used mostly as a state helper.

---

candidate
First model to compare.

running
Second model to compare.

models
A list of models to be used when comparing.

CLI Example:

```
salt '*' napalm_yang.diff {} {} models.openconfig_interfaces
```

Output Example:

```
{
    "interfaces": {
        "interface": {
            "both": {
                "Port-Channel1": {
                    "config": {
                        "mtu": {
                            "first": "0",
                            "second": "9000"
                        }
                    }
                }
            },
            "first_only": [
                "Loopback0"
            ],
            "second_only": [
                "Loopback1"
            ]
        }
    }
}
```

`salt.modules.napalm_yang_mod.`**`get_config`**(*data*, **models*, ***kwargs*)

Return the native config.

data
Dictionary structured with respect to the models referenced.

models
A list of models to be used when generating the config.

profiles: **`None`**
Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

CLI Example:

```
salt '*' napalm_yang.get_config {} models.openconfig_interfaces
```

Output Example:

```
interface et1
    ip address 192.168.1.1/24
    description Uplink1
    mtu 9000
interface et2
    ip address 192.168.2.1/24
    description Uplink2
    mtu 9000
```

`salt.modules.napalm_yang_mod.`**`load_config`**(*data*, **models*, ***kwargs*)

Generate and load the config on the device using the OpenConfig or IETF models and device profiles.

data
Dictionary structured with respect to the models referenced.

models
A list of models to be used when generating the config.

profiles: None
Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

test: False
Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: True
Commit? Default: `True`.

debug: False
Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

replace: False
Should replace the config with the new generate one?

CLI Example:

```
salt '*' napalm_yang.load_config {} models.openconfig_interfaces␣
↪test=True debug=True
```

Output Example:

```
device1:
    ----------
    already_configured:
        False
    comment:
    diff:
        [edit interfaces ge-0/0/0]
        -   mtu 1400;
        [edit interfaces ge-0/0/0 unit 0 family inet]
        -       dhcp;
        [edit interfaces lo0]
        -    unit 0 {
        -        description lo0.0;
        -    }
        +    unit 1 {
        +        description "new loopback";
        +    }
    loaded_config:
        <configuration>
          <interfaces replace="replace">

                <description>new loopback</description>
              </unit>
              <description>lo0</description>
            </interface>
          </interfaces>
        </configuration>
    result:
        True
```

salt.modules.napalm_yang_mod.**parse**(**models*, ***kwargs*)

Parse configuration from the device.

models
A list of models to be used when parsing.

config: **False**
Parse config.

state: **False**
Parse state.

profiles: **None**
Use certain profiles to parse. If not specified, will use the device default profile(s).

CLI Example:

```
salt '*' napalm_yang.parse models.openconfig_interfaces
```

Output Example:

```
{
    "interfaces": {
        "interface": {
            ".local.": {
                "name": ".local.",

```

26.6.129 salt.modules.netaddress

Module for getting information about network addresses.

New in version 2016.3.0.

depends
netaddr

`salt.modules.netaddress.`**`cidr_broadcast`**`(`*`cidr`*`)`

Get the broadcast address associated with a CIDR address.

CLI Example:

```
salt myminion netaddress.cidr_netmask 192.168.0.0/20
```

`salt.modules.netaddress.`**`cidr_netmask`**`(`*`cidr`*`)`

Get the netmask address associated with a CIDR address.

CLI Example:

```
salt myminion netaddress.cidr_netmask 192.168.0.0/20
```

`salt.modules.netaddress.`**`list_cidr_ips`**`(`*`cidr`*`)`

Get a list of IP addresses from a CIDR.

CLI Example:

```
salt myminion netaddress.list_cidr_ips 192.168.0.0/20
```

`salt.modules.netaddress.`**`list_cidr_ips_ipv6`**`(`*`cidr`*`)`

Get a list of IPv6 addresses from a CIDR.

CLI Example:

```
salt myminion netaddress.list_cidr_ips_ipv6 192.168.0.0/20
```

26.6.130 salt.modules.network

Module for gathering and managing network information

`salt.modules.network.`**`active_tcp`**`()`

Return a dict containing information on all of the running TCP connections (currently linux and solaris only)

Changed in version 2015.8.4: Added support for SunOS

CLI Example:

```
salt '*' network.active_tcp
```

salt.modules.network.**arp**()

Return the arp table from the minion

Changed in version 2015.8.0: Added support for SunOS

CLI Example:

```
salt '*' network.arp
```

salt.modules.network.**calc_net**(*ip_addr*, *netmask=None*)

Returns the CIDR of a subnet based on an IP address (CIDR notation supported) and optional netmask.

CLI Example:

```
salt '*' network.calc_net 172.17.0.5 255.255.255.240
salt '*' network.calc_net 2a02:f6e:a000:80:84d8:8332:7866:4e07/64
```

New in version 2015.8.0.

salt.modules.network.**connect**(*host*, *port=None*, ***kwargs*)

Test connectivity to a host using a particular port from the minion.

New in version 2014.7.0.

CLI Example:

```
salt '*' network.connect archlinux.org 80

salt '*' network.connect archlinux.org 80 timeout=3

salt '*' network.connect archlinux.org 80 timeout=3 family=ipv4

salt '*' network.connect google-public-dns-a.google.com port=53 proto=udp
↪timeout=3
```

salt.modules.network.**convert_cidr**(*cidr*)

returns the network address, subnet mask and broadcast address of a cidr address

New in version 2016.3.0.

CLI Example:

```
salt '*' network.convert_cidr 172.31.0.0/16
```

salt.modules.network.**default_route**(*family=None*)

Return default route(s) from routing table

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.default_route
```

salt.modules.network.**dig**(*host*)

Performs a DNS lookup with dig

CLI Example:

```
salt '*' network.dig archlinux.org
```

salt.modules.network.**fqdns**()

Return all known FQDNs for the system by enumerating all interfaces and then trying to reverse resolve them (excluding 'lo' interface).

CLI Example:

```
salt '*' network.fqdns
```

salt.modules.network.**get_bufsize**(*iface*)

Return network buffer sizes as a dict (currently linux only)

CLI Example:

```
salt '*' network.get_bufsize eth0
```

salt.modules.network.**get_fqdn**()

Get fully qualified domain name

CLI Example:

```
salt '*' network.get_fqdn
```

salt.modules.network.**get_hostname**()

Get hostname

CLI Example:

```
salt '*' network.get_hostname
```

salt.modules.network.**get_route**(*ip*)

Return routing information for given destination ip

New in version 2015.5.3.

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS) Added support for OpenBSD

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.get_route 10.10.10.10
```

salt.modules.network.**hw_addr**(*iface*)

Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```
salt '*' network.hw_addr eth0
```

salt.modules.network.**hwaddr**(*iface*)

This function is an alias of `hw_addr`.

> Return the hardware address (a.k.a. MAC address) for a given interface
>
> CLI Example:

```
salt '*' network.hw_addr eth0
```

`salt.modules.network.`**`ifacestartswith`**(*cidr*)

Retrieve the interface name from a specific CIDR

New in version 2016.11.0.

CLI Example:

```
salt '*' network.ifacestartswith 10.0
```

`salt.modules.network.`**`in_subnet`**(*cidr*)

Returns True if host is within specified subnet, otherwise False.

CLI Example:

```
salt '*' network.in_subnet 10.0.0.0/16
```

`salt.modules.network.`**`interface`**(*iface*)

Return the inet address for a given interface

New in version 2014.7.0.

CLI Example:

```
salt '*' network.interface eth0
```

`salt.modules.network.`**`interface_ip`**(*iface*)

Return the inet address for a given interface

New in version 2014.7.0.

CLI Example:

```
salt '*' network.interface_ip eth0
```

`salt.modules.network.`**`interfaces`**()

Return a dictionary of information about all the interfaces on the minion

CLI Example:

```
salt '*' network.interfaces
```

`salt.modules.network.`**`ip_addrs`**(*interface=None*, *include_loopback=False*, *cidr=None*, *type=None*)

Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless 'include_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="10.0.0.0/8"' will return only the addresses which are within that subnet. If 'type' is 'public', then only public addresses will be returned. Ditto for 'type'='private'.

Changed in version 3001: `interface` can now be a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```
salt '*' network.ip_addrs
```

`salt.modules.network.`**`ip_addrs6`**`(`*interface=None, include_loopback=False, cidr=None*`)`

Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless 'include_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="2000::/3"' will return only the addresses which are within that subnet.

Changed in version 3001: `interface` can now be a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```
salt '*' network.ip_addrs6
```

`salt.modules.network.`**`ip_in_subnet`**`(`*ip_addr, cidr*`)`

Returns True if given IP is within specified subnet, otherwise False.

CLI Example:

```
salt '*' network.ip_in_subnet 172.17.0.4 172.16.0.0/12
```

`salt.modules.network.`**`ip_neighs`**`()`

Return the ip neighbour (arp) table from the minion for IPv4 addresses

New in version 3007.0.

CLI Example:

```
salt '*' network.ip_neighs
```

`salt.modules.network.`**`ip_neighs6`**`()`

Return the ip neighbour (arp) table from the minion for IPv6 addresses

New in version 3007.0.

CLI Example:

```
salt '*' network.ip_neighs6
```

`salt.modules.network.`**`ip_networks`**`(`*interface=None, include_loopback=False, verbose=False*`)`

New in version 3001.

Returns a list of IPv4 networks to which the minion belongs.

interface
Restrict results to the specified interface(s). This value can be either a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```
salt '*' network.ip_networks
salt '*' network.ip_networks interface=docker0
salt '*' network.ip_networks interface=docker0,enp*
salt '*' network.ip_networks interface=eth*
```

`salt.modules.network.`**`ip_networks6`**`(`*interface=None, include_loopback=False, verbose=False*`)`

New in version 3001.

Returns a list of IPv6 networks to which the minion belongs.

interface
Restrict results to the specified interface(s). This value can be either a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```
salt '*' network.ip_networks6
salt '*' network.ip_networks6 interface=docker0
salt '*' network.ip_networks6 interface=docker0,enp*
salt '*' network.ip_networks6 interface=eth*
```

`salt.modules.network.`**`ipaddrs`**`(`*interface=None*, *include_loopback=False*, *cidr=None*, *type=None*`)`

This function is an alias of `ip_addrs`.

Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless 'include_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="10.0.0.0/8"' will return only the addresses which are within that subnet. If 'type' is 'public', then only public addresses will be returned. Ditto for 'type'='private'.

Changed in version 3001: `interface` can now be a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```
salt '*' network.ip_addrs
```

`salt.modules.network.`**`ipaddrs6`**`(`*interface=None*, *include_loopback=False*, *cidr=None*`)`

This function is an alias of `ip_addrs6`.

Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless 'include_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="2000::/3"' will return only the addresses which are within that subnet.

Changed in version 3001: `interface` can now be a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```
salt '*' network.ip_addrs6
```

`salt.modules.network.`**`iphexval`**`(`*ip*`)`

Retrieve the hexadecimal representation of an IP address

New in version 2016.11.0.

CLI Example:

```
salt '*' network.iphexval 10.0.0.1
```

`salt.modules.network.`**`ipneighs`**`()`

This function is an alias of `ip_neighs`.

Return the ip neighbour (arp) table from the minion for IPv4 addresses

New in version 3007.0.

CLI Example:

```
salt '*' network.ip_neighs
```

`salt.modules.network.`**`ipneighs6`**`()`

This function is an alias of `ip_neighs6`.

Return the ip neighbour (arp) table from the minion for IPv6 addresses

New in version 3007.0.

CLI Example:

```
salt '*' network.ip_neighs6
```

salt.modules.network.**is_loopback**(*ip_addr*)

Check if the given IP address is a loopback address

New in version 2014.7.0.

Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.is_loopback 127.0.0.1
```

salt.modules.network.**is_private**(*ip_addr*)

Check if the given IP address is a private address

New in version 2014.7.0.

Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.is_private 10.0.0.3
```

salt.modules.network.**mod_bufsize**(*iface*, **args*, ***kwargs*)

Modify network interface buffers (currently linux only)

CLI Example:

```
salt '*' network.mod_bufsize tx=<val> rx=<val> rx-mini=<val> rx-jumbo=
↪<val>
```

salt.modules.network.**mod_hostname**(*hostname*)

Modify hostname

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

CLI Example:

```
salt '*' network.mod_hostname master.saltstack.com
```

salt.modules.network.**netstat**()

Return information on open ports and states

Note: On BSD minions, the output contains PID info (where available) for each netstat entry, fetched from sockstat/fstat output.

Changed in version 2014.1.4: Added support for OpenBSD, FreeBSD, and NetBSD

Changed in version 2015.8.0: Added support for SunOS

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.netstat
```

`salt.modules.network.`**`ping`**(*host*, *timeout=False*, *return_boolean=False*)

Performs an ICMP ping to a host

Changed in version 2015.8.0: Added support for SunOS

CLI Example:

```
salt '*' network.ping archlinux.org
```

New in version 2015.5.0.

Return a True or False instead of ping output.

```
salt '*' network.ping archlinux.org return_boolean=True
```

Set the time to wait for a response in seconds.

```
salt '*' network.ping archlinux.org timeout=3
```

`salt.modules.network.`**`reverse_ip`**(*ip_addr*)

Returns the reversed IP address

Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.reverse_ip 172.17.0.4
```

`salt.modules.network.`**`routes`**(*family=None*)

Return currently configured routes from routing table

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.routes
```

`salt.modules.network.`**`subnets`**(*interfaces=None*)

Returns a list of IPv4 subnets to which the host belongs

CLI Example:

```
salt '*' network.subnets
salt '*' network.subnets interfaces=eth1
```

`salt.modules.network.`**`subnets6`**()

Returns a list of IPv6 subnets to which the host belongs

CLI Example:

```
salt '*' network.subnets
```

`salt.modules.network.`**`traceroute`**`(`*host*`)`

Performs a traceroute to a 3rd party host

Changed in version 2015.8.0: Added support for SunOS

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.traceroute archlinux.org
```

`salt.modules.network.`**`wol`**`(`*mac, bcast='255.255.255.255', destport=9*`)`

Send Wake On Lan packet to a host

CLI Example:

```
salt '*' network.wol 08-00-27-13-69-77
salt '*' network.wol 080027136977 255.255.255.255 7
salt '*' network.wol 08:00:27:13:69:77 255.255.255.255 7
```

26.6.131 salt.modules.nfs3

Module for managing NFS version 3.

`salt.modules.nfs3.`**`add_export`**`(`*exports='/etc/exports', path=None, hosts=None, options=None*`)`

Add an export

CLI Example:

```
salt '*' nfs3.add_export path='/srv/test' hosts='127.0.0.1' options=['rw']
```

`salt.modules.nfs3.`**`del_export`**`(`*exports='/etc/exports', path=None*`)`

Remove an export

CLI Example:

```
salt '*' nfs.del_export /media/storage
```

`salt.modules.nfs3.`**`list_exports`**`(`*exports='/etc/exports'*`)`

List configured exports

CLI Example:

```
salt '*' nfs.list_exports
```

`salt.modules.nfs3.`**`reload_exports`**`()`

Trigger a reload of the exports file to apply changes

CLI Example:

```
salt '*' nfs3.reload_exports
```

26.6.132 salt.modules.nftables

Support for nftables

`salt.modules.nftables.`**`append`**(*table='filter', chain=None, rule=None, family='ipv4'*)

Append a rule to the specified table & chain.

This function accepts a rule in a standard nftables command format,
starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' nftables.append filter input \
    rule='tcp dport 22 log accept'

IPv6:
salt '*' nftables.append filter input \
    rule='tcp dport 22 log accept' \
    family=ipv6
```

`salt.modules.nftables.`**`build_rule`**(*table=None, chain=None, command=None, position='', full=None, family='ipv4', **kwargs*)

Build a well-formatted nftables rule based on kwargs. A *table* and *chain* are not required, unless *full* is True.

If *full* is *True*, then *table*, *chain* and *command* are required. *command* may be specified as either insert, append, or delete. This will return the nftables command, exactly as it would be used from the command line.

If a position is required (as with *insert* or *delete*), it may be specified as *position*. This will only be useful if *full* is True.

If *connstate* is passed in, it will automatically be changed to *state*.

CLI Examples:

```
salt '*' nftables.build_rule match=state \
    connstate=RELATED,ESTABLISHED jump=ACCEPT
salt '*' nftables.build_rule filter input command=insert position=3 \
    full=True match=state state=related,established jump=accept

IPv6:
salt '*' nftables.build_rule match=state \
    connstate=related,established jump=accept \
    family=ipv6
salt '*' nftables.build_rule filter input command=insert position=3 \
    full=True match=state state=related,established jump=accept \
    family=ipv6
```

`salt.modules.nftables.`**`check`**(*table='filter', chain=None, rule=None, family='ipv4'*)

Check for the existence of a rule in the table and chain

This function accepts a rule in a standard nftables command format,
starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' nftables.check filter input \
    rule='tcp dport 22 log accept'
```

(continues on next page)

(continued from previous page)

```
IPv6:
salt '*' nftables.check filter input \
    rule='tcp dport 22 log accept' \
    family=ipv6
```

`salt.modules.nftables.`**`check_chain`**`(`*table='filter', chain=None, family='ipv4'*`)`

New in version 2014.7.0.

Check for the existence of a chain in the table

CLI Example:

```
salt '*' nftables.check_chain filter input

IPv6:
salt '*' nftables.check_chain filter input family=ipv6
```

`salt.modules.nftables.`**`check_table`**`(`*table=None, family='ipv4'*`)`

Check for the existence of a table

CLI Example:

```
salt '*' nftables.check_table nat
```

`salt.modules.nftables.`**`delete`**`(`*table, chain=None, position=None, rule=None, family='ipv4'*`)`

Delete a rule from the specified table & chain, specifying either the rule
in its entirety, or the rule's position in the chain.

This function accepts a rule in a standard nftables command format,
starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:

```
salt '*' nftables.delete filter input position=3

salt '*' nftables.delete filter input \
    rule='tcp dport 22 log accept'

IPv6:
salt '*' nftables.delete filter input position=3 family=ipv6

salt '*' nftables.delete filter input \
    rule='tcp dport 22 log accept' \
    family=ipv6
```

`salt.modules.nftables.`**`delete_chain`**`(`*table='filter', chain=None, family='ipv4'*`)`

New in version 2014.7.0.

Delete the chain from the specified table.

CLI Example:

```
salt '*' nftables.delete_chain filter input
```

(continues on next page)

(continued from previous page)

```
salt '*' nftables.delete_chain filter foo

IPv6:
salt '*' nftables.delete_chain filter input family=ipv6

salt '*' nftables.delete_chain filter foo family=ipv6
```

`salt.modules.nftables.`**`delete_table`**(*table*, *family='ipv4'*)

New in version 2014.7.0.

Create new custom table.

CLI Example:

```
salt '*' nftables.delete_table filter

IPv6:
salt '*' nftables.delete_table filter family=ipv6
```

`salt.modules.nftables.`**`flush`**(*table='filter'*, *chain=''*, *family='ipv4'*)

Flush the chain in the specified table, flush all chains in the specified table if chain is not specified.

CLI Example:

```
salt '*' nftables.flush filter

salt '*' nftables.flush filter input

IPv6:
salt '*' nftables.flush filter input family=ipv6
```

`salt.modules.nftables.`**`get_policy`**(*table='filter'*, *chain=None*, *family='ipv4'*)

New in version 3002.

Return the current policy for the specified table/chain

table
: Name of the table containing the chain to check

chain
: Name of the chain to get the policy for

family
: Networking family, either ipv4 or ipv6

CLI Example:

```
salt '*' nftables.get_policy filter input

IPv6:
salt '*' nftables.get_policy filter input family=ipv6
```

`salt.modules.nftables.`**`get_rule_handle`**(*table='filter'*, *chain=None*, *rule=None*, *family='ipv4'*)

Get the handle for a particular rule

This function accepts a rule in a standard nftables command format,
: starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' nftables.get_rule_handle filter input \
    rule='tcp dport 22 log accept'

IPv6:
salt '*' nftables.get_rule_handle filter input \
    rule='tcp dport 22 log accept' \
    family=ipv6
```

`salt.modules.nftables.`**`get_rules`**`(`*family='ipv4'*`)`

Return a data structure of the current, in-memory rules

CLI Example:

```
salt '*' nftables.get_rules

salt '*' nftables.get_rules family=ipv6
```

`salt.modules.nftables.`**`get_rules_json`**`(`*family='ipv4'*`)`

New in version 3002.

Return a list of dictionaries comprising the current, in-memory rules

family
Networking family, either ipv4 or ipv6

CLI Example:

```
salt '*' nftables.get_rules_json

salt '*' nftables.get_rules_json family=ipv6
```

`salt.modules.nftables.`**`get_saved_rules`**`(`*conf_file=None*`)`

Return a data structure of the rules in the conf file

CLI Example:

```
salt '*' nftables.get_saved_rules
```

`salt.modules.nftables.`**`insert`**`(`*table='filter', chain=None, position=None, rule=None, family='ipv4'*`)`

Insert a rule into the specified table & chain, at the specified position.

If position is not specified, rule will be inserted in first position.

This function accepts a rule in a standard nftables command format,
starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:

```
salt '*' nftables.insert filter input \
    rule='tcp dport 22 log accept'

salt '*' nftables.insert filter input position=3 \
    rule='tcp dport 22 log accept'

IPv6:
salt '*' nftables.insert filter input \
    rule='tcp dport 22 log accept' \
```

(continues on next page)

(continued from previous page)

```
    family=ipv6

salt '*' nftables.insert filter input position=3 \
    rule='tcp dport 22 log accept' \
    family=ipv6
```

salt.modules.nftables.**list_tables**(*family='ipv4'*)

Return a data structure of the current, in-memory tables

CLI Example:

```
salt '*' nftables.list_tables

salt '*' nftables.list_tables family=ipv6
```

salt.modules.nftables.**new_chain**(*table='filter'*, *chain=None*, *table_type=None*, *hook=None*, *priority=None*, *family='ipv4'*)

New in version 2014.7.0.

Create new chain to the specified table.

CLI Example:

```
salt '*' nftables.new_chain filter input

salt '*' nftables.new_chain filter input \
        table_type=filter hook=input priority=0

salt '*' nftables.new_chain filter foo

IPv6:
salt '*' nftables.new_chain filter input family=ipv6

salt '*' nftables.new_chain filter input \
        table_type=filter hook=input priority=0 family=ipv6

salt '*' nftables.new_chain filter foo family=ipv6
```

salt.modules.nftables.**new_table**(*table*, *family='ipv4'*)

New in version 2014.7.0.

Create new custom table.

CLI Example:

```
salt '*' nftables.new_table filter

IPv6:
salt '*' nftables.new_table filter family=ipv6
```

salt.modules.nftables.**save**(*filename=None*, *family='ipv4'*)

Changed in version 3002.

Save the current in-memory rules to disk. On systems where /etc/nftables is a directory, a file named salt-all-in-one.nft will be dropped inside by default. The main nftables configuration will need to include this file.

CLI Example:

```
salt '*' nftables.save /etc/nftables
```

`salt.modules.nftables.`**`set_policy`**`(`*table='filter', chain=None, policy=None, family='ipv4'*`)`

New in version 3002.

Set the current policy for the specified table/chain. This only works on chains with an existing base chain.

table
Name of the table containing the chain to modify

chain
Name of the chain to set the policy for

policy
accept or drop

family
Networking family, either ipv4 or ipv6

CLI Example:

```
salt '*' nftables.set_policy filter input accept

IPv6:
salt '*' nftables.set_policy filter input accept family=ipv6
```

`salt.modules.nftables.`**`version`**`()`

Return version from nftables --version

CLI Example:

```
salt '*' nftables.version
```

26.6.133 salt.modules.npm

Manage and query NPM packages.

`salt.modules.npm.`**`cache_clean`**`(`*path=None, runas=None, env=None, force=False*`)`

Clean cached NPM packages.

If no path for a specific package is provided the entire cache will be cleared.

path
The cache subpath to delete, or None to clear the entire cache

runas
The user to run NPM with

env
Environment variables to set when invoking npm. Uses the same `env` format as the `cmd.run` execution function.

force
Force cleaning of cache. Required for npm@5 and greater

New in version 2016.11.6.

CLI Example:

```
salt '*' npm.cache_clean force=True
```

`salt.modules.npm.`**`cache_list`**(*path=None*, *runas=None*, *env=None*)

List NPM cached packages.

If no path for a specific package is provided this will list all the cached packages.

path
The cache subpath to list, or None to list the entire cache

runas
The user to run NPM with

env
Environment variables to set when invoking npm. Uses the same `env` format as the *`cmd.run`* execution function.

CLI Example:

```
salt '*' npm.cache_clean
```

`salt.modules.npm.`**`cache_path`**(*runas=None*, *env=None*)

List path of the NPM cache directory.

runas
The user to run NPM with

env
Environment variables to set when invoking npm. Uses the same `env` format as the *`cmd.run`* execution function.

CLI Example:

```
salt '*' npm.cache_path
```

`salt.modules.npm.`**`install`**(*pkg=None*, *pkgs=None*, *dir=None*, *runas=None*, *registry=None*, *env=None*, *dry_run=False*, *silent=True*)

Install an NPM package.

If no directory is specified, the package will be installed globally. If no package is specified, the dependencies (from package.json) of the package in the given directory will be installed.

pkg
A package name in any format accepted by NPM, including a version identifier

pkgs
A list of package names in the same format as the `name` parameter

New in version 2014.7.0.

dir
The target directory in which to install the package, or None for global installation

runas
The user to run NPM with

registry
The NPM registry to install the package from.

New in version 2014.7.0.

env
Environment variables to set when invoking npm. Uses the same `env` format as the *`cmd.run`* execution function.

New in version 2014.7.0.

silent
Whether or not to run NPM install with --silent flag.

New in version 2016.3.0.

dry_run
Whether or not to run NPM install with --dry-run flag.

New in version 2015.8.4.

silent
Whether or not to run NPM install with --silent flag.

New in version 2015.8.5.

CLI Example:

```
salt '*' npm.install coffee-script

salt '*' npm.install coffee-script@1.0.1
```

`salt.modules.npm.`**`list_`**(*pkg=None*, *dir=None*, *runas=None*, *env=None*, *depth=None*)

List installed NPM packages.

If no directory is specified, this will return the list of globally- installed packages.

pkg
Limit package listing by name

dir
The directory whose packages will be listed, or None for global installation

runas
The user to run NPM with

New in version 2014.7.0.

env
Environment variables to set when invoking npm. Uses the same `env` format as the *`cmd.run`* execution function.

New in version 2014.7.0.

depth
Limit the depth of the packages listed

New in version 2016.11.6,2017.7.0.

CLI Example:

```
salt '*' npm.list
```

`salt.modules.npm.`**`uninstall`**(*pkg*, *dir=None*, *runas=None*, *env=None*)

Uninstall an NPM package.

If no directory is specified, the package will be uninstalled globally.

pkg
A package name in any format accepted by NPM

dir
The target directory from which to uninstall the package, or None for global installation

runas
The user to run NPM with

env
Environment variables to set when invoking npm. Uses the same `env` format as the *`cmd.run`* execution function.

New in version 2015.5.3.

CLI Example:

```
salt '*' npm.uninstall coffee-script
```

26.6.134 salt.modules.nxos

Execution module for Cisco NX OS Switches.

New in version 2016.11.0.

This module supports execution using a Proxy Minion or Native Minion:

1) Proxy Minion: Connect over SSH or NX-API HTTP(S). See `salt.proxy.nxos` for proxy minion setup details. 2) Native Minion: Connect over NX-API Unix Domain Socket (UDS). Install the minion inside the GuestShell running on the NX-OS device.

maturity

new

platform

nxos

Note: To use this module over remote NX-API the feature must be enabled on the NX-OS device by executing `feature nxapi` in configuration mode.

This is not required for NX-API over UDS.

Configuration example:

```
switch# conf t
switch(config)# feature nxapi
```

To check that NX-API is properly enabled, execute `show nxapi`.

Output example:

```
switch# show nxapi
nxapi enabled
HTTPS Listen on port 443
```

Native minion configuration options:

```
nxos:
  cookie: 'username'
  save_config: False
```

cookie

Use the option to override the default cookie 'admin:local' when connecting over UDS and use 'username:local' instead. This is needed when running the salt-minion in the GuestShell using a non-admin user.

This option is ignored for SSH and NX-API Proxy minions.

save_config:

If True, 'copy running-config starting-config' is issues for every configuration command. If False, Running config is not saved to startup config Default: True

The recommended approach is to use the *save_running_config* function instead of this option to improve performance. The default behavior controlled by this option is preserved for backwards compatibility.

The APIs defined in this execution module can also be executed using salt-call from the GuestShell environment as follows.

```
salt-call --local nxos.sendline 'show lldp neighbors' raw_text
```

Note: The functions in this module should be executed like so:

salt '*' nxos.<function> salt '*' nxos.get_user username=admin

For backwards compatibility, the following syntax will be supported until the 3001 release.

salt '*' nxos.cmd <function> salt '*' nxos.cmd get_user username=admin

---

`salt.modules.nxos.`**`add_config`**(*lines*, ***kwargs*)

Add one or more config lines to the NX-OS device running config.

lines
Configuration lines to add

save_config
If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

```
salt '*' nxos.add_config 'snmp-server community TESTSTRINGHERE group␣
↪network-operator'
```

Note: For more than one config added per command, lines should be a list.

`salt.modules.nxos.`**`check_password`**(*username*, *password*, *encrypted=False*, ***kwargs*)

Verify user password.

username
Username on which to perform password check

password
Password to check

encrypted
Whether or not the password is encrypted Default: False

`salt.modules.nxos.`**`check_role`**(*username*, *role*, ***kwargs*)

Verify role assignment for user.

```
salt '*' nxos.check_role username=admin role=network-admin
```

`salt.modules.nxos.`**`cmd`**(*command*, **args*, ***kwargs*)

NOTE: This function is preserved for backwards compatibility. This allows commands to be executed using either of the following syntactic forms.

salt '*' nxos.cmd <function>

or

salt '*' nxos.<function>

command
function from *salt.modules.nxos* to run

args
positional args to pass to *command* function

kwargs
key word arguments to pass to *command* function

```
salt '*' nxos.cmd sendline 'show ver'
salt '*' nxos.cmd show_run
```

(continues on next page)

(continued from previous page)

```
salt '*' nxos.cmd check_password username=admin password='$5$lkjsdfoi
↪$blahblahblah' encrypted=True
```

`salt.modules.nxos.`**`config`**(*commands=None, config_file=None, template_engine='jinja', context=None, defaults=None, saltenv='base', **kwargs*)

Configures the Nexus switch with the specified commands.

This method is used to send configuration commands to the switch. It will take either a string or a list and prepend the necessary commands to put the session into config mode.

Warning: All the commands will be applied directly to the running-config.

config_file

The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice.

This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

commands

The commands to send to the switch in config mode. If the commands argument is a string it will be cast to a list. The list of commands will also be prepended with the necessary commands to put the session in config mode.

Note: This argument is ignored when `config_file` is specified.

template_engine: `jinja`

The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file without attempting to render, set this argument to `None`.

context

Variables to add to the template context.

defaults

Default values of the context_dict.

save_config

If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

CLI Example:

```
salt '*' nxos.config commands="['spanning-tree mode mstp']"
salt '*' nxos.config config_file=salt://config.txt
salt '*' nxos.config config_file=https://bit.ly/2LGLcDy context="{'servers
↪': ['1.2.3.4']}"
```

`salt.modules.nxos.`**`delete_config`**(*lines, **kwargs*)

Delete one or more config lines to the switch running config.

lines

Configuration lines to remove.

save_config
If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

```
salt '*' nxos.delete_config 'snmp-server community TESTSTRINGHERE group␣
↪network-operator'
```

Note: For more than one config deleted per command, lines should be a list.

`salt.modules.nxos.`**`find`**`(`*pattern*, ***kwargs*`)`

Find all instances where the pattern is in the running configuration.

```
salt '*' nxos.find '^snmp-server.*$'
```

Note: This uses the *re.MULTILINE* regex format for python, and runs the regex against the whole show_run output.

`salt.modules.nxos.`**`get_roles`**`(`*username*, ***kwargs*`)`

Get roles assigned to a username.

`salt.modules.nxos.`**`get_user`**`(`*username*, ***kwargs*`)`

Get username line from switch.

`salt.modules.nxos.`**`grains`**`(`***kwargs*`)`

Get grains for minion.

`salt.modules.nxos.`**`grains_refresh`**`(`***kwargs*`)`

Refresh the grains for the NX-OS device.

`salt.modules.nxos.`**`ping`**`(`***kwargs*`)`

Ping the device on the other end of the connection.

`salt.modules.nxos.`**`remove_user`**`(`*username*, ***kwargs*`)`

Remove user from switch.

username
Username to remove

save_config
If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

```
salt '*' nxos.remove_user username=daniel
```

`salt.modules.nxos.`**`replace`**`(`*old_value*, *new_value*, *full_match=False*, ***kwargs*`)`

Replace string or full line matches in switch's running config.

If full_match is set to True, then the whole line will need to be matched as part of the old value.

```
salt '*' nxos.replace 'TESTSTRINGHERE' 'NEWTESTSTRINGHERE'
```

`salt.modules.nxos.`**`save_running_config`**`(`***kwargs*`)`

Save the running configuration to startup configuration.

```
salt '*' nxos.save_running_config
```

`salt.modules.nxos.`**`sendline`**(*command*, *method='cli_show_ascii'*, ***kwargs*)

Send arbitrary commands to the NX-OS device.

command
The command or list of commands to be sent. ['cmd1', 'cmd2'] is converted to 'cmd1 ; cmd2'.

method:
`cli_show_ascii`: Return raw test or unstructured output. `cli_show`: Return structured output. `cli_conf`: Send configuration commands to the device. Defaults to `cli_show_ascii`. NOTE: method is ignored for SSH proxy minion. All data is returned unstructured.

error_pattern
Use the option to pass in a regular expression to search for in the returned output of the command that indicates an error has occurred. This option is only used when proxy minion connection type is ssh and otherwise ignored.

`salt.modules.nxos.`**`set_password`**(*username*, *password*, *encrypted=False*, *role=None*, *crypt_salt=None*, *algorithm='sha256'*, ***kwargs*)

Set users password on switch.

username
Username to configure

password
Password to configure for username

encrypted
Whether or not to encrypt the password Default: False

role
Configure role for the username Default: None

crypt_salt
Configure crypt_salt setting Default: None

algorithm
Encryption algorithm Default: sha256

save_config
If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

```
salt '*' nxos.set_password admin TestPass
salt '*' nxos.set_password admin \
    password='$5$2fWwO2vK$s7.Hr3YltMNHuhywQQ3nfOd.gAPHgs3SOBYYdGT3E.A' \
    encrypted=True
```

`salt.modules.nxos.`**`set_role`**(*username*, *role*, ***kwargs*)

Assign role to username.

username
Username for role configuration

role
Configure role for username

save_config
If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

```
salt '*' nxos.set_role username=daniel role=vdc-admin.
```

`salt.modules.nxos.`**`show`**(*commands*, *raw_text=True*, ***kwargs*)

Execute one or more show (non-configuration) commands.

commands
The commands to be executed.

raw_text: `True`
Whether to return raw text or structured data. NOTE: raw_text option is ignored for SSH proxy minion. Data is returned unstructured.

CLI Example:

```
salt-call --local nxos.show 'show version'
salt '*' nxos.show 'show bgp sessions ; show processes' raw_text=False
salt 'regular-minion' nxos.show 'show interfaces' host=sw01.example.com␣
↪username=test password=test
```

`salt.modules.nxos.`**`show_run`**(***kwargs*)

Shortcut to run *show running-config* on the NX-OS device.

```
salt '*' nxos.show_run
```

`salt.modules.nxos.`**`show_ver`**(***kwargs*)

Shortcut to run *show version* on the NX-OS device.

```
salt '*' nxos.show_ver
```

`salt.modules.nxos.`**`system_info`**(***kwargs*)

Return system information for grains of the minion.

```
salt '*' nxos.system_info
```

`salt.modules.nxos.`**`unset_role`**(*username, role, **kwargs*)

Remove role from username.

username
Username for role removal

role
Role to remove

save_config
If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

```
salt '*' nxos.unset_role username=daniel role=vdc-admin
```

26.6.135 salt.modules.nxos_api

Execution module to manage Cisco Nexus Switches (NX-OS) over the NX-API

New in version 2019.2.0.

Execution module used to interface the interaction with a remote or local Nexus switch whether we're running in a Proxy Minion or regular Minion (or regular Minion running directly on the Nexus switch).

codeauthor
Mircea Ulinic <ping@mirceaulinic.net>

maturity
new

platform
any

Note: To be able to use this module you need to enable to NX-API on your switch, by executing `feature nxapi` in configuration mode.

Configuration example:

```
switch# conf t
switch(config)# feature nxapi
```

To check that NX-API is properly enabled, execute `show nxapi`.

Output example:

```
switch# show nxapi
nxapi enabled
HTTPS Listen on port 443
```

Note: NX-API requires modern NXOS distributions, typically at least 7.0 depending on the hardware. Due to reliability reasons it is recommended to run the most recent version.

Check https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus7000/sw/programmability/guide/b_Cisco_Nexus_7000_Series_NX-OS_Programmability_Guide/b_Cisco_Nexus_7000_Series_NX-OS_Programmability_Guide_chapter_0101.html for more details.

Usage

This module can equally be used via the `nxos_api` Proxy module or directly from an arbitrary (Proxy) Minion that is running on a machine having access to the network device API. Given that there are no external dependencies, this module can very well used when using the regular Salt Minion directly installed on the switch.

When running outside of the `nxos_api Proxy` (i.e., from another Proxy Minion type, or regular Minion), the NX-API connection arguments can be either specified from the CLI when executing the command, or in a configuration block under the `nxos_api` key in the configuration opts (i.e., (Proxy) Minion configuration file), or Pillar. The module supports these simultaneously. These fields are the exact same supported by the `nxos_api` Proxy Module:

transport: **`https`**
Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.

host: **`localhost`**
The IP address or DNS host name of the connection device.

username: **`admin`**
The username to pass to the device to authenticate the NX-API connection.

password
The password to pass to the device to authenticate the NX-API connection.

port
The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (`80` for `http`, or `443` for `https`).

timeout: **`60`**
Time in seconds to wait for the device to respond. Default: 60 seconds.

verify: `True`

Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to `True`.

When there is no certificate configuration on the device and this option is set as `True` (default), the commands will fail with the following error: `SSLError: [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed (_ssl.c:581)`. In this case, you either need to configure a proper certificate on the device (*recommended*), or bypass the checks setting this argument as `False` with all the security risks considered.

Check https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus3000/sw/programmability/6_x/b_Cisco_Nexus_3000_Series_NX-OS_Programmability_Guide/b_Cisco_Nexus_3000_Series_NX-OS_Programmability_Guide_chapter_01.html to see how to properly configure the certificate.

Example (when not running in a `nxos_api` Proxy Minion):

```
nxos_api:
  username: test
  password: test
```

In case the `username` and `password` are the same on any device you are targeting, the block above (besides other parameters specific to your environment you might need) should suffice to be able to execute commands from outside a `nxos_api` Proxy, e.g.:

```
salt-call --local nxos_api.show 'show lldp neighbors' raw_text
# The command above is available when running in a regular Minion where Salt
↪is installed

salt '*' nxos_api.show 'show version' raw_text=False
```

Note: Remember that the above applies only when not running in a `nxos_api` Proxy Minion. If you want to use the `nxos_api Proxy`, please follow the documentation notes for a proper setup.

`salt.modules.nxos_api.`**`config`**(*commands=None, config_file=None, template_engine='jinja', context=None, defaults=None, saltenv='base', **kwargs*)

Configures the Nexus switch with the specified commands.

This method is used to send configuration commands to the switch. It will take either a string or a list and prepend the necessary commands to put the session into config mode.

Warning: All the commands will be applied directly into the running-config.

config_file

The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice.

This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

commands

The commands to send to the switch in config mode. If the commands argument is a string it will be cast to a list. The list of commands will also be prepended with the necessary commands to put the session in config mode.

Note: This argument is ignored when `config_file` is specified.

---

template_engine: **`jinja`**
The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file without attempting to render, set this argument to `None`.

context
Variables to add to the template context.

defaults
Default values of the context_dict.

transport: **`https`**
Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.

host: **`localhost`**
The IP address or DNS host name of the connection device.

username: **`admin`**
The username to pass to the device to authenticate the NX-API connection.

password
The password to pass to the device to authenticate the NX-API connection.

port
The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (`80` for `http`, or `443` for `https`).

timeout: **`60`**
Time in seconds to wait for the device to respond. Default: 60 seconds.

verify: **`True`**
Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to `True`.

CLI Example:

```
salt '*' nxos_api.config commands="['spanning-tree mode mstp']"
salt '*' nxos_api.config config_file=salt://config.txt
salt '*' nxos_api.config config_file=https://bit.ly/2LGLcDy context="{
↪'servers': ['1.2.3.4']}"
```

`salt.modules.nxos_api.`**`rpc`**(*commands*, *method='cli'*, ***kwargs*)

Execute an arbitrary RPC request via the Nexus API.

commands
The commands to be executed.

method: **`cli`**
The type of the response, i.e., raw text (`cli_ascii`) or structured document (`cli`). Defaults to `cli` (structured data).

transport: **`https`**
Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.

host: **`localhost`**
The IP address or DNS host name of the connection device.

username: **`admin`**
The username to pass to the device to authenticate the NX-API connection.

password
The password to pass to the device to authenticate the NX-API connection.

port
The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (`80` for `http`, or `443` for `https`).

timeout: `60`
Time in seconds to wait for the device to respond. Default: 60 seconds.

verify: `True`
Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to `True`.

CLI Example:

```
salt-call --local nxos_api.rpc 'show version'
```

`salt.modules.nxos_api.`**`show`**(*commands*, *raw_text=True*, ***kwargs*)

Execute one or more show (non-configuration) commands.

commands
The commands to be executed. Multiple commands should be specified as a list.

raw_text: `True`
Whether to return raw text or structured data.

transport: `https`
Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.

host: `localhost`
The IP address or DNS host name of the connection device.

username: `admin`
The username to pass to the device to authenticate the NX-API connection.

password
The password to pass to the device to authenticate the NX-API connection.

port
The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (`80` for `http`, or `443` for `https`).

timeout: `60`
Time in seconds to wait for the device to respond. Default: 60 seconds.

verify: `True`
Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to `True`.

CLI Example:

```
salt-call --local nxos_api.show 'show version'
salt '*' nxos_api.show "['show bgp sessions','show processes']" raw_
↪text=False
salt 'regular-minion' nxos_api.show 'show interfaces' host=sw01.example.
↪com username=test password=test
```

26.6.136 salt.modules.nxos_upgrade

Execution module to upgrade Cisco NX-OS Switches.

New in version 3001.

This module supports execution using a Proxy Minion or Native Minion:

1) Proxy Minion: Connect over SSH or NX-API HTTP(S). See `salt.proxy.nxos` for proxy minion setup details.

2) Native Minion: Connect over NX-API Unix Domain Socket (UDS). Install the minion inside the GuestShell running on the NX-OS device.

maturity
new

platform
nxos

codeauthor
Michael G Wiebe

Note: To use this module over remote NX-API the feature must be enabled on the NX-OS device by executing `feature nxapi` in configuration mode.

This is not required for NX-API over UDS.

Configuration example:

```
switch# conf t
switch(config)# feature nxapi
```

To check that NX-API is properly enabled, execute `show nxapi`.

Output example:

```
switch# show nxapi
nxapi enabled
HTTPS Listen on port 443
```

`salt.modules.nxos_upgrade.`**`check_upgrade_impact`**(*system_image*, *kickstart_image=None*, *issu=True*, ***kwargs*)

Display upgrade impact information without actually upgrading the device.

system_image (Mandatory Option)
Path on bootflash: to system image upgrade file.

kickstart_image
Path on bootflash: to kickstart image upgrade file. (Not required if using combined system/kickstart image file) Default: None

issu
In Service Software Upgrade (non-disruptive). When True, the upgrade will abort if issu is not possible. When False: Force (disruptive) Upgrade/Downgrade. Default: True

timeout
Timeout in seconds for long running 'install all' impact command. Default: 900

error_pattern
Use the option to pass in a regular expression to search for in the output of the 'install all impact' command that indicates an error has occurred. This option is only used when proxy minion connection type is ssh and otherwise ignored.

```
salt 'n9k' nxos.check_upgrade_impact system_image=nxos.9.2.1.bin
salt 'n7k' nxos.check_upgrade_impact system_image=n7000-s2-dk9.8.1.1.bin \
    kickstart_image=n7000-s2-kickstart.8.1.1.bin issu=False
```

`salt.modules.nxos_upgrade.`**`upgrade`**(*system_image*, *kickstart_image=None*, *issu=True*, ***kwargs*)

Upgrade NX-OS switch.

system_image (Mandatory Option)
Path on bootflash: to system image upgrade file.

kickstart_image
Path on bootflash: to kickstart image upgrade file. (Not required if using combined system/kickstart image file) Default: None

issu
Set this option to True when an In Service Software Upgrade or non-disruptive upgrade is required. The upgrade will abort if issu is not possible. Default: True

timeout
Timeout in seconds for long running 'install all' upgrade command. Default: 900

error_pattern
Use the option to pass in a regular expression to search for in the output of the 'install all upgrade command that indicates an error has occurred. This option is only used when proxy minion connection type is ssh and otherwise ignored.

```
salt 'n9k' nxos.upgrade system_image=nxos.9.2.1.bin
salt 'n7k' nxos.upgrade system_image=n7000-s2-dk9.8.1.1.bin \
    kickstart_image=n7000-s2-kickstart.8.1.1.bin issu=False
```

26.6.137 salt.modules.oracle

Oracle DataBase connection module

maintainer
Vladimir Bormotov <bormotov@gmail.com>

maturity
new

depends
cx_Oracle

platform
all

configuration
module provide connections for multiple Oracle DB instances.

OS Environment

```
ORACLE_HOME: path to oracle product
PATH: path to Oracle Client libs need to be in PATH
```

pillar

```
oracle:
  dbs:
    <db>:
      uri: connection credentials in format:
    user/password@host[:port]/sid[ servicename as
↪{sysdba|sysoper}]
      optional keyword servicename will determine whether it is␣
↪a sid or service_name
    <db>:
      uri: .....
```

`salt.modules.oracle.`**`client_version`**`()`

Oracle Client Version

CLI Example:

```
salt '*' oracle.client_version
```

`salt.modules.oracle.`**`run_query`**`(`*db*, *query*`)`

Run SQL query and return result

CLI Example:

```
salt '*' oracle.run_query my_db "select * from my_table"
```

`salt.modules.oracle.`**`show_dbs`**`(`**dbs*`)`

Show databases configuration from pillar. Filter by **args*

CLI Example:

```
salt '*' oracle.show_dbs
salt '*' oracle.show_dbs my_db
```

`salt.modules.oracle.`**`show_env`**`()`

Show Environment used by Oracle Client

CLI Example:

```
salt '*' oracle.show_env
```

Note: at first _connect() `NLS_LANG` will forced to '.AL32UTF8'

`salt.modules.oracle.`**`show_pillar`**`(`*item=None*`)`

Show Pillar segment oracle.* and subitem with notation "item:subitem"

CLI Example:

```
salt '*' oracle.show_pillar
salt '*' oracle.show_pillar dbs:my_db
```

`salt.modules.oracle.`**`version`**`(`**dbs*`)`

Server Version (select banner from v$version)

CLI Example:

```
salt '*' oracle.version
salt '*' oracle.version my_db
```

26.6.138 salt.modules.osquery

Support for OSQuery - https://osquery.io.

New in version 2015.8.0.

`salt.modules.osquery.`**`acpi_tables`**`(`*attrs=None*, *where=None*`)`

Return acpi_tables information from osquery

CLI Example:

```
salt '*' osquery.acpi_tables
```

`salt.modules.osquery.`**`alf`**`(`*attrs=None*, *where=None*`)`

Return alf information from osquery

CLI Example:

```
salt '*' osquery.alf
```

`salt.modules.osquery.`**`alf_exceptions`**`(`*attrs=None*, *where=None*`)`

Return alf_exceptions information from osquery

CLI Example:

```
salt '*' osquery.alf_exceptions
```

`salt.modules.osquery.`**`alf_explicit_auths`**`(`*attrs=None*, *where=None*`)`

Return alf_explicit_auths information from osquery

CLI Example:

```
salt '*' osquery.alf_explicit_auths
```

`salt.modules.osquery.`**`alf_services`**`(`*attrs=None*, *where=None*`)`

Return alf_services information from osquery

CLI Example:

```
salt '*' osquery.alf_services
```

`salt.modules.osquery.`**`apps`**`(`*attrs=None*, *where=None*`)`

Return apps information from osquery

CLI Example:

```
salt '*' osquery.apps
```

`salt.modules.osquery.`**`apt_sources`**`(`*attrs=None*, *where=None*`)`

Return apt_sources information from osquery

CLI Example:

```
salt '*' osquery.apt_sources
```

`salt.modules.osquery.`**`arp_cache`**`(`*attrs=None*, *where=None*`)`

Return arp_cache information from osquery

CLI Example:

```
salt '*' osquery.arp_cache
```

`salt.modules.osquery.`**`block_devices`**`(`*attrs=None*, *where=None*`)`

Return block_devices information from osquery

CLI Example:

```
salt '*' osquery.block_devices
```

`salt.modules.osquery.`**`certificates`**`(`*attrs=None*, *where=None*`)`

Return certificates information from osquery

CLI Example:

```
salt '*' osquery.certificates
```

`salt.modules.osquery.`**`chrome_extensions`**`(`*attrs=None*, *where=None*`)`

Return chrome_extensions information from osquery

CLI Example:

```
salt '*' osquery.chrome_extensions
```

`salt.modules.osquery.`**`cpuid`**`(`*attrs=None*, *where=None*`)`

Return cpuid information from osquery

CLI Example:

```
salt '*' osquery.cpuid
```

`salt.modules.osquery.`**`crontab`**`(`*attrs=None*, *where=None*`)`

Return crontab information from osquery

CLI Example:

```
salt '*' osquery.crontab
```

`salt.modules.osquery.`**`deb_packages`**`(`*attrs=None*, *where=None*`)`

Return deb_packages information from osquery

CLI Example:

```
salt '*' osquery.deb_packages
```

`salt.modules.osquery.`**`etc_hosts`**`(`*attrs=None*, *where=None*`)`

Return etc_hosts information from osquery

CLI Example:

```
salt '*' osquery.etc_hosts
```

`salt.modules.osquery.`**`etc_services`**`(`*attrs=None*, *where=None*`)`

Return etc_services information from osquery

CLI Example:

```
salt '*' osquery.etc_services
```

`salt.modules.osquery.`**`file_`**`(`*attrs=None*, *where=None*`)`

Return file information from osquery

CLI Example:

```
salt '*' osquery.file
```

`salt.modules.osquery.`**`file_changes`**`(`*attrs=None*, *where=None*`)`

Return file_changes information from osquery

CLI Example:

```
salt '*' osquery.file_changes
```

`salt.modules.osquery.`**`firefox_addons`**`(`*attrs=None*, *where=None*`)`

Return firefox_addons information from osquery

CLI Example:

```
salt '*' osquery.firefox_addons
```

`salt.modules.osquery.`**`groups`**`(`*attrs=None*, *where=None*`)`

Return groups information from osquery

CLI Example:

```
salt '*' osquery.groups
```

`salt.modules.osquery.`**`hardware_events`**`(`*attrs=None*, *where=None*`)`

Return hardware_events information from osquery

CLI Example:

```
salt '*' osquery.hardware_events
```

`salt.modules.osquery.`**`hash_`**`(`*attrs=None*, *where=None*`)`

Return hash information from osquery

CLI Example:

```
salt '*' osquery.hash
```

`salt.modules.osquery.`**`homebrew_packages`**`(`*attrs=None*, *where=None*`)`

Return homebrew_packages information from osquery

CLI Example:

```
salt '*' osquery.homebrew_packages
```

`salt.modules.osquery.`**`interface_addresses`**`(`*attrs=None*, *where=None*`)`

Return interface_addresses information from osquery

CLI Example:

```
salt '*' osquery.interface_addresses
```

`salt.modules.osquery.`**`interface_details`**`(`*attrs=None*, *where=None*`)`

Return interface_details information from osquery

CLI Example:

```
salt '*' osquery.interface_details
```

`salt.modules.osquery.`**`iokit_devicetree`**(*attrs=None*, *where=None*)

Return iokit_devicetree information from osquery

CLI Example:

```
salt '*' osquery.iokit_devicetree
```

`salt.modules.osquery.`**`iokit_registry`**(*attrs=None*, *where=None*)

Return iokit_registry information from osquery

CLI Example:

```
salt '*' osquery.iokit_registry
```

`salt.modules.osquery.`**`kernel_extensions`**(*attrs=None*, *where=None*)

Return kernel_extensions information from osquery

CLI Example:

```
salt '*' osquery.kernel_extensions
```

`salt.modules.osquery.`**`kernel_info`**(*attrs=None*, *where=None*)

Return kernel_info information from osquery

CLI Example:

```
salt '*' osquery.kernel_info
```

`salt.modules.osquery.`**`kernel_integrity`**(*attrs=None*, *where=None*)

Return kernel_integrity information from osquery

CLI Example:

```
salt '*' osquery.kernel_integrity
```

`salt.modules.osquery.`**`kernel_modules`**(*attrs=None*, *where=None*)

Return kernel_modules information from osquery

CLI Example:

```
salt '*' osquery.kernel_modules
```

`salt.modules.osquery.`**`keychain_items`**(*attrs=None*, *where=None*)

Return keychain_items information from osquery

CLI Example:

```
salt '*' osquery.keychain_items
```

`salt.modules.osquery.`**`last`**(*attrs=None*, *where=None*)

Return last information from osquery

CLI Example:

```
salt '*' osquery.last
```

salt.modules.osquery.**launchd**(*attrs=None*, *where=None*)

Return launchd information from osquery

CLI Example:

```
salt '*' osquery.launchd
```

salt.modules.osquery.**listening_ports**(*attrs=None*, *where=None*)

Return listening_ports information from osquery

CLI Example:

```
salt '*' osquery.listening_ports
```

salt.modules.osquery.**logged_in_users**(*attrs=None*, *where=None*)

Return logged_in_users information from osquery

CLI Example:

```
salt '*' osquery.logged_in_users
```

salt.modules.osquery.**memory_map**(*attrs=None*, *where=None*)

Return memory_map information from osquery

CLI Example:

```
salt '*' osquery.memory_map
```

salt.modules.osquery.**mounts**(*attrs=None*, *where=None*)

Return mounts information from osquery

CLI Example:

```
salt '*' osquery.mounts
```

salt.modules.osquery.**nfs_shares**(*attrs=None*, *where=None*)

Return nfs_shares information from osquery

CLI Example:

```
salt '*' osquery.nfs_shares
```

salt.modules.osquery.**nvram**(*attrs=None*, *where=None*)

Return nvram information from osquery

CLI Example:

```
salt '*' osquery.nvram
```

salt.modules.osquery.**os_version**(*attrs=None*, *where=None*)

Return os_version information from osquery

CLI Example:

```
salt '*' osquery.os_version
```

`salt.modules.osquery.`**`osquery_extensions`**`(`*attrs=None, where=None*`)`

Return osquery_extensions information from osquery

CLI Example:

```
salt '*' osquery.osquery_extensions
```

`salt.modules.osquery.`**`osquery_flags`**`(`*attrs=None, where=None*`)`

Return osquery_flags information from osquery

CLI Example:

```
salt '*' osquery.osquery_flags
```

`salt.modules.osquery.`**`osquery_info`**`(`*attrs=None, where=None*`)`

Return osquery_info information from osquery

CLI Example:

```
salt '*' osquery.osquery_info
```

`salt.modules.osquery.`**`osquery_registry`**`(`*attrs=None, where=None*`)`

Return osquery_registry information from osquery

CLI Example:

```
salt '*' osquery.osquery_registry
```

`salt.modules.osquery.`**`passwd_changes`**`(`*attrs=None, where=None*`)`

Return passwd_changes information from osquery

CLI Example:

```
salt '*' osquery.passwd_changes
```

`salt.modules.osquery.`**`pci_devices`**`(`*attrs=None, where=None*`)`

Return pci_devices information from osquery

CLI Example:

```
salt '*' osquery.pci_devices
```

`salt.modules.osquery.`**`preferences`**`(`*attrs=None, where=None*`)`

Return preferences information from osquery

CLI Example:

```
salt '*' osquery.preferences
```

`salt.modules.osquery.`**`process_envs`**`(`*attrs=None, where=None*`)`

Return process_envs information from osquery

CLI Example:

```
salt '*' osquery.process_envs
```

salt.modules.osquery.**process_memory_map**(*attrs=None*, *where=None*)

Return process_memory_map information from osquery

CLI Example:

```
salt '*' osquery.process_memory_map
```

salt.modules.osquery.**process_open_files**(*attrs=None*, *where=None*)

Return process_open_files information from osquery

CLI Example:

```
salt '*' osquery.process_open_files
```

salt.modules.osquery.**process_open_sockets**(*attrs=None*, *where=None*)

Return process_open_sockets information from osquery

CLI Example:

```
salt '*' osquery.process_open_sockets
```

salt.modules.osquery.**processes**(*attrs=None*, *where=None*)

Return processes information from osquery

CLI Example:

```
salt '*' osquery.processes
```

salt.modules.osquery.**quarantine**(*attrs=None*, *where=None*)

Return quarantine information from osquery

CLI Example:

```
salt '*' osquery.quarantine
```

salt.modules.osquery.**query**(*sql=None*)

Return time information from osquery

CLI Example:

```
salt '*' osquery.query "select * from users;"
```

salt.modules.osquery.**routes**(*attrs=None*, *where=None*)

Return routes information from osquery

CLI Example:

```
salt '*' osquery.routes
```

salt.modules.osquery.**rpm_packages**(*attrs=None*, *where=None*)

Return cpuid information from osquery

CLI Example:

```
salt '*' osquery.rpm_packages
```

`salt.modules.osquery.`**`safari_extensions`**`(`*attrs=None*, *where=None*`)`

Return safari_extensions information from osquery

CLI Example:

```
salt '*' osquery.safari_extensions
```

`salt.modules.osquery.`**`shared_memory`**`(`*attrs=None*, *where=None*`)`

Return shared_memory information from osquery

CLI Example:

```
salt '*' osquery.shared_memory
```

`salt.modules.osquery.`**`shell_history`**`(`*attrs=None*, *where=None*`)`

Return shell_history information from osquery

CLI Example:

```
salt '*' osquery.shell_history
```

`salt.modules.osquery.`**`smbios_tables`**`(`*attrs=None*, *where=None*`)`

Return smbios_tables information from osquery

CLI Example:

```
salt '*' osquery.smbios_tables
```

`salt.modules.osquery.`**`startup_items`**`(`*attrs=None*, *where=None*`)`

Return startup_items information from osquery

CLI Example:

```
salt '*' osquery.startup_items
```

`salt.modules.osquery.`**`suid_bin`**`(`*attrs=None*, *where=None*`)`

Return suid_bin information from osquery

CLI Example:

```
salt '*' osquery.suid_bin
```

`salt.modules.osquery.`**`system_controls`**`(`*attrs=None*, *where=None*`)`

Return system_controls information from osquery

CLI Example:

```
salt '*' osquery.system_controls
```

`salt.modules.osquery.`**`time_`**`(`*attrs=None*`)`

Return time information from osquery

CLI Example:

```
salt '*' osquery.time
```

`salt.modules.osquery.`**`usb_devices`**`(`*attrs=None*, *where=None*`)`

Return usb_devices information from osquery

CLI Example:

```
salt '*' osquery.usb_devices
```

`salt.modules.osquery.`**`users`**`(`*attrs=None*, *where=None*`)`

Return users information from osquery

CLI Example:

```
salt '*' osquery.users
```

`salt.modules.osquery.`**`version`**`()`

Return version of osquery

CLI Example:

```
salt '*' osquery.version
```

`salt.modules.osquery.`**`xattr_where_from`**`(`*attrs=None*, *where=None*`)`

Return xattr_where_from information from osquery

CLI Example:

```
salt '*' osquery.xattr_where_from
```

`salt.modules.osquery.`**`xprotect_entries`**`(`*attrs=None*, *where=None*`)`

Return xprotect_entries information from osquery

CLI Example:

```
salt '*' osquery.xprotect_entries
```

`salt.modules.osquery.`**`xprotect_reports`**`(`*attrs=None*, *where=None*`)`

Return xprotect_reports information from osquery

CLI Example:

```
salt '*' osquery.xprotect_reports
```

26.6.139 salt.modules.out

Output Module

New in version 2018.3.0.

Execution module that processes JSON serializable data and returns string having the format as processed by the outputters.

Although this does not bring much value on the CLI, it turns very handy in applications that require human readable data rather than Python objects.

For example, inside a Jinja template:

```
{{ salt.out.string_format(complex_object, out='highstate') }}
```

`salt.modules.out.`**`html_format`**(*data*, *out='nested'*, *opts=None*, ***kwargs*)

Return the formatted string as HTML.

data

The JSON serializable object.

out: **`nested`**

The name of the output to use to transform the data. Default: `nested`.

opts

Dictionary of configuration options. Default: `__opts__`.

kwargs

Arguments to sent to the outputter module.

CLI Example:

```
salt '*' out.html_format "{'key': 'value'}" out=yaml
```

`salt.modules.out.`**`out_format`**(*data*, *out='nested'*, *opts=None*, ***kwargs*)

Return the formatted outputter string for the Python object.

data

The JSON serializable object.

out: **`nested`**

The name of the output to use to transform the data. Default: `nested`.

opts

Dictionary of configuration options. Default: `__opts__`.

kwargs

Arguments to sent to the outputter module.

CLI Example:

```
salt '*' out.out_format "{'key': 'value'}"
```

`salt.modules.out.`**`string_format`**(*data*, *out='nested'*, *opts=None*, ***kwargs*)

Return the outputter formatted string, removing the ANSI escape sequences.

data

The JSON serializable object.

out: **`nested`**

The name of the output to use to transform the data. Default: `nested`.

opts

Dictionary of configuration options. Default: `__opts__`.

kwargs

Arguments to sent to the outputter module.

CLI Example:

```
salt '*' out.string_format "{'key': 'value'}" out=table
```

26.6.140 salt.modules.pacmanpkg

A module to wrap pacman calls, since Arch is the best (https://wiki.archlinux.org/index.php/Arch_is_the_best)

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see *here*.

`salt.modules.pacmanpkg.`**`available_version`**`(`**names*, ***kwargs*`)`

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.pacmanpkg.`**`file_dict`**`(`**packages*, ***kwargs*`)`

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.pacmanpkg.`**`file_list`**`(`**packages*, ***kwargs*`)`

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.pacmanpkg.`**`group_diff`**`(`*name*`)`

New in version 2016.11.0.

Lists which of a group's packages are installed and which are not installed

Compatible with yumpkg.group_diff for easy support of state.pkg.group_installed

CLI Example:

```
salt '*' pkg.group_diff 'xorg'
```

`salt.modules.pacmanpkg.`**`group_info`**`(`*name*`)`

New in version 2016.11.0.

Lists all packages in the specified group

CLI Example:

```
salt '*' pkg.group_info 'xorg'
```

salt.modules.pacmanpkg.**group_list**()

New in version 2016.11.0.

Lists all groups known by pacman on this system

CLI Example:

```
salt '*' pkg.group_list
```

salt.modules.pacmanpkg.**install**(*name=None*, *refresh=False*, *sysupgrade=None*, *pkgs=None*, *sources=None*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Install (`pacman -S`) the specified packag(s). Add `refresh=True` to install with `-y`, add `sysupgrade=True` to install with `-u`.

name

The name of the package to be installed. Note that this parameter is ignored if either `pkgs` or `sources` is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the `sources` option.

CLI Example:

```
salt '*' pkg.install <package name>
```

refresh

Whether or not to refresh the package database before installing.

sysupgrade

Whether or not to upgrade the system packages before installing. If refresh is set to `True` but sysupgrade is not specified, `-u` will be applied

Multiple Package Installation Options:

pkgs

A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. As with the `version` parameter above, comparison operators can be used to target a specific version of a package.

CLI Examples:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-4"}]'
salt '*' pkg.install pkgs='["foo", {"bar": "<1.2.3-4"}]'
```

sources

A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install                    sources='[{"foo": "salt://foo.
↪pkg.tar.xz"},                  {"bar": "salt://bar.pkg.tar.xz"}]'
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

`salt.modules.pacmanpkg.`**`latest_version`**`(`**names*, ***kwargs*`)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.pacmanpkg.`**`list_pkgs`**`(`*versions_as_list=False*, ***kwargs*`)`

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.pacmanpkg.`**`list_repo_pkgs`**`(`**args*, ***kwargs*`)`

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names.

This function can be helpful in discovering the version or repo to specify in a `pkg.installed` state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If `byrepo` is set to `True`, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```
# With byrepo=False (default)
{
    'bash': ['4.4.005-2'],
    'nginx': ['1.10.2-2']
}
# With byrepo=True
{
    'core': {
        'bash': ['4.4.005-2']
    },
    'extra': {
        'nginx': ['1.10.2-2']
    }
}
```

fromrepo
[None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

byrepo
[False] When `True`, the return data for each package will be organized by repository.

refresh
[False] When `True`, the package database will be refreshed (i.e. `pacman -Sy`) before checking for available versions.

CLI Examples:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'samba4*' fromrepo=base,updates
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True
```

`salt.modules.pacmanpkg.`**`list_upgrades`**(*refresh=False*, *root=None*, ***kwargs*)

List all available package upgrades on this system

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.pacmanpkg.`**`owner`**(**paths*, ***kwargs*)

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like *`pkg.version`*, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /usr/bin/zsh
```

`salt.modules.pacmanpkg.`**`purge`**(*name=None*, *pkgs=None*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Recursively remove a package and all dependencies which were installed with it, this will call a `pacman -Rsc`

name
The name of the package to be deleted.

Multiple Package Options:

pkgs
A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

`salt.modules.pacmanpkg.`**`refresh_db`**(*root=None*, ***kwargs*)

Just run a `pacman -Sy`, return a dict:

```
{'<database name>': Bool}
```

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.pacmanpkg.`**`remove`**(*name=None*, *pkgs=None*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Remove packages with `pacman -R`.

name

The name of the package to be deleted.

Multiple Package Options:

pkgs

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.pacmanpkg.`**`upgrade`**(*refresh=False*, *root=None*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Run a full system upgrade, a pacman -Syu

refresh

Whether or not to refresh the package database before installing.

Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.pacmanpkg.`**`upgrade_available`**(*name*, ***kwargs*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.pacmanpkg.`**`version`**`(`**names, **kwargs*`)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

26.6.141 salt.modules.pam

Support for pam

`salt.modules.pam.`**`read_file`**`(`*file_name*`)`

This is just a test function, to make sure parsing works

CLI Example:

```
salt '*' pam.read_file /etc/pam.d/login
```

26.6.142 salt.modules.parted_partition

Module for managing partitions on POSIX-like systems.

depends

- parted, partprobe, lsblk (usually parted and util-linux packages)

Some functions may not be available, depending on your version of parted.

Check the manpage for `parted(8)` for more information, or the online docs at:

http://www.gnu.org/software/parted/manual/html_chapter/parted_2.html

In light of parted not directly supporting partition IDs, some of this module has been written to utilize sfdisk instead. For further information, please reference the man page for `sfdisk(8)`.

`salt.modules.parted_partition.`**`align_check`**`(`*device, part_type, partition*`)`

Check if partition satisfies the alignment constraint of part_type. Type must be ”minimal” or ”optimal”.

CLI Example:

```
salt '*' partition.align_check /dev/sda minimal 1
```

`salt.modules.parted_partition.`**`check`**`(`*device, minor*`)`

Checks if the file system on partition <minor> has any errors.

CLI Example:

```
salt '*' partition.check 1
```

`salt.modules.parted_partition.`**`cp`**`(`*device, from_minor, to_minor*`)`

Copies the file system on the partition <from-minor> to partition <to-minor>, deleting the original contents of the destination partition.

CLI Example:

```
salt '*' partition.cp /dev/sda 2 3
```

`salt.modules.parted_partition.`**`disk_set`**`(`*device, flag, state*`)`

Changes a flag on selected device.

A flag can be either ”on” or ”off” (make sure to use proper quoting, see *YAML Idiosyncrasies*). Some or all of these flags will be available, depending on what disk label you are using.

Valid flags are:

- cylinder_alignment
- pmbr_boot
- implicit_partition_table

CLI Example:

```
salt '*' partition.disk_set /dev/sda pmbr_boot '"on"'
```

`salt.modules.parted_partition.`**`disk_toggle`**`(`*device, flag*`)`

Toggle the state of <flag> on <device>. Valid flags are the same as the disk_set command.

CLI Example:

```
salt '*' partition.disk_toggle /dev/sda pmbr_boot
```

`salt.modules.parted_partition.`**`exists`**`(`*device=''*`)`

Check to see if the partition exists

CLI Example:

```
salt '*' partition.exists /dev/sdb1
```

`salt.modules.parted_partition.`**`get_block_device`**`()`

Retrieve a list of disk devices

New in version 2014.7.0.

CLI Example:

```
salt '*' partition.get_block_device
```

`salt.modules.parted_partition.`**`get_id`**`(`*device, minor*`)`

Prints the system ID for the partition. Some typical values are:

```
 b: FAT32 (vfat)
 7: HPFS/NTFS
82: Linux Swap
83: Linux
8e: Linux LVM
fd: Linux RAID Auto
```

CLI Example:

```
salt '*' partition.get_id /dev/sda 1
```

salt.modules.parted_partition.**list_**(*device*, *unit=None*)

Prints partition information of given <device>

CLI Examples:

```
salt '*' partition.list /dev/sda
salt '*' partition.list /dev/sda unit=s
salt '*' partition.list /dev/sda unit=kB
```

salt.modules.parted_partition.**mkfs**(*device*, *fs_type*)

Makes a file system <fs_type> on partition <device>, destroying all data that resides on that partition. <fs_type> must be one of "ext2", "fat32", "fat16", "linux-swap" or "reiserfs" (if libreiserfs is installed)

CLI Example:

```
salt '*' partition.mkfs /dev/sda2 fat32
```

salt.modules.parted_partition.**mklabel**(*device*, *label_type*)

Create a new disklabel (partition table) of label_type.

Type should be one of "aix", "amiga", "bsd", "dvh", "gpt", "loop", "mac", "msdos", "pc98", or "sun".

CLI Example:

```
salt '*' partition.mklabel /dev/sda msdos
```

salt.modules.parted_partition.**mkpart**(*device*, *part_type*, *fs_type=None*, *start=None*, *end=None*)

Make a part_type partition for filesystem fs_type, beginning at start and ending at end (by default in megabytes). part_type should be one of "primary", "logical", or "extended".

CLI Examples:

```
salt '*' partition.mkpart /dev/sda primary fs_type=fat32 start=0 end=639
salt '*' partition.mkpart /dev/sda primary start=0 end=639
```

salt.modules.parted_partition.**mkpartfs**(*device*, *part_type*, *fs_type=None*, *start=None*, *end=None*)

The mkpartfs actually is an alias to mkpart and is kept for compatibility. To know the valid options and usage syntax read mkpart documentation.

CLI Examples:

```
salt '*' partition.mkpartfs /dev/sda primary fs_type=fat32 start=0 end=639
salt '*' partition.mkpartfs /dev/sda primary start=0 end=639
```

salt.modules.parted_partition.**name**(*device*, *partition*, *name*)

Set the name of partition to name. This option works only on Mac, PC98, and GPT disklabels. The name can be placed in quotes, if necessary.

CLI Example:

```
salt '*' partition.name /dev/sda 1 'My Documents'
```

`salt.modules.parted_partition.`**`probe`**`(`**devices*`)`

Ask the kernel to update its local partition data. When no args are specified all block devices are tried.

Caution: Generally only works on devices with no mounted partitions and may take a long time to return if specified devices are in use.

CLI Examples:

```
salt '*' partition.probe
salt '*' partition.probe /dev/sda
salt '*' partition.probe /dev/sda /dev/sdb
```

`salt.modules.parted_partition.`**`rescue`**`(`*device*, *start*, *end*`)`

Rescue a lost partition that was located somewhere between start and end. If a partition is found, parted will ask if you want to create an entry for it in the partition table.

CLI Example:

```
salt '*' partition.rescue /dev/sda 0 8056
```

`salt.modules.parted_partition.`**`resize`**`(`*device*, *minor*, *start*, *end*`)`

Resizes the partition with number <minor>.

The partition will start <start> from the beginning of the disk, and end <end> from the beginning of the disk. resize never changes the minor number. Extended partitions can be resized, so long as the new extended partition completely contains all logical partitions.

CLI Example:

```
salt '*' partition.resize /dev/sda 3 200 850
```

`salt.modules.parted_partition.`**`rm`**`(`*device*, *minor*`)`

Removes the partition with number <minor>.

CLI Example:

```
salt '*' partition.rm /dev/sda 5
```

`salt.modules.parted_partition.`**`set_`**`(`*device*, *minor*, *flag*, *state*`)`

Changes a flag on the partition with number <minor>.

A flag can be either "on" or "off" (make sure to use proper quoting, see *YAML Idiosyncrasies*). Some or all of these flags will be available, depending on what disk label you are using.

Valid flags are:

- boot
- root
- swap
- hidden
- raid
- lvm
- lba
- hp-service
- palo
- prep
- msftres
- bios_grub
- atvrecv

- diag
- legacy_boot
- msftdata
- irst
- esp
- type

CLI Example:

```
salt '*' partition.set /dev/sda 1 boot '"on"'
```

`salt.modules.parted_partition.`**`set_id`**(*device*, *minor*, *system_id*)

Sets the system ID for the partition. Some typical values are:

```
 b: FAT32 (vfat)
 7: HPFS/NTFS
82: Linux Swap
83: Linux
8e: Linux LVM
fd: Linux RAID Auto
```

CLI Example:

```
salt '*' partition.set_id /dev/sda 1 83
```

`salt.modules.parted_partition.`**`system_types`**()

List the system types that are supported by the installed version of sfdisk

CLI Example:

```
salt '*' partition.system_types
```

`salt.modules.parted_partition.`**`toggle`**(*device*, *partition*, *flag*)

Toggle the state of <flag> on <partition>. Valid flags are the same as
the set command.

CLI Example:

```
salt '*' partition.toggle /dev/sda 1 boot
```

26.6.143 salt.modules.pillar

Extract the pillar data for this minion

`salt.modules.pillar.`**`data`**(**args*, *pillar=None*, *pillar_enc=None*, *pillarenv=None*, *saltenv=None*)

Calls the master for a fresh pillar, generates the pillar data on the fly (same as `items()`)

pillar

If specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar rendering. these pillar variables will also override any variables of the same name in pillar or ext_pillar.

pillar_enc

If specified, the data passed in the `pillar` argument will be passed through this renderer to decrypt it.

Note: This will decrypt on the minion side, so the specified renderer must be set up on the minion for this to work. Alternatively, pillar data can be decrypted master-side. For more information, see the *Pillar Encryption* documentation. Pillar data that is decrypted master-side, is not decrypted until the end of pillar compilation though, so minion-side decryption will be necessary if the encrypted pillar data must be made available in an decrypted state pillar/ext_pillar rendering.

---

pillarenv
Pass a specific pillar environment from which to compile pillar data. If not specified, then the minion's *pillarenv* option is not used, and if that also is not specified then all configured pillar environments will be merged into a single pillar dictionary and returned.

saltenv
Included only for compatibility with *pillarenv_from_saltenv*, and is otherwise ignored.

CLI Examples:

```
salt '*' pillar.data
```

`salt.modules.pillar.`**`ext`**(*external*, *pillar=None*)

Changed in version 2016.3.6,2016.11.3,2017.7.0: The supported ext_pillar types are now tunable using the *on_demand_ext_pillar* config option. Earlier releases used a hard-coded default.

Generate the pillar and apply an explicit external pillar

external
A single ext_pillar to add to the ext_pillar configuration. This must be passed as a single section from the ext_pillar configuration (see CLI examples below). For more complicated `ext_pillar` configurations, it can be helpful to use the Python shell to load YAML configuration into a dictionary, and figure out

```
>>> import salt.utils.yaml
>>> ext_pillar = salt.utils.yaml.safe_load("""
... ext_pillar:
...   - git:
...     - issue38440 https://github.com/terminalmage/git_pillar:
...       - env: base
... """)
>>> ext_pillar
{'ext_pillar': [{'git': [{'mybranch https://github.com/myuser/myrepo
↪': [{'env': 'base'}]}]}]}
>>> ext_pillar['ext_pillar'][0]
{'git': [{'mybranch https://github.com/myuser/myrepo': [{'env': 'base
↪'}]}]}
```

In the above example, the value to pass would be `{'git': [{'mybranch https://github.com/myuser/myrepo': [{'env': 'base'}]}]}`. Note that this would need to be quoted when passing on the CLI (as in the CLI examples below).

pillar
[None] If specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar rendering. These pillar variables will also override any variables of the same name in pillar or ext_pillar.

New in version 2015.5.0.

CLI Examples:

```
salt '*' pillar.ext '{libvirt: _}'
salt '*' pillar.ext "{'git': ['master https://github.com/myuser/myrepo']}"
salt '*' pillar.ext "{'git': [{'mybranch https://github.com/myuser/myrepo
↪': [{'env': 'base'}]}]}"
```

`salt.modules.pillar.`**`fetch`**(*key*, *default=<Constant.NOT_SET>*, *merge=False*, *merge_nested_lists=None*, *delimiter=':'*, *pillarenv=None*, *saltenv=None*)

New in version 0.14.0.

Attempt to retrieve the named value from *in-memory pillar data*. If the pillar key is not present in the in-memory pillar, then the value specified in the `default` option (described below) will be returned.

If the merge parameter is set to `True`, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in pillar looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the `apache` key in the `pkg` dict this key can be passed as:

```
pkg:apache
```

key
    The pillar key to get value from

default
    The value specified by this option will be returned if the desired pillar key does not exist.

    If a default value is not specified, then it will be an empty string, unless *`pillar_raise_on_missing`* is set to `True`, in which case an error will be raised.

merge
    [`False`] If `True`, the retrieved values will be merged into the passed default. When the default and the retrieved value are both dictionaries, the dictionaries will be recursively merged.

    New in version 2014.7.0.

    Changed in version 2016.3.7,2016.11.4,2017.7.0: If the default and the retrieved value are not of the same type, then merging will be skipped and the retrieved value will be returned. Earlier releases raised an error in these cases.

merge_nested_lists
    If set to `False`, lists nested within the retrieved pillar dictionary will *overwrite* lists in `default`. If set to `True`, nested lists will be *merged* into lists in `default`. If unspecified (the default), this option is inherited from the `pillar_merge_lists` minion config option.

    Note: This option is ignored when `merge` is set to `False`.

    New in version 2016.11.6.

delimiter
    Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

    New in version 2014.7.0.

pillarenv
    If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion's pillar data in memory (which can be sourced from more than one pillar environment).

    Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

    New in version 2017.7.0.

saltenv
    Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

New in version 2017.7.0.

CLI Example:

```
salt '*' pillar.get pkg:apache
salt '*' pillar.get abc::def|ghi delimiter='|'
```

`salt.modules.pillar.`**`file_exists`**(*path*, *saltenv=None*)

New in version 2016.3.0.

This is a master-only function. Calling from the minion is not supported.

Use the given path and search relative to the pillar environments to see if a file exists at that path.

If the `saltenv` argument is given, restrict search to that environment only.

Will only work with `pillar_roots`, not external pillars.

Returns True if the file is found, and False otherwise.

path
The path to the file in question. Will be treated as a relative path

saltenv
Optional argument to restrict the search to a specific saltenv

CLI Example:

```
salt '*' pillar.file_exists foo/bar.sls
```

`salt.modules.pillar.`**`filter_by`**(*lookup_dict*, *pillar*, *merge=None*, *default='default'*, *base=None*)

New in version 2017.7.0.

Look up the given pillar in a given dictionary and return the result

Parameters

- **`lookup_dict`** -- A dictionary, keyed by a pillar, containing a value or values relevant to systems matching that pillar. For example, a key could be a pillar for a role and the value could the name of a package on that particular OS.

  The dictionary key can be a globbing pattern. The function will return the corresponding `lookup_dict` value where the pillar value matches the pattern. For example:

  ```
  # this will render 'got some salt' if ``role`` begins
  ↪with 'salt'
  salt '*' pillar.filter_by '{salt*: got some salt,
  ↪default: salt is not here}' role
  ```

- **`pillar`** -- The name of a pillar to match with the system's pillar. For example, the value of the ”role” pillar could be used to pull values from the `lookup_dict` dictionary.

  The pillar value can be a list. The function will return the `lookup_dict` value for a first found item in the list matching one of the `lookup_dict` keys.
- **`merge`** -- A dictionary to merge with the results of the pillar selection from `lookup_dict`. This allows another dictionary to override the values in the `lookup_dict`.
- **`default`** -- default lookup_dict's key used if the pillar does not exist or if the pillar value has no match on lookup_dict. If unspecified the value is ”default”.
- **`base`** -- A lookup_dict key to use for a base dictionary. The pillar-selected `lookup_dict` is merged over this and then finally the `merge` dictionary is merged. This allows common values for each case to be collected in the base and overridden by the pillar selection dictionary and the merge dictionary. Default is unset.

CLI Example:

```
salt '*' pillar.filter_by '{web: Serve it up, db: I query, default: x_x}'
↪role
```

`salt.modules.pillar.`**`get`**(*key*, *default=<Constant.NOT_SET>*, *merge=False*, *merge_nested_lists=None*, *delimiter=':'*, *pillarenv=None*, *saltenv=None*)

New in version 0.14.0.

Attempt to retrieve the named value from *in-memory pillar data*. If the pillar key is not present in the in-memory pillar, then the value specified in the `default` option (described below) will be returned.

If the merge parameter is set to `True`, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in pillar looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the `apache` key in the `pkg` dict this key can be passed as:

```
pkg:apache
```

key

The pillar key to get value from

default

The value specified by this option will be returned if the desired pillar key does not exist.

If a default value is not specified, then it will be an empty string, unless *`pillar_raise_on_missing`* is set to `True`, in which case an error will be raised.

merge

[`False`] If `True`, the retrieved values will be merged into the passed default. When the default and the retrieved value are both dictionaries, the dictionaries will be recursively merged.

New in version 2014.7.0.

Changed in version 2016.3.7,2016.11.4,2017.7.0: If the default and the retrieved value are not of the same type, then merging will be skipped and the retrieved value will be returned. Earlier releases raised an error in these cases.

merge_nested_lists

If set to `False`, lists nested within the retrieved pillar dictionary will *overwrite* lists in `default`. If set to `True`, nested lists will be *merged* into lists in `default`. If unspecified (the default), this option is inherited from the `pillar_merge_lists` minion config option.

Note: This option is ignored when `merge` is set to `False`.

New in version 2016.11.6.

delimiter

Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

New in version 2014.7.0.

pillarenv

If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion's pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.0.

saltenv

Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

New in version 2017.7.0.

CLI Example:

```
salt '*' pillar.get pkg:apache
salt '*' pillar.get abc::def|ghi delimiter='|'
```

`salt.modules.pillar.`**`item`**`(`**args, default=None, delimiter=None, pillarenv=None, saltenv=None*`)`

New in version 0.16.2.

Return one or more pillar entries from the *in-memory pillar data*.

delimiter

Delimiter used to traverse nested dictionaries.

Note: This is different from *`pillar.get`* in that no default value can be specified. *`pillar.get`* should probably still be used in most cases to retrieve nested pillar values, as it is a bit more flexible. One reason to use this function instead of *`pillar.get`* however is when it is desirable to retrieve the values of more than one key, since *`pillar.get`* can only retrieve one key at a time.

New in version 2015.8.0.

pillarenv

If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion's pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.6,2018.3.1.

saltenv

Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

New in version 2017.7.6,2018.3.1.

CLI Examples:

```
salt '*' pillar.item foo
salt '*' pillar.item foo:bar
salt '*' pillar.item foo bar baz
```

`salt.modules.pillar.`**`items`**`(`**args, pillar=None, pillar_enc=None, pillarenv=None, saltenv=None*`)`

Calls the master for a fresh pillar and generates the pillar data on the fly

Contrast with *`raw()`* which returns the pillar data that is currently loaded into the minion.

pillar
If specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar rendering. these pillar variables will also override any variables of the same name in pillar or ext_pillar.

New in version 2015.5.0.

pillar_enc
If specified, the data passed in the `pillar` argument will be passed through this renderer to decrypt it.

Note: This will decrypt on the minion side, so the specified renderer must be set up on the minion for this to work. Alternatively, pillar data can be decrypted master-side. For more information, see the *Pillar Encryption* documentation. Pillar data that is decrypted master-side, is not decrypted until the end of pillar compilation though, so minion-side decryption will be necessary if the encrypted pillar data must be made available in an decrypted state pillar/ext_pillar rendering.

New in version 2017.7.0.

pillarenv
Pass a specific pillar environment from which to compile pillar data. If not specified, then the minion's `pillarenv` option is not used, and if that also is not specified then all configured pillar environments will be merged into a single pillar dictionary and returned.

New in version 2016.11.2.

saltenv
Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

CLI Example:

```
salt '*' pillar.items
```

salt.modules.pillar.**keys**(*key*, *delimiter=':'*)

New in version 2015.8.0.

Attempt to retrieve a list of keys from the named value from the pillar.

The value can also represent a value in a nested dict using a ":" delimiter for the dict, similar to how pillar.get works.

delimiter
Specify an alternate delimiter to use when traversing a nested dict

CLI Example:

```
salt '*' pillar.keys web:sites
```

salt.modules.pillar.**ls**(**args*, *pillar=None*, *pillar_enc=None*, *pillarenv=None*, *saltenv=None*)

New in version 2015.8.0.

Calls the master for a fresh pillar, generates the pillar data on the fly (same as `items()`), but only shows the available main keys.

pillar
If specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar rendering. these pillar variables will also override any variables of the same name in pillar or ext_pillar.

pillar_enc
If specified, the data passed in the `pillar` argument will be passed through this renderer to decrypt it.

Note: This will decrypt on the minion side, so the specified renderer must be set up on the minion for this to work. Alternatively, pillar data can be decrypted master-side. For more information, see the *Pillar Encryption* documentation. Pillar data that is decrypted master-side, is not decrypted until the end of pillar compilation though, so minion-side decryption will be necessary if the encrypted pillar data must be made available in an decrypted state pillar/ext_pillar rendering.

pillarenv
Pass a specific pillar environment from which to compile pillar data. If not specified, then the minion's `pillarenv` option is not used, and if that also is not specified then all configured pillar environments will be merged into a single pillar dictionary and returned.

saltenv
Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

CLI Examples:

```
salt '*' pillar.ls
```

`salt.modules.pillar.`**`obfuscate`**`(`**args, pillar=None, pillar_enc=None, pillarenv=None, saltenv=None*`)`

New in version 2015.8.0.

Same as `items()`, but replace pillar values with a simple type indication.

This is useful to avoid displaying sensitive information on console or flooding the console with long output, such as certificates. For many debug or control purposes, the stakes lie more in dispatching than in actual values.

In case the value is itself a collection type, obfuscation occurs within the value. For mapping types, keys are not obfuscated. Here are some examples:

- `'secret password'` becomes `'<str>'`
- `['secret', 1]` becomes `['<str>', '<int>']`
- `{'login': 'somelogin', 'pwd': 'secret'}` becomes `{'login': '<str>', 'pwd': '<str>'}`

CLI Examples:

```
salt '*' pillar.obfuscate
```

`salt.modules.pillar.`**`raw`**`(`*key=None*`)`

Return the raw pillar data that is currently loaded into the minion.

Contrast with `items()` which calls the master to fetch the most up-to-date Pillar.

CLI Example:

```
salt '*' pillar.raw
```

With the optional key argument, you can select a subtree of the pillar raw data.:

```
salt '*' pillar.raw key='roles'
```

26.6.144 salt.modules.pip

Install Python packages with pip to either the system or a virtualenv

Windows Support

New in version 2014.7.4.

Salt now uses a portable python. As a result the entire pip module is now functional on the salt installation itself. You can pip install dependencies for your custom modules. You can even upgrade salt itself using pip. For this to work properly, you must specify the Current Working Directory (`cwd`) and the Pip Binary (`bin_env`) salt should use. The variable `pip_bin` can be either a virtualenv path or the path to the pip binary itself.

For example, the following command will list all software installed using pip to your current salt environment:

```
salt <minion> pip.list cwd='C:\salt\bin\Scripts' bin_env='C:\salt\bin\Scripts\
↪pip.exe'
```

Specifying the `cwd` and `bin_env` options ensures you're modifying the salt environment. If these are omitted, it will default to the local installation of python. If python is not installed locally it will fail saying it couldn't find pip.

State File Support

This functionality works in states as well. If you need to pip install colorama with a state, for example, the following will work:

```
install_colorama:
  pip.installed:
    - name: colorama
    - cwd: 'C:\salt\bin\scripts'
    - bin_env: 'C:\salt\bin\scripts\pip.exe'
    - upgrade: True
```

Upgrading Salt using Pip

You can now update salt using pip to any version from the 2014.7 branch forward. Previous version require recompiling some of the dependencies which is painful in windows.

To do this you just use pip with git to update to the version you want and then restart the service. Here is a sample state file that upgrades salt to the head of the 2015.5 branch:

```
install_salt:
  pip.installed:
    - cwd: 'C:\salt\bin\scripts'
    - bin_env: 'C:\salt\bin\scripts\pip.exe'
    - editable: git+https://github.com/saltstack/salt@2015.5#egg=salt
    - upgrade: True

restart_service:
  service.running:
    - name: salt-minion
    - enable: True
    - watch:
      - pip: install_salt
```

Note: If you're having problems, you might try doubling the back slashes. For example, cwd: 'C:\salt\bin\scripts'. Sometimes python thinks the single back slash is an escape character.

There is a known incompatibility between Python2 pip>=10.* and Salt <=2018.3.0. The issue is described here: https://github.com/saltstack/salt/issues/46163

`salt.modules.pip.`**`freeze`**(*bin_env=None*, *user=None*, *cwd=None*, *use_vt=False*, *env_vars=None*, ***kwargs*)

Return a list of installed packages either globally or in the specified virtualenv

bin_env
Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`. If a directory path is specified, it is assumed to be a virtualenv.

user
The user under which to run pip

cwd
Directory from which to run pip

Note: If the version of pip available is older than 8.0.3, the list will not include the packages `pip`, `wheel`, `setuptools`, or `distribute` even if they are installed.

CLI Example:

```
salt '*' pip.freeze bin_env=/home/code/path/to/virtualenv
```

`salt.modules.pip.`**`install`**(*pkgs=None*, *requirements=None*, *bin_env=None*, *use_wheel=False*, *no_use_wheel=False*, *log=None*, *proxy=None*, *timeout=None*, *editable=None*, *find_links=None*, *index_url=None*, *extra_index_url=None*, *no_index=False*, *mirrors=None*, *build=None*, *target=None*, *download=None*, *download_cache=None*, *source=None*, *upgrade=False*, *force_reinstall=False*, *ignore_installed=False*, *exists_action=None*, *no_deps=False*, *no_install=False*, *no_download=False*, *global_options=None*, *install_options=None*, *user=None*, *cwd=None*, *pre_releases=False*, *cert=None*, *allow_all_external=False*, *allow_external=None*, *allow_unverified=None*, *process_dependency_links=False*, *saltenv='base'*, *env_vars=None*, *use_vt=False*, *trusted_host=None*, *no_cache_dir=False*, *extra_args=None*, *cache_dir=None*, *no_binary=None*, *disable_version_check=False*, ***kwargs*)

Install packages with pip

Install packages individually or from a pip requirements file. Install packages globally or to a virtualenv.

pkgs
Comma separated list of packages to install

requirements
Path to requirements

bin_env
Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`. If a directory path is specified, it is assumed to be a virtualenv.

Note: For Windows, if the pip module is being used to upgrade the pip package, bin_env should be the path to the virtualenv or to the python binary that should be used. The pip command is unable to upgrade itself in Windows.

use_wheel
Prefer wheel archives (requires pip>=1.4)

no_use_wheel
Force to not use wheel archives (requires pip>=1.4,<10.0.0)

no_binary
Force to not use binary packages (requires pip >= 7.0.0) Accepts either :all: to disable all binary packages, :none: to empty the set, or one or more package names with commas between them

log
Log file where a complete (maximum verbosity) record will be kept. If this file doesn't exist and the parent directory is writeable, it will be created.

proxy
Specify a proxy in the form `user:passwd@proxy.server:port`. Note that the `user:password@` is optional and required only if you are behind an authenticated proxy. If you provide `user@proxy.server:port` then you will be prompted for a password.

Note: If the Minion has a globaly configured proxy - it will be used even if no proxy was set here. To explicitly disable proxy for pip you should pass `False` as a value.

timeout
Set the socket timeout (default 15 seconds)

editable
install something editable (e.g. `git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed`)

find_links
URL to search for packages

index_url
Base URL of Python Package Index

extra_index_url
Extra URLs of package indexes to use in addition to `index_url`

no_index
Ignore package index

mirrors
Specific mirror URL(s) to query (automatically adds --use-mirrors)

Warning: This option has been deprecated and removed in pip version 7.0.0. Please use `index_url` and/or `extra_index_url` instead.

build
Unpack packages into `build` dir

target
Install packages into `target` dir

download
Download packages into `download` instead of installing them

download_cache | cache_dir
Cache downloaded packages in `download_cache` or `cache_dir` dir

source
Check out `editable` packages into `source` dir

upgrade
Upgrade all packages to the newest available version

force_reinstall
When upgrading, reinstall all packages even if they are already up-to-date.

ignore_installed
Ignore the installed packages (reinstalling instead)

exists_action
Default action when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup

no_deps
Ignore package dependencies

no_install
Download and unpack all packages, but don't actually install them

no_download
Don't download any packages, just install the ones already downloaded (completes an install run with `--no-install`)

install_options
Extra arguments to be supplied to the setup.py install command (e.g. like `--install-option='--install-scripts=/usr/local/bin'`). Use multiple --install-option options to pass multiple options to setup.py install. If you are using an option with a directory path, be sure to use absolute path.

global_options
Extra global options to be supplied to the setup.py call before the install command.

user
The user under which to run pip

cwd
Directory from which to run pip

pre_releases
Include pre-releases in the available versions

cert
Provide a path to an alternate CA bundle

allow_all_external
Allow the installation of all externally hosted files

allow_external
Allow the installation of externally hosted files (comma separated list)

allow_unverified
Allow the installation of insecure and unverifiable files (comma separated list)

process_dependency_links
Enable the processing of dependency links

env_vars
Set environment variables that some builds will depend on. For example, a Python C-module may have a Makefile that needs INCLUDE_PATH set to pick up a header file while compiling. This must be in the form of a dictionary or a mapping.

Example:

```
salt '*' pip.install django_app env_vars="{'CUSTOM_PATH': '/opt/
↪django_app'}"
```

trusted_host
Mark this host as trusted, even though it does not have valid or any HTTPS.

use_vt
Use VT terminal emulation (see output while installing)

no_cache_dir
Disable the cache.

extra_args
pip keyword and positional arguments not yet implemented in salt

```
salt '*' pip.install pandas extra_args="[{'--latest-pip-kwarg':'param
↪'}, '--latest-pip-arg']"
```

> **Warning:** If unsupported options are passed here that are not supported in a minion's version of pip, a *No such option error* will be thrown.

Will be translated into the following pip command:

```
pip install pandas --latest-pip-kwarg param --latest-pip-arg
```

disable_version_check
Pip may periodically check PyPI to determine whether a new version of pip is available to download. Passing True for this option disables that check.

CLI Example:

```
salt '*' pip.install <package name>,<package2 name>
salt '*' pip.install requirements=/path/to/requirements.txt
salt '*' pip.install <package name> bin_env=/path/to/virtualenv
salt '*' pip.install <package name> bin_env=/path/to/pip_bin
```

Complicated CLI Example:

```
salt '*' pip.install markdown,django                editable=git+https://
↪github.com/worldcompany/djangoembed.git#egg=djangoembed upgrade=True no_
↪deps=True
```

`salt.modules.pip.`**`is_installed`**(*pkgname*, *bin_env=None*, *user=None*, *cwd=None*)

New in version 2018.3.0.

Changed in version 3006.0.

Filter list of installed modules and return True if `pkgname` exists in the list of packages installed.

CLI Example:

```
salt '*' pip.is_installed salt
```

`salt.modules.pip.`**`list_`**(*prefix=None*, *bin_env=None*, *user=None*, *cwd=None*, *env_vars=None*, ***kwargs*)

Changed in version 3006.0.

Output list of installed apps from `pip list` in JSON format and check to see if `prefix` exists in the list of packages installed.

Note: If the version of pip available is older than 9.0.0, parsing the `freeze` function output will be used to determine the name and version of installed modules.

CLI Example:

```
salt '*' pip.list salt
```

`salt.modules.pip.`**`list_all_versions`**(*pkg*, *bin_env=None*, *include_alpha=False*, *include_beta=False*, *include_rc=False*, *user=None*, *cwd=None*, *index_url=None*, *extra_index_url=None*)

New in version 2017.7.3.

List all available versions of a pip package

pkg
The package to check

bin_env
Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`. If a directory path is specified, it is assumed to be a virtualenv.

include_alpha
Include alpha versions in the list

include_beta
Include beta versions in the list

include_rc
Include release candidates versions in the list

user
The user under which to run pip

cwd
Directory from which to run pip

index_url
Base URL of Python Package Index .. versionadded:: 2019.2.0

extra_index_url
Additional URL of Python Package Index .. versionadded:: 2019.2.0

CLI Example:

```
salt '*' pip.list_all_versions <package name>
```

`salt.modules.pip.`**`list_freeze_parse`**(*prefix=None*, *bin_env=None*, *user=None*, *cwd=None*, *env_vars=None*, ***kwargs*)

New in version 3006.0.

Filter list of installed apps from `freeze` and check to see if `prefix` exists in the list of packages installed.

Note: If the version of pip available is older than 8.0.3, the packages `wheel`, `setuptools`, and `distribute` will not be reported by this function even if they are installed. Unlike *`pip.freeze`*, this function always reports the version of pip which is installed.

CLI Example:

```
salt '*' pip.list_freeze_parse salt
```

`salt.modules.pip.`**`list_upgrades`**(*bin_env=None*, *user=None*, *cwd=None*)

Check whether or not an upgrade is available for all packages

CLI Example:

```
salt '*' pip.list_upgrades
```

`salt.modules.pip.`**`uninstall`**(*pkgs=None*, *requirements=None*, *bin_env=None*, *log=None*, *proxy=None*, *timeout=None*, *user=None*, *cwd=None*, *saltenv='base'*, *use_vt=False*)

Uninstall packages individually or from a pip requirements file

pkgs
comma separated list of packages to install

requirements
Path to requirements file

bin_env
Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`. If a directory path is specified, it is assumed to be a virtualenv.

log
Log file where a complete (maximum verbosity) record will be kept

proxy
Specify a proxy in the format `user:passwd@proxy.server:port`. Note that the

`user:password@` is optional and required only if you are behind an authenticated proxy. If you provide `user@proxy.server:port` then you will be prompted for a password.

Note: If the Minion has a globaly configured proxy - it will be used even if no proxy was set here. To explicitly disable proxy for pip you should pass `False` as a value.

---

timeout
Set the socket timeout (default 15 seconds)

user
The user under which to run pip

cwd
Directory from which to run pip

use_vt
Use VT terminal emulation (see output while installing)

CLI Example:

```
salt '*' pip.uninstall <package name>,<package2 name>
salt '*' pip.uninstall requirements=/path/to/requirements.txt
salt '*' pip.uninstall <package name> bin_env=/path/to/virtualenv
salt '*' pip.uninstall <package name> bin_env=/path/to/pip_bin
```

`salt.modules.pip.`**`upgrade`**`(`*bin_env=None, user=None, cwd=None, use_vt=False*`)`

New in version 2015.5.0.

Upgrades outdated pip packages.

Note: On Windows you can't update salt from pip using salt, so salt will be skipped

---

Returns a dict containing the changes.

{'<package>': {'old': '<old-version>',
'new': '<new-version>'}}

CLI Example:

```
salt '*' pip.upgrade
```

`salt.modules.pip.`**`upgrade_available`**`(`*pkg, bin_env=None, user=None, cwd=None*`)`

New in version 2015.5.0.

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pip.upgrade_available <package name>
```

`salt.modules.pip.`**`version`**`(`*bin_env=None, cwd=None, user=None*`)`

New in version 0.17.0.

Returns the version of pip. Use `bin_env` to specify the path to a virtualenv and get the version of pip in that virtualenv.

If unable to detect the pip version, returns `None`.

Changed in version 3001.1: The `user` parameter was added, to allow specifying the user who runs the version command.

CLI Example:

```
salt '*' pip.version
```

26.6.145 salt.modules.pkg_resource

Resources needed by pkg providers

`salt.modules.pkg_resource.`**`add_pkg`**`(`*pkgs, name, pkgver*`)`

Add a package to a dict of installed packages.

CLI Example:

```
salt '*' pkg_resource.add_pkg '{}' bind 9
```

`salt.modules.pkg_resource.`**`check_extra_requirements`**`(`*pkgname, pkgver*`)`

Check if the installed package already has the given requirements. This function will return the result of `pkg.check_extra_requirements` if this function exists for the minion, otherwise it will return True.

CLI Example:

```
salt '*' pkg_resource.check_extra_requirements <pkgname> <extra_
↪requirements>
```

`salt.modules.pkg_resource.`**`format_pkg_list`**`(`*packages, versions_as_list, attr*`)`

Formats packages according to parameters for list_pkgs.

`salt.modules.pkg_resource.`**`format_version`**`(`*epoch, version, release*`)`

Formats a version string for list_pkgs.

`salt.modules.pkg_resource.`**`pack_sources`**`(`*sources, normalize=True*`)`

Accepts list of dicts (or a string representing a list of dicts) and packs the key/value pairs into a single dict.

`'[{"foo": "salt://foo.rpm"}, {"bar": "salt://bar.rpm"}]'` would become `{"foo": "salt://foo.rpm", "bar": "salt://bar.rpm"}`

normalize

[True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

CLI Example:

```
salt '*' pkg_resource.pack_sources '[{"foo": "salt://foo.rpm"}, {"bar":
↪"salt://bar.rpm"}]'
```

`salt.modules.pkg_resource.`**`parse_targets`**`(`*name=None, pkgs=None, sources=None, saltenv='base', normalize=True, **kwargs*`)`

Parses the input to pkg.install and returns back the package(s) to be installed. Returns a list of packages, as well as a string noting whether the packages are to come from a repository or a binary package.

CLI Example:

```
salt '*' pkg_resource.parse_targets
```

`salt.modules.pkg_resource.`**`sort_pkglist`**`(`*pkgs*`)`

Accepts a dict obtained from pkg.list_pkgs() and sorts in place the list of versions for any packages that have multiple versions installed, so that two package lists can be compared to one another.

CLI Example:

```
salt '*' pkg_resource.sort_pkglist '["3.45", "2.13"]'
```

`salt.modules.pkg_resource.`**`stringify`**`(`*pkgs*`)`

Takes a dict of package name/version information and joins each list of installed versions into a string.

CLI Example:

```
salt '*' pkg_resource.stringify 'vim: 7.127'
```

`salt.modules.pkg_resource.`**`version`**`(`**names*, ***kwargs*`)`

Common interface for obtaining the version of installed packages.

CLI Example:

```
salt '*' pkg_resource.version vim
salt '*' pkg_resource.version foo bar baz
salt '*' pkg_resource.version 'python*'
```

`salt.modules.pkg_resource.`**`version_clean`**`(`*verstr*`)`

Clean the version string removing extra data. This function will simply try to call `pkg.version_clean`.

CLI Example:

```
salt '*' pkg_resource.version_clean <version_string>
```

`salt.modules.pkg_resource.`**`version_compare`**`(`*ver1*, *oper*, *ver2*, *ignore_epoch=False*`)`

New in version 3001.

Perform a version comparison, using (where available) platform-specific version comparison tools to make the comparison.

ver1
The first version to be compared

oper
One of ==, !=, >=, <=, >, <

ver2
The second version to be compared

Note: To avoid shell interpretation, each of the above values should be quoted when this function is used on the CLI.

---

ignore_epoch
[False] If `True`, both package versions will have their epoch prefix stripped before comparison.

This function is useful in Jinja templates, to perform specific actions when a package's version meets certain criteria. For example:

```
{%- set postfix_version = salt['pkg.version']('postfix') %}
{%- if postfix_version and salt['pkg_resource.version_compare'](postfix_
↪version, '>=', '3.3', ignore_epoch=True) %}
```

(continues on next page)

(continued from previous page)

```
  {#- do stuff #}
{%- endif %}
```

CLI Examples:

```
salt myminion pkg_resource.version_compare '3.5' '<=' '2.4'
salt myminion pkg_resource.version_compare '3.5' '<=' '2.4' ignore_
↪epoch=True
```

26.6.146 salt.modules.pkgin

Package support for pkgin based systems, inspired from freebsdpkg module

---

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see *here*.

`salt.modules.pkgin.`**`available_version`**`(`**names*, ***kwargs*`)`

This function is an alias of `latest_version`.

Changed in version 2016.3.0.

Return the latest version of the named package available for upgrade or installation.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> ...
```

`salt.modules.pkgin.`**`file_dict`**`(`**packages*, ***kwargs*`)`

Changed in version 2016.3.0.

List the files that belong to a package.

CLI Examples:

```
salt '*' pkg.file_dict nginx
salt '*' pkg.file_dict nginx varnish
```

`salt.modules.pkgin.`**`file_list`**`(`*package*, ***kwargs*`)`

List the files that belong to a package.

CLI Examples:

```
salt '*' pkg.file_list nginx
```

`salt.modules.pkgin.`**`install`**`(`*name=None*, *refresh=False*, *fromrepo=None*, *pkgs=None*, *sources=None*, ***kwargs*`)`

Install the passed package

name

The name of the package to be installed.

refresh
Whether or not to refresh the package database before installing.

fromrepo
Specify a package repository to install from.

Multiple Package Installation Options:

pkgs
A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo","bar"]'
```

sources
A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"},{"bar":
↪"salt://bar.deb"}]'
```

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install <package name>
```

`salt.modules.pkgin.`**`latest_version`**`(`**names*, ***kwargs*`)`

Changed in version 2016.3.0.

Return the latest version of the named package available for upgrade or installation.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> ...
```

`salt.modules.pkgin.`**`list_pkgs`**`(`*versions_as_list=False*, ***kwargs*`)`

Changed in version 2016.3.0.

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.pkgin.`**`list_upgrades`**`(`*refresh=True*, ***kwargs*`)`

List all available package upgrades.

New in version 2018.3.0.

refresh
Whether or not to refresh the package database before installing.

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.pkgin.`**`normalize_name`**`(`*pkgs*, ***kwargs*`)`

Normalize package names

Note: Nothing special to do to normalize, just return the original. (We do need it to be compatible with the pkg_resource provider.)

`salt.modules.pkgin.`**`purge`**`(`*name=None*, *pkgs=None*, ***kwargs*`)`

Package purges are not supported, this function is identical to `remove()`.

name

The name of the package to be deleted.

Multiple Package Options:

pkgs

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

`salt.modules.pkgin.`**`refresh_db`**`(`*force=False*, ***kwargs*`)`

Use pkg update to get latest pkg_summary

force

Pass -f so that the cache is always refreshed.

New in version 2018.3.0.

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.pkgin.`**`remove`**`(`*name=None*, *pkgs=None*, ***kwargs*`)`

name

The name of the package to be deleted.

Multiple Package Options:

pkgs

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.pkgin.`**`search`**(*pkg_name*, ***kwargs*)

Searches for an exact match using pkgin ^package$

CLI Example:

```
salt '*' pkg.search 'mysql-server'
```

`salt.modules.pkgin.`**`upgrade`**(*refresh=True*, *pkgs=None*, ***kwargs*)

Run pkg upgrade, if pkgin used. Otherwise do nothing

refresh
Whether or not to refresh the package database before installing.

Multiple Package Upgrade Options:

pkgs
A list of packages to upgrade from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.upgrade pkgs='["foo","bar"]'
```

Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.pkgin.`**`version`**(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

26.6.147 salt.modules.pkgng

Support for `pkgng`, the new package manager for FreeBSD

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see *here*.

Warning: This module has been completely rewritten. Up to and including version 0.17.x, it was available as the `pkgng` module, (`pkgng.install`, `pkgng.delete`, etc.), but moving forward this module will no longer be available as `pkgng`, as it will behave like a normal Salt `pkg` provider. The documentation below should not be considered to apply to this module in versions <= 0.17.x. If your minion is running a 0.17.x release or older, then the documentation for this module can be viewed using the `sys.doc` function:

```
salt bsdminion sys.doc pkgng
```

This module provides an interface to `pkg(8)`. It acts as the default package provider for FreeBSD 10 and newer. For FreeBSD hosts which have been upgraded to use pkgng, you will need to override the `pkg` provider by setting the *providers* parameter in your Minion config file, in order to use this module to manage packages, like so:

```
providers:
  pkg: pkgng
```

`salt.modules.pkgng.`**`audit`**(*jail=None*, *chroot=None*, *root=None*)

Audits installed packages against known vulnerabilities

CLI Example:

```
salt '*' pkg.audit
```

jail

Audit packages within the specified jail

CLI Example:

```
salt '*' pkg.audit jail=<jail name or id>
```

chroot

Audit packages within the specified chroot (ignored if `jail` is specified)

root

Audit packages within the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.audit chroot=/path/to/chroot
```

`salt.modules.pkgng.`**`autoremove`**(*jail=None*, *chroot=None*, *root=None*, *dryrun=False*)

Delete packages which were automatically installed as dependencies and are not required anymore.

dryrun

Dry-run mode. The list of changes to packages is always printed, but no changes are actually made.

CLI Example:

```
salt '*' pkg.autoremove
salt '*' pkg.autoremove jail=<jail name or id>
salt '*' pkg.autoremove dryrun=True
salt '*' pkg.autoremove jail=<jail name or id> dryrun=True
```

`salt.modules.pkgng.`**`available_version`**(**names*, ***kwargs*)

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> jail=<jail name or id>
salt '*' pkg.latest_version <package name> chroot=/path/to/chroot
```

`salt.modules.pkgng.`**`backup`**(*file_name*, *jail=None*, *chroot=None*, *root=None*)

Export installed packages into yaml+mtree file

CLI Example:

```
salt '*' pkg.backup /tmp/pkg
```

jail
Backup packages from the specified jail. Note that this will run the command within the jail, and so the path to the backup file will be relative to the root of the jail

CLI Example:

```
salt '*' pkg.backup /tmp/pkg jail=<jail name or id>
```

chroot
Backup packages from the specified chroot (ignored if `jail` is specified). Note that this will run the command within the chroot, and so the path to the backup file will be relative to the root of the chroot.

root
Backup packages from the specified root (ignored if `jail` is specified). Note that this will run the command within the root, and so the path to the backup file will be relative to the root of the root.

CLI Example:

```
salt '*' pkg.backup /tmp/pkg chroot=/path/to/chroot
```

`salt.modules.pkgng.`**`check`**(*jail=None*, *chroot=None*, *root=None*, *depends=False*, *recompute=False*, *checksum=False*, *checklibs=False*)

Sanity checks installed packages

jail
Perform the sanity check in the specified jail

CLI Example:

```
salt '*' pkg.check jail=<jail name or id>
```

chroot
Perform the sanity check in the specified chroot (ignored if `jail` is specified)

root
Perform the sanity check in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.check chroot=/path/to/chroot
```

Of the below, at least one must be set to `True`.

depends
Check for and install missing dependencies.

CLI Example:

```
salt '*' pkg.check depends=True
```

recompute
Recompute sizes and checksums of installed packages.

CLI Example:

```
salt '*' pkg.check recompute=True
```

checksum
Find invalid checksums for installed packages.

CLI Example:

```
salt '*' pkg.check checksum=True
```

checklibs

Regenerates the library dependency metadata for a package.

CLI Example:

```
salt '*' pkg.check checklibs=True
```

`salt.modules.pkgng.`**`clean`**(*jail=None*, *chroot=None*, *root=None*, *clean_all=False*, *dryrun=False*)

Cleans the local cache of fetched remote packages

CLI Example:

```
salt '*' pkg.clean
```

jail

Cleans the package cache in the specified jail

CLI Example:

```
salt '*' pkg.clean jail=<jail name or id>
```

chroot

Cleans the package cache in the specified chroot (ignored if `jail` is specified)

root

Cleans the package cache in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.clean chroot=/path/to/chroot
```

clean_all

Clean all packages from the local cache (not just those that have been superseded by newer versions).

CLI Example:

```
```

salt '*' pkg.clean clean_all=True

dryrun

Dry-run mode. This list of changes to the local cache is always printed, but no changes are actually made.

CLI Example:

```
salt '*' pkg.clean dryrun=True
```

`salt.modules.pkgng.`**`delete`**(*name=None*, *pkgs=None*, *jail=None*, *chroot=None*, *root=None*, *all_installed=False*, *force=False*, *glob=False*, *dryrun=False*, *recurse=False*, *regex=False*, *pcre=False*, ***kwargs*)

This function is an alias of `remove`.

Remove a package from the database and system

Note: This function can accessed using `pkg.delete` in addition to `pkg.remove`, to more closely match the CLI usage of `pkg(8)`.

---

name
The package to remove

CLI Example:

```
salt '*' pkg.remove <package name>
```

jail
Delete the package from the specified jail

chroot
Delete the package from the specified chroot (ignored if `jail` is specified)

root
Delete the package from the specified root (ignored if `jail` is specified)

all_installed
Deletes all installed packages from the system and empties the database. USE WITH CAUTION!

CLI Example:

```
salt '*' pkg.remove all all_installed=True force=True
```

force
Forces packages to be removed despite leaving unresolved dependencies.

CLI Example:

```
salt '*' pkg.remove <package name> force=True
```

glob
Treat the package names as shell glob patterns.

CLI Example:

```
salt '*' pkg.remove <package name> glob=True
```

dryrun
Dry run mode. The list of packages to delete is always printed, but no packages are actually deleted.

CLI Example:

```
salt '*' pkg.remove <package name> dryrun=True
```

recurse
Delete all packages that require the listed package as well.

CLI Example:

```
salt '*' pkg.remove <package name> recurse=True
```

regex
Treat the package names as regular expressions.

CLI Example:

```
salt '*' pkg.remove <regular expression> regex=True
```

pcre
Treat the package names as extended regular expressions.

CLI Example:

```
salt '*' pkg.remove <extended regular expression> pcre=True
```

`salt.modules.pkgng.`**`fetch`**`(`*name, jail=None, chroot=None, root=None, fetch_all=False, quiet=False, fromrepo=None, glob=True, regex=False, pcre=False, local=False, depends=False*`)`

Fetches remote packages

CLI Example:

```
salt '*' pkg.fetch <package name>
```

jail

Fetch package in the specified jail

CLI Example:

```
salt '*' pkg.fetch <package name> jail=<jail name or id>
```

chroot

Fetch package in the specified chroot (ignored if `jail` is specified)

root

Fetch package in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.fetch <package name> chroot=/path/to/chroot
```

fetch_all

Fetch all packages.

CLI Example:

```
salt '*' pkg.fetch <package name> fetch_all=True
```

quiet

Quiet mode. Show less output.

CLI Example:

```
salt '*' pkg.fetch <package name> quiet=True
```

fromrepo

Fetches packages from the given repo if multiple repo support is enabled. See `pkg.conf(5)`.

CLI Example:

```
salt '*' pkg.fetch <package name> fromrepo=repo
```

glob

Treat pkg_name as a shell glob pattern.

CLI Example:

```
salt '*' pkg.fetch <package name> glob=True
```

regex

Treat pkg_name as a regular expression.

CLI Example:

```
salt '*' pkg.fetch <regular expression> regex=True
```

pcre
Treat pkg_name is an extended regular expression.

CLI Example:

```
salt '*' pkg.fetch <extended regular expression> pcre=True
```

local
Skip updating the repository catalogs with pkg-update(8). Use the local cache only.

CLI Example:

```
salt '*' pkg.fetch <package name> local=True
```

depends
Fetch the package and its dependencies as well.

CLI Example:

```
salt '*' pkg.fetch <package name> depends=True
```

`salt.modules.pkgng.`**`hold`**`(`*name=None, pkgs=None, **kwargs*`)`

Version-lock packages

Note: This function is provided primarily for compatibility with some parts of *`states.pkg`*. Consider using Consider using *`pkg.lock`* instead. instead.

---

name
The name of the package to be held.

Multiple Package Options:

pkgs
A list of packages to hold. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.hold <package name>
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

`salt.modules.pkgng.`**`info`**`(`**names, **kwargs*`)`

This function is an alias of `version`.

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

Note: This function can accessed using `pkg.info` in addition to `pkg.version`, to more closely match the CLI usage of `pkg(8)`.

---

jail
Get package version information for the specified jail

chroot
Get package version information for the specified chroot (ignored if `jail` is specified)

root
Get package version information for the specified root (ignored if `jail` is specified)

with_origin
[False] Return a nested dictionary containing both the origin name and version for each specified package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package name> jail=<jail name or id>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.pkgng.`**`install`**`(`*name=None, fromrepo=None, pkgs=None, sources=None, jail=None, chroot=None, root=None, orphan=False, force=False, glob=False, local=False, dryrun=False, quiet=False, reinstall_requires=False, regex=False, pcre=False, batch=False, **kwargs*`)`

Install package(s) from a repository

name
The name of the package to install

CLI Example:

```
salt '*' pkg.install <package name>
```

jail
Install the package into the specified jail

chroot
Install the package into the specified chroot (ignored if `jail` is specified)

root
Install the package into the specified root (ignored if `jail` is specified)

orphan
Mark the installed package as orphan. Will be automatically removed if no other packages depend on them. For more information please refer to `pkg-autoremove(8)`.

CLI Example:

```
salt '*' pkg.install <package name> orphan=True
```

force
Force the reinstallation of the package if already installed.

CLI Example:

```
salt '*' pkg.install <package name> force=True
```

glob
Treat the package names as shell glob patterns.

CLI Example:

```
salt '*' pkg.install <package name> glob=True
```

local
Do not update the repository catalogs with `pkg-update(8)`. A value of `True` here is equivalent to using the `-U` flag with `pkg install`.

CLI Example:

```
salt '*' pkg.install <package name> local=True
```

dryrun

Dru-run mode. The list of changes to packages is always printed, but no changes are actually made.

CLI Example:

```
salt '*' pkg.install <package name> dryrun=True
```

quiet

Force quiet output, except when dryrun is used, where pkg install will always show packages to be installed, upgraded or deleted.

CLI Example:

```
salt '*' pkg.install <package name> quiet=True
```

reinstall_requires

When used with force, reinstalls any packages that require the given package.

CLI Example:

```
salt '*' pkg.install <package name> reinstall_requires=True
↪force=True
```

Changed in version 2014.7.0: `require` kwarg renamed to `reinstall_requires`

fromrepo

In multi-repo mode, override the pkg.conf ordering and only attempt to download packages from the named repository.

CLI Example:

```
salt '*' pkg.install <package name> fromrepo=repo
```

regex

Treat the package names as a regular expression

CLI Example:

```
salt '*' pkg.install <regular expression> regex=True
```

pcre

Treat the package names as extended regular expressions.

CLI Example:

```

```

batch

Use BATCH=true for pkg install, skipping all questions. Be careful when using in production.

CLI Example:

```
salt '*' pkg.install <package name> batch=True
```

`salt.modules.pkgng.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> jail=<jail name or id>
salt '*' pkg.latest_version <package name> chroot=/path/to/chroot
```

`salt.modules.pkgng.`**`list_locked`**`(`*`**kwargs`*`)`

Query the package database those packages which are locked against reinstallation, modification or deletion.

Returns returns a list of package names with version strings

CLI Example:

```
salt '*' pkg.list_locked
```

jail

List locked packages within the specified jail

CLI Example:

```
salt '*' pkg.list_locked jail=<jail name or id>
```

chroot

List locked packages within the specified chroot (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.list_locked chroot=/path/to/chroot
```

root

List locked packages within the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.list_locked root=/path/to/chroot
```

`salt.modules.pkgng.`**`list_pkgs`**`(`*versions_as_list=False, jail=None, chroot=None, root=None, with_origin=False, **kwargs*`)`

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

jail

List the packages in the specified jail

chroot

List the packages in the specified chroot (ignored if `jail` is specified)

root

List the packages in the specified root (ignored if `jail` is specified)

with_origin

[False] Return a nested dictionary containing both the origin name and version for each installed package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs jail=<jail name or id>
salt '*' pkg.list_pkgs chroot=/path/to/chroot
```

`salt.modules.pkgng.`**`list_upgrades`**`(`*refresh=True*, ***kwargs*`)`

List those packages for which an upgrade is available

The `fromrepo` argument is also supported, as used in pkg states.

CLI Example:

```
salt '*' pkg.list_upgrades
```

jail

List upgrades within the specified jail

CLI Example:

```
salt '*' pkg.list_upgrades jail=<jail name or id>
```

chroot

List upgrades within the specified chroot (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.list_upgrades chroot=/path/to/chroot
```

root

List upgrades within the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.list_upgrades root=/path/to/chroot
```

`salt.modules.pkgng.`**`lock`**`(`*name*, ***kwargs*`)`

Lock the named package against reinstallation, modification or deletion.

Returns True if the named package was successfully locked.

CLI Example:

```
salt '*' pkg.lock <package name>
```

jail

Lock packages within the specified jail

CLI Example:

```
salt '*' pkg.lock <package name> jail=<jail name or id>
```

chroot

Lock packages within the specified chroot (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.lock <package name> chroot=/path/to/chroot
```

root

Lock packages within the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.lock <package name> root=/path/to/chroot
```

`salt.modules.pkgng.`**`locked`**`(`*name*, ***kwargs*`)`

Query the package database to determine if the named package is locked against reinstallation, modification or deletion.

Returns True if the named package is locked, False otherwise.

CLI Example:

```
salt '*' pkg.locked <package name>
```

jail

Test if a package is locked within the specified jail

CLI Example:

```
salt '*' pkg.locked <package name> jail=<jail name or id>
```

chroot

Test if a package is locked within the specified chroot (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.locked <package name> chroot=/path/to/chroot
```

root

Test if a package is locked within the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.locked <package name> root=/path/to/chroot
```

`salt.modules.pkgng.`**`parse_config`**`(`*file_name='/usr/local/etc/pkg.conf'*`)`

Return dict of uncommented global variables.

CLI Example:

```
salt '*' pkg.parse_config
```

`NOTE:` not working properly right now

`salt.modules.pkgng.`**`purge`**`(`*name=None*, *pkgs=None*, *jail=None*, *chroot=None*, *root=None*, *all_installed=False*, *force=False*, *glob=False*, *dryrun=False*, *recurse=False*, *regex=False*, *pcre=False*, ***kwargs*`)`

This function is an alias of `remove`.

Remove a package from the database and system

Note: This function can accessed using `pkg.delete` in addition to `pkg.remove`, to more closely match the CLI usage of `pkg(8)`.

---

name

The package to remove

CLI Example:

```
salt '*' pkg.remove <package name>
```

jail

Delete the package from the specified jail

chroot
Delete the package from the specified chroot (ignored if `jail` is specified)

root
Delete the package from the specified root (ignored if `jail` is specified)

all_installed
Deletes all installed packages from the system and empties the database. USE WITH CAUTION!

CLI Example:

```
salt '*' pkg.remove all all_installed=True force=True
```

force
Forces packages to be removed despite leaving unresolved dependencies.

CLI Example:

```
salt '*' pkg.remove <package name> force=True
```

glob
Treat the package names as shell glob patterns.

CLI Example:

```
salt '*' pkg.remove <package name> glob=True
```

dryrun
Dry run mode. The list of packages to delete is always printed, but no packages are actually deleted.

CLI Example:

```
salt '*' pkg.remove <package name> dryrun=True
```

recurse
Delete all packages that require the listed package as well.

CLI Example:

```
salt '*' pkg.remove <package name> recurse=True
```

regex
Treat the package names as regular expressions.

CLI Example:

```
salt '*' pkg.remove <regular expression> regex=True
```

pcre
Treat the package names as extended regular expressions.

CLI Example:

```
salt '*' pkg.remove <extended regular expression> pcre=True
```

`salt.modules.pkgng.`**`refresh_db`**(*jail=None, chroot=None, root=None, force=False, **kwargs*)

Refresh PACKAGESITE contents

Note: This function can accessed using `pkg.update` in addition to `pkg.refresh_db`, to more closely match the CLI usage of `pkg(8)`.

CLI Example:

```
salt '*' pkg.refresh_db
```

jail
Refresh the pkg database within the specified jail

chroot
Refresh the pkg database within the specified chroot (ignored if `jail` is specified)

root
Refresh the pkg database within the specified root (ignored if `jail` is specified)

force
Force a full download of the repository catalog without regard to the respective ages of the local and remote copies of the catalog.

CLI Example:

```
salt '*' pkg.refresh_db force=True
```

`salt.modules.pkgng.`**`remove`**`(`*name=None, pkgs=None, jail=None, chroot=None, root=None, all_installed=False, force=False, glob=False, dryrun=False, recurse=False, regex=False, pcre=False, **kwargs*`)`

Remove a package from the database and system

Note: This function can accessed using `pkg.delete` in addition to `pkg.remove`, to more closely match the CLI usage of `pkg(8)`.

---

name
The package to remove

CLI Example:

```
salt '*' pkg.remove <package name>
```

jail
Delete the package from the specified jail

chroot
Delete the package from the specified chroot (ignored if `jail` is specified)

root
Delete the package from the specified root (ignored if `jail` is specified)

all_installed
Deletes all installed packages from the system and empties the database. USE WITH CAUTION!

CLI Example:

```
salt '*' pkg.remove all all_installed=True force=True
```

force
Forces packages to be removed despite leaving unresolved dependencies.

CLI Example:

```
salt '*' pkg.remove <package name> force=True
```

glob
Treat the package names as shell glob patterns.

CLI Example:

```
salt '*' pkg.remove <package name> glob=True
```

dryrun
Dry run mode. The list of packages to delete is always printed, but no packages are actually deleted.

CLI Example:

```
salt '*' pkg.remove <package name> dryrun=True
```

recurse
Delete all packages that require the listed package as well.

CLI Example:

```
salt '*' pkg.remove <package name> recurse=True
```

regex
Treat the package names as regular expressions.

CLI Example:

```
salt '*' pkg.remove <regular expression> regex=True
```

pcre
Treat the package names as extended regular expressions.

CLI Example:

```
salt '*' pkg.remove <extended regular expression> pcre=True
```

`salt.modules.pkgng.`**`restore`**(*file_name*, *jail=None*, *chroot=None*, *root=None*)

Reads archive created by pkg backup -d and recreates the database.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg
```

jail
Restore database to the specified jail. Note that this will run the command within the jail, and so the path to the file from which the pkg database will be restored is relative to the root of the jail.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg jail=<jail name or id>
```

chroot
Restore database to the specified chroot (ignored if `jail` is specified). Note that this will run the command within the chroot, and so the path to the file from which the pkg database will be restored is relative to the root of the chroot.

root
Restore database to the specified root (ignored if `jail` is specified). Note that this will run the command within the root, and so the path to the file from which the pkg database will be restored is relative to the root of the root.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg chroot=/path/to/chroot
```

`salt.modules.pkgng.`**`search`**(*name*, *jail=None*, *chroot=None*, *root=None*, *exact=False*, *glob=False*, *regex=False*, *pcre=False*, *comment=False*, *desc=False*, *full=False*, *depends=False*, *size=False*, *quiet=False*, *origin=False*, *prefix=False*)

Searches in remote package repositories

CLI Example:

```
salt '*' pkg.search pattern
```

jail
Perform the search using the `pkg.conf(5)` from the specified jail

CLI Example:

```
salt '*' pkg.search pattern jail=<jail name or id>
```

chroot
Perform the search using the `pkg.conf(5)` from the specified chroot (ignored if `jail` is specified)

root
Perform the search using the `pkg.conf(5)` from the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.search pattern chroot=/path/to/chroot
```

exact
Treat pattern as exact pattern.

CLI Example:

```
salt '*' pkg.search pattern exact=True
```

glob
Treat pattern as a shell glob pattern.

CLI Example:

```
salt '*' pkg.search pattern glob=True
```

regex
Treat pattern as a regular expression.

CLI Example:

```
salt '*' pkg.search pattern regex=True
```

pcre
Treat pattern as an extended regular expression.

CLI Example:

```
salt '*' pkg.search pattern pcre=True
```

comment
Search for pattern in the package comment one-line description.

CLI Example:

```
salt '*' pkg.search pattern comment=True
```

desc
Search for pattern in the package description.

CLI Example:

```
salt '*' pkg.search pattern desc=True
```

full
Displays full information about the matching packages.

CLI Example:

```
salt '*' pkg.search pattern full=True
```

depends
Displays the dependencies of pattern.

CLI Example:

```
salt '*' pkg.search pattern depends=True
```

size
Displays the size of the package

CLI Example:

```
salt '*' pkg.search pattern size=True
```

quiet
Be quiet. Prints only the requested information without displaying many hints.

CLI Example:

```
salt '*' pkg.search pattern quiet=True
```

origin
Displays pattern origin.

CLI Example:

```
salt '*' pkg.search pattern origin=True
```

prefix
Displays the installation prefix for each package matching pattern.

CLI Example:

```
salt '*' pkg.search pattern prefix=True
```

`salt.modules.pkgng.`**`stats`**(*local=False, remote=False, jail=None, chroot=None, root=None, bytes=False*)

Return pkgng stats.

CLI Example:

```
salt '*' pkg.stats
```

local
Display stats only for the local package database.

CLI Example:

```
salt '*' pkg.stats local=True
```

remote
Display stats only for the remote package database(s).

CLI Example:

```
salt '*' pkg.stats remote=True
```

bytes

Display disk space usage in bytes only.

CLI Example:

```
salt '*' pkg.stats bytes=True
```

jail

Retrieve stats from the specified jail.

CLI Example:

```
salt '*' pkg.stats jail=<jail name or id>
salt '*' pkg.stats jail=<jail name or id> local=True
salt '*' pkg.stats jail=<jail name or id> remote=True
```

chroot

Retrieve stats from the specified chroot (ignored if `jail` is specified).

root

Retrieve stats from the specified root (ignored if `jail` is specified).

CLI Example:

```
salt '*' pkg.stats chroot=/path/to/chroot
salt '*' pkg.stats chroot=/path/to/chroot local=True
salt '*' pkg.stats chroot=/path/to/chroot remote=True
```

`salt.modules.pkgng.`**`unhold`**(*name=None*, *pkgs=None*, ***kwargs*)

Remove version locks

Note: This function is provided primarily for compatibility with some parts of *`states.pkg`*. Consider using *`pkg.unlock`* instead.

name

The name of the package to be unheld

Multiple Package Options:

pkgs

A list of packages to unhold. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.unhold <package name>
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

`salt.modules.pkgng.`**`unlock`**(*name*, ***kwargs*)

Unlock the named package against reinstallation, modification or deletion.

Returns True if the named package was successfully unlocked.

CLI Example:

```
salt '*' pkg.unlock <package name>
```

jail
Unlock packages within the specified jail

CLI Example:

```
salt '*' pkg.unlock <package name> jail=<jail name or id>
```

chroot
Unlock packages within the specified chroot (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.unlock <package name> chroot=/path/to/chroot
```

root
Unlock packages within the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.unlock <package name> root=/path/to/chroot
```

`salt.modules.pkgng.`**`update`**(*jail=None*, *chroot=None*, *root=None*, *force=False*, ***kwargs*)

This function is an alias of `refresh_db`.
Refresh PACKAGESITE contents

Note: This function can accessed using `pkg.update` in addition to `pkg.refresh_db`, to more closely match the CLI usage of `pkg(8)`.

CLI Example:

```
salt '*' pkg.refresh_db
```

jail
Refresh the pkg database within the specified jail

chroot
Refresh the pkg database within the specified chroot (ignored if `jail` is specified)

root
Refresh the pkg database within the specified root (ignored if `jail` is specified)

force
Force a full download of the repository catalog without regard to the respective ages of the local and remote copies of the catalog.

CLI Example:

```
salt '*' pkg.refresh_db force=True
```

`salt.modules.pkgng.`**`update_package_site`**(*new_url*)

Updates remote package repo URL, PACKAGESITE var to be exact.

Must use `http://`, `ftp://`, or `https://` protocol

CLI Example:

```
salt '*' pkg.update_package_site http://127.0.0.1/
```

`salt.modules.pkgng.`**`updating`**(*name*, *jail=None*, *chroot=None*, *root=None*, *filedate=None*, *filename=None*)

' Displays UPDATING entries of software packages

CLI Example:

```
salt '*' pkg.updating foo
```

jail
Perform the action in the specified jail

CLI Example:

```
salt '*' pkg.updating foo jail=<jail name or id>
```

chroot
Perform the action in the specified chroot (ignored if `jail` is specified)

root
Perform the action in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.updating foo chroot=/path/to/chroot
```

filedate
Only entries newer than date are shown. Use a YYYYMMDD date format.

CLI Example:

```
salt '*' pkg.updating foo filedate=20130101
```

filename
Defines an alternative location of the UPDATING file.

CLI Example:

```
salt '*' pkg.updating foo filename=/tmp/UPDATING
```

`salt.modules.pkgng.`**`upgrade`**`(`**names*, ***kwargs*`)`

Upgrade named or all packages (run a `pkg upgrade`). If <package name> is omitted, the operation is executed on all packages.

Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade <package name>
```

jail
Audit packages within the specified jail

CLI Example:

```
salt '*' pkg.upgrade <package name> jail=<jail name or id>
```

chroot
Audit packages within the specified chroot (ignored if `jail` is specified)

root
Audit packages within the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.upgrade <package name> chroot=/path/to/chroot
```

Any of the below options can also be used with `jail` or `chroot`.

force

Force reinstalling/upgrading the whole set of packages.

CLI Example:

```
salt '*' pkg.upgrade <package name> force=True
```

local

Do not update the repository catalogs with `pkg-update(8)`. A value of `True` here is equivalent to using the `-U` flag with `pkg upgrade`.

CLI Example:

```
salt '*' pkg.upgrade <package name> local=True
```

dryrun

Dry-run mode: show what packages have updates available, but do not perform any upgrades. Repository catalogs will be updated as usual unless the local option is also given.

CLI Example:

```
salt '*' pkg.upgrade <package name> dryrun=True
```

fromrepo

In multi-repo mode, override the pkg.conf ordering and only attempt to upgrade packages from the named repository.

CLI Example:

```
salt '*' pkg.upgrade <package name> fromrepo=repo
```

fetchonly

Do not perform installation of packages, merely fetch packages that should be upgraded and detect possible conflicts.

CLI Example:

```
salt '*' pkg.upgrade <package name> fetchonly=True
```

`salt.modules.pkgng.`**`version`**`(`**names, **kwargs*`)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

Note: This function can accessed using `pkg.info` in addition to `pkg.version`, to more closely match the CLI usage of `pkg(8)`.

---

jail

Get package version information for the specified jail

chroot

Get package version information for the specified chroot (ignored if `jail` is specified)

root

Get package version information for the specified root (ignored if `jail` is specified)

with_origin

[False] Return a nested dictionary containing both the origin name and version for each specified package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package name> jail=<jail name or id>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.pkgng.`**`version_cmp`**(*pkg1*, *pkg2*, *ignore_epoch=False*, ***kwargs*)

Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

CLI Example:

```
salt '*' pkg.version_cmp '2.1.11' '2.1.12'
```

`salt.modules.pkgng.`**`which`**(*path*, *jail=None*, *chroot=None*, *root=None*, *origin=False*, *quiet=False*)

Displays which package installed a specific file

CLI Example:

```
salt '*' pkg.which <file name>
```

jail

Perform the check in the specified jail

CLI Example:

```
salt '*' pkg.which <file name> jail=<jail name or id>
```

chroot

Perform the check in the specified chroot (ignored if `jail` is specified)

root

Perform the check in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.which <file name> chroot=/path/to/chroot
```

origin

Shows the origin of the package instead of name-version.

CLI Example:

```
salt '*' pkg.which <file name> origin=True
```

quiet

Quiet output.

CLI Example:

```
salt '*' pkg.which <file name> quiet=True
```

26.6.148 salt.modules.pkgutil

Pkgutil support for Solaris

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see *here*.

`salt.modules.pkgutil.`**`available_version`**`(`**names, **kwargs*`)`

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkgutil.latest_version CSWpython
salt '*' pkgutil.latest_version <package1> <package2> <package3>
↪...
```

`salt.modules.pkgutil.`**`install`**`(`*name=None, refresh=False, version=None, pkgs=None, **kwargs*`)`

Install packages using the pkgutil tool.

CLI Example:

```
salt '*' pkg.install <package_name>
salt '*' pkg.install SMClgcc346
```

Multiple Package Installation Options:

pkgs

A list of packages to install from OpenCSW. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3"}]'
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

`salt.modules.pkgutil.`**`latest_version`**`(`**names, **kwargs*`)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkgutil.latest_version CSWpython
salt '*' pkgutil.latest_version <package1> <package2> <package3> ...
```

`salt.modules.pkgutil.`**`list_pkgs`**`(`*versions_as_list=False, **kwargs*`)`

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

`salt.modules.pkgutil.`**`list_upgrades`**`(`*refresh=True*, ***kwargs*`)`

List all available package upgrades on this system

CLI Example:

```
salt '*' pkgutil.list_upgrades
```

`salt.modules.pkgutil.`**`purge`**`(`*name=None*, *pkgs=None*, ***kwargs*`)`

Package purges are not supported, this function is identical to `remove()`.

name

The name of the package to be deleted.

Multiple Package Options:

pkgs

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

`salt.modules.pkgutil.`**`refresh_db`**`()`

Updates the pkgutil repo database (pkgutil -U)

CLI Example:

```
salt '*' pkgutil.refresh_db
```

`salt.modules.pkgutil.`**`remove`**`(`*name=None*, *pkgs=None*, ***kwargs*`)`

Remove a package and all its dependencies which are not in use by other packages.

name

The name of the package to be deleted.

Multiple Package Options:

pkgs

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.pkgutil.`**`upgrade`**`(`*refresh=True*`)`

Upgrade all of the packages to the latest available version.

Returns a dict containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkgutil.upgrade
```

`salt.modules.pkgutil.`**`upgrade_available`**`(`*name*`)`

Check if there is an upgrade available for a certain package

CLI Example:

```
salt '*' pkgutil.upgrade_available CSWpython
```

`salt.modules.pkgutil.`**`version`**`(`**names*, ***kwargs*`)`

Returns a version if the package is installed, else returns an empty string

CLI Example:

```
salt '*' pkgutil.version CSWpython
```

26.6.149 salt.modules.postgres

Module to provide Postgres compatibility to salt.

configuration

In order to connect to Postgres, certain configuration is required in /etc/salt/minion on the relevant minions. Some sample configs might look like:

```
postgres.host: 'localhost'
postgres.port: '5432'
postgres.user: 'postgres' -> db user
postgres.pass: ''
postgres.maintenance_db: 'postgres'
```

The default for the maintenance_db is 'postgres' and in most cases it can be left at the default setting. This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar

To prevent Postgres commands from running arbitrarily long, a timeout (in seconds) can be set

```
postgres.timeout: 60
```

New in version 3006.0.

note

This module uses MD5 hashing which may not be compliant with certain security audits.

note

When installing postgres from the official postgres repos, on certain linux distributions, either the psql or the initdb binary is *not* automatically placed on the path. Add a configuration to the location of the postgres bin's path to the relevant minion for this module:

```
postgres.bins_dir: '/usr/pgsql-9.5/bin/'
```

`salt.modules.postgres.`**`available_extensions`**(*user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*)

List available postgresql extensions

CLI Example:

```
salt '*' postgres.available_extensions
```

`salt.modules.postgres.`**`create_extension`**(*name, if_not_exists=None, schema=None, ext_version=None, from_version=None, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*)

Install a postgresql extension

CLI Example:

```
salt '*' postgres.create_extension 'adminpack'
```

`salt.modules.postgres.`**`create_metadata`**(*name, ext_version=None, schema=None, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*)

Get lifecycle information about an extension

CLI Example:

```
salt '*' postgres.create_metadata adminpack
```

`salt.modules.postgres.`**`datadir_exists`**(*name*)

New in version 2016.3.0.

Checks if postgres data directory has been initialized

CLI Example:

```
salt '*' postgres.datadir_exists '/var/lib/pgsql/data'
```

name
Name of the directory to check

`salt.modules.postgres.`**`datadir_init`**(*name, auth='password', user=None, password=None, encoding='UTF8', locale=None, waldir=None, checksums=False, runas=None*)

New in version 2016.3.0.

Initializes a postgres data directory

CLI Example:

```
salt '*' postgres.datadir_init '/var/lib/pgsql/data'
```

name
The name of the directory to initialize

auth
The default authentication method for local connections

password
The password to set for the postgres user

user
The database superuser name

encoding
The default encoding for new databases

locale
The default locale for new databases

waldir
The transaction log (WAL) directory (default is to keep WAL inside the data directory)

New in version 2019.2.0.

checksums
If True, the cluster will be created with data page checksums.

Note: Data page checksums are supported since PostgreSQL 9.3.

New in version 2019.2.0.

runas
The system user the operation should be performed on behalf of

`salt.modules.postgres.`**`db_alter`**(*name, user=None, host=None, port=None, maintenance_db=None, password=None, tablespace=None, owner=None, owner_recurse=False, runas=None*)

Change tablespace or/and owner of database.

CLI Example:

```
salt '*' postgres.db_alter dbname owner=otheruser
```

`salt.modules.postgres.`**`db_create`**(*name, user=None, host=None, port=None, maintenance_db=None, password=None, tablespace=None, encoding=None, lc_collate=None, lc_ctype=None, owner=None, template=None, runas=None*)

Adds a databases to the Postgres server.

CLI Example:

```
salt '*' postgres.db_create 'dbname'

salt '*' postgres.db_create 'dbname' template=template_postgis
```

`salt.modules.postgres.`**`db_exists`**(*name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*)

Checks if a database exists on the Postgres server.

CLI Example:

```
salt '*' postgres.db_exists 'dbname'
```

`salt.modules.postgres.`**`db_list`**(*user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*)

Return dictionary with information about databases of a Postgres server.

CLI Example:

```
salt '*' postgres.db_list
```

`salt.modules.postgres.`**`db_remove`**`(`*name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*`)`

Removes a databases from the Postgres server.

CLI Example:

```
salt '*' postgres.db_remove 'dbname'
```

`salt.modules.postgres.`**`drop_extension`**`(`*name, if_exists=None, restrict=None, cascade=None, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*`)`

Drop an installed postgresql extension

CLI Example:

```
salt '*' postgres.drop_extension 'adminpack'
```

`salt.modules.postgres.`**`get_available_extension`**`(`*name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*`)`

Get info about an available postgresql extension

CLI Example:

```
salt '*' postgres.get_available_extension plpgsql
```

`salt.modules.postgres.`**`get_installed_extension`**`(`*name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*`)`

Get info about an installed postgresql extension

CLI Example:

```
salt '*' postgres.get_installed_extension plpgsql
```

`salt.modules.postgres.`**`group_create`**`(`*groupname, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, createroles=None, encrypted=None, login=None, inherit=None, superuser=None, replication=None, rolepassword=None, groups=None, runas=None*`)`

Creates a Postgres group. A group is postgres is similar to a user, but cannot login.

CLI Example:

```
salt '*' postgres.group_create 'groupname' user='user' \
        host='hostname' port='port' password='password' \
        rolepassword='rolepassword'
```

`salt.modules.postgres.`**`group_remove`**`(`*groupname, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*`)`

Removes a group from the Postgres server.

CLI Example:

```
salt '*' postgres.group_remove 'groupname'
```

salt.modules.postgres.**group_update**(*groupname, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, createroles=None, encrypted=None, inherit=None, login=None, superuser=None, replication=None, rolepassword=None, groups=None, runas=None*)

Updates a postgres group

CLI Examples:

```
salt '*' postgres.group_update 'username' user='user' \
        host='hostname' port='port' password='password' \
        rolepassword='rolepassword'
```

salt.modules.postgres.**has_privileges**(*name, object_name, object_type, privileges=None, grant_option=None, prepend='public', maintenance_db=None, user=None, host=None, port=None, password=None, runas=None*)

New in version 2016.3.0.

Check if a role has the specified privileges on an object

CLI Example:

```
salt '*' postgres.has_privileges user_name table_name table \
SELECT,INSERT maintenance_db=db_name
```

name
Name of the role whose privileges should be checked on object_type

object_name
Name of the object on which the check is to be performed

object_type
The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

privileges
Comma separated list of privileges to check, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES

  - DELETE
  - ALL

grant_option
If grant_option is set to True, the grant option check is performed

prepend
Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

maintenance_db
The database to connect to

user
database username if different from config or default

password
user password if any password for a specified user

host
Database host if different from config or default

port
Database port if different from config or default

runas
System user all operations should be performed on behalf of

`salt.modules.postgres.`**`installed_extensions`**`(`*user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*`)`

List installed postgresql extensions

CLI Example:

```
salt '*' postgres.installed_extensions
```

`salt.modules.postgres.`**`is_available_extension`**`(`*name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*`)`

Test if a specific extension is available

CLI Example:

```
salt '*' postgres.is_available_extension
```

`salt.modules.postgres.`**`is_installed_extension`**`(`*name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*`)`

Test if a specific extension is installed

CLI Example:

```
salt '*' postgres.is_installed_extension
```

`salt.modules.postgres.`**`language_create`**`(`*name, maintenance_db, user=None, host=None, port=None, password=None, runas=None*`)`

New in version 2016.3.0.

Installs a language into a database

CLI Example:

```
salt '*' postgres.language_create plpgsql dbname
```

name
Language to install

maintenance_db
The database to install the language in

user
database username if different from config or default

password
user password if any password for a specified user

host
Database host if different from config or default

port
Database port if different from config or default

runas
System user all operations should be performed on behalf of

`salt.modules.postgres.`**`language_exists`**(*name*, *maintenance_db*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Checks if language exists in a database.

CLI Example:

```
salt '*' postgres.language_exists plpgsql dbname
```

name
Language to check for

maintenance_db
The database to check in

user
database username if different from config or default

password
user password if any password for a specified user

host
Database host if different from config or default

port
Database port if different from config or default

runas
System user all operations should be performed on behalf of

`salt.modules.postgres.`**`language_list`**(*maintenance_db*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Return a list of languages in a database.

CLI Example:

```
salt '*' postgres.language_list dbname
```

maintenance_db
The database to check

user
database username if different from config or default

password
user password if any password for a specified user

host
Database host if different from config or default

port
Database port if different from config or default

runas
System user all operations should be performed on behalf of

`salt.modules.postgres.`**`language_remove`**(*name, maintenance_db, user=None, host=None, port=None, password=None, runas=None*)

New in version 2016.3.0.

Removes a language from a database

CLI Example:

```
salt '*' postgres.language_remove plpgsql dbname
```

name
Language to remove

maintenance_db
The database to install the language in

user
database username if different from config or default

password
user password if any password for a specified user

host
Database host if different from config or default

port
Database port if different from config or default

runas
System user all operations should be performed on behalf of

`salt.modules.postgres.`**`owner_to`**(*dbname, ownername, user=None, host=None, port=None, password=None, runas=None*)

Set the owner of all schemas, functions, tables, views and sequences to the given username.

CLI Example:

```
salt '*' postgres.owner_to 'dbname' 'username'
```

`salt.modules.postgres.`**`privileges_grant`**(*name, object_name, object_type, privileges=None, grant_option=None, prepend='public', maintenance_db=None, user=None, host=None, port=None, password=None, runas=None*)

New in version 2016.3.0.

Grant privileges on a postgres object

CLI Example:

```
salt '*' postgres.privileges_grant user_name table_name table \
SELECT,UPDATE maintenance_db=db_name
```

name
Name of the role to which privileges should be granted

object_name
Name of the object on which the grant is to be performed

object_type
The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

privileges
Comma separated list of privileges to grant, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

grant_option
If grant_option is set to True, the recipient of the privilege can in turn grant it to others

prepend
Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

maintenance_db
The database to connect to

user
database username if different from config or default

password
user password if any password for a specified user

host
Database host if different from config or default

port
Database port if different from config or default

runas
System user all operations should be performed on behalf of

`salt.modules.postgres.`**`privileges_list`**(*name*, *object_type*, *prepend='public'*, *maintenance_db=None*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Return a list of privileges for the specified object.

CLI Example:

```
salt '*' postgres.privileges_list table_name table maintenance_db=db_name
```

name
Name of the object for which the permissions should be returned

object_type
The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

prepend
Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

maintenance_db
The database to connect to

user
database username if different from config or default

password
user password if any password for a specified user

host
Database host if different from config or default

port
Database port if different from config or default

runas
System user all operations should be performed on behalf of

`salt.modules.postgres.`**`privileges_revoke`**(*name*, *object_name*, *object_type*, *privileges=None*, *prepend='public'*, *maintenance_db=None*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Revoke privileges on a postgres object

CLI Example:

```
salt '*' postgres.privileges_revoke user_name table_name table \
SELECT,UPDATE maintenance_db=db_name
```

name
Name of the role whose privileges should be revoked

object_name
Name of the object on which the revoke is to be performed

object_type
The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group

- function

privileges
Comma separated list of privileges to revoke, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

maintenance_db
The database to connect to

user
database username if different from config or default

password
user password if any password for a specified user

host
Database host if different from config or default

port
Database port if different from config or default

runas
System user all operations should be performed on behalf of

`salt.modules.postgres.`**`psql_query`**(*query*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*, *write=False*)

Run an SQL-Query and return the results as a list. This command only supports SELECT statements. This limitation can be worked around with a query like this:

WITH updated AS (UPDATE pg_authid SET rolconnlimit = 2000 WHERE rolname = 'rolename' RETURNING rolconnlimit) SELECT * FROM updated;

query
The query string.

user
Database username, if different from config or default.

host
Database host, if different from config or default.

port
Database port, if different from the config or default.

maintenance_db
The database to run the query against.

password
User password, if different from the config or default.

runas
User to run the command as.

write
Mark query as READ WRITE transaction.

CLI Example:

```
salt '*' postgres.psql_query 'select * from pg_stat_activity'
```

salt.modules.postgres.**role_get**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*, *return_password=False*)

Return a dict with information about users of a Postgres server.

Set return_password to True to get password hash in the result.

CLI Example:

```
salt '*' postgres.role_get postgres
```

salt.modules.postgres.**schema_create**(*dbname*, *name*, *owner=None*, *user=None*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*)

Creates a Postgres schema.

CLI Example:

```
salt '*' postgres.schema_create dbname name owner='owner' \
        user='user' \
        db_user='user' db_password='password'
        db_host='hostname' db_port='port'
```

salt.modules.postgres.**schema_exists**(*dbname*, *name*, *user=None*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*)

Checks if a schema exists on the Postgres server.

CLI Example:

```
salt '*' postgres.schema_exists dbname schemaname
```

dbname
Database name we query on

name
Schema name we look for

user
The system user the operation should be performed on behalf of

db_user
database username if different from config or default

db_password
user password if any password for a specified user

db_host
Database host if different from config or default

db_port
Database port if different from config or default

salt.modules.postgres.**schema_get**(*dbname*, *name*, *user=None*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*)

Return a dict with information about schemas in a database.

CLI Example:

```
salt '*' postgres.schema_get dbname name
```

dbname
Database name we query on

name
Schema name we look for

user
The system user the operation should be performed on behalf of

db_user
database username if different from config or default

db_password
user password if any password for a specified user

db_host
Database host if different from config or default

db_port
Database port if different from config or default

`salt.modules.postgres.`**`schema_list`**(*dbname*, *user=None*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*)

Return a dict with information about schemas in a Postgres database.

CLI Example:

```
salt '*' postgres.schema_list dbname
```

dbname
Database name we query on

user
The system user the operation should be performed on behalf of

db_user
database username if different from config or default

db_password
user password if any password for a specified user

db_host
Database host if different from config or default

db_port
Database port if different from config or default

`salt.modules.postgres.`**`schema_remove`**(*dbname*, *name*, *user=None*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*)

Removes a schema from the Postgres server.

CLI Example:

```
salt '*' postgres.schema_remove dbname schemaname
```

dbname
Database name we work on

schemaname
The schema's name we'll remove

user
System user all operations should be performed on behalf of

db_user
database username if different from config or default

db_password
user password if any password for a specified user

db_host
Database host if different from config or default

db_port
Database port if different from config or default

`salt.modules.postgres.`**`tablespace_alter`**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *new_name=None*, *new_owner=None*, *set_option=None*, *reset_option=None*, *runas=None*)

Change tablespace name, owner, or options.

CLI Example:

```
salt '*' postgres.tablespace_alter tsname new_owner=otheruser
salt '*' postgres.tablespace_alter index_space new_name=fast_raid
salt '*' postgres.tablespace_alter test set_option="{'seq_page_cost': '1.1
↪'}"
salt '*' postgres.tablespace_alter tsname reset_option=seq_page_cost
```

New in version 2015.8.0.

`salt.modules.postgres.`**`tablespace_create`**(*name*, *location*, *options=None*, *owner=None*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Adds a tablespace to the Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_create tablespacename '/path/datadir'
```

New in version 2015.8.0.

`salt.modules.postgres.`**`tablespace_exists`**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Checks if a tablespace exists on the Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_exists 'dbname'
```

New in version 2015.8.0.

`salt.modules.postgres.`**`tablespace_list`**(*user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Return dictionary with information about tablespaces of a Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_list
```

New in version 2015.8.0.

`salt.modules.postgres.`**`tablespace_remove`**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Removes a tablespace from the Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_remove tsname
```

New in version 2015.8.0.

salt.modules.postgres.**user_create**(*username, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, createroles=None, inherit=None, login=None, connlimit=None, encrypted=None, superuser=None, replication=None, rolepassword=None, valid_until=None, groups=None, runas=None*)

Creates a Postgres user.

CLI Examples:

```
salt '*' postgres.user_create 'username' user='user' \
        host='hostname' port='port' password='password' \
        rolepassword='rolepassword' valid_until='valid_until'
```

salt.modules.postgres.**user_exists**(*name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*)

Checks if a user exists on the Postgres server.

CLI Example:

```
salt '*' postgres.user_exists 'username'
```

salt.modules.postgres.**user_list**(*user=None, host=None, port=None, maintenance_db=None, password=None, runas=None, return_password=False*)

Return a dict with information about users of a Postgres server.

Set return_password to True to get password hash in the result.

CLI Example:

```
salt '*' postgres.user_list
```

salt.modules.postgres.**user_remove**(*username, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*)

Removes a user from the Postgres server.

CLI Example:

```
salt '*' postgres.user_remove 'username'
```

salt.modules.postgres.**user_update**(*username, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, createroles=None, encrypted=None, superuser=None, inherit=None, login=None, connlimit=None, replication=None, rolepassword=None, valid_until=None, groups=None, runas=None*)

Updates a Postgres user.

CLI Examples:

```
salt '*' postgres.user_update 'username' user='user' \
        host='hostname' port='port' password='password' \
        rolepassword='rolepassword' valid_until='valid_until'
```

salt.modules.postgres.**version**(*user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*)

Return the version of a Postgres server.

CLI Example:

```
salt '*' postgres.version
```

26.6.150 salt.modules.proxy

This module allows you to manage proxy settings

```
salt '*' network.get_http_proxy
```

`salt.modules.proxy.`**`get_ftp_proxy`**`(`*network_service='Ethernet'*`)`

Returns the current ftp proxy settings

network_service

The network service to apply the changes to, this only necessary on macOS

CLI Example:

```
salt '*' proxy.get_ftp_proxy Ethernet
```

`salt.modules.proxy.`**`get_http_proxy`**`(`*network_service='Ethernet'*`)`

Returns the current http proxy settings

network_service

The network service to apply the changes to, this only necessary on macOS

CLI Example:

```
salt '*' proxy.get_http_proxy Ethernet
```

`salt.modules.proxy.`**`get_https_proxy`**`(`*network_service='Ethernet'*`)`

Returns the current https proxy settings

network_service

The network service to apply the changes to, this only necessary on macOS

CLI Example:

```
salt '*' proxy.get_https_proxy Ethernet
```

`salt.modules.proxy.`**`get_proxy_bypass`**`(`*network_service='Ethernet'*`)`

Returns the current domains that can bypass the proxy

network_service

The network service to get the bypass domains from, this is only necessary on macOS

CLI Example:

```
salt '*' proxy.get_proxy_bypass
```

`salt.modules.proxy.`**`get_proxy_win`**`()`

Gets all of the proxy settings in one call, only available on Windows

CLI Example:

```
salt '*' proxy.get_proxy_win
```

`salt.modules.proxy.`**`set_ftp_proxy`**`(`*server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None*`)`

Sets the ftp proxy settings

server

The proxy server to use

port
The port used by the proxy server

user
The username to use for the proxy server if required

password
The password to use if required by the server

network_service
The network service to apply the changes to, this only necessary on macOS

bypass_hosts
The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use set_proxy_bypass to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_ftp_proxy example.com 1080 user=proxy_user␣
↪password=proxy_pass network_service=Ethernet
```

salt.modules.proxy.**set_http_proxy**(*server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None*)

Sets the http proxy settings. Note: On Windows this will override any other proxy settings you have, the preferred method of updating proxies on windows is using set_proxy.

server
The proxy server to use

port
The port used by the proxy server

user
The username to use for the proxy server if required

password
The password to use if required by the server

network_service
The network service to apply the changes to, this only necessary on macOS

bypass_hosts
The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use set_proxy_bypass to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_http_proxy example.com 1080 user=proxy_user␣
↪password=proxy_pass network_service=Ethernet
```

salt.modules.proxy.**set_https_proxy**(*server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None*)

Sets the https proxy settings. Note: On Windows this will override any other proxy settings you have, the preferred method of updating proxies on windows is using set_proxy.

server
The proxy server to use

port
The port used by the proxy server

user
The username to use for the proxy server if required

password
The password to use if required by the server

network_service
The network service to apply the changes to, this only necessary on macOS

bypass_hosts
The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use

set_proxy_bypass to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_https_proxy example.com 1080 user=proxy_user
↪password=proxy_pass network_service=Ethernet
```

salt.modules.proxy.**set_proxy_bypass**(*domains, network_service='Ethernet'*)

Sets the domains that can bypass the proxy

domains

An array of domains allowed to bypass the proxy

network_service

The network service to apply the changes to, this only necessary on macOS

CLI Example:

```
salt '*' proxy.set_proxy_bypass "['127.0.0.1', 'localhost']"
```

salt.modules.proxy.**set_proxy_win**(*server, port, types=None, bypass_hosts=None*)

Sets the http proxy settings, only works with Windows.

server

The proxy server to use

password

The password to use if required by the server

types

The types of proxy connections should be setup with this server. Valid types are:

- `http`
- `https`
- `ftp`

bypass_hosts

The hosts that are allowed to by pass the proxy.

CLI Example:

```
salt '*' proxy.set_http_proxy example.com 1080 types="['http', 'https']"
```

26.6.151 salt.modules.ps

A salt interface to psutil, a system and process library. See http://code.google.com/p/psutil.

depends

- python-utmp package (optional)

salt.modules.ps.**boot_time**(*time_format=None*)

Return the boot time in number of seconds since the epoch began.

CLI Example:

time_format

Optionally specify a strftime format string. Use `time_format='%c'` to get a nicely-formatted locale specific date and time (i.e. `Fri May 2 19:08:32 2014`).

New in version 2014.1.4.

```
salt '*' ps.boot_time
```

salt.modules.ps.**cpu_percent**(*interval=0.1, per_cpu=False*)

Return the percent of time the CPU is busy.

interval
the number of seconds to sample CPU usage over

per_cpu
if True return an array of CPU percent busy for each CPU, otherwise aggregate all percents into one number

CLI Example:

```
salt '*' ps.cpu_percent
```

`salt.modules.ps.`**`cpu_times`**`(`*per_cpu=False*`)`

Return the percent of time the CPU spends in each state, e.g. user, system, idle, nice, iowait, irq, softirq.

per_cpu
if True return an array of percents for each CPU, otherwise aggregate all percents into one number

CLI Example:

```
salt '*' ps.cpu_times
```

`salt.modules.ps.`**`disk_io_counters`**`(`*device=None*`)`

Return disk I/O statistics.

CLI Example:

```
salt '*' ps.disk_io_counters

salt '*' ps.disk_io_counters device=sda1
```

`salt.modules.ps.`**`disk_partition_usage`**`(`*all=False*`)`

Return a list of disk partitions plus the mount point, filesystem and usage statistics.

CLI Example:

```
salt '*' ps.disk_partition_usage
```

`salt.modules.ps.`**`disk_partitions`**`(`*all=False*`)`

Return a list of disk partitions and their device, mount point, and filesystem type.

all
if set to False, only return local, physical partitions (hard disk, USB, CD/DVD partitions). If True, return all filesystems.

CLI Example:

```
salt '*' ps.disk_partitions
```

`salt.modules.ps.`**`disk_usage`**`(`*path*`)`

Given a path, return a dict listing the total available space as well as the free space, and used space.

CLI Example:

```
salt '*' ps.disk_usage /home
```

`salt.modules.ps.`**`get_pid_list`**`()`

Return a list of process ids (PIDs) for all running processes.

CLI Example:

```
salt '*' ps.get_pid_list
```

`salt.modules.ps.`**`get_users`**`()`

Return logged-in users.

CLI Example:

```
salt '*' ps.get_users
```

`salt.modules.ps.`**`kill_pid`**`(`*pid, signal=15*`)`

Kill a process by PID.

```
salt 'minion' ps.kill_pid pid [signal=signal_number]
```

pid
PID of process to kill.

signal
Signal to send to the process. See manpage entry for kill for possible values. Default: 15 (SIGTERM).

Example:

Send SIGKILL to process with PID 2000:

```
salt 'minion' ps.kill_pid 2000 signal=9
```

`salt.modules.ps.`**`lsof`**`(`*name*`)`

Retrieve the lsof information of the given process name.

CLI Example:

```
salt '*' ps.lsof apache2
```

`salt.modules.ps.`**`netstat`**`(`*name*`)`

Retrieve the netstat information of the given process name.

CLI Example:

```
salt '*' ps.netstat apache2
```

`salt.modules.ps.`**`network_io_counters`**`(`*interface=None*`)`

Return network I/O statistics.

CLI Example:

```
salt '*' ps.network_io_counters

salt '*' ps.network_io_counters interface=eth0
```

`salt.modules.ps.`**`num_cpus`**`()`

Return the number of CPUs.

CLI Example:

```
salt '*' ps.num_cpus
```

`salt.modules.ps.`**`pgrep`**`(`*pattern, user=None, full=False, pattern_is_regex=False*`)`

Return the pids for processes matching a pattern.

If full is true, the full command line is searched for a match, otherwise only the name of the command is searched.

```
salt '*' ps.pgrep pattern [user=username] [full=(true|false)]
```

pattern
Pattern to search for in the process list.

user
Limit matches to the given username. Default: All users.

full
A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.

pattern_is_regex
This flag enables ps.pgrep to mirror the regex search functionality found in the pgrep command line utility.

New in version 3001.

Examples:

Find all httpd processes on all 'www' minions:

```
salt 'www.*' ps.pgrep httpd
```

Find all bash processes owned by user 'tom':

```
salt '*' ps.pgrep bash user=tom
```

`salt.modules.ps.`**`pkill`**(*pattern*, *user=None*, *signal=15*, *full=False*)

Kill processes matching a pattern.

```
salt '*' ps.pkill pattern [user=username] [signal=signal_number] \
        [full=(true|false)]
```

pattern
Pattern to search for in the process list.

user
Limit matches to the given username. Default: All users.

signal
Signal to send to the process(es). See manpage entry for kill for possible values. Default: 15 (SIGTERM).

full
A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.

Examples:

Send SIGHUP to all httpd processes on all 'www' minions:

```
salt 'www.*' ps.pkill httpd signal=1
```

Send SIGKILL to all bash processes owned by user 'tom':

```
salt '*' ps.pkill bash signal=9 user=tom
```

`salt.modules.ps.`**`proc_info`**(*pid*, *attrs=None*)

Return a dictionary of information for a process id (PID).

CLI Example:

```
salt '*' ps.proc_info 2322
salt '*' ps.proc_info 2322 attrs='["pid", "name"]'
```

pid
PID of process to query.

attrs
Optional list of desired process attributes. The list of possible attributes can be found here: https://psutil.readthedocs.io/en/latest/#processes

`salt.modules.ps.`**`psaux`**`(`*name*`)`

Retrieve information corresponding to a "ps aux" filtered with the given pattern. It could be just a name or a regular expression (using python search from "re" module).

CLI Example:

```
salt '*' ps.psaux www-data.+apache2
```

`salt.modules.ps.`**`ss`**`(`*name*`)`

Retrieve the ss information of the given process name.

CLI Example:

```
salt '*' ps.ss apache2
```

New in version 2016.11.6.

`salt.modules.ps.`**`status`**`(`*status*`)`

New in version 3006.0.

Returns a list of processes according to their state.

CLI Example:

```
salt '*' ps.status STATUS
```

where `STATUS` is one of

- running
- sleeping
- disk_sleep
- stopped
- tracing_stop
- zombie
- dead
- wake_kill
- waking
- parked (Linux)
- idle (Linux, macOS, FreeBSD)
- locked (FreeBSD)
- waiting (FreeBSD)
- suspended (NetBSD)

See https://psutil.readthedocs.io/en/latest/index.html?highlight=status#process-status-constants

`salt.modules.ps.`**`swap_memory`**`()`

New in version 2014.7.0.

Return a dict that describes swap memory statistics.

Note: This function is only available in psutil version 0.6.0 and above.

CLI Example:

```
salt '*' ps.swap_memory
```

`salt.modules.ps.`**`top`**`(`*num_processes=5, interval=3*`)`

Return a list of top CPU consuming processes during the interval. num_processes = return the top N CPU consuming processes interval = the number of seconds to sample CPU usage over

CLI Examples:

```
salt '*' ps.top

salt '*' ps.top 5 10
```

`salt.modules.ps.`**`total_physical_memory`**`()`

Return the total number of bytes of physical memory.

CLI Example:

```
salt '*' ps.total_physical_memory
```

`salt.modules.ps.`**`virtual_memory`**`()`

New in version 2014.7.0.

Return a dict that describes statistics about system memory usage.

Note: This function is only available in psutil version 0.6.0 and above.

CLI Example:

```
salt '*' ps.virtual_memory
```

26.6.152 salt.modules.publish

Publish a command from a minion to a target

`salt.modules.publish.`**`full_data`**`(`*tgt, fun, arg=None, tgt_type='glob', returner='', timeout=5*`)`

Return the full data about the publication, this is invoked in the same way as the publish function

CLI Example:

```
salt system.example.com publish.full_data '*' cmd.run 'ls -la /tmp'
```

Attention

If you need to pass a value to a function argument and that value contains an equal sign, you **must** include the argument name. For example:

```
salt '*' publish.full_data test.kwarg arg='cheese=spam'
```

`salt.modules.publish.`**`publish`**`(`*tgt, fun, arg=None, tgt_type='glob', returner='', timeout=5, via_master=None*`)`

Publish a command from the minion out to other minions.

Publications need to be enabled on the Salt master and the minion needs to have permission to publish the command. The Salt master will also prevent a recursive publication loop, this means that a minion cannot command another minion to command another minion as that would create an infinite command loop.

The `tgt_type` argument is used to pass a target other than a glob into the execution, the available options are:

- glob
- pcre
- grain
- grain_pcre
- pillar
- pillar_pcre
- ipcidr
- range
- compound

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Note that for pillar matches must be exact, both in the pillar matcher and the compound matcher. No globbing is supported.

The arguments sent to the minion publish function are separated with commas. This means that for a minion executing a command with multiple args it will look like this:

```
salt system.example.com publish.publish '*' user.add 'foo,1020,1020'
salt system.example.com publish.publish 'os:Fedora' network.interfaces ''
↪grain
```

CLI Example:

```
salt system.example.com publish.publish '*' cmd.run 'ls -la /tmp'
```

Attention

If you need to pass a value to a function argument and that value contains an equal sign, you **must** include the argument name. For example:

```
salt '*' publish.publish test.kwarg arg='cheese=spam'
```

Multiple keyword arguments should be passed as a list.

```
salt '*' publish.publish test.kwarg arg="['cheese=spam','spam=cheese']"
```

When running via salt-call, the *via_master* flag may be set to specific which master the publication should be sent to. Only one master may be specified. If unset, the publication will be sent only to the first master in minion configuration.

`salt.modules.publish.`**`runner`**`(`*fun, arg=None, timeout=5*`)`

Execute a runner on the master and return the data from the runner function

CLI Example:

```
salt publish.runner manage.down
```

26.6.153 salt.modules.puppet

Execute puppet routines

`salt.modules.puppet.`**`disable`**`(`*message=None*`)`

New in version 2014.7.0.

Disable the puppet agent

message

New in version 2015.5.2.

Disable message to send to puppet

CLI Example:

```
salt '*' puppet.disable
salt '*' puppet.disable 'Disabled, contact XYZ before enabling'
```

`salt.modules.puppet.`**`enable`**`()`

New in version 2014.7.0.

Enable the puppet agent

CLI Example:

```
salt '*' puppet.enable
```

`salt.modules.puppet.`**`fact`**`(`*name, puppet=False*`)`

Run facter for a specific fact

CLI Example:

```
salt '*' puppet.fact kernel
```

`salt.modules.puppet.`**`facts`**`(`*puppet=False*`)`

Run facter and return the results

CLI Example:

```
salt '*' puppet.facts
```

`salt.modules.puppet.`**`noop`**`(`**args, **kwargs*`)`

Execute a puppet noop run and return a dict with the stderr, stdout, return code, etc. Usage is the same as for puppet.run.

CLI Example:

```
salt '*' puppet.noop
salt '*' puppet.noop tags=basefiles::edit,apache::server
salt '*' puppet.noop debug
salt '*' puppet.noop apply /a/b/manifest.pp modulepath=/a/b/modules tags=basefiles::edit,apache::server
```

`salt.modules.puppet.`**`plugin_sync`**`()`

Runs a plugin sync between the puppet master and agent

CLI Example:

```
salt '*' puppet.plugin_sync
```

`salt.modules.puppet.`**`run`**`(`**args, **kwargs*`)`

Execute a puppet run and return a dict with the stderr, stdout, return code, etc. The first positional argument given is checked as a subcommand. Following positional arguments should be ordered with arguments required by the subcommand first, followed by non-keyword arguments. Tags are specified by a tag keyword and comma separated list of values. -- http://docs.puppetlabs.com/puppet/latest/reference/lang_tags.html

CLI Examples:

```
salt '*' puppet.run
salt '*' puppet.run tags=basefiles::edit,apache::server
salt '*' puppet.run agent onetime no-daemonize no-usecacheonfailure no-
↪splay ignorecache
salt '*' puppet.run debug
salt '*' puppet.run apply /a/b/manifest.pp modulepath=/a/b/modules␣
↪tags=basefiles::edit,apache::server
```

`salt.modules.puppet.`**`status`**`()`

New in version 2014.7.0.

Display puppet agent status

CLI Example:

```
salt '*' puppet.status
```

`salt.modules.puppet.`**`summary`**`()`

New in version 2014.7.0.

Show a summary of the last puppet agent run

CLI Example:

```
salt '*' puppet.summary
```

26.6.154 salt.modules.pw_group

Manage groups on FreeBSD

Important: If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to *'group.info' is not available*), see *here*.

`salt.modules.pw_group.`**`add`**`(`*name, gid=None, **kwargs*`)`

Changed in version 3006.0.

Add the specified group

name

Name of the new group

gid
Use GID for the new group

CLI Example:

```
salt '*' group.add foo 3456
```

`salt.modules.pw_group.`**`adduser`**`(`*name, username*`)`

Add a user in the group.

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

`salt.modules.pw_group.`**`chgid`**`(`*name, gid*`)`

Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

`salt.modules.pw_group.`**`delete`**`(`*name*`)`

Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.pw_group.`**`deluser`**`(`*name, username*`)`

Remove a user from the group.

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.

`salt.modules.pw_group.`**`getent`**`(`*refresh=False*`)`

Return info on all groups

CLI Example:

```
salt '*' group.getent
```

`salt.modules.pw_group.`**`info`**`(`*name*`)`

Return information about a group

CLI Example:

```
salt '*' group.info foo
```

`salt.modules.pw_group.`**`members`**`(`*name, members_list*`)`

Replaces members of the group with a provided list.

New in version 2015.5.4.

CLI Example:

```
salt '*' group.members foo 'user1,user2,user3,...'
```

Replaces a membership list for a local group 'foo'.
foo:x:1234:user1,user2,user3,...

26.6.155 salt.modules.pw_user

Manage users with the pw command

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to *'user.info' is not available*), see *here*.

`salt.modules.pw_user.`**`add`**(*name, uid=None, gid=None, groups=None, home=None, shell=None, unique=True, fullname='', roomnumber='', workphone='', homephone='', createhome=True, loginclass=None, **kwargs*)

Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

`salt.modules.pw_user.`**`chfullname`**(*name, fullname*)

Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo "Foo Bar"
```

`salt.modules.pw_user.`**`chgid`**(*name, gid*)

Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

`salt.modules.pw_user.`**`chgroups`**(*name, groups, append=False*)

Change the groups to which a user belongs

name
Username to modify

groups
List of groups to set for the user. Can be passed as a comma-separated list or a Python list.

append
[False] Set to `True` to append these groups to the user's existing list of groups. Otherwise, the specified groups will replace any existing groups for the user.

CLI Example:

```
salt '*' user.chgroups foo wheel,root True
```

`salt.modules.pw_user.`**`chhome`**(*name, home, persist=False*)

Set a new home directory for an existing user

name
Username to modify

home
New home directory to set

persist
[False] Set to `True` to prevent configuration files in the new home directory from being overwritten by the files from the skeleton directory.

CLI Example:

```
salt '*' user.chhome foo /home/users/foo True
```

`salt.modules.pw_user.`**`chhomephone`**(*name*, *homephone*)

Change the user's Home Phone

CLI Example:

```
salt '*' user.chhomephone foo "7735551234"
```

`salt.modules.pw_user.`**`chloginclass`**(*name*, *loginclass*, *root=None*)

Change the default login class of the user

New in version 2016.3.5.

CLI Example:

```
salt '*' user.chloginclass foo staff
```

`salt.modules.pw_user.`**`chroomnumber`**(*name*, *roomnumber*)

Change the user's Room Number

CLI Example:

```
salt '*' user.chroomnumber foo 123
```

`salt.modules.pw_user.`**`chshell`**(*name*, *shell*)

Change the default shell of the user

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

`salt.modules.pw_user.`**`chuid`**(*name*, *uid*)

Change the uid for a named user

CLI Example:

```
salt '*' user.chuid foo 4376
```

`salt.modules.pw_user.`**`chworkphone`**(*name*, *workphone*)

Change the user's Work Phone

CLI Example:

```
salt '*' user.chworkphone foo "7735550123"
```

`salt.modules.pw_user.`**`delete`**(*name*, *remove=False*, *force=False*)

Remove a user from the minion

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

`salt.modules.pw_user.`**`get_loginclass`**`(`*name*`)`

Get the login class of the user

New in version 2016.3.0.

CLI Example:

```
salt '*' user.get_loginclass foo
```

`salt.modules.pw_user.`**`getent`**`(`*refresh=False*`)`

Return the list of all info for all users

CLI Example:

```
salt '*' user.getent
```

`salt.modules.pw_user.`**`info`**`(`*name*`)`

Return user information

CLI Example:

```
salt '*' user.info root
```

`salt.modules.pw_user.`**`list_groups`**`(`*name*`)`

Return a list of groups the named user belongs to

CLI Example:

```
salt '*' user.list_groups foo
```

`salt.modules.pw_user.`**`list_users`**`()`

Return a list of all users

CLI Example:

```
salt '*' user.list_users
```

`salt.modules.pw_user.`**`rename`**`(`*name, new_name*`)`

Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```

26.6.156 salt.modules.pyenv

Manage python installations with pyenv.

Note: Git needs to be installed and available via PATH if pyenv is to be installed automatically by the module.

New in version 2014.4.0.

`salt.modules.pyenv.`**`default`**`(`*python=None, runas=None*`)`

Returns or sets the currently defined default python.

python=None

The version to set as the default. Should match one of the versions listed by `pyenv.versions`. Leave blank to return the current default.

CLI Example:

```
salt '*' pyenv.default
salt '*' pyenv.default 2.0.0-p0
```

`salt.modules.pyenv.`**`do`**`(`*cmdline=None, runas=None*`)`

Execute a python command with pyenv's shims from the user or the system.

CLI Example:

```
salt '*' pyenv.do 'gem list bundler'
salt '*' pyenv.do 'gem list bundler' deploy
```

`salt.modules.pyenv.`**`do_with_python`**`(`*python, cmdline, runas=None*`)`

Execute a python command with pyenv's shims using a specific python version.

CLI Example:

```
salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler'
salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler' deploy
```

`salt.modules.pyenv.`**`install`**`(`*runas=None, path=None*`)`

Install pyenv systemwide

CLI Example:

```
salt '*' pyenv.install
```

`salt.modules.pyenv.`**`install_python`**`(`*python, runas=None*`)`

Install a python implementation.

python

The version of python to install, should match one of the versions listed by pyenv.list

CLI Example:

```
salt '*' pyenv.install_python 2.0.0-p0
```

`salt.modules.pyenv.`**`is_installed`**`(`*runas=None*`)`

Check if pyenv is installed.

CLI Example:

```
salt '*' pyenv.is_installed
```

`salt.modules.pyenv.`**`list_`**`(`*runas=None*`)`

List the installable versions of python.

CLI Example:

```
salt '*' pyenv.list
```

`salt.modules.pyenv.`**`rehash`**`(`*runas=None*`)`

Run pyenv rehash to update the installed shims.

CLI Example:

```
salt '*' pyenv.rehash
```

`salt.modules.pyenv.`**`uninstall_python`**`(`*python, runas=None*`)`

Uninstall a python implementation.

python

The version of python to uninstall. Should match one of the versions listed by `pyenv.versions`

CLI Example:

```
salt '*' pyenv.uninstall_python 2.0.0-p0
```

`salt.modules.pyenv.`**`update`**`(`*runas=None, path=None*`)`

Updates the current versions of pyenv and python-Build

CLI Example:

```
salt '*' pyenv.update
```

`salt.modules.pyenv.`**`versions`**`(`*runas=None*`)`

List the installed versions of python.

CLI Example:

```
salt '*' pyenv.versions
```

26.6.157 salt.modules.quota

Module for managing quotas on POSIX-like systems.

`salt.modules.quota.`**`get_mode`**`(`*device*`)`

Report whether the quota system for this device is on or off

CLI Example:

```
salt '*' quota.get_mode
```

`salt.modules.quota.`**`off`**`(`*device*`)`

Turns off the quota system

CLI Example:

```
salt '*' quota.off
```

`salt.modules.quota.`**`on`**`(`*device*`)`

Turns on the quota system

CLI Example:

```
salt '*' quota.on
```

`salt.modules.quota.`**`report`**`(`*mount*`)`

Report on quotas for a specific volume

CLI Example:

```
salt '*' quota.report /media/data
```

`salt.modules.quota.`**`set_`**`(`*device*, ***kwargs*`)`

Calls out to setquota, for a specific user or group

CLI Example:

```
salt '*' quota.set /media/data user=larry block-soft-limit=1048576
salt '*' quota.set /media/data group=painters file-hard-limit=1000
```

`salt.modules.quota.`**`stats`**`()`

Runs the quotastats command, and returns the parsed output

CLI Example:

```
salt '*' quota.stats
```

`salt.modules.quota.`**`warn`**`()`

Runs the warnquota command, to send warning emails to users who are over their quota limit.

CLI Example:

```
salt '*' quota.warn
```

26.6.158 salt.modules.rabbitmq

Module to provide RabbitMQ compatibility to Salt. Todo: A lot, need to add cluster support, logging, and minion configuration data.

`salt.modules.rabbitmq.`**`add_user`**`(`*name*, *password=None*, *runas=None*`)`

Add a rabbitMQ user via rabbitmqctl user_add <user> <password>

CLI Example:

```
salt '*' rabbitmq.add_user rabbit_user password
```

`salt.modules.rabbitmq.`**`add_vhost`**`(`*vhost*, *runas=None*`)`

Adds a vhost via rabbitmqctl add_vhost.

CLI Example:

```
salt '*' rabbitmq add_vhost '<vhost_name>'
```

`salt.modules.rabbitmq.`**`change_password`**`(`*name*, *password*, *runas=None*`)`

Changes a user's password.

CLI Example:

```
salt '*' rabbitmq.change_password rabbit_user password
```

`salt.modules.rabbitmq.`**`check_password`**`(`*name*, *password*, *runas=None*`)`

New in version 2016.3.0.

Checks if a user's password is valid.

CLI Example:

```
salt '*' rabbitmq.check_password rabbit_user password
```

`salt.modules.rabbitmq.`**`clear_password`**`(`*name*, *runas=None*`)`

Removes a user's password.

CLI Example:

```
salt '*' rabbitmq.clear_password rabbit_user
```

`salt.modules.rabbitmq.`**`cluster_status`**`(`*runas=None*`)`

return rabbitmq cluster_status

CLI Example:

```
salt '*' rabbitmq.cluster_status
```

`salt.modules.rabbitmq.`**`delete_policy`**`(`*vhost*, *name*, *runas=None*`)`

Delete a policy based on rabbitmqctl clear_policy.

Reference: http://www.rabbitmq.com/ha.html

CLI Example:

```
salt '*' rabbitmq.delete_policy / HA
```

`salt.modules.rabbitmq.`**`delete_upstream`**`(`*name*, *runas=None*`)`

Deletes an upstream via rabbitmqctl clear_parameter.

Parameters

- **name** (*str*) -- The name of the upstream to delete.
- **runas** (*str*) -- The name of the user to run the command as.

CLI Example:

```
salt '*' rabbitmq.delete_upstream upstream_name
```

New in version 3000.

`salt.modules.rabbitmq.`**`delete_user`**`(`*name*, *runas=None*`)`

Deletes a user via rabbitmqctl delete_user.

CLI Example:

```
salt '*' rabbitmq.delete_user rabbit_user
```

`salt.modules.rabbitmq.`**`delete_vhost`**`(`*vhost*, *runas=None*`)`

Deletes a vhost rabbitmqctl delete_vhost.

CLI Example:

```
salt '*' rabbitmq.delete_vhost '<vhost_name>'
```

`salt.modules.rabbitmq.`**`disable_plugin`**`(`*name*, *runas=None*`)`

Disable a RabbitMQ plugin via the rabbitmq-plugins command.

CLI Example:

```
salt '*' rabbitmq.disable_plugin foo
```

`salt.modules.rabbitmq.`**`enable_plugin`**`(`*name*, *runas=None*`)`

Enable a RabbitMQ plugin via the rabbitmq-plugins command.

CLI Example:

```
salt '*' rabbitmq.enable_plugin foo
```

`salt.modules.rabbitmq.`**`force_reset`**`(`*runas=None*`)`

Forcefully Return a RabbitMQ node to its virgin state

CLI Example:

```
salt '*' rabbitmq.force_reset
```

`salt.modules.rabbitmq.`**`join_cluster`**`(`*host*, *user='rabbit'*, *ram_node=None*, *runas=None*`)`

Join a rabbit cluster

CLI Example:

```
salt '*' rabbitmq.join_cluster rabbit.example.com rabbit
```

`salt.modules.rabbitmq.`**`list_available_plugins`**`(`*runas=None*`)`

Returns a list of the names of all available plugins (enabled and disabled).

CLI Example:

```
salt '*' rabbitmq.list_available_plugins
```

`salt.modules.rabbitmq.`**`list_enabled_plugins`**`(`*runas=None*`)`

Returns a list of the names of the enabled plugins.

CLI Example:

```
salt '*' rabbitmq.list_enabled_plugins
```

`salt.modules.rabbitmq.`**`list_permissions`**`(`*vhost*, *runas=None*`)`

Lists permissions for vhost via rabbitmqctl list_permissions

CLI Example:

```
salt '*' rabbitmq.list_permissions /myvhost
```

`salt.modules.rabbitmq.`**`list_policies`**`(`*vhost='/'*, *runas=None*`)`

Return a dictionary of policies nested by vhost and name based on the data returned from rabbitmqctl list_policies.

Reference: http://www.rabbitmq.com/ha.html

CLI Example:

```
salt '*' rabbitmq.list_policies
```

`salt.modules.rabbitmq.`**`list_queues`**`(`*runas=None*, **args*`)`

Returns queue details of the / virtual host

CLI Example:

```
salt '*' rabbitmq.list_queues messages consumers
```

`salt.modules.rabbitmq.`**`list_queues_vhost`**`(`*vhost*, *runas=None*, **args*`)`

Returns queue details of specified virtual host. This command will consider first parameter as the vhost name and rest will be treated as queueinfoitem. For getting details on vhost `/`, use `list_queues` instead).

CLI Example:

```
salt '*' rabbitmq.list_queues messages consumers
```

`salt.modules.rabbitmq.`**`list_upstreams`**`(`*runas=None*`)`

Returns a dict of upstreams based on rabbitmqctl list_parameters.

Parameters

runas (*str*) -- The name of the user to run this command as.

CLI Example:

```
salt '*' rabbitmq.list_upstreams
```

New in version 3000.

`salt.modules.rabbitmq.`**`list_user_permissions`**`(`*name*, *runas=None*`)`

List permissions for a user via rabbitmqctl list_user_permissions

CLI Example:

```
salt '*' rabbitmq.list_user_permissions user
```

`salt.modules.rabbitmq.`**`list_users`**`(`*runas=None*`)`

Return a list of users based off of rabbitmqctl user_list.

CLI Example:

```
salt '*' rabbitmq.list_users
```

`salt.modules.rabbitmq.`**`list_vhosts`**`(`*runas=None*`)`

Return a list of vhost based on rabbitmqctl list_vhosts.

CLI Example:

```
salt '*' rabbitmq.list_vhosts
```

`salt.modules.rabbitmq.`**`plugin_is_enabled`**`(`*name*, *runas=None*`)`

Return whether the plugin is enabled.

CLI Example:

```
salt '*' rabbitmq.plugin_is_enabled rabbitmq_plugin_name
```

`salt.modules.rabbitmq.`**`policy_exists`**`(`*vhost, name, runas=None*`)`

Return whether the policy exists based on rabbitmqctl list_policies.

Reference: http://www.rabbitmq.com/ha.html

CLI Example:

```
salt '*' rabbitmq.policy_exists / HA
```

`salt.modules.rabbitmq.`**`reset`**`(`*runas=None*`)`

Return a RabbitMQ node to its virgin state

CLI Example:

```
salt '*' rabbitmq.reset
```

`salt.modules.rabbitmq.`**`set_permissions`**`(`*vhost, user, conf='.*', write='.*', read='.*', runas=None*`)`

Sets permissions for vhost via rabbitmqctl set_permissions

CLI Example:

```
salt '*' rabbitmq.set_permissions myvhost myuser
```

`salt.modules.rabbitmq.`**`set_policy`**`(`*vhost, name, pattern, definition, priority=None, runas=None, apply_to=None*`)`

Set a policy based on rabbitmqctl set_policy.

Reference: http://www.rabbitmq.com/ha.html

CLI Example:

```
salt '*' rabbitmq.set_policy / HA '.*' '{"ha-mode":"all"}'
```

`salt.modules.rabbitmq.`**`set_upstream`**`(`*name, uri, prefetch_count=None, reconnect_delay=None, ack_mode=None, trust_user_id=None, exchange=None, max_hops=None, expires=None, message_ttl=None, ha_policy=None, queue=None, runas=None*`)`

Configures an upstream via rabbitmqctl set_parameter. This can be an exchange-upstream, a queue-upstream or both.

Parameters

name (*str*) -- The name of the upstream to configure.

The following parameters apply to federated exchanges and federated queues:

Parameters

- **uri** (*str*) -- The AMQP URI(s) for the upstream.
- **prefetch_count** (*int*) -- The maximum number of unacknowledged messages copied over a link at any one time. Default: 1000
- **reconnect_delay** (*int*) -- The duration (in seconds) to wait before reconnecting to the broker after being disconnected. Default: 1
- **ack_mode** (*str*) -- Determines how the link should acknowledge messages. If set to `on-confirm` (the default), messages are acknowledged to the upstream broker after they have been confirmed downstream. This handles network errors and broker failures without losing messages, and is the slowest option. If set to `on-publish`, messages are acknowledged to the upstream broker after they have been published downstream. This handles network errors without losing messages, but may lose messages in the event of broker failures. If set to `no-ack`, message acknowledgements are not used. This is the fastest option, but may lose messages in the event of network or broker failures.

- **trust_user_id** (*bool*) -- Determines how federation should interact with the validated user-id feature. If set to true, federation will pass through any validated user-id from the upstream, even though it cannot validate it itself. If set to false or not set, it will clear any validated user-id it encounters. You should only set this to true if you trust the upstream server (and by extension, all its upstreams) not to forge user-ids.

The following parameters apply to federated exchanges only:

Parameters

- **exchange** (*str*) -- The name of the upstream exchange. Default is to use the same name as the federated exchange.
- **max_hops** (*int*) -- The maximum number of federation links that a message published to a federated exchange can traverse before it is discarded. Default is 1. Note that even if max-hops is set to a value greater than 1, messages will never visit the same node twice due to travelling in a loop. However, messages may still be duplicated if it is possible for them to travel from the source to the destination via multiple routes.
- **expires** (*int*) -- The expiry time (in milliseconds) after which an upstream queue for a federated exchange may be deleted, if a connection to the upstream broker is lost. The default is 'none', meaning the queue should never expire. This setting controls how long the upstream queue will last before it is eligible for deletion if the connection is lost. This value is used to set the "x-expires" argument for the upstream queue.
- **message_ttl** (*int*) -- The expiry time for messages in the upstream queue for a federated exchange (see expires), in milliseconds. Default is `None`, meaning messages should never expire. This does not apply to federated queues. This value is used to set the "x-message-ttl" argument for the upstream queue.
- **ha_policy** (*str*) -- Determines the "x-ha-policy" argument for the upstream queue for a federated exchange (see expires). This is only of interest when connecting to old brokers which determine queue HA mode using this argument. Default is `None`, meaning the queue is not HA.

The following parameter applies to federated queues only:

Parameters

- **queue** (*str*) -- The name of the upstream queue. Default is to use the same name as the federated queue.
- **runas** (*str*) -- The name of the user to run the command as.

CLI Example:

```
salt '*' rabbitmq.set_upstream upstream_name ack_mode=on-confirm max_
↪hops=1               trust_user_id=True uri=amqp://hostname
```

New in version 3000.

`salt.modules.rabbitmq.`**`set_user_tags`**(*name*, *tags*, *runas=None*)

Add user tags via rabbitmqctl set_user_tags

CLI Example:

```
salt '*' rabbitmq.set_user_tags myadmin administrator
```

`salt.modules.rabbitmq.`**`start_app`**(*runas=None*)

Start the RabbitMQ application.

CLI Example:

```
salt '*' rabbitmq.start_app
```

`salt.modules.rabbitmq.`**`status`**(*runas=None*)

return rabbitmq status

CLI Example:

```
salt '*' rabbitmq.status
```

`salt.modules.rabbitmq.`**`stop_app`**(*runas=None*)

Stops the RabbitMQ application, leaving the Erlang node running.

CLI Example:

```
salt '*' rabbitmq.stop_app
```

`salt.modules.rabbitmq.`**`upstream_exists`**(*name*, *runas=None*)

Return whether the upstreamexists based on rabbitmqctl list_parameters.

Parameters

- **name** (*str*) -- The name of the upstream to check for.
- **runas** (*str*) -- The name of the user to run the command as.

CLI Example:

```
salt '*' rabbitmq.upstream_exists rabbit_upstream
```

New in version 3000.

`salt.modules.rabbitmq.`**`user_exists`**(*name*, *runas=None*)

Return whether the user exists based on rabbitmqctl list_users.

CLI Example:

```
salt '*' rabbitmq.user_exists rabbit_user
```

`salt.modules.rabbitmq.`**`vhost_exists`**(*name*, *runas=None*)

Return whether the vhost exists based on rabbitmqctl list_vhosts.

CLI Example:

```
salt '*' rabbitmq.vhost_exists rabbit_host
```

26.6.159 salt.modules.rbac_solaris

Module for Solaris' Role-Based Access Control

`salt.modules.rbac_solaris.`**`auth_add`**(*user*, *auth*)

Add authorization to user

user

[string] username

auth

[string] authorization name

CLI Example:

```
salt '*' rbac.auth_add martine solaris.zone.manage
salt '*' rbac.auth_add martine solaris.zone.manage,solaris.mail.mailq
```

`salt.modules.rbac_solaris.`**`auth_get`**`(`*user, computed=True*`)`

List authorization for user

user

[string] username

computed

[boolean] merge results from *auths* command into data from user_attr

CLI Example:

```
salt '*' rbac.auth_get leo
```

`salt.modules.rbac_solaris.`**`auth_list`**`()`

List all available authorization

CLI Example:

```
salt '*' rbac.auth_list
```

`salt.modules.rbac_solaris.`**`auth_rm`**`(`*user, auth*`)`

Remove authorization from user

user

[string] username

auth

[string] authorization name

CLI Example:

```
salt '*' rbac.auth_rm jorge solaris.zone.manage
salt '*' rbac.auth_rm jorge solaris.zone.manage,solaris.mail.mailq
```

`salt.modules.rbac_solaris.`**`profile_add`**`(`*user, profile*`)`

Add profile to user

user

[string] username

profile

[string] profile name

CLI Example:

```
salt '*' rbac.profile_add martine 'Primary Administrator'
salt '*' rbac.profile_add martine 'User Management,User Security'
```

`salt.modules.rbac_solaris.`**`profile_get`**`(`*user, default_hidden=True*`)`

List profiles for user

user

[string] username

default_hidden

[boolean] hide default profiles

CLI Example:

```
salt '*' rbac.profile_get leo
salt '*' rbac.profile_get leo default_hidden=False
```

`salt.modules.rbac_solaris.`**`profile_list`**`(`*default_only=False*`)`

List all available profiles

default_only

[boolean] return only default profile

CLI Example:

```
salt '*' rbac.profile_list
```

salt.modules.rbac_solaris.**profile_rm**(*user*, *profile*)

Remove profile from user

user

[string] username

profile

[string] profile name

CLI Example:

```
salt '*' rbac.profile_rm jorge 'Primary Administrator'
salt '*' rbac.profile_rm jorge 'User Management,User Security'
```

salt.modules.rbac_solaris.**role_add**(*user*, *role*)

Add role to user

user

[string] username

role

[string] role name

CLI Example:

```
salt '*' rbac.role_add martine netcfg
salt '*' rbac.role_add martine netcfg,zfssnap
```

salt.modules.rbac_solaris.**role_get**(*user*)

List roles for user

user

[string] username

CLI Example:

```
salt '*' rbac.role_get leo
```

salt.modules.rbac_solaris.**role_list**()

List all available roles

CLI Example:

```
salt '*' rbac.role_list
```

salt.modules.rbac_solaris.**role_rm**(*user*, *role*)

Remove role from user

user

[string] username

role

[string] role name

CLI Example:

```
salt '*' rbac.role_rm jorge netcfg
salt '*' rbac.role_rm jorge netcfg,zfssnap
```

26.6.160 salt.modules.rdp

Manage RDP Service on Windows servers

`salt.modules.rdp.`**`disable`**`()`

Disable RDP the service on the server

CLI Example:

```
salt '*' rdp.disable
```

`salt.modules.rdp.`**`disconnect_session`**`(`*session_id*`)`

Disconnect a session.

New in version 2016.11.0.

Parameters

`session_id` -- The numeric Id of the session.

Returns

A boolean representing whether the disconnect succeeded.

CLI Example:

```
salt '*' rdp.disconnect_session session_id

salt '*' rdp.disconnect_session 99
```

`salt.modules.rdp.`**`enable`**`()`

Enable RDP the service on the server

CLI Example:

```
salt '*' rdp.enable
```

`salt.modules.rdp.`**`get_session`**`(`*session_id*`)`

Get information about a session.

New in version 2016.11.0.

Parameters

`session_id` -- The numeric Id of the session.

Returns

A dictionary of session information.

CLI Example:

```
salt '*' rdp.get_session session_id

salt '*' rdp.get_session 99
```

`salt.modules.rdp.`**`list_sessions`**`(`*logged_in_users_only=False*`)`

List information about the sessions.

New in version 2016.11.0.

Parameters

`logged_in_users_only` -- If True, only return sessions with users logged in.

Returns

A list containing dictionaries of session information.

CLI Example:

```
salt '*' rdp.list_sessions
```

salt.modules.rdp.**logoff_session**(*session_id*)

Initiate the logoff of a session.

New in version 2016.11.0.

Parameters

session_id -- The numeric Id of the session.

Returns

A boolean representing whether the logoff succeeded.

CLI Example:

```
salt '*' rdp.logoff_session session_id

salt '*' rdp.logoff_session 99
```

salt.modules.rdp.**status**()

Show if rdp is enabled on the server

CLI Example:

```
salt '*' rdp.status
```

26.6.161 salt.modules.reg

Manage the Windows registry

Hives

Hives are the main sections of the registry and all begin with the word HKEY.

- HKEY_LOCAL_MACHINE
- HKEY_CURRENT_USER
- HKEY_USER

Keys

Keys are the folders in the registry. Keys can have many nested subkeys. Keys can have a value assigned to them under the (Default)

When passing a key on the CLI it must be quoted correctly depending on the backslashes being used (\ vs \\). The following are valid methods of passing the key on the CLI:

Using single backslashes:
`"SOFTWARE\Python"` `'SOFTWARE\Python'` (will not work on a Windows Master)

Using double backslashes:
`SOFTWARE\\Python`

Values or Entries

Values or Entries are the name/data pairs beneath the keys and subkeys. All keys have a default name/data pair. The name is `(Default)` with a displayed value of `(value not set)`. The actual value is Null.

Example

The following example is an export from the Windows startup portion of the registry:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Run]
"RTHDVCPL"="\"C:\\Program Files\\Realtek\\Audio\\HDA\\RtkNGUI64.exe\" -s"
"NvBackend"="\"C:\\Program Files (x86)\\NVIDIA Corporation\\Update Core\\
↪NvBackend.exe\""
"BTMTrayAgent"="rundll32.exe \"C:\\Program Files (x86)\\Intel\\Bluetooth\\
↪btmshellex.dll\",TrayApp"
```

In this example these are the values for each:

Hive:
`HKEY_LOCAL_MACHINE`

Key and subkeys:
`SOFTWARE\\Microsoft\\Windows\\CurrentVersion\\Run`

Value:

- **There are 3 value names:**
  - *RTHDVCPL*
  - *NvBackend*
  - *BTMTrayAgent*
- Each value name has a corresponding value

depends

- salt.utils.win_reg

`salt.modules.reg.`**`broadcast_change`**`()`

Refresh the windows environment.

Note: This will only effect new processes and windows. Services will not see the change until the system restarts.

Returns
True if successful, otherwise False

Return type
bool

CLI Example:

```
salt '*' reg.broadcast_change
```

`salt.modules.reg.`**`delete_key_recursive`**(*hive*, *key*, *use_32bit_registry=False*)

New in version 2015.5.4.

Delete a registry key to include all subkeys and value/data pairs.

Parameters

`hive` (*`str`*) -- The name of the hive. Can be one of the following

- HKEY_LOCAL_MACHINE or HKLM
- HKEY_CURRENT_USER or HKCU
- HKEY_USER or HKU
- HKEY_CLASSES_ROOT or HKCR
- HKEY_CURRENT_CONFIG or HKCC

key (str):
The key to remove (looks like a path)

use_32bit_registry (bool):
Deletes the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

Returns

A dictionary listing the keys that deleted successfully as well as
those that failed to delete.

Return type

dict

CLI Example:

The following example will remove `delete_me` and all its subkeys from the `SOFTWARE` key in `HKEY_LOCAL_MACHINE`:

```
salt '*' reg.delete_key_recursive HKLM SOFTWARE\\delete_me
```

`salt.modules.reg.`**`delete_value`**(*hive*, *key*, *vname=None*, *use_32bit_registry=False*)

Delete a registry value entry or the default value for a key.

Parameters

- **`hive`** (*`str`*) -- The name of the hive. Can be one of the following
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- **`key`** (*`str`*) -- The key (looks like a path) to the value name.
- **`vname`** (*`str`*) -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be deleted.
- **`use_32bit_registry`** (*`bool`*) -- Deletes the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

Returns

True if successful, otherwise False

Return type

bool

CLI Example:

```
salt '*' reg.delete_value HKEY_CURRENT_USER 'SOFTWARE\\Salt'
↪'version'
```

`salt.modules.reg.`**`import_file`**(*source*, *use_32bit_registry=False*)

Import registry settings from a Windows `REG` file by invoking `REG.EXE`.

New in version 2018.3.0.

Parameters

- **source** (*str*) -- The full path of the REG file. This can be either a local file path or a URL type supported by salt (e.g. `salt://salt_master_path`)
- **use_32bit_registry** (*bool*) -- If the value of this parameter is `True` then the REG file will be imported into the Windows 32 bit registry. Otherwise the Windows 64 bit registry will be used.

Returns

True if successful, otherwise an error is raised

Return type

bool

Raises

- **ValueError** -- If the value of `source` is an invalid path or otherwise causes `cp.cache_file` to return `False`
- ***CommandExecutionError*** -- If `reg.exe` exits with a non-0 exit code

CLI Example:

```
salt machine1 reg.import_file salt://win/printer_config/110_
↪Canon/postinstall_config.reg
```

`salt.modules.reg.`**`key_exists`**(*hive, key, use_32bit_registry=False*)

Check that the key is found in the registry. This refers to keys and not value/data pairs.

Parameters

- **hive** (*str*) -- The hive to connect to
- **key** (*str*) -- The key to check
- **use_32bit_registry** (*bool*) -- Look in the 32bit portion of the registry

Returns

True if exists, otherwise False

Return type

bool

CLI Example:

```
salt '*' reg.key_exists HKLM SOFTWARE\Microsoft
```

`salt.modules.reg.`**`list_keys`**(*hive, key=None, use_32bit_registry=False*)

Enumerates the subkeys in a registry key or hive.

Parameters

- **hive** (*str*) -- The name of the hive. Can be one of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- **key** (*str*) -- The key (looks like a path) to the value name. If a key is not passed, the keys under the hive will be returned.
- **use_32bit_registry** (*bool*) -- Accesses the 32bit portion of the registry on 64 bit installations. On 32bit machines this is ignored.

Returns

A list of keys/subkeys under the hive or key.

Return type

list

CLI Example:

```
salt '*' reg.list_keys HKLM 'SOFTWARE'
```

`salt.modules.reg.`**`list_values`**(*hive*, *key=None*, *use_32bit_registry=False*)

Enumerates the values in a registry key or hive.

Note: The `(Default)` value will only be returned if it is set, otherwise it will not be returned in the list of values.

Parameters

- **hive** (*str*) -- The name of the hive. Can be one of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- **key** (*str*) -- The key (looks like a path) to the value name. If a key is not passed, the values under the hive will be returned.
- **use_32bit_registry** (*bool*) -- Accesses the 32bit portion of the registry on 64 bit installations. On 32bit machines this is ignored.

Returns

A list of values under the hive or key.

Return type

list

CLI Example:

```
salt '*' reg.list_values HKLM 'SYSTEM\\CurrentControlSet\\
↪Services\\Tcpip'
```

`salt.modules.reg.`**`read_value`**(*hive*, *key*, *vname=None*, *use_32bit_registry=False*)

Reads a registry value entry or the default value for a key. To read the default value, don't pass `vname`

Parameters

- **hive** (*str*) -- The name of the hive. Can be one of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- **key** (*str*) -- The key (looks like a path) to the value name.
- **vname** (*str*) -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be returned.
- **use_32bit_registry** (*bool*) -- Accesses the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

Returns

A dictionary containing the passed settings as well as the value_data if successful. If unsuccessful, sets success to False.

bool: Returns False if the key is not found

If vname is not passed:

- Returns the first unnamed value (Default) as a string.
- Returns none if first unnamed value is empty.

Return type

dict

CLI Example:

The following will get the value of the `version` value name in the `HKEY_LOCAL_MACHINE\\SOFTWARE\\Salt` key

```
salt '*' reg.read_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt'
↪'version'
```

CLI Example:

The following will get the default value of the `HKEY_LOCAL_MACHINE\\SOFTWARE\\Salt` key

```
salt '*' reg.read_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt'
```

`salt.modules.reg.`**`set_value`**(*hive*, *key*, *vname=None*, *vdata=None*, *vtype='REG_SZ'*, *use_32bit_registry=False*, *volatile=False*)

Sets a value in the registry. If `vname` is passed, it will be the value for that value name, otherwise it will be the default value for the specified key

Parameters

- **hive** (*str*) -- The name of the hive. Can be one of the following
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- **key** (*str*) -- The key (looks like a path) to the value name.
- **vname** (*str*) -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be set.
- **vdata** (*str, int, list, bytes*) -- The value you'd like to set. If a value name (vname) is passed, this will be the data for that value name. If not, this will be the (Default) value for the key.

  The type of data this parameter expects is determined by the value type specified in `vtype`. The correspondence is as follows:
  - REG_BINARY: Binary data (str in Py2, bytes in Py3)
  - REG_DWORD: int
  - REG_EXPAND_SZ: str
  - REG_MULTI_SZ: list of str
  - REG_QWORD: int
  - REG_SZ: str

  Note: When setting REG_BINARY, string data will be converted to binary.

  Note: The type for the (Default) value is always REG_SZ and cannot be changed.

  Note: This parameter is optional. If `vdata` is not passed, the Key will be created with no associated item/value pairs.
- **vtype** (*str*) -- The value type. The possible values of the vtype parameter are indicated above in the description of the vdata parameter.
- **use_32bit_registry** (*bool*) -- Sets the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.
- **volatile** (*bool*) -- When this parameter has a value of True, the registry key will

be made volatile (i.e. it will not persist beyond a system reset or shutdown). This parameter only has an effect when a key is being created and at no other time.

Returns

True if successful, otherwise False

Return type

bool

CLI Example:

This will set the version value to 2015.5.2 in the SOFTWARESalt key in the HKEY_LOCAL_MACHINE hive

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt'
↪'version' '2015.5.2'
```

CLI Example:

This function is strict about the type of vdata. For instance this example will fail because vtype has a value of REG_SZ and vdata has a type of int (as opposed to str as expected).

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'str_
↪data' 1.2
```

CLI Example:

In this next example vdata is properly quoted and should succeed.

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'str_
↪data' vtype=REG_SZ vdata="'1.2'"
```

CLI Example:

This is an example of using vtype REG_BINARY.

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'bin_
↪data' vtype=REG_BINARY vdata='Salty Data'
```

CLI Example:

An example of using vtype REG_MULTI_SZ is as follows:

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'list_
↪data' vtype=REG_MULTI_SZ vdata='["Salt", "is", "great"]'
```

`salt.modules.reg.`**`value_exists`**(*hive, key, vname, use_32bit_registry=False*)

Check that the value/data pair is found in the registry.

New in version 3000.

Parameters

- **hive** (*str*) -- The hive to connect to
- **key** (*str*) -- The key to check in
- **vname** (*str*) -- The name of the value/data pair you're checking
- **use_32bit_registry** (*bool*) -- Look in the 32bit portion of the registry

Returns

True if exists, otherwise False

Return type

bool

CLI Example:

```
salt '*' reg.value_exists HKLM SOFTWARE\Microsoft\Windows\
↪CurrentVersion CommonFilesDir
```

26.6.162 salt.modules.rest_pkg

Package support for the REST example

`salt.modules.rest_pkg.`**`install`**`(`*name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs*`)`

`salt.modules.rest_pkg.`**`installed`**`(`*name, version=None, refresh=False, fromrepo=None, skip_verify=False, pkgs=None, sources=None, **kwargs*`)`

`salt.modules.rest_pkg.`**`list_pkgs`**`(`*versions_as_list=False, **kwargs*`)`

`salt.modules.rest_pkg.`**`remove`**`(`*name=None, pkgs=None, **kwargs*`)`

`salt.modules.rest_pkg.`**`upgrade`**`(`*refresh=True, skip_verify=True, **kwargs*`)`

`salt.modules.rest_pkg.`**`version`**`(`**names, **kwargs*`)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

26.6.163 salt.modules.rest_sample_utils

Utility functions for the rest_sample

`salt.modules.rest_sample_utils.`**`fix_outage`**`()`

”Fix” the outage

CLI Example:

```
salt 'rest-sample-proxy' rest_sample.fix_outage
```

`salt.modules.rest_sample_utils.`**`get_test_string`**`()`

Helper function to test cross-calling to the __proxy__ dunder.

CLI Example:

```
salt 'rest-sample-proxy' rest_sample.get_test_string
```

26.6.164 salt.modules.rest_service

Provide the service module for the proxy-minion REST sample

`salt.modules.rest_service.`**`enabled`**`(`*name, sig=None*`)`

Only the 'redbull' service is 'enabled' in the test

New in version 2015.8.1.

`salt.modules.rest_service.`**`get_all`**`()`

Return a list of all available services

New in version 2015.8.0.

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.rest_service.`**`list_`**`()`

Return a list of all available services.

New in version 2015.8.1.

CLI Example:

```
salt '*' service.list
```

`salt.modules.rest_service.`**`restart`**`(`*name*, *sig=None*`)`

Restart the specified service with rest_sample

New in version 2015.8.0.

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.rest_service.`**`running`**`(`*name*, *sig=None*`)`

Return whether this service is running.

New in version 2015.8.0.

`salt.modules.rest_service.`**`start`**`(`*name*, *sig=None*`)`

Start the specified service on the rest_sample

New in version 2015.8.0.

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.rest_service.`**`status`**`(`*name*, *sig=None*`)`

Return the status for a service via rest_sample. If the name contains globbing, a dict mapping service name to True/False values is returned.

New in version 2015.8.0.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Parameters

- **name** (*str*) -- The name of the service to check
- **sig** (*str*) -- Not implemented

Returns

True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type

bool

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.rest_service.`**`stop`**(*name*, *sig=None*)

Stop the specified service on the rest_sample

New in version 2015.8.0.

CLI Example:

```
salt '*' service.stop <service name>
```

26.6.165 salt.modules.restartcheck

checkrestart functionality for Debian and Red Hat Based systems

Identifies services (processes) that are linked against deleted files (for example after downloading an updated binary of a shared library).

Based on checkrestart script from debian-goodies (written by Matt Zimmerman for the Debian GNU/Linux distribution, https://packages.debian.org/debian-goodies) and psdel by Sam Morris.

codeauthor
Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.modules.restartcheck.`**`restartcheck`**(*ignorelist=None*, *blacklist=None*, *excludepid=None*, ***kwargs*)

Analyzes files openeded by running processes and seeks for packages which need to be restarted.

Parameters

- **`ignorelist`** -- string or list of packages to be ignored.
- **`blacklist`** -- string or list of file paths to be ignored.
- **`excludepid`** -- string or list of process IDs to be ignored.
- **`verbose`** -- boolean, enables extensive output.
- **`timeout`** -- int, timeout in minute.

Returns

`{ 'result': False, 'comment': '<reason>' }`. String with checkrestart output if some package seems to need to be restarted or if no packages need restarting.

Return type

Dict on error

New in version 2015.8.3.

CLI Example:

```
salt '*' restartcheck.restartcheck
```

26.6.166 salt.modules.ret

Module to integrate with the returner system and retrieve data sent to a salt returner

`salt.modules.ret.`**`get_fun`**(*returner*, *fun*)

Return info about last time fun was called on each minion

CLI Example:

```
salt '*' ret.get_fun mysql network.interfaces
```

`salt.modules.ret.`**`get_jid`**`(`*returner, jid*`)`

Return the information for a specified job id

CLI Example:

```
salt '*' ret.get_jid redis 20421104181954700505
```

`salt.modules.ret.`**`get_jids`**`(`*returner*`)`

Return a list of all job ids

CLI Example:

```
salt '*' ret.get_jids mysql
```

`salt.modules.ret.`**`get_minions`**`(`*returner*`)`

Return a list of all minions

CLI Example:

```
salt '*' ret.get_minions mysql
```

26.6.167 salt.modules.rh_ip

The networking module for RHEL/Fedora based distros

`salt.modules.rh_ip.`**`apply_network_settings`**`(`***settings*`)`

Apply global network configuration.

CLI Example:

```
salt '*' ip.apply_network_settings
```

`salt.modules.rh_ip.`**`build_interface`**`(`*iface, iface_type, enabled, **settings*`)`

Build an interface script for a network interface.

CLI Example:

```
salt '*' ip.build_interface eth0 eth <settings>
```

`salt.modules.rh_ip.`**`build_network_settings`**`(`***settings*`)`

Build the global network script.

CLI Example:

```
salt '*' ip.build_network_settings <settings>
```

`salt.modules.rh_ip.`**`build_routes`**`(`*iface, **settings*`)`

Build a route script for a network interface.

CLI Example:

```
salt '*' ip.build_routes eth0 <settings>
```

`salt.modules.rh_ip.`**`down`**`(`*iface, iface_type*`)`

Shutdown a network interface

CLI Example:

```
salt '*' ip.down eth0
```

`salt.modules.rh_ip.`**`get_interface`**`(`*iface*`)`

Return the contents of an interface script

CLI Example:

```
salt '*' ip.get_interface eth0
```

`salt.modules.rh_ip.`**`get_network_settings`**`()`

Return the contents of the global network script.

CLI Example:

```
salt '*' ip.get_network_settings
```

`salt.modules.rh_ip.`**`get_routes`**`(`*iface*`)`

Return the contents of the interface routes script.

CLI Example:

```
salt '*' ip.get_routes eth0
```

`salt.modules.rh_ip.`**`up`**`(`*iface, iface_type*`)`

Start up a network interface

CLI Example:

```
salt '*' ip.up eth0
```

26.6.168 salt.modules.rh_service

Service support for RHEL-based systems, including support for both upstart and sysvinit

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *'service.start' is not available*), see *here*.

`salt.modules.rh_service.`**`available`**`(`*name, limit=''*`)`

Return True if the named service is available. Use the `limit` param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.available sshd
salt '*' service.available sshd limit=upstart
salt '*' service.available sshd limit=sysvinit
```

`salt.modules.rh_service.`**`delete`**`(`*name, **kwargs*`)`

Delete the named service

New in version 2016.3.0.

CLI Example:

```
salt '*' service.delete <service name>
```

`salt.modules.rh_service.`**`disable`**(*name*, ***kwargs*)

Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.rh_service.`**`disabled`**(*name*)

Check to see if the named service is disabled to start on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.rh_service.`**`enable`**(*name*, ***kwargs*)

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.rh_service.`**`enabled`**(*name*, ***kwargs*)

Check to see if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.rh_service.`**`get_all`**(*limit=''*)

Return all installed services. Use the `limit` param to restrict results to services of that type.

CLI Example:

```
salt '*' service.get_all
salt '*' service.get_all limit=upstart
salt '*' service.get_all limit=sysvinit
```

`salt.modules.rh_service.`**`get_disabled`**(*limit=''*)

Return the disabled services. Use the `limit` param to restrict results to services of that type.

CLI Example:

```
salt '*' service.get_disabled
salt '*' service.get_disabled limit=upstart
salt '*' service.get_disabled limit=sysvinit
```

`salt.modules.rh_service.`**`get_enabled`**(*limit=''*)

Return the enabled services. Use the `limit` param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.get_enabled
salt '*' service.get_enabled limit=upstart
salt '*' service.get_enabled limit=sysvinit
```

`salt.modules.rh_service.`**`missing`**`(`*name*, *limit=''*`)`

The inverse of service.available. Return True if the named service is not available. Use the `limit` param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.missing sshd
salt '*' service.missing sshd limit=upstart
salt '*' service.missing sshd limit=sysvinit
```

`salt.modules.rh_service.`**`reload_`**`(`*name*`)`

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.rh_service.`**`restart`**`(`*name*`)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.rh_service.`**`start`**`(`*name*`)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.rh_service.`**`status`**`(`*name*, *sig=None*`)`

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Parameters

- **`name`** (`str`) -- The name of the service to check
- **`sig`** (`str`) -- Signature to use to find the service via ps

Returns

True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type

bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

`salt.modules.rh_service.`**`stop`**`(`*name*`)`

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

26.6.169 salt.modules.rpm_lowpkg

Support for rpm

`salt.modules.rpm_lowpkg.`**`bin_pkg_info`**`(`*path*, *saltenv='base'*`)`

New in version 2015.8.0.

Parses RPM metadata and returns a dictionary of information about the package (name, version, etc.).

path

Path to the file. Can either be an absolute path to a file on the minion, or a salt fileserver URL (e.g. `salt://path/to/file.rpm`). If a salt fileserver URL is passed, the file will be cached to the minion so that it can be examined.

saltenv

[base] Salt fileserver environment from which to retrieve the package. Ignored if `path` is a local file path on the minion.

CLI Example:

```
salt '*' lowpkg.bin_pkg_info /root/salt-2015.5.1-2.el7.noarch.rpm
salt '*' lowpkg.bin_pkg_info salt://salt-2015.5.1-2.el7.noarch.rpm
```

`salt.modules.rpm_lowpkg.`**`checksum`**`(`**paths*, ***kwargs*`)`

Return if the signature of a RPM file is valid.

root

use root as top level directory (default: "/")

CLI Example:

```
salt '*' lowpkg.checksum /path/to/package1.rpm
salt '*' lowpkg.checksum /path/to/package1.rpm /path/to/package2.rpm
```

`salt.modules.rpm_lowpkg.`**`diff`**`(`*package_path*, *path*`)`

Return a formatted diff between current file and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

Parameters

- **`package`** -- Full pack of the RPM file
- **`path`** -- Full path to the installed file

Returns

Difference or empty string. For binary files only a notification.

CLI Example:

```
salt '*' lowpkg.diff /path/to/apache2.rpm /etc/apache2/httpd.conf
```

`salt.modules.rpm_lowpkg.`**`file_dict`**`(`**packages*, ***kwargs*`)`

List the files that belong to a package, sorted by group. Not specifying any packages will return a list of _every_ file on the system's rpm database (not generally recommended).

root

use root as top level directory (default: "/")

CLI Examples:

```
salt '*' lowpkg.file_dict httpd
salt '*' lowpkg.file_dict httpd postfix
salt '*' lowpkg.file_dict
```

`salt.modules.rpm_lowpkg.`**`file_list`**`(`**packages*, ***kwargs*`)`

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's rpm database (not generally recommended).

root
use root as top level directory (default: "/")

CLI Examples:

```
salt '*' lowpkg.file_list httpd
salt '*' lowpkg.file_list httpd postfix
salt '*' lowpkg.file_list
```

`salt.modules.rpm_lowpkg.`**`info`**`(`**packages, **kwargs*`)`

Return a detailed package(s) summary information. If no packages specified, all packages will be returned.

Parameters

- **packages** --
- **attr** -- Comma-separated package attributes. If no 'attr' is specified, all available attributes returned.

  Valid attributes are:
  version, vendor, release, build_date, build_date_time_t, install_date, install_date_time_t, build_host, group, source_rpm, arch, epoch, size, license, signature, packager, url, summary, description.
- **all_versions** -- Return information for all installed versions of the packages
- **root** -- use root as top level directory (default: "/")

Returns

CLI Example:

```
salt '*' lowpkg.info apache2 bash
salt '*' lowpkg.info apache2 bash attr=version
salt '*' lowpkg.info apache2 bash attr=version,build_date_iso,size
salt '*' lowpkg.info apache2 bash attr=version,build_date_iso,size all_
↪versions=True
```

`salt.modules.rpm_lowpkg.`**`list_pkgs`**`(`**packages, **kwargs*`)`

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

root
use root as top level directory (default: "/")

CLI Example:

```
salt '*' lowpkg.list_pkgs
```

`salt.modules.rpm_lowpkg.`**`modified`**`(`**packages, **flags*`)`

List the modified files that belong to a package. Not specifying any packages will return a list of _all_ modified files on the system's RPM database.

New in version 2015.5.0.

root
use root as top level directory (default: "/")

CLI Examples:

```
salt '*' lowpkg.modified httpd
salt '*' lowpkg.modified httpd postfix
salt '*' lowpkg.modified
```

`salt.modules.rpm_lowpkg.`**`owner`**`(`**paths, **kwargs*`)`

Return the name of the package that owns the file. Multiple file paths can be passed. If a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

root
: use root as top level directory (default: "/")

CLI Examples:

```
salt '*' lowpkg.owner /usr/bin/apachectl
salt '*' lowpkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

`salt.modules.rpm_lowpkg.`**`verify`**`(`**packages, **kwargs*`)`

Runs an rpm -Va on a system, and returns the results in a dict

root
: use root as top level directory (default: "/")

Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the `ignore_types` keyword argument

CLI Example:

```
salt '*' lowpkg.verify
salt '*' lowpkg.verify httpd
salt '*' lowpkg.verify httpd postfix
salt '*' lowpkg.verify httpd postfix ignore_types=['config','doc']
```

`salt.modules.rpm_lowpkg.`**`version_cmp`**`(`*ver1, ver2, ignore_epoch=False*`)`

New in version 2015.8.9.

Do a cmp-style comparison on two packages. Return -1 if ver1 < ver2, 0 if ver1 == ver2, and 1 if ver1 > ver2. Return None if there was a problem making the comparison.

ignore_epoch
: [False] Set to `True` to ignore the epoch when comparing versions

  New in version 2015.8.10,2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

26.6.170 salt.modules.rpmbuild_pkgbuild

RPM Package builder system

New in version 2015.8.0.

This system allows for all of the components to build rpms safely in chrooted environments. This also provides a function to generate yum repositories

This module implements the pkgbuild interface

`salt.modules.rpmbuild_pkgbuild.`**`build`**`(`*runas, tgt, dest_dir, spec, sources, deps, env, template, saltenv='base', log_dir='/var/log/salt/pkgbuild'*`)`

Given the package destination directory, the spec file source and package sources, use mock to safely build the rpm defined in the spec file

CLI Example:

```
salt '*' pkgbuild.build mock epel-7-x86_64 /var/www/html
            https://raw.githubusercontent.com/saltstack/libnacl/master/
↪pkg/rpm/python-libnacl.spec
            https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.
↪5.tar.gz
```

This example command should build the libnacl package for rhel 7 using user mock and place it in /var/www/html/ on the minion

`salt.modules.rpmbuild_pkgbuild.`**`make_repo`**(*repodir*, *keyid=None*, *env=None*, *use_passphrase=False*, *gnupghome='/etc/salt/gpgkeys'*, *runas='root'*, *timeout=15.0*)

Make a package repository and optionally sign packages present

Given the repodir, create a `yum` repository out of the rpms therein and optionally sign it and packages present, the name is directory to turn into a repo. This state is best used with onchanges linked to your package building states.

repodir

The directory to find packages that will be in the repository.

keyid

Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with keyid which have been loaded into the minion's Pillar data.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```
gpg_pkg_priv_key: |
  -----BEGIN PGP PRIVATE KEY BLOCK-----
  Version: GnuPG v1

gpg_pkg_pub_keyname: gpg_pkg_key.pub
```

env

Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository.

Note: This parameter is not used for making `yum` repositories.

---

use_passphrase

[False] New in version 2016.3.0.

Use a passphrase with the signing key presented in `keyid`. Passphrase is received from Pillar data which could be passed on the command line with `pillar` parameter.

```
pillar='{ "gpg_passphrase" : "my_passphrase" }'
```

New in version 3001.1.

RHEL 8 and above leverages gpg-agent and gpg-preset-passphrase for caching keys, etc.

gnupghome

[/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with `keyid`.

runas

[root] New in version 2016.3.0.

User to create the repository as, and optionally sign packages.

Note: Ensure the user has correct permissions to any files and directories which are to be utilized.

---

timeout

[15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

CLI Example:

```
salt '*' pkgbuild.make_repo /var/www/html/
```

`salt.modules.rpmbuild_pkgbuild.`**`make_src_pkg`**(*dest_dir, spec, sources, env=None, template=None, saltenv='base', runas='root'*)

Create a source rpm from the given spec file and sources

CLI Example:

```
salt '*' pkgbuild.make_src_pkg /var/www/html/
        https://raw.githubusercontent.com/saltstack/libnacl/master/pkg/
↪rpm/python-libnacl.spec
        https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.
↪tar.gz
```

This example command should build the libnacl SOURCE package and place it in /var/www/html/ on the minion

Changed in version 2017.7.0.

dest_dir
The directory on the minion to place the built package(s)

spec
The location of the spec file (used for rpms)

sources
The list of package sources

env
A dictionary of environment variables to be set prior to execution.

template
Run the spec file through a templating engine Optional argument, allows for no templating engine used to be if none is desired.

saltenv
The saltenv to use for files downloaded from the salt filesever

runas
The user to run the build process as

New in version 2018.3.3.

Note: using SHA256 as digest and minimum level dist el6

26.6.171 salt.modules.rsync

Wrapper for rsync

New in version 2014.1.0.

This data can also be passed into *pillar*. Options passed into opts will overwrite options passed into pillar.

`salt.modules.rsync.`**`config`**`(`*conf_path='/etc/rsyncd.conf'*`)`

Changed in version 2016.3.0: Return data now contains just the contents of the rsyncd.conf as a string, instead of a dictionary as returned from `cmd.run_all`.

Returns the contents of the rsync config file

conf_path
[/etc/rsyncd.conf] Path to the config file

CLI Example:

```
salt '*' rsync.config
```

`salt.modules.rsync.`**`rsync`**`(`*src, dst, delete=False, force=False, update=False, passwordfile=None, exclude=None, excludefrom=None, dryrun=False, rsh=None, additional_opts=None, saltenv='base'*`)`

Changed in version 2016.3.0: Return data now contains just the output of the rsync command, instead of a dictionary as returned from `cmd.run_all`.

Rsync files from src to dst

src
The source location where files will be rsynced from.

dst
The destination location where files will be rsynced to.

delete
[False] Whether to enable the rsync *--delete* flag, which will delete extraneous files from dest dirs

force
[False] Whether to enable the rsync *--force* flag, which will force deletion of dirs even if not empty.

update
[False] Whether to enable the rsync *--update* flag, which forces rsync to skip any files which exist on the destination and have a modified time that is newer than the source file.

passwordfile
A file that contains a password for accessing an rsync daemon. The file should contain just the password.

exclude
Whether to enable the rsync *--exclude* flag, which will exclude files matching a PATTERN.

excludefrom
Whether to enable the rsync *--excludefrom* flag, which will read exclude patterns from a file.

dryrun
[False] Whether to enable the rsync *--dry-run* flag, which will perform a trial run with no changes made.

rsh
Whether to enable the rsync *--rsh* flag, to specify the remote shell to use.

additional_opts
Any additional rsync options, should be specified as a list.

saltenv
Specify a salt fileserver environment to be used.

CLI Example:

```
salt '*' rsync.rsync /path/to/src /path/to/dest delete=True update=True␣
↪passwordfile=/etc/pass.crt exclude=exclude/dir
salt '*' rsync.rsync /path/to/src delete=True excludefrom=/xx.ini
salt '*' rsync.rsync /path/to/src delete=True exclude='[exclude1/dir,
↪exclude2/dir]' additional_opts='["--partial", "--bwlimit=5000"]'
```

`salt.modules.rsync.`**`version`**`()`

Changed in version 2016.3.0: Return data now contains just the version number as a string, instead of a dictionary as returned from `cmd.run_all`.

Returns rsync version

CLI Example:

```
salt '*' rsync.version
```

26.6.172 salt.modules.salt_proxy

Salt proxy module

New in version 2015.8.3.

Module to deploy and manage salt-proxy processes on a minion.

`salt.modules.salt_proxy.`**`configure_proxy`**`(`*proxyname*, *start=True*`)`

Create the salt proxy file and start the proxy process if required

Parameters

- **`proxyname`** -- Name to be used for this proxy (should match entries in pillar)
- **`start`** -- Boolean indicating if the process should be started default = True

CLI Example:

```
salt deviceminion salt_proxy.configure_proxy p8000
```

`salt.modules.salt_proxy.`**`is_running`**`(`*proxyname*`)`

Check if the salt-proxy process associated with this proxy (name) is running.

Returns True if the process is running False otherwise

Parameters

proxyname -- String name of the proxy (p8000 for example)

CLI Example:

```
salt deviceminion salt_proxy.is_running p8000
```

26.6.173 salt.modules.salt_version

Access Salt's elemental release code-names.

New in version 3000.

Salt's feature release schedule is based on the Periodic Table, as described in the Version Numbers documentation.

When a feature was added (or removed) in a specific release, it can be difficult to build out future-proof functionality that is dependent on a naming scheme that moves.

For example, a state syntax needs to change to support an option that will be removed in the future, but there are many Minion versions in use across an infrastructure. It would be handy to use some Jinja syntax to check for these instances to perform one state syntax over another.

A simple example might be something like the following:

```
{# a boolean check #}
{% set option_deprecated = salt['salt_version.less_than']("Sodium") %}

{% if option_deprecated %}
  <use old syntax>
{% else %}
  <use new syntax>
{% endif %}
```

`salt.modules.salt_version.`**`equal`**(*name*)

Returns a boolean (True) if the minion's current version code name matches the named version.

name

The release code name to check the version against.

CLI Example:

```
salt '*' salt_version.equal 'Oxygen'
```

`salt.modules.salt_version.`**`get_release_number`**(*name*)

Returns the release number of a given release code name in a `MAJOR.PATCH` format (for Salt versions < 3000) or `MAJOR` for newer Salt versions.

If the release name has not been given an assigned release number, the function returns a string. If the release cannot be found, it returns `None`.

name

The release code name for which to find a release number.

CLI Example:

```
salt '*' salt_version.get_release_number 'Oxygen'
```

`salt.modules.salt_version.`**`greater_than`**(*name*)

Returns a boolean (True) if the minion's current version code name is greater than the named version.

name

The release code name to check the version against.

CLI Example:

```
salt '*' salt_version.greater_than 'Oxygen'
```

`salt.modules.salt_version.`**`less_than`**`(`*name*`)`

Returns a boolean (True) if the minion's current version code name is less than the named version.

name
The release code name to check the version against.

CLI Example:

```
salt '*' salt_version.less_than 'Oxygen'
```

26.6.174 salt.modules.saltcheck

A module for testing the logic of states and highstates on salt minions

codeauthor
William Cannon <william.cannon@gmail.com>

maturity
new

Saltcheck provides unittest like functionality requiring only the knowledge of salt module execution and yaml. Saltcheck uses salt modules to return data, then runs an assertion against that return. This allows for testing with all the features included in salt modules.

In order to run state and highstate saltcheck tests, a sub-folder in the state directory must be created and named `saltcheck-tests`. Tests for a state should be created in files ending in `*.tst` and placed in the `saltcheck-tests` folder. `tst` files are run through the salt rendering system, enabling tests to be written in yaml (or renderer of choice), and include jinja, as well as the usual grain and pillar information. Like states, multiple tests can be specified in a `tst` file. Multiple `tst` files can be created in the `saltcheck-tests` folder, and should be named the same as the associated state. The `id` of a test works in the same manner as in salt state files and should be unique and descriptive.

New in version 3000: The `saltcheck-tests` folder can be customized using the `saltcheck_test_location` minion configuration setting. This setting is a relative path from the formula's `salt://` path to the test files.

Usage

Example Default file system layout:

```
/srv/salt/apache/
    init.sls
    config.sls
    saltcheck-tests/
        init.tst
        config.tst
        deployment_validation.tst
```

Alternative example file system layout with custom saltcheck_test_location:

Minion configuration:

```
saltcheck_test_location: tests/integration/saltcheck
```

Filesystem layout:

```
/srv/salt/apache/
    init.sls
    config.sls
    tests/integration/saltcheck/
        init.tst
        config.tst
        deployment_validation.tst
```

Tests can be run for each state by name, for all `apache/saltcheck/*.tst` files, or for all states assigned to the minion in top.sls. Tests may also be created with no associated state. These tests will be run through the use of `saltcheck.run_state_tests`, but will not be automatically run by `saltcheck.run_highstate_tests`.

```
salt '*' saltcheck.run_state_tests apache,apache.config
salt '*' saltcheck.run_state_tests apache check_all=True
salt '*' saltcheck.run_highstate_tests
salt '*' saltcheck.run_state_tests apache.deployment_validation
```

Saltcheck Keywords

module_and_function:
(str) This is the salt module which will be run locally, the same as `salt-call --local <module>`. The `saltcheck.state_apply` module name is special as it bypasses the local option in order to resolve state names when run in a master/minion environment.

args:
(list) Optional arguments passed to the salt module

kwargs:
(dict) Optional keyword arguments to be passed to the salt module

assertion:
(str) One of the supported assertions and required except for `saltcheck.state_apply` Tests which fail the assertion and expected_return, cause saltcheck to exit which a non-zero exit code.

expected_return:
(str) Required except by `assertEmpty`, `assertNotEmpty`, `assertTrue`, `assertFalse`. The return of module_and_function is compared to this value in the assertion.

assertion_section:
(str) Optional keyword used to parse the module_and_function return. If a salt module returns a dictionary as a result, the `assertion_section` value is used to lookup a specific value in that return for the assertion comparison.

assertion_section_delimiter:
(str) Optional delimiter to use when splitting a nested structure. Defaults to ':'

print_result:
(bool) Optional keyword to show results in the `assertEqual`, `assertNotEqual`, `assertIn`, and `assertNotIn` output. Defaults to True.

output_details:
(bool) Optional keyword to display `module_and_function`, `args`, `assertion_section`, and assertion results text in the output. If print_result is False, assertion results will be hidden. This is a per test setting, but can be set globally for all tests by adding `saltcheck_output_details: True` in the minion configuration file. Defaults to False

pillar_data:
(dict) Optional keyword for passing in pillar data. Intended for use in potential test setup or teardown with the `saltcheck.state_apply` function.

skip:
(bool) Optional keyword to skip running the individual test

New in version 3000: Multiple assertions can be run against the output of a single `module_and_function` call. The `assertion`, `expected_return`, `assertion_section`, and `assertion_section_delimiter` keys can be placed in a list under an `assertions` key. See the multiple assertions example below.

Sample Cases/Examples

Basic Example

```
echo_test_hello:
  module_and_function: test.echo
  args:
    - "hello"
  kwargs:
  assertion: assertEqual
  expected_return:  'hello'
```

Example with jinja

```
{% for package in ["apache2", "openssh"] %}
{# or another example #}
{# for package in salt['pillar.get']("packages") #}
test_{{ package }}_latest:
  module_and_function: pkg.upgrade_available
  args:
    - {{ package }}
  assertion: assertFalse
{% endfor %}
```

Example with setup state including pillar

```
setup_test_environment:
  module_and_function: saltcheck.state_apply
  args:
    - common
  pillar_data:
    data: value

verify_vim:
  module_and_function: pkg.version
  args:
    - vim
  assertion: assertNotEmpty
```

Example with jinja

```
{% for package in ["apache2", "openssh"] %}
{# or another example #}
{# for package in salt['pillar.get']("packages") #}
test_{{ package }}_latest:
  module_and_function: pkg.upgrade_available
  args:
    - {{ package }}
  assertion: assertFalse
{% endfor %}
```

Example with setup state including pillar

```
setup_test_environment:
  module_and_function: saltcheck.state_apply
  args:
    - common
  pillar-data:
    data: value

verify_vim:
  module_and_function: pkg.version
  args:
    - vim
  assertion: assertNotEmpty
```

Example with skip

```
package_latest:
  module_and_function: pkg.upgrade_available
  args:
    - apache2
  assertion: assertFalse
  skip: True
```

Example with assertion_section

```
validate_shell:
  module_and_function: user.info
  args:
    - root
  assertion: assertEqual
  expected_return: /bin/bash
  assertion_section: shell
```

Example with a nested assertion_section

```
validate_smb_signing:
  module_and_function: lgpo.get
  args:
    - 'Machine'
  kwargs:
    return_full_policy_names: True
  assertion: assertEqual
  expected_return: Enabled
  assertion_section: 'Computer Configuration|Microsoft network client:
↪Digitally sign communications (always)'
  assertion_section_delimiter: '|'
```

Example suppressing print results

```
validate_env_nameNode:
  module_and_function: hadoop.dfs
  args:
    - text
    - /oozie/common/env.properties
  expected_return: nameNode = hdfs://nameservice2
  assertion: assertNotIn
  print_result: False
```

Example with multiple assertions and output_details

```
multiple_validations:
  module_and_function: network.netstat
  assertions:
    - assertion: assertEqual
      assertion_section: "0:program"
      expected_return: "systemd-resolve"
    - assertion: assertEqual
      assertion_section: "0:proto"
      expected_return: "udp"
  output_details: True
```

Supported assertions

- assertEqual
- assertNotEqual
- assertTrue
- assertFalse
- assertIn
- assertNotIn
- assertGreater
- assertGreaterEqual
- assertLess
- assertLessEqual
- assertEmpty
- assertNotEmpty

Warning: The saltcheck.state_apply function is an alias for `state.apply`. If using the *ACL system* `saltcheck.*` might provide more capability than intended if only `saltcheck.run_state_tests` and `saltcheck.run_highstate_tests` are needed.

class `salt.modules.saltcheck.`**`SaltCheck`**(*saltenv='base'*)

This class validates and runs the saltchecks

`run_test`(*test_dict*)

Run a single saltcheck test

class `salt.modules.saltcheck.`**`StateTestLoader`**(*saltenv='base'*)

Class loads in test files for a state e.g. state_dir/saltcheck-tests/[1.tst, 2.tst, 3.tst]

`add_test_files_for_sls`(*sls_name, check_all=False*)

Detects states used, caches needed files, and adds to test list

`load_test_suite`()

Load tests either from one file, or a set of files `salt.modules.saltcheck.`**`parallel_scheck`**`(`*data*`)`

triggers salt-call in parallel

`salt.modules.saltcheck.`**`report_highstate_tests`**`(`*saltenv=None*`)`

Report on tests for states assigned to the minion through highstate. Quits with the exit code for the number of missing tests.

CLI Example:

```
salt '*' saltcheck.report_highstate_tests
```

New in version 3000.

`salt.modules.saltcheck.`**`run_highstate_tests`**`(`*saltenv=None*, *only_fails=False*, *junit=False*`)`

Execute all tests for states assigned to the minion through highstate and return results

Parameters

- **saltenv** (*str*) -- optional saltenv. Defaults to base
- **only_fails** (*bool*) -- boolean to only print failure results
- **junit** (*bool*) -- boolean to print results in junit format .. versionadded:: 3007.0

CLI Example:

```
salt '*' saltcheck.run_highstate_tests
```

`salt.modules.saltcheck.`**`run_state_tests`**`(`*state*, *saltenv=None*, *check_all=False*, *only_fails=False*, *junit=False*`)`

Execute tests for a salt state and return results Nested states will also be tested

Parameters

- **state** (*str*) -- state name for which to run associated .tst test files
- **saltenv** (*str*) -- optional saltenv. Defaults to base
- **check_all** (*bool*) -- boolean to run all tests in state/saltcheck-tests directory
- **only_fails** (*bool*) -- boolean to only print failure results
- **junit** (*bool*) -- boolean to print results in junit format .. versionadded:: 3007.0

CLI Example:

```
salt '*' saltcheck.run_state_tests postfix,common
```

Tests will be run in parallel by adding "saltcheck_parallel: True" in minion config. When enabled, saltcheck will use up to the number of cores detected. This can be limited by setting the "saltcheck_processes" value to an integer to set the maximum number of parallel processes.

`salt.modules.saltcheck.`**`run_state_tests_ssh`**`(`*state*, *saltenv=None*, *check_all=False*, *only_fails=False*, *junit=False*`)`

This function is an alias of `run_state_tests`.

Execute tests for a salt state and return results Nested states will also be tested

param str state
state name for which to run associated .tst test files

param str saltenv
optional saltenv. Defaults to base

param bool check_all
boolean to run all tests in state/saltcheck-tests directory

param bool only_fails
boolean to only print failure results

param bool junit
boolean to print results in junit format .. versionadded:: 3007.0

CLI Example:

```
salt '*' saltcheck.run_state_tests postfix,common
```

Tests will be run in parallel by adding "saltcheck_parallel: True" in minion config. When enabled, saltcheck will use up to the number of cores detected. This can be limited by setting the "saltcheck_processes" value to an integer to set the maximum number of parallel processes.

`salt.modules.saltcheck.`**`run_test`**`(`*`**kwargs`*`)`

Execute one saltcheck test and return result

Parameters

`test` (*`keyword arg`*) --

CLI Example:

```
salt '*' saltcheck.run_test
    test='{"module_and_function": "test.echo",
           "assertion": "assertEqual",
           "expected_return": "This works!",
           "args":["This works!"] }'
```

`salt.modules.saltcheck.`**`state_apply`**`(`*`state_name, **kwargs`*`)`

Runs `state.apply` with given options to set up test data. Intended to be used for optional test setup or teardown

Reference the `state.apply` module documentation for arguments and usage options

CLI Example:

```
salt '*' saltcheck.state_apply postfix
```

26.6.175 salt.modules.saltcloudmod

Control a salt cloud system

`salt.modules.saltcloudmod.`**`create`**`(`*`name, profile`*`)`

Create the named vm

CLI Example:

```
salt <minion-id> saltcloud.create webserver rackspace_centos_512
```

26.6.176 salt.modules.saltutil

The Saltutil module is used to manage the state of the salt minion itself. It is used to manage minion modules as well as automate updates to the salt minion.

depends

- esky Python module for update functionality

`salt.modules.saltutil.`**`clear_cache`**`()`

Forcibly removes all caches on a minion.

New in version 2014.7.0.

WARNING: The safest way to clear a minion cache is by first stopping the minion and then deleting the cache files before restarting it.

CLI Example:

```
salt '*' saltutil.clear_cache
```

`salt.modules.saltutil.`**`clear_job_cache`**`(`*hours=24*`)`

Forcibly removes job cache folders and files on a minion.

New in version 2018.3.0.

WARNING: The safest way to clear a minion cache is by first stopping the minion and then deleting the cache files before restarting it.

CLI Example:

```
salt '*' saltutil.clear_job_cache hours=12
```

`salt.modules.saltutil.`**`cmd`**`(`*tgt, fun, arg=(), timeout=None, tgt_type='glob', ret='', kwarg=None, ssh=False, **kwargs*`)`

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Assuming this minion is a master, execute a salt command

CLI Example:

```
salt '*' saltutil.cmd
```

`salt.modules.saltutil.`**`cmd_iter`**`(`*tgt, fun, arg=(), timeout=None, tgt_type='glob', ret='', kwarg=None, ssh=False, **kwargs*`)`

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Assuming this minion is a master, execute a salt command

CLI Example:

```
salt '*' saltutil.cmd_iter
```

`salt.modules.saltutil.`**`find_cached_job`**`(`*jid*`)`

Return the data for a specific cached job id. Note this only works if cache_jobs has previously been set to True on the minion.

CLI Example:

```
salt '*' saltutil.find_cached_job <job id>
```

`salt.modules.saltutil.`**`find_job`**`(`*jid*`)`

Return the data for a specific job id that is currently running.

jid
The job id to search for and return data.

CLI Example:

```
salt '*' saltutil.find_job <job id>
```

Note that the find_job function only returns job information when the job is still running. If the job is currently running, the output looks something like this:

```
# salt my-minion saltutil.find_job 20160503150049487736
my-minion:
    ----------
    arg:
        - 30
    fun:
        test.sleep
    jid:
        20160503150049487736
    pid:
        9601
    ret:
    tgt:
        my-minion
    tgt_type:
        glob
    user:
        root
```

If the job has already completed, the job cannot be found and therefore the function returns an empty dictionary, which looks like this on the CLI:

```
# salt my-minion saltutil.find_job 20160503150049487736
my-minion:
    ----------
```

`salt.modules.saltutil.`**`is_running`**`(`*fun*`)`

If the named function is running return the data associated with it/them. The argument can be a glob

CLI Example:

```
salt '*' saltutil.is_running state.highstate
```

`salt.modules.saltutil.`**`kill_all_jobs`**`()`

Sends a kill signal (SIGKILL 9) to all currently running jobs

CLI Example:

```
salt '*' saltutil.kill_all_jobs
```

`salt.modules.saltutil.`**`kill_job`**`(`*jid*`)`

Sends a kill signal (SIGKILL 9) to the named salt job's process

CLI Example:

```
salt '*' saltutil.kill_job <job id>
```

`salt.modules.saltutil.`**`list_extmods`**`()`

New in version 2017.7.0.

List Salt modules which have been synced externally

CLI Examples:

```
salt '*' saltutil.list_extmods
```

`salt.modules.saltutil.`**`mmodule`**`(`*saltenv, fun, *args, **kwargs*`)`

Loads minion modules from an environment so that they can be used in pillars for that environment

CLI Example:

```
salt '*' saltutil.mmodule base test.ping
```

`salt.modules.saltutil.`**`pillar_refresh`**`(`*wait=False, timeout=30, clean_cache=True*`)`

This function is an alias of `refresh_pillar`.

Signal the minion to refresh the in-memory pillar data. See *In-Memory Pillar Data vs. On-Demand Pillar Data*.

param wait
Wait for pillar refresh to complete, defaults to False.

type wait
bool, optional

param timeout
How long to wait in seconds, only used when wait is True, defaults to 30.

type timeout
int, optional

param clean_cache
Clean the pillar cache, only used when *pillar_cache* is True. Defaults to True

type clean_cache
bool, optional .. versionadded:: 3005

return
Boolean status, True when the pillar_refresh event was fired successfully.

CLI Example:

```
salt '*' saltutil.refresh_pillar
salt '*' saltutil.refresh_pillar wait=True timeout=60
```

`salt.modules.saltutil.`**`refresh_beacons`**`()`

Signal the minion to refresh the beacons.

CLI Example:

```
salt '*' saltutil.refresh_beacons
```

`salt.modules.saltutil.`**`refresh_grains`**`(`***kwargs*`)`

New in version 2016.3.6,2016.11.4,2017.7.0.

Refresh the minion's grains without syncing custom grains modules from `salt://_grains`.

Note: The available execution modules will be reloaded as part of this proceess, as grains can affect which modules are available.

refresh_pillar
[True] Set to `False` to keep pillar data from being refreshed.

clean_pillar_cache
[False] Set to `True` to refresh pillar cache.

CLI Examples:

```
salt '*' saltutil.refresh_grains
```

`salt.modules.saltutil.`**`refresh_matchers`**`()`

Signal the minion to refresh its matchers.

CLI Example:

```
salt '*' saltutil.refresh_matchers
```

`salt.modules.saltutil.`**`refresh_modules`**`(`***kwargs*`)`

Signal the minion to refresh the module and grain data

The default is to refresh module asynchronously. To block until the module refresh is complete, set the 'async' flag to False.

CLI Example:

```
salt '*' saltutil.refresh_modules
```

`salt.modules.saltutil.`**`refresh_pillar`**`(`*wait=False, timeout=30, clean_cache=True*`)`

Signal the minion to refresh the in-memory pillar data. See *In-Memory Pillar Data vs. On-Demand Pillar Data*.

Parameters

- **`wait`** (*`bool, optional`*) -- Wait for pillar refresh to complete, defaults to False.
- **`timeout`** (*`int, optional`*) -- How long to wait in seconds, only used when wait is True, defaults to 30.
- **`clean_cache`** (*`bool, optional .. versionadded:: 3005`*) -- Clean the pillar cache, only used when *pillar_cache* is True. Defaults to True

Returns

Boolean status, True when the pillar_refresh event was fired successfully.

CLI Example:

```
salt '*' saltutil.refresh_pillar
salt '*' saltutil.refresh_pillar wait=True timeout=60
```

`salt.modules.saltutil.`**`regen_keys`**`()`

Used to regenerate the minion keys.

CLI Example:

```
salt '*' saltutil.regen_keys
```

`salt.modules.saltutil.`**`revoke_auth`**`(`*preserve_minion_cache=False*`)`

The minion sends a request to the master to revoke its own key. Note that the minion session will be revoked and the minion may not be able to return the result of this command back to the master.

If the 'preserve_minion_cache' flag is set to True, the master cache for this minion will not be removed.

CLI Example:

```
salt '*' saltutil.revoke_auth
```

`salt.modules.saltutil.`**`runner`**`(`*name, arg=None, kwarg=None, full_return=False, saltenv='base', jid=None, **kwargs*`)`

Execute a runner function. This function must be run on the master, either by targeting a minion running on a master or by using salt-call on a master.

New in version 2014.7.0.

name

The name of the function to run

kwargs
Any keyword arguments to pass to the runner function

CLI Example:

In this example, assume that *master_minion* is a minion running on a master.

```
salt master_minion saltutil.runner jobs.list_jobs
salt master_minion saltutil.runner test.arg arg="['baz']" kwarg="{'foo':
↪'bar'}"
```

`salt.modules.saltutil.`**`running`**`()`

Return the data on all running salt processes on the minion

CLI Example:

```
salt '*' saltutil.running
```

`salt.modules.saltutil.`**`signal_job`**`(`*jid*, *sig*`)`

Sends a signal to the named salt job's process

CLI Example:

```
salt '*' saltutil.signal_job <job id> 15
```

`salt.modules.saltutil.`**`sync_all`**`(`*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*, *clean_pillar_cache=False*`)`

Changed in version 3007.0: On masterless minions, master top modules are now synced as well. When `refresh` is set to `True`, this module's cache containing the environments from which extension modules are synced when `saltenv` is not specified will be refreshed.

Changed in version 2015.8.11,2016.3.2: On masterless minions, pillar modules are now synced, and refreshed when `refresh` is set to `True`.

Sync down all of the dynamic modules from the file server for a specific environment. This function synchronizes custom modules, states, beacons, grains, returners, output modules, renderers, and utils.

refresh
[True] Also refresh the execution modules and recompile pillar data available to the minion. If this is a masterless minion, also refresh the environments from which extension modules are synced after syncing master tops. This refresh will be performed even if no new dynamic modules are synced. Set to `False` to prevent this refresh.

Important: If this function is executed using a *`module.run`* state, the SLS file will not have access to newly synced execution modules unless a `refresh` argument is added to the state, like so:

```
load_my_custom_module:
  module.run:
    - name: saltutil.sync_all
    - refresh: True
```

See *here* for a more detailed explanation of why this is necessary.

---

extmod_whitelist
[None] dictionary of modules to sync based on type

extmod_blacklist
[None] dictionary of modules to blacklist based on type

clean_pillar_cache
[False] Set to `True` to refresh pillar cache.

CLI Examples:

```
salt '*' saltutil.sync_all
salt '*' saltutil.sync_all saltenv=dev
salt '*' saltutil.sync_all saltenv=base,dev
salt '*' saltutil.sync_all extmod_whitelist={'modules': ['custom_module']}
```

`salt.modules.saltutil.`**`sync_beacons`**(*saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None*)

New in version 2015.5.1.

Sync beacons from `salt://_beacons` to the minion

saltenv
The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for beacons to sync. If no top files are found, then the `base` environment will be synced.

refresh
[True] If `True`, refresh the available beacons on the minion. This refresh will be performed even if no new beacons are synced. Set to `False` to prevent this refresh.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt '*' saltutil.sync_beacons
salt '*' saltutil.sync_beacons saltenv=dev
salt '*' saltutil.sync_beacons saltenv=base,dev
```

`salt.modules.saltutil.`**`sync_clouds`**(*saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None*)

New in version 2017.7.0.

Sync cloud modules from `salt://_cloud` to the minion

saltenv
[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

refresh
[True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new utility modules are synced. Set to `False` to prevent this refresh.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_clouds
salt '*' saltutil.sync_clouds saltenv=dev
salt '*' saltutil.sync_clouds saltenv=base,dev
```

`salt.modules.saltutil.`**`sync_engines`**(*saltenv=None, refresh=False, extmod_whitelist=None, extmod_blacklist=None*)

New in version 2016.3.0.

Sync engine modules from `salt://_engines` to the minion

saltenv
The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for engines to sync. If no top files are found, then the `base` environment will be synced.

refresh
[True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new engine modules are synced. Set to `False` to prevent this refresh.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_engines
salt '*' saltutil.sync_engines saltenv=base,dev
```

`salt.modules.saltutil.`**`sync_executors`**`(`*saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None*`)`

New in version 3000.

Sync executors from `salt://_executors` to the minion

saltenv
The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for log handlers to sync. If no top files are found, then the `base` environment will be synced.

refresh
[True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new log handlers are synced. Set to `False` to prevent this refresh.

extmod_whitelist
[None] comma-seperated list of modules to sync

extmod_blacklist
[None] comma-seperated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_executors
salt '*' saltutil.sync_executors saltenv=dev
salt '*' saltutil.sync_executors saltenv=base,dev
```

`salt.modules.saltutil.`**`sync_grains`**`(`*saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None, clean_pillar_cache=False*`)`

New in version 0.10.0.

Sync grains modules from `salt://_grains` to the minion

saltenv
The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for grains modules to sync. If no top files are found, then the `base` environment will be synced.

refresh
[True] If `True`, refresh the available execution modules and recompile pillar data for the minion. This refresh will be performed even if no new grains modules are synced. Set to `False` to prevent this refresh.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

clean_pillar_cache
[False] Set to `True` to refresh pillar cache.

CLI Examples:

```
salt '*' saltutil.sync_grains
salt '*' saltutil.sync_grains saltenv=dev
salt '*' saltutil.sync_grains saltenv=base,dev
```

`salt.modules.saltutil.`**`sync_log_handlers`**(*saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None*)

New in version 2015.8.0.

Sync log handlers from `salt://_log_handlers` to the minion

saltenv
The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for log handlers to sync. If no top files are found, then the `base` environment will be synced.

refresh
[True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new log handlers are synced. Set to `False` to prevent this refresh.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_log_handlers
salt '*' saltutil.sync_log_handlers saltenv=dev
salt '*' saltutil.sync_log_handlers saltenv=base,dev
```

`salt.modules.saltutil.`**`sync_matchers`**(*saltenv=None, refresh=False, extmod_whitelist=None, extmod_blacklist=None*)

New in version 2019.2.0.

Sync engine modules from `salt://_matchers` to the minion

saltenv
The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for engines to sync. If no top files are found, then the `base` environment will be synced.

refresh
[True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new matcher modules are synced. Set to `False` to prevent this refresh.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_matchers
salt '*' saltutil.sync_matchers saltenv=base,dev
```

salt.modules.saltutil.**sync_modules**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 0.10.0.

Sync execution modules from `salt://_modules` to the minion

saltenv
The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for execution modules to sync. If no top files are found, then the `base` environment will be synced.

refresh
[True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new execution modules are synced. Set to `False` to prevent this refresh.

Important: If this function is executed using a *`module.run`* state, the SLS file will not have access to newly synced execution modules unless a `refresh` argument is added to the state, like so:

```
load_my_custom_module:
  module.run:
    - name: saltutil.sync_modules
    - refresh: True
```

See *here* for a more detailed explanation of why this is necessary.

---

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt '*' saltutil.sync_modules
salt '*' saltutil.sync_modules saltenv=dev
salt '*' saltutil.sync_modules saltenv=base,dev
```

salt.modules.saltutil.**sync_output**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

Sync outputters from `salt://_output` to the minion

saltenv
The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for outputters to sync. If no top files are found, then the `base` environment will be synced.

refresh
[True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to `False` to prevent this refresh.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_output
salt '*' saltutil.sync_output saltenv=dev
salt '*' saltutil.sync_output saltenv=base,dev
```

`salt.modules.saltutil.`**`sync_outputters`**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

This function is an alias of `sync_output`.

Sync outputters from `salt://_output` to the minion

saltenv
The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for outputters to sync. If no top files are found, then the `base` environment will be synced.

refresh
[True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to `False` to prevent this refresh.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_output
salt '*' saltutil.sync_output saltenv=dev
salt '*' saltutil.sync_output saltenv=base,dev
```

`salt.modules.saltutil.`**`sync_pillar`**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*, *clean_pillar_cache=False*)

New in version 2015.8.11,2016.3.2.

Sync pillar modules from the `salt://_pillar` directory on the Salt fileserver. This function is environment-aware, pass the desired environment to grab the contents of the `_pillar` directory from that environment. The default environment, if none is specified, is `base`.

refresh
[True] Also refresh the execution modules available to the minion, and refresh pillar data.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

clean_pillar_cache
[False] Set to `True` to refresh pillar cache.

Note: This function will raise an error if executed on a traditional (i.e. not masterless) minion

---

CLI Examples:

```
salt '*' saltutil.sync_pillar
salt '*' saltutil.sync_pillar saltenv=dev
```

`salt.modules.saltutil.`**`sync_proxymodules`**(*saltenv=None*, *refresh=False*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2015.8.2.

Sync proxy modules from `salt://_proxy` to the minion

saltenv

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for proxy modules to sync. If no top files are found, then the `base` environment will be synced.

refresh

[True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new proxy modules are synced. Set to `False` to prevent this refresh.

extmod_whitelist

[None] comma-separated list of modules to sync

extmod_blacklist

[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_proxymodules
salt '*' saltutil.sync_proxymodules saltenv=dev
salt '*' saltutil.sync_proxymodules saltenv=base,dev
```

`salt.modules.saltutil.`**`sync_renderers`**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 0.10.0.

Sync renderers from `salt://_renderers` to the minion

saltenv

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for renderers to sync. If no top files are found, then the `base` environment will be synced.

refresh

[True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new renderers are synced. Set to `False` to prevent this refresh.

extmod_whitelist

[None] comma-separated list of modules to sync

extmod_blacklist

[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_renderers
salt '*' saltutil.sync_renderers saltenv=dev
salt '*' saltutil.sync_renderers saltenv=base,dev
```

`salt.modules.saltutil.`**`sync_returners`**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 0.10.0.

Sync returners from `salt://_returners` to the minion

saltenv
The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for returners to sync. If no top files are found, then the `base` environment will be synced.

refresh
[True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new returners are synced. Set to `False` to prevent this refresh.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_returners
salt '*' saltutil.sync_returners saltenv=dev
```

`salt.modules.saltutil.`**`sync_sdb`**(*saltenv=None*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2015.5.8,2015.8.3.

Sync sdb modules from `salt://_sdb` to the minion

saltenv
The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for sdb modules to sync. If no top files are found, then the `base` environment will be synced.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt '*' saltutil.sync_sdb
salt '*' saltutil.sync_sdb saltenv=dev
salt '*' saltutil.sync_sdb saltenv=base,dev
```

`salt.modules.saltutil.`**`sync_serializers`**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2019.2.0.

Sync serializers from `salt://_serializers` to the minion

saltenv
The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for serializer modules to sync. If no top files are found, then the `base` environment will be synced.

refresh
[True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new serializer modules are synced. Set to `False` to prevent this refresh.

extmod_whitelist
[None] comma-seperated list of modules to sync

extmod_blacklist
[None] comma-seperated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_serializers
salt '*' saltutil.sync_serializers saltenv=dev
salt '*' saltutil.sync_serializers saltenv=base,dev
```

`salt.modules.saltutil.`**`sync_states`**`(`*saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None*`)`

New in version 0.10.0.

Sync state modules from `salt://_states` to the minion

saltenv

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for state modules to sync. If no top files are found, then the `base` environment will be synced.

refresh

[True] If `True`, refresh the available states on the minion. This refresh will be performed even if no new state modules are synced. Set to `False` to prevent this refresh.

extmod_whitelist

[None] comma-separated list of modules to sync

extmod_blacklist

[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_states
salt '*' saltutil.sync_states saltenv=dev
salt '*' saltutil.sync_states saltenv=base,dev
```

`salt.modules.saltutil.`**`sync_thorium`**`(`*saltenv=None, refresh=False, extmod_whitelist=None, extmod_blacklist=None*`)`

New in version 2018.3.0.

Sync Thorium modules from `salt://_thorium` to the minion

saltenv

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for engines to sync. If no top files are found, then the `base` environment will be synced.

refresh: `True`

If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new Thorium modules are synced. Set to `False` to prevent this refresh.

extmod_whitelist

comma-separated list of modules to sync

extmod_blacklist

comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_thorium
salt '*' saltutil.sync_thorium saltenv=base,dev
```

`salt.modules.saltutil.`**`sync_tops`**`(`*saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None*`)`

New in version 3007.0.

Sync master tops from `salt://_tops` to the minion.

saltenv
: The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

  If not passed, then all environments configured in the *top files* will be checked for master tops to sync. If no top files are found, then the `base` environment will be synced.

refresh
: [True] Refresh this module's cache containing the environments from which extension modules are synced when `saltenv` is not specified. This refresh will be performed even if no new master tops are synced. Set to `False` to prevent this refresh.

extmod_whitelist
: [None] comma-separated list of modules to sync

extmod_blacklist
: [None] comma-separated list of modules to blacklist based on type

---

Note: This function will raise an error if executed on a traditional (i.e. not masterless) minion

---

CLI Examples:

```
salt '*' saltutil.sync_tops
salt '*' saltutil.sync_tops saltenv=dev
```

`salt.modules.saltutil.`**`sync_utils`**`(`*saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None*`)`

New in version 2014.7.0.

Sync utility modules from `salt://_utils` to the minion

saltenv
: The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

  If not passed, then all environments configured in the *top files* will be checked for utility modules to sync. If no top files are found, then the `base` environment will be synced.

refresh
: [True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new utility modules are synced. Set to `False` to prevent this refresh.

extmod_whitelist
: [None] comma-separated list of modules to sync

extmod_blacklist
: [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_utils
salt '*' saltutil.sync_utils saltenv=dev
salt '*' saltutil.sync_utils saltenv=base,dev
```

`salt.modules.saltutil.`**`sync_wrapper`**`(`*saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None*`)`

New in version 3007.0.

Sync salt-ssh wrapper modules from `salt://_wrapper` to the minion.

saltenv
: The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for wrappers to sync. If no top files are found, then the `base` environment will be synced.

refresh
[True] If `True`, refresh the available wrapper modules on the minion. This refresh will be performed even if no wrappers are synced. Set to `False` to prevent this refresh.

extmod_whitelist
[None] comma-seperated list of modules to sync

extmod_blacklist
[None] comma-seperated list of modules to blacklist based on type

---

Note: This function will raise an error if executed on a traditional (i.e. not masterless) minion.

CLI Examples:

```
salt '*' saltutil.sync_wrapper
salt '*' saltutil.sync_wrapper saltenv=dev
salt '*' saltutil.sync_wrapper saltenv=base,dev
```

`salt.modules.saltutil.`**`term_all_jobs`**`()`

Sends a termination signal (SIGTERM 15) to all currently running jobs

CLI Example:

```
salt '*' saltutil.term_all_jobs
```

`salt.modules.saltutil.`**`term_job`**`(`*jid*`)`

Sends a termination signal (SIGTERM 15) to the named salt job's process

CLI Example:

```
salt '*' saltutil.term_job <job id>
```

`salt.modules.saltutil.`**`update`**`(`*version=None*`)`

Update the salt minion from the URL defined in opts['update_url'] Broadcom, Inc provides the latest builds here: update_url: https://packages.broadcom.com/artifactory/saltproject-generic/windows/

Be aware that as of 2014-8-11 there's a bug in esky such that only the latest version available in the update_url can be downloaded and installed.

This feature requires the minion to be running a bdist_esky build.

The version number is optional and will default to the most recent version available at opts['update_url'].

Returns details about the transaction upon completion.

CLI Examples:

```
salt '*' saltutil.update
salt '*' saltutil.update 0.10.3
```

`salt.modules.saltutil.`**`wheel`**`(`*name, *args, **kwargs*`)`

Execute a wheel module and function. This function must be run against a minion that is local to the master.

New in version 2014.7.0.

name
The name of the function to run

args

Any positional arguments to pass to the wheel function. A common example of this would be the `match` arg needed for key functions.

New in version 2015.8.11.

kwargs

Any keyword arguments to pass to the wheel function

CLI Example:

```
salt my-local-minion saltutil.wheel key.accept jerry
salt my-local-minion saltutil.wheel minions.connected
```

Note: Since this function must be run against a minion that is running locally on the master in order to get accurate returns, if this function is run against minions that are not local to the master, "empty" returns are expected. The remote minion does not have access to wheel functions and their return data.

26.6.177 salt.modules.schedule

Module for managing the Salt schedule on a minion

Requires that python-dateutil is installed on the minion.

New in version 2014.7.0.

`salt.modules.schedule.`**`add`**(*name*, ***kwargs*)

Add a job to the schedule

CLI Example:

```
salt '*' schedule.add job1 function='test.ping' seconds=3600
# If function have some arguments, use job_args
salt '*' schedule.add job2 function='cmd.run' job_args="['date >> /tmp/
↪date.log']" seconds=60

# Add job to Salt minion when the Salt minion is not running
salt '*' schedule.add job1 function='test.ping' seconds=3600 offline=True
```

`salt.modules.schedule.`**`build_schedule_item`**(*name*, ***kwargs*)

Build a schedule job

CLI Example:

```
salt '*' schedule.build_schedule_item job1 function='test.ping'
↪seconds=3600
```

`salt.modules.schedule.`**`copy`**(*name*, *target*, ***kwargs*)

Copy scheduled job to another minion or minions.

CLI Example:

```
salt '*' schedule.copy jobname target
```

`salt.modules.schedule.`**`delete`**`(`*name*, ***kwargs*`)`

Delete a job from the minion's schedule

CLI Example:

```
salt '*' schedule.delete job1

# Delete job on Salt minion when the Salt minion is not running
salt '*' schedule.delete job1
```

`salt.modules.schedule.`**`disable`**`(`***kwargs*`)`

Disable all scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.disable
```

`salt.modules.schedule.`**`disable_job`**`(`*name*, ***kwargs*`)`

Disable a job in the minion's schedule

CLI Example:

```
salt '*' schedule.disable_job job1
```

`salt.modules.schedule.`**`enable`**`(`***kwargs*`)`

Enable all scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.enable
```

`salt.modules.schedule.`**`enable_job`**`(`*name*, ***kwargs*`)`

Enable a job in the minion's schedule

CLI Example:

```
salt '*' schedule.enable_job job1
```

`salt.modules.schedule.`**`is_enabled`**`(`*name=None*`)`

List a Job only if its enabled

If job is not specified, indicate if the scheduler is enabled or disabled.

New in version 2015.5.3.

CLI Example:

```
salt '*' schedule.is_enabled name=job_name
salt '*' schedule.is_enabled
```

`salt.modules.schedule.`**`job_status`**`(`*name*, *time_fmt='%Y-%m-%dT%H:%M:%S'*`)`

Show the information for a particular job.

CLI Example:

```
salt '*' schedule.job_status job_name
```

`salt.modules.schedule.`**`list_`**(*show_all=False*, *show_disabled=True*, *where=None*, *return_yaml=True*, *offline=False*)

List the jobs currently scheduled on the minion

CLI Example:

```
salt '*' schedule.list

# Show all jobs including hidden internal jobs
salt '*' schedule.list show_all=True

# Hide disabled jobs from list of jobs
salt '*' schedule.list show_disabled=False
```

`salt.modules.schedule.`**`modify`**(*name*, ***kwargs*)

Modify an existing job in the schedule

CLI Example:

```
salt '*' schedule.modify job1 function='test.ping' seconds=3600

# Modify job on Salt minion when the Salt minion is not running
salt '*' schedule.modify job1 function='test.ping' seconds=3600⊠
↪offline=True
```

`salt.modules.schedule.`**`move`**(*name*, *target*, ***kwargs*)

Move scheduled job to another minion or minions.

CLI Example:

```
salt '*' schedule.move jobname target
```

`salt.modules.schedule.`**`postpone_job`**(*name*, *current_time*, *new_time*, ***kwargs*)

Postpone a job in the minion's schedule

Current time and new time should be in date string format, default value is %Y-%m-%dT%H:%M:%S.

New in version 2018.3.0.

CLI Example:

```
salt '*' schedule.postpone_job job current_time new_time

salt '*' schedule.postpone_job job current_time new_time time_fmt='%Y-%m-
↪%dT%H:%M:%S'
```

`salt.modules.schedule.`**`purge`**(***kwargs*)

Purge all the jobs currently scheduled on the minion

CLI Example:

```
salt '*' schedule.purge

# Purge jobs on Salt minion
salt '*' schedule.purge
```

`salt.modules.schedule.`**`reload_`**`()`

Reload saved scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.reload
```

`salt.modules.schedule.`**`run_job`**`(`*name*, *force=False*`)`

Run a scheduled job on the minion immediately

CLI Example:

```
salt '*' schedule.run_job job1

salt '*' schedule.run_job job1 force=True
Force the job to run even if it is disabled.
```

`salt.modules.schedule.`**`save`**`(`***kwargs*`)`

Save all scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.save
```

`salt.modules.schedule.`**`show_next_fire_time`**`(`*name*, ***kwargs*`)`

Show the next fire time for scheduled job

New in version 2018.3.0.

CLI Example:

```
salt '*' schedule.show_next_fire_time job_name
```

`salt.modules.schedule.`**`skip_job`**`(`*name*, *current_time*, ***kwargs*`)`

Skip a job in the minion's schedule at specified time.

Time to skip should be specified as date string format, default value is %Y-%m-%dT%H:%M:%S.

New in version 2018.3.0.

CLI Example:

```
salt '*' schedule.skip_job job time
```

26.6.178 salt.modules.scp

SCP Module

New in version 2019.2.0.

Module to copy files via SCP

`salt.modules.scp_mod.`**`get`**`(`*remote_path*, *local_path=''*, *recursive=False*, *preserve_times=False*, ***kwargs*`)`

Transfer files and directories from remote host to the localhost of the Minion.

remote_path

Path to retrieve from remote host. Since this is evaluated by scp on the remote host, shell wildcards and environment variables may be used.

recursive: **`False`**
: Transfer files and directories recursively.

preserve_times: **`False`**
: Preserve `mtime` and `atime` of transferred files and directories.

hostname
: The hostname of the remote device.

port: **`22`**
: The port of the remote device.

username
: The username required for SSH authentication on the device.

password
: Used for password authentication. It is also used for private key decryption if `passphrase` is not given.

passphrase
: Used for decrypting private keys.

pkey
: An optional private key to use for authentication.

key_filename
: The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.

timeout
: An optional timeout (in seconds) for the TCP connect.

socket_timeout: **`10`**
: The channel socket timeout in seconds.

buff_size: **`16384`**
: The size of the SCP send buffer.

allow_agent: **`True`**
: Set to `False` to disable connecting to the SSH agent.

look_for_keys: **`True`**
: Set to `False` to disable searching for discoverable private key files in `~/.ssh/`

banner_timeout
: An optional timeout (in seconds) to wait for the SSH banner to be presented.

auth_timeout
: An optional timeout (in seconds) to wait for an authentication response.

auto_add_policy: **`False`**
: Automatically add the host to the `known_hosts`.

CLI Example:

```
salt '*' scp.get /var/tmp/file /tmp/file hostname=10.10.10.1 auto_add_
↪policy=True
```

`salt.modules.scp_mod.`**`put`**(*files*, *remote_path=None*, *recursive=False*, *preserve_times=False*, *saltenv='base'*, ***kwargs*)

Transfer files and directories to remote host.

files
: A single path or a list of paths to be transferred.

remote_path
: The path on the remote device where to store the files.

recursive: **`True`**
: Transfer files and directories recursively.

preserve_times: **`False`**
: Preserve `mtime` and `atime` of transferred files and directories.

hostname
: The hostname of the remote device.

port: **`22`**

The port of the remote device.

username
The username required for SSH authentication on the device.

password
Used for password authentication. It is also used for private key decryption if `passphrase` is not given.

passphrase
Used for decrypting private keys.

pkey
An optional private key to use for authentication.

key_filename
The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.

timeout
An optional timeout (in seconds) for the TCP connect.

socket_timeout: **`10`**
The channel socket timeout in seconds.

buff_size: **`16384`**
The size of the SCP send buffer.

allow_agent: **`True`**
Set to `False` to disable connecting to the SSH agent.

look_for_keys: **`True`**
Set to `False` to disable searching for discoverable private key files in `~/.ssh/`

banner_timeout
An optional timeout (in seconds) to wait for the SSH banner to be presented.

auth_timeout
An optional timeout (in seconds) to wait for an authentication response.

auto_add_policy: **`False`**
Automatically add the host to the `known_hosts`.

CLI Example:

```
salt '*' scp.put /path/to/file /var/tmp/file hostname=server1 auto_add_
↪policy=True
```

26.6.179 salt.modules.scsi

SCSI administration module

`salt.modules.scsi.`**`ls_`**(*get_size=True*)

List SCSI devices, with details

CLI Examples:

```
salt '*' scsi.ls
salt '*' scsi.ls get_size=False
```

get_size
[True] Get the size information for scsi devices. This option should be set to False for older OS distributions (RHEL6 and older) due to lack of support for the '-s' option in lsscsi.

New in version 2015.5.10.

`salt.modules.scsi.`**`rescan_all`**(*host*)

List scsi devices

CLI Example:

```
salt '*' scsi.rescan_all 0
```

26.6.180 salt.modules.sdb

Module for Manipulating Data via the Salt DB API

`salt.modules.sdb.`**`delete`**`(`*uri*`)`

Delete a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully deleted, return `False`.

CLI Example:

```
salt '*' sdb.delete sdb://mymemcached/foo
```

`salt.modules.sdb.`**`get`**`(`*uri, strict=False*`)`

Get a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided is not valid, then it will be returned as-is, unless `strict=True` was passed.

CLI Example:

```
salt '*' sdb.get sdb://mymemcached/foo strict=True
```

`salt.modules.sdb.`**`get_or_set_hash`**`(`*uri, length=8, chars='abcdefghijklmnopqrstuvwxyz0123456789!@#$%^&*(-_=+)'*`)`

Perform a one-time generation of a hash and write it to sdb. If that value has already been set return the value instead.

This is useful for generating passwords or keys that are specific to multiple minions that need to be stored somewhere centrally.

State Example:

```
some_mysql_user:
  mysql_user:
    - present
    - host: localhost
    - password: '{{ salt["sdb.get_or_set_hash"]("sdb://mymemcached/some_
↪user_pass") }}'
```

CLI Example:

```
salt '*' sdb.get_or_set_hash 'sdb://mymemcached/SECRET_KEY' 50
```

> **Warning:** This function could return strings which may contain characters which are reserved as directives by the YAML parser, such as strings beginning with %. To avoid issues when using the output of this function in an SLS file containing YAML+Jinja, surround the call with single quotes.

`salt.modules.sdb.`**`set_`**`(`*uri, value*`)`

Set a value in a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully set, return `False`.

CLI Example:

```
salt '*' sdb.set sdb://mymemcached/foo bar
```

26.6.181 salt.modules.seed

Virtual machine image management tools

`salt.modules.seed.`**`apply_`**`(`*path, id_=None, config=None, approve_key=True, install=True, prep_install=False, pub_key=None, priv_key=None, mount_point=None*`)`

Seed a location (disk image, directory, or block device) with the minion config, approve the minion's key, and/or install salt-minion.

CLI Example:

```
salt 'minion' seed.apply path id [config=config_data] \
        [gen_key=(true|false)] [approve_key=(true|false)] \
        [install=(true|false)]
```

path
Full path to the directory, device, or disk image on the target minion's file system.

id
Minion id with which to seed the path.

config
Minion configuration options. By default, the 'master' option is set to the target host's 'master'.

approve_key
Request a pre-approval of the generated minion key. Requires that the salt-master be configured to either auto-accept all keys or expect a signing request from the target host. Default: true.

install
Install salt-minion, if absent. Default: true.

prep_install
Prepare the bootstrap script, but don't run it. Default: false

`salt.modules.seed.`**`mkconfig`**`(`*config=None, tmp=None, id_=None, approve_key=True, pub_key=None, priv_key=None*`)`

Generate keys and config and put them in a tmp directory.

pub_key
absolute path or file content of an optional preseeded salt key

priv_key
absolute path or file content of an optional preseeded salt key

CLI Example:

```
salt 'minion' seed.mkconfig [config=config_data] [tmp=tmp_dir] \
        [id_=minion_id] [approve_key=(true|false)]
```

`salt.modules.seed.`**`prep_bootstrap`**`(`*mpt*`)`

Update and get the random script to a random place

CLI Example:

```
salt '*' seed.prep_bootstrap /tmp
```

26.6.182 salt.modules.selinux

Execute calls on selinux

Note: This module requires the `semanage`, `setsebool`, and `semodule` commands to be available on the minion. On RHEL-based distributions, ensure that the `policycoreutils` and `policycoreutils-python` packages are installed. If not on a Fedora or RHEL-based distribution, consult the selinux documentation for your distribution to ensure that the proper packages are installed.

`salt.modules.selinux.`**`fcontext_add_policy`**(*name*, *filetype=None*, *sel_type=None*, *sel_user=None*, *sel_level=None*)

New in version 2019.2.0.

Adds the SELinux policy for a given filespec and other optional parameters.

Returns the result of the call to semanage.

Note that you don't have to remove an entry before setting a new one for a given filespec and filetype, as adding one with semanage automatically overwrites a previously configured SELinux context.

name
filespec of the file or directory. Regex syntax is allowed.

file_type
The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also `man semanage-fcontext`. Defaults to 'a' (all files).

sel_type
SELinux context type. There are many.

sel_user
SELinux user. Use `semanage login -l` to determine which ones are available to you.

sel_level
The MLS range of the SELinux context.

CLI Example:

```
salt '*' selinux.fcontext_add_policy my-policy
```

`salt.modules.selinux.`**`fcontext_apply_policy`**(*name*, *recursive=False*)

New in version 2017.7.0.

Applies SElinux policies to filespec using *restorecon [-R] filespec*. Returns dict with changes if successful, the output of the restorecon command otherwise.

name
filespec of the file or directory. Regex syntax is allowed.

recursive
Recursively apply SELinux policies.

CLI Example:

```
salt '*' selinux.fcontext_apply_policy my-policy
```

`salt.modules.selinux.`**`fcontext_delete_policy`**(*name*, *filetype=None*, *sel_type=None*, *sel_user=None*, *sel_level=None*)

New in version 2019.2.0.

Deletes the SELinux policy for a given filespec and other optional parameters.

Returns the result of the call to semanage.

Note that you don't have to remove an entry before setting a new one for a given filespec and filetype, as adding one with semanage automatically overwrites a previously configured SELinux context.

name
filespec of the file or directory. Regex syntax is allowed.

file_type
The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also `man semanage-fcontext`. Defaults to 'a' (all files).

sel_type
SELinux context type. There are many.

sel_user
SELinux user. Use `semanage login -l` to determine which ones are available to you.

sel_level
The MLS range of the SELinux context.

CLI Example:

```
salt '*' selinux.fcontext_delete_policy my-policy
```

`salt.modules.selinux.`**`fcontext_get_policy`**`(`*name, filetype=None, sel_type=None, sel_user=None, sel_level=None*`)`

New in version 2017.7.0.

Returns the current entry in the SELinux policy list as a dictionary. Returns None if no exact match was found.

Returned keys are:

- filespec (the name supplied and matched)
- filetype (the descriptive name of the filetype supplied)
- sel_user, sel_role, sel_type, sel_level (the selinux context)

For a more in-depth explanation of the selinux context, go to https://access.redhat.com/documentation/en-US/Red_Hat_Enterprise_Linux/6/html/Security-Enhanced_Linux/chap-Security-Enhanced_Linux-SELinux_Contexts.html

name
filespec of the file or directory. Regex syntax is allowed.

filetype
The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also *man semanage-fcontext*. Defaults to 'a' (all files).

CLI Example:

```
salt '*' selinux.fcontext_get_policy my-policy
```

`salt.modules.selinux.`**`fcontext_policy_is_applied`**`(`*name, recursive=False*`)`

New in version 2017.7.0.

Returns an empty string if the SELinux policy for a given filespec is applied, returns string with differences in policy and actual situation otherwise.

name
filespec of the file or directory. Regex syntax is allowed.

CLI Example:

```
salt '*' selinux.fcontext_policy_is_applied my-policy
```

`salt.modules.selinux.`**`filetype_id_to_string`**`(`*filetype='a'*`)`

New in version 2017.7.0.

Translates SELinux filetype single-letter representation to a more human-readable version (which is also used in *semanage fcontext -l*).

`salt.modules.selinux.`**`getconfig`**`()`

Return the selinux mode from the config file

CLI Example:

```
salt '*' selinux.getconfig
```

`salt.modules.selinux.`**`getenforce`**`()`

Return the mode selinux is running in

CLI Example:

```
salt '*' selinux.getenforce
```

`salt.modules.selinux.`**`getsebool`**`(`*boolean*`)`

Return the information on a specific selinux boolean

CLI Example:

```
salt '*' selinux.getsebool virt_use_usb
```

`salt.modules.selinux.`**`getsemod`**`(`*module*`)`

Return the information on a specific selinux module

CLI Example:

```
salt '*' selinux.getsemod mysql
```

New in version 2016.3.0.

`salt.modules.selinux.`**`install_semod`**`(`*module_path*`)`

Install custom SELinux module from file

CLI Example:

```
salt '*' selinux.install_semod [salt://]path/to/module.pp
```

New in version 2016.11.6.

`salt.modules.selinux.`**`list_sebool`**`()`

Return a structure listing all of the selinux booleans on the system and what state they are in

CLI Example:

```
salt '*' selinux.list_sebool
```

`salt.modules.selinux.`**`list_semod`**`()`

Return a structure listing all of the selinux modules on the system and what state they are in

CLI Example:

```
salt '*' selinux.list_semod
```

New in version 2016.3.0.

`salt.modules.selinux.`**`port_add_policy`**`(`*name, sel_type=None, protocol=None, port=None, sel_range=None*`)`

New in version 2019.2.0.

Adds the SELinux policy for a given protocol and port.

Returns the result of the call to semanage.

name
The protocol and port spec. Can be formatted as `(tcp|udp)/(port|port-range)`.

sel_type
The SELinux Type. Required.

protocol
The protocol for the port, `tcp` or `udp`. Required if name is not formatted.

port
The port or port range. Required if name is not formatted.

sel_range
The SELinux MLS/MCS Security Range.

CLI Example:

```
salt '*' selinux.port_add_policy tcp/8080 http_port_t
salt '*' selinux.port_add_policy foobar http_port_t protocol=tcp port=8091
```

`salt.modules.selinux.`**`port_delete_policy`**`(`*name, protocol=None, port=None*`)`

New in version 2019.2.0.

Deletes the SELinux policy for a given protocol and port.

Returns the result of the call to semanage.

name
The protocol and port spec. Can be formatted as `(tcp|udp)/(port|port-range)`.

protocol
The protocol for the port, `tcp` or `udp`. Required if name is not formatted.

port
The port or port range. Required if name is not formatted.

CLI Example:

```
salt '*' selinux.port_delete_policy tcp/8080
salt '*' selinux.port_delete_policy foobar protocol=tcp port=8091
```

`salt.modules.selinux.`**`port_get_policy`**`(`*name, sel_type=None, protocol=None, port=None*`)`

New in version 2019.2.0.

Returns the current entry in the SELinux policy list as a dictionary. Returns None if no exact match was found.

Returned keys are:

- sel_type (the selinux type)
- proto (the protocol)
- port (the port(s) and/or port range(s))

name
The protocol and port spec. Can be formatted as `(tcp|udp)/(port|port-range)`.

sel_type
The SELinux Type.

protocol
The protocol for the port, `tcp` or `udp`. Required if name is not formatted.

port
The port or port range. Required if name is not formatted.

CLI Example:

```
salt '*' selinux.port_get_policy tcp/80
salt '*' selinux.port_get_policy foobar protocol=tcp port=80
```

salt.modules.selinux.**port_modify_policy**(*name, sel_type=None, protocol=None, port=None, sel_range=None*)

New in version 2019.2.0.

Modifies the SELinux policy for a given protocol and port.

Returns the result of the call to semanage.

name
The protocol and port spec. Can be formatted as `(tcp|udp)/(port|port-range)`.

sel_type
The SELinux Type. Required.

protocol
The protocol for the port, `tcp` or `udp`. Required if name is not formatted.

port
The port or port range. Required if name is not formatted.

sel_range
The SELinux MLS/MCS Security Range.

CLI Example:

```
salt '*' selinux.port_modify_policy tcp/8080 http_port_t
salt '*' selinux.port_modify_policy foobar http_port_t protocol=tcp port=8091
```

salt.modules.selinux.**remove_semod**(*module*)

Remove SELinux module

CLI Example:

```
salt '*' selinux.remove_semod module_name
```

New in version 2016.11.6.

salt.modules.selinux.**selinux_fs_path**()

Return the location of the SELinux VFS directory

CLI Example:

```
salt '*' selinux.selinux_fs_path
```

salt.modules.selinux.**setenforce**(*mode*)

Set the SELinux enforcing mode

CLI Example:

```
salt '*' selinux.setenforce enforcing
```

salt.modules.selinux.**setsebool**(*boolean, value, persist=False*)

Set the value for a boolean

CLI Example:

```
salt '*' selinux.setsebool virt_use_usb off
```

`salt.modules.selinux.`**`setsebools`**(*pairs*, *persist=False*)

Set the value of multiple booleans

CLI Example:

```
salt '*' selinux.setsebools '{virt_use_usb: on, squid_use_tproxy: off}'
```

`salt.modules.selinux.`**`setsemod`**(*module*, *state*)

Enable or disable an SELinux module.

CLI Example:

```
salt '*' selinux.setsemod nagios Enabled
```

New in version 2016.3.0.

26.6.183 salt.modules.slack_notify

Module for sending messages to Slack

New in version 2015.5.0.

configuration

This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
slack:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.`**`call_hook`**(*message*, *attachment=None*, *color='good'*, *short=False*, *identifier=None*, *channel=None*, *username=None*, *icon_emoji=None*)

Send message to Slack incoming webhook.

Parameters

- **`message`** -- The topic of message.
- **`attachment`** -- The message to send to the Slack WebHook.
- **`color`** -- The color of border of left side
- **`short`** -- An optional flag indicating whether the value is short enough to be displayed side-by-side with other values.
- **`identifier`** -- The identifier of WebHook.
- **`channel`** -- The channel to use instead of the WebHook default.
- **`username`** -- Username to use instead of WebHook default.
- **`icon_emoji`** -- Icon to use instead of WebHook default.

Returns

Boolean if message was sent successfully.

CLI Example:

```
salt '*' slack.call_hook message='Hello, from SaltStack'
```

`salt.modules.slack_notify.`**`find_room`**(*name*, *api_key=None*)

Find a room by name and return it.

Parameters

- **`name`** -- The room name.

- **api_key** -- The Slack admin api key.

Returns
The room object.

CLI Example:

```
salt '*' slack.find_room name="random"

salt '*' slack.find_room name="random" api_
↪key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.`**`find_user`**(*name*, *api_key=None*)

Find a user by name and return it.

Parameters

- **name** -- The user name.
- **api_key** -- The Slack admin api key.

Returns
The user object.

CLI Example:

```
salt '*' slack.find_user name="ThomasHatch"

salt '*' slack.find_user name="ThomasHatch" api_
↪key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.`**`list_rooms`**(*api_key=None*)

List all Slack rooms.

Parameters
api_key -- The Slack admin api key.

Returns
The room list.

CLI Example:

```
salt '*' slack.list_rooms

salt '*' slack.list_rooms api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.`**`list_users`**(*api_key=None*)

List all Slack users.

Parameters
api_key -- The Slack admin api key.

Returns
The user list.

CLI Example:

```
salt '*' slack.list_users

salt '*' slack.list_users api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.`**`post_message`**(*channel*, *message*, *from_name*, *api_key=None*, *icon=None*, *attachments=None*, *blocks=None*)

Send a message to a Slack channel.

Changed in version 3003: Added *attachments* and *blocks* kwargs

Parameters

- **channel** -- The channel name, either will work.
- **message** -- The message to send to the Slack channel.
- **from_name** -- Specify who the message is from.
- **api_key** -- The Slack api key, if not specified in the configuration.
- **icon** -- URL to an image to use as the icon for this message
- **attachments** -- Any attachments to be sent with the message.
- **blocks** -- Any blocks to be sent with the message.

Returns

Boolean if message was sent successfully.

CLI Example:

```
salt '*' slack.post_message channel="Development Room" message="Build is
↪done" from_name="Build Server"
```

26.6.184 salt.modules.slsutil

Utility functions for use with or in SLS files

`salt.modules.slsutil.`**banner**(*width=72*, *commentchar='#'*, *borderchar='#'*, *blockstart=None*, *blockend=None*, *title=None*, *text=None*, *newline=False*)

Create a standardized comment block to include in a templated file.

A common technique in configuration management is to include a comment block in managed files, warning users not to modify the file. This function simplifies and standardizes those comment blocks.

Parameters

- **width** -- The width, in characters, of the banner. Default is 72.
- **commentchar** -- The character to be used in the starting position of each line. This value should be set to a valid line comment character for the syntax of the file in which the banner is being inserted. Multiple character sequences, like '//' are supported. If the file's syntax does not support line comments (such as XML), use the `blockstart` and `blockend` options.
- **borderchar** -- The character to use in the top and bottom border of the comment box. Must be a single character.
- **blockstart** -- The character sequence to use at the beginning of a block comment. Should be used in conjunction with `blockend`
- **blockend** -- The character sequence to use at the end of a block comment. Should be used in conjunction with `blockstart`
- **title** -- The first field of the comment block. This field appears centered at the top of the box.
- **text** -- The second filed of the comment block. This field appears left-justified at the bottom of the box.
- **newline** -- Boolean value to indicate whether the comment block should end with a newline. Default is `False`.

Example 1 - the default banner:

```
{{ salt['slsutil.banner']() }}
```

```
########################################################################
#                                                                      #
#              THIS FILE IS MANAGED BY SALT - DO NOT EDIT              #
#                                                                      #
# The contents of this file are managed by Salt. Any changes to this   #
```

(continues on next page)

(continued from previous page)

```
# file may be overwritten automatically and without warning.           #
########################################################################
```

Example 2 - a Javadoc-style banner:

```
{{ salt['slsutil.banner'](commentchar=' *', borderchar='*', blockstart='/
↪**', blockend=' */') }}
```

```
/**
 ***********************************************************************
 *                                                                     *
 *               THIS FILE IS MANAGED BY SALT - DO NOT EDIT            *
 *                                                                     *
 * The contents of this file are managed by Salt. Any changes to this  *
 * file may be overwritten automatically and without warning.          *
 ***********************************************************************
 */
```

Example 3 - custom text:

```
{{ set copyright='This file may not be copied or distributed without
↪permission of VMware, Inc.' }}
{{ salt['slsutil.banner'](title='Copyright 2019 VMware, Inc.',
↪text=copyright, width=60) }}
```

```
############################################################
#                                                          #
#              Copyright 2019 VMware, Inc.                 #
#                                                          #
# This file may not be copied or distributed without       #
# permission of VMware, Inc.                               #
############################################################
```

`salt.modules.slsutil.`**`boolstr`**(*value*, *true='true'*, *false='false'*)

Convert a boolean value into a string. This function is intended to be used from within file templates to provide an easy way to take boolean values stored in Pillars or Grains, and write them out in the appropriate syntax for a particular file template.

Parameters

- **`value`** -- The boolean value to be converted
- **`true`** -- The value to return if `value` is `True`
- **`false`** -- The value to return if `value` is `False`

In this example, a pillar named `smtp:encrypted` stores a boolean value, but the template that uses that value needs `yes` or `no` to be written, based on the boolean value.

Note: this is written on two lines for clarity. The same result could be achieved in one line.

```
{% set encrypted = salt[pillar.get]('smtp:encrypted', false) %}
use_tls: {{ salt['slsutil.boolstr'](encrypted, 'yes', 'no') }}
```

Result (assuming the value is `True`):

```
use_tls: yes
```

`salt.modules.slsutil.`**`deserialize`**`(`*serializer*, *stream_or_string*, ***mod_kwargs*`)`

Deserialize a Python object using one of the available *serializer modules*.

CLI Example:

```
salt '*' slsutil.deserialize 'json' '{"foo": "Foo!"}'
salt '*' --no-parse=stream_or_string slsutil.deserialize 'json' \
    stream_or_string='{"foo": "Foo!"}'
```

Jinja Example:

```
{% set python_object = salt['slsutil.deserialize']('json',
    '{"foo": "Foo!"}') %}
```

`salt.modules.slsutil.`**`dir_exists`**`(`*path*, *saltenv='base'*`)`

Return `True` if a directory exists in the state tree, `False` otherwise.

Parameters

- **`path`** (*`str`*) -- The fully qualified path to a directory in the state tree.
- **`saltenv`** (*`str`*) -- The fileserver environment to search. Default: `base`

New in version 3004.

CLI Example:

```
salt '*' slsutil.dir_exists nginx/files
```

`salt.modules.slsutil.`**`file_exists`**`(`*path*, *saltenv='base'*`)`

Return `True` if a file exists in the state tree, `False` otherwise.

New in version 3004.

Parameters

- **`path`** (*`str`*) -- The fully qualified path to a file in the state tree.
- **`saltenv`** (*`str`*) -- The fileserver environment to search. Default: `base`

CLI Example:

```
salt '*' slsutil.file_exists nginx/defaults.yaml
```

`salt.modules.slsutil.`**`findup`**`(`*startpath*, *filenames*, *saltenv='base'*`)`

Find the first path matching a filename or list of filenames in a specified directory or the nearest ancestor directory. Returns the full path to the first file found.

New in version 3004.

Parameters

- **`startpath`** (*`str`*) -- The fileserver path from which to begin the search. An empty string refers to the state tree root.
- **`filenames`** -- A filename or list of filenames to search for. Searching for directory names is also supported.
- **`saltenv`** (*`str`*) -- The fileserver environment to search. Default: `base`

Example: return the path to `defaults.yaml`, walking up the tree from the state file currently being processed.

```
{{ salt["slsutil.findup"](tplfile, "defaults.yaml") }}
```

CLI Example:

```
salt '*' slsutil.findup formulas/shared/nginx map.jinja
```

`salt.modules.slsutil.`**`merge`**(*obj_a*, *obj_b*, *strategy='smart'*, *renderer='yaml'*, *merge_lists=False*)

Merge a data structure into another by choosing a merge strategy

Strategies:
- aggregate
- list
- overwrite
- recurse
- smart

CLI Example:

```
salt '*' slsutil.merge '{foo: Foo}' '{bar: Bar}'
```

`salt.modules.slsutil.`**`merge_all`**(*lst*, *strategy='smart'*, *renderer='yaml'*, *merge_lists=False*)

New in version 2019.2.0.

Merge a list of objects into each other in order

Parameters
- **`lst`** (*`Iterable`*) -- List of objects to be merged.
- **`strategy`** (*`String`*) -- Merge strategy. See utils.dictupdate.
- **`renderer`** (*`String`*) -- Renderer type. Used to determine strategy when strategy is 'smart'.
- **`merge_lists`** (*`Bool`*) -- Defines whether to merge embedded object lists.

CLI Example:

```
$ salt-call --output=txt slsutil.merge_all '[{foo: Foo}, {foo: Bar}]'
local: {u'foo': u'Bar'}
```

`salt.modules.slsutil.`**`path_exists`**(*path*, *saltenv='base'*)

Return `True` if a path exists in the state tree, `False` otherwise. The path could refer to a file or directory.

New in version 3004.

Parameters
- **`path`** (*`str`*) -- The fully qualified path to a file or directory in the state tree.
- **`saltenv`** (*`str`*) -- The fileserver environment to search. Default: `base`

CLI Example:

```
salt '*' slsutil.path_exists nginx/defaults.yaml
```

`salt.modules.slsutil.`**`renderer`**(*path=None*, *string=None*, *default_renderer='jinja|yaml'*, ***kwargs*)

Parse a string or file through Salt's renderer system

Changed in version 2018.3.0: Add support for Salt fileserver URIs.

This is an open-ended function and can be used for a variety of tasks. It makes use of Salt's "renderer pipes" system to run a string or file through a pipe of any of the loaded renderer modules.

Parameters
- **`path`** -- The path to a file on Salt's fileserver (any URIs supported by *`cp.get_url`*) or on the local file system.
- **`string`** -- An inline string to be used as the file to send through the renderer system. Note, not all renderer modules can work with strings; the 'py' renderer requires a file, for example.
- **`default_renderer`** -- The renderer pipe to send the file through; this is overridden by a "she-bang" at the top of the file.
- **`kwargs`** -- Keyword args to pass to Salt's compile_template() function.

Keep in mind the goal of each renderer when choosing a render-pipe; for example, the Jinja renderer processes a text file and produces a string, however the YAML renderer processes a text file and produces a data structure.

One possible use is to allow writing "map files", as are commonly seen in Salt formulas, but without tying the renderer of the map file to the renderer used in the other sls files. In other words, a map file could use the Python renderer and still be included and used by an sls file that uses the default 'jinja|yaml' renderer.

For example, the two following map files produce identical results but one is written using the normal 'jinja|yaml' and the other is using 'py':

```
#!jinja|yaml
{% set apache = salt['grains.filter_by']({
    ...normal jinja map file here...
}, merge=salt['pillar.get']('apache:lookup')) %}
{{ apache | yaml() }}
```

```
#!py
def run():
    apache = __salt__['grains.filter_by']({
        ...normal map here but as a python dict...
    }, merge=__salt__['pillar.get']('apache:lookup'))
    return apache
```

Regardless of which of the above map files is used, it can be accessed from any other sls file by calling this function. The following is a usage example in Jinja:

```
{% set apache = salt['slsutil.renderer']('map.sls') %}
```

CLI Example:

```
salt '*' slsutil.renderer salt://path/to/file
salt '*' slsutil.renderer /path/to/file
salt '*' slsutil.renderer /path/to/file.jinja default_renderer='jinja'
salt '*' slsutil.renderer /path/to/file.sls default_renderer='jinja|yaml'
salt '*' slsutil.renderer string='Inline template! {{ saltenv }}'
salt '*' slsutil.renderer string='Hello, {{ name }}.' name='world'
```

`salt.modules.slsutil.`**`serialize`**(*serializer*, *obj*, ***mod_kwargs*)

Serialize a Python object using one of the available *serializer modules*.

CLI Example:

```
salt '*' --no-parse=obj slsutil.serialize 'json' obj="{'foo': 'Foo!'}
```

Jinja Example:

```
{% set json_string = salt['slsutil.serialize']('json',
    {'foo': 'Foo!'}) %}
```

`salt.modules.slsutil.`**`update`**(*dest*, *upd*, *recursive_update=True*, *merge_lists=False*)

Merge `upd` recursively into `dest`

If `merge_lists=True`, will aggregate list object types instead of replacing. This behavior is only activated when `recursive_update=True`.

CLI Example:

```
salt '*' slsutil.update '{foo: Foo}' '{bar: Bar}'
```

26.6.185 salt.modules.smbios

Interface to SMBIOS/DMI

(Parsing through dmidecode)

External References

Desktop Management Interface (DMI)
System Management BIOS
DMIdecode

`salt.modules.smbios.`**`get`**`(`*string*, *clean=True*`)`

Get an individual DMI string from SMBIOS info

string

The string to fetch. DMIdecode supports:

- `bios-vendor`
- `bios-version`
- `bios-release-date`
- `system-manufacturer`
- `system-product-name`
- `system-version`
- `system-serial-number`
- `system-uuid`
- `baseboard-manufacturer`
- `baseboard-product-name`
- `baseboard-version`
- `baseboard-serial-number`
- `baseboard-asset-tag`
- `chassis-manufacturer`
- `chassis-type`
- `chassis-version`
- `chassis-serial-number`
- `chassis-asset-tag`
- `processor-family`
- `processor-manufacturer`
- `processor-version`
- `processor-frequency`

clean

Don't return well-known false information

(invalid UUID's, serial 000000000's, etcetera)

Defaults to `True`

CLI Example:

```
salt '*' smbios.get system-uuid clean=False
```

`salt.modules.smbios.`**`records`**(*rec_type=None*, *fields=None*, *clean=True*)

Return DMI records from SMBIOS

type

Return only records of type(s) The SMBIOS specification defines the following DMI types:

Type	Information
0	BIOS
1	System
2	Baseboard
3	Chassis
4	Processor
5	Memory Controller
6	Memory Module
7	Cache
8	Port Connector
9	System Slots
10	On Board Devices
11	OEM Strings
12	System Configuration Options
13	BIOS Language
14	Group Associations
15	System Event Log
16	Physical Memory Array
17	Memory Device
18	32-bit Memory Error
19	Memory Array Mapped Address
20	Memory Device Mapped Address
21	Built-in Pointing Device
22	Portable Battery
23	System Reset
24	Hardware Security
25	System Power Controls
26	Voltage Probe
27	Cooling Device
28	Temperature Probe
29	Electrical Current Probe
30	Out-of-band Remote Access
31	Boot Integrity Services
32	System Boot
33	64-bit Memory Error
34	Management Device
35	Management Device Component
36	Management Device Threshold Data
37	Memory Channel
38	IPMI Device
39	Power Supply
40	Additional Information
41	Onboard Devices Extended Information
42	Management Controller Host Interface

clean

Don't return well-known false information
(invalid UUID's, serial 000000000's, etcetera)
Defaults to `True`

CLI Example:

```
salt '*' smbios.records clean=False
salt '*' smbios.records 14
salt '*' smbios.records 4 core_count,thread_count,current_speed
```

26.6.186 salt.modules.smf_service

Service support for Solaris 10 and 11, should work with other systems that use SMF also. (e.g. SmartOS)

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *'service.start' is not available*), see *here*.

`salt.modules.smf_service.`**`available`**`(`*name*`)`

Returns `True` if the specified service is available, otherwise returns `False`.

We look up the name with the svcs command to get back the FMRI This allows users to use simpler service names

CLI Example:

```
salt '*' service.available net-snmp
```

`salt.modules.smf_service.`**`disable`**`(`*name*, ***kwargs*`)`

Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.smf_service.`**`disabled`**`(`*name*`)`

Check to see if the named service is disabled to start on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.smf_service.`**`enable`**`(`*name*, ***kwargs*`)`

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.smf_service.`**`enabled`**`(`*name*, ***kwargs*`)`

Check to see if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.smf_service.`**`get_all`**`()`

Return all installed services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.smf_service.`**`get_disabled`**`()`

Return the disabled services

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.smf_service.`**`get_enabled`**`()`

Return the enabled services

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.smf_service.`**`get_running`**`()`

Return the running services

CLI Example:

```
salt '*' service.get_running
```

`salt.modules.smf_service.`**`get_stopped`**`()`

Return the stopped services

CLI Example:

```
salt '*' service.get_stopped
```

`salt.modules.smf_service.`**`missing`**`(`*name*`)`

The inverse of service.available. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' service.missing net-snmp
```

`salt.modules.smf_service.`**`reload_`**`(`*name*`)`

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.smf_service.`**`restart`**`(`*name*`)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.smf_service.`**`start`**`(`*name*`)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.smf_service.`**`status`**`(`*name, sig=None*`)`

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Parameters

- **name** (*str*) -- The name of the service to check
- **sig** (*str*) -- Not implemented

Returns

True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type

bool

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.smf_service.`**`stop`**`(`*name*`)`

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

26.6.187 salt.modules.snapper

Module to manage filesystem snapshots with snapper

New in version 2016.11.0.

codeauthor

Duncan Mac-Vicar P. <dmacvicar@suse.de>

codeauthor

Pablo Suárez Hernández <psuarezhernandez@suse.de>

depends

`dbus` Python module.

depends

`snapper` http://snapper.io, available in most distros

maturity

new

platform

Linux

`salt.modules.snapper.`**`changed_files`**`(`*config='root', num_pre=None, num_post=None*`)`

Returns the files changed between two snapshots

config

Configuration name.

num_pre
first snapshot ID to compare. Default is last snapshot

num_post
last snapshot ID to compare. Default is 0 (current state)

CLI Example:

```
salt '*' snapper.changed_files
salt '*' snapper.changed_files num_pre=19 num_post=20
```

salt.modules.snapper.**create_baseline**(*tag='baseline'*, *config='root'*)

Creates a snapshot marked as baseline

tag
Tag name for the baseline

config
Configuration name.

CLI Example:

```
salt '*' snapper.create_baseline
salt '*' snapper.create_baseline my_custom_baseline
```

salt.modules.snapper.**create_config**(*name=None*, *subvolume=None*, *fstype=None*, *template=None*, *extra_opts=None*)

Creates a new Snapper configuration

name
Name of the new Snapper configuration.

subvolume
Path to the related subvolume.

fstype
Filesystem type of the subvolume.

template
Configuration template to use. (Default: default)

extra_opts
Extra Snapper configuration opts dictionary. It will override the values provided by the given template (if any).

CLI Example:

```
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/⊠
↪fstype=btrfs
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/⊠
↪fstype=btrfs template="default"
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/⊠
↪fstype=btrfs extra_opts='{"NUMBER_CLEANUP": False}'
```

salt.modules.snapper.**create_snapshot**(*config='root'*, *snapshot_type='single'*, *pre_number=None*, *description=None*, *cleanup_algorithm='number'*, *userdata=None*, ***kwargs*)

Creates an snapshot

config
Configuration name.

snapshot_type
Specifies the type of the new snapshot. Possible values are single, pre and post.

pre_number
For post snapshots the number of the pre snapshot must be provided.

description
Description for the snapshot. If not given, the salt job will be used.

cleanup_algorithm
Set the cleanup algorithm for the snapshot.

number
Deletes old snapshots when a certain number of snapshots is reached.

timeline
Deletes old snapshots but keeps a number of hourly, daily, weekly, monthly and yearly snapshots.

empty-pre-post
Deletes pre/post snapshot pairs with empty diffs.

userdata
Set userdata for the snapshot (key-value pairs).

Returns the number of the created snapshot.

CLI Example:

```
salt '*' snapper.create_snapshot
```

`salt.modules.snapper.`**`delete_snapshot`**(*snapshots_ids=None, config='root'*)

Deletes an snapshot

config
Configuration name. (Default: root)

snapshots_ids
List of the snapshots IDs to be deleted.

CLI Example:

```
salt '*' snapper.delete_snapshot 54
salt '*' snapper.delete_snapshot config=root 54
salt '*' snapper.delete_snapshot config=root snapshots_ids=[54,55,56]
```

`salt.modules.snapper.`**`diff`**(*config='root', filename=None, num_pre=None, num_post=None*)

Returns the differences between two snapshots

config
Configuration name.

filename
if not provided the showing differences between snapshots for all "text" files

num_pre
first snapshot ID to compare. Default is last snapshot

num_post
last snapshot ID to compare. Default is 0 (current state)

CLI Example:

```
salt '*' snapper.diff
salt '*' snapper.diff filename=/var/log/snapper.log num_pre=19 num_post=20
```

`salt.modules.snapper.`**`diff_jid`**(*jid, config='root'*)

Returns the changes applied by a *jid*

jid
The job id to lookup

config
Configuration name.

CLI Example:

```
salt '*' snapper.diff_jid jid=20160607130930720112
```

`salt.modules.snapper.`**`get_config`**(*name='root'*)

Retrieves all values from a given configuration

CLI Example:

```
salt '*' snapper.get_config
```

`salt.modules.snapper.`**`get_snapshot`**(*number=0, config='root'*)

Get detailed information about a given snapshot

CLI Example:

```
salt '*' snapper.get_snapshot 1
```

`salt.modules.snapper.`**`list_configs`**()

List all available configs

CLI Example:

```
salt '*' snapper.list_configs
```

`salt.modules.snapper.`**`list_snapshots`**(*config='root'*)

List available snapshots

CLI Example:

```
salt '*' snapper.list_snapshots config=myconfig
```

`salt.modules.snapper.`**`modify_snapshot`**(*snapshot_id=None, description=None, userdata=None, cleanup=None, config='root'*)

Modify attributes of an existing snapshot.

config
Configuration name. (Default: root)

snapshot_id
ID of the snapshot to be modified.

cleanup
Change the cleanup method of the snapshot. (str)

description
Change the description of the snapshot. (str)

userdata
Change the userdata dictionary of the snapshot. (dict)

CLI Example:

```
salt '*' snapper.modify_snapshot 54 description="my snapshot description"
salt '*' snapper.modify_snapshot 54 description="my snapshot description"
salt '*' snapper.modify_snapshot 54 userdata='{"foo": "bar"}'
salt '*' snapper.modify_snapshot snapshot_id=54 cleanup="number"
```

`salt.modules.snapper.`**`run`**(*function, *args, **kwargs*)

Runs a function from an execution module creating pre and post snapshots and associating the salt job id with those snapshots for easy undo and cleanup.

function
Salt function to call.

config
Configuration name. (default: "root")

description
A description for the snapshots. (default: None)

userdata
Data to include in the snapshot metadata. (default: None)

cleanup_algorithm
Snapper cleanup algorithm. (default: "number")

***args**
args for the function to call. (default: None)

****kwargs**
kwargs for the function to call (default: None)

This would run append text to /etc/motd using the file.append module, and will create two snapshots, pre and post with the associated metadata. The jid will be available as salt_jid in the userdata of the snapshot.

You can immediately see the changes

CLI Example:

```
salt '*' snapper.run file.append args='["/etc/motd", "some text"]'
```

`salt.modules.snapper.`**`set_config`**(*name='root'*, ***kwargs*)

Set configuration values

CLI Example:

```
salt '*' snapper.set_config SYNC_ACL=True
```

Keys are case insensitive as they will be always uppercased to snapper convention. The above example is equivalent to:

```
salt '*' snapper.set_config sync_acl=True
```

`salt.modules.snapper.`**`status`**(*config='root'*, *num_pre=None*, *num_post=None*)

Returns a comparison between two snapshots

config
Configuration name.

num_pre
first snapshot ID to compare. Default is last snapshot

num_post
last snapshot ID to compare. Default is 0 (current state)

CLI Example:

```
salt '*' snapper.status
salt '*' snapper.status num_pre=19 num_post=20
```

`salt.modules.snapper.`**`status_to_string`**(*dbus_status*)

Converts a numeric dbus snapper status into a string

CLI Example:

```
salt '*' snapper.status_to_string <dbus_status>
```

`salt.modules.snapper.`**`undo`**(*config='root'*, *files=None*, *num_pre=None*, *num_post=None*)

Undo all file changes that happened between num_pre and num_post, leaving the files into the state of num_pre.

> **Warning:** If one of the files has changes after num_post, they will be overwritten The snapshots are used to determine the file list, but the current version of the files will be overwritten by the versions in num_pre.
>
> You to undo changes between num_pre and the current version of the files use num_post=0.

CLI Example:

```
salt '*' snapper.undo
```

`salt.modules.snapper.`**`undo_jid`**`(`*jid, config='root'*`)`

Undo the changes applied by a salt job

jid
The job id to lookup

config
Configuration name.

CLI Example:

```
salt '*' snapper.undo_jid jid=20160607130930720112
```

26.6.188 salt.modules.solaris_fmadm

Module for running fmadm and fmdump on Solaris

maintainer
Jorge Schrauwen <sjorge@blackdot.be>

maturity
new

platform
solaris,illumos

New in version 2016.3.0.

`salt.modules.solaris_fmadm.`**`acquit`**`(`*fmri*`)`

Acquit resource or acquit case

fmri: string
fmri or uuid

CLI Example:

```
salt '*' fmadm.acquit fmri | uuid
```

`salt.modules.solaris_fmadm.`**`config`**`()`

Display fault manager configuration

CLI Example:

```
salt '*' fmadm.config
```

`salt.modules.solaris_fmadm.`**`faulty`**`()`

Display list of faulty resources

CLI Example:

```
salt '*' fmadm.faulty
```

salt.modules.solaris_fmadm.**flush**(*fmri*)

Flush cached state for resource

fmri: string
fmri

CLI Example:

```
salt '*' fmadm.flush fmri
```

salt.modules.solaris_fmadm.**healthy**()

Return whether fmadm is reporting faults

CLI Example:

```
salt '*' fmadm.healthy
```

salt.modules.solaris_fmadm.**list_records**(*after=None*, *before=None*)

Display fault management logs

after
[string] filter events after time, see man fmdump for format

before
[string] filter events before time, see man fmdump for format

CLI Example:

```
salt '*' fmadm.list
```

salt.modules.solaris_fmadm.**load**(*path*)

Load specified fault manager module

path: string
path of fault manager module

CLI Example:

```
salt '*' fmadm.load /module/path
```

salt.modules.solaris_fmadm.**repaired**(*fmri*)

Notify fault manager that resource has been repaired

fmri: string
fmri

CLI Example:

```
salt '*' fmadm.repaired fmri
```

salt.modules.solaris_fmadm.**replaced**(*fmri*)

Notify fault manager that resource has been replaced

fmri: string
fmri

CLI Example:

```
salt '*' fmadm.repaired fmri
```

salt.modules.solaris_fmadm.**reset**(*module*, *serd=None*)

Reset module or sub-component

module: **string**
module to unload

serd
[string] serd sub module

CLI Example:

```
salt '*' fmadm.reset software-response
```

`salt.modules.solaris_fmadm.`**`show`**`(`*uuid*`)`

Display log details

uuid: **string**
uuid of fault

CLI Example:

```
salt '*' fmadm.show 11b4070f-4358-62fa-9e1e-998f485977e1
```

`salt.modules.solaris_fmadm.`**`unload`**`(`*module*`)`

Unload specified fault manager module

module: **string**
module to unload

CLI Example:

```
salt '*' fmadm.unload software-response
```

26.6.189 salt.modules.solaris_group

Manage groups on Solaris

Important: If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to *'group.info' is not available*), see *here*.

`salt.modules.solaris_group.`**`add`**`(`*name, gid=None, **kwargs*`)`

Add the specified group

CLI Example:

```
salt '*' group.add foo 3456
```

`salt.modules.solaris_group.`**`chgid`**`(`*name, gid*`)`

Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

`salt.modules.solaris_group.`**`delete`**`(`*name*`)`

Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.solaris_group.`**`getent`**`(`*refresh=False*`)`

Return info on all groups

CLI Example:

```
salt '*' group.getent
```

`salt.modules.solaris_group.`**`info`**`(`*name*`)`

Return information about a group

CLI Example:

```
salt '*' group.info foo
```

26.6.190 salt.modules.solaris_shadow

Manage the password database on Solaris systems

Important: If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to *'shadow.info' is not available*), see *here*.

`salt.modules.solaris_shadow.`**`default_hash`**`()`

Returns the default hash used for unset passwords

CLI Example:

```
salt '*' shadow.default_hash
```

`salt.modules.solaris_shadow.`**`del_password`**`(`*name*`)`

New in version 2015.8.8.

Delete the password from name user

CLI Example:

```
salt '*' shadow.del_password username
```

`salt.modules.solaris_shadow.`**`gen_password`**`(`*password, crypt_salt=None, algorithm='sha512'*`)`

New in version 2015.8.8.

Generate hashed password

Note: When called this function is called directly via remote-execution, the password argument may be displayed in the system's process list. This may be a security risk on certain systems.

password
Plaintext password to be hashed.

crypt_salt
Crpytographic salt. If not given, a random 8-character salt will be generated.

algorithm
The following hash algorithms are supported:

- md5
- blowfish (not in mainline glibc, only available in distros that add it)

- sha256
- sha512 (default)

CLI Example:

```
salt '*' shadow.gen_password 'I_am_password'
salt '*' shadow.gen_password 'I_am_password' crypt_salt='I_am_salt'
↪algorithm=sha256
```

`salt.modules.solaris_shadow.`**`info`**`(`*name*`)`

Return information for the specified user

CLI Example:

```
salt '*' shadow.info root
```

`salt.modules.solaris_shadow.`**`set_maxdays`**`(`*name, maxdays*`)`

Set the maximum number of days during which a password is valid. See man passwd.

CLI Example:

```
salt '*' shadow.set_maxdays username 90
```

`salt.modules.solaris_shadow.`**`set_mindays`**`(`*name, mindays*`)`

Set the minimum number of days between password changes. See man passwd.

CLI Example:

```
salt '*' shadow.set_mindays username 7
```

`salt.modules.solaris_shadow.`**`set_password`**`(`*name, password*`)`

Set the password for a named user. The password must be a properly defined hash, the password hash can be generated with this command: `openssl passwd -1 <plaintext password>`

CLI Example:

```
salt '*' shadow.set_password root $1$UYCIxa628.9qXjpQCjM4a..
```

`salt.modules.solaris_shadow.`**`set_warndays`**`(`*name, warndays*`)`

Set the number of days of warning before a password change is required. See man passwd.

CLI Example:

```
salt '*' shadow.set_warndays username 7
```

26.6.191 salt.modules.solaris_system

Support for reboot, shutdown, etc

This module is assumes we are using solaris-like shutdown

New in version 2016.3.0.

`salt.modules.solaris_system.`**`halt`**`()`

Halt a running system

CLI Example:

```
salt '*' system.halt
```

`salt.modules.solaris_system.`**`init`**`(`*state*`)`

Change the system runlevel on sysV compatible systems

CLI Example:

state
[string] Init state

```
salt '*' system.init 3
```

`salt.modules.solaris_system.`**`poweroff`**`()`

Poweroff a running system

CLI Example:

```
salt '*' system.poweroff
```

`salt.modules.solaris_system.`**`reboot`**`(`*delay=0, message=None*`)`

Reboot the system

delay
[int] Optional wait time in seconds before the system will be rebooted.

message
[string] Optional message to broadcast before rebooting.

CLI Example:

```
salt '*' system.reboot
salt '*' system.reboot 60 "=== system upgraded ==="
```

`salt.modules.solaris_system.`**`shutdown`**`(`*delay=0, message=None*`)`

Shutdown a running system

delay
[int] Optional wait time in seconds before the system will be shutdown.

message
[string] Optional message to broadcast before rebooting.

CLI Example:

```
salt '*' system.shutdown
salt '*' system.shutdown 60 "=== disk replacement ==="
```

26.6.192 salt.modules.solaris_user

Manage users with the useradd command

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to *'user.info' is not available*), see *here*.

`salt.modules.solaris_user.`**`add`**`(`*name, uid=None, gid=None, groups=None, home=None, shell=None, unique=True, fullname='', roomnumber='', workphone='', homephone='', createhome=True, **kwargs*`)`

Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

`salt.modules.solaris_user.`**`chfullname`**(*name*, *fullname*)

Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo "Foo Bar"
```

`salt.modules.solaris_user.`**`chgid`**(*name*, *gid*)

Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

`salt.modules.solaris_user.`**`chgroups`**(*name*, *groups*, *append=False*)

Change the groups to which a user belongs

name
Username to modify

groups
List of groups to set for the user. Can be passed as a comma-separated list or a Python list.

append
[False] Set to `True` to append these groups to the user's existing list of groups. Otherwise, the specified groups will replace any existing groups for the user.

CLI Example:

```
salt '*' user.chgroups foo wheel,root True
```

`salt.modules.solaris_user.`**`chhome`**(*name*, *home*, *persist=False*)

Set a new home directory for an existing user

name
Username to modify

home
New home directory to set

persist
[False] Set to `True` to prevent configuration files in the new home directory from being overwritten by the files from the skeleton directory.

CLI Example:

```
salt '*' user.chhome foo /home/users/foo True
```

`salt.modules.solaris_user.`**`chhomephone`**(*name*, *homephone*)

Change the user's Home Phone

CLI Example:

```
salt '*' user.chhomephone foo "7735551234"
```

`salt.modules.solaris_user.`**`chroomnumber`**(*name*, *roomnumber*)

Change the user's Room Number

CLI Example:

```
salt '*' user.chroomnumber foo 123
```

`salt.modules.solaris_user.`**`chshell`**`(`*name*, *shell*`)`

Change the default shell of the user

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

`salt.modules.solaris_user.`**`chuid`**`(`*name*, *uid*`)`

Change the uid for a named user

CLI Example:

```
salt '*' user.chuid foo 4376
```

`salt.modules.solaris_user.`**`chworkphone`**`(`*name*, *workphone*`)`

Change the user's Work Phone

CLI Example:

```
salt '*' user.chworkphone foo "7735550123"
```

`salt.modules.solaris_user.`**`delete`**`(`*name*, *remove=False*, *force=False*`)`

Remove a user from the minion

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

`salt.modules.solaris_user.`**`getent`**`(`*refresh=False*`)`

Return the list of all info for all users

CLI Example:

```
salt '*' user.getent
```

`salt.modules.solaris_user.`**`info`**`(`*name*`)`

Return user information

CLI Example:

```
salt '*' user.info root
```

`salt.modules.solaris_user.`**`list_groups`**`(`*name*`)`

Return a list of groups the named user belongs to

CLI Example:

```
salt '*' user.list_groups foo
```

`salt.modules.solaris_user.`**`list_users`**`()`

Return a list of all users

CLI Example:

```
salt '*' user.list_users
```

`salt.modules.solaris_user.`**`rename`**`(`*name*, *new_name*`)`

Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```

26.6.193 salt.modules.solarisipspkg

IPS pkg support for Solaris

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see *here*.

This module provides support for Solaris 11 new package management - IPS (Image Packaging System). This is the default pkg module for Solaris 11 (and later).

If you want to use also other packaging module (e.g. pkgutil) together with IPS, you need to override the `pkg` provider in sls for each package:

```
mypackage:
  pkg.installed:
    - provider: pkgutil
```

Or you can override it globally by setting the *`providers`* parameter in your Minion config file like this:

```
providers:
  pkg: pkgutil
```

Or you can override it globally by setting the *`providers`* parameter in your Minion config file like this:

```
providers:
  pkg: pkgutil
```

`salt.modules.solarisipspkg.`**`available_version`**`(`**names*, ***kwargs*`)`

This function is an alias of `latest_version`.

The available version of packages in the repository. Accepts full or partial FMRI. Partial FMRI is returned if the full FMRI could not be resolved.

If the latest version of a given package is already installed, an empty string will be returned for that package.

Please use pkg.latest_version as pkg.available_version is being deprecated.

Changed in version 2019.2.0: Support for multiple package names added.

CLI Example:

```
salt '*' pkg.latest_version bash
salt '*' pkg.latest_version pkg://solaris/entire
salt '*' pkg.latest_version postfix sendmail
```

`salt.modules.solarisipspkg.`**`get_fmri`**`(`*name*, ***kwargs*`)`

Returns FMRI from partial name. Returns empty string ('') if not found. In case of multiple match, the function returns list of all matched packages.

CLI Example:

```
salt '*' pkg.get_fmri bash
```

`salt.modules.solarisipspkg.`**`install`**`(`*name=None*, *refresh=False*, *pkgs=None*, *version=None*, *test=False*, ***kwargs*`)`

Install the named package using the IPS pkg command. Accepts full or partial FMRI.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

Multiple Package Installation Options:

pkgs

A list of packages to install. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install vim
salt '*' pkg.install pkg://solaris/editor/vim
salt '*' pkg.install pkg://solaris/editor/vim refresh=True
salt '*' pkg.install pkgs='["foo", "bar"]'
```

`salt.modules.solarisipspkg.`**`is_installed`**`(`*name*, ***kwargs*`)`

Returns True if the package is installed. Otherwise returns False. Name can be full or partial FMRI. In case of multiple match from partial FMRI name, it returns True.

CLI Example:

```
salt '*' pkg.is_installed bash
```

`salt.modules.solarisipspkg.`**`latest_version`**`(`**names*, ***kwargs*`)`

The available version of packages in the repository. Accepts full or partial FMRI. Partial FMRI is returned if the full FMRI could not be resolved.

If the latest version of a given package is already installed, an empty string will be returned for that package.

Please use pkg.latest_version as pkg.available_version is being deprecated.

Changed in version 2019.2.0: Support for multiple package names added.

CLI Example:

```
salt '*' pkg.latest_version bash
salt '*' pkg.latest_version pkg://solaris/entire
salt '*' pkg.latest_version postfix sendmail
```

`salt.modules.solarisipspkg.`**`list_pkgs`**`(`*versions_as_list=False*, ***kwargs*`)`

List the currently installed packages as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.solarisipspkg.`**`list_upgrades`**`(`*refresh=True*, ***kwargs*`)`

Lists all packages available for update.

When run in global zone, it reports only upgradable packages for the global zone.

When run in non-global zone, it can report more upgradable packages than `pkg update -vn`, because `pkg update` hides packages that require newer version of `pkg://solaris/entire` (which means that they can be upgraded only from the global zone). If `pkg://solaris/entire` is found in the list of upgrades, then the global zone should be updated to get all possible updates. Use `refresh=True` to refresh the package database.

refresh

[True] Runs a full package database refresh before listing. Set to `False` to disable running the refresh.

Changed in version 2017.7.0.

In previous versions of Salt, `refresh` defaulted to `False`. This was changed to default to `True` in the 2017.7.0 release to make the behavior more consistent with the other package modules, which all default to `True`.

CLI Example:

```
salt '*' pkg.list_upgrades
salt '*' pkg.list_upgrades refresh=False
```

`salt.modules.solarisipspkg.`**`normalize_name`**`(`*name*, ***kwargs*`)`

Internal function. Normalizes pkg name to full FMRI before running pkg.install. In case of multiple matches or no match, it returns the name without modifications.

CLI Example:

```
salt '*' pkg.normalize_name vim
```

`salt.modules.solarisipspkg.`**`purge`**`(`*name*, ***kwargs*`)`

Remove specified package. Accepts full or partial FMRI.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.purge <package name>
```

`salt.modules.solarisipspkg.`**`refresh_db`**`(`*full=False*, ***kwargs*`)`

Updates the remote repos database.

full : False

Set to `True` to force a refresh of the pkg DB from all publishers, regardless of the last refresh time.

CLI Example:

```
salt '*' pkg.refresh_db
salt '*' pkg.refresh_db full=True
```

`salt.modules.solarisipspkg.`**`remove`**`(`*name=None*, *pkgs=None*, ***kwargs*`)`

Remove specified package. Accepts full or partial FMRI. In case of multiple match, the command fails and won't modify the OS.

name

The name of the package to be deleted.

Multiple Package Options:

pkgs

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove tcsh
salt '*' pkg.remove pkg://solaris/shell/tcsh
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.solarisipspkg.`**`search`**`(`*name*, *versions_as_list=False*, ***kwargs*`)`

Searches the repository for given pkg name. The name can be full or partial FMRI. All matches are printed. Globs are also supported.

CLI Example:

```
salt '*' pkg.search bash
```

`salt.modules.solarisipspkg.`**`upgrade`**`(`*refresh=False*, ***kwargs*`)`

Upgrade all packages to the latest possible version. When run in global zone, it updates also all non-global zones. In non-global zones upgrade is limited by dependency constrains linked to the version of pkg://solaris/entire.

Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

When there is a failure, an explanation is also included in the error message, based on the return code of the `pkg update` command.

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.solarisipspkg.`**`upgrade_available`**`(`*name*, ***kwargs*`)`

Check if there is an upgrade available for a certain package Accepts full or partial FMRI. Returns all matches found.

CLI Example:

```
salt '*' pkg.upgrade_available apache-22
```

`salt.modules.solarisipspkg.`**`version`**`(`**names*, ***kwargs*`)`

Common interface for obtaining the version of installed packages. Accepts full or partial FMRI. If called using pkg_resource, full FMRI is required. Partial FMRI is returned if the package is not installed.

CLI Example:

```
salt '*' pkg.version vim
salt '*' pkg.version foo bar baz
salt '*' pkg_resource.version pkg://solaris/entire
```

26.6.194 salt.modules.solarispkg

Package support for Solaris

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see *here*.

`salt.modules.solarispkg.`**`available_version`**`(`**names*, ***kwargs*`)`

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

NOTE: As package repositories are not presently supported for Solaris pkgadd, this function will always return an empty string for a given package.

`salt.modules.solarispkg.`**`install`**`(`*name=None*, *sources=None*, *saltenv='base'*, ***kwargs*`)`

Install the passed package. Can install packages from the following sources:

- Locally (package already exists on the minion
- HTTP/HTTPS server
- FTP server
- Salt master

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Examples:

```
# Installing a data stream pkg that already exists on the minion

salt '*' pkg.install sources='[{"<pkg name>": "/dir/on/minion/<pkg␣
↪filename>"}]'
salt '*' pkg.install sources='[{"SMClgcc346": "/var/spool/pkg/gcc-3.4.6-
↪sol10-sparc-local.pkg"}]'

# Installing a data stream pkg that exists on the salt master

salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>
↪"}]'
salt '*' pkg.install sources='[{"SMClgcc346": "salt://pkgs/gcc-3.4.6-
↪sol10-sparc-local.pkg"}]'
```

CLI Example:

```
# Installing a data stream pkg that exists on a HTTP server
salt '*' pkg.install sources='[{"<pkg name>": "http://packages.server.com/
```

(continues on next page)

(continued from previous page)

```
↪<pkg filename>"}]'
salt '*' pkg.install sources='[{"SMClgcc346": "http://packages.server.com/
↪gcc-3.4.6-sol10-sparc-local.pkg"}]'
```

If working with solaris zones and you want to install a package only in the global zone you can pass 'current_zone_only=True' to salt to have the package only installed in the global zone. (Behind the scenes this is passing '-G' to the pkgadd command.) Solaris default when installing a package in the global zone is to install it in all zones. This overrides that and installs the package only in the global.

CLI Example:

```
# Installing a data stream package only in the global zone:
salt 'global_zone' pkg.install sources='[{"SMClgcc346": "/var/spool/pkg/
↪gcc-3.4.6-sol10-sparc-local.pkg"}]' current_zone_only=True
```

By default salt automatically provides an adminfile, to automate package installation, with these options set:

```
email=
instance=quit
partial=nocheck
runlevel=nocheck
idepend=nocheck
rdepend=nocheck
space=nocheck
setuid=nocheck
conflict=nocheck
action=nocheck
basedir=default
```

You can override any of these options in two ways. First you can optionally pass any of the options as a kwarg to the module/state to override the default value or you can optionally pass the 'admin_source' option providing your own adminfile to the minions.

Note: You can find all of the possible options to provide to the adminfile by reading the admin man page:

```
man -s 4 admin
```

CLI Example:

```
# Overriding the 'instance' adminfile option when calling the module⊠
↪directly
salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>
↪"}]' instance="overwrite"
```

SLS Example:

```
# Overriding the 'instance' adminfile option when used in a state

SMClgcc346:
  pkg.installed:
    - sources:
      - SMClgcc346: salt://srv/salt/pkgs/gcc-3.4.6-sol10-sparc-local.pkg
    - instance: overwrite
```

Note: The ID declaration is ignored, as the package name is read from the `sources` parameter.

CLI Example:

```
# Providing your own adminfile when calling the module directly

salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>
↪"}]' admin_source='salt://pkgs/<adminfile filename>'

# Providing your own adminfile when using states

<pkg name>:
  pkg.installed:
    - sources:
      - <pkg name>: salt://pkgs/<pkg filename>
    - admin_source: salt://pkgs/<adminfile filename>
```

Note: The ID declaration is ignored, as the package name is read from the `sources` parameter.

`salt.modules.solarispkg.`**`latest_version`**`(`**names, **kwargs*`)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

NOTE: As package repositories are not presently supported for Solaris pkgadd, this function will always return an empty string for a given package.

`salt.modules.solarispkg.`**`list_pkgs`**`(`*versions_as_list=False, **kwargs*`)`

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.solarispkg.`**`purge`**`(`*name=None, pkgs=None, **kwargs*`)`

Package purges are not supported, this function is identical to `remove()`.

name

The name of the package to be deleted

Multiple Package Options:

pkgs

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

`salt.modules.solarispkg.`**`remove`**(*name=None*, *pkgs=None*, *saltenv='base'*, ***kwargs*)

Remove packages with pkgrm

name

The name of the package to be deleted

By default salt automatically provides an adminfile, to automate package removal, with these options set:

```
email=
instance=quit
partial=nocheck
runlevel=nocheck
idepend=nocheck
rdepend=nocheck
space=nocheck
setuid=nocheck
conflict=nocheck
action=nocheck
basedir=default
```

You can override any of these options in two ways. First you can optionally pass any of the options as a kwarg to the module/state to override the default value or you can optionally pass the 'admin_source' option providing your own adminfile to the minions.

Note: You can find all of the possible options to provide to the adminfile by reading the admin man page:

```
man -s 4 admin
```

Multiple Package Options:

pkgs

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove SUNWgit
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.solarispkg.`**`upgrade_available`**(*name*, ***kwargs*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.solarispkg.`**`version`**(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

26.6.195 salt.modules.sqlite3

Support for SQLite3

`salt.modules.sqlite3.`**`fetch`**`(`*db=None, sql=None*`)`

Retrieve data from an sqlite3 db (returns all rows, be careful!)

CLI Example:

```
salt '*' sqlite3.fetch /root/test.db 'SELECT * FROM test;'
```

`salt.modules.sqlite3.`**`indexes`**`(`*db=None*`)`

Show all indices in the database, for people with poor spelling skills

CLI Example:

```
salt '*' sqlite3.indexes /root/test.db
```

`salt.modules.sqlite3.`**`indices`**`(`*db=None*`)`

Show all indices in the database

CLI Example:

```
salt '*' sqlite3.indices /root/test.db
```

`salt.modules.sqlite3.`**`modify`**`(`*db=None, sql=None*`)`

Issue an SQL query to sqlite3 (with no return data), usually used to modify the database in some way (insert, delete, create, etc)

CLI Example:

```
salt '*' sqlite3.modify /root/test.db 'CREATE TABLE test(id INT, testdata␣
↪TEXT);'
```

`salt.modules.sqlite3.`**`sqlite_version`**`()`

Return version of sqlite

CLI Example:

```
salt '*' sqlite3.sqlite_version
```

`salt.modules.sqlite3.`**`tables`**`(`*db=None*`)`

Show all tables in the database

CLI Example:

```
salt '*' sqlite3.tables /root/test.db
```

`salt.modules.sqlite3.`**`version`**`()`

Return version of pysqlite

CLI Example:

```
salt '*' sqlite3.version
```

26.6.196 salt.modules.ssh

Manage client ssh components

Note: This module requires the use of MD5 hashing. Certain security audits may not permit the use of MD5. For those cases, this module should be disabled or removed.

`salt.modules.ssh.`**`auth_keys`**`(`*user=None, config='.ssh/authorized_keys', fingerprint_hash_type=None*`)`

Return the authorized keys for users

CLI Example:

```
salt '*' ssh.auth_keys
salt '*' ssh.auth_keys root
salt '*' ssh.auth_keys user=root
salt '*' ssh.auth_keys user="[user1, user2]"
```

`salt.modules.ssh.`**`check_key`**`(`*user, key, enc, comment, options, config='.ssh/authorized_keys', cache_keys=None, fingerprint_hash_type=None*`)`

Check to see if a key needs updating, returns "update", "add" or "exists"

CLI Example:

```
salt '*' ssh.check_key <user> <key> <enc> <comment> <options>
```

`salt.modules.ssh.`**`check_key_file`**`(`*user, source, config='.ssh/authorized_keys', saltenv='base', fingerprint_hash_type=None*`)`

Check a keyfile from a source destination against the local keys and return the keys to change

CLI Example:

```
salt '*' ssh.check_key_file root salt://ssh/keyfile
```

`salt.modules.ssh.`**`check_known_host`**`(`*user=None, hostname=None, key=None, fingerprint=None, config=None, port=None, fingerprint_hash_type=None*`)`

Check the record in known_hosts file, either by its value or by fingerprint (it's enough to set up either key or fingerprint, you don't need to set up both).

If provided key or fingerprint doesn't match with stored value, return "update", if no value is found for a given host, return "add", otherwise return "exists".

If neither key, nor fingerprint is defined, then additional validation is not performed.

CLI Example:

```
salt '*' ssh.check_known_host <user> <hostname> key='AAAA...FAaQ=='
```

`salt.modules.ssh.`**`get_known_host_entries`**`(`*user, hostname, config=None, port=None, fingerprint_hash_type=None*`)`

New in version 2018.3.0.

Return information about known host entries from the configfile, if any. If there are no entries for a matching hostname, return None.

CLI Example:

```
salt '*' ssh.get_known_host_entries <user> <hostname>
```

`salt.modules.ssh.`**`hash_known_hosts`**(*user=None*, *config=None*)

Hash all the hostnames in the known hosts file.

New in version 2014.7.0.

user
: hash known hosts of this user

config
: path to known hosts file: can be absolute or relative to user's home directory

CLI Example:

```
salt '*' ssh.hash_known_hosts
```

`salt.modules.ssh.`**`host_keys`**(*keydir=None*, *private=True*, *certs=True*)

Return the minion's host keys

CLI Example:

```
salt '*' ssh.host_keys
salt '*' ssh.host_keys keydir=/etc/ssh
salt '*' ssh.host_keys keydir=/etc/ssh private=False
salt '*' ssh.host_keys keydir=/etc/ssh certs=False
```

`salt.modules.ssh.`**`key_is_encrypted`**(*key*)

New in version 2015.8.7.

Function to determine whether or not a private key is encrypted with a passphrase.

Checks key for a `Proc-Type` header with `ENCRYPTED` in the value. If found, returns `True`, otherwise returns `False`.

CLI Example:

```
salt '*' ssh.key_is_encrypted /root/id_rsa
```

`salt.modules.ssh.`**`recv_known_host_entries`**(*hostname*, *enc=None*, *port=None*, *hash_known_hosts=True*, *timeout=5*, *fingerprint_hash_type=None*)

New in version 2018.3.0.

Retrieve information about host public keys from remote server

hostname
: The name of the remote host (e.g. "github.com")

enc
: Defines what type of key is being used, can be ed25519, ecdsa, ssh-rsa, ssh-dss or any other type as of openssh server version 8.7.

port
: Optional parameter, denoting the port of the remote host on which an SSH daemon is running. By default the port 22 is used.

hash_known_hosts
: [True] Hash all hostnames and addresses in the known hosts file.

timeout
: [int] Set the timeout for connection attempts. If `timeout` seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

fingerprint_hash_type
: The fingerprint hash type that the public key fingerprints were originally hashed with. This defaults to `sha256` if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0: default changed from `md5` to `sha256`

CLI Example:

```
salt '*' ssh.recv_known_host_entries <hostname> enc=<enc> port=<port>
```

`salt.modules.ssh.`**`rm_auth_key`**(*user, key, config='.ssh/authorized_keys', fingerprint_hash_type=None*)

Remove an authorized key from the specified user's authorized key file

CLI Example:

```
salt '*' ssh.rm_auth_key <user> <key>
```

`salt.modules.ssh.`**`rm_auth_key_from_file`**(*user, source, config='.ssh/authorized_keys', saltenv='base', fingerprint_hash_type=None*)

Remove an authorized key from the specified user's authorized key file, using a file as source

CLI Example:

```
salt '*' ssh.rm_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.
↪pub
```

`salt.modules.ssh.`**`rm_known_host`**(*user=None, hostname=None, config=None, port=None*)

Remove all keys belonging to hostname from a known_hosts file.

CLI Example:

```
salt '*' ssh.rm_known_host <user> <hostname>
```

`salt.modules.ssh.`**`set_auth_key`**(*user, key, enc='ssh-rsa', comment='', options=None, config='.ssh/authorized_keys', cache_keys=None, fingerprint_hash_type=None*)

Add a key to the authorized_keys file. The "key" parameter must only be the string of text that is the encoded key. If the key begins with "ssh-rsa" or ends with user@host, remove those from the key before passing it to this function.

CLI Example:

```
salt '*' ssh.set_auth_key <user> '<key>' enc='dsa'
```

`salt.modules.ssh.`**`set_auth_key_from_file`**(*user, source, config='.ssh/authorized_keys', saltenv='base', fingerprint_hash_type=None*)

Add a key to the authorized_keys file, using a file as the source.

CLI Example:

```
salt '*' ssh.set_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.
↪pub
```

`salt.modules.ssh.`**`set_known_host`**(*user=None, hostname=None, fingerprint=None, key=None, port=None, enc=None, config=None, hash_known_hosts=True, timeout=5, fingerprint_hash_type=None*)

Download SSH public key from remote host "hostname", optionally validate its fingerprint against "fingerprint" variable and save the record in the known_hosts file.

If such a record does already exists in there, do nothing.

user
The user who owns the ssh authorized keys file to modify

hostname
The name of the remote host (e.g. "github.com")

fingerprint
The fingerprint of the key which must be present in the known_hosts file (optional if key specified)

key
The public key which must be presented in the known_hosts file (optional if fingerprint specified)

port
optional parameter, denoting the port of the remote host, which will be used in case, if the public key will be requested from it. By default the port 22 is used.

enc
Defines what type of key is being used, can be ed25519, ecdsa, ssh-rsa, ssh-dss or any other type as of openssh server version 8.7.

config
The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/known_hosts". If no user is specified, defaults to "/etc/ssh/ssh_known_hosts". If present, must be an absolute path when a user is not specified.

hash_known_hosts
[True] Hash all hostnames and addresses in the known hosts file.

timeout
[int] Set the timeout for connection attempts. If `timeout` seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

New in version 2016.3.0.

fingerprint_hash_type
The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to `sha256` if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0: default changed from `md5` to `sha256`

CLI Example:

```
salt '*' ssh.set_known_host <user> fingerprint='xx:xx:..:xx' enc='ssh-rsa
↪' config='.ssh/known_hosts'
```

`salt.modules.ssh.`**`user_keys`**(*user=None, pubfile=None, prvfile=None*)

Return the user's ssh keys on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' ssh.user_keys
salt '*' ssh.user_keys user=user1
salt '*' ssh.user_keys user=user1 pubfile=/home/user1/.ssh/id_rsa.pub
↪prvfile=/home/user1/.ssh/id_rsa
```

(continues on next page)

(continued from previous page)

```
salt '*' ssh.user_keys user=user1 prvfile=False
salt '*' ssh.user_keys user="['user1','user2'] pubfile=id_rsa.pub
↪prvfile=id_rsa
```

As you can see you can tell Salt not to read from the user's private (or public) key file by setting the file path to `False`. This can be useful to prevent Salt from publishing private data via Salt Mine or others.

26.6.197 salt.modules.ssh_pkg

Service support for the REST example

`salt.modules.ssh_pkg.`**`install`**`(`*name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs*`)`

`salt.modules.ssh_pkg.`**`list_pkgs`**`(`*versions_as_list=False, **kwargs*`)`

`salt.modules.ssh_pkg.`**`remove`**`(`*name=None, pkgs=None, **kwargs*`)`

26.6.198 salt.modules.ssh_service

Provide the service module for the proxy-minion SSH sample .. versionadded:: 2015.8.2

`salt.modules.ssh_service.`**`enabled`**`(`*name, sig=None*`)`

Only the 'redbull' service is 'enabled' in the test

`salt.modules.ssh_service.`**`get_all`**`()`

Return a list of all available services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.ssh_service.`**`list_`**`()`

Return a list of all available services.

CLI Example:

```
salt '*' service.list
```

`salt.modules.ssh_service.`**`restart`**`(`*name, sig=None*`)`

Restart the specified service with rest_sample

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.ssh_service.`**`running`**`(`*name, sig=None*`)`

Return whether this service is running.

`salt.modules.ssh_service.`**`start`**`(`*name, sig=None*`)`

Start the specified service on the ssh_sample

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.ssh_service.**status**(*name*, *sig=None*)

Return the status for a service via ssh_sample. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Parameters

- **name** (*str*) -- The name of the service to check
- **sig** (*str*) -- Not implemented

Returns

True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type

bool

CLI Example:

```
salt '*' service.status <service name>
```

salt.modules.ssh_service.**stop**(*name*, *sig=None*)

Stop the specified service on the rest_sample

CLI Example:

```
salt '*' service.stop <service name>
```

26.6.199 salt.modules.state

Control the state system on the minion.

State Caching

When a highstate is called, the minion automatically caches a copy of the last high data. If you then run a highstate with cache=True it will use that cached highdata and won't hit the fileserver except for `salt://` links in the states themselves.

salt.modules.state.**apply_**(*mods=None*, ***kwargs*)

New in version 2015.5.0.

This function will call *state.highstate* or *state.sls* based on the arguments passed to this function. It exists as a more intuitive way of applying states.

APPLYING ALL STATES CONFIGURED IN TOP.SLS (A.K.A. HIGHSTATE)

To apply all configured states, simply run `state.apply` with no SLS targets, like so:

```
salt '*' state.apply
```

The following additional arguments are also accepted when applying all states configured in top.sls:

test

Run states in test-only (dry-run) mode

mock
The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

pillar
Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.apply stuff pillar='{"foo": "bar"}'
```

Note: Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

---

exclude
Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing `sls` or `id` keys. Glob-patterns may be used to match multiple states.

```
salt '*' state.apply exclude=bar,baz
salt '*' state.apply exclude=foo*
salt '*' state.apply exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_
↪to_exclude'}]"
```

queue
[False] Instead of failing immediately when another state run is in progress, a value of `True` will queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

Changed in version 3006.0: This parameter can also be set via the `state_queue` configuration option. Additionally, it can now be set to an integer representing the maximum queue size which can be attained before the state runs will fail to be queued. This can prevent runaway conditions where new threads are started until system performance is hampered.

localconfig
Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

```
salt '*' state.apply localconfig=/path/to/minion.yml
```

state_events
The state_events option sends progress events as each function in a state run completes execution.

New in version 3006.0.

APPLYING INDIVIDUAL SLS FILES (A.K.A. `STATE.SLS`)

To apply individual SLS files, pass them as a comma-separated list:

```
# Run the states configured in salt://stuff.sls (or salt://stuff/init.sls)
salt '*' state.apply stuff

# Run the states configured in salt://stuff.sls (or salt://stuff/init.sls)
# and salt://pkgs.sls (or salt://pkgs/init.sls).
salt '*' state.apply stuff,pkgs
```

(continues on next page)

(continued from previous page)

```
# Run the states configured in a more deeply nested directory such as␣
↪salt://my/organized/stuff.sls (or salt://my/organized/stuff/init.sls)
salt '*' state.apply my.organized.stuff
```

The following additional arguments are also accepted when applying individual SLS files:

test
Run states in test-only (dry-run) mode

mock
The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

pillar
Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.apply stuff pillar='{"foo": "bar"}'
```

Note: Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

---

queue
[False] Instead of failing immediately when another state run is in progress, a value of `True` will queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

Changed in version 3006.0: This parameter can also be set via the `state_queue` configuration option. Additionally, it can now be set to an integer representing the maximum queue size which can be attained before the state runs will fail to be queued. This can prevent runaway conditions where new threads are started until system performance is hampered.

concurrent
[False] Execute state runs concurrently instead of serially

Warning: This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do *not* use this flag for performance optimization.

saltenv
Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from `env` to `saltenv`

Changed in version 2014.7.0: If no saltenv is specified, the minion config will be checked for an `environment` parameter and if found, it will be used. If none is found, `base` will be used. In prior releases, the minion config was not checked and `base` would always be assumed when the saltenv was not explicitly set.

pillarenv
Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the *`pillarenv`* option. When neither the *`pillarenv`* minion config option nor this CLI argument is used, all Pillar environments will be merged together.

localconfig
Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

```
salt '*' state.apply stuff localconfig=/path/to/minion.yml
```

sync_mods

If specified, the desired custom module types will be synced prior to running the SLS files:

```
salt '*' state.apply stuff sync_mods=states,modules
salt '*' state.apply stuff sync_mods=all
```

Note: This option is ignored when no SLS files are specified, as a *highstate* automatically syncs all custom module types.

New in version 2017.7.8,2018.3.3,2019.2.0.

state_events

The state_events option sends progress events as each function in a state run completes execution.

New in version 3006.0.

`salt.modules.state.`**`check_request`**`(`*name=None*`)`

New in version 2015.5.0.

Return the state request information, if any

CLI Example:

```
salt '*' state.check_request
```

`salt.modules.state.`**`clear_cache`**`()`

Clear out cached state files, forcing even cache runs to refresh the cache on the next state execution.

Remember that the state cache is completely disabled by default, this execution only applies if cache=True is used in states

CLI Example:

```
salt '*' state.clear_cache
```

`salt.modules.state.`**`clear_request`**`(`*name=None*`)`

New in version 2015.5.0.

Clear out the state execution request without executing it

CLI Example:

```
salt '*' state.clear_request
```

`salt.modules.state.`**`disable`**`(`*states*`)`

Disable state runs.

CLI Example:

```
salt '*' state.disable highstate

salt '*' state.disable highstate,test.succeed_without_changes
```

Note: To disable a state file from running provide the same name that would be passed in a state.sls call.

salt '*' state.disable bind.config

`salt.modules.state.`**`enable`**`(`*states*`)`

Enable state function or sls run

CLI Example:

```
salt '*' state.enable highstate

salt '*' state.enable test.succeed_without_changes
```

Note: To enable a state file from running provide the same name that would be passed in a state.sls call.

salt '*' state.disable bind.config

`salt.modules.state.`**`event`**`(`*tagmatch='*', count=-1, quiet=False, sock_dir=None, pretty=False, node='minion'*`)`

Watch Salt's event bus and block until the given tag is matched

New in version 2016.3.0.

Changed in version 2019.2.0: `tagmatch` can now be either a glob or regular expression.

This is useful for utilizing Salt's event bus from shell scripts or for taking simple actions directly from the CLI.

Enable debug logging to see ignored events.

Parameters

- **`tagmatch`** -- the event is written to stdout for each tag that matches this glob or regular expression.
- **`count`** -- this number is decremented for each event that matches the `tagmatch` parameter; pass `-1` to listen forever.
- **`quiet`** -- do not print to stdout; just block
- **`sock_dir`** -- path to the Salt master's event socket file.
- **`pretty`** -- Output the JSON all on a single line if `False` (useful for shell tools); pretty-print the JSON output if `True`.
- **`node`** -- Watch the minion-side or master-side event bus.

CLI Example:

```
salt-call --local state.event pretty=True
```

`salt.modules.state.`**`get_pauses`**`(`*jid=None*`)`

Get a report on all of the currently paused state runs and pause run settings. Optionally send in a jid if you only desire to see a single pause data set.

`salt.modules.state.`**`high`**`(`*data, test=None, queue=None, **kwargs*`)`

Execute the compound calls stored in a single set of high data

This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.

CLI Example:

```
salt '*' state.high '{"vim": {"pkg": ["installed"]}}'
```

`salt.modules.state.`**`highstate`**`(`*test=None, queue=None, state_events=None, **kwargs*`)`

Retrieve the state data from the salt master for this minion and execute it

test
Run states in test-only (dry-run) mode

pillar
Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.highstate stuff pillar='{"foo": "bar"}'
```

Note: Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See *here* for details.

pillar_enc
Specify which renderer to use to decrypt encrypted data located within the `pillar` value. Currently, only `gpg` is supported.

New in version 2016.3.0.

exclude
Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing `sls` or `id` keys. Glob-patterns may be used to match multiple states.

```
salt '*' state.highstate exclude=bar,baz
salt '*' state.highstate exclude=foo*
salt '*' state.highstate exclude="[{'id': 'id_to_exclude'}, {'sls':
↪'sls_to_exclude'}]"
```

saltenv
Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from `env` to `saltenv`.

Changed in version 2014.7.0: If no saltenv is specified, the minion config will be checked for a `saltenv` parameter and if found, it will be used. If none is found, `base` will be used. In prior releases, the minion config was not checked and `base` would always be assumed when the saltenv was not explicitly set.

pillarenv
Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the *`pillarenv`* option. When neither the *`pillarenv`* minion config option nor this CLI argument is used, all Pillar environments will be merged together.

queue
[False] Instead of failing immediately when another state run is in progress, a value of `True` will queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

Changed in version 3006.0: This parameter can also be set via the `state_queue` configuration option. Additionally, it can now be set to an integer representing the maximum queue size which can be attained before the state runs will fail to be queued. This can prevent runaway conditions where new threads are started until system performance is hampered.

concurrent
[False] Execute state runs concurrently instead of serially

Warning: This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do *not* use this flag for performance optimization.

localconfig
Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

mock
The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

state_events
The state_events option sends progress events as each function in a state run completes execution.

New in version 3006.0.

CLI Examples:

```
salt '*' state.highstate

salt '*' state.highstate whitelist=sls1_to_run,sls2_to_run
salt '*' state.highstate exclude=sls_to_exclude
salt '*' state.highstate exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_
↪to_exclude'}]"

salt '*' state.highstate pillar="{foo: 'Foo!', bar: 'Bar!'}"
```

`salt.modules.state.`**`id_exists`**(*ids*, *mods*, *test=None*, *queue=None*, ***kwargs*)

Tests for the existence of a specific ID or list of IDs within the specified SLS file(s). Similar to *`state.sls_exists`*, returns True or False. The default environment is base``, use `saltenv` to specify a different environment.

New in version 2019.2.0.

saltenv
Specify a salt fileserver environment from which to look for the SLS files specified in the `mods` argument

CLI Example:

```
salt '*' state.id_exists create_myfile,update_template filestate
↪saltenv=dev
```

`salt.modules.state.`**`list_disabled`**()

List the states which are currently disabled

CLI Example:

```
salt '*' state.list_disabled
```

`salt.modules.state.`**`low`**(*data*, *queue=None*, ***kwargs*)

Execute a single low data call

This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.

CLI Example:

```
salt '*' state.low '{"state": "pkg", "fun": "installed", "name": "vi"}'
```

`salt.modules.state.`**`orchestrate`**(*mods*, *saltenv='base'*, *test=None*, *exclude=None*, *pillar=None*, *pillarenv=None*)

New in version 2016.11.0.

Execute the orchestrate runner from a masterless minion.

See also:

More Orchestrate documentation
- *Full Orchestrate Tutorial*
- Docs for the salt state module `salt.states.saltmod`

CLI Examples:

```
salt-call --local state.orchestrate webserver
salt-call --local state.orchestrate webserver saltenv=dev test=True
salt-call --local state.orchestrate webserver saltenv=dev pillarenv=aws
```

`salt.modules.state.`**`pause`**(*jid*, *state_id=None*, *duration=None*)

Set up a state id pause, this instructs a running state to pause at a given state id. This needs to pass in the jid of the running state and can optionally pass in a duration in seconds. If a state_id is not passed then the jid referenced will be paused at the beginning of the next state run.

The given state id is the id got a given state execution, so given a state that looks like this:

```
vim:
  pkg.installed: []
```

The state_id to pass to *pause* is *vim*

CLI Examples:

```
salt '*' state.pause 20171130110407769519
salt '*' state.pause 20171130110407769519 vim
salt '*' state.pause 20171130110407769519 vim 20
```

`salt.modules.state.`**`pkg`**(*pkg_path*, *pkg_sum*, *hash_type*, *test=None*, ***kwargs*)

Execute a packaged state run, the packaged state run will exist in a tarball available locally. This packaged state can be generated using salt-ssh.

CLI Example:

```
salt '*' state.pkg /tmp/salt_state.tgz 760a9353810e36f6d81416366fc426dc
↪md5
```

`salt.modules.state.`**`request`**(*mods=None*, ***kwargs*)

New in version 2015.5.0.

Request that the local admin execute a state run via *salt-call state.run_request*. All arguments match those of state.apply.

CLI Example:

```
salt '*' state.request
salt '*' state.request stuff
salt '*' state.request stuff,pkgs
```

`salt.modules.state.`**`resume`**(*jid*, *state_id=None*)

Remove a pause from a jid, allowing it to continue. If the state_id is not specified then the a general pause will be resumed.

The given state_id is the id got a given state execution, so given a state that looks like this:

```
vim:
  pkg.installed: []
```

The state_id to pass to *rm_pause* is *vim*

CLI Examples:

```
salt '*' state.resume 20171130110407769519
salt '*' state.resume 20171130110407769519 vim
```

`salt.modules.state.`**`run_request`**`(`*name='default'*, ***kwargs*`)`

New in version 2015.5.0.

Execute the pending state request

CLI Example:

```
salt '*' state.run_request
```

`salt.modules.state.`**`running`**`(`*concurrent=False*`)`

Return a list of strings that contain state return data if a state function is already running. This function is used to prevent multiple state calls from being run at the same time.

CLI Example:

```
salt '*' state.running
```

`salt.modules.state.`**`show_highstate`**`(`*queue=None*, ***kwargs*`)`

Retrieve the highstate data from the salt master and display it

Custom Pillar data can be passed with the `pillar` kwarg.

CLI Example:

```
salt '*' state.show_highstate
```

`salt.modules.state.`**`show_low_sls`**`(`*mods*, *test=None*, *queue=None*, ***kwargs*`)`

Display the low data from a specific sls. The default environment is `base`, use `saltenv` to specify a different environment.

saltenv
Specify a salt fileserver environment to be used when applying states

pillar
Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.show_low_sls stuff pillar='{"foo": "bar"}'
```

Note: Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

pillarenv
Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the *`pillarenv`* option. When neither the *`pillarenv`* minion config option nor this CLI argument is used, all Pillar environments will be merged together.

CLI Example:

```
salt '*' state.show_low_sls foo
salt '*' state.show_low_sls foo saltenv=dev
```

`salt.modules.state.`**`show_lowstate`**`(`*queue=None*, ***kwargs*`)`

List out the low data that will be applied to this minion

CLI Example:

```
salt '*' state.show_lowstate
```

`salt.modules.state.`**`show_sls`**`(`*mods*, *test=None*, *queue=None*, ***kwargs*`)`

Display the state data from a specific sls or list of sls files on the master. The default environment is `base`, use `saltenv` to specify a different environment.

This function does not support topfiles. For `top.sls` please use `show_top` instead.

Custom Pillar data can be passed with the `pillar` kwarg.

saltenv
Specify a salt fileserver environment to be used when applying states

pillarenv
Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the *`pillarenv`* option. When neither the *`pillarenv`* minion config option nor this CLI argument is used, all Pillar environments will be merged together.

CLI Example:

```
salt '*' state.show_sls core,edit.vim saltenv=dev
```

`salt.modules.state.`**`show_state_usage`**`(`*queue=None*, ***kwargs*`)`

Retrieve the highstate data from the salt master to analyse used and unused states

Custom Pillar data can be passed with the `pillar` kwarg.

CLI Example:

```
salt '*' state.show_state_usage
```

`salt.modules.state.`**`show_states`**`(`*queue=None*, ***kwargs*`)`

Returns the list of states that will be applied on highstate.

CLI Example:

```
salt '*' state.show_states
```

New in version 2019.2.0.

`salt.modules.state.`**`show_top`**`(`*queue=None*, ***kwargs*`)`

Return the top data that the minion will use for a highstate

CLI Example:

```
salt '*' state.show_top
```

`salt.modules.state.`**`single`**`(`*fun*, *name*, *test=None*, *queue=None*, ***kwargs*`)`

Execute a single state function with the named kwargs, returns False if insufficient data is sent to the command

By default, the values of the kwargs will be parsed as YAML. So, you can specify lists values, or lists of single entry key-value maps, as you would in a YAML salt file. Alternatively, JSON format of keyword values is also supported.

CLI Example:

```
salt '*' state.single pkg.installed name=vim
```

`salt.modules.state.sls`(*mods*, *test=None*, *exclude=None*, *queue=None*, *sync_mods=None*, *state_events=None*, ***kwargs*)

Execute the states in one or more SLS files

test
Run states in test-only (dry-run) mode

pillar
Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.sls stuff pillar='{"foo": "bar"}'
```

Note: Values passed this way will override existing Pillar values set via `pillar_roots` or an external Pillar source. Pillar values that are not included in the kwarg will not be overwritten.

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See *here* for details.

pillar_enc
Specify which renderer to use to decrypt encrypted data located within the `pillar` value. Currently, only `gpg` is supported.

New in version 2016.3.0.

exclude
Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing `sls` or `id` keys. Glob-patterns may be used to match multiple states.

```
salt '*' state.sls foo,bar,baz exclude=bar,baz
salt '*' state.sls foo,bar,baz exclude=ba*
salt '*' state.sls foo,bar,baz exclude="[{'id': 'id_to_exclude'}, {
↪'sls': 'sls_to_exclude'}]"
```

queue
[False] Instead of failing immediately when another state run is in progress, a value of `True` will queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

Changed in version 3006.0: This parameter can also be set via the `state_queue` configuration option. Additionally, it can now be set to an integer representing the maximum queue size which can be attained before the state runs will fail to be queued. This can prevent runaway conditions where new threads are started until system performance is hampered.

concurrent
[False] Execute state runs concurrently instead of serially

Warning: This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do *not* use this flag for performance optimization.

saltenv
Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from `env` to `saltenv`.

Changed in version 2014.7.0: If no saltenv is specified, the minion config will be checked for an `environment` parameter and if found, it will be used. If none is found, `base` will be used. In prior releases, the minion config was not checked and `base` would always be assumed when the saltenv was not explicitly set.

pillarenv

Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the *`pillarenv`* option. When neither the *`pillarenv`* minion config option nor this CLI argument is used, all Pillar environments will be merged together.

localconfig

Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

mock

The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

sync_mods

If specified, the desired custom module types will be synced prior to running the SLS files:

```
salt '*' state.sls stuff sync_mods=states,modules
salt '*' state.sls stuff sync_mods=all
```

New in version 2017.7.8,2018.3.3,2019.2.0.

state_events

The state_events option sends progress events as each function in a state run completes execution.

New in version 3006.0.

CLI Example:

```
# Run the states configured in salt://example.sls (or salt://example/init.
↪sls)
salt '*' state.apply example

# Run the states configured in salt://core.sls (or salt://core/init.sls)
# and salt://edit/vim.sls (or salt://edit/vim/init.sls)
salt '*' state.sls core,edit.vim

# Run the states configured in a more deeply nested directory such as
↪salt://my/nested/state.sls (or salt://my/nested/state/init.sls)
salt '*' state.sls my.nested.state

salt '*' state.sls core exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_
↪to_exclude'}]"
salt '*' state.sls myslsfile pillar="{foo: 'Foo!', bar: 'Bar!'}"
```

`salt.modules.state.`**`sls_exists`**(*mods*, *test=None*, *queue=None*, ***kwargs*)

Tests for the existence of a specific SLS or list of SLS files on the master. Similar to *`state.show_sls`*, rather than returning state details, returns True or False. The default environment is `base`, use `saltenv` to specify a different environment.

New in version 2019.2.0.

saltenv

Specify a salt fileserver environment from which to look for the SLS files specified in the `mods` argument

CLI Example:

```
salt '*' state.sls_exists core,edit.vim saltenv=dev
```

`salt.modules.state.`**`sls_id`**(*id_*, *mods*, *test=None*, *queue=None*, *state_events=None*, ***kwargs*)

Call a single ID from the named module(s) and handle all requisites

The state ID comes *before* the module ID(s) on the command line.

id

ID to call

mods

Comma-delimited list of modules to search for given id and its requisites

New in version 2014.7.0.

saltenv

[base] Specify a salt fileserver environment to be used when applying states

pillarenv

Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the *pillarenv* option. When neither the *pillarenv* minion config option nor this CLI argument is used, all Pillar environments will be merged together.

pillar

Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.sls_id my_state my_module pillar='{"foo": "bar"}'
```

Note: Values passed this way will override existing Pillar values set via `pillar_roots` or an external Pillar source. Pillar values that are not included in the kwarg will not be overwritten.

New in version 2018.3.0.

CLI Example:

```
salt '*' state.sls_id my_state my_module

salt '*' state.sls_id my_state my_module,a_common_module
```

`salt.modules.state.`**`soft_kill`**(*jid*, *state_id=None*)

Set up a state run to die before executing the given state id, this instructs a running state to safely exit at a given state id. This needs to pass in the jid of the running state. If a state_id is not passed then the jid referenced will be safely exited at the beginning of the next state run.

The given state id is the id got a given state execution, so given a state that looks like this:

```
vim:
  pkg.installed: []
```

The state_id to pass to *soft_kill* is *vim*

CLI Examples:

```
salt '*' state.soft_kill 20171130110407769519
salt '*' state.soft_kill 20171130110407769519 vim
```

`salt.modules.state.`**`template`**(*tem*, *queue=None*, ***kwargs*)

Execute the information stored in a template file on the minion.

This function does not ask a master for a SLS file to render but instead directly processes the file at the provided path on the minion.

CLI Example:

```
salt '*' state.template '<Path to template on the minion>'
```

`salt.modules.state.`**`template_str`**`(`*tem*, *queue=None*, ***kwargs*`)`

Execute the information stored in a string from an sls template

CLI Example:

```
salt '*' state.template_str '<Template String>'
```

`salt.modules.state.`**`test`**`(`**args*, ***kwargs*`)`

New in version 3001.

Alias for *state.apply* with the kwarg *test* forced to *True*.

This is a nicety to avoid the need to type out *test=True* and the possibility of a typo causing changes you do not intend.

`salt.modules.state.`**`top`**`(`*topfn*, *test=None*, *queue=None*, ***kwargs*`)`

Execute a specific top file instead of the default. This is useful to apply configurations from a different environment (for example, dev or prod), without modifying the default top file.

queue

[False] Instead of failing immediately when another state run is in progress, a value of `True` will queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

Changed in version 3006.0: This parameter can also be set via the `state_queue` configuration option. Additionally, it can now be set to an integer representing the maximum queue size which can be attained before the state runs will fail to be queued. This can prevent runaway conditions where new threads are started until system performance is hampered.

saltenv

Specify a salt fileserver environment to be used when applying states

pillarenv

Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the *`pillarenv`* option. When neither the *`pillarenv`* minion config option nor this CLI argument is used, all Pillar environments will be merged together.

New in version 2017.7.0.

CLI Example:

```
salt '*' state.top reverse_top.sls
salt '*' state.top prod_top.sls exclude=sls_to_exclude
salt '*' state.top dev_top.sls exclude="[{'id': 'id_to_exclude'}, {'sls':
↪'sls_to_exclude'}]"
```

26.6.200 salt.modules.status

Module for returning various status data about a minion. These data can be useful for compiling into stats later.

`salt.modules.status.`**`all_status`**`()`

Return a composite of all status data and info for this minion. Warning: There is a LOT here!

CLI Example:

```
salt '*' status.all_status
```

`salt.modules.status.`**`cpuinfo`**`()`

Changed in version 2016.3.2: Return the CPU info for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for NetBSD and OpenBSD

CLI Example:

```
salt '*' status.cpuinfo
```

`salt.modules.status.`**`cpustats`**`()`

Return the CPU stats for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```
salt '*' status.cpustats
```

`salt.modules.status.`**`custom`**`()`

Return a custom composite of status data and info for this minion, based on the minion config file. An example config like might be:

```
status.cpustats.custom: [ 'cpu', 'ctxt', 'btime', 'processes' ]
```

Where status refers to status.py, cpustats is the function where we get our data, and custom is this function It is followed by a list of keys that we want returned.

This function is meant to replace all_status(), which returns anything and everything, which we probably don't want.

By default, nothing is returned. Warning: Depending on what you include, there can be a LOT here!

CLI Example:

```
salt '*' status.custom
```

`salt.modules.status.`**`diskstats`**`()`

Changed in version 2016.3.2: Return the disk stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.diskstats
```

salt.modules.status.**diskusage**(**args*)

Return the disk usage for this minion

Usage:

```
salt '*' status.diskusage [paths and/or filesystem types]
```

CLI Example:

```
salt '*' status.diskusage         # usage for all filesystems
salt '*' status.diskusage / /tmp  # usage for / and /tmp
salt '*' status.diskusage ext?    # usage for ext[234] filesystems
salt '*' status.diskusage / ext?  # usage for / and all ext filesystems
```

salt.modules.status.**loadavg**()

Return the load averages for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.loadavg

:raises CommandExecutionError: If the system cannot report loadaverages␣
↪to Python
```

salt.modules.status.**master**(*master=None*, *connected=True*)

New in version 2014.7.0.

Return the connection status with master. Fire an event if the connection to master is not as expected. This function is meant to be run via a scheduled job from the minion. If master_ip is an FQDN/Hostname, it must be resolvable to a valid IPv4 address.

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.master
```

salt.modules.status.**meminfo**()

Return the memory info for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```
salt '*' status.meminfo
```

salt.modules.status.**netdev**()

Changed in version 2016.3.2: Return the network device stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.netdev
```

`salt.modules.status.`**`netstats`**`()`

Return the network stats for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```
salt '*' status.netstats
```

`salt.modules.status.`**`nproc`**`()`

Return the number of processing units available on this system

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for Darwin, FreeBSD and OpenBSD

CLI Example:

```
salt '*' status.nproc
```

`salt.modules.status.`**`pid`**`(`*sig*`)`

Return the PID or an empty string if the process is running or not. Pass a signature to use to find the process via ps. Note you can pass a Python-compatible regular expression to return all pids of processes matching the regexp.

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.pid <sig>
```

`salt.modules.status.`**`ping_master`**`(`*master*`)`

New in version 2016.3.0.

Sends ping request to the given master. Fires '__master_failback' event on success. Returns bool result.

CLI Example:

```
salt '*' status.ping_master localhost
```

`salt.modules.status.`**`procs`**`()`

Return the process data

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.procs
```

`salt.modules.status.`**`proxy_reconnect`**`(`*proxy_name*, *opts=None*`)`

Forces proxy minion reconnection when not alive.

proxy_name
    The virtual name of the proxy module.

opts: **None**
    Opts dictionary. Not intended for CLI usage.

CLI Example:

```
salt '*' status.proxy_reconnect rest_sample
```

salt.modules.status.**time_**(*format='%A, %d. %B %Y %I:%M%p'*)

New in version 2016.3.0.

Return the current time on the minion, formatted based on the format parameter.

Default date format: Monday, 27. July 2015 07:55AM

CLI Example:

```
salt '*' status.time

salt '*' status.time '%s'
```

salt.modules.status.**uptime**()

Return the uptime for this system.

Changed in version 2015.8.9: The uptime function was changed to return a dictionary of easy-to-read key/value pairs containing uptime information, instead of the output from a `cmd.run` call.

Changed in version 2016.11.0: Support for OpenBSD, FreeBSD, NetBSD, MacOS, and Solaris

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.uptime
```

salt.modules.status.**version**()

Return the system version for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```
salt '*' status.version
```

salt.modules.status.**vmstats**()

Changed in version 2016.3.2: Return the virtual memory stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.vmstats
```

salt.modules.status.**w**()

Return a list of logged in users for this minion, using the w command

CLI Example:

```
salt '*' status.w
```

26.6.201 salt.modules.supervisord

Provide the service module for system supervisord or supervisord in a virtualenv

`salt.modules.supervisord.`**`add`**`(`*name*, *user=None*, *conf_file=None*, *bin_env=None*`)`

Activates any updates in config for process/group.

user
user to run supervisorctl as

conf_file
path to supervisord config file

bin_env
path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.add <name>
```

`salt.modules.supervisord.`**`custom`**`(`*command*, *user=None*, *conf_file=None*, *bin_env=None*`)`

Run any custom supervisord command

user
user to run supervisorctl as

conf_file
path to supervisord config file

bin_env
path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.custom "mstop '*gunicorn*'"
```

`salt.modules.supervisord.`**`options`**`(`*name*, *conf_file=None*`)`

New in version 2014.1.0.

Read the config file and return the config options for a given process

name
Name of the configured process

conf_file
path to supervisord config file

CLI Example:

```
salt '*' supervisord.options foo
```

`salt.modules.supervisord.`**`remove`**`(`*name*, *user=None*, *conf_file=None*, *bin_env=None*`)`

Removes process/group from active config

user
user to run supervisorctl as

conf_file
path to supervisord config file

bin_env
path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.remove <name>
```

`salt.modules.supervisord.`**`reread`**`(`*user=None*, *conf_file=None*, *bin_env=None*`)`

Reload the daemon's configuration files

user
user to run supervisorctl as

conf_file
path to supervisord config file

bin_env
path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.reread
```

`salt.modules.supervisord.`**`restart`**`(`*name='all', user=None, conf_file=None, bin_env=None*`)`

Restart the named service. Process group names should not include a trailing asterisk.

user
user to run supervisorctl as

conf_file
path to supervisord config file

bin_env
path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.restart <service>
salt '*' supervisord.restart <group>:
```

`salt.modules.supervisord.`**`start`**`(`*name='all', user=None, conf_file=None, bin_env=None*`)`

Start the named service. Process group names should not include a trailing asterisk.

user
user to run supervisorctl as

conf_file
path to supervisord config file

bin_env
path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.start <service>
salt '*' supervisord.start <group>:
```

`salt.modules.supervisord.`**`status`**`(`*name=None, user=None, conf_file=None, bin_env=None*`)`

List programs and its state

user
user to run supervisorctl as

conf_file
path to supervisord config file

bin_env
path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.status
```

`salt.modules.supervisord.`**`status_bool`**`(`*name, expected_state=None, user=None, conf_file=None, bin_env=None*`)`

Check for status of a specific supervisord process and return boolean result.

name
name of the process to check

expected_state
search for a specific process state. If set to `None` - any process state will match.

user
user to run supervisorctl as

conf_file
path to supervisord config file

bin_env
path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.status_bool nginx expected_state='RUNNING'
```

`salt.modules.supervisord.`**`status_raw`**(*name=None*, *user=None*, *conf_file=None*, *bin_env=None*)

Display the raw output of status

user
user to run supervisorctl as

conf_file
path to supervisord config file

bin_env
path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.status_raw
```

`salt.modules.supervisord.`**`stop`**(*name='all'*, *user=None*, *conf_file=None*, *bin_env=None*)

Stop the named service. Process group names should not include a trailing asterisk.

user
user to run supervisorctl as

conf_file
path to supervisord config file

bin_env
path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.stop <service>
salt '*' supervisord.stop <group>:
```

`salt.modules.supervisord.`**`update`**(*user=None*, *conf_file=None*, *bin_env=None*, *name=None*)

Reload config and add/remove/update as necessary

user
user to run supervisorctl as

conf_file
path to supervisord config file

bin_env
path to supervisorctl bin or path to virtualenv with supervisor installed

name
name of the process group to update. if none then update any process group that has changes

CLI Example:

```
salt '*' supervisord.update
```

26.6.202 salt.modules.sysfs

Module for interfacing with SysFS

See also:

https://www.kernel.org/doc/Documentation/filesystems/sysfs.txt

New in version 2016.3.0.

`salt.modules.sysfs.`**`attr`**`(`*key*, *value=None*`)`

Access/write a SysFS attribute. If the attribute is a symlink, its destination is returned

Returns

value or bool

CLI Example:

```
salt '*' sysfs.attr block/sda/queue/logical_block_size
```

`salt.modules.sysfs.`**`interfaces`**`(`*root*`)`

Generate a dictionary with all available interfaces relative to root. Symlinks are not followed.

CLI Example:

```
salt '*' sysfs.interfaces block/bcache0/bcache
```

Output example:

```
{
   "r": [
     "state",
     "partial_stripes_expensive",
     "writeback_rate_debug",
     "stripe_size",
     "dirty_data",
     "stats_total/cache_hits",
     "stats_total/cache_bypass_misses",
     "stats_total/bypassed",
     "stats_total/cache_readaheads",
     "stats_total/cache_hit_ratio",
     "stats_total/cache_miss_collisions",
     "stats_total/cache_misses",
     "stats_total/cache_bypass_hits",
   ],
   "rw": [
     "writeback_rate",
     "writeback_rate_update_seconds",
     "cache_mode",
     "writeback_delay",
     "label",
     "writeback_running",
     "writeback_metadata",
     "running",
     "writeback_rate_p_term_inverse",
     "sequential_cutoff",
     "writeback_percent",
     "writeback_rate_d_term",
```

(continues on next page)

(continued from previous page)

```
    "readahead"
  ],
  "w": [
    "stop",
    "clear_stats",
    "attach",
    "detach"
  ]
}
```

Note:

- 'r' interfaces are read-only
- 'w' interfaces are write-only (e.g. actions)
- 'rw' are interfaces that can both be read or written

`salt.modules.sysfs.`**`read`**`(`*key, root=''*`)`

Read from SysFS

Parameters

`key` -- file or path in SysFS; if key is a list then root will be prefixed on each key

Returns

the full (tree of) SysFS attributes under key

CLI Example:

```
salt '*' sysfs.read class/net/em1/statistics
```

`salt.modules.sysfs.`**`target`**`(`*key, full=True*`)`

Return the basename of a SysFS key path

Parameters

- **`key`** -- the location to resolve within SysFS
- **`full`** -- full path instead of basename

Returns

fullpath or basename of path

CLI Example:

```
salt '*' sysfs.read class/ttyS0
```

`salt.modules.sysfs.`**`write`**`(`*key, value*`)`

Write a SysFS attribute/action

CLI Example:

```
salt '*' sysfs.write devices/system/cpu/cpu0/cpufreq/scaling_
↪governor 'performance'
```

26.6.203 salt.modules.syslog_ng

Module for getting information about syslog-ng

maintainer
Tibor Benke <btibi@sch.bme.hu>

maturity
new

depends
cmd

platform
all

This module is capable of managing syslog-ng instances which were installed via a package manager or from source. Users can use a directory as a parameter in the case of most functions, which contains the syslog-ng and syslog-ng-ctl binaries.

Syslog-ng can be installed via a package manager or from source. In the latter case, the syslog-ng and syslog-ng-ctl binaries are not available from the PATH, so users should set location of the sbin directory with `syslog_ng.set_binary_path`.

Similarly, users can specify the location of the configuration file with `syslog_ng.set_config_file`, then the module will use it. If it is not set, syslog-ng uses the default configuration file.

class `salt.modules.syslog_ng.`**`Argument`**(*value=''*)

A TypedParameterValue has one or more Arguments. For example this can be the value of key_file.

Does not need examples.

`build`()

class `salt.modules.syslog_ng.`**`Buildable`**(*iterable*, *join_body_on=''*, *append_extra_newline=True*)

Base class of most classes, which have a build method.

It contains a common build function.

Does not need examples.

`build`()

Builds the textual representation of the whole configuration object with its children.

`build_body`()

Builds the body of a syslog-ng configuration object.

`build_header`()

Builds the header of a syslog-ng configuration object.

`build_tail`()

Builds the tail of a syslog-ng configuration object.

class `salt.modules.syslog_ng.`**`GivenStatement`**(*value*, *add_newline=True*)

This statement returns a string without modification. It can be used to
use existing configuration snippets.

Does not need examples.

`build`()

Builds the textual representation of the whole configuration object with its children.

class salt.modules.syslog_ng.**NamedStatement**(*type*, *id=''*, *options=None*)

It represents a configuration statement, which has a name, e.g. a source.

Does not need examples.

class salt.modules.syslog_ng.**Option**(*type=''*, *params=None*)

A Statement class contains Option instances.

An instance of Option can represent a file(), tcp(), udp(), etc. option.

Does not need examples.

add_parameter(*param*)

build()

Builds the textual representation of the whole configuration object with its children.

class salt.modules.syslog_ng.**Parameter**(*iterable=None*, *join_body_on=''*)

An Option has one or more Parameter instances.

Does not need examples.

class salt.modules.syslog_ng.**ParameterValue**(*iterable=None*, *join_body_on=''*)

A TypedParameter can have one or more values.

Does not need examples.

class salt.modules.syslog_ng.**SimpleParameter**(*value=''*)

A Parameter is a SimpleParameter, if it's just a simple type, like a string.

For example:

```
destination d_file {
    file(
        '/var/log/messages'
    );
};
```

`/var/log/messages` is a SimpleParameter.

Does not need examples.

build()

Builds the textual representation of the whole configuration object with its children.

class salt.modules.syslog_ng.**SimpleParameterValue**(*value=''*)

A ParameterValuem which holds a simple type, like a string or a number.

For example in ip(127.0.0.1) 127.0.0.1 is a SimpleParameterValue.

Does not need examples.

build()

Builds the textual representation of the whole configuration object with its children.

class salt.modules.syslog_ng.**Statement**(*type*, *id=''*, *options=None*, *has_name=True*)

It represents a syslog-ng configuration statement, e.g. source, destination, filter.

Does not need examples.

add_child(*option*)

build_header()

Builds the header of a syslog-ng configuration object.

build_tail()

Builds the tail of a syslog-ng configuration object.

exception salt.modules.syslog_ng.**SyslogNgError**

class salt.modules.syslog_ng.**TypedParameter**(*type='', values=None*)

A Parameter, which has a type:

```
destination d_tcp {
    tcp(
        ip(127.0.0.1)
    );
};
```

`ip(127.0.0.1)` is a TypedParameter.

Does not need examples.

add_value(*value*)

build()

Builds the textual representation of the whole configuration object with its children.

class salt.modules.syslog_ng.**TypedParameterValue**(*type='', arguments=None*)

We have to go deeper...

A TypedParameter can have a 'parameter', which also have a type. For example key_file and cert_file:

```
source demo_tls_source {
    tcp(
        ip(0.0.0.0)
        port(1999)
        tls(
            key_file('/opt/syslog-ng/etc/syslog-ng/key.d/syslog-ng.key')
            cert_file('/opt/syslog-ng/etc/syslog-ng/cert.d/syslog-ng.cert
↪')
        )
    );
};
```

Does not need examples.

add_argument(*arg*)

build()

Builds the textual representation of the whole configuration object with its children.

class salt.modules.syslog_ng.**UnnamedStatement**(*type, options=None*)

It represents a configuration statement, which doesn't have a name, e.g. a log path.

Does not need examples.

salt.modules.syslog_ng.**config**(*name, config, write=True*)

Builds syslog-ng configuration. This function is intended to be used from the state module, users should not use it directly!

name : the id of the Salt document or it is the format of <statement name>.id config : the parsed YAML code write : if True, it writes the config into the configuration file, otherwise just returns it

CLI Example:

```
salt '*' syslog_ng.config name='s_local' config="[{'tcp':[{'ip':'127.0.0.1
↪'},{'port':1233}]}]"
```

`salt.modules.syslog_ng.`**`config_test`**(*syslog_ng_sbin_dir=None*, *cfgfile=None*)

Runs syntax check against cfgfile. If syslog_ng_sbin_dir is specified, it is added to the PATH during the test.

CLI Example:

```
salt '*' syslog_ng.config_test
salt '*' syslog_ng.config_test /home/user/install/syslog-ng/sbin
salt '*' syslog_ng.config_test /home/user/install/syslog-ng/sbin /etc/
↪syslog-ng/syslog-ng.conf
```

`salt.modules.syslog_ng.`**`get_config_file`**()

Returns the configuration directory, which contains syslog-ng.conf.

CLI Example:

```
salt '*' syslog_ng.get_config_file
```

`salt.modules.syslog_ng.`**`modules`**(*syslog_ng_sbin_dir=None*)

Returns the available modules. If syslog_ng_sbin_dir is specified, it is added to the PATH during the execution of the command syslog-ng.

CLI Example:

```
salt '*' syslog_ng.modules
salt '*' syslog_ng.modules /home/user/install/syslog-ng/sbin
```

`salt.modules.syslog_ng.`**`reload_`**(*name*)

Reloads syslog-ng. This function is intended to be used from states.

If *`syslog_ng.set_config_file`*, is called before, this function will use the set binary path.

CLI Example:

```
salt '*' syslog_ng.reload
```

`salt.modules.syslog_ng.`**`set_binary_path`**(*name*)

Sets the path, where the syslog-ng binary can be found. This function is intended to be used from states.

If syslog-ng is installed via a package manager, users don't need to use this function.

CLI Example:

```
salt '*' syslog_ng.set_binary_path name=/usr/sbin
```

`salt.modules.syslog_ng.`**`set_config_file`**(*name*)

Sets the configuration's name. This function is intended to be used from states.

CLI Example:

```
salt '*' syslog_ng.set_config_file name=/etc/syslog-ng
```

salt.modules.syslog_ng.**set_parameters**(*version=None*, *binary_path=None*, *config_file=None*, **args*, ***kwargs*)

Sets variables.

CLI Example:

```
salt '*' syslog_ng.set_parameters version='3.6'
salt '*' syslog_ng.set_parameters  binary_path=/home/user/install/syslog-
↪ng/sbin config_file=/home/user/install/syslog-ng/etc/syslog-ng.conf
```

salt.modules.syslog_ng.**start**(*name=None*, *user=None*, *group=None*, *chroot=None*, *caps=None*, *no_caps=False*, *pidfile=None*, *enable_core=False*, *fd_limit=None*, *verbose=False*, *debug=False*, *trace=False*, *yydebug=False*, *persist_file=None*, *control=None*, *worker_threads=None*)

Ensures, that syslog-ng is started via the given parameters. This function is intended to be used from the state module.

Users shouldn't use this function, if the service module is available on their system. If `syslog_ng.set_config_file`, is called before, this function will use the set binary path.

CLI Example:

```
salt '*' syslog_ng.start
```

salt.modules.syslog_ng.**stats**(*syslog_ng_sbin_dir=None*)

Returns statistics from the running syslog-ng instance. If syslog_ng_sbin_dir is specified, it is added to the PATH during the execution of the command syslog-ng-ctl.

CLI Example:

```
salt '*' syslog_ng.stats
salt '*' syslog_ng.stats /home/user/install/syslog-ng/sbin
```

salt.modules.syslog_ng.**stop**(*name=None*)

Kills syslog-ng. This function is intended to be used from the state module.

Users shouldn't use this function, if the service module is available on their system. If `syslog_ng.set_config_file` is called before, this function will use the set binary path.

CLI Example:

```
salt '*' syslog_ng.stop
```

salt.modules.syslog_ng.**version**(*syslog_ng_sbin_dir=None*)

Returns the version of the installed syslog-ng. If syslog_ng_sbin_dir is specified, it is added to the PATH during the execution of the command syslog-ng.

CLI Example:

```
salt '*' syslog_ng.version
salt '*' syslog_ng.version /home/user/install/syslog-ng/sbin
```

`salt.modules.syslog_ng.`**`write_config`**`(`*config*, *newlines=2*`)`

Writes the given parameter config into the config file. This function is intended to be used from states.

If *`syslog_ng.set_config_file`*, is called before, this function will use the set config file.

CLI Example:

```
salt '*' syslog_ng.write_config config='# comment'
```

`salt.modules.syslog_ng.`**`write_version`**`(`*name*`)`

Removes the previous configuration file, then creates a new one and writes the name line. This function is intended to be used from states.

If *`syslog_ng.set_config_file`*, is called before, this function will use the set config file.

CLI Example:

```
salt '*' syslog_ng.write_version name="3.6"
```

26.6.204 salt.modules.sysmod

The sys module provides information about the available functions on the minion

`salt.modules.sysmod.`**`argspec`**`(`*module=''*`)`

Return the argument specification of functions in Salt execution modules.

CLI Example:

```
salt '*' sys.argspec pkg.install
salt '*' sys.argspec sys
salt '*' sys.argspec
```

Module names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.argspec 'pkg.*'
```

`salt.modules.sysmod.`**`doc`**`(`**args*`)`

Return the docstrings for all modules. Optionally, specify a module or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple modules/functions can be specified.

CLI Example:

```
salt '*' sys.doc
salt '*' sys.doc sys
salt '*' sys.doc sys.doc
salt '*' sys.doc network.traceroute user.info
```

Modules can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.doc 'sys.*'
salt '*' sys.doc 'sys.list_*'
```

salt.modules.sysmod.**list_functions**(**args, **kwargs*)

List the functions for all modules. Optionally, specify a module or modules from which to list.

CLI Example:

```
salt '*' sys.list_functions
salt '*' sys.list_functions sys
salt '*' sys.list_functions sys user
```

New in version 0.12.0.

```
salt '*' sys.list_functions 'module.specific_function'
```

Function names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_functions 'sys.list_*'
```

salt.modules.sysmod.**list_modules**(**args*)

List the modules loaded on the minion

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.list_modules
```

Module names can be specified as globs.

```
salt '*' sys.list_modules 's*'
```

salt.modules.sysmod.**list_renderers**(**args*)

List the renderers loaded on the minion

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.list_renderers
```

Render names can be specified as globs.

```
salt '*' sys.list_renderers 'yaml*'
```

salt.modules.sysmod.**list_returner_functions**(**args, **kwargs*)

List the functions for all returner modules. Optionally, specify a returner module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_returner_functions
salt '*' sys.list_returner_functions mysql
salt '*' sys.list_returner_functions mysql etcd
```

Returner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_returner_functions 'sqlite3.get_*'
```

salt.modules.sysmod.**list_returners**(**args*)

List the returners loaded on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_returners
```

Returner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_returners 's*'
```

salt.modules.sysmod.**list_runner_functions**(**args*, ***kwargs*)

List the functions for all runner modules. Optionally, specify a runner module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_runner_functions
salt '*' sys.list_runner_functions state
salt '*' sys.list_runner_functions state virt
```

Runner function names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_runner_functions 'state.*' 'virt.*'
```

salt.modules.sysmod.**list_runners**(**args*)

List the runners loaded on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_runners
```

Runner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_runners 'm*'
```

salt.modules.sysmod.**list_state_functions**(**args*, ***kwargs*)

List the functions for all state modules. Optionally, specify a state module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_state_functions
salt '*' sys.list_state_functions file
salt '*' sys.list_state_functions pkg user
```

State function names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_state_functions 'file.*'
salt '*' sys.list_state_functions 'file.s*'
```

New in version 2016.9.0.

```
salt '*' sys.list_state_functions 'module.specific_function'
```

`salt.modules.sysmod.`**`list_state_modules`**`(`**args*`)`

List the modules loaded on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_state_modules
```

State module names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_state_modules 'mysql_*'
```

`salt.modules.sysmod.`**`reload_modules`**`()`

Tell the minion to reload the execution modules

CLI Example:

```
salt '*' sys.reload_modules
```

`salt.modules.sysmod.`**`renderer_doc`**`(`**args*`)`

Return the docstrings for all renderers. Optionally, specify a renderer or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple renderers can be specified.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.renderer_doc
salt '*' sys.renderer_doc cheetah
salt '*' sys.renderer_doc jinja json
```

Renderer names can be specified as globs.

```
salt '*' sys.renderer_doc 'c*' 'j*'
```

`salt.modules.sysmod.`**`returner_argspec`**`(`*module=''*`)`

Return the argument specification of functions in Salt returner modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.returner_argspec xmpp
salt '*' sys.returner_argspec xmpp smtp
salt '*' sys.returner_argspec
```

Returner names can be specified as globs.

```
salt '*' sys.returner_argspec 'sqlite3.*'
```

`salt.modules.sysmod.`**`returner_doc`**`(`**args*`)`

Return the docstrings for all returners. Optionally, specify a returner or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple returners/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.returner_doc
salt '*' sys.returner_doc sqlite3
salt '*' sys.returner_doc sqlite3.get_fun
salt '*' sys.returner_doc sqlite3.get_fun etcd.get_fun
```

Returner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.returner_doc 'sqlite3.get_*'
```

`salt.modules.sysmod.`**`runner_argspec`**`(`*module=''*`)`

Return the argument specification of functions in Salt runner modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.runner_argspec state
salt '*' sys.runner_argspec http
salt '*' sys.runner_argspec
```

Runner names can be specified as globs.

```
salt '*' sys.runner_argspec 'winrepo.*'
```

`salt.modules.sysmod.`**`runner_doc`**`(`**args*`)`

Return the docstrings for all runners. Optionally, specify a runner or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple runners/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.runner_doc
salt '*' sys.runner_doc cache
```

(continues on next page)

(continued from previous page)

```
salt '*' sys.runner_doc cache.grains
salt '*' sys.runner_doc cache.grains mine.get
```

Runner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.runner_doc 'cache.clear_*'
```

`salt.modules.sysmod.`**`state_argspec`**`(`*module=''*`)`

Return the argument specification of functions in Salt state modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.state_argspec pkg.installed
salt '*' sys.state_argspec file
salt '*' sys.state_argspec
```

State names can be specified as globs.

```
salt '*' sys.state_argspec 'pkg.*'
```

`salt.modules.sysmod.`**`state_doc`**`(`**args*`)`

Return the docstrings for all states. Optionally, specify a state or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple states/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.state_doc
salt '*' sys.state_doc service
salt '*' sys.state_doc service.running
salt '*' sys.state_doc service.running ipables.append
```

State names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.state_doc 'service.*' 'iptables.*'
```

`salt.modules.sysmod.`**`state_schema`**`(`*module=''*`)`

Return a JSON Schema for the given state function(s)

New in version 2016.3.0.

CLI Example:

```
salt '*' sys.state_schema
salt '*' sys.state_schema pkg.installed
```

26.6.205 salt.modules.system

Support for reboot, shutdown, etc on POSIX-like systems.

Note: If a wrapper such as `molly-guard` to intercept *interactive* shutdown commands is configured, calling `system.halt`, `system.poweroff`, `system.reboot`, and `system.shutdown` with `salt-call` will hang indefinitely while the wrapper script waits for user input. Calling them with `salt` will work as expected.

`salt.modules.system.`**`get_computer_desc`**`()`

Get `PRETTY_HOSTNAME` value stored in `/etc/machine-info` If this file doesn't exist or the variable doesn't exist return `False`.

Returns

Value of `PRETTY_HOSTNAME` in `/etc/machine-info`. If file/variable does not exist `False`.

Return type

str

CLI Example:

```
salt '*' system.get_computer_desc
```

`salt.modules.system.`**`get_computer_name`**`()`

Get hostname.

CLI Example:

```
salt '*' system.get_computer_name
```

`salt.modules.system.`**`get_reboot_required_witnessed`**`()`

Note: This only applies to Minions running on NI Linux RT

Determine if at any time during the current boot session the salt minion witnessed an event indicating that a reboot is required.

Returns

`True` if the a reboot request was witnessed, `False` otherwise

Return type

bool

CLI Example:

```
salt '*' system.get_reboot_required_witnessed
```

`salt.modules.system.`**`get_system_date`**`(`*utc_offset=None*`)`

Get the system date

Parameters

`utc_offset` (*str*) -- The UTC offset in 4 digit (`+0600`) format with an optional sign (+/-). Will default to `None` which will use the local timezone. To set the time based off of UTC use `+0000`. Note: If being passed through the command line will need to be quoted twice to allow negative offsets (e.g. `"'+0000'"`).

Returns

Returns the system date.

Return type

str

CLI Example:

```
salt '*' system.get_system_date
```

`salt.modules.system.`**`get_system_date_time`**`(`*utc_offset=None*`)`

Get the system date/time.

Parameters

`utc_offset` (*str*) -- The UTC offset in 4 digit (`+0600`) format with an optional sign (`+/-`). Will default to `None` which will use the local timezone. To set the time based off of UTC use `+0000`. Note: If being passed through the command line will need to be quoted twice to allow negative offsets (e.g. `"'+0000'"`).

Returns

Returns the system time in `YYYY-MM-DD hh:mm:ss` format.

Return type

str

CLI Example:

```
salt '*' system.get_system_date_time "'-0500'"
```

`salt.modules.system.`**`get_system_time`**`(`*utc_offset=None*`)`

Get the system time.

Parameters

`utc_offset` (*str*) -- The UTC offset in 4 digit (e.g. `+0600`) format with an optional sign (`+/-`). Will default to `None` which will use the local timezone. To set the time based off of UTC use `+0000`. Note: If being passed through the command line will need to be quoted twice to allow negative offsets (e.g. `"'+0000'"`).

Returns

Returns the system time in `HH:MM:SS AM/PM` format.

Return type

str

CLI Example:

```
salt '*' system.get_system_time
```

`salt.modules.system.`**`halt`**`()`

Halt a running system

CLI Example:

```
salt '*' system.halt
```

`salt.modules.system.`**`has_settable_hwclock`**`()`

Returns `True` if the system has a hardware clock capable of being set from software.

CLI Example:

```
salt '*' system.has_settable_hwclock
```

`salt.modules.system.`**`init`**`(`*runlevel*`)`

Change the system runlevel on sysV compatible systems

CLI Example:

```
salt '*' system.init 3
```

`salt.modules.system.`**`poweroff`**`()`

Poweroff a running system

CLI Example:

```
salt '*' system.poweroff
```

`salt.modules.system.`**`reboot`**`(`*at_time=None*`)`

Reboot the system

at_time

The wait time in minutes before the system will be rebooted.

CLI Example:

```
salt '*' system.reboot
```

`salt.modules.system.`**`set_computer_desc`**`(`*desc*`)`

Set `PRETTY_HOSTNAME` value stored in `/etc/machine-info` This will create the file if it does not exist. If it is unable to create or modify this file, `False` is returned.

Parameters

`desc` (*`str`*) -- The computer description

Returns

`False` on failure. `True` if successful.

CLI Example:

```
salt '*' system.set_computer_desc "Michael's laptop"
```

`salt.modules.system.`**`set_computer_name`**`(`*hostname*`)`

Modify hostname.

CLI Example:

```
salt '*' system.set_computer_name master.saltstack.com
```

`salt.modules.system.`**`set_reboot_required_witnessed`**`()`

Note: This only applies to Minions running on NI Linux RT

This function is used to remember that an event indicating that a reboot is required was witnessed. This function writes to a temporary filesystem so the event gets cleared upon reboot.

Returns

`True` if successful, otherwise `False`

Return type

bool

CLI Example:

```
salt '*' system.set_reboot_required_witnessed
```

`salt.modules.system.`**`set_system_date`**`(`*newdate, utc_offset=None*`)`

Set the system date. Use `<mm-dd-yy>` format for the date.

Parameters

`newdate` (*`str`*) -- The date to set. Can be any of the following formats:

- `YYYY-MM-DD`
- `MM-DD-YYYY`
- `MM-DD-YY`

- `MM/DD/YYYY`
- `MM/DD/YY`
- `YYYY/MM/DD`

CLI Example:

```
salt '*' system.set_system_date '03-28-13'
```

`salt.modules.system.`**`set_system_date_time`**(*years=None, months=None, days=None, hours=None, minutes=None, seconds=None, utc_offset=None*)

Set the system date and time. Each argument is an element of the date, but not required. If an element is not passed, the current system value for that element will be used. For example, if the year is not passed, the current system year will be used. (Used by `system.set_system_date` and `system.set_system_time`)

Updates hardware clock, if present, in addition to software (kernel) clock.

Parameters

- **years** (`int`) -- Years digit, e.g.: `2015`
- **months** (`int`) -- Months digit: `1-12`
- **days** (`int`) -- Days digit: `1-31`
- **hours** (`int`) -- Hours digit: `0-23`
- **minutes** (`int`) -- Minutes digit: `0-59`
- **seconds** (`int`) -- Seconds digit: `0-59`
- **utc_offset** (`str`) -- The UTC offset in 4 digit (`+0600`) format with an optional sign (`+/-`). Will default to `None` which will use the local timezone. To set the time based off of UTC use `+0000`. Note: If being passed through the command line will need to be quoted twice to allow negative offsets (e.g. `"'+0000'"`).

Returns

`True` if successful. Otherwise `False`.

Return type

bool

CLI Example:

```
salt '*' system.set_system_date_time 2015 5 12 11 37 53 "'-0500'"
```

`salt.modules.system.`**`set_system_time`**(*newtime, utc_offset=None*)

Set the system time.

Parameters

- **newtime** (`str`) -- The time to set. Can be any of the following formats.
  - `HH:MM:SS AM/PM`
  - `HH:MM AM/PM`
  - `HH:MM:SS` (24 hour)
  - `HH:MM` (24 hour)

  Note that the Salt command line parser parses the date/time before we obtain the argument (preventing us from doing UTC) Therefore the argument must be passed in as a string. Meaning the text might have to be quoted twice on the command line.
- **utc_offset** (`str`) -- The UTC offset in 4 digit (`+0600`) format with an optional sign (`+/-`). Will default to `None` which will use the local timezone. To set the time based off of UTC use `+0000`. Note: If being passed through the command line will need to be quoted twice to allow negative offsets (e.g. `"'+0000'"`)

Returns

Returns `True` if successful. Otherwise `False`.

Return type

bool

CLI Example:

```
salt '*' system.set_system_time "'11:20'"
```

salt.modules.system.**shutdown**(*at_time=None*)

Shutdown a running system

at_time

The wait time in minutes before the system will be shutdown.

CLI Example:

```
salt '*' system.shutdown 5
```

26.6.206 salt.modules.systemd_service

Provides the service module for systemd

New in version 0.10.0.

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *'service.start' is not available*), see *here*.

Important: This is an implementation of virtual 'service' module. As such, you must call it under the name 'service' and NOT 'systemd'. You can see that also in the examples below.

---

salt.modules.systemd_service.**available**(*name*)

New in version 0.10.4.

Check that the given service is available taking into account template units.

CLI Example:

```
salt '*' service.available sshd
```

salt.modules.systemd_service.**disable**(*name, no_block=False, root=None, **kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a `config option` called `systemd.scope`, with a value of `False` (no quotes).

Disable the named service to not start when the system boots

no_block

[False] Set to `True` to start the service using `--no-block`.

New in version 2017.7.0.

root

Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.disable <service name>
```

salt.modules.systemd_service.**disabled**(*name, root=None*)

Return if the named service is disabled from starting on boot

root
Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.systemd_service.`**`enable`**(*name*, *no_block=False*, *unmask=False*, *unmask_runtime=False*, *root=None*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a `config option` called `systemd.scope`, with a value of `False` (no quotes).

Enable the named service to start when the system boots

no_block
[False] Set to `True` to start the service using `--no-block`.

New in version 2017.7.0.

unmask
[False] Set to `True` to remove an indefinite mask before attempting to enable the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before enabling. This behavior is no longer the default.

unmask_runtime
[False] Set to `True` to remove a runtime mask before attempting to enable the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before enabling. This behavior is no longer the default.

root
Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.systemd_service.`**`enabled`**(*name*, *root=None*, ***kwargs*)

Return if the named service is enabled to start on boot

root
Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.systemd_service.`**`execs`**(*root=None*)

New in version 2014.7.0.

Return a list of all files specified as `ExecStart` for all services.

root
Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.execs
```

`salt.modules.systemd_service.`**`firstboot`**(*locale=None*, *locale_message=None*, *keymap=None*, *timezone=None*, *hostname=None*, *machine_id=None*, *root=None*)

New in version 3001.

Call systemd-firstboot to configure basic settings of the system

locale
Set primary locale (LANG=)

locale_message
Set message locale (LC_MESSAGES=)

keymap
Set keymap

timezone
Set timezone

hostname
Set host name

machine_id
Set machine ID

root
Operate on an alternative filesystem root

CLI Example:

```
salt '*' service.firstboot keymap=jp locale=en_US.UTF-8
```

`salt.modules.systemd_service.`**`force_reload`**`(`*name, no_block=True, unmask=False, unmask_runtime=False*`)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

New in version 0.12.0.

Force-reload the specified service with systemd

no_block
[False] Set to `True` to start the service using `--no-block`.

New in version 2017.7.0.

unmask
[False] Set to `True` to remove an indefinite mask before attempting to force-reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before force-reloading. This behavior is no longer the default.

unmask_runtime
[False] Set to `True` to remove a runtime mask before attempting to force-reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before force-reloading. This behavior is no longer the default.

CLI Example:

```
salt '*' service.force_reload <service name>
```

`salt.modules.systemd_service.`**`get_all`**`(`*root=None*`)`

Return a list of all available services

root
Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.systemd_service.`**`get_disabled`**`(`*root=None*`)`

Return a list of all disabled services

root

Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.systemd_service.`**`get_enabled`**`(`*root=None*`)`

Return a list of all enabled services

root

Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.systemd_service.`**`get_running`**`()`

Return a list of all running services, so far as systemd is concerned

CLI Example:

```
salt '*' service.get_running
```

`salt.modules.systemd_service.`**`get_static`**`(`*root=None*`)`

New in version 2015.8.5.

Return a list of all static services

root

Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.get_static
```

`salt.modules.systemd_service.`**`mask`**`(`*name*, *runtime=False*, *root=None*`)`

New in version 2015.5.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Mask the specified service with systemd

runtime

[False] Set to `True` to mask this service only until the next reboot

New in version 2015.8.5.

root

Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.mask foo
salt '*' service.mask foo runtime=True
```

`salt.modules.systemd_service.`**`masked`**`(`*name*, *runtime=False*, *root=None*`)`

New in version 2015.8.0.

Changed in version 2015.8.5: The return data for this function has changed. If the service is masked, the return value will now be the output of the `systemctl is-enabled` command (so that a persistent mask can be distinguished from a runtime mask). If the service is not masked, then `False` will be returned.

Changed in version 2017.7.0: This function now returns a boolean telling the user whether a mask specified by the new `runtime` argument is set. If `runtime` is `False`, this function will return `True` if an indefinite mask is set for the named service (otherwise `False` will be returned). If `runtime` is `False`, this function will return `True` if a runtime mask is set, otherwise `False`.

Check whether or not a service is masked

runtime

[False] Set to `True` to check for a runtime mask

New in version 2017.7.0: In previous versions, this function would simply return the output of `systemctl is-enabled` when the service was found to be masked. However, since it is possible to both have both indefinite and runtime masks on a service simultaneously, this function now only checks for runtime masks if this argument is set to `True`. Otherwise, it will check for an indefinite mask.

root

Enable/disable/mask unit files in the specified root directory

CLI Examples:

```
salt '*' service.masked foo
salt '*' service.masked foo runtime=True
```

`salt.modules.systemd_service.`**`missing`**`(`*name*`)`

New in version 2014.1.0.

The inverse of `service.available`. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.systemd_service.`**`offline`**`()`

New in version 3004.

Check if systemd is working in offline mode, where is not possible to talk with PID 1.

CLI Example:

```
salt '*' service.offline
```

`salt.modules.systemd_service.`**`reload_`**`(`*name*, *no_block=False*, *unmask=False*, *unmask_runtime=False*`)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Reload the specified service with systemd

no_block

[False] Set to `True` to reload the service using `--no-block`.

New in version 2017.7.0.

unmask
[False] Set to `True` to remove an indefinite mask before attempting to reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before reloading. This behavior is no longer the default.

unmask_runtime
[False] Set to `True` to remove a runtime mask before attempting to reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before reloading. This behavior is no longer the default.

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.systemd_service.`**`restart`**`(`*name*, *no_block=False*, *unmask=False*, *unmask_runtime=False*`)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Restart the specified service with systemd

no_block
[False] Set to `True` to start the service using `--no-block`.

New in version 2017.7.0.

unmask
[False] Set to `True` to remove an indefinite mask before attempting to restart the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before restarting. This behavior is no longer the default.

unmask_runtime
[False] Set to `True` to remove a runtime mask before attempting to restart the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before restarting. This behavior is no longer the default.

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.systemd_service.`**`show`**`(`*name*, *root=None*`)`

New in version 2014.7.0.

Show properties of one or more units/jobs or the manager

root
Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.show <service name>
```

`salt.modules.systemd_service.`**`start`**`(`*name*, *no_block=False*, *unmask=False*, *unmask_runtime=False*`)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Start the specified service with systemd

no_block
[False] Set to `True` to start the service using `--no-block`.

New in version 2017.7.0.

unmask
[False] Set to `True` to remove an indefinite mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before starting. This behavior is no longer the default.

unmask_runtime
[False] Set to `True` to remove a runtime mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before starting. This behavior is no longer the default.

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.systemd_service.`**`status`**(*name*, *sig=None*)

Return the status for a service via systemd. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Parameters

- **name** (*str*) -- The name of the service to check
- **sig** (*str*) -- Not implemented

Returns
True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type
bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

`salt.modules.systemd_service.`**`stop`**(*name*, *no_block=False*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Stop the specified service with systemd

no_block
[False] Set to `True` to start the service using `--no-block`.

New in version 2017.7.0.

CLI Example:

```
salt '*' service.stop <service name>
```

`salt.modules.systemd_service.`**`systemctl_reload`**()

New in version 0.15.0.

Reloads systemctl, an action needed whenever unit files are updated.

CLI Example:

```
salt '*' service.systemctl_reload
```

`salt.modules.systemd_service.`**`unmask_`**`(`*name*, *runtime=False*, *root=None*`)`

New in version 2015.5.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Unmask the specified service with systemd

runtime

[False] Set to `True` to unmask this service only until the next reboot

New in version 2017.7.0: In previous versions, this function would remove whichever mask was identified by running `systemctl is-enabled` on the service. However, since it is possible to both have both indefinite and runtime masks on a service simultaneously, this function now removes a runtime mask only when this argument is set to `True`, and otherwise removes an indefinite mask.

root

Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.unmask foo
salt '*' service.unmask foo runtime=True
```

26.6.207 salt.modules.temp

Simple module for creating temporary directories and files

This is a thin wrapper around Pythons tempfile module

New in version 2015.8.0.

`salt.modules.temp.`**`dir`**`(`*suffix=''*, *prefix='tmp'*, *parent=None*`)`

Create a temporary directory

CLI Example:

```
salt '*' temp.dir
salt '*' temp.dir prefix='mytemp-' parent='/var/run/'
```

`salt.modules.temp.`**`file`**`(`*suffix=''*, *prefix='tmp'*, *parent=None*`)`

Create a temporary file

CLI Example:

```
salt '*' temp.file
salt '*' temp.file prefix='mytemp-' parent='/var/run/'
```

26.6.208 salt.modules.test

Module for running arbitrary tests

`salt.modules.test.`**`arg`**`(`**args*, ***kwargs*`)`

Print out the data passed into the function `*args` and `kwargs`, this is used to both test the publication data and CLI argument passing, but also to display the information available within the publication data.

Returns
`{"args": args, "kwargs": kwargs}`

Return type
dict

CLI Example:

```
salt '*' test.arg 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

`salt.modules.test.`**`arg_clean`**`(`**args*, ***kwargs*`)`

Like *`test.arg`* but cleans `kwargs` of the `__pub*` items

CLI Example:

```
salt '*' test.arg_clean 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

`salt.modules.test.`**`arg_repr`**`(`**args*, ***kwargs*`)`

Print out the data passed into the function `*args` and `kwargs`, this is used to both test the publication data and CLI argument passing, but also to display the information available within the publication data.

Returns
`{"args": repr(args), "kwargs": repr(kwargs)}`

CLI Example:

```
salt '*' test.arg_repr 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

`salt.modules.test.`**`arg_type`**`(`**args*, ***kwargs*`)`

Print out the types of the `args` and `kwargs`. This is used to test the types of the `args` and `kwargs` passed down to the Minion

Return type
dict

CLI Example:

```
salt '*' test.arg_type 1 'int'
```

`salt.modules.test.`**`assertion`**`(`*assertion*`)`

Assert the given argument

CLI Example:

```
salt '*' test.assertion False
```

`salt.modules.test.`**`attr_call`**`()`

Call grains.items via the attribute

CLI Example:

```
salt '*' test.attr_call
```

`salt.modules.test.`**`collatz`**`(`*start*`)`

Execute the collatz conjecture from the passed starting number, returns the sequence and the time it took to compute. Used for performance tests.

CLI Example:

```
salt '*' test.collatz 3
```

`salt.modules.test.`**`conf_test`**`()`

Return the value for test.foo in the minion configuration file, or return the default value

CLI Example:

```
salt '*' test.conf_test
```

`salt.modules.test.`**`cross_test`**`(`*func, args=None*`)`

Execute a minion function via the `__salt__` object in the test module, used to verify that the Minion functions can be called via the `__salt__` module.

CLI Example:

```
salt '*' test.cross_test file.gid_to_group 0
```

`salt.modules.test.`**`deprecation_warning`**`()`

Return True, but also produce two DeprecationWarnings. One by date, the other by the codename - release Oganesson, which should correspond to Salt 3108.

CLI Example:

```
salt \* test.deprecation_warning
```

`salt.modules.test.`**`echo`**`(`*text*`)`

Return a string - used for testing the connection

CLI Example:

```
salt '*' test.echo 'foo bar baz quo qux'
```

`salt.modules.test.`**`exception`**`(`*message='Test Exception'*`)`

Raise an exception

Optionally provide an error message or output the full stack.

CLI Example:

```
salt '*' test.exception 'Oh noes!'
```

`salt.modules.test.`**`false_`**`()`

Always return `False`

CLI Example:

```
salt '*' test.false
```

`salt.modules.test.`**`fib`**`(`*num*`)`

Return the `num`-th Fibonacci number, and the time it took to compute in seconds. Used for performance tests.

This function is designed to have terrible performance.

CLI Example:

```
salt '*' test.fib 3
```

`salt.modules.test.`**`get_opts`**`()`

Return the configuration options passed to this minion

CLI Example:

```
salt '*' test.get_opts
```

`salt.modules.test.`**`kwarg`**`(`***kwargs*`)`

Print out the data passed into the function `**kwargs`, this is used to both test the publication data and CLI `kwarg` passing, but also to display the information available within the publication data.

CLI Example:

```
salt '*' test.kwarg num=1 txt="two" env='{a: 1, b: "hello"}'
```

`salt.modules.test.`**`missing_func`**`()`

`salt.modules.test.`**`module_report`**`()`

Return a dict containing all of the execution modules with a report on the overall availability via different references

CLI Example:

```
salt '*' test.module_report
```

`salt.modules.test.`**`not_loaded`**`()`

List the modules that were not loaded by the salt loader system

CLI Example:

```
salt '*' test.not_loaded
```

`salt.modules.test.`**`opts_pkg`**`()`

Return an `opts` package with the `grains` and `opts` for this Minion. This is primarily used to create the options used for Master side state compiling routines

CLI Example:

```
salt '*' test.opts_pkg
```

`salt.modules.test.`**`outputter`**`(`*data*`)`

Test the outputter, pass in data to return

CLI Example:

```
salt '*' test.outputter foobar
```

`salt.modules.test.`**`ping`**`()`

Used to make sure the minion is up and responding. Not an ICMP ping.

Returns `True`.

CLI Example:

```
salt '*' test.ping
```

`salt.modules.test.`**`provider`**`(`*module*`)`

Pass in a function name to discover what provider is being used

CLI Example:

```
salt '*' test.provider service
```

`salt.modules.test.`**`providers`**`()`

Return a dict of the provider names and the files that provided them

CLI Example:

```
salt '*' test.providers
```

`salt.modules.test.`**`raise_exception`**`(`*name, *args, **kwargs*`)`

Raise an exception. Built-in exceptions and those in `salt.exceptions` can be raised by this test function. If no matching exception is found, then no exception will be raised and this function will return `False`.

This function is designed to test Salt's exception and return code handling.

CLI Example:

```
salt '*' test.raise_exception TypeError "An integer is required"
salt '*' test.raise_exception salt.exceptions.CommandExecutionError
↪"Something went wrong"
```

`salt.modules.test.`**`rand_sleep`**`(`*max=60*`)`

Sleep for a random number of seconds, used to test long-running commands and minions returning at differing intervals

CLI Example:

```
salt '*' test.rand_sleep 60
```

`salt.modules.test.`**`rand_str`**`(`*size=9999999999, hash_type=None*`)`

This function has been renamed to *`test.random_hash`*. This function will stay to ensure backwards compatibility, but please switch to using the preferred name *`test.random_hash`*.

`salt.modules.test.`**`random_hash`**`(`*size=9999999999, hash_type=None*`)`

New in version 2015.5.2.

Changed in version 2018.3.0: Function has been renamed from `test.rand_str` to `test.random_hash`

Generates a random number between 1 and `size`, then returns a hash of that number. If no `hash_type` is passed, the `hash_type` specified by the Minion's *`hash_type`* config option is used.

CLI Example:

```
salt '*' test.random_hash
salt '*' test.random_hash hash_type=sha512
```

`salt.modules.test.`**`retcode`**`(`*code=42*`)`

Test that the returncode system is functioning correctly

CLI Example:

```
salt '*' test.retcode 42
```

`salt.modules.test.`**`sleep`**`(`*length*`)`

Instruct the minion to initiate a process that will sleep for a given period of time.

CLI Example:

```
salt '*' test.sleep 20
```

`salt.modules.test.`**`stack`**`()`

Return the current stack trace

CLI Example:

```
salt '*' test.stack
```

`salt.modules.test.`**`true_`**`()`

Always return `True`

CLI Example:

```
salt '*' test.true
```

`salt.modules.test.`**`try_`**`(`*module, return_try_exception=False, **kwargs*`)`

Try to run a module command. On an exception return `None`. If `return_try_exception` is set to `True`, return the exception. This can be helpful in templates where running a module might fail as expected.

Jinja Example:

```
{% for i in range(0,230) %}
    {{ salt['test.try'](module='ipmi.get_users', bmc_host='172.2.2.
↪'+i)|yaml(False) }}
{% endfor %}
```

`salt.modules.test.`**`tty`**`(`**args, **kwargs*`)`

Deprecated! Moved to *`cmd.tty`*

CLI Example:

```
salt '*' test.tty tty0 'This is a test'
salt '*' test.tty pts3 'This is a test'
```

`salt.modules.test.`**`version`**`()`

Return the version of salt on the minion

CLI Example:

```
salt '*' test.version
```

`salt.modules.test.`**`versions`**`()`

This function is an alias of `versions_report`.

Returns versions of components used by salt

CLI Example:

```
salt '*' test.versions_report
```

`salt.modules.test.`**`versions_information`**`()`

Report the versions of dependent and system software

CLI Example:

```
salt '*' test.versions_information
```

`salt.modules.test.`**`versions_report`**`()`

Returns versions of components used by salt

CLI Example:

```
salt '*' test.versions_report
```

26.6.209 salt.modules.test_virtual

Module for testing that a __virtual__ function returning False will not be available via the Salt Loader.

`salt.modules.test_virtual.`**`ping`**`()`

26.6.210 salt.modules.textfsm_mod

TextFSM

New in version 2018.3.0.

Execution module that processes plain text and extracts data using TextFSM templates. The output is presented in JSON serializable data, and can be easily re-used in other modules, or directly inside the renderer (Jinja, Mako, Genshi, etc.).

depends

- textfsm Python library

Note: Install `textfsm` library: `pip install textfsm`.

`salt.modules.textfsm_mod.`**`extract`**`(`*template_path*, *raw_text=None*, *raw_text_file=None*, *saltenv='base'*`)`

Extracts the data entities from the unstructured raw text sent as input and returns the data mapping, processing using the TextFSM template.

template_path

The path to the TextFSM template. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the template from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

raw_text: **`None`**

The unstructured text to be parsed.

raw_text_file: `None`
Text file to read, having the raw text to be parsed using the TextFSM template. Supports the same URL schemes as the `template_path` argument.

saltenv: `base`
Salt fileserver environment from which to retrieve the file. Ignored if `template_path` is not a `salt://` URL.

CLI Example:

```
salt '*' textfsm.extract salt://textfsm/juniper_version_template raw_text_
↪file=s3://junos_ver.txt
salt '*' textfsm.extract http://some-server/textfsm/juniper_version_
↪template raw_text='Hostname: router.abc ... snip ...'
```

Jinja template example:

```
{%- set raw_text = 'Hostname: router.abc ... snip ...' -%}
{%- set textfsm_extract = salt.textfsm.extract('https://some-server/
↪textfsm/juniper_version_template', raw_text) -%}
```

Raw text example:

```
Hostname: router.abc
Model: mx960
JUNOS Base OS boot [9.1S3.5]
JUNOS Base OS Software Suite [9.1S3.5]
JUNOS Kernel Software Suite [9.1S3.5]
JUNOS Crypto Software Suite [9.1S3.5]
JUNOS Packet Forwarding Engine Support (M/T Common) [9.1S3.5]
JUNOS Packet Forwarding Engine Support (MX Common) [9.1S3.5]
JUNOS Online Documentation [9.1S3.5]
JUNOS Routing Software Suite [9.1S3.5]
```

TextFSM Example:

```
Value Chassis (\S+)
Value Required Model (\S+)
Value Boot (.*)
Value Base (.*)
Value Kernel (.*)
Value Crypto (.*)
Value Documentation (.*)
Value Routing (.*)

Start
# Support multiple chassis systems.
  ^\S+:$$ -> Continue.Record
  ^${Chassis}:$$
  ^Model: ${Model}
  ^JUNOS Base OS boot \[${Boot}\]
  ^JUNOS Software Release \[${Base}\]
  ^JUNOS Base OS Software Suite \[${Base}\]
  ^JUNOS Kernel Software Suite \[${Kernel}\]
  ^JUNOS Crypto Software Suite \[${Crypto}\]
  ^JUNOS Online Documentation \[${Documentation}\]
```

(continues on next page)

(continued from previous page)

```
^JUNOS Routing Software Suite \[${Routing}\]
```

Output example:

```
{
    "comment": "",
    "result": true,
    "out": [
        {
            "kernel": "9.1S3.5",
            "documentation": "9.1S3.5",
            "boot": "9.1S3.5",
            "crypto": "9.1S3.5",
            "chassis": "",
            "routing": "9.1S3.5",
            "base": "9.1S3.5",
            "model": "mx960"
        }
    ]
}
```

`salt.modules.textfsm_mod.`**`index`**(*command*, *platform=None*, *platform_grain_name=None*, *platform_column_name=None*, *output=None*, *output_file=None*, *textfsm_path=None*, *index_file=None*, *saltenv='base'*, *include_empty=False*, *include_pat=None*, *exclude_pat=None*)

Dynamically identify the template required to extract the information from the unstructured raw text.

The output has the same structure as the `extract` execution function, the difference being that `index` is capable to identify what template to use, based on the platform details and the `command`.

command
The command executed on the device, to get the output.

platform
The platform name, as defined in the TextFSM index file.

Note: For ease of use, it is recommended to define the TextFSM indexfile with values that can be matches using the grains.

platform_grain_name
The name of the grain used to identify the platform name in the TextFSM index file.

Note: This option can be also specified in the minion configuration file or pillar as `textfsm_platform_grain`.

Note: This option is ignored when `platform` is specified.

platform_column_name: **`Platform`**
The column name used to identify the platform, exactly as specified in the TextFSM index file. Default: `Platform`.

Note: This is field is case sensitive, make sure to assign the correct value to this option, exactly as defined in the index file.

Note: This option can be also specified in the minion configuration file or pillar as `textfsm_platform_column_name`.

---

output
The raw output from the device, to be parsed and extract the structured data.

output_file
The path to a file that contains the raw output from the device, used to extract the structured data. This option supports the usual Salt-specific schemes: `file://`, `salt://`, `http://`, `https://`, `ftp://`, `s3://`, `swift://`.

textfsm_path
The path where the TextFSM templates can be found. This can be either absolute path on the server, either specified using the following URL schemes: `file://`, `salt://`, `http://`, `https://`, `ftp://`, `s3://`, `swift://`.

Note: This needs to be a directory with a flat structure, having an index file (whose name can be specified using the `index_file` option) and a number of TextFSM templates.

Note: This option can be also specified in the minion configuration file or pillar as `textfsm_path`.

---

index_file: **`index`**
The name of the TextFSM index file, under the `textfsm_path`. Default: `index`.

Note: This option can be also specified in the minion configuration file or pillar as `textfsm_index_file`.

---

saltenv: **`base`**
Salt fileserver environment from which to retrieve the file. Ignored if `textfsm_path` is not a `salt://` URL.

include_empty: **`False`**
Include empty files under the `textfsm_path`.

include_pat
Glob or regex to narrow down the files cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

exclude_pat
Glob or regex to exclude certain files from being cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

Note: If used with `include_pat`, files matching this pattern will be excluded from the subset of files defined by `include_pat`.

CLI Example:

```
salt '*' textfsm.index 'sh ver' platform=Juniper output_file=salt://
↪textfsm/juniper_version_example textfsm_path=salt://textfsm/
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_
↪version_example textfsm_path=ftp://textfsm/ platform_column_name=Vendor
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_
```

(continues on next page)

(continued from previous page)

```
↪version_example textfsm_path=https://some-server/textfsm/ platform_
↪column_name=Vendor platform_grain_name=vendor
```

TextFSM index file example:

`salt://textfsm/index`

```
Template, Hostname, Vendor, Command
juniper_version_template, .*, Juniper, sh[[ow]] ve[[rsion]]
```

The usage can be simplified, by defining (some of) the following options: `textfsm_platform_grain`, `textfsm_path`, `textfsm_platform_column_name`, or `textfsm_index_file`, in the (proxy) minion configuration file or pillar.

Configuration example:

```
textfsm_platform_grain: vendor
textfsm_path: salt://textfsm/
textfsm_platform_column_name: Vendor
```

And the CLI usage becomes as simple as:

```
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_
↪version_example
```

Usgae inside a Jinja template:

```
{%- set command = 'sh ver' -%}
{%- set output = salt.net.cli(command) -%}
{%- set textfsm_extract = salt.textfsm.index(command, output=output) -%}
```

26.6.211 salt.modules.timezone

Module for managing timezone on POSIX-like systems.

`salt.modules.timezone.`**`get_hwclock`**`()`

Get current hardware clock setting (UTC or localtime)

CLI Example:

```
salt '*' timezone.get_hwclock
```

`salt.modules.timezone.`**`get_offset`**`()`

Get current numeric timezone offset from UTC (i.e. -0700)

CLI Example:

```
salt '*' timezone.get_offset
```

`salt.modules.timezone.`**`get_zone`**`()`

Get current timezone (i.e. America/Denver)

Changed in version 2016.11.4.

Note: On AIX operating systems, Posix values can also be returned 'CST6CDT,M3.2.0/2:00:00,M11.1.0/2:00:00'

CLI Example:

```
salt '*' timezone.get_zone
```

`salt.modules.timezone.`**`get_zonecode`**`()`

Get current timezone (i.e. PST, MDT, etc)

CLI Example:

```
salt '*' timezone.get_zonecode
```

`salt.modules.timezone.`**`set_hwclock`**`(`*clock*`)`

Sets the hardware clock to be either UTC or localtime

CLI Example:

```
salt '*' timezone.set_hwclock UTC
```

`salt.modules.timezone.`**`set_zone`**`(`*timezone*`)`

Unlinks, then symlinks /etc/localtime to the set timezone.

The timezone is crucial to several system processes, each of which SHOULD be restarted (for instance, whatever you system uses as its cron and syslog daemons). This will not be automagically done and must be done manually!

CLI Example:

```
salt '*' timezone.set_zone 'America/Denver'
```

Changed in version 2016.11.4.

Note: On AIX operating systems, Posix values are also allowed, see below

---

```
salt '*' timezone.set_zone 'CST6CDT,M3.2.0/2:00:00,M11.1.0/2:00:00'
```

`salt.modules.timezone.`**`zone_compare`**`(`*timezone*`)`

Compares the given timezone name with the system timezone name determined by timezone.get_zone. Returns True if names match, and False if not. Mostly useful for running state checks.

Changed in version 2016.3.0.

Note: On Solaris-like operating systems only a string comparison is done.

Changed in version 2016.11.4.

Note: On AIX operating systems only a string comparison is done.

CLI Example:

```
salt '*' timezone.zone_compare 'America/Denver'
```

26.6.212 salt.modules.tls

A salt module for SSL/TLS. Can create a Certificate Authority (CA) or use Self-Signed certificates.

depends
PyOpenSSL Python module (0.10 or later, 0.14 or later for X509 extension support)

configuration
Add the following values in /etc/salt/minion for the CA module to function properly:

```
ca.cert_base_path: '/etc/pki'
```

CLI Example #1: Creating a CA, a server request and its signed certificate:

```
# salt-call tls.create_ca my_little \
days=5 \
CN='My Little CA' \
C=US \
ST=Utah \
L=Salt Lake City \
O=Saltstack \
emailAddress=pleasedontemail@example.com

Created Private Key: "/etc/pki/my_little/my_little_ca_cert.key"
Created CA "my_little_ca": "/etc/pki/my_little_ca/my_little_ca_cert.crt"

# salt-call tls.create_csr my_little CN=www.example.com
Created Private Key: "/etc/pki/my_little/certs/www.example.com.key
Created CSR for "www.example.com": "/etc/pki/my_little/certs/www.example.com.
↪csr"

# salt-call tls.create_ca_signed_cert my_little CN=www.example.com
Created Certificate for "www.example.com": /etc/pki/my_little/certs/www.
↪example.com.crt"
```

CLI Example #2: Creating a client request and its signed certificate

```
# salt-call tls.create_csr my_little CN=DBReplica_No.1 cert_type=client
Created Private Key: "/etc/pki/my_little/certs//DBReplica_No.1.key"
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.csr
↪"

# salt-call tls.create_ca_signed_cert my_little CN=DBReplica_No.1
Created Certificate for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_
↪No.1.crt"
```

CLI Example #3: Creating both a server and client req + cert for the same CN

```
# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2  \
    cert_type=client
Created Private Key: "/etc/pki/my_little/certs/MasterDBReplica_No.2.key"
```

(continues on next page)

(continued from previous page)

```
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/MasterDBReplica_
↪No.2.csr"

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2
Created Certificate for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_
↪No.1.crt"

# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \
    cert_type=server
Certificate "MasterDBReplica_No.2" already exists

(doh!)

# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \
    cert_type=server type_ext=True
Created Private Key: "/etc/pki/my_little/certs/DBReplica_No.1_client.key"
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1_
↪client.csr"

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2
Certificate "MasterDBReplica_No.2" already exists

(DOH!)

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2 \
    cert_type=server type_ext=True
Created Certificate for "MasterDBReplica_No.2": "/etc/pki/my_little/certs/
↪MasterDBReplica_No.2_server.crt"
```

CLI Example #4: Create a server req + cert with non-CN filename for the cert

```
# salt-call tls.create_csr my_little CN=www.anothersometh.ing \
    cert_type=server type_ext=True
Created Private Key: "/etc/pki/my_little/certs/www.anothersometh.ing_server.
↪key"
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/www.anothersometh.
↪ing_server.csr"

# salt-call tls_create_ca_signed_cert my_little CN=www.anothersometh.ing \
    cert_type=server cert_filename="something_completely_different"
Created Certificate for "www.anothersometh.ing": /etc/pki/my_little/certs/
↪something_completely_different.crt
```

`salt.modules.tls.`**`ca_exists`**(*ca_name, cacert_path=None, ca_filename=None*)

Verify whether a Certificate Authority (CA) already exists

ca_name
name of the CA

cacert_path
absolute path to ca certificates root directory

ca_filename
alternative filename for the CA

New in version 2015.5.3.

CLI Example:

```
salt '*' tls.ca_exists test_ca /etc/certs
```

`salt.modules.tls.`**`cert_base_path`**(*cacert_path=None*)

Return the base path for certs from CLI or from options

cacert_path
absolute path to ca certificates root directory

CLI Example:

```
salt '*' tls.cert_base_path
```

`salt.modules.tls.`**`cert_info`**(*cert, digest='sha256'*)

Return information for a particular certificate

cert
path to the certifiate PEM file or string

Changed in version 2018.3.4.

digest
what digest to use for fingerprinting

CLI Example:

```
salt '*' tls.cert_info /dir/for/certs/cert.pem
```

`salt.modules.tls.`**`create_ca`**(*ca_name, bits=2048, days=365, CN='localhost', C='US', ST='Utah', L='Salt Lake City', O='SaltStack', OU=None, emailAddress=None, fixmode=False, cacert_path=None, ca_filename=None, digest='sha256', onlyif=None, unless=None, replace=False*)

Create a Certificate Authority (CA)

ca_name
name of the CA

bits
number of RSA key bits, default is 2048

days
number of days the CA will be valid, default is 365

CN
common name in the request, default is ”localhost”

C
country, default is ”US”

ST
state, default is ”Utah”

L
locality, default is ”Centerville”, the city where SaltStack originated

O
organization, default is ”SaltStack”

OU
organizational unit, default is None

emailAddress
email address for the CA owner, default is None

cacert_path
absolute path to ca certificates root directory

ca_filename
alternative filename for the CA

New in version 2015.5.3.

digest
The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'

replace
Replace this certificate even if it exists

New in version 2015.5.1.

Writes out a CA certificate based upon defined config values. If the file already exists, the function just returns assuming the CA certificate already exists.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
```

the resulting CA, and corresponding key, would be written in the following location with appropriate permissions:

```
/etc/pki/koji/koji_ca_cert.crt
/etc/pki/koji/koji_ca_cert.key
```

CLI Example:

```
salt '*' tls.create_ca test_ca
```

`salt.modules.tls.`**`create_ca_signed_cert`**(*ca_name*, *CN*, *days=365*, *cacert_path=None*, *ca_filename=None*, *cert_path=None*, *cert_filename=None*, *digest='sha256'*, *cert_type=None*, *type_ext=False*, *replace=False*)

Create a Certificate (CERT) signed by a named Certificate Authority (CA)

If the certificate file already exists, the function just returns assuming the CERT already exists.

The CN *must* match an existing CSR generated by create_csr. If it does not, this method does nothing.

ca_name
name of the CA

CN
common name matching the certificate signing request

days
number of days certificate is valid, default is 365 (1 year)

cacert_path
absolute path to ca certificates root directory

ca_filename
alternative filename for the CA

New in version 2015.5.3.

cert_path
full path to the certificates directory

cert_filename
alternative filename for the certificate, useful when using special characters in the CN. If this option is set it will override the certificate filename output effects of `cert_type`. `type_ext` will be completely overridden.

New in version 2015.5.3.

digest
The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'

replace
Replace this certificate even if it exists

New in version 2015.5.1.

cert_type
string. Either 'server' or 'client' (see create_csr() for details).

If create_csr(type_ext=True) this function **must** be called with the same cert_type so it can find the CSR file.

Note: create_csr() defaults to cert_type='server'; therefore, if it was also called with type_ext, cert_type becomes a required argument for create_ca_signed_cert()

---

type_ext
bool. If set True, use `cert_type` as an extension to the CN when formatting the filename.

e.g.: some_subject_CN_server.crt or some_subject_CN_client.crt

This facilitates the context where both types are required for the same subject

If `cert_filename` is *not None*, setting `type_ext` has no effect

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
CN='test.egavas.org'
```

the resulting signed certificate would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.crt
```

CLI Example:

```
salt '*' tls.create_ca_signed_cert test localhost
```

`salt.modules.tls.`**`create_csr`**(*ca_name*, *bits=2048*, *CN='localhost'*, *C='US'*, *ST='Utah'*, *L='Salt Lake City'*, *O='SaltStack'*, *OU=None*, *emailAddress=None*, *subjectAltName=None*, *cacert_path=None*, *ca_filename=None*, *csr_path=None*, *csr_filename=None*, *digest='sha256'*, *type_ext=False*, *cert_type='server'*, *replace=False*)

Create a Certificate Signing Request (CSR) for a particular Certificate Authority (CA)

ca_name
name of the CA

bits
number of RSA key bits, default is 2048

CN
common name in the request, default is "localhost"

C
country, default is "US"

ST
state, default is "Utah"

L
locality, default is "Centerville", the city where SaltStack originated

O
organization, default is "SaltStack" NOTE: Must the same as CA certificate or an error will be raised

OU
organizational unit, default is None

emailAddress
email address for the request, default is None

subjectAltName
valid subjectAltNames in full form, e.g. to add DNS entry you would call this function with this value:
examples: ['DNS:somednsname.com',
'DNS:1.2.3.4', 'IP:1.2.3.4', 'IP:2001:4801:7821:77:be76:4eff:fe11:e51', 'email:me@i.like.pie.com']

Note: some libraries do not properly query IP: prefixes, instead looking for the given req. source with a DNS: prefix. To be thorough, you may want to include both DNS: and IP: entries if you are using subjectAltNames for destinations for your TLS connections. e.g.: requests to https://1.2.3.4 will fail from python's requests library w/out the second entry in the above list

---

New in version 2015.8.0.

cert_type
Specify the general certificate type. Can be either *server* or *client*. Indicates the set of common extensions added to the CSR.

```
server: {
   'basicConstraints': 'CA:FALSE',
   'extendedKeyUsage': 'serverAuth',
   'keyUsage': 'digitalSignature, keyEncipherment'
}

client: {
   'basicConstraints': 'CA:FALSE',
   'extendedKeyUsage': 'clientAuth',
   'keyUsage': 'nonRepudiation, digitalSignature, keyEncipherment'
}
```

type_ext
boolean. Whether or not to extend the filename with CN_[cert_type] This can be useful if a server and client certificate are needed for the same CN. Defaults to False to avoid introducing an unexpected file naming pattern

The files normally named some_subject_CN.csr and some_subject_CN.key will then be saved

replace
Replace this signing request even if it exists

New in version 2015.5.1.

Writes out a Certificate Signing Request (CSR) If the file already exists, the function just returns assuming the CSR already exists.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
CN='test.egavas.org'
```

the resulting CSR, and corresponding key, would be written in the following location with appropriate permissions:

```
/etc/pki/koji/certs/test.egavas.org.csr
/etc/pki/koji/certs/test.egavas.org.key
```

CLI Example:

```
salt '*' tls.create_csr test
```

`salt.modules.tls.`**`create_empty_crl`**`(`*ca_name, cacert_path=None, ca_filename=None, crl_file=None, digest='sha256'*`)`

Create an empty Certificate Revocation List.

New in version 2015.8.0.

ca_name
name of the CA

cacert_path
absolute path to ca certificates root directory

ca_filename
alternative filename for the CA

New in version 2015.5.3.

crl_file
full path to the CRL file

digest
The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'

CLI Example:

```
salt '*' tls.create_empty_crl ca_name='koji'                 ca_filename=
↪'ca'                     crl_file='/etc/openvpn/team1/crl.pem'
```

`salt.modules.tls.`**`create_pkcs12`**`(`*ca_name, CN, passphrase='', cacert_path=None, replace=False*`)`

Create a PKCS#12 browser certificate for a particular Certificate (CN)

ca_name
name of the CA

CN
common name matching the certificate signing request

passphrase
used to unlock the PKCS#12 certificate when loaded into the browser

cacert_path
absolute path to ca certificates root directory

replace
Replace this certificate even if it exists

New in version 2015.5.1.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
CN='test.egavas.org'
```

the resulting signed certificate would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.p12
```

CLI Example:

```
salt '*' tls.create_pkcs12 test localhost
```

salt.modules.tls.**create_self_signed_cert**(*tls_dir='tls', bits=2048, days=365, CN='localhost', C='US', ST='Utah', L='Salt Lake City', O='SaltStack', OU=None, emailAddress=None, cacert_path=None, cert_filename=None, digest='sha256', replace=False*)

Create a Self-Signed Certificate (CERT)

tls_dir
location appended to the ca.cert_base_path, default is 'tls'

bits
number of RSA key bits, default is 2048

CN
common name in the request, default is "localhost"

C
country, default is "US"

ST
state, default is "Utah"

L
locality, default is "Centerville", the city where SaltStack originated

O
organization, default is "SaltStack" NOTE: Must the same as CA certificate or an error will be raised

OU
organizational unit, default is None

emailAddress
email address for the request, default is None

cacert_path
absolute path to ca certificates root directory

digest
The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'

replace
Replace this certificate even if it exists

New in version 2015.5.1.

Writes out a Self-Signed Certificate (CERT). If the file already exists, the function just returns.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
tls_dir='koji'
CN='test.egavas.org'
```

the resulting CERT, and corresponding key, would be written in the following location with appropriate permissions:

```
/etc/pki/koji/certs/test.egavas.org.crt
/etc/pki/koji/certs/test.egavas.org.key
```

CLI Example:

```
salt '*' tls.create_self_signed_cert
```

Passing options from the command line:

```
salt 'minion' tls.create_self_signed_cert CN='test.mysite.org'
```

salt.modules.tls.**get_ca**(*ca_name, as_text=False, cacert_path=None*)

Get the certificate path or content

ca_name
name of the CA

as_text
if true, return the certificate content instead of the path

cacert_path
absolute path to ca certificates root directory

CLI Example:

```
salt '*' tls.get_ca test_ca as_text=False cacert_path=/etc/certs
```

salt.modules.tls.**get_ca_signed_cert**(*ca_name*, *CN='localhost'*, *as_text=False*, *cacert_path=None*, *cert_filename=None*)

Get the certificate path or content

ca_name
name of the CA

CN
common name of the certificate

as_text
if true, return the certificate content instead of the path

cacert_path
absolute path to certificates root directory

cert_filename
alternative filename for the certificate, useful when using special characters in the CN

New in version 2015.5.3.

CLI Example:

```
salt '*' tls.get_ca_signed_cert test_ca CN=localhost as_text=False cacert_
↪path=/etc/certs
```

salt.modules.tls.**get_ca_signed_key**(*ca_name*, *CN='localhost'*, *as_text=False*, *cacert_path=None*, *key_filename=None*)

Get the certificate path or content

ca_name
name of the CA

CN
common name of the certificate

as_text
if true, return the certificate content instead of the path

cacert_path
absolute path to certificates root directory

key_filename
alternative filename for the key, useful when using special characters

New in version 2015.5.3.

in the CN

CLI Example:

```
salt '*' tls.get_ca_signed_key                  test_ca CN=localhost      
↪           as_text=False                cacert_path=/etc/certs
```

salt.modules.tls.**get_expiration_date**(*cert*, *date_format='%Y-%m-%d'*)

New in version 2019.2.0.

Get a certificate's expiration date

cert
Full path to the certificate

date_format
By default this will return the expiration date in YYYY-MM-DD format, use this to specify a different strftime format string. Note that the expiration time will be in UTC.

CLI Examples:

```
salt '*' tls.get_expiration_date /path/to/foo.crt
salt '*' tls.get_expiration_date /path/to/foo.crt date_format='%d/%m/%Y'
```

`salt.modules.tls.`**`get_extensions`**`(`*cert_type*`)`

Fetch X509 and CSR extension definitions from tls:extensions: (common|server|client) or set them to standard defaults.

New in version 2015.8.0.

cert_type:
The type of certificate such as `server` or `client`.

CLI Example:

```
salt '*' tls.get_extensions client
```

`salt.modules.tls.`**`maybe_fix_ssl_version`**`(`*ca_name, cacert_path=None, ca_filename=None*`)`

Check that the X509 version is correct (was incorrectly set in previous salt versions). This will fix the version if needed.

ca_name
ca authority name

cacert_path
absolute path to ca certificates root directory

ca_filename
alternative filename for the CA

New in version 2015.5.3.

CLI Example:

```
salt '*' tls.maybe_fix_ssl_version test_ca /etc/certs
```

`salt.modules.tls.`**`revoke_cert`**`(`*ca_name, CN, cacert_path=None, ca_filename=None, cert_path=None, cert_filename=None, crl_file=None, digest='sha256'*`)`

Revoke a certificate.

New in version 2015.8.0.

ca_name
Name of the CA.

CN
Common name matching the certificate signing request.

cacert_path
Absolute path to ca certificates root directory.

ca_filename
Alternative filename for the CA.

cert_path
Path to the cert file.

cert_filename
Alternative filename for the certificate, useful when using special characters in the CN.

crl_file
Full path to the CRL file.

digest
The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'

CLI Example:

```
salt '*' tls.revoke_cert ca_name='koji'              ca_filename='ca'
↪              crl_file='/etc/openvpn/team1/crl.pem'
```

`salt.modules.tls.`**`set_ca_path`**`(`*cacert_path*`)`

If wanted, store the aforementioned cacert_path in context to be used as the basepath for further operations

CLI Example:

```
salt '*' tls.set_ca_path /etc/certs
```

`salt.modules.tls.`**`validate`**`(`*cert, ca_name, crl_file*`)`

New in version 3000.

Validate a certificate against a given CA/CRL.

cert
path to the certifiate PEM file or string

ca_name
name of the CA

crl_file
full path to the CRL file

26.6.213 salt.modules.udev

Manage and query udev info

New in version 2015.8.0.

`salt.modules.udev.`**`env`**`(`*dev*`)`

Return all environment variables udev has for dev

CLI Example:

```
salt '*' udev.env /dev/sda
salt '*' udev.env /sys/class/net/eth0
```

`salt.modules.udev.`**`exportdb`**`(`*subsystems=None*`)`

Return the complete udev database.

Parameters

`subsystems` (*`list`*) -- This parameter limits the returned data to specified subsystems such as "pci", "usb", "block", etc.

New in version 3008.0.

CLI Example:

```
salt '*' udev.exportdb
salt '*' udev.exportdb subsystems='[usb, block]'
```

`salt.modules.udev.`**`info`**`(`*dev*`)`

Extract all info delivered by udevadm

CLI Example:

```
salt '*' udev.info /dev/sda
salt '*' udev.info /sys/class/net/eth0
```

`salt.modules.udev.`**`links`**`(`*dev*`)`

Return all udev-created device symlinks

CLI Example:

```
salt '*' udev.links /dev/sda
salt '*' udev.links /sys/class/net/eth0
```

`salt.modules.udev.`**`name`**`(`*dev*`)`

Return the actual dev name(s?) according to udev for dev

CLI Example:

```
salt '*' udev.dev /dev/sda
salt '*' udev.dev /sys/class/net/eth0
```

`salt.modules.udev.`**`path`**`(`*dev*`)`

Return the physical device path(s?) according to udev for dev

CLI Example:

```
salt '*' udev.path /dev/sda
salt '*' udev.path /sys/class/net/eth0
```

26.6.214 salt.modules.upstart_service

Module for the management of upstart systems. The Upstart system only supports service starting, stopping and restarting.

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *'service.start' is not available*), see *here*.

Currently (as of Ubuntu 12.04) there is no tool available to disable Upstart services (like update-rc.d). This[1] is the recommended way to disable an Upstart service. So we assume that all Upstart services that have not been disabled in this manner are enabled.

But this is broken because we do not check to see that the dependent services are enabled. Otherwise we would have to do something like parse the output of "initctl show-config" to determine if all service dependencies are enabled to start on boot. For example, see the "start on" condition for the lightdm service below[2]. And this would be too hard. So we wait until the upstart developers have solved this problem. :) This is to say that an Upstart service that is enabled may not really be enabled.

Also, when an Upstart service is enabled, should the dependent services be enabled too? Probably not. But there should be a notice about this, at least.

[1] http://upstart.ubuntu.com/cookbook/#disabling-a-job-from-automatically-starting

[2] example upstart configuration file:

```
lightdm
emits login-session-start
emits desktop-session-start
emits desktop-shutdown
start on ((((filesystem and runlevel [!06]) and started dbus) and (drm-device-
↪added card0 PRIMARY_DEVICE_FOR_DISPLAY=1 or stopped udev-fallback-
↪graphics)) or runlevel PREVLEVEL=S)
stop on runlevel [016]
```

Warning: This module should not be used on Red Hat systems. For these, the `rh_service` module should be used, as it supports the hybrid upstart/sysvinit system used in RHEL/CentOS 6.

`salt.modules.upstart_service.`**`available`**`(`*name*`)`

Returns `True` if the specified service is available, otherwise returns `False`.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.upstart_service.`**`disable`**`(`*name, **kwargs*`)`

Disable the named service from starting on boot

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.upstart_service.`**`disabled`**`(`*name*`)`

Check to see if the named service is disabled to start on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.upstart_service.`**`enable`**`(`*name, **kwargs*`)`

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.upstart_service.`**`enabled`**`(`*name, **kwargs*`)`

Check to see if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.upstart_service.`**`force_reload`**`(`*name*`)`

Force-reload the named service

CLI Example:

```
salt '*' service.force_reload <service name>
```

`salt.modules.upstart_service.`**`full_restart`**`(`*name*`)`

Do a full restart (stop/start) of the named service

CLI Example:

```
salt '*' service.full_restart <service name>
```

`salt.modules.upstart_service.`**`get_all`**`()`

Return all installed services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.upstart_service.`**`get_disabled`**`()`

Return the disabled services

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.upstart_service.`**`get_enabled`**`()`

Return the enabled services

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.upstart_service.`**`missing`**`(`*name*`)`

The inverse of service.available. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.upstart_service.`**`reload_`**`(`*name*`)`

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.upstart_service.`**`restart`**`(`*name*`)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.upstart_service.`**`start`**`(`*name*`)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.upstart_service.`**`status`**`(`*name*, *sig=None*`)`

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Parameters

- **`name`** (*`str`*) -- The name of the service to check
- **`sig`** (*`str`*) -- Signature to use to find the service via ps

Returns

True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type

bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

`salt.modules.upstart_service.`**`stop`**`(`*name*`)`

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

26.6.215 salt.modules.useradd

Manage users with the useradd command

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to *'user.info' is not available*), see *here*.

`salt.modules.useradd.`**`add`**`(`*name, uid=None, gid=None, groups=None, home=None, shell=None, unique=True, system=False, fullname='', roomnumber='', workphone='', homephone='', other='', createhome=True, loginclass=None, nologinit=False, root=None, usergroup=None, local=False*`)`

Add a user to the minion

name

Username LOGIN to add

uid

User ID of the new account

gid

Name or ID of the primary group of the new account

groups

List of supplementary groups of the new account

home

Home directory of the new account

shell

Login shell of the new account

unique

If not True, the user account can have a non-unique UID

system

Create a system account

fullname
GECOS field for the full name

roomnumber
GECOS field for the room number

workphone
GECOS field for the work phone

homephone
GECOS field for the home phone

other
GECOS field for other information

createhome
Create the user's home directory

loginclass
Login class for the new account (OpenBSD)

nologinit
Do not add the user to the lastlog and faillog databases

root
Directory to chroot into

usergroup
Create and add the user to a new primary group of the same name

local (Only on systems with luseradd available)
Specifically add the user locally rather than possibly through remote providers (e.g. LDAP)

New in version 3007.0.

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

`salt.modules.useradd.`**`chfullname`**(*name*, *fullname*, *root=None*)

Change the user's Full Name

name
User to modify

fullname
GECOS field for the full name

root
Directory to chroot into

CLI Example:

```
salt '*' user.chfullname foo "Foo Bar"
```

`salt.modules.useradd.`**`chgid`**(*name*, *gid*, *root=None*)

Change the default group of the user

name
User to modify

gid
Force use GID as new primary group

root
Directory to chroot into

CLI Example:

```
salt '*' user.chgid foo 4376
```

`salt.modules.useradd.`**`chgroups`**(*name*, *groups*, *append=False*, *root=None*)

Change the groups to which this user belongs

name
User to modify

groups
Groups to set for the user

append
[False] If `True`, append the specified group(s). Otherwise, this function will replace the user's groups with the specified group(s).

root
Directory to chroot into

CLI Examples:

```
salt '*' user.chgroups foo wheel,root
salt '*' user.chgroups foo wheel,root append=True
```

`salt.modules.useradd.`**`chhome`**`(`*name, home, persist=False, root=None*`)`

Change the home directory of the user, pass True for persist to move files to the new home directory if the old home directory exist.

name
User to modify

home
New home directory for the user account

persist
Move contents of the home directory to the new location

root
Directory to chroot into

CLI Example:

```
salt '*' user.chhome foo /home/users/foo True
```

`salt.modules.useradd.`**`chhomephone`**`(`*name, homephone, root=None*`)`

Change the user's Home Phone

name
User to modify

homephone
GECOS field for the home phone

root
Directory to chroot into

CLI Example:

```
salt '*' user.chhomephone foo 7735551234
```

`salt.modules.useradd.`**`chloginclass`**`(`*name, loginclass, root=None*`)`

Change the default login class of the user

name
User to modify

loginclass
Login class for the new account

root
Directory to chroot into

Note: This function only applies to OpenBSD systems.

CLI Example:

```
salt '*' user.chloginclass foo staff
```

`salt.modules.useradd.`**`chother`**(*name*, *other*, *root=None*)

Change the user's other GECOS attribute

name
User to modify

other
GECOS field for other information

root
Directory to chroot into

CLI Example:

```
salt '*' user.chother foobar
```

`salt.modules.useradd.`**`chroomnumber`**(*name*, *roomnumber*, *root=None*)

Change the user's Room Number

CLI Example:

```
salt '*' user.chroomnumber foo 123
```

`salt.modules.useradd.`**`chshell`**(*name*, *shell*, *root=None*)

Change the default shell of the user

name
User to modify

shell
New login shell for the user account

root
Directory to chroot into

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

`salt.modules.useradd.`**`chuid`**(*name*, *uid*, *root=None*)

Change the uid for a named user

name
User to modify

uid
New UID for the user account

root
Directory to chroot into

CLI Example:

```
salt '*' user.chuid foo 4376
```

`salt.modules.useradd.`**`chworkphone`**(*name*, *workphone*, *root=None*)

Change the user's Work Phone

name
User to modify

workphone
GECOS field for the work phone

root
Directory to chroot into

CLI Example:

```
salt '*' user.chworkphone foo 7735550123
```

`salt.modules.useradd.`**`delete`**`(`*name*, *remove=False*, *force=False*, *root=None*, *local=False*`)`

Remove a user from the minion

name
Username to delete

remove
Remove home directory and mail spool

force
Force some actions that would fail otherwise

root
Directory to chroot into

local (Only on systems with luserdel available):
Ensure the user account is removed locally ignoring global account management (default is False).

New in version 3007.0.

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

`salt.modules.useradd.`**`get_loginclass`**`(`*name*`)`

Get the login class of the user

name
User to get the information

Note: This function only applies to OpenBSD systems.

CLI Example:

```
salt '*' user.get_loginclass foo
```

`salt.modules.useradd.`**`getent`**`(`*refresh=False*, *root=None*`)`

Return the list of all info for all users

refresh
Force a refresh of user information

root
Directory to chroot into

CLI Example:

```
salt '*' user.getent
```

`salt.modules.useradd.`**`info`**`(`*name*, *root=None*`)`

Return user information

name
User to get the information

root
Directory to chroot into

CLI Example:

```
salt '*' user.info root
```

`salt.modules.useradd.`**`list_groups`**`(`*name*`)`

Return a list of groups the named user belongs to

name
User to get the information

CLI Example:

```
salt '*' user.list_groups foo
```

`salt.modules.useradd.`**`list_users`**`(`*root=None*`)`

Return a list of all users

root
Directory to chroot into

CLI Example:

```
salt '*' user.list_users
```

`salt.modules.useradd.`**`primary_group`**`(`*name*`)`

Return the primary group of the named user

New in version 2016.3.0.

name
User to get the information

CLI Example:

```
salt '*' user.primary_group saltadmin
```

`salt.modules.useradd.`**`rename`**`(`*name, new_name, root=None*`)`

Change the username for a named user

name
User to modify

new_name
New value of the login name

root
Directory to chroot into

CLI Example:

```
salt '*' user.rename name new_name
```

26.6.216 salt.modules.vagrant

Work with virtual machines managed by Vagrant.

New in version 2018.3.0.

Mapping between a Salt node id and the Vagrant machine name (and the path to the Vagrantfile where it is defined) is stored in a Salt sdb database on the Vagrant host (minion) machine. In order to use this module, sdb must be configured. An SQLite database is the recommended storage method. The URI used for the sdb lookup is ”sdb://vagrant_sdb_data”.

requirements:

- the VM host machine must have salt-minion, Vagrant and a vm provider installed.
- the VM host must have a valid definition for *sdb://vagrant_sdb_data*

  Configuration example:

```
# file /etc/salt/minion.d/vagrant_sdb.conf
vagrant_sdb_data:
  driver: sqlite3
  database: /var/cache/salt/vagrant.sqlite
  table: sdb
  create_table: True
```

`salt.modules.vagrant.`**`destroy`**`(`*name*`)`

Destroy and delete a virtual machine. (vagrant destroy -f)

This also removes the salt_id name defined by vagrant.init.

CLI Example:

```
salt <host> vagrant.destroy <salt_id>
```

`salt.modules.vagrant.`**`get_machine_id`**`(`*machine*, *cwd*`)`

returns the salt_id name of the Vagrant VM

Parameters

- **machine** -- the Vagrant machine name
- **cwd** -- the path to Vagrantfile

Returns

salt_id name

`salt.modules.vagrant.`**`get_ssh_config`**`(`*name*, *network_mask=''*, *get_private_key=False*`)`

Retrieve hints of how you might connect to a Vagrant VM.

Parameters

- **name** -- the salt_id of the machine
- **network_mask** -- a CIDR mask to search for the VM's address
- **get_private_key** -- (default: False) return the key used for ssh login

Returns

a dict of ssh login information for the VM

CLI Example:

```
salt <host> vagrant.get_ssh_config <salt_id>
salt my_laptop vagrant.get_ssh_config quail1 network_mask=10.0.0.0/8 get_
↪private_key=True
```

The returned dictionary contains:

- key_filename: the name of the private key file on the VM host computer
- ssh_username: the username to be used to log in to the VM
- ssh_host: the IP address used to log in to the VM. (This will usually be *127.0.0.1*)
- ssh_port: the TCP port used to log in to the VM. (This will often be *2222*)
- [ip_address:] (if *network_mask* is defined. see below)
- [private_key:] (if *get_private_key* is True) the private key for ssh_username

About *network_mask*:

Vagrant usually uses a redirected TCP port on its host computer to log in to a VM using ssh. This redirected port and its IP address are "ssh_port" and "ssh_host". The ssh_host is usually the localhost (127.0.0.1). This makes it impossible for a third machine (such as a salt-cloud master) to contact the VM unless the VM has another network interface defined. You will usually want a bridged network defined by having a *config.vm.network "public_network"* statement in your *Vagrantfile*.

The IP address of the bridged adapter will typically be assigned by DHCP and unknown to you, but you should be able to determine what IP network the address will be chosen from. If you enter a CIDR network mask, Salt will attempt to find the VM's address for you. The host machine will send an "ip link show" or "ifconfig" command to the VM (using ssh to *ssh_host*:*ssh_port*) and return the IP address of the first interface it can find which matches your mask.

`salt.modules.vagrant.`**`get_vm_info`**`(`*name*`)`

get the information for a VM.

Parameters

`name` -- salt_id name

Returns

dictionary of {'machine': x, 'cwd': y, ...}.

`salt.modules.vagrant.`**`init`**`(`*name*, *cwd=None*, *machine=''*, *runas=None*, *start=False*, *vagrant_provider=''*, *vm=None*`)`

Initialize a new Vagrant VM.

This inputs all the information needed to start a Vagrant VM. These settings are stored in a Salt sdb database on the Vagrant host minion and used to start, control, and query the guest VMs. The salt_id assigned here is the key field for that database and must be unique.

Parameters

- **`name`** -- The salt_id name you will use to control this VM
- **`cwd`** -- The path to the directory where the Vagrantfile is located
- **`machine`** -- The machine name in the Vagrantfile. If blank, the primary machine will be used.
- **`runas`** -- The username on the host who owns the Vagrant work files.
- **`start`** -- (default: False) Start the virtual machine now.
- **`vagrant_provider`** -- The name of a Vagrant VM provider (if not the default).
- **`vm`** -- Optionally, all the above information may be supplied in this dictionary.

Returns

A string indicating success, or False.

CLI Example:

```
salt <host> vagrant.init <salt_id> /path/to/Vagrantfile
salt my_laptop vagrant.init x1 /projects/bevy_master machine=quail1
```

`salt.modules.vagrant.`**`list_active_vms`**`(`*cwd=None*`)`

Return a list of machine names for active virtual machine on the host, which are defined in the Vagrantfile at the indicated path.

CLI Example:

```
salt '*' vagrant.list_active_vms  cwd=/projects/project_1
```

`salt.modules.vagrant.`**`list_domains`**`()`

Return a list of the salt_id names of all available Vagrant VMs on this host without regard to the path where they are defined.

CLI Example:

```
salt '*' vagrant.list_domains --log-level=info
```

The log shows information about all known Vagrant environments on this machine. This data is cached and may not be completely up-to-date.

`salt.modules.vagrant.`**`list_inactive_vms`**`(`*cwd=None*`)`

Return a list of machine names for inactive virtual machine on the host, which are defined in the Vagrantfile at the indicated path.

CLI Example:

```
salt '*' virt.list_inactive_vms cwd=/projects/project_1
```

`salt.modules.vagrant.`**`pause`**`(`*name*`)`

Pause (vagrant suspend) the named VM.

CLI Example:

```
salt <host> vagrant.pause <salt_id>
```

`salt.modules.vagrant.`**`reboot`**`(`*name*, *provision=False*`)`

Reboot a VM. (vagrant reload)

CLI Example:

```
salt <host> vagrant.reboot <salt_id> provision=True
```

Parameters

- **`name`** -- The salt_id name you will use to control this VM
- **`provision`** -- (False) also re-run the Vagrant provisioning scripts.

`salt.modules.vagrant.`**`shutdown`**`(`*name*`)`

Send a soft shutdown (vagrant halt) signal to the named vm.

This does the same thing as vagrant.stop. Other-VM control modules use "stop" and "shutdown" to differentiate between hard and soft shutdowns.

CLI Example:

```
salt <host> vagrant.shutdown <salt_id>
```

`salt.modules.vagrant.`**`start`**`(`*name*`)`

Start (vagrant up) a virtual machine defined by salt_id name. The machine must have been previously defined using "vagrant.init".

CLI Example:

```
salt <host> vagrant.start <salt_id>
```

`salt.modules.vagrant.`**`stop`**`(`*name*`)`

Hard shutdown the virtual machine. (vagrant halt)

CLI Example:

```
salt <host> vagrant.stop <salt_id>
```

`salt.modules.vagrant.`**`version`**`()`

Return the version of Vagrant on the minion

CLI Example:

```
salt '*' vagrant.version
```

`salt.modules.vagrant.`**`vm_state`**`(`*name='', cwd=None*`)`

Return list of information for all the vms indicating their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs defined by the Vagrantfile in the *cwd* directory.

CLI Example:

```
salt '*' vagrant.vm_state <name>  cwd=/projects/project_1
```

returns a list of dictionaries with machine name, state, provider, and salt_id name.

```
datum = {'machine': _, # Vagrant machine name,
         'state': _, # string indicating machine state, like 'running'
         'provider': _, # the Vagrant VM provider
         'name': _} # salt_id name
```

Known bug: if there are multiple machines in your Vagrantfile, and you request the status of the `primary` machine, which you defined by leaving the `machine` parameter blank, then you may receive the status of all of them. Please specify the actual machine name for each VM if there are more than one.

26.6.217 salt.modules.virtualenv

Create virtualenv environments.

New in version 0.17.0.

`salt.modules.virtualenv_mod.`**`create`**(*path*, *venv_bin=None*, *system_site_packages=False*, *distribute=False*, *clear=False*, *python=None*, *extra_search_dir=None*, *never_download=None*, *prompt=None*, *pip=False*, *symlinks=None*, *upgrade=None*, *user=None*, *use_vt=False*, *saltenv='base'*, ***kwargs*)

Create a virtualenv

path
The path to the virtualenv to be created

venv_bin
The name (and optionally path) of the virtualenv command. This can also be set globally in the minion config file as `virtualenv.venv_bin`. Defaults to `virtualenv`.

system_site_packages
[False] Passthrough argument given to virtualenv or venv

distribute
[False] Passthrough argument given to virtualenv

pip
[False] Install pip after creating a virtual environment. Implies `distribute=True`

clear
[False] Passthrough argument given to virtualenv or venv

python
[None (default)] Passthrough argument given to virtualenv

extra_search_dir
[None (default)] Passthrough argument given to virtualenv

never_download
[None (default)] Passthrough argument given to virtualenv if True

prompt
[None (default)] Passthrough argument given to virtualenv if not None

symlinks
[None] Passthrough argument given to venv if True

upgrade
[None] Passthrough argument given to venv if True

user
[None] Set ownership for the virtualenv

Note: On Windows you must also pass a `password` parameter. Additionally, the user must have permissions to the location where the virtual environment is being created

---

runas
[None] Set ownership for the virtualenv

Deprecated since version 2014.1.0: `user` should be used instead

use_vt
[False] Use VT terminal emulation (see output while installing)

New in version 2015.5.0.

saltenv
['base'] Specify a different environment. The default environment is `base`.

New in version 2014.1.0.

Note: The `runas` argument is deprecated as of 2014.1.0. `user` should be used instead.

CLI Example:

```
   salt '*' virtualenv.create /path/to/new/virtualenv

Example of using --always-copy environment variable (in case your fs doesn
↪'t support symlinks).
This will copy files into the virtualenv instead of symlinking them.

.. code-block:: yaml

    - env:
      - VIRTUALENV_ALWAYS_COPY: 1
```

`salt.modules.virtualenv_mod.`**`get_distribution_path`**(*venv, distribution*)

Return the path to a distribution installed inside a virtualenv

New in version 2016.3.0.

venv
Path to the virtualenv.

distribution
Name of the distribution. Note, all non-alphanumeric characters will be converted to dashes.

CLI Example:

```
salt '*' virtualenv.get_distribution_path /path/to/my/venv my_distribution
```

`salt.modules.virtualenv_mod.`**`get_resource_content`**(*venv, package=None, resource=None*)

Return the content of a package resource installed inside a virtualenv

New in version 2015.5.0.

venv
Path to the virtualenv

package
Name of the package in which the resource resides

New in version 2016.3.0.

resource
Name of the resource of which the content is to be returned

New in version 2016.3.0.

CLI Example:

```
salt '*' virtualenv.get_resource_content /path/to/my/venv my_package my/
↪resource.xml
```

salt.modules.virtualenv_mod.**get_resource_path**(*venv*, *package=None*, *resource=None*)

Return the path to a package resource installed inside a virtualenv

New in version 2015.5.0.

venv
Path to the virtualenv

package
Name of the package in which the resource resides

New in version 2016.3.0.

resource
Name of the resource of which the path is to be returned

New in version 2016.3.0.

CLI Example:

```
salt '*' virtualenv.get_resource_path /path/to/my/venv my_package my/
↪resource.xml
```

salt.modules.virtualenv_mod.**get_site_packages**(*venv*)

Return the path to the site-packages directory of a virtualenv

venv
Path to the virtualenv.

CLI Example:

```
salt '*' virtualenv.get_site_packages /path/to/my/venv
```

salt.modules.virtualenv_mod.**virtualenv_ver**(*venv_bin*, *user=None*, ***kwargs*)

return virtualenv version if exists

26.6.218 salt.modules.vsphere

Manage VMware vCenter servers and ESXi hosts.

New in version 2015.8.4.

codeauthor
Alexandru Bleotu <alexandru.bleotu@morganstaley.com>

Dependencies

- pyVmomi Python Module
- ESXCLI

pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

Note: Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See Issue #29537 for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original vSphere Execution Module was developed against.

vSphere Automation SDK

vSphere Automation SDK can be installed via pip:

```
pip install --upgrade pip setuptools
pip install --upgrade git+https://github.com/vmware/vsphere-automation-sdk-
↪python.git
```

Note: The SDK also requires OpenSSL 1.0.1+ if you want to connect to vSphere 6.5+ in order to support TLS1.1 & 1.2.

In order to use the tagging functions in this module, vSphere Automation SDK is necessary to install.

The module is currently in version 1.0.3 (as of 8/26/2019)

ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for vSphere 5.5 and vSphere 6.0.

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host's syslog configuration.

Note: Be aware that some functionality in this execution module may depend on the type of license attached to a vCenter Server or ESXi host(s).

For example, certain services are only available to manipulate service state or policies with a VMware vSphere Enterprise or Enterprise Plus license, while others are available with a Standard license. The `ntpd` service is restricted to an Enterprise Plus license, while `ssh` is available via the Standard license.

Please see the vSphere Comparison page for more information.

About

This execution module was designed to be able to handle connections both to a vCenter Server, as well as to an ESXi host. It utilizes the pyVmomi Python library and the ESXCLI package to run remote execution functions against either the defined vCenter server or the ESXi host.

Whether or not the function runs against a vCenter Server or an ESXi host depends entirely upon the arguments passed into the function. Each function requires a `host` location, `username`, and `password`. If the credentials provided apply to a vCenter Server, then the function will be run against the vCenter Server. For example, when listing hosts using vCenter credentials, you'll get a list of hosts associated with that vCenter Server:

```
# salt my-minion vsphere.list_hosts <vcenter-ip> <vcenter-user> <vcenter-
↪password>
my-minion:
- esxi-1.example.com
- esxi-2.example.com
```

However, some functions should be used against ESXi hosts, not vCenter Servers. Functionality such as getting a host's coredump network configuration should be performed against a host and not a vCenter server. If the authentication information you're using is against a vCenter server and not an ESXi host, you can provide the host name that is associated with the vCenter server in the command, as a list, using the `host_names` or `esxi_host` kwarg. For example:

```
# salt my-minion vsphere.get_coredump_network_config <vcenter-ip> <vcenter-
↪user>         <vcenter-password> esxi_hosts='[esxi-1.example.com, esxi-2.
↪example.com]'
my-minion:
----------
    esxi-1.example.com:
        ----------
        Coredump Config:
            ----------
            enabled:
                False
    esxi-2.example.com:
        ----------
        Coredump Config:
            ----------
            enabled:
                True
            host_vnic:
                vmk0
            ip:
                coredump-location.example.com
            port:
                6500
```

You can also use these functions against an ESXi host directly by establishing a connection to an ESXi host using the host's location, username, and password. If ESXi connection credentials are used instead of vCenter credentials, the `host_names` and `esxi_hosts` arguments are not needed.

```
# salt my-minion vsphere.get_coredump_network_config esxi-1.example.com root
↪<host-password>
local:
----------
    10.4.28.150:
        ----------
        Coredump Config:
            ----------
            enabled:
                True
            host_vnic:
                vmk0
            ip:
                coredump-location.example.com
            port:
                6500
```

`salt.modules.vsphere.`**`add_capacity_to_diskgroup`**(*cache_disk_id*, *capacity_disk_ids*, *safety_checks=True*, *service_instance=None*)

Adds capacity disks to the disk group with the specified cache disk.

cache_disk_id
The canonical name of the cache disk.

capacity_disk_ids
A list containing canonical names of the capacity disks to add.

safety_checks
Specify whether to perform safety check or to skip the checks and try performing the required task. Default value is True.

service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.add_capacity_to_diskgroup
    cache_disk_id='naa.000000000000001'
    capacity_disk_ids='[naa.000000000000002, naa.000000000000003]'
```

`salt.modules.vsphere.`**`add_host_to_dvs`**(*host*, *username*, *password*, *vmknic_name*, *vmnic_name*, *dvs_name*, *target_portgroup_name*, *uplink_portgroup_name*, *protocol=None*, *port=None*, *host_names=None*, *verify_ssl=True*)

Adds an ESXi host to a vSphere Distributed Virtual Switch and migrates the desired adapters to the DVS from the standard switch.

host
The location of the vCenter server.

username
The username used to login to the vCenter server.

password
The password used to login to the vCenter server.

vmknic_name
The name of the virtual NIC to migrate.

vmnic_name

The name of the physical NIC to migrate.

dvs_name
The name of the Distributed Virtual Switch.

target_portgroup_name
The name of the distributed portgroup in which to migrate the virtual NIC.

uplink_portgroup_name
The name of the uplink portgroup in which to migrate the physical NIC.

protocol
Optionally set to alternate protocol if the vCenter server or ESX/ESXi host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the vCenter server or ESX/ESXi host is not using the default port. Default port is `443`.

host_names:
An array of VMware host names to migrate

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
salt some_host vsphere.add_host_to_dvs host='vsphere.corp.com'
    username='administrator@vsphere.corp.com' password='vsphere_password'
    vmknic_name='vmk0' vmnic_name='vnmic0' dvs_name='DSwitch'
    target_portgroup_name='DPortGroup' uplink_portgroup_name='DSwitch1-
↪DVUplinks-181'
    protocol='https' port='443', host_names="['esxi1.corp.com','esxi2.
↪corp.com','esxi3.corp.com']"
```

Return Example:

```
somehost:
    ----------
    esxi1.corp.com:
        ----------
        dvs:
            DSwitch
        portgroup:
            DPortGroup
        status:
            True
        uplink:
            DSwitch-DVUplinks-181
        vmknic:
            vmk0
        vmnic:
            vmnic0
    esxi2.corp.com:
        ----------
        dvs:
            DSwitch
        portgroup:
            DPortGroup
        status:
            True
        uplink:
```

(continues on next page)

(continued from previous page)

```
            DSwitch-DVUplinks-181
        vmknic:
            vmk0
        vmnic:
            vmnic0
    esxi3.corp.com:
        ----------
        dvs:
            DSwitch
        portgroup:
            DPortGroup
        status:
            True
        uplink:
            DSwitch-DVUplinks-181
        vmknic:
            vmk0
        vmnic:
            vmnic0
    message:
    success:
        True
```

This was very difficult to figure out. VMware's PyVmomi documentation at

https://github.com/vmware/pyvmomi/blob/master/docs/vim/DistributedVirtualSwitch.rst (which is a copy of the official documentation here: https://www.vmware.com/support/developer/converter-sdk/conv60_apireference/vim.DistributedVirtualSwitch.html)

says to create the DVS, create distributed portgroups, and then add the host to the DVS specifying which physical NIC to use as the port backing. However, if the physical NIC is in use as the only link from the host to vSphere, this will fail with an unhelpful "busy" error.

There is, however, a Powershell PowerCLI cmdlet called Add-VDSwitchPhysicalNetworkAdapter that does what we want. I used Onyx (https://labs.vmware.com/flings/onyx) to sniff the SOAP stream from Powershell to our vSphere server and got this snippet out:

```
<UpdateNetworkConfig xmlns="urn:vim25">
  <_this type="HostNetworkSystem">networkSystem-187</_this>
  <config>
    <vswitch>
      <changeOperation>edit</changeOperation>
      <name>vSwitch0</name>
      <spec>
        <numPorts>7812</numPorts>
      </spec>
    </vswitch>
    <proxySwitch>
        <changeOperation>edit</changeOperation>
        <uuid>73 a4 05 50 b0 d2 7e b9-38 80 5d 24 65 8f da 70</uuid>
        <spec>
        <backing xsi:type="DistributedVirtualSwitchHostMemberPnicBacking">

```

The SOAP API maps closely to PyVmomi, so from there it was (relatively) easy to figure out what Python to write.

`salt.modules.vsphere.`**`add_license`**(*key*, *description*, *safety_checks=True*, *service_instance=None*)

Adds a license to the vCenter or ESXi host

key
License key.

description
License description added in as a label.

safety_checks
Specify whether to perform safety check or to skip the checks and try performing the required task

service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.add_license key=<license_key> desc='License desc'
```

`salt.modules.vsphere.`**`assign_default_storage_policy_to_datastore`**(*policy*, *datastore*, *service_instance=None*)

Assigns a storage policy as the default policy to a datastore.

policy
Name of the policy to assign.

datastore
Name of the datastore to assign. The datastore needs to be visible to the VMware entity the proxy points to.

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.assign_storage_policy_to_datastore
    policy='policy name' datastore=ds1
```

`salt.modules.vsphere.`**`assign_license`**(*license_key*, *license_name*, *entity*, *entity_display_name*, *safety_checks=True*, *service_instance=None*)

Assigns a license to an entity

license_key
Key of the license to assign See `_get_entity` docstrings for format.

license_name
Display name of license

entity
Dictionary representation of an entity

entity_display_name
Entity name used in logging

safety_checks
Specify whether to perform safety check or to skip the checks and try performing the required task. Default is False.

service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.assign_license license_key=AAAAA-11111-AAAAA-11111-AAAAA
    license_name=test entity={type:cluster,datacenter:dc,cluster:cl}
```

`salt.modules.vsphere.`**`attach_tag`**(*object_id*, *tag_id*, *managed_obj='ClusterComputeResource'*, *server=None*, *username=None*, *password=None*, *service_instance=None*, *verify_ssl=None*, *ca_bundle=None*)

Attach an existing tag to an input object.

The tag needs to meet the cardinality (*CategoryModel.cardinality*) and associability (*CategoryModel.associable_types*) criteria in order to be eligible for attachment. If the tag is already attached to the object, then this method is a no-op and an error will not be thrown. To invoke this method, you need the attach tag privilege on the tag and the read privilege on the object.

CLI Example:

```
salt vm_minion vsphere.attach_tag domain-c2283                    
↪urn:vmomi:InventoryServiceTag:b55ecc77-f4a5-49f8-ab52-
↪38865467cfbe:GLOBAL
```

Parameters

- **`object_id`** (*`str`*) -- The identifier of the input object.
- **`tag_id`** (*`str`*) -- The identifier of the tag object.
- **`managed_obj`** (*`str`*) -- Classes that contain methods for creating and deleting resources typically contain a class attribute specifying the resource type for the resources being created and deleted.
- **`server`** (*`basestring`*) -- Target DNS or IP of vCenter center.
- **`username`** (*`basestring`*) -- Username associated with the vCenter center.
- **`password`** (*`basestring`*) -- Password associated with the vCenter center.
- **`verify_ssl`** (*`boolean`*) -- Verify the SSL certificate. Default: True
- **`ca_bundle`** (*`basestring`*) -- Path to the ca bundle to use when verifying SSL certificates.

Returns
The list of all tag identifiers that correspond to the tags attached to the given object.

Return type
list of tags

Raise
Unauthorized if you do not have the privilege to read the object.

Raise
Unauthenticated if the user can not be authenticated.

`salt.modules.vsphere.`**`compare_vm_configs`**`(`*new_config, current_config*`)`

Compares virtual machine current and new configuration, the current is the one which is deployed now, and the new is the target config. Returns the differences between the objects in a dictionary, the keys are the configuration parameter keys and the values are differences objects: either list or recursive difference

new_config:
New config dictionary with every available parameter

current_config
Currently deployed configuration

`salt.modules.vsphere.`**`configure_host_cache`**`(`*enabled, datastore=None, swap_size_MiB=None, service_instance=None*`)`

Configures the host cache on the selected host.

enabled
Boolean flag specifying whether the host cache is enabled.

datastore
Name of the datastore that contains the host cache. Must be set if enabled is `true`.

swap_size_MiB
Swap size in Mibibytes. Needs to be set if enabled is `true`. Must be smaller than the datastore size.

service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.configure_host_cache enabled=False

salt '*' vsphere.configure_host_cache enabled=True datastore=ds1
    swap_size_MiB=1024
```

`salt.modules.vsphere.`**`coredump_network_enable`**`(`*host, username, password, enabled, protocol=None, port=None, esxi_hosts=None, credstore=None*`)`

Enable or disable ESXi core dump collection. Returns `True` if coredump is enabled and returns `False` if core dump is not enabled. If there was an error, the error will be the value printed in the `Error` key dictionary for the given host.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

enabled
Python True or False to enable or disable coredumps.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

esxi_hosts
If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi

machines.

credstore
Optionally set to path to the credential store file.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.coredump_network_enable my.esxi.host root bad-password
↪True

# Used for connecting to a vCenter Server
salt '*' vsphere.coredump_network_enable my.vcenter.location root bad-
↪password True            esxi_hosts='[esxi-1.host.com, esxi-2.host.com]
↪'
```

`salt.modules.vsphere.`**`create_cluster`**(*cluster_dict, datacenter=None, cluster=None, service_instance=None*)

Creates a cluster.

Note: cluster_dict['name'] will be overridden by the cluster param value

config_dict
Dictionary with the config values of the new cluster.

datacenter
Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default value is None.

cluster
Name of cluster. Ignored if already contained by proxy details. Default value is None.

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
# esxdatacenter proxy
salt '*' vsphere.create_cluster cluster_dict=$cluster_dict cluster=cl1

# esxcluster proxy
salt '*' vsphere.create_cluster cluster_dict=$cluster_dict
```

`salt.modules.vsphere.`**`create_datacenter`**(*datacenter_name, service_instance=None*)

Creates a datacenter.

Supported proxies: esxdatacenter

datacenter_name
The datacenter name

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.create_datacenter dc1
```

`salt.modules.vsphere.`**`create_diskgroup`**(*cache_disk_id, capacity_disk_ids, safety_checks=True, service_instance=None*)

Creates disk group on an ESXi host with the specified cache and capacity disks.

cache_disk_id
The canonical name of the disk to be used as a cache. The disk must be ssd.

capacity_disk_ids
A list containing canonical names of the capacity disks. Must contain at least one id. Default is True.

safety_checks
Specify whether to perform safety check or to skip the checks and try performing the required task. Default value is True.

service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.create_diskgroup cache_disk_id='naa.000000000000001'
    capacity_disk_ids='[naa.000000000000002, naa.000000000000003]'
```

`salt.modules.vsphere.`**`create_dvportgroup`**(*portgroup_dict*, *portgroup_name*, *dvs*, *service_instance=None*)

Creates a distributed virtual portgroup.

Note: The `portgroup_name` param will override any name already set in `portgroup_dict`.

portgroup_dict
Dictionary with the config values the portgroup should be created with (example in salt.states.dvs).

portgroup_name
Name of the portgroup to be created.

dvs
Name of the DVS that will contain the portgroup.

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.create_dvportgroup portgroup_dict=<dict>
    portgroup_name=pg1 dvs=dvs1
```

`salt.modules.vsphere.`**`create_dvs`**(*dvs_dict*, *dvs_name*, *service_instance=None*)

Creates a distributed virtual switch (DVS).

Note: The `dvs_name` param will override any name set in `dvs_dict`.

dvs_dict
Dict representation of the new DVS (example in salt.states.dvs)

dvs_name
Name of the DVS to be created.

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.create_dvs dvs dict=$dvs_dict dvs_name=dvs_name
```

`salt.modules.vsphere.`**`create_storage_policy`**(*policy_name*, *policy_dict*, *service_instance=None*)

Creates a storage policy.

Supported capability types: scalar, set, range.

policy_name
Name of the policy to create. The value of the argument will override any existing name in `policy_dict`.

policy_dict
Dictionary containing the changes to apply to the policy. (example in salt.states.pbm)

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.create_storage_policy policy_name='policy name'
    policy_dict="$policy_dict"
```

`salt.modules.vsphere.`**`create_tag`**`(`*name, description, category_id, server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None*`)`

Create a tag under a category with given description.

CLI Example:

```
salt vm_minion vsphere.create_tag
```

Parameters
- **server** (*basestring*) -- Target DNS or IP of vCenter client.
- **username** (*basestring*) -- Username associated with the vCenter client.
- **password** (*basestring*) -- Password associated with the vCenter client.
- **name** (*str*) -- Name of tag category to create (ex. Machine, OS, Availability, etc.)
- **description** (*str*) -- Given description of tag category.
- **category_id** (*str*) -- Value of category_id representative of the category created previously.
- **verify_ssl** (*boolean*) -- Verify the SSL certificate. Default: True
- **ca_bundle** (*basestring*) -- Path to the ca bundle to use when verifying SSL certificates.

Returns
The identifier of the created tag.

Return type
str

Raise
AlreadyExists if the name provided in the create_spec is the name of an already existing tag in the input category.

Raise
InvalidArgument if any of the input information in the create_spec is invalid.

Raise
NotFound if the category for in the given create_spec does not exist in the system.

Raise
Unauthorized if you do not have the privilege to create tag.

`salt.modules.vsphere.`**`create_tag_category`**`(`*name, description, cardinality, server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None*`)`

Create a category with given cardinality.

CLI Example:

```
salt vm_minion vsphere.create_tag_category
```

Parameters
- **name** (*str*) -- Name of tag category to create (ex. Machine, OS, Availability, etc.)
- **description** (*str*) -- Given description of tag category.
- **cardinality** (*str*) -- The associated cardinality (SINGLE, MULTIPLE) of the category.
- **server** (*basestring*) -- Target DNS or IP of vCenter center.
- **username** (*basestring*) -- Username associated with the vCenter center.
- **password** (*basestring*) -- Password associated with the vCenter center.

- **verify_ssl** (*boolean*) -- Verify the SSL certificate. Default: True
- **ca_bundle** (*basestring*) -- Path to the ca bundle to use when verifying SSL certificates.

Returns
Identifier of the created category.

Return type
str

Raise
AlreadyExists if the name` provided in the create_spec is the name of an already existing category.

Raise
InvalidArgument if any of the information in the create_spec is invalid.

Raise
Unauthorized if you do not have the privilege to create a category.

`salt.modules.vsphere.`**`create_vm`**`(`*vm_name, cpu, memory, image, version, datacenter, datastore, placement, interfaces, disks, scsi_devices, serial_ports=None, ide_controllers=None, sata_controllers=None, cd_drives=None, advanced_configs=None, service_instance=None*`)`

Creates a virtual machine container.

CLI Example:

```
salt vm_minion vsphere.create_vm vm_name=vmname cpu='{count: 2, nested:␣
↪True}' ...
```

vm_name
Name of the virtual machine

cpu
Properties of CPUs for freshly created machines

memory
Memory size for freshly created machines

image
Virtual machine guest OS version identifier VirtualMachineGuestOsIdentifier

version
Virtual machine container hardware version

datacenter
Datacenter where the virtual machine will be deployed (mandatory)

datastore
Datastore where the virtual machine files will be placed

placement
Resource pool or cluster or host or folder where the virtual machine will be deployed

devices
interfaces

```
interfaces:
  adapter: 'Network adapter 1'
  name: vlan100
  switch_type: distributed or standard
  adapter_type: vmxnet3 or vmxnet, vmxnet2, vmxnet3, e1000, e1000e
  mac: '00:11:22:33:44:55'
  connectable:
    allow_guest_control: True
    connected: True
    start_connected: True
```

disks

```
disks:
  adapter: 'Hard disk 1'
  size: 16
  unit: GB
  address: '0:0'
  controller: 'SCSI controller 0'
  thin_provision: False
  eagerly_scrub: False
  datastore: 'myshare'
  filename: 'vm/mydisk.vmdk'
```

scsi_devices

```
scsi_devices:
  controller: 'SCSI controller 0'
  type: paravirtual
  bus_sharing: no_sharing
```

serial_ports

```
serial_ports:
  adapter: 'Serial port 1'
  type: network
  backing:
    uri: 'telnet://something:port'
    direction: <client|server>
    filename: 'service_uri'
  connectable:
    allow_guest_control: True
    connected: True
    start_connected: True
  yield: False
```

cd_drives

```
cd_drives:
  adapter: 'CD/DVD drive 0'
  controller: 'IDE 0'
  device_type: datastore_iso_file
  datastore_iso_file:
    path: path_to_iso
  connectable:
    allow_guest_control: True
    connected: True
    start_connected: True
```

advanced_config
Advanced config parameters to be set for the virtual machine

`salt.modules.vsphere.`**`create_vmfs_datastore`**(*datastore_name, disk_id, vmfs_major_version, safety_checks=True, service_instance=None*)

Creates a ESXi host disk group with the specified cache and capacity disks.

datastore_name
The name of the datastore to be created.

disk_id
The disk id (canonical name) on which the datastore is created.

vmfs_major_version
The VMFS major version.

safety_checks
Specify whether to perform safety check or to skip the checks and try performing the required task. Default is True.

service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.create_vmfs_datastore datastore_name=ds1 disk_id=
    vmfs_major_version=5
```

`salt.modules.vsphere.`**`delete_advanced_configs`**(*vm_name, datacenter, advanced_configs, service_instance=None*)

Removes extra config parameters from a virtual machine

vm_name
Virtual machine name

datacenter
Datacenter name where the virtual machine is available

advanced_configs
List of advanced config values to be removed

service_instance
vCenter service instance for connection and configuration

`salt.modules.vsphere.`**`delete_tag`**(*tag_id, server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None*)

Delete a tag.

CLI Example:

```
salt vm_minion vsphere.delete_tag
```

Parameters

- **`tag_id`** (*`str`*) -- The identifier of tag to be deleted. The parameter must be an identifier for the resource type: `com.vmware.cis.tagging.Tag`.
- **`server`** (*`basestring`*) -- Target DNS or IP of vCenter center.
- **`username`** (*`basestring`*) -- Username associated with the vCenter center.
- **`password`** (*`basestring`*) -- Password associated with the vCenter center.
- **`verify_ssl`** (*`boolean`*) -- Verify the SSL certificate. Default: True
- **`ca_bundle`** (*`basestring`*) -- Path to the ca bundle to use when verifying SSL certificates.

Raise
AlreadyExists if the name provided in the create_spec is the name of an already existing category.

Raise
InvalidArgument if any of the information in the create_spec is invalid.

Raise
Unauthorized if you do not have the privilege to create a category.

`salt.modules.vsphere.`**`delete_tag_category`**(*category_id, server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None*)

Delete a category.

CLI Example:

```
salt vm_minion vsphere.delete_tag_category
```

Parameters

- **`category_id`** (*`str`*) -- The identifier of category to be deleted. The parameter must be an identifier for the resource type: `com.vmware.cis.tagging.Category`.
- **`server`** (*`basestring`*) -- Target DNS or IP of vCenter center.
- **`username`** (*`basestring`*) -- Username associated with the vCenter center.
- **`password`** (*`basestring`*) -- Password associated with the vCenter center.
- **`verify_ssl`** (*`boolean`*) -- Verify the SSL certificate. Default: True
- **`ca_bundle`** (*`basestring`*) -- Path to the ca bundle to use when verifying SSL certificates.

Raise

NotFound if the tag for the given tag_id does not exist in the system.

Raise

Unauthorized if you do not have the privilege to delete the tag.

Raise

Unauthenticated if the user can not be authenticated.

`salt.modules.vsphere.`**`delete_vm`**`(`*name, datacenter, placement=None, power_off=False, service_instance=None*`)`

Deletes a virtual machine defined by name and placement

name

Name of the virtual machine

datacenter

Datacenter of the virtual machine

placement

Placement information of the virtual machine

service_instance

vCenter service instance for connection and configuration

CLI Example:

```
salt '*' vsphere.delete_vm name=my_vm datacenter=my_datacenter
```

`salt.modules.vsphere.`**`disconnect`**`(`*service_instance*`)`

Disconnects from a vCenter or ESXi host

Note: Should be used by state functions, not invoked directly.

service_instance

Service instance (vim.ServiceInstance)

CLI Example:

See note above.

`salt.modules.vsphere.`**`enable_firewall_ruleset`**`(`*host, username, password, ruleset_enable, ruleset_name, protocol=None, port=None, esxi_hosts=None, credstore=None*`)`

Enable or disable an ESXi firewall rule set.

host

The location of the host.

username

The username used to login to the host, such as `root`.

password
The password used to login to the host.

ruleset_enable
True to enable the ruleset, false to disable.

ruleset_name
Name of ruleset to target.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

esxi_hosts
If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

credstore
Optionally set to path to the credential store file.

Returns
A standard cmd.run_all dictionary, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.enable_firewall_ruleset my.esxi.host root bad-password
↪True 'syslog'

# Used for connecting to a vCenter Server
salt '*' vsphere.enable_firewall_ruleset my.vcenter.location root bad-
↪password True 'syslog'            esxi_hosts='[esxi-1.host.com, esxi-2.
↪host.com]'
```

`salt.modules.vsphere.`**`erase_disk_partitions`**(*disk_id=None, scsi_address=None, service_instance=None*)

Erases the partitions on a disk. The disk can be specified either by the canonical name, or by the scsi_address.

disk_id
Canonical name of the disk. Either `disk_id` or `scsi_address` needs to be specified (`disk_id` supersedes `scsi_address`.

scsi_address
Scsi address of the disk. `disk_id` or `scsi_address` needs to be specified (`disk_id` supersedes `scsi_address`.

service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.erase_disk_partitions scsi_address='vmhaba0:C0:T0:L0'

salt '*' vsphere.erase_disk_partitions disk_id='naa.000000000000001'
```

`salt.modules.vsphere.`**`esxcli_cmd`**(*cmd_str, host=None, username=None, password=None, protocol=None, port=None, esxi_hosts=None, credstore=None*)

Run an ESXCLI command directly on the host or list of hosts.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

cmd_str
The ESXCLI command to run. Note: This should not include the `-s`, `-u`, `-p`, `-h`, `--protocol`, or `--portnumber` arguments that are frequently passed when using a bare ESXCLI command from the command line. Those arguments are handled by this function via the other args and kwargs.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

esxi_hosts
If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

credstore
Optionally set to path to the credential store file.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.esxcli_cmd my.esxi.host root bad-password
↪'system coredump network get'

# Used for connecting to a vCenter Server
salt '*' vsphere.esxcli_cmd my.vcenter.location root bad-password
↪    'system coredump network get' esxi_hosts='[esxi-1.host.com, esxi-2.
↪host.com]'
```

`salt.modules.vsphere.`**`get_advanced_configs`**(*vm_name*, *datacenter*, *service_instance=None*)

Returns extra config parameters from a virtual machine advanced config list

vm_name
Virtual machine name

datacenter
Datacenter name where the virtual machine is available

service_instance
vCenter service instance for connection and configuration

`salt.modules.vsphere.`**`get_coredump_network_config`**(*host*, *username*, *password*, *protocol=None*, *port=None*, *esxi_hosts=None*, *credstore=None*)

Retrieve information on ESXi or vCenter network dump collection and format it into a dictionary.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

esxi_hosts
If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

credstore
Optionally set to path to the credential store file.

Returns
A dictionary with the network configuration, or, if getting the network config failed, a an error message retrieved from the standard cmd.run_all dictionary, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.get_coredump_network_config my.esxi.host root bad-
↪password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_coredump_network_config my.vcenter.location root bad-
↪password             esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`get_firewall_status`**(*host, username, password, protocol=None, port=None, esxi_hosts=None, credstore=None*)

Show status of all firewall rule sets.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

esxi_hosts
If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

credstore
Optionally set to path to the credential store file.

Returns
Nested dictionary with two toplevel keys `rulesets` and `success` `success` will be True or False depending on query success `rulesets` will list the rulesets and their statuses if `success` was true, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.get_firewall_status my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_firewall_status my.vcenter.location root bad-
↪password             esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`get_host_cache`**(*service_instance=None*)

Returns the host cache configuration on the proxy host.

service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.get_host_cache
```

salt.modules.vsphere.**get_host_datetime**(*host*, *username*, *password*, *protocol=None*, *port=None*, *host_names=None*, *verify_ssl=True*)

Get the date/time information for a given host or list of host_names.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to get date/time information.

If host_names is not provided, the date/time information will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_host_datetime my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_host_datetime my.vcenter.location root bad-password ␣
↪       host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.**get_ntp_config**(*host*, *username*, *password*, *protocol=None*, *port=None*, *host_names=None*, *verify_ssl=True*)

Get the NTP configuration information for a given host or list of host_names.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to get ntp configuration information.

If host_names is not provided, the NTP configuration will be retrieved for the `host` location instead.

This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl

Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_ntp_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_ntp_config my.vcenter.location root bad-password ␣
↪    host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`get_proxy_type`**`()`

Returns the proxy type retrieved either from the pillar of from the proxy minion's config. Returns `<undefined>` otherwise.

CLI Example:

```
salt '*' vsphere.get_proxy_type
```

`salt.modules.vsphere.`**`get_service_instance_via_proxy`**`(`*service_instance=None*`)`

Returns a service instance to the proxied endpoint (vCenter/ESXi host).

service_instance

Service instance (vim.ServiceInstance) of the vCenter. Default is None.

Note: Should be used by state functions not invoked directly.

CLI Example:

See note above

`salt.modules.vsphere.`**`get_service_policy`**`(`*host, username, password, service_name, protocol=None, port=None, host_names=None, verify_ssl=True*`)`

Get the service name's policy for a given host or list of hosts.

host

The location of the host.

username

The username used to login to the host, such as `root`.

password

The password used to login to the host.

service_name

The name of the service for which to retrieve the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

protocol

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port

Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names

List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to get service policy information.

If host_names is not provided, the service policy information will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl

Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_service_policy my.esxi.host root bad-password 'ssh'

# Used for connecting to a vCenter Server
salt '*' vsphere.get_service_policy my.vcenter.location root bad-password
↪'ntpd'         host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`get_service_running`**(*host, username, password, service_name, protocol=None, port=None, host_names=None, verify_ssl=True*)

Get the service name's running state for a given host or list of hosts.

host

The location of the host.

username

The username used to login to the host, such as `root`.

password

The password used to login to the host.

service_name

The name of the service for which to retrieve the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

protocol

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port

Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names

List of ESXi host names. When the host, username, and password credentials are provided for a vCenter

Server, the host_names argument is required to tell vCenter the hosts for which to get the service's running state.

If host_names is not provided, the service's running state will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_service_running my.esxi.host root bad-password 'ssh'

# Used for connecting to a vCenter Server
salt '*' vsphere.get_service_running my.vcenter.location root bad-
↪password 'ntpd'         host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`get_ssh_key`**(*host*, *username*, *password*, *protocol=None*, *port=None*, *certificate_verify=None*)

Retrieve the authorized_keys entry for root. This function only works for ESXi, not vCenter.

Parameters

- **`host`** -- The location of the ESXi Host
- **`username`** -- Username to connect as
- **`password`** -- Password for the ESXi web endpoint
- **`protocol`** -- defaults to https, can be http if ssl is disabled on ESXi
- **`port`** -- defaults to 443 for https
- **`certificate_verify`** -- If true require that the SSL connection present a valid certificate. Default: True

Returns
True if upload is successful

CLI Example:

```
salt '*' vsphere.get_ssh_key my.esxi.host root bad-password certificate_
↪verify=True
```

`salt.modules.vsphere.`**`get_syslog_config`**(*host*, *username*, *password*, *protocol=None*, *port=None*, *esxi_hosts=None*, *credstore=None*)

Retrieve the syslog configuration.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

esxi_hosts
If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

credstore
Optionally set to path to the credential store file.

Returns

Dictionary with keys and values corresponding to the syslog configuration, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.get_syslog_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_syslog_config my.vcenter.location root bad-password ␣
↪           esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`get_vm`**(*name*, *datacenter=None*, *vm_properties=None*, *traversal_spec=None*, *parent_ref=None*, *service_instance=None*)

Returns vm object properties.

name
Name of the virtual machine.

datacenter
Datacenter name

vm_properties
List of vm properties.

traversal_spec
Traversal Spec object(s) for searching.

parent_ref
Container Reference object for searching under a given object.

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

`salt.modules.vsphere.`**`get_vm_config`**(*name*, *datacenter=None*, *objects=True*, *service_instance=None*)

Queries and converts the virtual machine properties to the available format from the schema. If the objects attribute is True the config objects will have extra properties, like 'object' which will include the vim.vm.device.VirtualDevice, this is necessary for deletion and update actions.

name
Name of the virtual machine

datacenter
Datacenter's name where the virtual machine is available

objects
Indicates whether to return the vmware object properties (eg. object, key) or just the properties which can be set

service_instance
vCenter service instance for connection and configuration

`salt.modules.vsphere.`**`get_vm_config_file`**(*name*, *datacenter*, *placement*, *datastore*, *service_instance=None*)

Queries the virtual machine config file and returns vim.host.DatastoreBrowser.SearchResults object on success None on failure

name
Name of the virtual machine

datacenter
Datacenter name

datastore
Datastore where the virtual machine files are stored

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

`salt.modules.vsphere.`**`get_vmotion_enabled`**(*host*, *username*, *password*, *protocol=None*, *port=None*, *host_names=None*, *verify_ssl=True*)

Get the VMotion enabled status for a given host or a list of host_names. Returns `True` if VMotion is enabled, `False` if it is not enabled.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to check if VMotion is enabled.

If host_names is not provided, the VMotion status will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_vmotion_enabled my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_vmotion_enabled my.vcenter.location root bad-
↪password         host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`get_vsan_eligible_disks`**(*host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True*)

Returns a list of VSAN-eligible disks for a given host or list of host_names.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to check if any VSAN-eligible disks are available.

If host_names is not provided, the VSAN-eligible disks will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_vsan_eligible_disks my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_vsan_eligible_disks my.vcenter.location root bad-
↪password         host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`get_vsan_enabled`**(*host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True*)

Get the VSAN enabled status for a given host or a list of host_names. Returns `True` if VSAN is enabled, `False` if it is not enabled, and `None` if a VSAN Host Config is unset, per host.

host
: The location of the host.

username
: The username used to login to the host, such as `root`.

password
: The password used to login to the host.

protocol
: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
: Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
: List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to check if VSAN enabled.

  If host_names is not provided, the VSAN status will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
: Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_vsan_enabled my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_vsan_enabled my.vcenter.location root bad-password  ⊠
↪      host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`list_assigned_licenses`**(*entity, entity_display_name, license_keys=None, service_instance=None*)

Lists the licenses assigned to an entity

entity
: Dictionary representation of an entity. See `_get_entity` docstrings for format.

entity_display_name
: Entity name used in logging

license_keys:
: List of license keys to be retrieved. Default is None.

service_instance
: Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.list_assigned_licenses
    entity={type:cluster,datacenter:dc,cluster:cl}
    entiy_display_name=cl
```

`salt.modules.vsphere.`**`list_attached_tags`**(*object_id, managed_obj='ClusterComputeResource', server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None*)

List existing tags a user has access to.

CLI Example:

```
salt vm_minion vsphere.list_attached_tags domain-c2283
```

Parameters

- **object_id** (*str*) -- The identifier of the input object.
- **managed_obj** (*str*) -- Classes that contain methods for creating and deleting resources typically contain a class attribute specifying the resource type for the resources being created and deleted.
- **server** (*basestring*) -- Target DNS or IP of vCenter center.
- **username** (*basestring*) -- Username associated with the vCenter center.
- **password** (*basestring*) -- Password associated with the vCenter center.
- **verify_ssl** (*boolean*) -- Verify the SSL certificate. Default: True
- **ca_bundle** (*basestring*) -- Path to the ca bundle to use when verifying SSL certificates.

Returns

The list of all tag identifiers that correspond to the tags attached to the given object.

Return type

list of tags

Raise

Unauthorized if you do not have the privilege to read the object.

Raise

Unauthenticated if the user can not be authenticated.

`salt.modules.vsphere.`**`list_capability_definitions`**(*service_instance=None*)

Returns a list of the metadata of all capabilities in the vCenter.

service_instance

Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.list_capabilities
```

`salt.modules.vsphere.`**`list_cluster`**(*datacenter=None, cluster=None, service_instance=None*)

Returns a dict representation of an ESX cluster.

datacenter

Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default value is None.

cluster

Name of cluster. Ignored if already contained by proxy details. Default value is None.

service_instance

Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
# vcenter proxy
salt '*' vsphere.list_cluster datacenter=dc1 cluster=cl1

# esxdatacenter proxy
salt '*' vsphere.list_cluster cluster=cl1

# esxcluster proxy
salt '*' vsphere.list_cluster
```

`salt.modules.vsphere.`**`list_clusters`**(*host*, *username*, *password*, *protocol=None*, *port=None*, *verify_ssl=True*)

Returns a list of clusters for the specified host.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_clusters 1.2.3.4 root bad-password
```

`salt.modules.vsphere.`**`list_datacenters`**(*host*, *username*, *password*, *protocol=None*, *port=None*, *verify_ssl=True*)

Returns a list of datacenters for the specified host.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_datacenters 1.2.3.4 root bad-password
```

`salt.modules.vsphere.`**`list_datacenters_via_proxy`**(*datacenter_names=None*, *service_instance=None*)

Returns a list of dict representations of VMware datacenters. Connection is done via the proxy details.

Supported proxies: esxdatacenter

datacenter_names
List of datacenter names. Default is None.

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.list_datacenters_via_proxy

salt '*' vsphere.list_datacenters_via_proxy dc1

salt '*' vsphere.list_datacenters_via_proxy dc1,dc2

salt '*' vsphere.list_datacenters_via_proxy datacenter_names=[dc1, dc2]
```

`salt.modules.vsphere.`**`list_datastore_clusters`**(*host, username, password, protocol=None, port=None, verify_ssl=True*)

Returns a list of datastore clusters for the specified host.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_datastore_clusters 1.2.3.4 root bad-password
```

`salt.modules.vsphere.`**`list_datastores`**(*host, username, password, protocol=None, port=None, verify_ssl=True*)

Returns a list of datastores for the specified host.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_datastores 1.2.3.4 root bad-password
```

`salt.modules.vsphere.`**`list_datastores_via_proxy`**(*datastore_names=None, backing_disk_ids=None, backing_disk_scsi_addresses=None, service_instance=None*)

Returns a list of dict representations of the datastores visible to the proxy object. The list of datastores can be filtered by datastore names, backing disk ids (canonical names) or backing disk scsi addresses.

Supported proxy types: esxi, esxcluster, esxdatacenter

datastore_names
List of the names of datastores to filter on

backing_disk_ids
List of canonical names of the backing disks of the datastores to filer. Default is None.

backing_disk_scsi_addresses
List of scsi addresses of the backing disks of the datastores to filter. Default is None.

service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.list_datastores_via_proxy

salt '*' vsphere.list_datastores_via_proxy datastore_names=[ds1, ds2]
```

`salt.modules.vsphere.`**`list_default_storage_policy_of_datastore`**(*datastore, service_instance=None*)

Returns a list of datastores assign the storage policies.

datastore
Name of the datastore to assign. The datastore needs to be visible to the VMware entity the proxy points to.

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.list_default_storage_policy_of_datastore datastore=ds1
```

`salt.modules.vsphere.`**`list_default_vsan_policy`**(*service_instance=None*)

Returns the default vsan storage policy.

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.list_default_vsan_policy
```

`salt.modules.vsphere.`**`list_disk_partitions`**(*disk_id=None, scsi_address=None, service_instance=None*)

Lists the partitions on a disk. The disk can be specified either by the canonical name, or by the scsi_address.

disk_id
Canonical name of the disk. Either `disk_id` or `scsi_address` needs to be specified (`disk_id` supersedes `scsi_address`.

scsi_address`
Scsi address of the disk. `disk_id` or `scsi_address` needs to be specified (`disk_id` supersedes `scsi_address`.

service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.list_disk_partitions scsi_address='vmhaba0:C0:T0:L0'

salt '*' vsphere.list_disk_partitions disk_id='naa.000000000000001'
```

`salt.modules.vsphere.`**`list_diskgroups`**(*cache_disk_ids=None*, *service_instance=None*)

Returns a list of disk group dict representation on an ESXi host. The list of disk groups can be filtered by the cache disks canonical names. If no filtering is applied, all disk groups are returned.

cache_disk_ids:
List of cache disk canonical names of the disk groups to be retrieved. Default is None.

use_proxy_details
Specify whether to use the proxy minion's details instead of the arguments

service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.list_diskgroups

salt '*' vsphere.list_diskgroups cache_disk_ids='[naa.000000000000001]'
```

`salt.modules.vsphere.`**`list_disks`**(*disk_ids=None*, *scsi_addresses=None*, *service_instance=None*)

Returns a list of dict representations of the disks in an ESXi host. The list of disks can be filtered by disk canonical names or scsi addresses.

disk_ids:
List of disk canonical names to be retrieved. Default is None.

scsi_addresses
List of scsi addresses of disks to be retrieved. Default is None

service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.list_disks

salt '*' vsphere.list_disks disk_ids='[naa.00, naa.001]'

salt '*' vsphere.list_disks
    scsi_addresses='[vmhba0:C0:T0:L0, vmhba1:C0:T0:L0]'
```

`salt.modules.vsphere.`**`list_dvportgroups`**(*dvs=None*, *portgroup_names=None*, *service_instance=None*)

Returns a list of distributed virtual switch portgroups. The list can be filtered by the portgroup names or by the DVS.

dvs
Name of the DVS containing the portgroups. Default value is None.

portgroup_names
List of portgroup names to look for. If None, all portgroups are returned. Default value is None

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.list_dvportgroups

salt '*' vsphere.list_dvportgroups dvs=dvs1
```

(continues on next page)

(continued from previous page)

```
salt '*' vsphere.list_dvportgroups portgroup_names=[pg1]

salt '*' vsphere.list_dvportgroups dvs=dvs1 portgroup_names=[pg1]
```

`salt.modules.vsphere.`**`list_dvs`**(*host, username, password, protocol=None, port=None, verify_ssl=True*)

Returns a list of distributed virtual switches for the specified host.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_dvs 1.2.3.4 root bad-password
```

`salt.modules.vsphere.`**`list_dvss`**(*datacenter=None, dvs_names=None, service_instance=None*)

Returns a list of distributed virtual switches (DVSs). The list can be filtered by the datacenter or DVS names.

datacenter
The datacenter to look for DVSs in. Default value is None.

dvs_names
List of DVS names to look for. If None, all DVSs are returned. Default value is None.

CLI Example:

```
salt '*' vsphere.list_dvss

salt '*' vsphere.list_dvss dvs_names=[dvs1,dvs2]
```

`salt.modules.vsphere.`**`list_folders`**(*host, username, password, protocol=None, port=None, verify_ssl=True*)

Returns a list of folders for the specified host.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_folders 1.2.3.4 root bad-password
```

salt.modules.vsphere.**list_hosts**(*host*, *username*, *password*, *protocol=None*, *port=None*, *verify_ssl=True*)

Returns a list of hosts for the specified VMware environment.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_hosts 1.2.3.4 root bad-password
```

salt.modules.vsphere.**list_hosts_via_proxy**(*hostnames=None*, *datacenter=None*, *cluster=None*, *service_instance=None*)

Returns a list of hosts for the specified VMware environment. The list of hosts can be filtered by datacenter name and/or cluster name

hostnames
Hostnames to filter on.

datacenter_name
Name of datacenter. Only hosts in this datacenter will be retrieved. Default is None.

cluster_name
Name of cluster. Only hosts in this cluster will be retrieved. If a datacenter is not specified the first cluster with this name will be considerred. Default is None.

service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.list_hosts_via_proxy

salt '*' vsphere.list_hosts_via_proxy hostnames=[esxi1.example.com]

salt '*' vsphere.list_hosts_via_proxy datacenter=dc1 cluster=cluster1
```

salt.modules.vsphere.**list_licenses**(*service_instance=None*)

Lists all licenses on a vCenter.

service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.list_licenses
```

salt.modules.vsphere.**list_networks**(*host*, *username*, *password*, *protocol=None*, *port=None*, *verify_ssl=True*)

Returns a list of networks for the specified host.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_networks 1.2.3.4 root bad-password
```

`salt.modules.vsphere.`**`list_non_ssds`**(*host*, *username*, *password*, *protocol=None*, *port=None*, *host_names=None*, *verify_ssl=True*)

Returns a list of Non-SSD disks for the given host or list of host_names.

Note: In the pyVmomi StorageSystem, ScsiDisks may, or may not have an `ssd` attribute. This attribute indicates if the ScsiDisk is SSD backed. As this option is optional, if a relevant disk in the StorageSystem does not have `ssd = true`, it will end up in the `non_ssds` list here.

---

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to retrieve Non-SSD disks.

If host_names is not provided, Non-SSD disks will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.list_non_ssds my.esxi.host root bad-password

```

(continues on next page)

(continued from previous page)

```
# Used for connecting to a vCenter Server
salt '*' vsphere.list_non_ssds my.vcenter.location root bad-password ␣
↪   host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`list_resourcepools`**(*host*, *username*, *password*, *protocol=None*, *port=None*, *verify_ssl=True*)

Returns a list of resource pools for the specified host.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_resourcepools 1.2.3.4 root bad-password
```

`salt.modules.vsphere.`**`list_ssds`**(*host*, *username*, *password*, *protocol=None*, *port=None*, *host_names=None*, *verify_ssl=True*)

Returns a list of SSDs for the given host or list of host_names.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to retrieve SSDs.

If host_names is not provided, SSDs will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.list_ssds my.esxi.host root bad-password

# Used for connecting to a vCenter Server
```

(continues on next page)

(continued from previous page)

```
salt '*' vsphere.list_ssds my.vcenter.location root bad-password ␣
↪host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.**list_storage_policies**(*policy_names=None*, *service_instance=None*)

Returns a list of storage policies.

policy_names
Names of policies to list. If None, all policies are listed. Default is None.

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.list_storage_policies

salt '*' vsphere.list_storage_policies policy_names=[policy_name]
```

salt.modules.vsphere.**list_tag_categories**(*server=None*, *username=None*, *password=None*, *service_instance=None*, *verify_ssl=None*, *ca_bundle=None*)

List existing categories a user has access to.

CLI Example:

```
salt vm_minion vsphere.list_tag_categories
```

Parameters
- **server** (*basestring*) -- Target DNS or IP of vCenter center.
- **username** (*basestring*) -- Username associated with the vCenter center.
- **password** (*basestring*) -- Password associated with the vCenter center.
- **verify_ssl** (*boolean*) -- Verify the SSL certificate. Default: True
- **ca_bundle** (*basestring*) -- Path to the ca bundle to use when verifying SSL certificates.

Returns
Value(s) of category_id.

Return type
list of str

salt.modules.vsphere.**list_tags**(*server=None*, *username=None*, *password=None*, *service_instance=None*, *verify_ssl=None*, *ca_bundle=None*)

List existing tags a user has access to.

CLI Example:

```
salt vm_minion vsphere.list_tags
```

Parameters
- **server** (*basestring*) -- Target DNS or IP of vCenter center.
- **username** (*basestring*) -- Username associated with the vCenter center.
- **password** (*basestring*) -- Password associated with the vCenter center.
- **verify_ssl** (*boolean*) -- Verify the SSL certificate. Default: True
- **ca_bundle** (*basestring*) -- Path to the ca bundle to use when verifying SSL certificates.

Returns
Value(s) of tag_id.

Return type
list of str

`salt.modules.vsphere.`**`list_uplink_dvportgroup`**(*dvs*, *service_instance=None*)

Returns the uplink portgroup of a distributed virtual switch.

dvs
Name of the DVS containing the portgroup.

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.list_uplink_dvportgroup dvs=dvs_name
```

`salt.modules.vsphere.`**`list_vapps`**(*host*, *username*, *password*, *protocol=None*, *port=None*, *verify_ssl=True*)

Returns a list of vApps for the specified host.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# List vapps from all minions
salt '*' vsphere.list_vapps 1.2.3.4 root bad-password
```

`salt.modules.vsphere.`**`list_vms`**(*host*, *username*, *password*, *protocol=None*, *port=None*, *verify_ssl=True*)

Returns a list of VMs for the specified host.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_vms 1.2.3.4 root bad-password
```

`salt.modules.vsphere.`**`power_off_vm`**(*name*, *datacenter=None*, *service_instance=None*)

Powers off a virtual machine specified by its name.

name
Name of the virtual machine

datacenter
Datacenter of the virtual machine

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.power_off_vm name=my_vm
```

`salt.modules.vsphere.`**`power_on_vm`**`(`*name, datacenter=None, service_instance=None*`)`

Powers on a virtual machine specified by its name.

name
Name of the virtual machine

datacenter
Datacenter of the virtual machine

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.power_on_vm name=my_vm
```

`salt.modules.vsphere.`**`register_vm`**`(`*name, datacenter, placement, vmx_path, service_instance=None*`)`

Registers a virtual machine to the inventory with the given vmx file. Returns comments and change list

name
Name of the virtual machine

datacenter
Datacenter of the virtual machine

placement
Placement dictionary of the virtual machine, host or cluster

vmx_path:
Full path to the vmx file, datastore name should be included

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

`salt.modules.vsphere.`**`remove_capacity_from_diskgroup`**`(`*cache_disk_id, capacity_disk_ids, data_evacuation=True, safety_checks=True, service_instance=None*`)`

Remove capacity disks from the disk group with the specified cache disk.

cache_disk_id
The canonical name of the cache disk.

capacity_disk_ids
A list containing canonical names of the capacity disks to add.

data_evacuation
Specifies whether to gracefully evacuate the data on the capacity disks before removing them from the disk group. Default value is True.

safety_checks
Specify whether to perform safety check or to skip the checks and try performing the required task. Default value is True.

service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.remove_capacity_from_diskgroup
    cache_disk_id='naa.000000000000001'
    capacity_disk_ids='[naa.000000000000002, naa.000000000000003]'
```

`salt.modules.vsphere.`**`remove_datastore`**(*datastore*, *service_instance=None*)

Removes a datastore. If multiple datastores an error is raised.

datastore
Datastore name

service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.remove_datastore ds_name
```

`salt.modules.vsphere.`**`remove_diskgroup`**(*cache_disk_id*, *data_accessibility=True*, *service_instance=None*)

Remove the diskgroup with the specified cache disk.

cache_disk_id
The canonical name of the cache disk.

data_accessibility
Specifies whether to ensure data accessibility. Default value is True.

service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.remove_diskgroup cache_disk_id='naa.000000000000001'
```

`salt.modules.vsphere.`**`remove_dvportgroup`**(*portgroup*, *dvs*, *service_instance=None*)

Removes a distributed virtual portgroup.

portgroup
Name of the portgroup to be removed.

dvs
Name of the DVS containing the portgroups.

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.remove_dvportgroup portgroup=pg1 dvs=dvs1
```

`salt.modules.vsphere.`**`rename_datastore`**(*datastore_name*, *new_datastore_name*, *service_instance=None*)

Renames a datastore. The datastore needs to be visible to the proxy.

datastore_name
Current datastore name.

new_datastore_name
New datastore name.

service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.rename_datastore old_name new_name
```

`salt.modules.vsphere.`**`reset_syslog_config`**(*host*, *username*, *password*, *protocol=None*, *port=None*, *syslog_config=None*, *esxi_hosts=None*, *credstore=None*)

Reset the syslog service to its default settings.

Valid syslog_config values are `logdir`, `loghost`, `logdir-unique`, `default-rotate`, `default-size`, `default-timeout`, or `all` for all of these.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

syslog_config
List of parameters to reset, provided as a comma-delimited string, or 'all' to reset all syslog configuration parameters. Required.

esxi_hosts
If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

credstore
Optionally set to path to the credential store file.

Returns
Dictionary with a top-level key of 'success' which indicates if all the parameters were reset, and individual keys for each parameter indicating which succeeded or failed, per host.

Note: `syslog_config` can be passed as a quoted, comma-separated string. See CLI Example for details.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.reset_syslog_config my.esxi.host root bad-password syslog_config='logdir,loghost'

# Used for connecting to a vCenter Server
salt '*' vsphere.reset_syslog_config my.vcenter.location root bad-password syslog_config='logdir,loghost' esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`service_restart`**(*host*, *username*, *password*, *service_name*, *protocol=None*, *port=None*, *host_names=None*, *verify_ssl=True*)

Restart the named service for the given host or list of hosts.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

service_name
The name of the service for which to set the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to restart the service.

If host_names is not provided, the service will be restarted for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.service_restart my.esxi.host root bad-password 'ntpd'

# Used for connecting to a vCenter Server
salt '*' vsphere.service_restart my.vcenter.location root bad-password
↪'ntpd'        host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`service_start`**(*host, username, password, service_name, protocol=None, port=None, host_names=None, verify_ssl=True*)

Start the named service for the given host or list of hosts.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

service_name
The name of the service for which to set the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd

- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to start the service.

If host_names is not provided, the service will be started for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.service_start my.esxi.host root bad-password 'ntpd'

# Used for connecting to a vCenter Server
salt '*' vsphere.service_start my.vcenter.location root bad-password 'ntpd
↪'         host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`service_stop`**(*host*, *username*, *password*, *service_name*, *protocol=None*, *port=None*, *host_names=None*, *verify_ssl=True*)

Stop the named service for the given host or list of hosts.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

service_name
The name of the service for which to set the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to stop the service.

If host_names is not provided, the service will be stopped for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.service_stop my.esxi.host root bad-password 'ssh'

# Used for connecting to a vCenter Server
salt '*' vsphere.service_stop my.vcenter.location root bad-password 'ssh'␣
↪        host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.**set_advanced_configs**(*vm_name, datacenter, advanced_configs, service_instance=None*)

Appends extra config parameters to a virtual machine advanced config list

vm_name
Virtual machine name

datacenter
Datacenter name where the virtual machine is available

advanced_configs
Dictionary with advanced parameter key value pairs

service_instance
vCenter service instance for connection and configuration

salt.modules.vsphere.**set_coredump_network_config**(*host, username, password, dump_ip, protocol=None, port=None, host_vnic='vmk0', dump_port=6500, esxi_hosts=None, credstore=None*)

Set the network parameters for a network coredump collection. Note that ESXi requires that the dumps first be enabled (see *coredump_network_enable*) before these parameters may be set.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

dump_ip
IP address of host that will accept the dump.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

esxi_hosts
If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

host_vnic
Host VNic port through which to communicate. Defaults to `vmk0`.

dump_port
TCP port to use for the dump, defaults to `6500`.

credstore
Optionally set to path to the credential store file.

Returns
A standard cmd.run_all dictionary with a *success* key added, per host. *success* will be True if the set succeeded, False otherwise.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.set_coredump_network_config my.esxi.host root bad-
↪password 'dump_ip.host.com'

# Used for connecting to a vCenter Server
salt '*' vsphere.set_coredump_network_config my.vcenter.location root bad-
↪password 'dump_ip.host.com'          esxi_hosts='[esxi-1.host.com,⊠
↪esxi-2.host.com]'
```

`salt.modules.vsphere.`**`set_ntp_config`**(*host, username, password, ntp_servers, protocol=None, port=None, host_names=None, verify_ssl=True*)

Set NTP configuration for a given host of list of host_names.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

ntp_servers
A list of servers that should be added to and configured for the specified host's NTP configuration.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to configure ntp servers.

If host_names is not provided, the NTP servers will be configured for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.ntp_configure my.esxi.host root bad-password '[192.174.1.
↪100, 192.174.1.200]'

# Used for connecting to a vCenter Server
salt '*' vsphere.ntp_configure my.vcenter.location root bad-password
↪'[192.174.1.100, 192.174.1.200]'         host_names='[esxi-1.host.com,⊠
↪esxi-2.host.com]'
```

`salt.modules.vsphere.`**`set_service_policy`**(*host, username, password, service_name, service_policy, protocol=None, port=None, host_names=None, verify_ssl=True*)

Set the service name's policy for a given host or list of hosts.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

service_name
The name of the service for which to set the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

service_policy
The policy to set for the service. For example, 'automatic'.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to set the service policy.

If host_names is not provided, the service policy information will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.set_service_policy my.esxi.host root bad-password 'ntpd'
↪'automatic'

# Used for connecting to a vCenter Server
salt '*' vsphere.set_service_policy my.vcenter.location root bad-password
↪'ntpd' 'automatic'        host_names='[esxi-1.host.com, esxi-2.host.
↪com]'
```

`salt.modules.vsphere.`**`set_syslog_config`**(*host, username, password, syslog_config, config_value, protocol=None, port=None, firewall=True, reset_service=True, esxi_hosts=None, credstore=None*)

Set the specified syslog configuration parameter. By default, this function will reset the syslog service after the configuration is set.

host
ESXi or vCenter host to connect to.

username
User to connect as, usually root.

password
Password to connect with.

syslog_config
Name of parameter to set (corresponds to the command line switch for esxcli without the double dashes (--))

Valid syslog_config values are `logdir`, `loghost`, `default-rotate`, ``default-size`, `default-timeout`, and `logdir-unique`.

config_value
Value for the above parameter. For `loghost`, URLs or IP addresses to use for logging. Multiple log servers can be specified by listing them, comma-separated, but without spaces before or after commas.

(reference: https://blogs.vmware.com/vsphere/2012/04/configuring-multiple-syslog-servers-for-esxi-5.html)

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

firewall
Enable the firewall rule set for syslog. Defaults to `True`.

reset_service
After a successful parameter set, reset the service. Defaults to `True`.

esxi_hosts
If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

credstore
Optionally set to path to the credential store file.

Returns
Dictionary with a top-level key of 'success' which indicates if all the parameters were reset, and individual keys for each parameter indicating which succeeded or failed, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.set_syslog_config my.esxi.host root bad-password
↪    loghost ssl://localhost:5432,tcp://10.1.0.1:1514

# Used for connecting to a vCenter Server
salt '*' vsphere.set_syslog_config my.vcenter.location root bad-password
↪             loghost ssl://localhost:5432,tcp://10.1.0.1:1514
↪esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`syslog_service_reload`**(*host, username, password, protocol=None, port=None, esxi_hosts=None, credstore=None*)

Reload the syslog service so it will pick up any changes.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

esxi_hosts
If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

credstore
Optionally set to path to the credential store file.

Returns
A standard cmd.run_all dictionary. This dictionary will at least have a *retcode* key. If *retcode* is 0 the command was successful.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.syslog_service_reload my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.syslog_service_reload my.vcenter.location root bad-
↪password            esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`system_info`**(*host*, *username*, *password*, *protocol=None*, *port=None*, *verify_ssl=True*)

Return system information about a VMware environment.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.system_info 1.2.3.4 root bad-password
```

`salt.modules.vsphere.`**`test_vcenter_connection`**(*service_instance=None*)

Checks if a connection is to a vCenter

CLI Example:

```
salt '*' vsphere.test_vcenter_connection
```

`salt.modules.vsphere.`**`unregister_vm`**(*name*, *datacenter*, *placement=None*, *power_off=False*, *service_instance=None*)

Unregisters a virtual machine defined by name and placement

name
Name of the virtual machine

datacenter
Datacenter of the virtual machine

placement
Placement information of the virtual machine

service_instance
vCenter service instance for connection and configuration

CLI Example:

```
salt '*' vsphere.unregister_vm name=my_vm datacenter=my_datacenter
```

`salt.modules.vsphere.`**`update_cluster`**(*cluster_dict*, *datacenter=None*, *cluster=None*, *service_instance=None*)

Updates a cluster.

config_dict
Dictionary with the config values of the new cluster.

datacenter
Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default value is None.

cluster
Name of cluster. Ignored if already contained by proxy details. Default value is None.

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
# esxdatacenter proxy
salt '*' vsphere.update_cluster cluster_dict=$cluster_dict cluster=cl1

# esxcluster proxy
salt '*' vsphere.update_cluster cluster_dict=$cluster_dict
```

`salt.modules.vsphere.`**`update_dvportgroup`**(*portgroup_dict*, *portgroup*, *dvs*, *service_instance=True*)

Updates a distributed virtual portgroup.

portgroup_dict
Dictionary with the values the portgroup should be update with (example in salt.states.dvs).

portgroup
Name of the portgroup to be updated.

dvs
Name of the DVS containing the portgroups.

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.update_dvportgroup portgroup_dict=<dict>
    portgroup=pg1

salt '*' vsphere.update_dvportgroup portgroup_dict=<dict>
    portgroup=pg1 dvs=dvs1
```

`salt.modules.vsphere.`**`update_dvs`**(*dvs_dict*, *dvs*, *service_instance=None*)

Updates a distributed virtual switch (DVS).

Note: Updating the product info, capability, uplinks of a DVS is not
supported so the corresponding entries in `dvs_dict` will be ignored.

dvs_dict
Dictionary with the values the DVS should be update with (example in salt.states.dvs)

dvs
Name of the DVS to be updated.

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.update_dvs dvs_dict=$dvs_dict dvs=dvs1
```

`salt.modules.vsphere.`**`update_host_datetime`**(*host*, *username*, *password*, *protocol=None*, *port=None*, *host_names=None*, *verify_ssl=True*)

Update the date/time on the given host or list of host_names. This function should be used with caution since network delays and execution delays can result in time skews.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should update their date/time.

If host_names is not provided, the date/time will be updated for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.update_date_time my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.update_date_time my.vcenter.location root bad-password ␣
↪     host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`update_host_password`**(*host*, *username*, *password*, *new_password*, *protocol=None*, *port=None*, *verify_ssl=True*)

Update the password for a given host.

Note: Currently only works with connections to ESXi hosts. Does not work with vCenter servers.

---

host

The location of the ESXi host.

username
The username used to login to the ESXi host, such as `root`.

password
The password used to login to the ESXi host.

new_password
The new password that will be updated for the provided username on the ESXi host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.update_host_password my.esxi.host root original-bad-
↪password new-bad-password
```

`salt.modules.vsphere.`**`update_storage_policy`**(*policy*, *policy_dict*, *service_instance=None*)

Updates a storage policy.

Supported capability types: scalar, set, range.

policy
Name of the policy to update.

policy_dict
Dictionary containing the changes to apply to the policy. (example in salt.states.pbm)

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.update_storage_policy policy='policy name'
    policy_dict="$policy_dict"
```

`salt.modules.vsphere.`**`update_vm`**(*vm_name*, *cpu=None*, *memory=None*, *image=None*, *version=None*, *interfaces=None*, *disks=None*, *scsi_devices=None*, *serial_ports=None*, *datacenter=None*, *datastore=None*, *cd_dvd_drives=None*, *sata_controllers=None*, *advanced_configs=None*, *service_instance=None*)

Updates the configuration of the virtual machine if the config differs

vm_name
Virtual Machine name to be updated

cpu
CPU configuration options

memory
Memory configuration options

version
Virtual machine container hardware version

image
Virtual machine guest OS version identifier VirtualMachineGuestOsIdentifier

interfaces
Network interfaces configuration options

disks
Disks configuration options

scsi_devices
SCSI devices configuration options

serial_ports
Serial ports configuration options

datacenter
Datacenter where the virtual machine is available

datastore
Datastore where the virtual machine config files are available

cd_dvd_drives
CD/DVD drives configuration options

advanced_config
Advanced config parameters to be set for the virtual machine

service_instance
vCenter service instance for connection and configuration

`salt.modules.vsphere.`**`upload_ssh_key`**(*host, username, password, ssh_key=None, ssh_key_file=None, protocol=None, port=None, certificate_verify=None*)

Upload an ssh key for root to an ESXi host via http PUT. This function only works for ESXi, not vCenter. Only one ssh key can be uploaded for root. Uploading a second key will replace any existing key.

Parameters

- **`host`** -- The location of the ESXi Host
- **`username`** -- Username to connect as
- **`password`** -- Password for the ESXi web endpoint
- **`ssh_key`** -- Public SSH key, will be added to authorized_keys on ESXi
- **`ssh_key_file`** -- File containing the SSH key. Use 'ssh_key' or ssh_key_file, but not both.
- **`protocol`** -- defaults to https, can be http if ssl is disabled on ESXi
- **`port`** -- defaults to 443 for https
- **`certificate_verify`** -- If true require that the SSL connection present a valid certificate. Default: True

Returns

Dictionary with a 'status' key, True if upload is successful. If upload is unsuccessful, 'status' key will be False and an 'Error' key will have an informative message.

CLI Example:

```
salt '*' vsphere.upload_ssh_key my.esxi.host root bad-password ssh_key_
↪file='/etc/salt/my_keys/my_key.pub'
```

`salt.modules.vsphere.`**`vmotion_disable`**(*host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True*)

Disable vMotion for a given host or list of host_names.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter

Server, the host_names argument is required to tell vCenter which hosts should disable VMotion.

If host_names is not provided, VMotion will be disabled for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vmotion_disable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vmotion_disable my.vcenter.location root bad-password host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`vmotion_enable`**(*host, username, password, protocol=None, port=None, host_names=None, device='vmk0', verify_ssl=True*)

Enable vMotion for a given host or list of host_names.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should enable VMotion.

If host_names is not provided, VMotion will be enabled for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

device
The device that uniquely identifies the VirtualNic that will be used for VMotion for each host. Defaults to `vmk0`.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vmotion_enable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vmotion_enable my.vcenter.location root bad-password host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`vsan_add_disks`**(*host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True*)

Add any VSAN-eligible disks to the VSAN System for the given host or list of host_names.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts need to add any VSAN-eligible disks to the host's VSAN system.

If host_names is not provided, VSAN-eligible disks will be added to the hosts's VSAN system for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vsan_add_disks my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vsan_add_disks my.vcenter.location root bad-password
↪    host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`vsan_disable`**(*host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True*)

Disable VSAN for a given host or list of host_names.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should disable VSAN.

If host_names is not provided, VSAN will be disabled for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vsan_disable my.esxi.host root bad-password
```

(continues on next page)

(continued from previous page)

```
# Used for connecting to a vCenter Server
salt '*' vsphere.vsan_disable my.vcenter.location root bad-password
↪  host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`vsan_enable`**(*host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True*)

Enable VSAN for a given host or list of host_names.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should enable VSAN.

If host_names is not provided, VSAN will be enabled for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vsan_enable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vsan_enable my.vcenter.location root bad-password
↪ host_names='[esxi-1.host.com, esxi-2.host.com]'
```

26.6.219 salt.modules.webutil

Support for htpasswd command. Requires the apache2-utils package for Debian-based distros.

New in version 2014.1.0.

The functions here will load inside the webutil module. This allows other functions that don't use htpasswd to use the webutil module name.

`salt.modules.webutil.`**`useradd`**(*pwfile, user, password, opts='', runas=None*)

Add a user to htpasswd file using the htpasswd command. If the htpasswd file does not exist, it will be created.

pwfile
Path to htpasswd file

user
User name

password
User password

opts

Valid options that can be passed are:

- *n* Don't update file; display results on stdout.
- *m* Force MD5 encryption of the password (default).
- *d* Force CRYPT encryption of the password.
- *p* Do not encrypt the password (plaintext).
- *s* Force SHA encryption of the password.

runas

The system user to run htpasswd command with

CLI Examples:

```
salt '*' webutil.useradd /etc/httpd/htpasswd larry badpassword
salt '*' webutil.useradd /etc/httpd/htpasswd larry badpass opts=ns
```

`salt.modules.webutil.`**`userdel`**(*pwfile, user, runas=None, all_results=False*)

Delete a user from the specified htpasswd file.

pwfile

Path to htpasswd file

user

User name

runas

The system user to run htpasswd command with

all_results

Return stdout, stderr, and retcode, not just stdout

CLI Examples:

```
salt '*' webutil.userdel /etc/httpd/htpasswd larry
```

`salt.modules.webutil.`**`verify`**(*pwfile, user, password, opts='', runas=None*)

Return True if the htpasswd file exists, the user has an entry, and their password matches.

pwfile

Fully qualified path to htpasswd file

user

User name

password

User password

opts

Valid options that can be passed are:

- *m* Force MD5 encryption of the password (default).
- *d* Force CRYPT encryption of the password.
- *p* Do not encrypt the password (plaintext).
- *s* Force SHA encryption of the password.

runas

The system user to run htpasswd command with

CLI Examples:

```
salt '*' webutil.verify /etc/httpd/htpasswd larry maybepassword
salt '*' webutil.verify /etc/httpd/htpasswd larry maybepassword opts=ns
```

26.6.220 salt.modules.win_appx

Manage provisioned apps

New in version 3007.0.

Provisioned apps are part of the image and are installed for every user the first time the user logs on. Provisioned apps are also updated and sometimes reinstalled when the system is updated.

Apps removed with this module will remove the app for all users and deprovision the app. Deprovisioned apps will neither be installed for new users nor will they be upgraded.

An app removed with this module can only be re-provisioned on the machine, but it can't be re-installed for all users. Also, once a package has been deprovisioned, the only way to reinstall it is to download the package. This is difficult. The steps are outlined below:

1. **Obtain the Microsoft Store URL for the app**:
    - Open the page for the app in the Microsoft Store
    - Click the share button and copy the URL
2. **Look up the packages on https://store.rg-adguard.net/**:
    - Ensure `URL (link)` is selected in the first dropdown
    - Paste the URL in the search field
    - Ensure Retail is selected in the 2nd dropdown
    - Click the checkmark button

This should return a list of URLs for the package and all dependencies for all architectures. Download the package and all dependencies for your system architecture. These will usually have one of the following file extensions:

- `.appx`
- `.appxbundle`
- `.msix`
- `.msixbundle`

Dependencies will need to be installed first.

Not all packages can be found this way, but it seems like most of them can.

Use the `appx.install` function to provision the new app.

`salt.modules.win_appx.`**`install`**`(`*package*`)`

This function uses `dism` to provision a package. This means that it will be made a part of the online image and added to new users on the system. If a package has dependencies, those must be installed first.

If a package installed using this function has been deprovisioned previously, the registry entry marking it as deprovisioned will be removed.

Note: There is no `appx.present` state. Instead, use the `dism.provisioned_package_installed` state.

Parameters

`package` (*`str`*) -- The full path to the package to install. Can be one of the following:
- `.appx` or `.appxbundle`
- `.msix` or `.msixbundle`

- `.ppkg`

Returns
`True` if successful, otherwise `False`

Return type
bool

CLI Example:

```
salt "*" appx.install "C:\Temp\Microsoft.ZuneMusic.msixbundle"
```

`salt.modules.win_appx.`**`list_`**(*query=None*, *field='Name'*, *include_store=False*, *frameworks=False*, *bundles=True*)

Get a list of Microsoft Store packages installed on the system.

Parameters

- **`query`** (*str*) -- The query string to use to filter packages to be listed. The string can match multiple packages. `None` will return all packages. Here are some example strings:
  - `*teams*` - Returns Microsoft Teams
  - `*zune*` - Returns Windows Media Player and ZuneVideo
  - `*zuneMusic*` - Only returns Windows Media Player
  - `*xbox*` - Returns all xbox packages, there are 5 by default
  - `*` - Returns everything but the Microsoft Store, unless `include_store=True`
- **`field`** (*str*) -- This function returns a list of packages on the system. It can display a short name or a full name. If `None` is passed, a dictionary will be returned with some common fields. The default is `Name`. Valid options are any fields returned by the powershell command `Get-AppxPackage`. Here are some useful fields:
  - Name
  - Version
  - PackageFullName
  - PackageFamilyName
- **`include_store`** (*bool*) -- Include the Microsoft Store in the results. Default is `False`
- **`frameworks`** (*bool*) -- Include frameworks in the results. Default is `False`
- **`bundles`** (*bool*) -- If `True`, this will return application bundles only. If `False`, this will return individual packages only, even if they are part of a bundle.

Returns
A list of packages ordered by the string passed in field list: A list of dictionaries of package information if field is `None`

Return type
list

Raises
`CommandExecutionError` -- If an error is encountered retrieving packages

CLI Example:

```
# List installed apps that contain the word "candy"
salt '*' appx.list *candy*

# Return more information about the package
salt '*' appx.list *candy* field=None

# List all installed apps, including the Microsoft Store
salt '*' appx.list include_store=True

```

(continues on next page)

(continued from previous page)

```
# List all installed apps, including frameworks
salt '*' appx.list frameworks=True

# List all installed apps that are bundles
salt '*' appx.list bundles=True
```

`salt.modules.win_appx.`**`list_deprovisioned`**(*query=None*)

When an app is deprovisioned, a registry key is created that will keep it from being reinstalled during a major system update. This function returns a list of keys for apps that have been deprovisioned.

Parameters

`query` (*`str`*) -- The query string to use to filter packages to be listed. The string can match multiple packages. `None` will return all packages. Here are some example strings:

- `*teams*` - Returns Microsoft Teams
- `*zune*` - Returns Windows Media Player and ZuneVideo
- `*zuneMusic*` - Only returns Windows Media Player
- `*xbox*` - Returns all xbox packages, there are 5 by default
- `*` - Returns everything but the Microsoft Store, unless `include_store=True`

Returns

A list of packages matching the query criteria

Return type

list

CLI Example:

```
salt "*" appx.list_deprovisioned *zune*
```

`salt.modules.win_appx.`**`remove`**(*query=None*, *include_store=False*, *frameworks=False*, *deprovision_only=False*)

Removes Microsoft Store packages from the system. If the package is part of a bundle, the entire bundle will be removed.

This function removes the package for all users on the system. It also deprovisions the package so that it isn't re-installed by later system updates. To only deprovision a package and not remove it for all users, set `deprovision_only=True`.

Parameters

- **`query`** (*`str`*) -- The query string to use to select the packages to be removed. If the string matches multiple packages, they will all be removed. Here are some example strings:
  - `*teams*` - Remove Microsoft Teams
  - `*zune*` - Remove Windows Media Player and ZuneVideo
  - `*zuneMusic*` - Only remove Windows Media Player
  - `*xbox*` - Remove all xbox packages, there are 5 by default
  - `*` - Remove everything but the Microsoft Store, unless `include_store=True`

  Note: Use the `appx.list` function to make sure your query is returning what you expect. Then use the same query to remove those packages

- **`include_store`** (*`bool`*) -- Include the Microsoft Store in the results of the query to be removed. Use this with caution. It is difficult to reinstall the Microsoft Store once it has been removed with this function. Default is `False`
- **`frameworks`** (*`bool`*) -- Include frameworks in the results of the query to be removed. Default is `False`
- **`deprovision_only`** (*`bool`*) -- Only deprovision the package. The package will be

removed from the current user and added to the list of deprovisioned packages. The package will not be re-installed in future system updates. New users of the system will not have the package installed. However, the package will still be installed for existing users. Default is `False`

Returns
`True` if successful, `None` if no packages found

Return type
bool

Raises
`CommandExecutionError` -- On errors encountered removing the package

CLI Example:

```
salt "*" appx.remove *candy*
```

26.6.221 salt.modules.win_auditpol

A salt module for modifying the audit policies on the machine

Though this module does not set group policy for auditing, it displays how all auditing configuration is applied on the machine, either set directly or via local or domain group policy.

New in version 2018.3.4.

New in version 2019.2.1.

This module allows you to view and modify the audit settings as they are applied on the machine. The audit settings are broken down into nine categories:

- Account Logon
- Account Management
- Detailed Tracking
- DS Access
- Logon/Logoff
- Object Access
- Policy Change
- Privilege Use
- System

The `get_settings` function will return the subcategories for all nine of the above categories in one dictionary along with their auditing status.

To modify a setting you only need to specify the subcategory name and the value you wish to set. Valid settings are:

- No Auditing
- Success
- Failure
- Success and Failure

CLI Example:

```
# Get current state of all audit settings
salt * auditpol.get_settings

# Get the current state of all audit settings in the "Account Logon"
# category
salt * auditpol.get_settings category="Account Logon"

# Get current state of the "Credential Validation" setting
salt * auditpol.get_setting name="Credential Validation"

# Set the state of the "Credential Validation" setting to Success and
# Failure
salt * auditpol.set_setting name="Credential Validation" value="Success and␣
↪Failure"

# Set the state of the "Credential Validation" setting to No Auditing
salt * auditpol.set_setting name="Credential Validation" value="No Auditing"
```

`salt.modules.win_auditpol.`**`get_setting`**(*name*)

Get the current configuration for the named audit setting

Parameters

name (*str*) -- The name of the setting to retrieve

Returns

The current configuration for the named setting

Return type

str

Raises

- **KeyError** -- On invalid setting name
- ***CommandExecutionError*** -- If an error is encountered retrieving the settings

CLI Example:

```
# Get current state of the "Credential Validation" setting
salt * auditpol.get_setting "Credential Validation"
```

`salt.modules.win_auditpol.`**`get_settings`**(*category='All'*)

Get the current configuration for all audit settings specified in the category

Parameters

category (*str*) -- One of the nine categories to return. Can also be `All` to return the settings for all categories. Valid options are:

- Account Logon
- Account Management
- Detailed Tracking
- DS Access
- Logon/Logoff
- Object Access
- Policy Change
- Privilege Use
- System
- All

Default value is `All`

Returns

A dictionary containing all subcategories for the specified

category along with their current configuration

Return type
dict

Raises
- **KeyError** -- On invalid category
- ***CommandExecutionError*** -- If an error is encountered retrieving the settings

CLI Example:

```
# Get current state of all audit settings
salt * auditipol.get_settings

# Get the current state of all audit settings in the "Account Logon"
# category
salt * auditpol.get_settings "Account Logon"
```

`salt.modules.win_auditpol.`**`set_setting`**(*name*, *value*)

Set the configuration for the named audit setting

Parameters
- **name** (*str*) -- The name of the setting to configure
- **value** (*str*) -- The configuration for the named value. Valid options are:
  - No Auditing
  - Success
  - Failure
  - Success and Failure

Returns
True if successful

Return type
bool

Raises
- **KeyError** -- On invalid `name` or `value`
- ***CommandExecutionError*** -- If an error is encountered modifying the setting

CLI Example:

```
# Set the state of the "Credential Validation" setting to Success and
# Failure
salt * auditpol.set_setting "Credential Validation" "Success and Failure"

# Set the state of the "Credential Validation" setting to No Auditing
salt * auditpol.set_setting "Credential Validation" "No Auditing"
```

26.6.222 salt.modules.win_autoruns

Module for listing programs that automatically run on startup (very alpha...not tested on anything but my Win 7x64)

`salt.modules.win_autoruns.`**`list_`**()

Get a list of automatically running programs

CLI Example:

```
salt '*' autoruns.list
```

26.6.223 salt.modules.win_certutil

This module allows you to install certificates into the windows certificate manager.

```
salt '*' certutil.add_store salt://cert.cer "TrustedPublisher"
```

`salt.modules.win_certutil.`**`add_store`**(*source*, *store*, *retcode=False*, *saltenv='base'*)

Add the cert to the given Certificate Store

source (str):

The source certificate file. This is either the path to a local file or a file from the file server in the form of `salt://path/to/file`

store (str):

The certificate store to add the certificate to

retcode (bool):

If `True`, return the retcode instead of stdout. Default is `False`

saltenv (str):

The salt environment to use. This is ignored if the path is local

CLI Example:

```
salt '*' certutil.add_store salt://cert.cer TrustedPublisher
salt '*' certutil.add_store C:\path\to\local.cer TrustedPublisher
```

`salt.modules.win_certutil.`**`del_store`**(*source*, *store*, *retcode=False*, *saltenv='base'*)

Delete the cert from the given Certificate Store

source (str):

The source certificate file. This is either the path to a local file or a file from the file server in the form of `salt://path/to/file`

store (str):

The certificate store to delete the certificate from

retcode (bool):

If `True`, return the retcode instead of stdout. Default is `False`

saltenv (str):

The salt environment to use. This is ignored if the path is local

CLI Example:

```
salt '*' certutil.del_store salt://cert.cer TrustedPublisher
salt '*' certutil.del_store C:\path\to\local.cer TrustedPublisher
```

`salt.modules.win_certutil.`**`get_cert_serial`**(*cert_file*, *saltenv='base'*)

Get the serial number of a certificate file

cert_file (str):

The certificate file to find the serial for. Can be a local file or a a file on the file server (`salt://`)

Returns

The serial number of the certificate if found, otherwise None

Return type

str

CLI Example:

```
salt '*' certutil.get_cert_serial <certificate name>
```

`salt.modules.win_certutil.`**`get_stored_cert_serials`**(*store*)

Get all of the certificate serials in the specified store

store (str):
The store to get all the certificate serials from

Returns
A list of serial numbers found, or an empty list if none found

Return type
list

CLI Example:

```
salt '*' certutil.get_stored_cert_serials <store>
```

26.6.224 salt.modules.win_dacl

Manage DACLs on Windows

depends

- winreg Python module

`salt.modules.win_dacl.`**`add_ace`**(*path*, *objectType*, *user*, *permission*, *acetype*, *propagation*)

add an ace to an object

path: path to the object (i.e. c:\temp\file, HKEY_LOCAL_MACHINE\SOFTWARE\KEY, etc) user: user to add permission: permissions for the user acetype: either allow/deny for each user/permission (ALLOW, DENY) propagation: how the ACE applies to children for Registry Keys and Directories(KEY, KEY&SUBKEYS, SUBKEYS)

CLI Example:

```
allow domain\fakeuser full control on HKLM\\SOFTWARE\\somekey, propagate
↪to this key and subkeys
    salt 'myminion' win_dacl.add_ace 'HKEY_LOCAL_MACHINE\\SOFTWARE\\
↪somekey' 'Registry' 'domain\fakeuser' 'FULLCONTROL' 'ALLOW' 'KEY&SUBKEYS
↪'
```

`salt.modules.win_dacl.`**`check_ace`**(*path*, *objectType*, *user*, *permission=None*, *acetype=None*, *propagation=None*, *exactPermissionMatch=False*)

Checks a path to verify the ACE (access control entry) specified exists

Parameters

- **`path`** -- path to the file/reg key
- **`objectType`** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **`user`** -- user that the ACL is for
- **`permission`** -- permission to test for (READ, FULLCONTROL, etc)
- **`acetype`** -- the type of ACE (ALLOW or DENY)
- **`propagation`** -- the propagation type of the ACE (FILES, FOLDERS, KEY, KEY&SUBKEYS, SUBKEYS, etc)
- **`exactPermissionMatch`** -- the ACL must match exactly, IE if READ is specified, the user must have READ exactly and not FULLCONTROL (which also has the READ permission obviously)

Returns (dict): 'Exists' true if the ACE exists, false if it does not

CLI Example:

```
salt 'minion-id' win_dacl.check_ace c:   emp directory <username>
↪fullcontrol
```

`salt.modules.win_dacl.`**`check_inheritance`**(*path*, *objectType*, *user=None*)

Check a specified path to verify if inheritance is enabled

Parameters

- **`path`** -- path of the registry key or file system object to check
- **`objectType`** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **`user`** -- if provided, will consider only the ACEs for that user

Returns (bool): 'Inheritance' of True/False

CLI Example:

```
salt 'minion-id' win_dacl.check_inheritance c:  emp directory <username>
```

`class` `salt.modules.win_dacl.`**`daclConstants`**

DACL constants used throughout the module

`getAceTypeBit`(*t*)

returns the acetype bit of a text value

`getAceTypeText`(*t*)

returns the textual representation of a acetype bit

`getObjectTypeBit`(*t*)

returns the bit value of the string object type

`getPermissionBit`(*t*, *m*)

returns a permission bit of the string permission value for the specified object type

`getPermissionText`(*t*, *m*)

returns the permission textual representation of a specified permission bit/object type

`getPropagationBit`(*t*, *p*)

returns the propagation bit of a text value

`getPropagationText`(*t*, *p*)

returns the textual representation of a propagation bit

`getSecurityHkey`(*s*)

returns the necessary string value for an HKEY for the win32security module

`processPath`(*path*, *objectType*)

processes a path/object type combo and returns:

registry types with the correct HKEY text representation files/directories with environment variables expanded

`salt.modules.win_dacl.`**`disable_inheritance`**(*path*, *objectType*, *copy=True*)

Disable inheritance on an object

Parameters

- **`path`** -- The path to the object
- **`objectType`** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **`copy`** -- True will copy the Inherited ACEs to the DACL before disabling inheritance

Returns (dict): A dictionary containing the results

CLI Example:

```
salt 'minion-id' win_dacl.disable_inheritance c:        emp directory
```

salt.modules.win_dacl.**enable_inheritance**(*path*, *objectType*, *clear=False*)

enable/disable inheritance on an object

Parameters

- **path** -- The path to the object
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **clear** -- True will remove non-Inherited ACEs from the ACL

Returns (dict): A dictionary containing the results

CLI Example:

```
salt 'minion-id' win_dacl.enable_inheritance c: emp directory
```

salt.modules.win_dacl.**get**(*path*, *objectType*, *user=None*)

Get the ACL of an object. Will filter by user if one is provided.

Parameters

- **path** -- The path to the object
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **user** -- A user name to filter by

Returns (dict): A dictionary containing the ACL

CLI Example:

```
salt 'minion-id' win_dacl.get c:        emp directory
```

salt.modules.win_dacl.**rm_ace**(*path*, *objectType*, *user*, *permission=None*, *acetype=None*, *propagation=None*)

remove an ace to an object

path: path to the object (i.e. c:\temp\file, HKEY_LOCAL_MACHINE\SOFTWARE\KEY, etc) user: user to remove permission: permissions for the user acetypes: either allow/deny for each user/permission (ALLOW, DENY) propagation: how the ACE applies to children for Registry Keys and Directories(KEY, KEY&SUBKEYS, SUBKEYS)

If any of the optional parameters are omitted (or set to None) they act as wildcards.

CLI Example:

```
remove allow domain\fakeuser full control on HKLM\\SOFTWARE\\somekey propagated to this key and subkeys
    salt 'myminion' win_dacl.rm_ace 'Registry' 'HKEY_LOCAL_MACHINE\\SOFTWARE\\somekey' 'domain\fakeuser' 'FULLCONTROL' 'ALLOW' 'KEY&SUBKEYS'
```

26.6.225 salt.modules.win_disk

Module for gathering disk information on Windows

depends

- win32api Python module

salt.modules.win_disk.**usage**()

Return usage information for volumes mounted on this minion

CLI Example:

```
salt '*' disk.usage
```

26.6.226 salt.modules.win_dism

Install features/packages for Windows using DISM, which is useful for minions not running server versions of Windows. Some functions are only available on Windows 10.

`salt.modules.win_dism.`**`add_capability`**(*capability*, *source=None*, *limit_access=False*, *image=None*, *restart=False*)

Install a capability

Parameters

- **`capability`** (*`str`*) -- The capability to install
- **`source`** (*`Optional[str]`*) -- The optional source of the capability. Default is set by group policy and can be Windows Update.
- **`limit_access`** (*`Optional[bool]`*) -- Prevent DISM from contacting Windows Update for the source package
- **`image`** (*`Optional[str]`*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.
- **`restart`** (*`Optional[bool]`*) -- Reboot the machine if required by the install

Raises

- **`NotImplementedError`** -- For all versions of Windows that are not Windows 10
- **`and later. Server editions of Windows use ServerManager instead.`** --

Returns

A dictionary containing the results of the command

Return type

dict

CLI Example:

```
salt '*' dism.add_capability Tools.Graphics.DirectX~~~~0.0.1.0
```

`salt.modules.win_dism.`**`add_feature`**(*feature*, *package=None*, *source=None*, *limit_access=False*, *enable_parent=False*, *image=None*, *restart=False*)

Install a feature using DISM

Parameters

- **`feature`** (*`str`*) -- The feature to install
- **`package`** (*`Optional[str]`*) -- The parent package for the feature. You do not have to specify the package if it is the Windows Foundation Package. Otherwise, use package to specify the parent package of the feature
- **`source`** (*`Optional[str]`*) -- The optional source of the capability. Default is set by group policy and can be Windows Update
- **`limit_access`** (*`Optional[bool]`*) -- Prevent DISM from contacting Windows Update for the source package
- **`enable_parent`** (*`Optional[bool]`*) -- True will enable all parent features of the specified feature
- **`image`** (*`Optional[str]`*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.
- **`restart`** (*`Optional[bool]`*) -- Reboot the machine if required by the install

Returns

A dictionary containing the results of the command

Return type

dict

CLI Example:

```
salt '*' dism.add_feature NetFx3
```

`salt.modules.win_dism.`**`add_package`**(*package*, *ignore_check=False*, *prevent_pending=False*, *image=None*, *restart=False*)

Install a package using DISM

Parameters

- **`package`** (`str`) -- The package to install. Can be a .cab file, a .msu file, or a folder

---

Note: An *.msu* package is supported only when the target image is offline, either mounted or applied.

- **`ignore_check`** (`Optional[bool]`) -- Skip installation of the package if the applicability checks fail
- **`prevent_pending`** (`Optional[bool]`) -- Skip the installation of the package if there are pending online actions
- **`image`** (`Optional[str]`) -- The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is None.
- **`restart`** (`Optional[bool]`) -- Reboot the machine if required by the install

Returns

A dictionary containing the results of the command

Return type

dict

CLI Example:

```
salt '*' dism.add_package C:\Packages\package.cab
```

`salt.modules.win_dism.`**`add_provisioned_package`**(*package*, *image=None*, *restart=False*)

Provision a package using DISM. A provisioned package will install for new users on the system. It will also be reinstalled on each user if the system is updated.

New in version 3007.0.

Parameters

- **`package`** (`str`) -- The package to install. Can be one of the following:
  - `.appx` or `.appxbundle`
  - `.msix` or `.msixbundle`
  - `.ppkg`
- **`image`** (`Optional[str]`) -- The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is `None`.
- **`restart`** (`Optional[bool]`) -- Reboot the machine if required by the installation. Default is `False`

Returns

A dictionary containing the results of the command

Return type

dict

CLI Example:

```
salt '*' dism.add_provisioned_package C:\Packages\package.appx
salt '*' dism.add_provisioned_package C:\Packages\package.appxbundle
salt '*' dism.add_provisioned_package C:\Packages\package.msix
salt '*' dism.add_provisioned_package C:\Packages\package.msixbundle
salt '*' dism.add_provisioned_package C:\Packages\package.ppkg
```

`salt.modules.win_dism.`**`available_capabilities`**(*image=None*)

List the capabilities available on the system

Parameters

`image` (`Optional[str]`) -- The path to the root directory of an offline Windows image.

If *None* is passed, the running operating system is targeted. Default is None.

Raises

- `NotImplementedError` -- For all versions of Windows that are not Windows 10
- **`and later. Server editions of Windows use ServerManager instead.`** --

Returns

A list of available capabilities

Return type

list

CLI Example:

```
salt '*' dism.installed_capabilities
```

`salt.modules.win_dism.`**`available_features`**`(`*image=None*`)`

List the features available on the system

Parameters

`image` (`Optional[str]`) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.

Returns

A list of available features

Return type

list

CLI Example:

```
salt '*' dism.available_features
```

`salt.modules.win_dism.`**`get_capabilities`**`(`*image=None*`)`

List all capabilities on the system

Parameters

`image` (`Optional[str]`) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.

Raises

- `NotImplementedError` -- For all versions of Windows that are not Windows 10
- **`and later. Server editions of Windows use ServerManager instead.`** --

Returns

A list of capabilities

Return type

list

CLI Example:

```
salt '*' dism.get_capabilities
```

`salt.modules.win_dism.`**`get_features`**`(`*package=None*, *image=None*`)`

List features on the system or in a package

Parameters

- **`package`** (`Optional[str]`) -- The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. You cannot use this command to get package information for .msu files

  This can also be the name of a package as listed in `dism.installed_packages`
- **`image`** (`Optional[str]`) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.

Returns
A list of features

Return type
list

CLI Example:

```
# Return all features on the system
salt '*' dism.get_features

# Return all features in package.cab
salt '*' dism.get_features C:\packages\package.cab

# Return all features in the calc package
salt '*' dism.get_features Microsoft.Windows.Calc.Demo~
↪6595b6144ccf1df~x86~en~1.0.0.0
```

`salt.modules.win_dism.`**`get_kb_package_name`**(*kb*, *image=None*)

Get the actual package name on the system based on the KB name

New in version 3006.0.

Parameters

- **kb** (`str`) -- The name of the KB to remove. Can also be just the KB number
- **image** (`Optional[str]`) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.

Returns
The name of the package found on the system None: If the package is not installed on the system

Return type
str

CLI Example:

```
# Get the package name for KB1231231
salt '*' dism.get_kb_package_name KB1231231

# Get the package name for KB1231231 using just the number
salt '*' dism.get_kb_package_name 1231231
```

`salt.modules.win_dism.`**`installed_capabilities`**(*image=None*)

List the capabilities installed on the system

Parameters
image (`Optional[str]`) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.

Raises

- **NotImplementedError** -- For all versions of Windows that are not Windows 10
- **and later. Server editions of Windows use ServerManager instead.** --

Returns
A list of installed capabilities

Return type
list

CLI Example:

```
salt '*' dism.installed_capabilities
```

`salt.modules.win_dism.`**`installed_features`**`(`*image=None*`)`

List the features installed on the system

Parameters

`image` (`Optional[str]`) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.

Returns

A list of installed features

Return type

list

CLI Example:

```
salt '*' dism.installed_features
```

`salt.modules.win_dism.`**`installed_packages`**`(`*image=None*`)`

List the packages installed on the system

Parameters

`image` (`Optional[str]`) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.

Returns

A list of installed packages

Return type

list

CLI Example:

```
salt '*' dism.installed_packages
```

`salt.modules.win_dism.`**`package_info`**`(`*package, image=None*`)`

Display information about a package

Parameters

- **`package`** (`str`) -- The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. You cannot use this command to get package information for .msu files
- **`image`** (`Optional[str]`) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.

Returns

A dictionary containing the results of the command

Return type

dict

CLI Example:

```
salt '*' dism.package_info C:\packages\package.cab
```

`salt.modules.win_dism.`**`provisioned_packages`**`(`*image=None*`)`

List the packages installed on the system

New in version 3007.0.

Parameters

`image` (`Optional[str]`) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.

Returns

A list of installed packages

Return type

list

CLI Example:

```
salt '*' dism.installed_packages
```

`salt.modules.win_dism.`**`remove_capability`**(*capability*, *image=None*, *restart=False*)

Uninstall a capability

Parameters

- **capability** (`str`) -- The capability to be removed
- **image** (`Optional[str]`) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.
- **restart** (`Optional[bool]`) -- Reboot the machine if required by the install

Raises

- **NotImplementedError** -- For all versions of Windows that are not Windows 10
- **and later. Server editions of Windows use ServerManager instead.** --

Returns

A dictionary containing the results of the command

Return type

dict

CLI Example:

```
salt '*' dism.remove_capability Tools.Graphics.DirectX~~~~0.0.1.0
```

`salt.modules.win_dism.`**`remove_feature`**(*feature*, *remove_payload=False*, *image=None*, *restart=False*)

Disables the feature.

Parameters

- **feature** (`str`) -- The feature to uninstall
- **remove_payload** (`Optional[bool]`) -- Remove the feature's payload. Must supply source when enabling in the future.
- **image** (`Optional[str]`) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.
- **restart** (`Optional[bool]`) -- Reboot the machine if required by the install

Returns

A dictionary containing the results of the command

Return type

dict

CLI Example:

```
salt '*' dism.remove_feature NetFx3
```

`salt.modules.win_dism.`**`remove_kb`**(*kb*, *image=None*, *restart=False*)

Remove a package by passing a KB number. This searches the installed packages to get the full package name of the KB. It then calls the `dism.remove_package` function to remove the package.

New in version 3006.0.

Parameters

- **kb** (`str`) -- The name of the KB to remove. Can also be just the KB number
- **image** (`Optional[str]`) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.
- **restart** (`Optional[bool]`) -- Reboot the machine if required by the uninstall

Returns

A dictionary containing the results of the command

Return type

dict

CLI Example:

```
# Remove the KB5007575 just passing the number
salt '*' dism.remove_kb 5007575

# Remove the KB5007575 just passing the full name
salt '*' dism.remove_kb KB5007575
```

`salt.modules.win_dism.`**`remove_package`**(*package*, *image=None*, *restart=False*)

Uninstall a package

Parameters

- **`package`** (`str`) -- The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. This can also be the name of a package as listed in `dism.installed_packages`
- **`image`** (`Optional[str]`) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.
- **`restart`** (`Optional[bool]`) -- Reboot the machine if required by the uninstall

Returns

A dictionary containing the results of the command

Return type

dict

CLI Example:

```
# Remove the Calc Package
salt '*' dism.remove_package Microsoft.Windows.Calc.Demo~6595b6144ccf1df~
↪x86~en~1.0.0.0

# Remove the package.cab (does not remove C:\packages\package.cab)
salt '*' dism.remove_package C:\packages\package.cab
```

26.6.227 salt.modules.win_dns_client

Module for configuring DNS Client on Windows systems

`salt.modules.win_dns_client.`**`add_dns`**(*ip*, *interface='Local Area Connection'*, *index=1*)

Add the DNS server to the network interface (index starts from 1)

Note: if the interface DNS is configured by DHCP, all the DNS servers will be removed from the interface and the requested DNS will be the only one

CLI Example:

```
salt '*' win_dns_client.add_dns <ip> <interface> <index>
```

`salt.modules.win_dns_client.`**`dns_dhcp`**(*interface='Local Area Connection'*)

Configure the interface to get its DNS servers from the DHCP server

CLI Example:

```
salt '*' win_dns_client.dns_dhcp <interface>
```

`salt.modules.win_dns_client.`**`get_dns_config`**(*interface='Local Area Connection'*)

Get the type of DNS configuration (dhcp / static).

Parameters

- **`interface`** (`str`) -- The name of the network interface. This is the

- **device** (*Description in the Network Connection Details for the*) --

Returns
`True` if DNS is configured, otherwise `False`

Return type
bool

CLI Example:

```
salt '*' win_dns_client.get_dns_config 'Local Area Connection'
```

`salt.modules.win_dns_client.`**`get_dns_servers`**(*interface='Local Area Connection'*)

Return a list of the configured DNS servers of the specified interface

Parameters

- **interface** (*str*) -- The name of the network interface. This is the name as
- **Connections** (*it appears in the Control Panel under Network*) --

Returns
A list of dns servers

Return type
list

CLI Example:

```
salt '*' win_dns_client.get_dns_servers 'Local Area Connection'
```

`salt.modules.win_dns_client.`**`rm_dns`**(*ip*, *interface='Local Area Connection'*)

Remove the DNS server from the network interface

CLI Example:

```
salt '*' win_dns_client.rm_dns <ip> <interface>
```

26.6.228 salt.modules.win_dsc

Module for working with Windows PowerShell DSC (Desired State Configuration)

This module is Alpha

This module applies DSC Configurations in the form of PowerShell scripts or MOF (Managed Object Format) schema files.

Use the `psget` module to manage PowerShell resources.

The idea is to leverage Salt to push DSC configuration scripts or MOF files to the Minion.

depends

- PowerShell 5.0

`salt.modules.win_dsc.`**`apply_config`**(*path*, *source=None*, *salt_env='base'*)

Run an compiled DSC configuration (a folder containing a .mof file). The folder can be cached from the salt master using the `source` option.

Parameters

- **path** (*str*) -- Local path to the directory that contains the .mof configuration file to apply. Required.
- **source** (*str*) -- Path to the directory that contains the .mof file on the `file_roots`. The source directory will be copied to the path directory and then

executed. If the path and source directories differ, the source directory will be applied. If source is not passed, the config located at `path` will be applied. Optional.

- **salt_env** (*str*) -- The salt environment to use when copying your source. Default is 'base'

Returns
True if successful, otherwise False

Return type
bool

CLI Example:

To apply a config that already exists on the system

```
salt '*' dsc.apply_config C:\\DSC\\WebSiteConfiguration
```

To cache a configuration from the master and apply it:

```
salt '*' dsc.apply_config C:\\DSC\\WebSiteConfiguration salt://dsc/
↪configs/WebSiteConfiguration
```

`salt.modules.win_dsc.`**`compile_config`**(*path*, *source=None*, *config_name=None*, *config_data=None*, *config_data_source=None*, *script_parameters=None*, *salt_env='base'*)

Compile a config from a PowerShell script (`.ps1`)

Parameters

- **path** (*str*) -- Path (local) to the script that will create the `.mof` configuration file. If no source is passed, the file must exist locally. Required.
- **source** (*str*) -- Path to the script on `file_roots` to cache at the location specified by `path`. The source file will be cached locally and then executed. If source is not passed, the config script located at `path` will be compiled. Optional.
- **config_name** (*str*) -- The name of the Configuration within the script to apply. If the script contains multiple configurations within the file a `config_name` must be specified. If the `config_name` is not specified, the name of the file will be used as the `config_name` to run. Optional.
- **config_data** (*str*) -- Configuration data in the form of a hash table that will be passed to the `ConfigurationData` parameter when the `config_name` is compiled. This can be the path to a `.psd1` file containing the proper hash table or the PowerShell code to create the hash table.

  New in version 2017.7.0.
- **config_data_source** (*str*) -- The path to the `.psd1` file on `file_roots` to cache at the location specified by `config_data`. If this is specified, `config_data` must be a local path instead of a hash table.

  New in version 2017.7.0.
- **script_parameters** (*str*) -- Any additional parameters expected by the configuration script. These must be defined in the script itself.

  New in version 2017.7.0.
- **salt_env** (*str*) -- The salt environment to use when copying the source. Default is 'base'

Returns
A dictionary containing the results of the compilation

Return type
dict

CLI Example:

To compile a config from a script that already exists on the system:

```
salt '*' dsc.compile_config C:\\DSC\\WebsiteConfig.ps1
```

To cache a config script to the system from the master and compile it:

```
salt '*' dsc.compile_config C:\\DSC\\WebsiteConfig.ps1 salt://dsc/configs/
↪WebsiteConfig.ps1
```

`salt.modules.win_dsc.`**`get_config`**`()`

Get the current DSC Configuration

Returns

A dictionary representing the DSC Configuration on the machine

Return type

dict

Raises

`CommandExecutionError` -- On failure

CLI Example:

```
salt '*' dsc.get_config
```

`salt.modules.win_dsc.`**`get_config_status`**`()`

Get the status of the current DSC Configuration

Returns

A dictionary representing the status of the current DSC

Configuration on the machine

Return type

dict

CLI Example:

```
salt '*' dsc.get_config_status
```

`salt.modules.win_dsc.`**`get_lcm_config`**`()`

Get the current Local Configuration Manager settings

Returns

A dictionary representing the Local Configuration Manager settings

on the machine

Return type

dict

CLI Example:

```
salt '*' dsc.get_lcm_config
```

`salt.modules.win_dsc.`**`remove_config`**`(`*reset=False*`)`

Remove the current DSC Configuration. Removes current, pending, and previous dsc configurations.

New in version 2017.7.5.

Parameters

`reset` (*`bool`*) -- Attempts to reset the DSC configuration by removing the following from `C:\Windows\System32\Configuration`:

- File: DSCStatusHistory.mof
- File: DSCEngineCache.mof
- Dir: ConfigurationStatus

Default is False

> **Warning:** `remove_config` may fail to reset the DSC environment if any of the files in the `ConfigurationStatus` directory are in use. If you wait a few minutes and run again, it may complete successfully.

Returns
True if successful

Return type
bool

Raises
`CommandExecutionError` -- On failure

CLI Example:

```
salt '*' dsc.remove_config True
```

`salt.modules.win_dsc.`**`restore_config`**`()`

Reapplies the previous configuration.

New in version 2017.7.5.

Note: The current configuration will be come the previous configuration. If run a second time back-to-back it is like toggling between two configs.

Returns
True if successfully restored

Return type
bool

Raises
`CommandExecutionError` -- On failure

CLI Example:

```
salt '*' dsc.restore_config
```

`salt.modules.win_dsc.`**`run_config`**`(`*path, source=None, config_name=None, config_data=None, config_data_source=None, script_parameters=None, salt_env='base'*`)`

Compile a DSC Configuration in the form of a PowerShell script (.ps1) and apply it. The PowerShell script can be cached from the master using the `source` option. If there is more than one config within the PowerShell script, the desired configuration can be applied by passing the name in the `config` option.

This command would be the equivalent of running `dsc.compile_config` followed by `dsc.apply_config`.

Parameters

- **`path`** (*`str`*) -- The local path to the PowerShell script that contains the DSC Configuration. Required.
- **`source`** (*`str`*) -- The path to the script on `file_roots` to cache at the location specified by `path`. The source file will be cached locally and then executed. If source is not passed, the config script located at `path` will be compiled. Optional.
- **`config_name`** (*`str`*) -- The name of the Configuration within the script to apply. If the script contains multiple configurations within the file a `config_name` must be specified. If the `config_name` is not specified, the name of the file will be used as the `config_name` to run. Optional.
- **`config_data`** (*`str`*) -- Configuration data in the form of a hash table that will be passed to the `ConfigurationData` parameter when the `config_name` is com-

piled. This can be the path to a `.psd1` file containing the proper hash table or the PowerShell code to create the hash table.

New in version 2017.7.0.

- **`config_data_source`** (*str*) -- The path to the `.psd1` file on `file_roots` to cache at the location specified by `config_data`. If this is specified, `config_data` must be a local path instead of a hash table.

  New in version 2017.7.0.
- **`script_parameters`** (*str*) -- Any additional parameters expected by the configuration script. These must be defined in the script itself. Note that these are passed to the script (the outermost scope), and not to the dsc configuration inside the script (the inner scope).

  New in version 2017.7.0.
- **`salt_env`** (*str*) -- The salt environment to use when copying the source. Default is 'base'

Returns

True if successfully compiled and applied, otherwise False

Return type

bool

CLI Example:

To compile a config from a script that already exists on the system:

```
salt '*' dsc.run_config C:\\DSC\\WebsiteConfig.ps1
```

To cache a config script to the system from the master and compile it:

```
salt '*' dsc.run_config C:\\DSC\\WebsiteConfig.ps1 salt://dsc/configs/
↪WebsiteConfig.ps1
```

To cache a config script to the system from the master and compile it, passing in *script_parameters*:

```
salt '*' dsc.run_config path=C:\\DSC\\WebsiteConfig.ps1 source=salt://dsc/
↪configs/WebsiteConfig.ps1 script_parameters="-hostname 'my-computer' -
↪ip '192.168.1.10' -DnsArray '192.168.1.3','192.168.1.4','1.1.1.1'"
```

salt.modules.win_dsc.**set_lcm_config**(*config_mode=None, config_mode_freq=None, refresh_freq=None, reboot_if_needed=None, action_after_reboot=None, refresh_mode=None, certificate_id=None, configuration_id=None, allow_module_overwrite=None, debug_mode=False, status_retention_days=None*)

For detailed descriptions of the parameters see: https://msdn.microsoft.com/en-us/PowerShell/DSC/metaConfig

config_mode (str): How the LCM applies the configuration. Valid values

are:

- ApplyOnly
- ApplyAndMonitor
- ApplyAndAutoCorrect

config_mode_freq (int): How often, in minutes, the current configuration

is checked and applied. Ignored if config_mode is set to ApplyOnly. Default is 15.

refresh_mode (str): How the LCM gets configurations. Valid values are:

- Disabled
- Push

- Pull

refresh_freq (int): How often, in minutes, the LCM checks for updated
configurations. (pull mode only) Default is 30.

reboot_if_needed (bool): Reboot the machine if needed after a
configuration is applied. Default is False.

action_after_reboot (str): Action to take after reboot. Valid values
are:

  - ContinueConfiguration
  - StopConfiguration

certificate_id (guid): A GUID that specifies a certificate used to
access the configuration: (pull mode)

configuration_id (guid): A GUID that identifies the config file to get
from a pull server. (pull mode)

allow_module_overwrite (bool): New configs are allowed to overwrite old
ones on the target node.

debug_mode (str): Sets the debug level. Valid values are:

- None
- ForceModuleImport
- All

status_retention_days (int): Number of days to keep status of the
current config.

Note: Either `config_mode_freq` or `refresh_freq` needs to be a multiple of the other. See documentation on MSDN for more details.

Returns
True if successful, otherwise False

Return type
bool

CLI Example:

```
salt '*' dsc.set_lcm_config ApplyOnly
```

`salt.modules.win_dsc.`**`test_config`**`()`

Tests the current applied DSC Configuration

Returns
True if successfully applied, otherwise False

Return type
bool

CLI Example:

```
salt '*' dsc.test_config
```

26.6.229 salt.modules.win_event

A module for working with the Windows Event log system. .. versionadded:: 3006.0

`salt.modules.win_event.`**`add`**(*log_name*, *event_id*, *event_category=0*, *event_type=None*, *event_strings=None*, *event_data=None*, *event_sid=None*)

Adds an event to the application event log.

Parameters

- **`log_name`** (*`str`*) -- The name of the application or source
- **`event_id`** (*`int`*) -- The event ID
- **`event_category`** (*`int`*) -- The event category
- **`event_type`** (*`str`*) -- The event category. Must be one of:
  - Success
  - Error
  - Warning
  - Information
  - AuditSuccess
  - AuditFailure
- **`event_strings`** (*`list`*) -- A list of strings
- **`event_data`** (*`bytes`*) -- Event data. Strings will be converted to bytes
- **`event_sid`** (*`sid`*) -- The SID for the event

Raises

- ***`CommandExecutionError`*** -- event_id is not an integer
- ***`CommandExecutionError`*** -- event_category is not an integer
- ***`CommandExecutionError`*** -- event_type is not one of the valid event types
- ***`CommandExecutionError`*** -- event_strings is not a list or string

CLI Example:

```
# A simple Application event log warning entry
salt '*' win_event.add Application 1234 12 Warning

# A more complex System event log information entry
salt '*' win_event.add System 1234 12 Information "['Event string data 1',
↪ 'Event string data 2']" "Some event data"

# Log to the System Event log with the source "Service Control Manager"
salt '*' win_event.add "Service Control Manager" 1234 12 Warning "['Event
↪string data 1', 'Event string data 2']" "Some event data"

# Log to the PowerShell event log with the source "PowerShell (PowerShell)
↪"
salt-call --local win_event.add "PowerShell" 6969 12 Warning
```

`salt.modules.win_event.`**`clear`**(*log_name*, *backup=None*)

Clears the specified event log.

Note: A clear log event will be added to the log after it is cleared.

Parameters

- **`log_name`** (*`str`*) -- The name of the log to clear
- **`backup`** (*`str`*) -- Path to backup file

CLI Example:

```
salt "*" win_event.clear Application
```

`salt.modules.win_event.`**`count`**(*log_name*)

Gets the number of events in the specified.

Parameters

`log_name` (*`str`*) -- The name of the log

Returns

The number of events the log contains

Return type

int

CLI Example:

```
salt "*" win_event.count Application
```

`salt.modules.win_event.`**`get`**(*log_name*)

Get events from the specified log. Get a list of available logs using the *`win_event.get_log_names`* function.

> **Warning:** Running this command on a log with thousands of events, such as the `Applications` log, can take a long time.

Parameters

`log_name` (*`str`*) -- The name of the log to retrieve.

Returns

tuple: A tuple of events as dictionaries

CLI Example:

```
salt '*' win_event.get Application
```

`salt.modules.win_event.`**`get_filtered`**(*log_name*, *all_requirements=True*, ***kwargs*)

Will find events that match the fields and values specified in the kwargs. Kwargs can be any item in the return for the event.

> **Warning:** Running this command on a log with thousands of events, such as the `Applications` log, can take a long time.

Parameters

- **`log_name`** (*`str`*) -- The name of the log to retrieve
- **`all_requirements`** (*`bool`*) -- `True` matches all requirements. `False` matches any requirement. Default is `True`

Kwargs:

eventID (int): The event ID number

eventType (int): The event type number. Valid options and their

corresponding meaning are:

- 0 : Success
- 1 : Error
- 2 : Warning
- 4 : Information
- 8 : Audit Success
- 10 : Audit Failure

year (int): The year

month (int): The month

day (int): The day of the month

hour (int): The hour

minute (int): The minute

second (int): The second

eventCategory (int): The event category number

sid (sid): The SID of the user that created the event

sourceName (str): The name of the event source

Returns
A tuple of dicts of each filtered event

Return type
tuple

CLI Example:

```
# Return all events from the Security log with an ID of 1100
salt "*" win_event.get_filtered Security eventID=1100

# Return all events from the System log with an Error (1) event type
salt "*" win_event.get_filtered System eventType=1

# Return all events from System log with an Error (1) type, source is␣
↪Service Control Manager, and data is netprofm
salt "*" win_event.get_filtered System eventType=1 sourceName="Service␣
↪Control Manager" data="netprofm"

# Return events from the System log that match any of the kwargs below
salt "*" win_event.get_filtered System eventType=1 sourceName="Service␣
↪Control Manager" data="netprofm" all_requirements=False
```

`salt.modules.win_event.`**`get_log_names`**`()`

Get a list of event logs available on the system

Returns
A list of event logs available on the system

Return type
list

CLI Example:

```
salt "*" win_event.get_log_names
```

`salt.modules.win_event.`**`query`**`(`*log_name, query_text=None, records=20, latest=True, raw=False*`)`

Query a log for a specific event_id. Return the top number of records specified. Use the `win_event.get_log_names` to see a list of available logs on the system.

Note: You can use the Windows Event Viewer to create the XPath query for the `query_text` parameter. Click on `Filter Current Log`, configure the filter, then click on the XML tab. Copy the text between the two `<Select>` tags. This will be the contents of the `query_text` parameter. You will have to convert some codes. For example, `&gt;` becomes `>`, `&lt;` becomes `<`. Additionally, you'll need to put spaces between comparison operators. For example: `this >= that`.

Parameters

- **`log_name`** (*str*) -- The name of the log to query
- **`query_text`** (*str*) -- The filter to apply to the log
- **`records`** (*int*) -- The number of records to return
- **`latest`** (*bool*) -- `True` will return the newest events. `False` will return the oldest events. Default is `True`
- **`raw`** (*bool*) -- `True` will return the raw xml results. `False` will return the xml converted to a dictionary. Default is `False`

Returns

A list of dict objects that contain information about the event

Return type

list

CLI Example:

```
# Return the 20 most recent events from the Application log with an event
↪ID of 22
salt '*' win_event.query Application "*[System[(EventID=22)]]"

# Return the 20 most recent events from the Application log with an event
↪ID of 22
# Return raw xml
salt '*' win_event.query Application "*[System[(EventID=22)]]" raw=True

# Return the 20 oldest events from the Application log with an event ID
↪of 22
salt '*' win_event.query Application "*[System[(EventID=22)]]"
↪latest=False

# Return the 20 most recent Critical (1) events from the Application log
↪in the last 12 hours
salt '*" win_event.query Application "*[System[(Level=1) and
↪TimeCreated[timediff(@SystemTime) <= 43200000]]]"

# Return the 5 most recent Error (2) events from the application log
salt '*" win_event.query Application "*[System[(Level=2)]]" records=5

# Return the 20 most recent Warning (3) events from the Windows
↪PowerShell log where the Event Source is PowerShell
salt '*" win_event.query "Windows PowerShell" "*[System[Provider[@Name=
↪'PowerShell'] and (Level=3)]]"

# Return the 20 most recent Information (0 or 4) events from the
↪Microsoft-Windows-PowerShell/Operational on 2022-08-24 with an Event ID
↪of 4103
salt '*" win_event.query "Microsoft-Windows-PowerShell/Operational"
↪"*[System[(Level=4 or Level=0) and (EventID=4103) and
↪TimeCreated[@SystemTime >= '2022-08-24T06:00:00.000Z']]]"

# Return the 20 most recent Information (0 or 4) events from the
```

(continues on next page)

(continued from previous page)

```
↪Microsoft-Windows-PowerShell/Operational within the last hour
salt '*" win_event.query "Microsoft-Windows-PowerShell/Operational"
↪"*[System[(Level=4 or Level=0) and TimeCreated[timediff(@SystemTime) <=
↪3600000]]]"
```

26.6.230 salt.modules.win_file

Manage information about files on the minion, set/read user, group data, modify the ACL of files/directories

depends

- win32api
- win32file
- win32con
- salt.utils.win_dacl

`salt.modules.win_file.`**`check_perms`**(*path*, *ret=None*, *owner=None*, *grant_perms=None*, *deny_perms=None*, *inheritance=True*, *reset=False*)

Check owner and permissions for the passed directory. This function checks the permissions and sets them, returning the changes made. Used by the file state to populate the return dict

Parameters

- **path** (*str*) -- The full path to the directory.
- **ret** (*dict*) -- A dictionary to append changes to and return. If not passed, will create a new dictionary to return.
- **owner** (*str*) -- The owner to set for the directory.
- **grant_perms** (*dict*) -- A dictionary containing the user/group and the basic permissions to check/grant, ie: `{'user': {'perms': 'basic_permission'}}`. Default is `None`.
- **deny_perms** (*dict*) -- A dictionary containing the user/group and permissions to check/deny. Default is `None`.
- **inheritance** (*bool*) -- `True will check if inheritance is enabled and enable it. ``False` will check if inheritance is disabled and disable it. Default is `True`.
- **reset** (*bool*) -- `True` will show what permissions will be removed by resetting the DACL. `False` will do nothing. Default is `False`.

Returns

A dictionary of changes that have been made

Return type

dict

CLI Example:

```
# To see changes to ``C:\Temp`` if the 'Users' group is given 'read &
↪execute' permissions.
salt '*' file.check_perms C:\Temp\ {} Administrators "{'Users': {'perms':
↪'read_execute'}}"

# Locally using salt call
salt-call file.check_perms C:\Temp\ {} Administrators "{'Users': {'perms
↪': 'read_execute', 'applies_to': 'this_folder_only'}}"
```

(continues on next page)

(continued from previous page)

```
# Specify advanced attributes with a list
salt '*' file.check_perms C:\Temp\ {} Administrators "{'jsnuffy': {'perms
↪': ['read_attributes', 'read_ea'], 'applies_to': 'files_only'}}"
```

`salt.modules.win_file.`**`chgrp`**(*path*, *group*)

Change the group of a file

Under Windows, this will do nothing.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to do nothing while still being compatible with Unix behavior. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to set the 'primary group' of a file, use `file .chpgrp`.

To set group permissions use `file.set_perms`

Parameters

- **path** (*str*) -- The path to the file or directory
- **group** (*str*) -- The group (unused)

Returns

None

CLI Example:

```
salt '*' file.chgrp c:\temp\test.txt administrators
```

`salt.modules.win_file.`**`chown`**(*path*, *user*, *group=None*, *pgroup=None*, *follow_symlinks=True*)

Chown a file, pass the file the desired user and group

Under Windows, the group parameter will be ignored.

This is because while files in Windows do have a 'primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

If you do want to change the 'primary group' property and understand the implications, pass the Windows only parameter, pgroup, instead.

Parameters

- **path** (*str*) -- The path to the file or directory
- **user** (*str*) -- The name of the user to own the file
- **group** (*str*) -- The group (not used)
- **pgroup** (*str*) -- The primary group to assign
- **follow_symlinks** (*bool*) -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns

True if successful, otherwise error

Return type

bool

CLI Example:

```
salt '*' file.chown c:\temp\test.txt myusername
salt '*' file.chown c:\temp\test.txt myusername pgroup=Administrators
salt '*' file.chown c:\temp\test.txt myusername "pgroup='None'"
```

`salt.modules.win_file.`**`chpgrp`**(*path*, *group*)

Change the group of a file

Under Windows, this will set the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

Parameters

- **path** (*str*) -- The path to the file or directory
- **pgroup** (*str*) -- The primary group to assign

Returns

True if successful, otherwise error

Return type

bool

CLI Example:

```
salt '*' file.chpgrp c:\temp\test.txt Administrators
salt '*' file.chpgrp c:\temp\test.txt "'None'"
```

`salt.modules.win_file.`**`get_attributes`**(*path*)

Return a dictionary object with the Windows file attributes for a file.

Parameters

path (*str*) -- The path to the file or directory

Returns

A dictionary of file attributes

Return type

dict

CLI Example:

```
salt '*' file.get_attributes c:\temp\a.txt
```

`salt.modules.win_file.`**`get_gid`**(*path*, *follow_symlinks=True*)

Return the id of the group that owns a given file

Under Windows, this will return the uid of the file.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to provide functionality that somewhat resembles Unix behavior for API compatibility reasons. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to access the 'primary group' of a file, use *file.get_pgid*.

Parameters

- **path** (*str*) -- The path to the file or directory
- **follow_symlinks** (*bool*) -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns

The gid of the owner

Return type

str

CLI Example:

```
salt '*' file.get_gid c:\temp\test.txt
```

`salt.modules.win_file.`**`get_group`**`(`*path*, *follow_symlinks=True*`)`

Return the group that owns a given file

Under Windows, this will return the user (owner) of the file.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to provide functionality that somewhat resembles Unix behavior for API compatibility reasons. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to access the 'primary group' of a file, use *file.get_pgroup*.

Parameters

- **`path`** (*`str`*) -- The path to the file or directory
- **`follow_symlinks`** (*`bool`*) -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns

The name of the owner

Return type

str

CLI Example:

```
salt '*' file.get_group c:\temp\test.txt
```

`salt.modules.win_file.`**`get_mode`**`(`*path*`)`

Return the mode of a file

Right now we're just returning None because Windows' doesn't have a mode like Linux

Parameters

`path` (*`str`*) -- The path to the file or directory

Returns

None

CLI Example:

```
salt '*' file.get_mode /etc/passwd
```

`salt.modules.win_file.`**`get_pgid`**`(`*path*, *follow_symlinks=True*`)`

Return the id of the primary group that owns a given file (Windows only)

This function will return the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

Parameters

- **`path`** (*`str`*) -- The path to the file or directory
- **`follow_symlinks`** (*`bool`*) -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns

The gid of the primary group

Return type

str

CLI Example:

```
salt '*' file.get_pgid c:\temp\test.txt
```

`salt.modules.win_file.`**`get_pgroup`**`(`*path*, *follow_symlinks=True*`)`

Return the name of the primary group that owns a given file (Windows only)

This function will return the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

The return value may be 'None', e.g. if the user is not on a domain. This is a valid group - do not confuse this with the Salt/Python value of None which means no value was returned. To be certain, use the *get_pgid* function which will return the SID, including for the system 'None' group.

Parameters

- **`path`** (*`str`*) -- The path to the file or directory
- **`follow_symlinks`** (*`bool`*) -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns

The name of the primary group

Return type

str

CLI Example:

```
salt '*' file.get_pgroup c:\temp\test.txt
```

`salt.modules.win_file.`**`get_uid`**`(`*path*, *follow_symlinks=True*`)`

Return the id of the user that owns a given file

Symlinks are followed by default to mimic Unix behavior. Specify *follow_symlinks=False* to turn off this behavior.

Parameters

- **`path`** (*`str`*) -- The path to the file or directory
- **`follow_symlinks`** (*`bool`*) -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns

The uid of the owner

Return type

str

CLI Example:

```
salt '*' file.get_uid c:\temp\test.txt
salt '*' file.get_uid c:\temp\test.txt follow_symlinks=False
```

`salt.modules.win_file.`**`get_user`**`(`*path*, *follow_symlinks=True*`)`

Return the user that owns a given file

Symlinks are followed by default to mimic Unix behavior. Specify *follow_symlinks=False* to turn off this behavior.

Parameters

- **`path`** (*`str`*) -- The path to the file or directory
- **`follow_symlinks`** (*`bool`*) -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns

The name of the owner

Return type
str

CLI Example:

```
salt '*' file.get_user c:\temp\test.txt
salt '*' file.get_user c:\temp\test.txt follow_symlinks=False
```

salt.modules.win_file.**gid_to_group**(*gid*)

Convert the group id to the group name on this system

Under Windows, because groups are just another ACL entity, this function behaves the same as uid_to_user.

For maintaining Windows systems, this function is superfluous and only exists for API compatibility with Unix. Use the uid_to_user function instead; an info level log entry will be generated if this function is used directly.

Parameters
gid (*str*) -- The gid of the group

Returns
The name of the group

Return type
str

CLI Example:

```
salt '*' file.gid_to_group S-1-5-21-626487655-2533044672-482107328-1010
```

salt.modules.win_file.**group_to_gid**(*group*)

Convert the group to the gid on this system

Under Windows, because groups are just another ACL entity, this function behaves the same as user_to_uid, except if None is given, '' is returned.

For maintaining Windows systems, this function is superfluous and only exists for API compatibility with Unix. Use the user_to_uid function instead; an info level log entry will be generated if this function is used directly.

Parameters
group (*str*) -- The name of the group

Returns
The gid of the group

Return type
str

CLI Example:

```
salt '*' file.group_to_gid administrators
```

salt.modules.win_file.**is_link**(*path*)

Check if the path is a symlink

This is only supported on Windows Vista or later.

Inline with Unix behavior, this function will raise an error if the path is not a symlink, however, the error raised will be a SaltInvocationError, not an OSError.

Parameters
path (*str*) -- The path to a file or directory

Returns
True if path is a symlink, otherwise False

Return type
bool

CLI Example:

```
salt '*' file.is_link /path/to/link
```

`salt.modules.win_file.`**`lchown`**(*path*, *user*, *group=None*, *pgroup=None*)

Chown a file, pass the file the desired user and group without following any symlinks.

Under Windows, the group parameter will be ignored.

This is because while files in Windows do have a 'primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

If you do want to change the 'primary group' property and understand the implications, pass the Windows only parameter, pgroup, instead.

To set the primary group to 'None', it must be specified in quotes. Otherwise Salt will interpret it as the Python value of None and no primary group changes will occur. See the example below.

Parameters

- **path** (*str*) -- The path to the file or directory
- **user** (*str*) -- The name of the user to own the file
- **group** (*str*) -- The group (not used)
- **pgroup** (*str*) -- The primary group to assign

Returns

True if successful, otherwise error

Return type

bool

CLI Example:

```
salt '*' file.lchown c:\temp\test.txt myusername
salt '*' file.lchown c:\temp\test.txt myusername pgroup=Administrators
salt '*' file.lchown c:\temp\test.txt myusername "pgroup='None'"
```

`salt.modules.win_file.`**`makedirs_`**(*path*, *owner=None*, *grant_perms=None*, *deny_perms=None*, *inheritance=True*, *reset=False*)

Ensure that the parent directory containing this path is available.

Parameters

- **path** (*str*) -- The full path to the directory.

  Note: The path must end with a trailing slash otherwise the directory(s) will be created up to the parent directory. For example if path is `C:\temp\test`, then it would be treated as `C:\temp\` but if the path ends with a trailing slash like `C:\temp\test\`, then it would be treated as `C:\temp\test\`.

- **owner** (*str*) -- The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM.
- **grant_perms** (*dict*) -- A dictionary containing the user/group and the basic permissions to grant, ie: `{'user': {'perms': 'basic_permission'}}`. You can also set the `applies_to` setting here. The default is `this_folder_subfolders_files`. Specify another `applies_to` setting like this:

  ```
  {'user': {'perms': 'full_control', 'applies_to': 'this_
  ↪folder'}}
  ```

  To set advanced permissions use a list for the `perms` parameter, ie:

```
{'user': {'perms': ['read_attributes', 'read_ea'],
↪'applies_to': 'this_folder'}}
```

- **deny_perms** (*dict*) -- A dictionary containing the user/group and permissions to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.
- **inheritance** (*bool*) -- If True the object will inherit permissions from the parent, if False, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created.
- **reset** (*bool*) -- If `True` the existing DACL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

  New in version 2018.3.0.

Returns
True if successful

Return type
bool

Raises
CommandExecutionError -- If unsuccessful

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.makedirs C:\Temp\ Administrators "{'Users': {'perms': 'read_
↪execute'}}"

# Locally using salt call
salt-call file.makedirs C:\Temp\ Administrators "{'Users': {'perms':
↪'read_execute', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.makedirs C:\Temp\ Administrators "{'jsnuffy': {'perms': [
↪'read_attributes', 'read_ea'], 'applies_to': 'this_folder_only'}}"
```

salt.modules.win_file.**makedirs_perms**(*path, owner=None, grant_perms=None, deny_perms=None, inheritance=True, reset=True*)

Set owner and permissions for each directory created.

Parameters

- **path** (*str*) -- The full path to the directory.
- **owner** (*str*) -- The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM.
- **grant_perms** (*dict*) -- A dictionary containing the user/group and the basic permissions to grant, ie: `{'user': {'perms': 'basic_permission'}}`. You can also set the `applies_to` setting here. The default is `this_folder_subfolders_files`. Specify another `applies_to` setting like this:

```
{'user': {'perms': 'full_control', 'applies_to': 'this_
↪folder'}}
```

  To set advanced permissions use a list for the `perms` parameter, ie:

```
{'user': {'perms': ['read_attributes', 'read_ea'],
↪'applies_to': 'this_folder'}}
```

- **deny_perms** (*dict*) -- A dictionary containing the user/group and permissions to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.
- **inheritance** (*bool*) -- If `True` the object will inherit permissions from the parent, if `False`, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created
- **reset** (*bool*) -- If `True` the existing DACL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

  New in version 2018.3.0.

Returns

True if successful, otherwise raises an error

Return type

bool

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.makedirs_perms C:\Temp\ Administrators "{'Users': {'perms':
↪'read_execute'}}"

# Locally using salt call
salt-call file.makedirs_perms C:\Temp\ Administrators "{'Users': {'perms
↪': 'read_execute', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.makedirs_perms C:\Temp\ Administrators "{'jsnuffy': {'perms
↪': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder_files'}}"
```

`salt.modules.win_file.`**`mkdir`**(*path*, *owner=None*, *grant_perms=None*, *deny_perms=None*, *inheritance=True*, *reset=False*)

Ensure that the directory is available and permissions are set.

Parameters

- **path** (*str*) -- The full path to the directory.
- **owner** (*str*) -- The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM
- **grant_perms** (*dict*) -- A dictionary containing the user/group and the basic permissions to grant, ie: `{'user': {'perms': 'basic_permission'}}`. You can also set the `applies_to` setting here. The default is `this_folder_subfolders_files`. Specify another `applies_to` setting like this:

```
{'user': {'perms': 'full_control', 'applies_to': 'this_
↪folder'}}
```

  To set advanced permissions use a list for the `perms` parameter, ie:

```
{'user': {'perms': ['read_attributes', 'read_ea'],
↪'applies_to': 'this_folder'}}
```

- **deny_perms** (*dict*) -- A dictionary containing the user/group and permissions to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.

- **inheritance** (*bool*) -- If True the object will inherit permissions from the parent, if `False`, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created.
- **reset** (*bool*) -- If `True` the existing DACL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

New in version 2018.3.0.

Returns

True if successful

Return type

bool

Raises

CommandExecutionError -- If unsuccessful

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.mkdir C:\Temp\ Administrators "{'Users': {'perms': 'read_
↪execute'}}"

# Locally using salt call
salt-call file.mkdir C:\Temp\ Administrators "{'Users': {'perms': 'read_
↪execute', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.mkdir C:\Temp\ Administrators "{'jsnuffy': {'perms': ['read_
↪attributes', 'read_ea'], 'applies_to': 'this_folder_only'}}"
```

`salt.modules.win_file.`**remove**(*path*, *force=False*)

Remove the named file or directory

Parameters

- **path** (*str*) -- The path to the file or directory to remove.
- **force** (*bool*) -- Remove even if marked Read-Only. Default is False

Returns

True if successful, False if unsuccessful

Return type

bool

CLI Example:

```
salt '*' file.remove C:\Temp
```

`salt.modules.win_file.`**set_attributes**(*path*, *archive=None*, *hidden=None*, *normal=None*, *notIndexed=None*, *readonly=None*, *system=None*, *temporary=None*)

Set file attributes for a file. Note that the normal attribute means that all others are false. So setting it will clear all others.

Parameters

- **path** (*str*) -- The path to the file or directory
- **archive** (*bool*) -- Sets the archive attribute. Default is None
- **hidden** (*bool*) -- Sets the hidden attribute. Default is None
- **normal** (*bool*) -- Resets the file attributes. Cannot be used in conjunction with any

other attribute. Default is None
- **notIndexed** (*bool*) -- Sets the indexed attribute. Default is None
- **readonly** (*bool*) -- Sets the readonly attribute. Default is None
- **system** (*bool*) -- Sets the system attribute. Default is None
- **temporary** (*bool*) -- Sets the temporary attribute. Default is None

Returns
True if successful, otherwise False

Return type
bool

CLI Example:

```
salt '*' file.set_attributes c:\temp\a.txt normal=True
salt '*' file.set_attributes c:\temp\a.txt readonly=True hidden=True
```

`salt.modules.win_file.`**`set_mode`**(*path*, *mode*)

Set the mode of a file

This just calls get_mode, which returns None because we don't use mode on Windows

Parameters
- **path** -- The path to the file or directory
- **mode** -- The mode (not used)

Returns
None

CLI Example:

```
salt '*' file.set_mode /etc/passwd 0644
```

`salt.modules.win_file.`**`set_perms`**(*path*, *grant_perms=None*, *deny_perms=None*, *inheritance=True*, *reset=False*)

Set permissions for the given path

Parameters
- **path** (*str*) -- The full path to the directory.
- **grant_perms** (*dict*) -- A dictionary containing the user/group and the basic permissions to grant, ie: `{'user': {'perms': 'basic_permission'}}`. You can also set the `applies_to` setting here for directories. The default for `applies_to` is `this_folder_subfolders_files`. Specify another `applies_to` setting like this:

  ```
  {'user': {'perms': 'full_control', 'applies_to': 'this_
  ↪folder'}}
  ```

  To set advanced permissions use a list for the `perms` parameter, ie:

  ```
  {'user': {'perms': ['read_attributes', 'read_ea'],
  ↪'applies_to': 'this_folder'}}
  ```

  To see a list of available attributes and applies to settings see the documentation for salt.utils.win_dacl.

  A value of `None` will make no changes to the `grant` portion of the DACL. Default is `None`.
- **deny_perms** (*dict*) -- A dictionary containing the user/group and permissions to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.

A value of `None` will make no changes to the `deny` portion of the DACL. Default is `None`.
- **inheritance** (*bool*) -- If `True` the object will inherit permissions from the parent, if `False`, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created. Default is `False`.
- **reset** (*bool*) -- If `True` the existing DCL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

  New in version 2018.3.0.

Returns
True if successful

Return type
bool

Raises
CommandExecutionError -- If unsuccessful

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.set_perms C:\Temp\ "{'Users': {'perms': 'read_execute'}}"

# Locally using salt call
salt-call file.set_perms C:\Temp\ "{'Users': {'perms': 'read_execute',
↪'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.set_perms C:\Temp\ "{'jsnuffy': {'perms': ['read_attributes
↪', 'read_ea'], 'applies_to': 'this_folder_only'}}"
```

`salt.modules.win_file.`**`stats`**(*path*, *hash_type='sha256'*, *follow_symlinks=True*)

Return a dict containing the stats about a given file

Under Windows, *gid* will equal *uid* and *group* will equal *user*.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps these properties to keep some kind of compatibility with Unix behavior. If the 'primary group' is required, it can be accessed in the *pgroup* and *pgid* properties.

Parameters
- **path** (*str*) -- The path to the file or directory
- **hash_type** (*str*) -- The type of hash to return
- **follow_symlinks** (*bool*) -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns
A dictionary of file/directory stats

Return type
dict

CLI Example:

```
salt '*' file.stats /etc/passwd
```

`salt.modules.win_file.`**`symlink`**(*src*, *link*, *force=False*, *atomic=False*, *follow_symlinks=True*)

Create a symbolic link to a file

This is only supported with Windows Vista or later and must be executed by a user with the SeCreateSymbolicLink privilege.

The behavior of this function matches the Unix equivalent, with one exception - invalid symlinks cannot be created. The source path must exist. If it doesn't, an error will be raised.

Parameters

- **`src`** (*`str`*) -- The path to a file or directory
- **`link`** (*`str`*) -- The path to the link. Must be an absolute path
- **`force`** (*`bool`*) -- Overwrite an existing symlink with the same name .. versionadded:: 3005
- **`atomic`** (*`bool`*) -- Use atomic file operations to create the symlink .. versionadded:: 3006.0
- **`follow_symlinks`** (*`bool`*) -- If set to `False`, use `os.path.lexists()` for existence checks instead of `os.path.exists()`. .. versionadded:: 3007.0

Returns

`True` if successful, otherwise raises `CommandExecutionError`

Return type

bool

CLI Example:

```
salt '*' file.symlink /path/to/file /path/to/link
```

`salt.modules.win_file.`**`uid_to_user`**`(`*uid*`)`

Convert a User ID (uid) to a username

Parameters

`uid` (*`str`*) -- The user id to lookup

Returns

The name of the user. The `uid` will be returned if there is no
corresponding username

Return type

str

CLI Example:

```
salt '*' file.uid_to_user S-1-5-21-626487655-2533044672-482107328-1010
```

`salt.modules.win_file.`**`user_to_uid`**`(`*user*`)`

Convert user name to a uid

Parameters

`user` (*`str`*) -- The user to lookup

Returns

The user id of the user

Return type

str

CLI Example:

```
salt '*' file.user_to_uid myusername
```

`salt.modules.win_file.`**`version`**`(`*path*`)`

New in version 3005.

Get the version of a file.

Note: Not all files have version information. The following are common file types that contain version information:

- .exe
- .dll
- .sys

Parameters
`path` (*str*) -- The path to the file.

Returns
The version of the file if the file contains it. Otherwise, an empty string will be returned.

Return type
str

Raises
- ***CommandExecutionError*** -- If the file does not exist
- ***CommandExecutionError*** -- If the path is not a file

CLI Example:

```
salt * file.version C:\Windows\notepad.exe
```

`salt.modules.win_file.`**`version_details`**(*path*)

New in version 3005.

Get file details for a file. Similar to what's in the details tab on the file properties.

Note: Not all files have version information. The following are common file types that contain version information:

- .exe
- .dll
- .sys

Parameters
`path` (*str*) -- The path to the file.

Returns
A dictionary containing details about the file related to version. An empty dictionary if the file contains no version information.

Return type
dict

Raises
- ***CommandExecutionError*** -- If the file does not exist
- ***CommandExecutionError*** -- If the path is not a file

CLI Example:

```
salt * file.version_details C:\Windows\notepad.exe
```

26.6.231 salt.modules.win_firewall

Module for configuring Windows Firewall using `netsh`

`salt.modules.win_firewall.`**`add_rule`**(*name*, *localport*, *protocol='tcp'*, *action='allow'*, *dir='in'*, *remoteip='any'*)

New in version 2015.5.0.

Add a new inbound or outbound rule to the firewall policy

Parameters

- **`name`** (*`str`*) -- The name of the rule. Must be unique and cannot be "all". Required.
- **`localport`** (*`int`*) -- The port the rule applies to. Must be a number between 0 and 65535. Can be a range. Can specify multiple ports separated by commas. Required.
- **`protocol`** (*`Optional[str]`*) -- The protocol. Can be any of the following:
  - A number between 0 and 255
  - icmpv4
  - icmpv6
  - tcp
  - udp
  - any
- **`action`** (*`Optional[str]`*) -- The action the rule performs. Can be any of the following:
  - allow
  - block
  - bypass
- **`dir`** (*`Optional[str]`*) -- The direction. Can be `in` or `out`.
- **`remoteip`** (*`Optional [str]`*) -- The remote IP. Can be any of the following:
  - any
  - localsubnet
  - dns
  - dhcp
  - wins
  - defaultgateway
  - Any valid IPv4 address (192.168.0.12)
  - Any valid IPv6 address (2002:9b3b:1a31:4:208:74ff:fe39:6c43)
  - Any valid subnet (192.168.1.0/24)
  - Any valid range of IP addresses (192.168.0.1-192.168.0.12)
  - A list of valid IP addresses

  Can be combinations of the above separated by commas.

Returns

True if successful

Return type

bool

Raises

`CommandExecutionError` -- If the command fails

CLI Example:

```
salt '*' firewall.add_rule 'test' '8080' 'tcp'
salt '*' firewall.add_rule 'test' '1' 'icmpv4'
salt '*' firewall.add_rule 'test_remote_ip' '8000' 'tcp' 'allow' 'in'
↪'192.168.0.1'
```

`salt.modules.win_firewall.`**`delete_rule`**(*name=None*, *localport=None*, *protocol=None*, *dir=None*, *remoteip=None*)

New in version 2015.8.0.

Delete an existing firewall rule identified by name and optionally by ports, protocols, direction, and remote IP.

Parameters

- **name** (*str*) -- The name of the rule to delete. If the name `all` is used you must specify additional parameters.
- **localport** (*Optional[str]*) -- The port of the rule. If protocol is not specified, protocol will be set to `tcp`
- **protocol** (*Optional[str]*) -- The protocol of the rule. Default is `tcp` when `localport` is specified
- **dir** (*Optional[str]*) -- The direction of the rule.
- **remoteip** (*Optional[str]*) -- The remote IP of the rule.

Returns

True if successful

Return type

bool

Raises

CommandExecutionError -- If the command fails

CLI Example:

```
# Delete incoming tcp port 8080 in the rule named 'test'
salt '*' firewall.delete_rule 'test' '8080' 'tcp' 'in'

# Delete the incoming tcp port 8000 from 192.168.0.1 in the rule named
# 'test_remote_ip'
salt '*' firewall.delete_rule 'test_remote_ip' '8000' 'tcp' 'in' '192.168.
↪0.1'

# Delete all rules for local port 80:
salt '*' firewall.delete_rule all 80 tcp

# Delete a rule called 'allow80':
salt '*' firewall.delete_rule allow80
```

`salt.modules.win_firewall.`**`disable`**`(`*profile='allprofiles'*`)`

Disable firewall profile

Parameters

profile (*Optional[str]*) -- The name of the profile to disable. Default is `allprofiles`. Valid options are:

- allprofiles
- domainprofile
- privateprofile
- publicprofile

Returns

True if successful

Return type

bool

Raises

CommandExecutionError -- If the command fails

CLI Example:

```
salt '*' firewall.disable
```

`salt.modules.win_firewall.`**`enable`**`(`*profile='allprofiles'*`)`

New in version 2015.5.0.

Enable firewall profile

Parameters

`profile` (*`Optional[str]`*) -- The name of the profile to enable. Default is `allprofiles`. Valid options are:

- allprofiles
- domainprofile
- privateprofile
- publicprofile

Returns

True if successful

Return type

bool

Raises

`CommandExecutionError` -- If the command fails

CLI Example:

```
salt '*' firewall.enable
```

`salt.modules.win_firewall.`**`get_all_profiles`**(*store='local'*)

Gets all properties for all profiles in the specified store

New in version 2018.3.4.

New in version 2019.2.0.

Parameters

`store` (*`str`*) -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:

- lgpo
- local

Default is `local`

Returns

A dictionary containing the specified settings for each profile

Return type

dict

CLI Example:

```
# Get all firewall settings for all profiles
salt * firewall.get_all_settings

# Get all firewall settings for all profiles as defined by local group
# policy

salt * firewall.get_all_settings lgpo
```

`salt.modules.win_firewall.`**`get_all_settings`**(*domain, store='local'*)

Gets all the properties for the specified profile in the specified store

New in version 2018.3.4.

New in version 2019.2.0.

Parameters

- **`profile`** (*`str`*) -- The firewall profile to query. Valid options are:
  - domain
  - public
  - private
- **`store`** (*`str`*) -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:

    - lgpo
    - local

  Default is `local`

Returns
A dictionary containing the specified settings

Return type
dict

CLI Example:

```
# Get all firewall settings for connections on the domain profile
salt * win_firewall.get_all_settings domain

# Get all firewall settings for connections on the domain profile as
# defined by local group policy
salt * win_firewall.get_all_settings domain lgpo
```

`salt.modules.win_firewall.`**`get_config`**`()`

Get the status of all the firewall profiles

Returns
A dictionary of all profiles on the system

Return type
dict

Raises
`CommandExecutionError` -- If the command fails

CLI Example:

```
salt '*' firewall.get_config
```

`salt.modules.win_firewall.`**`get_rule`**`(`*name='all'*`)`

New in version 2015.5.0.

Display all matching rules as specified by name

Parameters
`name` (*`Optional[str]`*) -- The full name of the rule. `all` will return all rules. Default is `all`

Returns
A dictionary of all rules or rules that match the name exactly

Return type
dict

Raises
`CommandExecutionError` -- If the command fails

CLI Example:

```
salt '*' firewall.get_rule 'MyAppPort'
```

`salt.modules.win_firewall.`**`get_settings`**`(`*profile, section, store='local'*`)`

Get the firewall property from the specified profile in the specified store as returned by `netsh advfirewall`.

New in version 2018.3.4.

New in version 2019.2.0.

Parameters

- **`profile`** (*`str`*) -- The firewall profile to query. Valid options are:
    - domain

    - public
    - private
- **section** (*str*) -- The property to query within the selected profile. Valid options are:
    - firewallpolicy : inbound/outbound behavior
    - logging : firewall logging settings
    - settings : firewall properties
    - state : firewalls state (on | off)
- **store** (*str*) -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
    - lgpo
    - local

  Default is `local`

Returns
A dictionary containing the properties for the specified profile

Return type
dict

Raises

- ***CommandExecutionError*** -- If an error occurs
- **ValueError** -- If the parameters are incorrect

CLI Example:

```
# Get the inbound/outbound firewall settings for connections on the
# local domain profile
salt * win_firewall.get_settings domain firewallpolicy

# Get the inbound/outbound firewall settings for connections on the
# domain profile as defined by local group policy
salt * win_firewall.get_settings domain firewallpolicy lgpo
```

salt.modules.win_firewall.**rule_exists**(*name*)

New in version 2016.11.6.

Checks if a firewall rule exists in the firewall policy

Parameters
name (*str*) -- The name of the rule

Returns
True if exists, otherwise False

Return type
bool

CLI Example:

```
# Is there a rule named RemoteDesktop
salt '*' firewall.rule_exists RemoteDesktop
```

salt.modules.win_firewall.**set_firewall_settings**(*profile, inbound=None, outbound=None, store='local'*)

Set the firewall inbound/outbound settings for the specified profile and store

New in version 2018.3.4.

New in version 2019.2.0.

Parameters

- **profile** (*str*) -- The firewall profile to query. Valid options are:
    - domain

  - public
  - private
- **`inbound`** (*str*) -- The inbound setting. If `None` is passed, the setting will remain unchanged. Valid values are:
  - blockinbound
  - blockinboundalways
  - allowinbound
  - notconfigured

  Default is `None`
- **`outbound`** (*str*) -- The outbound setting. If `None` is passed, the setting will remain unchanged. Valid values are:
  - allowoutbound
  - blockoutbound
  - notconfigured

  Default is `None`
- **`store`** (*str*) -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local

  Default is `local`

Returns

`True` if successful

Return type

bool

Raises

- ***`CommandExecutionError`*** -- If an error occurs
- **`ValueError`** -- If the parameters are incorrect

CLI Example:

```
# Set the inbound setting for the domain profile to block inbound
# connections
salt * firewall.set_firewall_settings domain='domain' inbound=
↪'blockinbound'

# Set the outbound setting for the domain profile to allow outbound
# connections
salt * firewall.set_firewall_settings domain='domain' outbound=
↪'allowoutbound'

# Set inbound/outbound settings for the domain profile in the group
# policy to block inbound and allow outbound
salt * firewall.set_firewall_settings domain='domain' inbound=
↪'blockinbound' outbound='allowoutbound' store='lgpo'
```

`salt.modules.win_firewall.`**`set_logging_settings`**(*profile, setting, value, store='local'*)

Configure logging settings for the Windows firewall.

New in version 2018.3.4.

New in version 2019.2.0.

Parameters

- **`profile`** (*str*) -- The firewall profile to configure. Valid options are:
  - domain
  - public
  - private

- **setting** (*str*) -- The logging setting to configure. Valid options are:
  - allowedconnections
  - droppedconnections
  - filename
  - maxfilesize
- **value** (*str*) -- The value to apply to the setting. Valid values are dependent upon the setting being configured. Valid options are:

  allowedconnections:
    - enable
    - disable
    - notconfigured

  droppedconnections:
    - enable
    - disable
    - notconfigured

  filename:
    - Full path and name of the firewall log file
    - notconfigured

  maxfilesize:
    - 1 - 32767
    - notconfigured

  Note: `notconfigured` can only be used when using the lgpo store

- **store** (*str*) -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local

  Default is `local`

Returns

`True` if successful

Return type

bool

Raises

- ***CommandExecutionError*** -- If an error occurs
- **ValueError** -- If the parameters are incorrect

CLI Example:

```
# Log allowed connections and set that in local group policy
salt * firewall.set_logging_settings domain allowedconnections enable lgpo

# Don't log dropped connections
salt * firewall.set_logging_settings profile=private␣
↪setting=droppedconnections value=disable

# Set the location of the log file
salt * firewall.set_logging_settings domain filename C:\windows\logs\
↪firewall.log

# You can also use environment variables
salt * firewall.set_logging_settings domain filename %systemroot%\
↪system32\LogFiles\Firewall\pfirewall.log
```

(continues on next page)

(continued from previous page)

```
# Set the max file size of the log to 2048 Kb
salt * firewall.set_logging_settings domain maxfilesize 2048
```

`salt.modules.win_firewall.`**`set_settings`**(*profile*, *setting*, *value*, *store='local'*)

Configure firewall settings.

New in version 2018.3.4.

New in version 2019.2.0.

Parameters

- **`profile`** (*`str`*) -- The firewall profile to configure. Valid options are:
  - domain
  - public
  - private
- **`setting`** (*`str`*) -- The firewall setting to configure. Valid options are:
  - localfirewallrules
  - localconsecrules
  - inboundusernotification
  - remotemanagement
  - unicastresponsetomulticast
- **`value`** (*`str`*) -- The value to apply to the setting. Valid options are
  - enable
  - disable
  - notconfigured

  Note: `notconfigured` can only be used when using the lgpo store

- **`store`** (*`str`*) -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local

  Default is `local`

Returns

`True` if successful

Return type

bool

Raises

- ***`CommandExecutionError`*** -- If an error occurs
- **`ValueError`** -- If the parameters are incorrect

CLI Example:

```
# Merge local rules with those distributed through group policy
salt * firewall.set_settings domain localfirewallrules enable

# Allow remote management of Windows Firewall
salt * firewall.set_settings domain remotemanagement enable
```

`salt.modules.win_firewall.`**`set_state`**(*profile*, *state*, *store='local'*)

Configure the firewall state.

New in version 2018.3.4.

New in version 2019.2.0.

Parameters

- **profile** (*str*) -- The firewall profile to configure. Valid options are:
  - domain
  - public
  - private
- **state** (*str*) -- The firewall state. Valid options are:
  - on
  - off
  - notconfigured

  Note: `notconfigured` can only be used when using the lgpo store

- **store** (*str*) -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local

  Default is `local`

Returns
True if successful

Return type
bool

Raises

- ***CommandExecutionError*** -- If an error occurs
- **ValueError** -- If the parameters are incorrect

CLI Example:

```
# Turn the firewall off when the domain profile is active
salt * firewall.set_state domain off

# Turn the firewall on when the public profile is active and set that in
# the local group policy
salt * firewall.set_state public on lgpo
```

26.6.232 salt.modules.win_groupadd

Manage groups on Windows

Important: If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to *'group.info' is not available*), see *here*.

`salt.modules.win_groupadd.`**`add`**`(`*name*, ***kwargs*`)`

Add the specified group

Parameters
name (*str*) -- The name of the group to add

Returns
`True` if successful, otherwise `False`

Return type
bool

CLI Example:

```
salt '*' group.add foo
```

`salt.modules.win_groupadd.`**`adduser`**`(`*name*, *username*, ***kwargs*`)`

Add a user to a group

Parameters

- **`name`** (*`str`*) -- The name of the group to modify
- **`username`** (*`str`*) -- The name of the user to add to the group

Returns

`True` if successful, otherwise `False`

Return type

bool

CLI Example:

```
salt '*' group.adduser foo username
```

`salt.modules.win_groupadd.`**`delete`**`(`*name*, ***kwargs*`)`

Remove the named group

Parameters

`name` (*`str`*) -- The name of the group to remove

Returns

`True` if successful, otherwise `False`

Return type

bool

CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.win_groupadd.`**`deluser`**`(`*name*, *username*, ***kwargs*`)`

Remove a user from a group

Parameters

- **`name`** (*`str`*) -- The name of the group to modify
- **`username`** (*`str`*) -- The name of the user to remove from the group

Returns

`True` if successful, otherwise `False`

Return type

bool

CLI Example:

```
salt '*' group.deluser foo username
```

`salt.modules.win_groupadd.`**`getent`**`(`*refresh=False*`)`

Return info on all groups

Parameters

`refresh` (*`bool`*) -- Refresh the info for all groups in `__context__`. If False only the groups in `__context__` will be returned. If True the `__context__` will be refreshed with current data and returned. Default is False

Returns

A list of groups and their information

CLI Example:

```
salt '*' group.getent
```

`salt.modules.win_groupadd.`**`info`**`(`*name*`)`

Return information about a group

Parameters

`name` (*`str`*) -- The name of the group for which to get information

Returns
A dictionary of information about the group

Return type
dict

CLI Example:

```
salt '*' group.info foo
```

`salt.modules.win_groupadd.`**`list_groups`**`(`*refresh=False*`)`

Return a list of groups

Parameters
`refresh` (*`bool`*) -- Refresh the info for all groups in `__context__`. If False only the groups in `__context__` will be returned. If True, the `__context__` will be refreshed with current data and returned. Default is False

Returns
A list of groups on the machine

Return type
list

CLI Example:

```
salt '*' group.list_groups
```

`salt.modules.win_groupadd.`**`members`**`(`*name*, *members_list*, ***kwargs*`)`

Ensure a group contains only the members in the list

Parameters

- **`name`** (*`str`*) -- The name of the group to modify
- **`members_list`** (*`str`*) -- A single user or a comma separated list of users. The group will contain only the users specified in this list.

Returns
`True` if successful, otherwise `False`

Return type
bool

CLI Example:

```
salt '*' group.members foo 'user1,user2,user3'
```

26.6.233 salt.modules.win_iis

Microsoft IIS site management via WebAdministration powershell module

maintainer
Shane Lee <slee@saltstack.com>, Robert Booth <rbooth@saltstack.com>

platform
Windows

depends
PowerShell

depends
WebAdministration module (PowerShell) (IIS)

New in version 2016.3.0.

`salt.modules.win_iis.`**`create_app`**(*name*, *site*, *sourcepath*, *apppool=None*)

Create an IIS application.

Note: This function only validates against the application name, and will return True even if the application already exists with a different configuration. It will not modify the configuration of an existing application.

Parameters
- **`name`** (*`str`*) -- The IIS application.
- **`site`** (*`str`*) -- The IIS site name.
- **`sourcepath`** (*`str`*) -- The physical path.
- **`apppool`** (*`str`*) -- The name of the IIS application pool.

Returns
True if successful, otherwise False

Return type
bool

CLI Example:

```
salt '*' win_iis.create_app name='app0' site='site0' sourcepath='C:\site0
↪' apppool='site0'
```

`salt.modules.win_iis.`**`create_apppool`**(*name*)

Create an IIS application pool.

Note: This function only validates against the application pool name, and will return True even if the application pool already exists with a different configuration. It will not modify the configuration of an existing application pool.

Parameters
`name` (*`str`*) -- The name of the IIS application pool.

Returns
True if successful, otherwise False

Return type
bool

CLI Example:

```
salt '*' win_iis.create_apppool name='MyTestPool'
```

`salt.modules.win_iis.`**`create_backup`**(*name*)

Backup an IIS Configuration on the System.

New in version 2017.7.0.

Note: Backups are stored in the `$env:Windir\System32\inetsrv\backup` folder.

Parameters
`name` (*`str`*) -- The name to give the backup

Returns
True if successful, otherwise False

Return type
bool

CLI Example:

```
salt '*' win_iis.create_backup good_config_20170209
```

`salt.modules.win_iis.`**`create_binding`**(*site, hostheader='', ipaddress='*', port=80, protocol='http', sslflags=None*)

Create an IIS Web Binding.

Note: This function only validates against the binding ipaddress:port:hostheader combination, and will return True even if the binding already exists with a different configuration. It will not modify the configuration of an existing binding.

Parameters

- **`site`** (*str*) -- The IIS site name.
- **`hostheader`** (*str*) -- The host header of the binding. Usually a hostname.
- **`ipaddress`** (*str*) -- The IP address of the binding.
- **`port`** (*int*) -- The TCP port of the binding.
- **`protocol`** (*str*) -- The application protocol of the binding.
- **`sslflags`** (*str*) -- The flags representing certificate type and storage of the binding.

Returns

True if successful, otherwise False

Return type

bool

CLI Example:

```
salt '*' win_iis.create_binding site='site0' hostheader='example.com'
↪ipaddress='*' port='80'
```

`salt.modules.win_iis.`**`create_cert_binding`**(*name, site, hostheader='', ipaddress='*', port=443, sslflags=0*)

Assign a certificate to an IIS Web Binding.

New in version 2016.11.0.

Note: The web binding that the certificate is being assigned to must already exist.

Parameters

- **`name`** (*str*) -- The thumbprint of the certificate.
- **`site`** (*str*) -- The IIS site name.
- **`hostheader`** (*str*) -- The host header of the binding.
- **`ipaddress`** (*str*) -- The IP address of the binding.
- **`port`** (*int*) -- The TCP port of the binding.
- **`sslflags`** (*int*) -- Flags representing certificate type and certificate storage of the binding.

Returns

True if successful, otherwise False

Return type

bool

CLI Example:

```
salt '*' win_iis.create_cert_binding name='AAA000' site='site0'␣
↪hostheader='example.com' ipaddress='*' port='443'
```

`salt.modules.win_iis.`**`create_site`**(*name*, *sourcepath*, *apppool=''*, *hostheader=''*, *ipaddress='*'*, *port=80*, *protocol='http'*)

Create a basic website in IIS.

Note: This function only validates against the site name, and will return True even if the site already exists with a different configuration. It will not modify the configuration of an existing site.

Parameters

- **`name`** (*`str`*) -- The IIS site name.
- **`sourcepath`** (*`str`*) -- The physical path of the IIS site.
- **`apppool`** (*`str`*) -- The name of the IIS application pool.
- **`hostheader`** (*`str`*) -- The host header of the binding. Usually the hostname or website name, ie: www.contoso.com
- **`ipaddress`** (*`str`*) -- The IP address of the binding.
- **`port`** (*`int`*) -- The TCP port of the binding.
- **`protocol`** (*`str`*) -- The application protocol of the binding. (http, https, etc.)

Returns

True if successful, otherwise False.

Return type

bool

Note: If an application pool is specified, and that application pool does not already exist, it will be created.

CLI Example:

```
salt '*' win_iis.create_site name='My Test Site' sourcepath='c:\stage'␣
↪apppool='TestPool'
```

`salt.modules.win_iis.`**`create_vdir`**(*name*, *site*, *sourcepath*, *app='/'*)

Create an IIS virtual directory.

Note: This function only validates against the virtual directory name, and will return True even if the virtual directory already exists with a different configuration. It will not modify the configuration of an existing virtual directory.

Parameters

- **`name`** (*`str`*) -- The virtual directory name.
- **`site`** (*`str`*) -- The IIS site name.
- **`sourcepath`** (*`str`*) -- The physical path.
- **`app`** (*`str`*) -- The IIS application.

Returns

True if successful, otherwise False

Return type

bool

CLI Example:

```
salt '*' win_iis.create_vdir name='vd0' site='site0' sourcepath='C:\
↪inetpub\vdirs\vd0'
```

salt.modules.win_iis.**get_container_setting**(*name*, *container*, *settings*)

Get the value of the setting for the IIS container.

New in version 2016.11.0.

Parameters

- **name** (*str*) -- The name of the IIS container.
- **container** (*str*) -- The type of IIS container. The container types are: AppPools, Sites, SslBindings
- **settings** (*dict*) -- A dictionary of the setting names and their values.

Returns

A dictionary of the provided settings and their values.

Return type

dict

CLI Example:

```
salt '*' win_iis.get_container_setting name='MyTestPool' container=
↪'AppPools'
    settings="['processModel.identityType']"
```

salt.modules.win_iis.**get_webapp_settings**(*name*, *site*, *settings*)

New in version 2017.7.0.

Get the value of the setting for the IIS web application.

Note: Params are case sensitive

Parameters

- **name** (*str*) -- The name of the IIS web application.
- **site** (*str*) -- The site name contains the web application. Example: Default Web Site
- **settings** (*str*) -- A dictionary of the setting names and their values. Available settings: physicalPath, applicationPool, userName, password

Returns

A dictionary of the provided settings and their values.

Return type

dict

CLI Example:

```
salt '*' win_iis.get_webapp_settings name='app0' site='Default Web Site'
    settings="['physicalPath','applicationPool']"
```

salt.modules.win_iis.**get_webconfiguration_settings**(*name*, *settings*)

Get the webconfiguration settings for the IIS PSPath.

Parameters

- **name** (*str*) -- The PSPath of the IIS webconfiguration settings.
- **settings** (*list*) -- A list of dictionaries containing setting name and filter.

Returns

A list of dictionaries containing setting name, filter and value.

Return type

dict

CLI Example:

```
salt '*' win_iis.get_webconfiguration_settings name='IIS:\' settings="[{
↪'name': 'enabled', 'filter': 'system.webServer/security/authentication/
↪anonymousAuthentication'}]"
```

`salt.modules.win_iis.`**`list_apppools`**`()`

List all configured IIS application pools.

Returns

A dictionary of IIS application pools and their details.

Return type

dict

CLI Example:

```
salt '*' win_iis.list_apppools
```

`salt.modules.win_iis.`**`list_apps`**`(`*site*`)`

Get all configured IIS applications for the specified site.

Parameters

`site` (*`str`*) -- The IIS site name.

Returns: A dictionary of the application names and properties.

CLI Example:

```
salt '*' win_iis.list_apps site
```

`salt.modules.win_iis.`**`list_backups`**`()`

List the IIS Configuration Backups on the System.

New in version 2017.7.0.

Note: Backups are made when a configuration is edited. Manual backups are stored in the `$env:Windir\System32\inetsrv\backup` folder.

Returns

A dictionary of IIS Configurations backed up on the system.

Return type

dict

CLI Example:

```
salt '*' win_iis.list_backups
```

`salt.modules.win_iis.`**`list_bindings`**`(`*site*`)`

Get all configured IIS bindings for the specified site.

Parameters

`site` (*`str`*) -- The name if the IIS Site

Returns

A dictionary of the binding names and properties.

Return type

dict

CLI Example:

```
salt '*' win_iis.list_bindings site
```

`salt.modules.win_iis.`**`list_cert_bindings`**`(`*site*`)`

List certificate bindings for an IIS site.

New in version 2016.11.0.

Parameters
site (*str*) -- The IIS site name.

Returns
A dictionary of the binding names and properties.

Return type
dict

CLI Example:

```
salt '*' win_iis.list_bindings site
```

`salt.modules.win_iis.`**`list_sites`**`()`

List all the currently deployed websites.

Returns
A dictionary of the IIS sites and their properties.

Return type
dict

CLI Example:

```
salt '*' win_iis.list_sites
```

`salt.modules.win_iis.`**`list_vdirs`**`(`*site*, *app='/'*`)`

Get all configured IIS virtual directories for the specified site, or for the combination of site and application.

Parameters
- **site** (*str*) -- The IIS site name.
- **app** (*str*) -- The IIS application.

Returns
A dictionary of the virtual directory names and properties.

Return type
dict

CLI Example:

```
salt '*' win_iis.list_vdirs site
```

`salt.modules.win_iis.`**`list_worker_processes`**`(`*apppool*`)`

Returns a list of worker processes that correspond to the passed application pool.

New in version 2017.7.0.

Parameters
apppool (*str*) -- The application pool to query

Returns
A dictionary of worker processes with their process IDs

Return type
dict

CLI Example:

```
salt '*' win_iis.list_worker_processes 'My App Pool'
```

`salt.modules.win_iis.`**`modify_binding`**`(`*site*, *binding*, *hostheader=None*, *ipaddress=None*, *port=None*, *sslflags=None*`)`

Modify an IIS Web Binding. Use `site` and `binding` to target the binding.

New in version 2017.7.0.

Parameters

- **site** (*str*) -- The IIS site name.
- **binding** (*str*) -- The binding to edit. This is a combination of the IP address, port, and hostheader. It is in the following format: ipaddress:port:hostheader. For example, `*:80:` or `*:80:salt.com`
- **hostheader** (*str*) -- The host header of the binding. Usually the hostname.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*int*) -- The TCP port of the binding.
- **sslflags** (*str*) -- The flags representing certificate type and storage of the binding.

Returns

True if successful, otherwise False

Return type

bool

CLI Example:

The following will seat the host header of binding `*:80:` for `site0` to `example.com`

```
salt '*' win_iis.modify_binding site='site0' binding='*:80:' hostheader=
↪'example.com'
```

`salt.modules.win_iis.`**`modify_site`**(*name*, *sourcepath=None*, *apppool=None*)

Modify a basic website in IIS.

New in version 2017.7.0.

Parameters

- **name** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path of the IIS site.
- **apppool** (*str*) -- The name of the IIS application pool.

Returns

True if successful, otherwise False.

Return type

bool

Note: If an application pool is specified, and that application pool does not already exist, it will be created.

CLI Example:

```
salt '*' win_iis.modify_site name='My Test Site' sourcepath='c:\new_path'
↪apppool='NewTestPool'
```

`salt.modules.win_iis.`**`remove_app`**(*name*, *site*)

Remove an IIS application.

Parameters

- **name** (*str*) -- The application name.
- **site** (*str*) -- The IIS site name.

Returns

True if successful, otherwise False

Return type

bool

CLI Example:

```
salt '*' win_iis.remove_app name='app0' site='site0'
```

`salt.modules.win_iis.`**`remove_apppool`**(*name*)

Remove an IIS application pool.

Parameters

name (*str*) -- The name of the IIS application pool.

Returns

True if successful, otherwise False

Return type

bool

CLI Example:

```
salt '*' win_iis.remove_apppool name='MyTestPool'
```

`salt.modules.win_iis.`**`remove_backup`**(*name*)

Remove an IIS Configuration backup from the System.

New in version 2017.7.0.

Parameters

name (*str*) -- The name of the backup to remove

Returns

True if successful, otherwise False

Return type

bool

CLI Example:

```
salt '*' win_iis.remove_backup backup_20170209
```

`salt.modules.win_iis.`**`remove_binding`**(*site, hostheader='', ipaddress='*', port=80*)

Remove an IIS binding.

Parameters

- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*int*) -- The TCP port of the binding.

Returns

True if successful, otherwise False

Return type

bool

CLI Example:

```
salt '*' win_iis.remove_binding site='site0' hostheader='example.com'
↪ipaddress='*' port='80'
```

`salt.modules.win_iis.`**`remove_cert_binding`**(*name, site, hostheader='', ipaddress='*', port=443*)

Remove a certificate from an IIS Web Binding.

New in version 2016.11.0.

Note: This function only removes the certificate from the web binding. It does not remove the web binding itself.

Parameters

- **name** (*str*) -- The thumbprint of the certificate.
- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*int*) -- The TCP port of the binding.

Returns
True if successful, otherwise False

Return type
bool

CLI Example:

```
salt '*' win_iis.remove_cert_binding name='AAA000' site='site0'
↪hostheader='example.com' ipaddress='*' port='443'
```

salt.modules.win_iis.**remove_site**(*name*)

Delete a website from IIS.

Parameters
name (*str*) -- The IIS site name.

Returns
True if successful, otherwise False

Return type
bool

Note: This will not remove the application pool used by the site.

CLI Example:

```
salt '*' win_iis.remove_site name='My Test Site'
```

salt.modules.win_iis.**remove_vdir**(*name*, *site*, *app='/'*)

Remove an IIS virtual directory.

Parameters

- **name** (*str*) -- The virtual directory name.
- **site** (*str*) -- The IIS site name.
- **app** (*str*) -- The IIS application.

Returns
True if successful, otherwise False

Return type
bool

CLI Example:

```
salt '*' win_iis.remove_vdir name='vdir0' site='site0'
```

salt.modules.win_iis.**restart_apppool**(*name*)

Restart an IIS application pool.

New in version 2016.11.0.

Parameters
name (*str*) -- The name of the IIS application pool.

Returns
True if successful, otherwise False

Return type
bool

CLI Example:

```
salt '*' win_iis.restart_apppool name='MyTestPool'
```

`salt.modules.win_iis.`**`restart_site`**(*name*)

Restart a Web Site in IIS.

New in version 2017.7.0.

Parameters

name (*str*) -- The name of the website to restart.

Returns

True if successful, otherwise False

Return type

bool

CLI Example:

```
salt '*' win_iis.restart_site name='My Test Site'
```

`salt.modules.win_iis.`**`set_container_setting`**(*name*, *container*, *settings*)

Set the value of the setting for an IIS container.

New in version 2016.11.0.

Parameters

- **name** (*str*) -- The name of the IIS container.
- **container** (*str*) -- The type of IIS container. The container types are: AppPools, Sites, SslBindings
- **settings** (*dict*) -- A dictionary of the setting names and their values.

Returns

True if successful, otherwise False

Return type

bool

CLI Example:

```
salt '*' win_iis.set_container_setting name='MyTestPool' container=
↪'AppPools'
    settings="{'managedPipeLineMode': 'Integrated'}"
```

`salt.modules.win_iis.`**`set_webapp_settings`**(*name*, *site*, *settings*)

New in version 2017.7.0.

Configure an IIS application.

Note: This function only configures an existing app. Params are case sensitive.

Parameters

- **name** (*str*) -- The IIS application.
- **site** (*str*) -- The IIS site name.
- **settings** (*str*) -- A dictionary of the setting names and their values. - physicalPath: The physical path of the webapp. - applicationPool: The application pool for the webapp. - userName: "connectAs" user - password: "connectAs" password for user

Returns

A boolean representing whether all changes succeeded.

Return type

bool

CLI Example:

```
salt '*' win_iis.set_webapp_settings name='app0' site='site0' settings="{
↪'physicalPath': 'C:\site0', 'apppool': 'site0'}"
```

salt.modules.win_iis.**set_webconfiguration_settings**(*name*, *settings*)

Set the value of the setting for an IIS container.

Parameters

- **name** (*str*) -- The PSPath of the IIS webconfiguration settings.
- **settings** (*list*) -- A list of dictionaries containing setting name, filter and value.

Returns

True if successful, otherwise False

Return type

bool

CLI Example:

```
salt '*' win_iis.set_webconfiguration_settings name='IIS:\' settings="[{
↪'name': 'enabled', 'filter': 'system.webServer/security/authentication/
↪anonymousAuthentication', 'value': False}]"
```

salt.modules.win_iis.**start_apppool**(*name*)

Start an IIS application pool.

New in version 2017.7.0.

Parameters

name (*str*) -- The name of the App Pool to start.

Returns

True if successful, otherwise False

Return type

bool

CLI Example:

```
salt '*' win_iis.start_apppool name='MyTestPool'
```

salt.modules.win_iis.**start_site**(*name*)

Start a Web Site in IIS.

New in version 2017.7.0.

Parameters

name (*str*) -- The name of the website to start.

Returns

True if successful, otherwise False

Return type

bool

CLI Example:

```
salt '*' win_iis.start_site name='My Test Site'
```

salt.modules.win_iis.**stop_apppool**(*name*)

Stop an IIS application pool.

New in version 2017.7.0.

Parameters

name (*str*) -- The name of the App Pool to stop.

Returns

True if successful, otherwise False

Return type
bool

CLI Example:

```
salt '*' win_iis.stop_apppool name='MyTestPool'
```

`salt.modules.win_iis.`**`stop_site`**`(`*name*`)`

Stop a Web Site in IIS.

New in version 2017.7.0.

Parameters
name (*str*) -- The name of the website to stop.

Returns
True if successful, otherwise False

Return type
bool

CLI Example:

```
salt '*' win_iis.stop_site name='My Test Site'
```

26.6.234 salt.modules.win_ip

The networking module for Windows based systems

`salt.modules.win_ip.`**`disable`**`(`*iface*`)`

Disable an interface

CLI Example:

```
salt -G 'os_family:Windows' ip.disable 'Local Area Connection #2'
```

`salt.modules.win_ip.`**`enable`**`(`*iface*`)`

Enable an interface

CLI Example:

```
salt -G 'os_family:Windows' ip.enable 'Local Area Connection #2'
```

`salt.modules.win_ip.`**`get_all_interfaces`**`()`

Return configs for all interfaces

CLI Example:

```
salt -G 'os_family:Windows' ip.get_all_interfaces
```

`salt.modules.win_ip.`**`get_default_gateway`**`()`

Set DNS source to DHCP on Windows

CLI Example:

```
salt -G 'os_family:Windows' ip.get_default_gateway
```

`salt.modules.win_ip.`**`get_interface`**`(`*iface*`)`

Return the configuration of a network interface

CLI Example:

```
salt -G 'os_family:Windows' ip.get_interface 'Local Area Connection'
```

`salt.modules.win_ip.`**`get_subnet_length`**`(`*mask*`)`

Convenience function to convert the netmask to the CIDR subnet length

CLI Example:

```
salt -G 'os_family:Windows' ip.get_subnet_length 255.255.255.0
```

`salt.modules.win_ip.`**`is_disabled`**`(`*iface*`)`

Returns `True` if interface is disabled, otherwise `False`

CLI Example:

```
salt -G 'os_family:Windows' ip.is_disabled 'Local Area Connection #2'
```

`salt.modules.win_ip.`**`is_enabled`**`(`*iface*`)`

Returns `True` if interface is enabled, otherwise `False`

CLI Example:

```
salt -G 'os_family:Windows' ip.is_enabled 'Local Area Connection #2'
```

`salt.modules.win_ip.`**`raw_interface_configs`**`()`

Return raw configs for all interfaces

CLI Example:

```
salt -G 'os_family:Windows' ip.raw_interface_configs
```

`salt.modules.win_ip.`**`set_dhcp_all`**`(`*iface*`)`

Set both IP Address and DNS to DHCP

CLI Example:

```
salt -G 'os_family:Windows' ip.set_dhcp_all 'Local Area Connection'
```

`salt.modules.win_ip.`**`set_dhcp_dns`**`(`*iface*`)`

Set DNS source to DHCP on Windows

CLI Example:

```
salt -G 'os_family:Windows' ip.set_dhcp_dns 'Local Area Connection'
```

`salt.modules.win_ip.`**`set_dhcp_ip`**`(`*iface*`)`

Set Windows NIC to get IP from DHCP

CLI Example:

```
salt -G 'os_family:Windows' ip.set_dhcp_ip 'Local Area Connection'
```

`salt.modules.win_ip.`**`set_static_dns`**`(`*iface, *addrs*`)`

Set static DNS configuration on a Windows NIC

Parameters

- **`iface`** (*`str`*) -- The name of the interface to set
- **`addrs`** -- One or more DNS servers to be added. To clear the list of DNS servers pass an empty list (`[]`). If undefined or `None` no changes will be made.

Returns
A dictionary containing the new DNS settings

Return type
dict

CLI Example:

```
salt -G 'os_family:Windows' ip.set_static_dns 'Local Area Connection'
↪'192.168.1.1'
salt -G 'os_family:Windows' ip.set_static_dns 'Local Area Connection'
↪'192.168.1.252' '192.168.1.253'
```

`salt.modules.win_ip.`**`set_static_ip`**(*iface*, *addr*, *gateway=None*, *append=False*)

Set static IP configuration on a Windows NIC

iface
The name of the interface to manage

addr
IP address with subnet length (ex. `10.1.2.3/24`). The *`ip.get_subnet_length`* function can be used to calculate the subnet length from a netmask.

gateway
[None] If specified, the default gateway will be set to this value.

append
[False] If `True`, this IP address will be added to the interface. Default is `False`, which overrides any existing configuration for the interface and sets `addr` as the only address on the interface.

CLI Example:

```
salt -G 'os_family:Windows' ip.set_static_ip 'Local Area Connection' 10.1.
↪2.3/24 gateway=10.1.2.1
salt -G 'os_family:Windows' ip.set_static_ip 'Local Area Connection' 10.1.
↪2.4/24 append=True
```

26.6.235 salt.modules.win_lgpo

Manage Local Policy on Windows

This module allows configuring local group policy (i.e. `gpedit.msc`) on a Windows machine.

New in version 2016.11.0.

Warning: Local Group Policy will always be superseded by Domain Group policy. If policies are configured with Local Group Policy that are also configured with Domain Group policy, the Domain Group policy will take precedence.

Administrative Templates

Administrative template policies are dynamically read from ADMX/ADML files on the server.

Windows Settings

Policies contained in the ”Windows Settings” section of the `gpedit.msc` GUI are statically defined in this module. Each policy is configured for the section (Machine/User) in the module's _policy_info class. The `_policy_info` class contains a ”policies” dict on how the module will configure the policy, where the policy resides in the GUI (for display purposes), data validation data, data transformation data, etc.

Current known limitations

- At this time, start/shutdown scripts policies are displayed, but are not configurable.
- Not all ”Security Settings” policies exist in the _policy_info class

  depends

  - pywin32 Python module
  - lxml
  - uuid
  - struct
  - salt.utils.win_reg

`salt.modules.win_lgpo.`**`clear_policy_cache`**`()`

Clears the policy definitions and resource stored in `__context__`. They will be rebuilt the next time a policy is applied.

CLI Example:

```
salt '*' lgpo.clear_policy_cache
```

`salt.modules.win_lgpo.`**`get`**`(`*policy_class=None*, *return_full_policy_names=True*, *hierarchical_return=False*, *adml_language='en-US'*, *return_not_configured=False*`)`

Get a policy value

Parameters

- **`policy_class`** (*`str`*) -- Some policies are both user and computer, by default all policies will be pulled, but this can be used to retrieve only a specific policy class User/USER/user = retrieve user policies Machine/MACHINE/machine/Computer/COMPUTER/computer = retrieve machine/computer policies
- **`return_full_policy_names`** (*`bool`*) -- True/False to return the policy name as it is seen in the `gpedit.msc` GUI or to only return the policy key/id.
- **`hierarchical_return`** (*`bool`*) -- True/False to return the policy data in the hierarchy as seen in the `gpedit.msc` GUI. The default of False will return data split only into User/Computer configuration sections
- **`adml_language`** (*`str`*) -- The ADML language to use for processing display/descriptive names and enumeration values of ADMX template data, defaults to en-US
- **`return_not_configured`** (*`bool`*) -- Include Administrative Template policies that are 'Not Configured' in the return data

Returns

A dictionary containing the policy values for the specified class

Return type

dict

CLI Example:

```
salt '*' lgpo.get machine return_full_policy_names=True
```

salt.modules.win_lgpo.**get_policy**(*policy_name, policy_class, adml_language='en-US', return_value_only=True, return_full_policy_names=True, hierarchical_return=False*)

Get the current settings for a single policy on the machine

Parameters

- **`policy_name`** (*str*) -- The name of the policy to retrieve. Can be the any of the names or alieses returned by `lgpo.get_policy_info`
- **`policy_class`** (*str*) -- The policy class. Must be one of `machine` or `user`
- **`adml_language`** (*str*) -- The language code for the adml file to use for localization. The default is `en-US`
- **`return_value_only`** (*bool*) -- `True` will return only the value for the policy, without the name of the policy. `return_full_policy_names` and `hierarchical_return` will be ignored. Default is `True`
- **`return_full_policy_names`** (*bool*) -- Returns the full policy name regardless of what was passed in `policy_name`

Note: This setting applies to sub-elements of the policy if they exist. The value passed in `policy_name` will always be used as the policy name when this setting is `False`

- **`hierarchical_return`** (*bool*) -- Returns a hierarchical view of the policy showing its parents

Returns

A dictionary containing the policy settings

Return type

dict

CLI Example:

```
# Using the policy id
salt * lgpo.get_policy LockoutDuration machine
salt * lgpo.get_policy AutoUpdateCfg machine

# Using the full name
salt * lgpo.get_policy "Account lockout duration" machine
salt * lgpo.get_policy "Configure Automatic Updates" machine

# Using full path and name
salt * lgpo.get_policy "Windows Components\Windows Update\Configure
↪Automatic Updates" machine
```

salt.modules.win_lgpo.**get_policy_info**(*policy_name, policy_class, adml_language='en-US'*)

Returns information about a specified policy

Parameters

- **`policy_name`** (*str*) -- The name of the policy to lookup
- **`policy_class`** (*str*) -- The class of policy, i.e. machine, user, both
- **`adml_language`** (*str*) -- The ADML language to use for Administrative Template data lookup

Returns

Information about the specified policy

Return type

dict

CLI Example:

```
salt '*' lgpo.get_policy_info 'Maximum password age' machine
```

You can use `lgpo.get_policy_info` to get all the possible names that could be used in a state file or from the command line (along with elements that need to be set/etc). The key is to match the text you see in the `gpedit.msc` gui exactly, including quotes around words or phrases. The "full path" style is really only needed when there are multiple policies that use the same base name. For example, `Access data sources across domains` exists in ~10 different paths. If you put that through `get_policy_info` you'll get back a message that it is used for multiple policies and you need to be more specific.

CLI Example:

```
salt-call --local lgpo.get_policy_info ShellRemoveOrderPrints_2 machine

local:
    ----------
    message:
    policy_aliases:
        - Turn off the "Order Prints" picture task
        - ShellRemoveOrderPrints_2
        - System\Internet Communication Management\Internet Communication
 ↪settings\Turn off the "Order Prints" picture task
    policy_class:
        machine
    policy_elements:
    policy_found:
        True
    policy_name:
        ShellRemoveOrderPrints_2
    rights_assignment:
        False
```

Escaping can get tricky in cmd/Powershell. The following is an example of escaping in Powershell using backquotes:

```
PS>salt-call --local lgpo.get_policy_info "Turn off the `\`"Order Prints`\
 ↪`" picture task" machine

local:
    ----------
    message:
    policy_aliases:
        - Turn off the "Order Prints" picture task
        - ShellRemoveOrderPrints_2
        - System\Internet Communication Management\Internet Communication
 ↪settings\Turn off the "Order Prints" picture task
    policy_class:
        machine
    policy_elements:
    policy_found:
        True
    policy_name:
        Turn off the "Order Prints" picture task
    rights_assignment:
        False
```

This function can then be used to get the options available for specifying Group Policy Objects to be used in state files. Based on the above any of these *should* be usable:

```
internet_communications_settings:
  lgpo.set:
    - computer_policy:
        Turn off the "Order Prints" picture task: Enabled
```

```
internet_communications_settings:
  lgpo.set:
    - computer_policy:
        ShellRemoveOrderPrints_2: Enabled
```

When using the full path, it might be a good idea to use single quotes around the path:

```
internet_communications_settings:
  lgpo.set:
    - computer_policy:
        'System\Internet Communication Management\Internet Communication
↪settings\Turn off the "Order Prints" picture task': 'Enabled'
```

If you struggle to find the policy from `get_policy_info` using the name as you see in `gpedit.msc`, the names such as "ShellRemoveOrderPrints_2" come from the `.admx` files. If you know nothing about `.admx/ .adml` relationships (ADML holds what you see in the GUI, ADMX holds the more technical details), then this may be a little bit too much info, but here is an example with the above policy using Powershell:

```
PS>Get-ChildItem -Path C:\Windows\PolicyDefinitions -Recurse -Filter *.
↪adml | Select-String "Order Prints"

C:\windows\PolicyDefinitions\en-US\ICM.adml:152:      <string id=
↪"ShellRemoveOrderPrints">Turn off the "Order Prints" picture task</
↪string>
C:\windows\PolicyDefinitions\en-US\ICM.adml:153:      <string id=
↪"ShellRemoveOrderPrints_Help">This policy setting specifies whether the
↪"Order Prints Online" task is available from Picture Tasks in Windows
↪folders.
C:\windows\PolicyDefinitions\en-US\ICM.adml:155:The Order Prints Online
↪Wizard is used to download a list of providers and allow users to order
↪prints online.
C:\windows\PolicyDefinitions\en-US\ICM.adml:157:If you enable this policy
↪setting, the task "Order Prints Online" is removed from Picture Tasks
↪in File Explorer folders.
```

From this grep, we can see id "ShellRemoveOrderPrints" is the ID of the string used to describe this policy, then we search for it in the ADMX:

```
PS>Get-ChildItem -Path C:\Windows\PolicyDefinitions -Recurse -Filter *.
↪admx | Select-String "ShellRemoveOrderPrints"

C:\windows\PolicyDefinitions\ICM.admx:661:    <policy name=
↪"ShellRemoveOrderPrints_1" class="User" displayName="$(string.
↪ShellRemoveOrderPrints)" explainText="$(string.ShellRemoveOrderPrints_
↪Help)" key="Software\Microsoft\Windows\CurrentVersion\Policies\Explorer
↪" valueName="NoOnlinePrintsWizard">
```

(continues on next page)

(continued from previous page)

```
C:\windows\PolicyDefinitions\ICM.admx:671:    <policy name=
↪"ShellRemoveOrderPrints_2" class="Machine" displayName="$(string.
↪ShellRemoveOrderPrints)" explainText="$(string.ShellRemoveOrderPrints_
↪Help)" key="Software\Microsoft\Windows\CurrentVersion\Policies\Explorer
↪" valueName="NoOnlinePrintsWizard">
```

Now we have two to pick from. And if you notice the `class="Machine"` and `class="User"` (which details if it is a computer policy or user policy respectively) the `ShellRemoveOrderPrints_2` is the ”short name” we could use to pass through `get_policy_info` to see what the module itself is expecting.

`salt.modules.win_lgpo.`**`set_`**`(`*computer_policy=None*, *user_policy=None*, *cumulative_rights_assignments=True*, *adml_language='en-US'*`)`

Set a local server policy.

Parameters

- **`computer_policy`** (*`dict`*) -- A dictionary of ”policyname: value” pairs of computer policies to set. 'value' should be how it is displayed in the gpedit GUI, i.e. if a setting can be 'Enabled'/'Disabled', then that should be passed

  Administrative Template data may require dicts within dicts, to specify each element of the Administrative Template policy. Administrative Templates policies are always cumulative.

  Policy names can be specified in a number of ways based on the type of policy:

  Windows Settings Policies:

  These policies can be specified using the GUI display name or the key name from the _policy_info class in this module. The GUI display name is also contained in the _policy_info class in this module.

  Administrative Template Policies:

  These can be specified using the policy name as displayed in the GUI (case sensitive). Some policies have the same name, but a different location (for example, ”Access data sources across domains”). These can be differentiated by the ”path” in the GUI (for example, ”Windows ComponentsInternet ExplorerInternet Control PanelSecurity PageInternet ZoneAccess data sources across domains”).

  Additionally, policies can be specified using the ”name” and ”id” attributes from the ADMX files.

  For Administrative Templates that have policy elements, each element can be specified using the text string as seen in the GUI or using the ID attribute from the ADMX file. Due to the way some of the GUI text is laid out, some policy element names could include descriptive text that appears lbefore the policy element in the GUI.

  Use the get_policy_info function for the policy name to view the element ID/names that the module will accept.
- **`user_policy`** (*`dict`*) -- The same setup as the computer_policy, except with data to configure the local user policy.
- **`cumulative_rights_assignments`** (*`bool`*) -- Determine how user rights assignment policies are configured.

  If True, user right assignment specifications are simply added to the existing policy

If False, only the users specified will get the right (any existing will have the right revoked)
- **adml_language** (*str*) -- The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US' (U.S. English).

Returns
True is successful, otherwise False

Return type
bool

CLI Example:

```
salt '*' lgpo.set computer_policy="{'LockoutDuration': 2,
↪'RestrictAnonymous': 'Enabled', 'AuditProcessTracking': 'Succes, Failure
↪'}"
```

`salt.modules.win_lgpo.`**`set_computer_policy`**(*name, setting, cumulative_rights_assignments=True, adml_language='en-US'*)

Set a single computer policy

Parameters
- **name** (*str*) -- The name of the policy to configure
- **setting** (*str*) -- The setting to configure the named policy with
- **cumulative_rights_assignments** (*bool*) -- Determine how user rights assignment policies are configured. If True, user right assignment specifications are simply added to the existing policy. If False, only the users specified will get the right (any existing will have the right revoked)
- **adml_language** (*str*) -- The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US' (U.S. English).

Returns
True if successful, otherwise False

Return type
bool

CLI Example:

```
salt '*' lgpo.set_computer_policy LockoutDuration 1440
```

`salt.modules.win_lgpo.`**`set_user_policy`**(*name, setting, adml_language='en-US'*)

Set a single user policy

Parameters
- **name** (*str*) -- The name of the policy to configure
- **setting** (*str*) -- The setting to configure the named policy with
- **adml_language** (*str*) -- The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US' (U.S. English).

Returns
True if successful, Otherwise False

Return type
bool

CLI Example:

```
salt '*' lgpo.set_user_policy "Control Panel\Display\Disable the Display␣
↪Control Panel" Enabled
```

26.6.236 salt.modules.win_lgpo_reg

LGPO - Registry.pol

New in version 3006.0.

A module for working with registry based policies in Windows Local Group Policy (LGPO). This module contains functions for working with the `Registry.pol` file. The `Registry.pol` file is the source of truth for registry settings and LGPO.

Group Policy is refreshed every 90 seconds by default. During that refresh the contents of the `Registry.pol` file are applied to the Registry. If the setting is changed outside of Group Policy to something other than what is contained in the `Registry.pol` file, it will be changed back during the next refresh.

In the Group Policy Editor (`gpedit.msc`) these policies can be set to three states:

- Not Configured
- Enabled
- Disabled

A policy that is "Not Configured" does not have an entry in the `Registry.pol` file. A Group Policy refresh will not make any changes to key/value pairs in the registry that are not specified in the `Registry.pol` file.

An "Enabled" policy will have an entry in the `Registry.pol` files that contains its key path, value name, value type, value size, and value data. When Group Policy is refreshed, existing values will be overwritten with those contained in the `Registry.pol` file.

A "Disabled" policy will have an entry in the `Registry.pol` file with the key path and the value name, but the value name will be prepended with `**del.`. When Group Policy is refreshed the key/value will be deleted from the registry. If the key contains no values, it will also be deleted.

Working with LGPO Reg

The easiest way to figure out the values needed for this module is to set the policy using the Group Policy Editor (`gpedit.msc`) and then run the `lgpo_reg.read_reg_pol` function. This function will display a dictionary of all registry-based policies in the `Registry.pol` file. From its return you can get the `key`, `v_name`, `v_type`, and `v_data` required to "enable" that policy. Use those values to set/disable/delete policies using this module. The same values can also be used to create states for setting these policies.

Note: Not all policies in the Group Policy Editor (`gpedit.msc`) that write to the registry make that change in the `Registry.pol` file. Those policies could still be enforced via the `Registry.pol` file... theoretically. But you will have to find the values needed to set them with this module using a different method.

`salt.modules.win_lgpo_reg.`**`delete_value`**(*key*, *v_name*, *policy_class='Machine'*)

Delete a key/value pair from the Registry.pol file. This bypasses the admx/adml style policies. This is the equivalent of setting the policy to `Not Configured`.

Parameters

- **key** (*str*) -- The registry key path
- **v_name** (*str*) -- The registry value name within the key
- **policy_class** (*str*) -- The registry class to write to. Can be one of the following:
  - Computer
  - Machine
  - User

  Default is `Machine`

Raises

- ***SaltInvocationError*** -- Invalid policy_class
- ***CommandExecutionError*** -- On failure

Returns

`True` if successful, otherwise `False` None: Key/value not present

Return type

bool

CLI Example:

```
# Delete all values under a key
salt '*' lgpo_reg.delete_value "SOFTWARE\MyKey" "MyValue"
```

`salt.modules.win_lgpo_reg.`**`disable_value`**(*key*, *v_name*, *policy_class='machine'*)

Mark a registry value for deletion in the registry.pol file. This bypasses the admx/adml style policies. This is the equivalent of setting the policy to `Disabled` in the Group Policy editor (`gpedit.msc`)

Parameters

- **key** (*str*) -- The registry key path
- **v_name** (*str*) -- The registry value name within the key
- **policy_class** (*str*) -- The registry class to write to. Can be one of the following:
  - Computer
  - Machine
  - User

  Default is `Machine`

Raises

- ***SaltInvocationError*** -- Invalid policy_class
- ***CommandExecutionError*** -- On failure

Returns

`True` if successful, otherwise `False` None: If already disabled

Return type

bool

CLI Example:

```
# Delete a value
salt '*' lgpo_reg.delete_value "SOFTWARE\MyKey" "MyValue"
```

`salt.modules.win_lgpo_reg.`**`get_key`**(*key*, *policy_class='Machine'*)

Get all the values set in a key in the `Registry.pol` file.

Parameters

- **key** (*str*) -- The registry key where the values reside
- **policy_class** (*str*) -- The registry class to read from. Can be one of the following:

Raises

SaltInvocationError -- Invalid policy class

Returns

A dictionary containing the value data and the value type

Return type

dict

CLI Example:

```
# Get all values from a key
salt '*' lgpo_reg.get_key "SOFTWARE\MyKey"
```

`salt.modules.win_lgpo_reg.`**`get_value`**(*key*, *v_name*, *policy_class='Machine'*)

Get the value of a single value pair as set in the `Registry.pol` file.

Parameters

- **`key`** (*str*) -- The registry key where the value name resides
- **`v_name`** (*str*) -- The value name to retrieve
- **`policy_class`** (*str*) -- The registry class to read from. Can be one of the following:

Raises

SaltInvocationError -- Invalid policy class

Returns

A dictionary containing the value data and the value type found

Return type

dict

CLI Example:

```
# Get a value
salt '*' lgpo_reg.get_value "SOFTWARE\MyKey" "MyValue"
```

`salt.modules.win_lgpo_reg.`**`read_reg_pol`**`(`*policy_class='Machine'*`)`

Read the contents of the Registry.pol file. Display the contents as a human-readable dictionary.

Parameters

`policy_class` (*str*) -- The registry class to retrieve. Can be one of the following:

- Computer
- Machine
- User

Default is `Machine`

Raises

SaltInvocationError -- Invalid policy class

Returns

A dictionary representing the contents of the Registry.pol file

Return type

dict

CLI Example:

```
# Read the machine Registry.pol
salt '*' lgpo_reg.read_reg_pol
```

`salt.modules.win_lgpo_reg.`**`set_value`**`(`*key, v_name, v_data, v_type='REG_DWORD', policy_class='Machine'*`)`

Add a key/value pair to the registry.pol file. This bypasses the admx/adml style policies. This is the equivalent of setting a policy to `Enabled`

Parameters

- **`key`** (*str*) -- The registry key path
- **`v_name`** (*str*) -- The registry value name within the key
- **`v_data`** (*str*) -- The registry value
- **`v_type`** (*str*) -- The registry value type. Must be one of the following:
  - REG_BINARY
  - REG_DWORD
  - REG_EXPAND_SZ
  - REG_MULTI_SZ
  - REG_QWORD
  - REG_SZ

  Default is REG_DWORD
- **`policy_class`** (*str*) -- The registry class to write to. Can be one of the following:
  - Computer
  - Machine

    - User

  Default is `Machine`

Raises

- ***SaltInvocationError*** -- Invalid policy_class
- ***SaltInvocationError*** -- Invalid v_type
- ***SaltInvocationError*** -- v_data doesn't match v_type

Returns

`True` if successful, otherwise `False`

Return type

bool

CLI Example:

```
# Set REG_DWORD value (default)
salt '*' lgpo_reg.set_value "SOFTWARE\MyKey" "MyValue" 1

# Set REG_SZ value
salt '*' lgpo_reg.set_value "SOFTWARE\MyKey" "MyValue" "string value"
↪"REG_SZ"
```

`salt.modules.win_lgpo_reg.`**`write_reg_pol`**`(`*data, policy_class='Machine'*`)`

Write data to the Registry.pol file. The data is a dictionary that is then converted to the appropriate bytes format expected by Registry.pol

Parameters

- **`data`** (*`dict`*) -- A dictionary containing Registry.pol data
- **`policy_class`** (*`str`*) -- The registry class to write to. Can be one of the following:
    - Computer
    - Machine
    - User

  Default is `Machine`

Raises

- ***SaltInvocationError*** -- Invalid policy class
- ***CommandExecutionError*** -- On failure

Returns

True if successful

Return type

bool

CLI Example:

```
# Write to Machine Registry.pol
salt '*' lgpo_reg.write_reg_pol "{'SOFTWARE\MyKey': {'MyValue': 'data': 1,
↪ 'type': 'REG_DWORD'}}"
```

26.6.237 salt.modules.win_license

This module allows you to manage windows licensing via slmgr.vbs

```
salt '*' license.install XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
```

`salt.modules.win_license.`**`activate`**`()`

Attempt to activate the current machine via Windows Activation

CLI Example:

```
salt '*' license.activate
```

`salt.modules.win_license.`**`info`**`()`

Return information about the license, if the license is not correctly activated this will return None.

CLI Example:

```
salt '*' license.info
```

`salt.modules.win_license.`**`install`**`(`*product_key*`)`

Install the given product key

CLI Example:

```
salt '*' license.install XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
```

`salt.modules.win_license.`**`installed`**`(`*product_key*`)`

Check to see if the product key is already installed.

Note: This is not 100% accurate as we can only see the last

5 digits of the license.

CLI Example:

```
salt '*' license.installed XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
```

`salt.modules.win_license.`**`licensed`**`()`

Return true if the current machine is licensed correctly

CLI Example:

```
salt '*' license.licensed
```

`salt.modules.win_license.`**`uninstall`**`()`

Uninstall the current product key

CLI Example:

```
salt '*' license.uninstall
```

26.6.238 salt.modules.win_network

Module for gathering and managing network information

`salt.modules.win_network.`**`connect`**`(`*host*, *port=None*, ***kwargs*`)`

Test connectivity to a host using a particular port from the minion.

New in version 2016.3.0.

CLI Example:

```
salt '*' network.connect archlinux.org 80

salt '*' network.connect archlinux.org 80 timeout=3

salt '*' network.connect archlinux.org 80 timeout=3 family=ipv4
```

(continues on next page)

(continued from previous page)

```
salt '*' network.connect google-public-dns-a.google.com port=53 proto=udp␣
↪timeout=3
```

salt.modules.win_network.**dig**(*host*)

Performs a DNS lookup with dig

Note: dig must be installed on the Windows minion

CLI Example:

```
salt '*' network.dig archlinux.org
```

salt.modules.win_network.**get_route**(*ip*)

Return routing information for given destination ip

New in version 2016.11.5.

CLI Example:

```
salt '*' network.get_route 10.10.10.10
```

salt.modules.win_network.**hw_addr**(*iface*)

Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```
salt '*' network.hw_addr 'Wireless Connection #1'
```

salt.modules.win_network.**hwaddr**(*iface*)

This function is an alias of `hw_addr`.

> Return the hardware address (a.k.a. MAC address) for a given interface
>
> CLI Example:
>
> ```
> salt '*' network.hw_addr 'Wireless Connection #1'
> ```

salt.modules.win_network.**in_subnet**(*cidr*)

Returns True if host is within specified subnet, otherwise False

CLI Example:

```
salt '*' network.in_subnet 10.0.0.0/16
```

salt.modules.win_network.**interfaces**()

Return a dictionary of information about all the interfaces on the minion

CLI Example:

```
salt '*' network.interfaces
```

salt.modules.win_network.**interfaces_names**()

Return a list of all the interfaces names

CLI Example:

```
salt '*' network.interfaces_names
```

`salt.modules.win_network.`**`ip_addrs`**(*interface=None*, *include_loopback=False*, *cidr=None*, *type=None*)

Returns a list of IPv4 addresses assigned to the host.

interface
Only IP addresses from that interface will be returned.

include_loopback
[False] Include loopback 127.0.0.1 IPv4 address.

cidr
Describes subnet using CIDR notation and only IPv4 addresses that belong to this subnet will be returned.

Changed in version 2019.2.0.

type
If option set to 'public' then only public addresses will be returned. Ditto for 'private'.

Changed in version 2019.2.0.

CLI Example:

```
salt '*' network.ip_addrs
salt '*' network.ip_addrs cidr=10.0.0.0/8
salt '*' network.ip_addrs cidr=192.168.0.0/16 type=private
```

`salt.modules.win_network.`**`ip_addrs6`**(*interface=None*, *include_loopback=False*, *cidr=None*)

Returns a list of IPv6 addresses assigned to the host.

interface
Only IP addresses from that interface will be returned.

include_loopback
[False] Include loopback ::1 IPv6 address.

cidr
Describes subnet using CIDR notation and only IPv6 addresses that belong to this subnet will be returned.

Changed in version 2019.2.0.

CLI Example:

```
salt '*' network.ip_addrs6
salt '*' network.ip_addrs6 cidr=2000::/3
```

`salt.modules.win_network.`**`ipaddrs`**(*interface=None*, *include_loopback=False*, *cidr=None*, *type=None*)

This function is an alias of `ip_addrs`.

Returns a list of IPv4 addresses assigned to the host.

interface
Only IP addresses from that interface will be returned.

include_loopback
[False] Include loopback 127.0.0.1 IPv4 address.

cidr
Describes subnet using CIDR notation and only IPv4 addresses that belong to this subnet will be returned.

Changed in version 2019.2.0.

type
If option set to 'public' then only public addresses will be returned. Ditto for 'private'.

Changed in version 2019.2.0.

CLI Example:

```
salt '*' network.ip_addrs
salt '*' network.ip_addrs cidr=10.0.0.0/8
salt '*' network.ip_addrs cidr=192.168.0.0/16 type=private
```

`salt.modules.win_network.`**`ipaddrs6`**(*interface=None, include_loopback=False, cidr=None*)

This function is an alias of `ip_addrs6`.

Returns a list of IPv6 addresses assigned to the host.

interface
Only IP addresses from that interface will be returned.

include_loopback
[False] Include loopback ::1 IPv6 address.

cidr
Describes subnet using CIDR notation and only IPv6 addresses that belong to this subnet will be returned.

Changed in version 2019.2.0.

CLI Example:

```
salt '*' network.ip_addrs6
salt '*' network.ip_addrs6 cidr=2000::/3
```

`salt.modules.win_network.`**`is_private`**(*ip_addr*)

Check if the given IP address is a private address

New in version 2019.2.0.

CLI Example:

```
salt '*' network.is_private 10.0.0.3
```

`salt.modules.win_network.`**`netstat`**()

Return information on open ports and states

CLI Example:

```
salt '*' network.netstat
```

`salt.modules.win_network.`**`nslookup`**(*host*)

Query DNS for information about a domain or ip address

CLI Example:

```
salt '*' network.nslookup archlinux.org
```

`salt.modules.win_network.`**`ping`**(*host, timeout=False, return_boolean=False*)

Performs a ping to a host

CLI Example:

```
salt '*' network.ping archlinux.org
```

New in version 2016.11.0.

Return a True or False instead of ping output.

```
salt '*' network.ping archlinux.org return_boolean=True
```

Set the time to wait for a response in seconds.

```
salt '*' network.ping archlinux.org timeout=3
```

`salt.modules.win_network.`**`subnets`**`()`

Returns a list of subnets to which the host belongs

CLI Example:

```
salt '*' network.subnets
```

`salt.modules.win_network.`**`traceroute`**`(`*host*`)`

Performs a traceroute to a 3rd party host

CLI Example:

```
salt '*' network.traceroute archlinux.org
```

26.6.239 salt.modules.win_ntp

Management of NTP servers on Windows

New in version 2014.1.0.

`salt.modules.win_ntp.`**`get_servers`**`()`

Get list of configured NTP servers

CLI Example:

```
salt '*' ntp.get_servers
```

`salt.modules.win_ntp.`**`set_servers`**`(`**servers*`)`

Set Windows to use a list of NTP servers

CLI Example:

```
salt '*' ntp.set_servers 'pool.ntp.org' 'us.pool.ntp.org'
```

26.6.240 salt.modules.win_path

Manage the Windows System PATH

Note that not all Windows applications will rehash the PATH environment variable, Only the ones that listen to the WM_SETTINGCHANGE message.

`salt.modules.win_path.`**`add`**`(`*path*, *index=None*, ***kwargs*`)`

Add the directory to the SYSTEM path in the index location. Returns `True` if successful, otherwise `False`.

path
Directory to add to path

index
Optionally specify an index at which to insert the directory

rehash
[True] If the registry was updated, and this value is set to `True`, sends a WM_SETTINGCHANGE broadcast to refresh the environment variables. Set this to `False` to skip this broadcast.

CLI Examples:

```
# Will add to the beginning of the path
salt '*' win_path.add 'c:\python27' 0

# Will add to the end of the path
salt '*' win_path.add 'c:\python27' index='-1'
```

`salt.modules.win_path.`**`exists`**`(`*path*`)`

Check if the directory is configured in the SYSTEM path Case-insensitive and ignores trailing backslash

Returns

boolean True if path exists, False if not

CLI Example:

```
salt '*' win_path.exists 'c:\python27'
salt '*' win_path.exists 'c:\python27\'
salt '*' win_path.exists 'C:\pyThon27'
```

`salt.modules.win_path.`**`get_path`**`()`

Returns a list of items in the SYSTEM path

CLI Example:

```
salt '*' win_path.get_path
```

`salt.modules.win_path.`**`rehash`**`()`

Send a WM_SETTINGCHANGE Broadcast to Windows to refresh the Environment variables for new processes.

Note: This will only affect new processes that aren't launched by services. To apply changes to the path to services, the host must be restarted. The `salt-minion`, if running as a service, will not see changes to the environment until the system is restarted. See MSDN Documentation

CLI Example:

```
salt '*' win_path.rehash
```

`salt.modules.win_path.`**`remove`**`(`*path*, ***kwargs*`)`

Remove the directory from the SYSTEM path

Returns

boolean True if successful, False if unsuccessful

rehash

[True] If the registry was updated, and this value is set to `True`, sends a WM_SETTINGCHANGE broadcast to refresh the environment variables. Set this to `False` to skip this broadcast.

CLI Example:

```
# Will remove C:\Python27 from the path
salt '*' win_path.remove 'c:\\python27'
```

26.6.241 salt.modules.win_pkg

A module to manage software on Windows

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see *here*.

The following functions require the existence of a *windows repository* metadata DB, typically created by running `pkg.refresh_db`:

- `pkg.get_repo_data`
- `pkg.install`
- `pkg.latest_version`
- `pkg.list_available`
- `pkg.list_pkgs`
- `pkg.list_upgrades`
- `pkg.remove`

If a metadata DB does not already exist and one of these functions is run, then one will be created from the repo SLS files that are present.

As the creation of this metadata can take some time, the `winrepo_cache_expire_min` minion config option can be used to suppress refreshes when the metadata is less than a given number of seconds old.

Note: Version numbers can be `version number string`, `latest` and `Not Found`, where `Not Found` means this module was not able to determine the version of the software installed, it can also be used as the version number in sls definitions file in these cases. Versions numbers are sorted in order of 0, `Not Found`, `order version numbers`, ..., `latest`.

`salt.modules.win_pkg.`**`compare_versions`**`(`*ver1='', oper='==', ver2=''*`)`

Compare software package versions. Made public for use with Jinja

Parameters

- **`ver1`** (`str`) -- A software version to compare
- **`oper`** (`str`) -- The operand to use to compare
- **`ver2`** (`str`) -- A software version to compare

Returns

True if the comparison is valid, otherwise False

Return type

bool

CLI Example:

```
salt '*' pkg.compare_versions 1.2 >= 1.3
```

`salt.modules.win_pkg.`**`genrepo`**`(`***kwargs*`)`

Generate package metadata db based on files within the winrepo_source_dir

Kwargs:

saltenv (str): Salt environment. Default: `base`

verbose (bool):

Return verbose data structure which includes 'success_list', a list of all sls files and the package names contained within. Default `False`.

failhard (bool):
If `True`, an error will be raised if any repo SLS files failed to process. If `False`, no error will be raised, and a dictionary containing the full results will be returned.

Note:
- Hidden directories (directories beginning with '.', such as '*.git*') will be ignored.

Returns
A dictionary of the results of the command

Return type
dict

CLI Example:

```
salt-run pkg.genrepo
salt -G 'os:windows' pkg.genrepo verbose=true failhard=false
salt -G 'os:windows' pkg.genrepo saltenv=base
```

`salt.modules.win_pkg.`**`get_package_info`**(*name*, *saltenv='base'*)

Get information about the package as found in the winrepo database

Parameters
- **`name`** (*`str`*) -- The name of the package
- **`saltenv`** (*`str`*) -- The salt environment to use. Default is "base"

Returns
A dictionary of package info, empty if package not available

Return type
dict

CLI Example:

```
salt '*' pkg.get_package_info chrome
```

`salt.modules.win_pkg.`**`get_repo_data`**(*saltenv='base'*)

Returns the existing package metadata db. Will create it, if it does not exist, however will not refresh it.

Parameters
`saltenv` (*`str`*) -- Salt environment. Default `base`

Returns
A dict containing contents of metadata db.

Return type
dict

CLI Example:

```
salt '*' pkg.get_repo_data
```

`salt.modules.win_pkg.`**`install`**(*name=None*, *refresh=False*, *pkgs=None*, ***kwargs*)

Install the passed package(s) on the system using winrepo

Parameters
- **`name`** (*`str`*) -- The name of a single package, or a comma-separated list of packages to install. (no spaces after the commas)
- **`refresh`** (*`bool`*) -- Boolean value representing whether or not to refresh the winrepo db. Default `False`.
- **`pkgs`** (*`list`*) -- A list of packages to install from a software repository. All packages listed under `pkgs` will be installed via a single command.

  You can specify a version by passing the item as a dict:

CLI Example:

```
# will install the latest version of foo and bar
salt '*' pkg.install pkgs='["foo", "bar"]'

# will install the latest version of foo and version 1.2.
↪3 of bar
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3"}]'
```

Kwargs:

version (str):

The specific version to install. If omitted, the latest version will be installed. Recommend for use when installing a single package.

If passed with a list of packages in the `pkgs` parameter, the version will be ignored.

Note: Remember that versions that contain a single . will be interpreted as numbers and must be double-quoted. For example, version `3006.10` will be rendered as `3006.1`. To pass `3006.10` you'll need to use double-quotes. `version="'3006.10'"`

CLI Example:

```
# Version is ignored
salt '*' pkg.install pkgs="['foo', 'bar']" version=1.
↪2.3
```

If passed with a comma separated list in the `name` parameter, the version will apply to all packages in the list.

CLI Example:

```
# Version 1.2.3 will apply to packages foo and bar
salt '*' pkg.install foo,bar version=1.2.3
```

extra_install_flags (str):

Additional install flags that will be appended to the `install_flags` defined in the software definition file. Only applies when single package is passed.

saltenv (str):

Salt environment. Default 'base'

report_reboot_exit_codes (bool):

If the installer exits with a recognized exit code indicating that a reboot is required, the module function

win_system.set_reboot_required_witnessed

will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, 3010 is the only recognized exit code. The value of this param defaults to True.

New in version 2016.11.0.

Returns

Return a dict containing the new package names and versions. If the package is already installed, an empty dict is returned.

If the package is installed by `pkg.install`:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

Return type
dict

The following example will refresh the winrepo and install a single package, 7zip.

CLI Example:

```
salt '*' pkg.install 7zip refresh=True
```

CLI Example:

```
salt '*' pkg.install 7zip
salt '*' pkg.install 7zip,filezilla
salt '*' pkg.install pkgs='["7zip","filezilla"]'
```

WinRepo Definition File Examples:

The following example demonstrates the use of `cache_file`. This would be used if you have multiple installers in the same directory that use the same `install.ini` file and you don't want to download the additional installers.

```
ntp:
  4.2.8:
    installer: 'salt://win/repo/ntp/ntp-4.2.8-win32-setup.exe'
    full_name: Meinberg NTP Windows Client
    locale: en_US
    reboot: False
    cache_file: 'salt://win/repo/ntp/install.ini'
    install_flags: '/USEFILE=C:\salt\var\cache\salt\minion\files\base\win\
↪repo\ntp\install.ini'
    uninstaller: 'NTP/uninst.exe'
```

The following example demonstrates the use of `cache_dir`. It assumes a file named `install.ini` resides in the same directory as the installer.

```
ntp:
  4.2.8:
    installer: 'salt://win/repo/ntp/ntp-4.2.8-win32-setup.exe'
    full_name: Meinberg NTP Windows Client
    locale: en_US
    reboot: False
    cache_dir: True
    install_flags: '/USEFILE=C:\salt\var\cache\salt\minion\files\base\win\
↪repo\ntp\install.ini'
    uninstaller: 'NTP/uninst.exe'
```

`salt.modules.win_pkg.`**`latest_version`**`(`**names*, ***kwargs*`)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

Note: Since this is looking for the latest version available, a refresh_db will be triggered by default. This can take some time. To avoid this set `refresh` to `False`.

Parameters
`names` (*`str`*) -- A single or multiple names to lookup

Kwargs:
saltenv (str): Salt environment. Default `base` refresh (bool): Refresh package metadata. Default `True`

Returns
A dictionary of packages with the latest version available

Return type
dict

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.win_pkg.`**`list_available`**(**names*, ***kwargs*)

Return a list of available versions of the specified package.

Parameters
`names` (*`str`*) -- One or more package names

Kwargs:
saltenv (str): The salt environment to use. Default `base`.

refresh (bool): Refresh package metadata. Default `False`.

return_dict_always (bool):
Default `False` dict when a single package name is queried.

reverse_sort (bool):
Sort the versions for latest to oldest

New in version 3007.2.

Returns
The package name with its available versions

Return type
dict

```
{'<package name>': ['<version>', '<version>', ]}
```

CLI Example:

```
salt '*' pkg.list_available <package name> return_dict_always=True
salt '*' pkg.list_available <package name01> <package name02>
```

`salt.modules.win_pkg.`**`list_pkgs`**(*versions_as_list=False*, *include_components=True*, *include_updates=True*, ***kwargs*)

List the packages currently installed.

Note: To view installed software as displayed in the Add/Remove Programs, set `include_components` and `include_updates` to False.

Parameters

- **`versions_as_list`** (*`bool`*) -- Returns the versions as a list
- **`include_components`** (*`bool`*) -- Include sub components of installed software. Default is `True`
- **`include_updates`** (*`bool`*) -- Include software updates and Windows updates. Default is `True`

Kwargs:

saltenv (str):
The salt environment to use. Default `base`

refresh (bool):
Refresh package metadata. Default `False`

Returns
A dictionary of installed software with versions installed

Return type
dict

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

`salt.modules.win_pkg.`**`list_repo_pkgs`**(**args, saltenv='base', **kwargs*)

New in version 3007.2.

This function was added to match a similar function in Linux. It will return all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names.

This function can be helpful in discovering the version or repo to specify in a *`pkg.installed`* state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. For example:

```
{
    'bash': ['4.3-14ubuntu1.1',
             '4.3-14ubuntu1'],
    'nginx': ['1.10.0-0ubuntu0.16.04.4',
              '1.9.15-0ubuntu1']
}
```

CLI Examples:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
```

`salt.modules.win_pkg.`**`list_upgrades`**(*refresh=True, **kwargs*)

List all available package upgrades on this system

Parameters
`refresh` (*`bool`*) -- Refresh package metadata. Default `True`

Kwargs:
saltenv (str): Salt environment. Default `base`

Returns
A dictionary of packages with available upgrades

Return type
dict

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.win_pkg.`**`normalize_name`**`(`*name*`)`

Nothing to do on Windows. We need this function so that Salt doesn't go through every module looking for `pkg.normalize_name`.

New in version 3006.0.

Parameters
`name` (*`str`*) -- The name of the package

Returns
The name of the package

Return type
str

CLI Example:

```
salt '*' pkg.normalize_name git
```

`salt.modules.win_pkg.`**`purge`**`(`*name=None*, *pkgs=None*, ***kwargs*`)`

Package purges are not supported on Windows, this function is identical to `remove()`.

Note: At some point in the future, `pkg.purge` may direct the installer to remove all configs and settings for software packages that support that option.

New in version 0.16.0.

Parameters

- **`name`** (*`str`*) -- The name of the package to be deleted.
- **`version`** (*`str`*) -- The version of the package to be deleted. If this option is used in combination with the `pkgs` option below, then this version will be applied to all targeted packages.
- **`pkgs`** (*`list`*) -- A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Kwargs:
saltenv (str): Salt environment. Default `base` refresh (bool): Refresh package metadata. Default `False`

Returns
A dict containing the changes.

Return type
dict

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

`salt.modules.win_pkg.`**`refresh_db`**`(`***kwargs*`)`

Generates the local software metadata database (*winrepo.p*) on the minion. The database is stored in a serialized format located by default at the following location:

`C:\ProgramData\Salt Project\Salt\var\cache\salt\minion\files\base\win\repo-ng\winrepo.p`

This module performs the following steps to generate the software metadata database:

- Fetch the package definition files (.sls) from *winrepo_source_dir* (default *salt://win/repo-ng*) and cache them in *<cachedir>files<saltenv><winrepo_source_dir>* (default: `C:\ProgramData\Salt Project\Salt\var\cache\salt\minion\files\base\win\repo-ng`)
- Call `pkg.genrepo` to parse the package definition files and generate the repository metadata database file (*winrepo.p*)
- Return the report received from `pkg.genrepo`

The default winrepo directory on the master is */srv/salt/win/repo-ng*. All files that end with *.sls* in this and all subdirectories will be used to generate the repository metadata database (*winrepo.p*).

Note:

- Hidden directories (directories beginning with '*.*', such as '*.git*') will be ignored.

Note: There is no need to call *pkg.refresh_db* every time you work with the pkg module. Automatic refresh will occur based on the following minion configuration settings:

- *winrepo_cache_expire_min*
- *winrepo_cache_expire_max*

However, if the package definition files have changed, as would be the case if you are developing a new package definition, this function should be called to ensure the minion has the latest information about packages available to it.

Warning: Directories and files fetched from <winrepo_source_dir> (*/srv/salt/win/repo-ng*) will be processed in alphabetical order. If two or more software definition files contain the same name, the last one processed replaces all data from the files processed before it.

For more information see *Windows Software Repository*

Arguments:

saltenv (str): Salt environment. Default: `base`

verbose (bool):
Return a verbose data structure which includes 'success_list', a list of all sls files and the package names contained within. Default is 'False'

failhard (bool):
If `True`, an error will be raised if any repo SLS files fails to process. If `False`, no error will be raised, and a dictionary containing the full results will be returned.

Returns
A dictionary containing the results of the database refresh.

Return type
dict

Note: A result with a *total: 0* generally means that the files are in the wrong location on the master. Try running the following command on the minion: *salt-call -l debug pkg.refresh saltenv=base*

Warning: When calling this command from a state using *module.run* be sure to pass *failhard: False*. Otherwise, the state will report failure if it encounters a bad software definition file.

CLI Example:

```
salt '*' pkg.refresh_db
salt '*' pkg.refresh_db saltenv=base
```

`salt.modules.win_pkg.`**`remove`**`(`*name=None*, *pkgs=None*, ***kwargs*`)`

Remove the passed package(s) from the system using winrepo

New in version 0.16.0.

Parameters

- **`name`** (*`str`*) -- The name(s) of the package(s) to be uninstalled. Can be a single package or a comma delimited list of packages, no spaces.
- **`pkgs`** (*`list`*) -- A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Kwargs:

version (str):

The version of the package to be uninstalled. If this option is used to to uninstall multiple packages, then this version will be applied to all targeted packages. Recommended using only when uninstalling a single package. If this parameter is omitted, the latest version will be uninstalled.

saltenv (str): Salt environment. Default `base` refresh (bool): Refresh package metadata. Default `False`

Returns

Returns a dict containing the changes.

If the package is removed by `pkg.remove`:
{'<package>': {'old': '<old-version>',
'new': '<new-version>'}}
If the package is already uninstalled:
{'<package>': {'current': 'not installed'}}

Return type

dict

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.win_pkg.`**`upgrade`**`(`***kwargs*`)`

Upgrade all software. Currently not implemented

Kwargs:

saltenv (str): The salt environment to use. Default `base`. refresh (bool): Refresh package metadata. Default `True`.

Note: This feature is not yet implemented for Windows.

Returns

Empty dict, until implemented

Return type

dict

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.win_pkg.`**`upgrade_available`**(*name*, ***kwargs*)

Check whether or not an upgrade is available for a given package

Parameters

name (*str*) -- The name of a single package

Kwargs:

refresh (bool): Refresh package metadata. Default `True` saltenv (str): The salt environment. Default `base`

Returns

True if new version available, otherwise False

Return type

bool

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.win_pkg.`**`version`**(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

Parameters

name (*str*) -- One or more package names

Kwargs:

saltenv (str): The salt environment to use. Default `base`. refresh (bool): Refresh package metadata. Default `False`.

Returns

version string when a single package is specified. dict: The package name(s) with the installed versions.

Return type

str

```
{['<version>', '<version>', ]} OR
{'<package name>': ['<version>', '<version>', ]}
```

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package name01> <package name02>
```

26.6.242 salt.modules.win_pki

Microsoft certificate management via the PKI Client PowerShell module. https://technet.microsoft.com/en-us/itpro/powershell/windows/pkiclient/pkiclient

The PKI Client PowerShell module is only available on Windows 8+ and Windows Server 2012+. https://technet.microsoft.com/en-us/library/hh848636(v=wps.620).aspx

platform

Windows

depends

- PowerShell 4
- PKI Client Module (Windows 8+ / Windows Server 2012+)

New in version 2016.11.0.

`salt.modules.win_pki.`**`export_cert`**`(`*name, thumbprint, cert_format='cer', context='LocalMachine', store='My', password=''*`)`

Export the certificate to a file from the given certificate store.

Parameters

- **name** (*str*) -- The destination path for the exported certificate file.
- **thumbprint** (*str*) -- The thumbprint value of the target certificate.
- **cert_format** (*str*) -- The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
- **context** (*str*) -- The name of the certificate store location context.
- **store** (*str*) -- The name of the certificate store.
- **password** (*str*) -- The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.

Returns

A boolean representing whether all changes succeeded.

Return type

bool

CLI Example:

```
salt '*' win_pki.export_cert name='C:\certs\example.cer' thumbprint=
↪'AAA000'
```

`salt.modules.win_pki.`**`get_cert_file`**`(`*name, cert_format='cer', password=''*`)`

Get the details of the certificate file.

Parameters

- **name** (*str*) -- The filesystem path of the certificate file.
- **cert_format** (*str*) -- The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
- **password** (*str*) -- The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.

Returns

A dictionary of the certificate thumbprints and properties.

Return type

dict

CLI Example:

```
salt '*' win_pki.get_cert_file name='C:\certs\example.cer'
```

`salt.modules.win_pki.`**`get_certs`**`(`*context='LocalMachine', store='My'*`)`

Get the available certificates in the given store.

Parameters

- **context** (*str*) -- The name of the certificate store location context.
- **store** (*str*) -- The name of the certificate store.

Returns

A dictionary of the certificate thumbprints and properties.

Return type

dict

CLI Example:

```
salt '*' win_pki.get_certs
```

`salt.modules.win_pki.`**`get_stores`**`()`

Get the certificate location contexts and their corresponding stores.

Returns
A dictionary of the certificate location contexts and stores.

Return type
dict

CLI Example:

```
salt '*' win_pki.get_stores
```

`salt.modules.win_pki.`**`import_cert`**`(`*name, cert_format='cer', context='LocalMachine', store='My', exportable=True, password='', saltenv='base'*`)`

Import the certificate file into the given certificate store.

Parameters

- **`name`** (*`str`*) -- The path of the certificate file to import.
- **`cert_format`** (*`str`*) -- The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
- **`context`** (*`str`*) -- The name of the certificate store location context.
- **`store`** (*`str`*) -- The name of the certificate store.
- **`exportable`** (*`bool`*) -- Mark the certificate as exportable. Only applicable to pfx format.
- **`password`** (*`str`*) -- The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.
- **`saltenv`** (*`str`*) -- The environment the file resides in.

Returns
A boolean representing whether all changes succeeded.

Return type
bool

CLI Example:

```
salt '*' win_pki.import_cert name='salt://cert.cer'
```

`salt.modules.win_pki.`**`remove_cert`**`(`*thumbprint, context='LocalMachine', store='My'*`)`

Remove the certificate from the given certificate store.

Parameters

- **`thumbprint`** (*`str`*) -- The thumbprint value of the target certificate.
- **`context`** (*`str`*) -- The name of the certificate store location context.
- **`store`** (*`str`*) -- The name of the certificate store.

Returns
A boolean representing whether all changes succeeded.

Return type
bool

CLI Example:

```
salt '*' win_pki.remove_cert thumbprint='AAA000'
```

`salt.modules.win_pki.`**`test_cert`**`(`*thumbprint, context='LocalMachine', store='My', untrusted_root=False, dns_name='', eku=''*`)`

Check the certificate for validity.

Parameters

- **thumbprint** (*str*) -- The thumbprint value of the target certificate.
- **context** (*str*) -- The name of the certificate store location context.
- **store** (*str*) -- The name of the certificate store.
- **untrusted_root** (*bool*) -- Whether the root certificate is required to be trusted in chain building.
- **dns_name** (*str*) -- The DNS name to verify as valid for the certificate.
- **eku** (*str*) -- The enhanced key usage object identifiers to verify for the certificate chain.

Returns
A boolean representing whether the certificate was considered valid.

Return type
bool

CLI Example:

```
salt '*' win_pki.test_cert thumbprint='AAA000' dns_name='example.test'
```

26.6.243 salt.modules.win_powercfg

This module allows you to control the power settings of a windows minion via powercfg.

New in version 2015.8.0.

```
# Set monitor to never turn off on Battery power
salt '*' powercfg.set_monitor_timeout 0 power=dc
# Set disk timeout to 120 minutes on AC power
salt '*' powercfg.set_disk_timeout 120 power=ac
```

`salt.modules.win_powercfg.`**`get_disk_timeout`**`(`*scheme=None*`)`

Get the current disk timeout of the given scheme

Parameters
scheme (*str*) -- The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- `SCHEME_BALANCED` - Balanced
- `SCHEME_MAX` - Power saver
- `SCHEME_MIN` - High performance

Returns
A dictionary of both the AC and DC settings

Return type
dict

CLI Example:

```
salt '*' powercfg.get_disk_timeout
```

`salt.modules.win_powercfg.`**`get_hibernate_timeout`**`(`*scheme=None*`)`

Get the current hibernate timeout of the given scheme

scheme (str):
The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- `SCHEME_BALANCED` - Balanced
- `SCHEME_MAX` - Power saver
- `SCHEME_MIN` - High performance

Returns
A dictionary of both the AC and DC settings

Return type
dict

CLI Example:

```
salt '*' powercfg.get_hibernate_timeout
```

`salt.modules.win_powercfg.`**`get_monitor_timeout`**(*scheme=None*)

Get the current monitor timeout of the given scheme

Parameters
scheme (*str*) -- The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- `SCHEME_BALANCED` - Balanced
- `SCHEME_MAX` - Power saver
- `SCHEME_MIN` - High performance

Returns
A dictionary of both the AC and DC settings

Return type
dict

CLI Example:

```
salt '*' powercfg.get_monitor_timeout
```

`salt.modules.win_powercfg.`**`get_standby_timeout`**(*scheme=None*)

Get the current standby timeout of the given scheme

scheme (str):
The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- `SCHEME_BALANCED` - Balanced
- `SCHEME_MAX` - Power saver
- `SCHEME_MIN` - High performance

Returns
A dictionary of both the AC and DC settings

Return type
dict

CLI Example:

```
salt '*' powercfg.get_standby_timeout
```

`salt.modules.win_powercfg.`**`set_disk_timeout`**(*timeout*, *power='ac'*, *scheme=None*)

Set the disk timeout in minutes for the given power scheme

Parameters

- **timeout** (*int*) -- The amount of time in minutes before the disk will timeout
- **power** (*str*) -- Set the value for AC or DC power. Default is `ac`. Valid options are:
  - `ac` (AC Power)
  - `dc` (Battery)
- **scheme** (*str*) -- The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - `SCHEME_BALANCED` - Balanced
  - `SCHEME_MAX` - Power saver
  - `SCHEME_MIN` - High performance

Returns
`True` if successful, otherwise `False`

Return type
bool

CLI Example:

```
# Sets the disk timeout to 30 minutes on battery
salt '*' powercfg.set_disk_timeout 30 power=dc
```

`salt.modules.win_powercfg.`**`set_hibernate_timeout`**`(`*timeout*, *power='ac'*, *scheme=None*`)`

Set the hibernate timeout in minutes for the given power scheme

Parameters

- **`timeout`** (*`int`*) -- The amount of time in minutes before the computer hibernates
- **`power`** (*`str`*) -- Set the value for AC or DC power. Default is `ac`. Valid options are:
  - `ac` (AC Power)
  - `dc` (Battery)
- **`scheme`** (*`str`*) -- The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - `SCHEME_BALANCED` - Balanced
  - `SCHEME_MAX` - Power saver
  - `SCHEME_MIN` - High performance

Returns
`True` if successful, otherwise `False`

Return type
bool

CLI Example:

```
# Sets the hibernate timeout to 30 minutes on Battery
salt '*' powercfg.set_hibernate_timeout 30 power=dc
```

`salt.modules.win_powercfg.`**`set_monitor_timeout`**`(`*timeout*, *power='ac'*, *scheme=None*`)`

Set the monitor timeout in minutes for the given power scheme

Parameters

- **`timeout`** (*`int`*) -- The amount of time in minutes before the monitor will timeout
- **`power`** (*`str`*) -- Set the value for AC or DC power. Default is `ac`. Valid options are:
  - `ac` (AC Power)
  - `dc` (Battery)
- **`scheme`** (*`str`*) -- The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - `SCHEME_BALANCED` - Balanced
  - `SCHEME_MAX` - Power saver
  - `SCHEME_MIN` - High performance

Returns
`True` if successful, otherwise `False`

Return type
bool

CLI Example:

```
# Sets the monitor timeout to 30 minutes
salt '*' powercfg.set_monitor_timeout 30
```

`salt.modules.win_powercfg.`**`set_standby_timeout`**`(`*timeout*, *power='ac'*, *scheme=None*`)`

Set the standby timeout in minutes for the given power scheme

Parameters

- **`timeout`** (*`int`*) -- The amount of time in minutes before the computer sleeps
- **`power`** (*`str`*) -- Set the value for AC or DC power. Default is `ac`. Valid options are:

    - `ac` (AC Power)
    - `dc` (Battery)
  - **scheme** (*str*) -- The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:
    - `SCHEME_BALANCED` - Balanced
    - `SCHEME_MAX` - Power saver
    - `SCHEME_MIN` - High performance

Returns
`True` if successful, otherwise `False`

Return type
bool

CLI Example:

```
# Sets the system standby timeout to 30 minutes on Battery
salt '*' powercfg.set_standby_timeout 30 power=dc
```

26.6.244 salt.modules.win_psget

Module for managing PowerShell through PowerShellGet (PSGet)

depends

- PowerShell 5.0
- PSGet

Support for PowerShell

`salt.modules.win_psget.`**`avail_modules`**`(`*desc=False*`)`

List available modules in registered Powershell module repositories.

Parameters
desc (`bool`) -- If `True`, the verbose description will be returned.

CLI Example:

```
salt 'win01' psget.avail_modules
salt 'win01' psget.avail_modules desc=True
```

`salt.modules.win_psget.`**`bootstrap`**`()`

Make sure that nuget-anycpu.exe is installed. This will download the official nuget-anycpu.exe from the internet.

CLI Example:

```
salt 'win01' psget.bootstrap
```

`salt.modules.win_psget.`**`get_repository`**`(`*name*`)`

Get the details of a local PSGet repository

Parameters
name (`str`) -- Name of the repository

CLI Example:

```
salt 'win01' psget.get_repository MyRepo
```

`salt.modules.win_psget.`**`install`**`(`*name, minimum_version=None, required_version=None, scope=None, repository=None*`)`

Install a Powershell module from powershell gallery on the system.

Parameters

- **name** (`str`) -- Name of a Powershell module
- **minimum_version** (`str`) -- The maximum version to install, e.g. 1.23.2
- **required_version** (`str`) -- Install a specific version
- **scope** (`str`) -- The scope to install the module to, e.g. CurrentUser, Computer
- **repository** (`str`) -- The friendly name of a private repository, e.g. MyREpo

CLI Example:

```
salt 'win01' psget.install PowerPlan
```

`salt.modules.win_psget.`**`list_modules`**(*desc=False*)

List currently installed PSGet Modules on the system.

Parameters

desc (`bool`) -- If `True`, the verbose description will be returned.

CLI Example:

```
salt 'win01' psget.list_modules
salt 'win01' psget.list_modules desc=True
```

`salt.modules.win_psget.`**`register_repository`**(*name*, *location*, *installation_policy=None*)

Register a PSGet repository on the local machine

Parameters

- **name** (`str`) -- The name for the repository
- **location** (`str`) -- The URI for the repository
- **installation_policy** (`str`) -- The installation policy for packages, e.g. Trusted, Untrusted

CLI Example:

```
salt 'win01' psget.register_repository MyRepo https://myrepo.mycompany.
↪com/packages
```

`salt.modules.win_psget.`**`remove`**(*name*)

Remove a Powershell DSC module from the system.

Parameters

name (`str`) -- Name of a Powershell DSC module

CLI Example:

```
salt 'win01' psget.remove PowerPlan
```

`salt.modules.win_psget.`**`update`**(*name*, *maximum_version=None*, *required_version=None*)

Update a PowerShell module to a specific version, or the newest

Parameters

- **name** (`str`) -- Name of a Powershell module
- **maximum_version** (`str`) -- The maximum version to install, e.g. 1.23.2
- **required_version** (`str`) -- Install a specific version

CLI Example:

```
salt 'win01' psget.update PowerPlan
```

26.6.245 salt.modules.win_servermanager

Manage Windows features via the ServerManager powershell module. Can list available and installed roles/features. Can install and remove roles/features.

maintainer
Shane Lee <slee@saltstack.com>

platform
Windows Server 2008R2 or greater

depends
PowerShell module `ServerManager`

`salt.modules.win_servermanager.`**`install`**(*feature*, *recurse=False*, *restart=False*, *source=None*, *exclude=None*)

Install a feature

Note: Some features require reboot after un/installation, if so until the server is restarted other features can not be installed!

Note: Some features take a long time to complete un/installation, set -t with a long timeout

---

Parameters

- **`feature`** (*`str, list`*) -- The name of the feature(s) to install. This can be a single feature, a string of features in a comma delimited list (no spaces), or a list of features.

  New in version 2018.3.0: Added the ability to pass a list of features to be installed.
- **`recurse`** (*`Options[bool]`*) -- Install all sub-features. Default is False
- **`restart`** (*`Optional[bool]`*) -- Restarts the computer when installation is complete, if required by the role/feature installed. Will also trigger a reboot if an item in `exclude` requires a reboot to be properly removed. Default is False
- **`source`** (*`Optional[str]`*) -- Path to the source files if missing from the target system. None means that the system will use windows update services to find the required files. Default is None
- **`exclude`** (*`Optional[str]`*) -- The name of the feature to exclude when installing the named feature. This can be a single feature, a string of features in a comma-delimited list (no spaces), or a list of features.

  > **Warning:** As there is no exclude option for the `Add-WindowsFeature` or `Install-WindowsFeature` PowerShell commands the features named in `exclude` will be installed with other sub-features and will then be removed. **If the feature named in ``exclude`` is not a sub-feature of one of the installed items it will still be removed.**

Returns
A dictionary containing the results of the install

Return type
dict

CLI Example:

```
# Install the Telnet Client passing a single string
salt '*' win_servermanager.install Telnet-Client

# Install the TFTP Client and the SNMP Service passing a comma-delimited
# string. Install all sub-features
salt '*' win_servermanager.install TFTP-Client,SNMP-Service recurse=True

# Install the TFTP Client from d:\side-by-side
salt '*' win_servermanager.install TFTP-Client source=d:\\side-by-side

# Install the XPS Viewer, SNMP Service, and Remote Access passing a
# list. Install all sub-features, but exclude the Web Server
salt '*' win_servermanager.install "['XPS-Viewer', 'SNMP-Service',
↪'RemoteAccess']" True recurse=True exclude="Web-Server"
```

`salt.modules.win_servermanager.`**`list_available`**`()`

List available features to install

Returns

A list of available features as returned by the `Get-WindowsFeature` PowerShell command

Return type

str

CLI Example:

```
salt '*' win_servermanager.list_available
```

`salt.modules.win_servermanager.`**`list_installed`**`()`

List installed features. Supported on Windows Server 2008 and Windows 8 and newer.

Returns

A dictionary of installed features

Return type

dict

CLI Example:

```
salt '*' win_servermanager.list_installed
```

`salt.modules.win_servermanager.`**`remove`**`(`*feature, remove_payload=False, restart=False*`)`

Remove an installed feature

Note: Some features require a reboot after installation/uninstallation. If one of these features are modified, then other features cannot be installed until the server is restarted. Additionally, some features take a while to complete installation/uninstallation, so it is a good idea to use the `-t` option to set a longer timeout.

Parameters

- **`feature`** (*`str, list`*) -- The name of the feature(s) to remove. This can be a single feature, a string of features in a comma delimited list (no spaces), or a list of features.

  New in version 2018.3.0: Added the ability to pass a list of features to be removed.
- **`remove_payload`** (*`Optional[bool]`*) -- True will cause the feature to be removed from the side-by-side store (`%SystemDrive%:\Windows\WinSxS`). Default is False
- **`restart`** (*`Optional[bool]`*) -- Restarts the computer when uninstall is complete, if required by the role/feature removed. Default is False

Returns
A dictionary containing the results of the uninstall

Return type
dict

CLI Example:

```
salt -t 600 '*' win_servermanager.remove Telnet-Client
```

26.6.246 salt.modules.win_service

Windows Service module.

Changed in version 2016.11.0: Rewritten to use PyWin32

`salt.modules.win_service.`**`available`**`(`*name*`)`

Check if a service is available on the system.

Parameters
`name` (*`str`*) -- The name of the service to check

Returns
`True` if the service is available, `False` otherwise

Return type
bool

CLI Example:

```
salt '*' service.available <service name>
```

`salt.modules.win_service.`**`create`**`(`*name*, *bin_path*, *exe_args=None*, *display_name=None*, *description=None*, *service_type='own'*, *start_type='manual'*, *start_delayed=False*, *error_control='normal'*, *load_order_group=None*, *dependencies=None*, *account_name='.\\LocalSystem'*, *account_password=None*, *run_interactive=False*, ***kwargs*`)`

Create the named service.

New in version 2015.8.0.

Parameters

- **`name`** (*`str`*) -- Specifies the service name. This is not the display_name
- **`bin_path`** (*`str`*) -- Specifies the path to the service binary file. Backslashes must be escaped, eg: `C:\path\to\binary.exe`
- **`exe_args`** (*`str`*) -- Any additional arguments required by the service binary.
- **`display_name`** (*`str`*) -- The name to be displayed in the service manager. If not passed, the `name` will be used
- **`description`** (*`str`*) -- A description of the service
- **`service_type`** (*`str`*) -- Specifies the service type. Default is `own`. Valid options are as follows:
  - kernel: Driver service
  - filesystem: File system driver service
  - adapter: Adapter driver service (reserved)
  - recognizer: Recognizer driver service (reserved)
  - own (default): Service runs in its own process
  - share: Service shares a process with one or more other services
- **`start_type`** (*`str`*) -- Specifies the service start type. Valid options are as follows:
  - boot: Device driver that is loaded by the boot loader
  - system: Device driver that is started during kernel initialization

    - auto: Service that automatically starts
    - manual (default): Service must be started manually
    - disabled: Service cannot be started
- **start_delayed** (*bool*) -- Set the service to Auto(Delayed Start). Only valid if the start_type is set to `Auto`. If service_type is not passed, but the service is already set to `Auto`, then the flag will be set. Default is `False`
- **error_control** (*str*) -- The severity of the error, and action taken, if this service fails to start. Valid options are as follows:
    - normal (normal): Error is logged and a message box is displayed
    - severe: Error is logged and computer attempts a restart with the last known good configuration
    - critical: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure
    - ignore: Error is logged and startup continues, no notification is given to the user
- **load_order_group** (*str*) -- The name of the load order group to which this service belongs
- **dependencies** (*list*) -- A list of services or load ordering groups that must start before this service
- **account_name** (*str*) -- The name of the account under which the service should run. For `own` type services this should be in the `domain\username` format. The following are examples of valid built-in service accounts:
    - NT AuthorityLocalService
    - NT AuthorityNetworkService
    - NT AuthorityLocalSystem
    - .LocalSystem
- **account_password** (*str*) -- The password for the account name specified in `account_name`. For the above built-in accounts, this can be None. Otherwise a password must be specified.
- **run_interactive** (*bool*) -- If this setting is True, the service will be allowed to interact with the user. Not recommended for services that run with elevated privileges.

Returns

A dictionary containing information about the new service

Return type

dict

CLI Example:

```
salt '*' service.create <service name> <path to exe> display_name='
↪<display name>'
```

salt.modules.win_service.**create_win_salt_restart_task**()

Create a task in Windows task scheduler to enable restarting the salt-minion

Returns

`True` if successful, otherwise `False`

Return type

bool

CLI Example:

```
salt '*' service.create_win_salt_restart_task()
```

salt.modules.win_service.**delete**(*name, timeout=90*)

Delete the named service

Parameters

- **name** (*str*) -- The name of the service to delete
- **timeout** (*int*) -- The time in seconds to wait for the service to be deleted before returning. This is necessary because a service must be stopped before it can be deleted. Default is 90 seconds

  New in version 2017.7.9,2018.3.4.

Returns
: **`True` if successful, otherwise `False`. Also returns `True`**
  if the service is not present

Return type
: bool

CLI Example:

```
salt '*' service.delete <service name>
```

salt.modules.win_service.**disable**(*name*, ***kwargs*)

Disable the named service to start at boot

Parameters
: **name** (*str*) -- The name of the service to disable

Returns
: `True` if disabled, `False` otherwise

Return type
: bool

CLI Example:

```
salt '*' service.disable <service name>
```

salt.modules.win_service.**disabled**(*name*)

Check to see if the named service is disabled to start on boot

Parameters
: **name** (*str*) -- The name of the service to check

Returns
: True if the service is disabled

Return type
: bool

CLI Example:

```
salt '*' service.disabled <service name>
```

salt.modules.win_service.**enable**(*name*, *start_type='auto'*, *start_delayed=False*, ***kwargs*)

Enable the named service to start at boot

Parameters

- **name** (*str*) -- The name of the service to enable.
- **start_type** (*str*) -- Specifies the service start type. Valid options are as follows:
  - boot: Device driver that is loaded by the boot loader
  - system: Device driver that is started during kernel initialization
  - auto: Service that automatically starts
  - manual: Service must be started manually
  - disabled: Service cannot be started
- **start_delayed** (*bool*) -- Set the service to Auto(Delayed Start). Only valid if the start_type is set to `Auto`. If service_type is not passed, but the service is already set to `Auto`, then the flag will be set.

Returns
: `True` if successful, `False` otherwise

Return type
bool

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.win_service.`**`enabled`**`(`*name*, ***kwargs*`)`

Check to see if the named service is enabled to start on boot

Parameters
name (*str*) -- The name of the service to check

Returns
True if the service is set to start

Return type
bool

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.win_service.`**`execute_salt_restart_task`**`()`

Run the Windows Salt restart task

Returns
`True` if successful, otherwise `False`

Return type
bool

CLI Example:

```
salt '*' service.execute_salt_restart_task()
```

`salt.modules.win_service.`**`get_all`**`()`

Return all installed services

Returns
Returns a list of all services on the system.

Return type
list

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.win_service.`**`get_disabled`**`()`

Return a list of disabled services. Disabled is defined as a service that is marked 'Disabled' or 'Manual'.

Returns
A list of disabled services.

Return type
list

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.win_service.`**`get_enabled`**`()`

Return a list of enabled services. Enabled is defined as a service that is marked to Auto Start.

Returns
A list of enabled services

Return type
list

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.win_service.`**`get_service_name`**`(`**args*`)`

The Display Name is what is displayed in Windows when services.msc is executed. Each Display Name has an associated Service Name which is the actual name of the service. This function allows you to discover the Service Name by returning a dictionary of Display Names and Service Names, or filter by adding arguments of Display Names.

If no args are passed, return a dict of all services where the keys are the service Display Names and the values are the Service Names.

If arguments are passed, create a dict of Display Names and Service Names

Returns
A dictionary of display names and service names

Return type
dict

CLI Examples:

```
salt '*' service.get_service_name
salt '*' service.get_service_name 'Google Update Service (gupdate)' 'DHCP
↪Client'
```

`salt.modules.win_service.`**`getsid`**`(`*name*`)`

Return the SID for this windows service

Parameters
`name` (*`str`*) -- The name of the service for which to return the SID

Returns
A string representing the SID for the service

Return type
str

CLI Example:

```
salt '*' service.getsid <service name>
```

`salt.modules.win_service.`**`info`**`(`*name*`)`

Get information about a service on the system

Parameters
`name` (*`str`*) -- The name of the service. This is not the display name. Use `get_service_name` to find the service name.

Returns
A dictionary containing information about the service.

Return type
dict

CLI Example:

```
salt '*' service.info spooler
```

`salt.modules.win_service.`**`missing`**`(`*name*`)`

The inverse of service.available.

Parameters
`name` (*`str`*) -- The name of the service to check

Returns
`True` if the service is missing, `False` otherwise

Return type
bool

CLI Example:

```
salt '*' service.missing <service name>
```

`salt.modules.win_service.`**`modify`**`(`*name, bin_path=None, exe_args=None, display_name=None, description=None, service_type=None, start_type=None, start_delayed=None, error_control=None, load_order_group=None, dependencies=None, account_name=None, account_password=None, run_interactive=None*`)`

Modify a service's parameters. Changes will not be made for parameters that are not passed.

New in version 2016.11.0.

Parameters

- **name** (*str*) -- The name of the service. Can be found using the `service.get_service_name` function
- **bin_path** (*str*) -- The path to the service executable. Backslashes must be escaped, eg: `C:\path\to\binary.exe`
- **exe_args** (*str*) -- Any arguments required by the service executable
- **display_name** (*str*) -- The name to display in the service manager
- **description** (*str*) -- The description to display for the service
- **service_type** (*str*) -- Specifies the service type. Default is `own`. Valid options are as follows:
  - kernel: Driver service
  - filesystem: File system driver service
  - adapter: Adapter driver service (reserved)
  - recognizer: Recognizer driver service (reserved)
  - own (default): Service runs in its own process
  - share: Service shares a process with one or more other services
- **start_type** (*str*) -- Specifies the service start type. Valid options are as follows:
  - boot: Device driver that is loaded by the boot loader
  - system: Device driver that is started during kernel initialization
  - auto: Service that automatically starts
  - manual: Service must be started manually
  - disabled: Service cannot be started
- **start_delayed** (*bool*) -- Set the service to Auto(Delayed Start). Only valid if the start_type is set to `Auto`. If service_type is not passed, but the service is already set to `Auto`, then the flag will be set.
- **error_control** (*str*) -- The severity of the error, and action taken, if this service fails to start. Valid options are as follows:
  - normal: Error is logged and a message box is displayed
  - severe: Error is logged and computer attempts a restart with the last known good configuration
  - critical: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure
  - ignore: Error is logged and startup continues, no notification is given to the user
- **load_order_group** (*str*) -- The name of the load order group to which this service belongs
- **dependencies** (*list*) -- A list of services or load ordering groups that must start before this service
- **account_name** (*str*) -- The name of the account under which the service should run. For `own` type services this should be in the `domain\username` format. The

following are examples of valid built-in service accounts:
  - NT AuthorityLocalService
  - NT AuthorityNetworkService
  - NT AuthorityLocalSystem
  - .LocalSystem
- **`account_password`** (*`str`*) -- The password for the account name specified in `account_name`. For the above built-in accounts, this can be None. Otherwise a password must be specified.
- **`run_interactive`** (*`bool`*) -- If this setting is True, the service will be allowed to interact with the user. Not recommended for services that run with elevated privileges.

Returns
a dictionary of changes made

Return type
dict

CLI Example:

```
salt '*' service.modify spooler start_type=disabled
```

`salt.modules.win_service.`**`restart`**(*name*, *timeout=90*)

Restart the named service. This issues a stop command followed by a start.

Parameters

- **`name`** -- The name of the service to restart.

Note: If the name passed is `salt-minion` a scheduled task is created and executed to restart the salt-minion service.

- **`timeout`** (*`int`*) -- The time in seconds to wait for the service to stop and start before returning. Default is 90 seconds

---

Note: The timeout is cumulative meaning it is applied to the stop and then to the start command. A timeout of 90 could take up to 180 seconds if the service is long in stopping and starting

---

New in version 2017.7.9,2018.3.4.

Returns
`True` if successful, otherwise `False`

Return type
bool

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.win_service.`**`start`**(*name*, *timeout=90*)

Start the specified service.

Warning: You cannot start a disabled service in Windows. If the service is disabled, it will be changed to `Manual` start.

Parameters

- **`name`** (*`str`*) -- The name of the service to start

- **`timeout`** (*int*) -- The time in seconds to wait for the service to start before returning. Default is 90 seconds

  New in version 2017.7.9,2018.3.4.

Returns
: **`True`** if successful, otherwise **`False`**. Also returns **`True`** if the service is already started

Return type
: bool

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.win_service.`**`status`**(*name*, **args*, ***kwargs*)

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Changed in version 3006.0: Returns "Not Found" if the service is not found on the system

Parameters
: **`name`** (*str*) -- The name of the service to check

Returns
: True if running, False otherwise dict: Maps service name to True if running, False otherwise str: Not Found if the service is not found on the system

Return type
: bool

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.win_service.`**`stop`**(*name*, *timeout=90*)

Stop the specified service

Parameters

- **`name`** (*str*) -- The name of the service to stop
- **`timeout`** (*int*) -- The time in seconds to wait for the service to stop before returning. Default is 90 seconds

  New in version 2017.7.9,2018.3.4.

Returns
: **`True`** if successful, otherwise **`False`**. Also returns **`True`** if the service is already stopped

Return type
: bool

CLI Example:

```
salt '*' service.stop <service name>
```

26.6.247 salt.modules.win_shadow

Manage the shadow file

Important: If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to *'shadow.info' is not available*), see *here*.

`salt.modules.win_shadow.`**`info`**`(`*name*`)`

Return information for the specified user This is just returns dummy data so that salt states can work.

Parameters

`name` (*`str`*) -- The name of the user account to show.

CLI Example:

```
salt '*' shadow.info root
```

`salt.modules.win_shadow.`**`require_password_change`**`(`*name*`)`

Require the user to change their password the next time they log in.

Parameters

`name` -- The name of the user account to require a password change.

Returns

True if successful. False if unsuccessful.

Return type

bool

CLI Example:

```
salt '*' shadow.require_password_change <username>
```

`salt.modules.win_shadow.`**`set_expire`**`(`*name, expire*`)`

Set the expiration date for a user account.

Parameters

- **`name`** -- The name of the user account to edit.
- **`expire`** -- The date the account will expire.

Returns

True if successful. False if unsuccessful.

Return type

bool

CLI Example:

```
salt '*' shadow.set_expire <username> 2016/7/1
```

`salt.modules.win_shadow.`**`set_password`**`(`*name, password*`)`

Set the password for a named user.

Parameters

- **`name`** (*`str`*) -- The name of the user account
- **`password`** (*`str`*) -- The new password

Returns

True if successful. False if unsuccessful.

Return type

bool

CLI Example:

```
salt '*' shadow.set_password root mysecretpassword
```

`salt.modules.win_shadow.`**`unlock_account`**`(`*name*`)`

Unlocks a user account.

Parameters

`name` -- The name of the user account to unlock.

Returns

True if successful. False if unsuccessful.

Return type

bool

CLI Example:

```
salt '*' shadow.unlock_account <username>
```

26.6.248 salt.modules.win_shortcut

Execution module for creating shortcuts on Windows. Handles file shortcuts (*.lnk*) and url shortcuts (*.url*). Allows for the configuration of icons and hot keys on file shortcuts. Changing the icon and hot keys are unsupported for url shortcuts.

New in version 3005.

`salt.modules.win_shortcut.`**`create`**`(`*path, target, arguments='', description='', hot_key='', icon_index=0, icon_location='', window_style='Normal', working_dir='', backup=False, force=False, make_dirs=False, user=None*`)`

Create a new shortcut. This can be a file shortcut (`.lnk`) or a url shortcut (`.url`).

Parameters

- **`path`** (`str`) -- The full path to the shortcut. Must have a *.lnk* or *.url* file extension.
- **`target`** (`str`) -- The full path to the target
- **`arguments`** (`str, optional`) -- Any arguments to be passed to the target
- **`description`** (`str, optional`) -- The description for the shortcut. This is shown in the `Comment` field of the dialog box. Default is an empty string
- **`hot_key`** (`str, optional`) -- A combination of hot Keys to trigger this shortcut. This is something like `Ctrl+Alt+D`. This is shown in the `Shortcut key` field in the dialog box. Default is an empty string. Available options are:
  - Ctrl
  - Alt
  - Shift
  - Ext
- **`icon_index`** (`int, optional`) -- The index for the icon to use in files that contain multiple icons. Default is 0
- **`icon_location`** (`str, optional`) -- The full path to a file containing icons. This is shown in the `Change Icon` dialog box by clicking the `Change Icon` button. If no file is specified and a binary is passed as the target, Windows will attempt to get the icon from the binary file. Default is an empty string
- **`window_style`** (`str, optional`) -- The window style the program should start in. This is shown in the `Run` field of the dialog box. Default is `Normal`. Valid options are:
  - Normal
  - Minimized
  - Maximized
- **`working_dir`** (`str, optional`) -- The full path to the working directory for the program to run in. This is shown in the `Start in` field of the dialog box.
- **`backup`** (`bool, optional`) -- If there is already a shortcut with the same name, set this value to `True` to backup the existing shortcut and continue creating the new

shortcut. Default is `False`

- **force** (*bool, optional*) -- If there is already a shortcut with the same name and you aren't backing up the shortcut, set this value to `True` to remove the existing shortcut and create a new with these settings. Default is `False`
- **make_dirs** (*bool, optional*) -- If the parent directory structure does not exist for the new shortcut, create it. Default is `False`
- **user** (*str, optional*) -- The user to be the owner of any directories created by setting `make_dirs` to `True`. If no value is passed Salt will use the user account that it is running under. Default is an empty string.

Returns

True if successful

Return type

bool

Raises

- ***CommandExecutionError*** -- If the path is not a `.lnk` or `.url` file extension.
- ***CommandExecutionError*** -- If there is an existing shortcut with the same name and `backup` and `force` are both `False`
- ***CommandExecutionError*** -- If the parent directory is not created and `make_dirs` is `False`
- ***CommandExecutionError*** -- If there was an error creating the parent directories

CLI Example:

```
# Create a shortcut and set the ``Shortcut key`` (``hot_key``)
salt * shortcut.create "C:\path\to\shortcut.lnk" "C:\Windows\notepad.exe"␣
↪hot_key="Ctrl+Alt+N"

# Create a shortcut and change the icon to the 3rd one in the icon file
salt * shortcut.create "C:\path\to\shortcut.lnk" "C:\Windows\notepad.exe"␣
↪icon_location="C:\path\to\icon.ico" icon_index=2

# Create a shortcut and change the startup mode to full screen
salt * shortcut.create "C:\path\to\shortcut.lnk" "C:\Windows\notepad.exe"␣
↪window_style="Maximized"

# Create a shortcut and change the icon
salt * shortcut.create "C:\path\to\shortcut.lnk" "C:\Windows\notepad.exe"␣
↪icon_location="C:\path\to\icon.ico"

# Create a shortcut and force it to overwrite an existing shortcut
salt * shortcut.create "C:\path\to\shortcut.lnk" "C:\Windows\notepad.exe"␣
↪force=True

# Create a shortcut and create any parent directories if they are missing
salt * shortcut.create "C:\path\to\shortcut.lnk" "C:\Windows\notepad.exe"␣
↪make_dirs=True
```

`salt.modules.win_shortcut.`**`get`**(*path*)

Gets the properties for a shortcut

Parameters

path (*str*) -- The path to the shortcut. Must have a *.lnk* or *.url* file extension.

Returns

A dictionary containing all available properties for the specified
shortcut

Return type

dict

CLI Example:

```
salt * shortcut.get path="C:\path\to\shortcut.lnk"
```

`salt.modules.win_shortcut.`**`modify`**(*path, target='', arguments='', description='', hot_key='', icon_index=0, icon_location='', window_style='Normal', working_dir=''*)

Modify an existing shortcut. This can be a file shortcut (`.lnk`) or a url shortcut (`.url`).

Parameters

- **path** (*str*) -- The full path to the shortcut. Must have a *.lnk* or *.url* file extension.
- **target** (*str, optional*) -- The full path to the target
- **arguments** (*str, optional*) -- Any arguments to be passed to the target
- **description** (*str, optional*) -- The description for the shortcut. This is shown in the `Comment` field of the dialog box. Default is an empty string
- **hot_key** (*str, optional*) -- A combination of hot Keys to trigger this shortcut. This is something like `Ctrl+Alt+D`. This is shown in the `Shortcut key` field in the dialog box. Default is an empty string. Available options are:
  - Ctrl
  - Alt
  - Shift
  - Ext
- **icon_index** (*int, optional*) -- The index for the icon to use in files that contain multiple icons. Default is 0
- **icon_location** (*str, optional*) -- The full path to a file containing icons. This is shown in the `Change Icon` dialog box by clicking the `Change Icon` button. If no file is specified and a binary is passed as the target, Windows will attempt to get the icon from the binary file. Default is an empty string
- **window_style** (*str, optional*) -- The window style the program should start in. This is shown in the `Run` field of the dialog box. Default is `Normal`. Valid options are:
  - Normal
  - Minimized
  - Maximized
- **working_dir** (*str, optional*) -- The full path to the working directory for the program to run in. This is shown in the `Start in` field of the dialog box.

Returns

True if successful

Return type

bool

CLI Example:

```
# Modify an existing shortcut. Set it to target notepad.exe
salt * shortcut.modify "C:\path\to\shortcut.lnk" "C:\Windows\notepad.exe"
```

26.6.249 salt.modules.win_smtp_server

Module for managing IIS SMTP server configuration on Windows servers. The Windows features 'SMTP-Server' and 'Web-WMI' must be installed.

depends
wmi

`salt.modules.win_smtp_server.`**`get_connection_ip_list`**`(`*as_wmi_format=False, server='SmtpSvc/1'*`)`

Get the IPGrant list for the SMTP virtual server.

Parameters

- **`as_wmi_format`** (*`bool`*) -- Returns the connection IPs as a list in the format WMI expects.
- **`server`** (*`str`*) -- The SMTP server name.

Returns
A dictionary of the IP and subnet pairs.

Return type
dict

CLI Example:

```
salt '*' win_smtp_server.get_connection_ip_list
```

`salt.modules.win_smtp_server.`**`get_log_format`**`(`*server='SmtpSvc/1'*`)`

Get the active log format for the SMTP virtual server.

Parameters
`server` (*`str`*) -- The SMTP server name.

Returns
A string of the log format name.

Return type
str

CLI Example:

```
salt '*' win_smtp_server.get_log_format
```

`salt.modules.win_smtp_server.`**`get_log_format_types`**`()`

Get all available log format names and ids.

Returns
A dictionary of the log format names and ids.

Return type
dict

CLI Example:

```
salt '*' win_smtp_server.get_log_format_types
```

`salt.modules.win_smtp_server.`**`get_relay_ip_list`**`(`*server='SmtpSvc/1'*`)`

Get the RelayIpList list for the SMTP virtual server.

Parameters
`server` (*`str`*) -- The SMTP server name.

Returns
A list of the relay IPs.

Return type
list

Note: A return value of None corresponds to the restrictive 'Only the list below' GUI parameter with an empty access list, and setting an empty list/tuple corresponds to the more permissive 'All except the list below' GUI parameter.

CLI Example:

```
salt '*' win_smtp_server.get_relay_ip_list
```

`salt.modules.win_smtp_server.`**`get_server_setting`**`(`*settings, server='SmtpSvc/1'*`)`

Get the value of the setting for the SMTP virtual server.

Parameters

- **settings** (*str*) -- A list of the setting names.
- **server** (*str*) -- The SMTP server name.

Returns

A dictionary of the provided settings and their values.

Return type

dict

CLI Example:

```
salt '*' win_smtp_server.get_server_setting settings="['MaxRecipients']"
```

`salt.modules.win_smtp_server.`**`get_servers`**`()`

Get the SMTP virtual server names.

Returns

A list of the SMTP virtual servers.

Return type

list

CLI Example:

```
salt '*' win_smtp_server.get_servers
```

`salt.modules.win_smtp_server.`**`set_connection_ip_list`**`(`*addresses=None, grant_by_default=False, server='SmtpSvc/1'*`)`

Set the IPGrant list for the SMTP virtual server.

Parameters

- **addresses** (*str*) -- A dictionary of IP + subnet pairs.
- **grant_by_default** (*bool*) -- Whether the addresses should be a blacklist or whitelist.
- **server** (*str*) -- The SMTP server name.

Returns

A boolean representing whether the change succeeded.

Return type

bool

CLI Example:

```
salt '*' win_smtp_server.set_connection_ip_list addresses="{'127.0.0.1':
↪'255.255.255.255'}"
```

`salt.modules.win_smtp_server.`**`set_log_format`**`(`*log_format, server='SmtpSvc/1'*`)`

Set the active log format for the SMTP virtual server.

Parameters

- **log_format** (*str*) -- The log format name.
- **server** (*str*) -- The SMTP server name.

Returns
A boolean representing whether the change succeeded.

Return type
bool

CLI Example:

```
salt '*' win_smtp_server.set_log_format 'Microsoft IIS Log File Format'
```

salt.modules.win_smtp_server.**set_relay_ip_list**(*addresses=None, server='SmtpSvc/1'*)

Set the RelayIpList list for the SMTP virtual server.

Due to the unusual way that Windows stores the relay IPs, it is advisable to retrieve the existing list you wish to set from a pre-configured server.

For example, setting '127.0.0.1' as an allowed relay IP through the GUI would generate an actual relay IP list similar to the following:

```
['24.0.0.128', '32.0.0.128', '60.0.0.128', '68.0.0.128', '1.0.0.0', '76.0.
↪0.0',
 '0.0.0.0', '0.0.0.0', '1.0.0.0', '1.0.0.0', '2.0.0.0', '2.0.0.0', '4.0.0.
↪0',
 '0.0.0.0', '76.0.0.128', '0.0.0.0', '0.0.0.0', '0.0.0.0', '0.0.0.0',
 '255.255.255.255', '127.0.0.1']
```

Note: Setting the list to None corresponds to the restrictive 'Only the list below' GUI parameter with an empty access list configured, and setting an empty list/tuple corresponds to the more permissive 'All except the list below' GUI parameter.

Parameters
- **addresses** (*str*) -- A list of the relay IPs. The order of the list is important.
- **server** (*str*) -- The SMTP server name.

Returns
A boolean representing whether the change succeeded.

Return type
bool

CLI Example:

```
salt '*' win_smtp_server.set_relay_ip_list addresses="['192.168.1.1',
↪'172.16.1.1']"
```

salt.modules.win_smtp_server.**set_server_setting**(*settings, server='SmtpSvc/1'*)

Set the value of the setting for the SMTP virtual server.

Note: The setting names are case-sensitive.

Parameters
- **settings** (*str*) -- A dictionary of the setting names and their values.
- **server** (*str*) -- The SMTP server name.

Returns
A boolean representing whether all changes succeeded.

Return type
bool

CLI Example:

```
salt '*' win_smtp_server.set_server_setting settings="{'MaxRecipients':
↪'500'}"
```

26.6.250 salt.modules.win_snmp

Module for managing SNMP service settings on Windows servers. The Windows feature 'SNMP-Service' must be installed.

`salt.modules.win_snmp.`**`get_agent_service_types`**`()`

Get the sysServices types that can be configured.

Returns
A list of service types.

Return type
list

CLI Example:

```
salt '*' win_snmp.get_agent_service_types
```

`salt.modules.win_snmp.`**`get_agent_settings`**`()`

Determine the value of the SNMP sysContact, sysLocation, and sysServices settings.

Returns
A dictionary of the agent settings.

Return type
dict

CLI Example:

```
salt '*' win_snmp.get_agent_settings
```

`salt.modules.win_snmp.`**`get_auth_traps_enabled`**`()`

Determine whether the host is configured to send authentication traps.

Returns
True if traps are enabled, otherwise False

Return type
bool

CLI Example:

```
salt '*' win_snmp.get_auth_traps_enabled
```

`salt.modules.win_snmp.`**`get_community_names`**`()`

Get the current accepted SNMP community names and their permissions.

If community names are being managed by Group Policy, those values will be returned instead like this:

```
TestCommunity:
    Managed by GPO
```

Community names managed normally will denote the permission instead:

```
TestCommunity:
    Read Only
```

Returns
A dictionary of community names and permissions.

Return type
dict

CLI Example:

```
salt '*' win_snmp.get_community_names
```

`salt.modules.win_snmp.`**`get_permission_types`**`()`

Get the permission types that can be configured for communities.

Returns
A list of permission types.

Return type
list

CLI Example:

```
salt '*' win_snmp.get_permission_types
```

`salt.modules.win_snmp.`**`set_agent_settings`**`(`*contact=None*, *location=None*, *services=None*`)`

Manage the SNMP sysContact, sysLocation, and sysServices settings.

Parameters

- **`contact`** (*`str`*, *`optional`*) -- The SNMP contact.
- **`location`** (*`str`*, *`optional`*) -- The SNMP location.
- **`services`** (*`list`*, *`optional`*) -- A list of selected services. The possible service names can be found via `win_snmp.get_agent_service_types`. To disable all services pass a list of None, ie: ['None']

Returns
True if successful, otherwise False

Return type
bool

CLI Example:

```
salt '*' win_snmp.set_agent_settings contact='Contact Name' location=
↪'Place' services="['Physical']"
```

`salt.modules.win_snmp.`**`set_auth_traps_enabled`**`(`*status=True*`)`

Manage the sending of authentication traps.

Parameters
`status` (*`bool`*) -- True to enable traps. False to disable.

Returns
True if successful, otherwise False

Return type
bool

CLI Example:

```
salt '*' win_snmp.set_auth_traps_enabled status='True'
```

`salt.modules.win_snmp.`**`set_community_names`**`(`*communities*`)`

Manage the SNMP accepted community names and their permissions.

Note: Settings managed by Group Policy will always take precedence over those set using the SNMP interface. Therefore if this function finds Group Policy settings it will raise a CommandExecutionError

---

Parameters
: **`communities`** (*dict*) -- A dictionary of SNMP community names and permissions. The possible permissions can be found via `win_snmp.get_permission_types`.

Returns
: True if successful, otherwise False

Return type
: bool

Raises
: ***`CommandExecutionError`*** -- If SNMP settings are being managed by Group Policy

CLI Example:

```
salt '*' win_snmp.set_community_names communities="{'TestCommunity':
↪'Read Only'}'
```

26.6.251 salt.modules.win_status

Module for returning various status data about a minion. These data can be useful for compiling into stats later, or for problem solving if your minion is having problems.

New in version 0.12.0.

depends

- wmi

`salt.modules.win_status.`**`cpuload`**`()`

New in version 2015.8.0.

Return the processor load as a percentage

CLI Example:

```
salt '*' status.cpuload
```

`salt.modules.win_status.`**`cpustats`**`()`

Return information about the CPU.

Returns
dict: A dictionary containing information about the CPU stats

CLI Example:

```
salt * status.cpustats
```

`salt.modules.win_status.`**`diskusage`**`(`*human_readable=False*, *path=None*`)`

New in version 2015.8.0.

Return the disk usage for this minion

human_readable
[False] If `True`, usage will be in KB/MB/GB etc.

CLI Example:

```
salt '*' status.diskusage path=c:/salt
```

`salt.modules.win_status.`**`loadavg`**`()`

Returns counter information related to the load of the machine

Returns
A dictionary of counters

Return type
dict

CLI Example:

```
salt * status.loadavg
```

`salt.modules.win_status.`**`master`**`(`*master=None*, *connected=True*`)`

New in version 2015.5.0.

Fire an event if the minion gets disconnected from its master. This function is meant to be run via a scheduled job from the minion. If master_ip is an FQDN/Hostname, is must be resolvable to a valid IPv4 address.

CLI Example:

```
salt '*' status.master
```

`salt.modules.win_status.`**`meminfo`**`()`

Return information about physical and virtual memory on the system

Returns
A dictionary of information about memory on the system

Return type
dict

CLI Example:

```
salt * status.meminfo
```

`salt.modules.win_status.`**`procs`**`(`*count=False*`)`

Return the process data

count
[False] If `True`, this function will simply return the number of processes.

New in version 2015.8.0.

CLI Example:

```
salt '*' status.procs
salt '*' status.procs count
```

`salt.modules.win_status.`**`saltmem`**`(`*human_readable=False*`)`

New in version 2015.8.0.

Returns the amount of memory that salt is using

human_readable
[False] return the value in a nicely formatted number

CLI Example:

```
salt '*' status.saltmem
salt '*' status.saltmem human_readable=True
```

`salt.modules.win_status.`**`uptime`**`(`*human_readable=False*`)`

New in version 2015.8.0.

Return the system uptime for the machine

Parameters

`human_readable` (*bool*) -- Return uptime in human readable format if `True`, otherwise return seconds. Default is `False`

Note: Human readable format is `days, hours:min:sec`. Days will only be displayed if more than 0

Returns

The uptime in seconds or human readable format depending on the value of `human_readable`

Return type

str

CLI Example:

```
salt '*' status.uptime
salt '*' status.uptime human_readable=True
```

`salt.modules.win_status.`**`vmstats`**`()`

Return information about the virtual memory on the machine

Returns

A dictionary of virtual memory stats

Return type

dict

CLI Example:

```
salt * status.vmstats
```

26.6.252 salt.modules.win_system

Module for managing Windows systems and getting Windows system information. Support for reboot, shutdown, join domain, rename

depends

- pywintypes
- win32api
- win32con
- win32net
- wmi

`salt.modules.win_system.`**`get_computer_desc`**`()`

Get the Windows computer description

Returns

Returns the computer description if found. Otherwise returns `False`.

Return type

str

CLI Example:

```
salt 'minion-id' system.get_computer_desc
```

`salt.modules.win_system.`**`get_computer_description`**`()`

This function is an alias of `get_computer_desc`.

Get the Windows computer description

Returns:

str: Returns the computer description if found. Otherwise returns `False`.

CLI Example:

```
salt 'minion-id' system.get_computer_desc
```

`salt.modules.win_system.`**`get_computer_name`**`()`

Get the Windows computer name

Returns

Returns the computer name if found. Otherwise returns `False`.

Return type

str

CLI Example:

```
salt 'minion-id' system.get_computer_name
```

`salt.modules.win_system.`**`get_domain_workgroup`**`()`

Get the domain or workgroup the computer belongs to.

New in version 2015.5.7.

New in version 2015.8.2.

Returns

The name of the domain or workgroup

Return type

str

CLI Example:

```
salt 'minion-id' system.get_domain_workgroup
```

`salt.modules.win_system.`**`get_hostname`**`()`

Get the hostname of the windows minion

New in version 2016.3.0.

Returns

Returns the hostname of the windows minion

Return type

str

CLI Example:

```
salt 'minion-id' system.get_hostname
```

`salt.modules.win_system.`**`get_pending_component_servicing`**`()`

Determine whether there are pending Component Based Servicing tasks that require a reboot.

New in version 2016.11.0.

Returns

`True` if there are pending Component Based Servicing tasks, otherwise `False`

Return type

bool

CLI Example:

```
salt '*' system.get_pending_component_servicing
```

`salt.modules.win_system.`**`get_pending_computer_name`**`()`

Get a pending computer name. If the computer name has been changed, and the change is pending a system reboot, this function will return the pending computer name. Otherwise, `None` will be returned. If there was an error retrieving the pending computer name, `False` will be returned, and an error message will be logged to the minion log.

Returns
Returns the pending name if pending restart. Returns `None` if not pending restart.

Return type
str

CLI Example:

```
salt 'minion-id' system.get_pending_computer_name
```

`salt.modules.win_system.`**`get_pending_domain_join`**`()`

Determine whether there is a pending domain join action that requires a reboot.

New in version 2016.11.0.

Returns
`True` if there is a pending domain join action, otherwise `False`

Return type
bool

CLI Example:

```
salt '*' system.get_pending_domain_join
```

`salt.modules.win_system.`**`get_pending_file_rename`**`()`

Determine whether there are pending file rename operations that require a reboot.

New in version 2016.11.0.

Returns
`True` if there are pending file rename operations, otherwise `False`

Return type
bool

CLI Example:

```
salt '*' system.get_pending_file_rename
```

`salt.modules.win_system.`**`get_pending_reboot`**`()`

Determine whether there is a reboot pending.

New in version 2016.11.0.

Returns
`True` if the system is pending reboot, otherwise `False`

Return type
bool

CLI Example:

```
salt '*' system.get_pending_reboot
```

`salt.modules.win_system.`**`get_pending_reboot_details`**`()`

Determine which check is signalling that the system is pending a reboot. Useful in determining why your system is signalling that it needs a reboot.

New in version 3001.

Returns
A dictionary of the results of each system that would indicate a pending reboot

Return type
dict

CLI Example:

```
salt '*' system.get_pending_reboot_details
```

salt.modules.win_system.**get_pending_servermanager**()

Determine whether there are pending Server Manager tasks that require a reboot.

New in version 2016.11.0.

Returns
`True` if there are pending Server Manager tasks, otherwise `False`

Return type
bool

CLI Example:

```
salt '*' system.get_pending_servermanager
```

salt.modules.win_system.**get_pending_update**()

Determine whether there are pending updates that require a reboot.

New in version 2016.11.0.

Returns
`True` if there are pending updates, otherwise `False`

Return type
bool

CLI Example:

```
salt '*' system.get_pending_update
```

salt.modules.win_system.**get_pending_windows_update**()

Check the Windows Update system for a pending reboot state.

This leverages the Windows Update System to determine if the system is pending a reboot.

New in version 3001.

Returns
`True` if the Windows Update system reports a pending update, otherwise `False`

Return type
bool

CLI Example:

```
salt '*' system.get_pending_windows_update
```

salt.modules.win_system.**get_reboot_required_witnessed**()

Determine if at any time during the current boot session the salt minion witnessed an event indicating that a reboot is required.

This function will return `True` if an install completed with exit code 3010 during the current boot session and can be extended where appropriate in the future.

New in version 2016.11.0.

Returns
`True` if the `Requires reboot` registry flag is set to `1`, otherwise `False`

Return type
bool

CLI Example:

```
salt '*' system.get_reboot_required_witnessed
```

`salt.modules.win_system.`**`get_system_date`**`()`

Get the Windows system date

Returns
Returns the system date

Return type
str

CLI Example:

```
salt '*' system.get_system_date
```

`salt.modules.win_system.`**`get_system_info`**`()`

Get system information.

Note: Not all system info is available across all versions of Windows. If it is not available on an older version, it will be skipped

---

Returns
Dictionary containing information about the system to include name, description, version, etc...

Return type
dict

CLI Example:

```
salt 'minion-id' system.get_system_info
```

`salt.modules.win_system.`**`get_system_time`**`()`

Get the system time.

Returns
Returns the system time in HH:MM:SS AM/PM format.

Return type
str

CLI Example:

```
salt 'minion-id' system.get_system_time
```

`salt.modules.win_system.`**`halt`**`(`*timeout=5, in_seconds=False*`)`

Halt a running system.

Parameters

- **`timeout`** (*`int`*) -- Number of seconds before halting the system. Default is 5 seconds.
- **`in_seconds`** (*`bool`*) -- Whether to treat timeout as seconds or minutes.

  New in version 2015.8.0.

Returns
`True` if successful, otherwise `False`

Return type
bool

CLI Example:

```
salt '*' system.halt 5 True
```

`salt.modules.win_system.`**`init`**(*runlevel*)

Change the system runlevel on sysV compatible systems. Not applicable to Windows

CLI Example:

```
salt '*' system.init 3
```

`salt.modules.win_system.`**`join_domain`**(*domain, username=None, password=None, account_ou=None, account_exists=False, restart=False*)

Join a computer to an Active Directory domain. Requires a reboot.

Parameters

- **`domain`** (*`str`*) -- The domain to which the computer should be joined, e.g. `example.com`
- **`username`** (*`str`*) -- Username of an account which is authorized to join computers to the specified domain. Needs to be either fully qualified like `user@domain.tld` or simply `user`
- **`password`** (*`str`*) -- Password of the specified user
- **`account_ou`** (*`str`*) -- The DN of the OU below which the account for this computer should be created when joining the domain, e.g. `ou=computers,ou=departm_432,dc=my-company,dc=com`
- **`account_exists`** (*`bool`*) -- If set to `True` the computer will only join the domain if the account already exists. If set to `False` the computer account will be created if it does not exist, otherwise it will use the existing account. Default is `False`
- **`restart`** (*`bool`*) -- `True` will restart the computer after a successful join. Default is `False`

New in version 2015.5.7,2015.8.2.

Returns

Returns a dictionary if successful, otherwise `False`

Return type

dict

CLI Example:

```
salt 'minion-id' system.join_domain domain='domain.tld' \
                 username='joinuser' password='joinpassword' \
                 account_ou='ou=clients,ou=org,dc=domain,dc=tld' \
                 account_exists=False, restart=True
```

`salt.modules.win_system.`**`lock`**()

Lock the workstation.

Returns

`True` if successful, otherwise `False`

Return type

bool

CLI Example:

```
salt 'minion-id' system.lock
```

`salt.modules.win_system.`**`poweroff`**(*timeout=5, in_seconds=False*)

Power off a running system.

Parameters

- **timeout** (*int*) -- Number of seconds before powering off the system. Default is 5 seconds.
- **in_seconds** (*bool*) -- Whether to treat timeout as seconds or minutes.

  New in version 2015.8.0.

Returns
`True` if successful, otherwise `False`

Return type
bool

CLI Example:

```
salt '*' system.poweroff 5
```

`salt.modules.win_system.`**reboot**(*timeout=5*, *in_seconds=False*, *wait_for_reboot=False*, *only_on_pending_reboot=False*)

Reboot a running system.

Parameters

- **timeout** (*int*) -- The number of minutes/seconds before rebooting the system. Use of minutes or seconds depends on the value of `in_seconds`. Default is 5 minutes.
- **in_seconds** (*bool*) --
  True will cause the timeout parameter to be in seconds.
  `False` will be in minutes. Default is `False`.
  New in version 2015.8.0.
- **wait_for_reboot** (*bool*) -- `True` will sleep for timeout + 30 seconds after reboot has been initiated. This is useful for use in a highstate. For example, you may have states that you want to apply only after the reboot. Default is `False`.

  New in version 2015.8.0.
- **only_on_pending_reboot** (*bool*) -- If this is set to `True`, then the reboot will only proceed if the system reports a pending reboot. Setting this parameter to `True` could be useful when calling this function from a final housekeeping state intended to be executed at the end of a state run (using *order: last*). Default is `False`.

Returns
`True` if successful (a reboot will occur), otherwise `False`

Return type
bool

CLI Example:

```
salt '*' system.reboot 5
salt '*' system.reboot 5 True
```

Invoking this function from a final housekeeping state:

```
final_housekeeping:
   module.run:
      - name: system.reboot
      - only_on_pending_reboot: True
      - order: last
```

`salt.modules.win_system.`**set_computer_desc**(*desc=None*)

Set the Windows computer description

Parameters
desc (*str*) -- The computer description

Returns
Description if successful, otherwise `False`

Return type
str

CLI Example:

```
salt 'minion-id' system.set_computer_desc 'This computer belongs to Dave!'
```

`salt.modules.win_system.`**`set_computer_description`**(*desc=None*)

This function is an alias of `set_computer_desc`.

Set the Windows computer description

Args:

desc (str):

The computer description

Returns:

str: Description if successful, otherwise `False`

CLI Example:

```
salt 'minion-id' system.set_computer_desc 'This computer belongs⤶
↪to Dave!'
```

`salt.modules.win_system.`**`set_computer_name`**(*name*)

Set the Windows computer name

Parameters

`name` (*`str`*) -- The new name to give the computer. Requires a reboot to take effect.

Returns

Returns a dictionary containing the old and new names if successful. `False` if not.

Return type
dict

CLI Example:

```
salt 'minion-id' system.set_computer_name 'DavesComputer'
```

`salt.modules.win_system.`**`set_domain_workgroup`**(*workgroup*)

Set the domain or workgroup the computer belongs to.

New in version 3001.

Returns

`True` if successful, otherwise `False`

Return type
bool

CLI Example:

```
salt 'minion-id' system.set_domain_workgroup LOCAL
```

`salt.modules.win_system.`**`set_hostname`**(*hostname*)

Set the hostname of the windows minion, requires a restart before this will be updated.

New in version 2016.3.0.

Parameters

`hostname` (*`str`*) -- The hostname to set

Returns

`True` if successful, otherwise `False`

Return type
bool

CLI Example:

```
salt 'minion-id' system.set_hostname newhostname
```

`salt.modules.win_system.`**`set_reboot_required_witnessed`**`()`

This function is used to remember that an event indicating that a reboot is required was witnessed. This function relies on the salt-minion's ability to create the following volatile registry key in the *HKLM* hive:

SYSTEM\CurrentControlSet\Services\salt-minion\Volatile-Data

Because this registry key is volatile, it will not persist beyond the current boot session. Also, in the scope of this key, the name *'Reboot required'* will be assigned the value of *1*.

For the time being, this function is being used whenever an install completes with exit code 3010 and can be extended where appropriate in the future.

New in version 2016.11.0.

Returns

`True` if successful, otherwise `False`

Return type

bool

CLI Example:

```
salt '*' system.set_reboot_required_witnessed
```

`salt.modules.win_system.`**`set_system_date`**`(`*newdate*`)`

Set the Windows system date. Use <mm-dd-yy> format for the date.

Parameters

`newdate` (*`str`*) -- The date to set. Can be any of the following formats

- YYYY-MM-DD
- MM-DD-YYYY
- MM-DD-YY
- MM/DD/YYYY
- MM/DD/YY
- YYYY/MM/DD

Returns

`True` if successful, otherwise `False`

Return type

bool

CLI Example:

```
salt '*' system.set_system_date '03-28-13'
```

`salt.modules.win_system.`**`set_system_date_time`**`(`*years=None*, *months=None*, *days=None*, *hours=None*, *minutes=None*, *seconds=None*`)`

Set the system date and time. Each argument is an element of the date, but not required. If an element is not passed, the current system value for that element will be used. For example, if you don't pass the year, the current system year will be used. (Used by set_system_date and set_system_time)

Parameters

- **`years`** (*`int`*) -- Years digit, ie: 2015
- **`months`** (*`int`*) -- Months digit: 1 - 12
- **`days`** (*`int`*) -- Days digit: 1 - 31
- **`hours`** (*`int`*) -- Hours digit: 0 - 23
- **`minutes`** (*`int`*) -- Minutes digit: 0 - 59
- **`seconds`** (*`int`*) -- Seconds digit: 0 - 59

Returns

`True` if successful, otherwise `False`

Return type
bool

CLI Example:

```
salt '*' system.set_system_date_ time 2015 5 12 11 37 53
```

`salt.modules.win_system.`**`set_system_time`**(*newtime*)

Set the system time.

Parameters

`newtime` (*`str`*) -- The time to set. Can be any of the following formats:

- HH:MM:SS AM/PM
- HH:MM AM/PM
- HH:MM:SS (24 hour)
- HH:MM (24 hour)

Returns
`True` if successful, otherwise `False`

Return type
bool

CLI Example:

```
salt 'minion-id' system.set_system_time 12:01
```

`salt.modules.win_system.`**`shutdown`**(*message=None*, *timeout=5*, *force_close=True*, *reboot=False*, *in_seconds=False*, *only_on_pending_reboot=False*)

Shutdown a running system.

Parameters

- **`message`** (*`str`*) -- The message to display to the user before shutting down.
- **`timeout`** (*`int`*) -- The length of time (in seconds) that the shutdown dialog box should be displayed. While this dialog box is displayed, the shutdown can be aborted using the `system.shutdown_abort` function.

  If timeout is not zero, InitiateSystemShutdown displays a dialog box on the specified computer. The dialog box displays the name of the user who called the function, the message specified by the lpMessage parameter, and prompts the user to log off. The dialog box beeps when it is created and remains on top of other windows (system modal). The dialog box can be moved but not closed. A timer counts down the remaining time before the shutdown occurs.

  If timeout is zero, the computer shuts down immediately without displaying the dialog box and cannot be stopped by `system.shutdown_abort`.

  Default is 5 minutes
- **`in_seconds`** (*`bool`*) --
  `True` will cause the `timeout` parameter to be in seconds.
  `False` will be in minutes. Default is `False`.
  New in version 2015.8.0.
- **`force_close`** (*`bool`*) -- `True` will force close all open applications. `False` will display a dialog box instructing the user to close open applications. Default is `True`.
- **`reboot`** (*`bool`*) -- `True` restarts the computer immediately after shutdown. `False` powers down the system. Default is `False`.
- **`only_on_pending_reboot`** (*`bool`*) -- If this is set to True, then the shutdown will only proceed if the system reports a pending reboot. To optionally shutdown in a highstate, consider using the shutdown state instead of this module.
- **`only_on_pending_reboot`** -- If `True` the shutdown will only proceed if there is a reboot pending. `False` will shutdown the system. Default is `False`.

Returns
`True` if successful (a shutdown or reboot will occur), otherwise `False`

Return type
bool

CLI Example:

```
salt '*' system.shutdown "System will shutdown in 5 minutes"
```

`salt.modules.win_system.`**`shutdown_abort`**`()`

Abort a shutdown. Only available while the dialog box is being displayed to the user. Once the shutdown has initiated, it cannot be aborted.

Returns
`True` if successful, otherwise `False`

Return type
bool

CLI Example:

```
salt 'minion-id' system.shutdown_abort
```

`salt.modules.win_system.`**`shutdown_hard`**`()`

Shutdown a running system with no timeout or warning.

Returns
`True` if successful, otherwise `False`

Return type
bool

CLI Example:

```
salt '*' system.shutdown_hard
```

`salt.modules.win_system.`**`start_time_service`**`()`

Start the Windows time service

Returns
`True` if successful, otherwise `False`

Return type
bool

CLI Example:

```
salt '*' system.start_time_service
```

`salt.modules.win_system.`**`stop_time_service`**`()`

Stop the Windows time service

Returns
`True` if successful, otherwise `False`

Return type
bool

CLI Example:

```
salt '*' system.stop_time_service
```

`salt.modules.win_system.`**`unjoin_domain`**`(`*username=None, password=None, domain=None, workgroup='WORKGROUP', disable=False, restart=False*`)`

Unjoin a computer from an Active Directory Domain. Requires a restart.

Parameters

- **`username`** (*`str`*) -- Username of an account which is authorized to manage computer accounts on the domain. Needs to be a fully qualified name like `user@domain.tld` or `domain.tld\user`. If the domain is not specified, the passed domain will be used. If the computer account doesn't need to be disabled after the computer is unjoined, this can be `None`.
- **`password`** (*`str`*) -- The password of the specified user
- **`domain`** (*`str`*) -- The domain from which to unjoin the computer. Can be `None`
- **`workgroup`** (*`str`*) -- The workgroup to join the computer to. Default is `WORKGROUP`

  New in version 2015.5.7,2015.8.2.
- **`disable`** (*`bool`*) -- `True` to disable the computer account in Active Directory. Default is `False`
- **`restart`** (*`bool`*) -- `True` will restart the computer after successful unjoin. Default is `False`

  New in version 2015.5.7,2015.8.2.

Returns
Returns a dictionary if successful, otherwise `False`

Return type
dict

CLI Example:

```
salt 'minion-id' system.unjoin_domain restart=True

salt 'minion-id' system.unjoin_domain username='unjoinuser' \
                 password='unjoinpassword' disable=True \
                 restart=True
```

26.6.253 salt.modules.win_task

Windows Task Scheduler Module .. versionadded:: 2016.3.0

A module for working with the Windows Task Scheduler. You can add and edit existing tasks. You can add and clear triggers and actions. You can list all tasks, folders, triggers, and actions.

`salt.modules.win_task.`**`add_action`**(*name=None, location='\\', action_type='Execute', **kwargs*)

Add an action to a task.

Parameters

- **`name`** (*`str`*) -- The name of the task to which to add the action.
- **`location`** (*`str`*) -- A string value representing the location of the task. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).
- **`action_type`** (*`str`*) -- The type of action to add. There are three action types. Each one requires its own set of Keyword Arguments (kwargs). Valid values are:
  - Execute
  - Email
  - Message

Required arguments for each action_type:

Execute
Execute a command or an executable

cmd (str):
(required) The command or executable to run.

arguments (str):
(optional) Arguments to be passed to the command or executable. To launch a

script the first command will need to be the interpreter for the script. For example, to run a vbscript you would pass `cscript.exe` in the `cmd` parameter and pass the script in the `arguments` parameter as follows:

- `cmd='cscript.exe' arguments='c:\scripts\myscript.vbs'`

Batch files do not need an interpreter and may be passed to the cmd parameter directly.

start_in (str):
(optional) The current working directory for the command.

Email

Send and email. Requires `server`, `from`, and `to` or `cc`.

from (str): The sender

reply_to (str): Who to reply to

to (str): The recipient

cc (str): The CC recipient

bcc (str): The BCC recipient

subject (str): The subject of the email

body (str): The Message Body of the email

server (str): The server used to send the email

attachments (list):
A list of attachments. These will be the paths to the files to attach. ie: `attachments="['C:\attachment1.txt', 'C:\attachment2.txt']"`

Message

Display a dialog box. The task must be set to "Run only when user is logged on" in order for the dialog box to display. Both parameters are required.

title (str):
The dialog box title.

message (str):
The dialog box message body

Returns
A dictionary containing the task configuration

Return type
dict

CLI Example:

```
salt 'minion-id' task.add_action <task_name> cmd='del /Q /S C:\\Temp'
```

`salt.modules.win_task.`**`add_trigger`**(*name=None, location='\\', trigger_type=None, trigger_enabled=True, start_date=None, start_time=None, end_date=None, end_time=None, random_delay=None, repeat_interval=None, repeat_duration=None, repeat_stop_at_duration_end=False, execution_time_limit=None, delay=None, **kwargs*)

Add a trigger to a Windows Scheduled task

Note: Arguments are parsed by the YAML loader and are subject to yaml's idiosyncrasies. Therefore, time values in some formats (`%H:%M:%S` and `%H:%M`) should to be quoted. See YAML IDIOSYNCRASIES for more details.

Parameters

- **`name`** (*`str`*) -- The name of the task to which to add the trigger.
- **`location`** (*`str`*) -- A string value representing the location of the task. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).
- **`trigger_type`** (*`str`*) -- The type of trigger to create. This is defined when the trigger is created and cannot be changed later. Options are as follows:
  - Event
  - Once
  - Daily
  - Weekly
  - Monthly
  - MonthlyDay
  - OnIdle
  - OnTaskCreation
  - OnBoot
  - OnLogon
  - OnSessionChange
- **`trigger_enabled`** (*`bool`*) -- Boolean value that indicates whether the trigger is enabled.
- **`start_date`** (*`str`*) -- The date when the trigger is activated. If no value is passed, the current date will be used. Can be one of the following formats:
  - %Y-%m-%d
  - %m-%d-%y
  - %m-%d-%Y
  - %m/%d/%y
  - %m/%d/%Y
  - %Y/%m/%d
- **`start_time`** (*`str`*) -- The time when the trigger is activated. If no value is passed, midnight will be used. Can be one of the following formats:
  - %I:%M:%S %p
  - %I:%M %p
  - %H:%M:%S
  - %H:%M
- **`end_date`** (*`str`*) -- The date when the trigger is deactivated. The trigger cannot start the task after it is deactivated. Can be one of the following formats:
  - %Y-%m-%d
  - %m-%d-%y
  - %m-%d-%Y
  - %m/%d/%y
  - %m/%d/%Y
  - %Y/%m/%d
- **`end_time`** (*`str`*) -- The time when the trigger is deactivated. If this is not passed with `end_date` it will be set to midnight. Can be one of the following formats:
  - %I:%M:%S %p
  - %I:%M %p
  - %H:%M:%S
  - %H:%M
- **`random_delay`** (*`str`*) -- The delay time that is randomly added to the start time of the trigger. Valid values are:
  - 30 seconds
  - 1 minute

  - 30 minutes
  - 1 hour
  - 8 hours
  - 1 day

Note: This parameter applies to the following trigger types

  - Once
  - Daily
  - Weekly
  - Monthly
  - MonthlyDay

- **`repeat_interval`** (*`str`*) -- The amount of time between each restart of the task. Valid values are:
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour
- **`repeat_duration`** (*`str`*) -- How long the pattern is repeated. Valid values are:
  - Indefinitely
  - 15 minutes
  - 30 minutes
  - 1 hour
  - 12 hours
  - 1 day
- **`repeat_stop_at_duration_end`** (*`bool`*) -- Boolean value that indicates if a running instance of the task is stopped at the end of the repetition pattern duration.
- **`execution_time_limit`** (*`str`*) -- The maximum amount of time that the task launched by the trigger is allowed to run. Valid values are:
  - 30 minutes
  - 1 hour
  - 2 hours
  - 4 hours
  - 8 hours
  - 12 hours
  - 1 day
  - 3 days (default)
- **`delay`** (*`str`*) -- The time the trigger waits after its activation to start the task. Valid values are:
  - 15 seconds
  - 30 seconds
  - 1 minute
  - 30 minutes
  - 1 hour
  - 8 hours
  - 1 day

Note: This parameter applies to the following trigger types:

  - OnLogon
  - OnBoot
  - Event
  - OnTaskCreation
  - OnSessionChange

---

kwargs

There are optional keyword arguments determined by the type of trigger being defined. They are as follows:

Event

The trigger will be fired by an event.

subscription (str):

An event definition in xml format that fires the trigger. The easiest way to get this would is to create an event in Windows Task Scheduler and then copy the xml text.

Once

No special parameters required.

Daily

The task will run daily.

days_interval (int):

The interval between days in the schedule. An interval of 1 produces a daily schedule. An interval of 2 produces an every-other day schedule. If no interval is specified, 1 is used. Valid entries are 1 - 999.

Weekly

The task will run weekly.

weeks_interval (int):

The interval between weeks in the schedule. An interval of 1 produces a weekly schedule. An interval of 2 produces an every-other week schedule. If no interval is specified, 1 is used. Valid entries are 1 - 52.

days_of_week (list):

Sets the days of the week on which the task runs. Should be a list. ie: `['Monday','Wednesday','Friday']`. Valid entries are the names of the days of the week.

Monthly

The task will run monthly.

months_of_year (list):

Sets the months of the year during which the task runs. Should be a list. ie: `['January','July']`. Valid entries are the full names of all the months.

days_of_month (list):

Sets the days of the month during which the task runs. Should be a list. ie: `[1, 15, 'Last']`. Options are all days of the month 1 - 31 and the word 'Last' to indicate the last day of the month.

last_day_of_month (bool):

Boolean value that indicates that the task runs on the last day of the month regardless of the actual date of that day.

Note: You can set the task to run on the last day of the month by either including the word 'Last' in the list of days, or setting the parameter 'last_day_of_month' equal to `True`.

MonthlyDay

The task will run monthly on the specified day.

months_of_year (list):

Sets the months of the year during which the task runs. Should be a list. ie: `['January','July']`. Valid entries are the full names of all the months.

weeks_of_month (list):

Sets the weeks of the month during which the task runs. Should be a list. ie: `['First','Third']`. Valid options are:

    - First
    - Second
    - Third
    - Fourth

last_week_of_month (bool):
Boolean value that indicates that the task runs on the last week of the month.

days_of_week (list):
Sets the days of the week during which the task runs. Should be a list. ie: `['Monday','Wednesday','Friday']`. Valid entries are the names of the days of the week.

OnIdle
No special parameters required.

OnTaskCreation
No special parameters required.

OnBoot
No special parameters required.

OnLogon
No special parameters required.

OnSessionChange
The task will be triggered by a session change.

session_user_name (str):
Sets the user for the Terminal Server session. When a session state change is detected for this user, a task is started. To detect session status change for any user, do not pass this parameter.

state_change (str):
Sets the kind of Terminal Server session change that would trigger a task launch. Valid options are:

- ConsoleConnect: When you connect to a user session (switch users)
- ConsoleDisconnect: When you disconnect a user session (switch users)
- RemoteConnect: When a user connects via Remote Desktop
- RemoteDisconnect: When a user disconnects via Remote Desktop
- SessionLock: When the workstation is locked
- SessionUnlock: When the workstation is unlocked

Returns
`True` if successful, otherwise `False`

Return type
bool

CLI Example:

```
salt 'minion-id' task.add_trigger <task_name> trigger_type=Once trigger_
↪enabled=True start_date=2016/12/1 start_time='"12:01"'
```

`salt.modules.win_task.`**`clear_triggers`**`(`*name*, *location='\\'*`)`

Remove all triggers from the task.

Parameters

- **`name`** (*`str`*) -- The name of the task from which to clear all triggers.
- **`location`** (*`str`*) -- A string value representing the location of the task. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns
`True` if successful, otherwise `False`

Return type
bool

CLI Example:

```
salt 'minion-id' task.clear_trigger <task_name>
```

salt.modules.win_task.**create_folder**(*name*, *location='\\'*)

Create a folder in which to create tasks.

Parameters

- **name** (*str*) -- The name of the folder. This will be displayed in the task scheduler.
- **location** (*str*) -- A string value representing the location in which to create the folder. Default is \ which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns

`True` if successful, otherwise `False`

Return type

bool

CLI Example:

```
salt 'minion-id' task.create_folder <folder_name>
```

salt.modules.win_task.**create_task**(*name*, *location='\\'*, *user_name='System'*, *password=None*, *force=False*, ***kwargs*)

Create a new task in the designated location. This function has many keyword arguments that are not listed here. For additional arguments see:

- *edit_task()*
- *add_action()*
- *add_trigger()*

Parameters

- **name** (*str*) -- The name of the task. This will be displayed in the task scheduler.
- **location** (*str*) -- A string value representing the location in which to create the task. Default is \ which is the root for the task scheduler (`C:\Windows\System32\tasks`).
- **user_name** (*str*) -- The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.
- **password** (*str*) -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.
- **force** (*bool*) -- If the task exists, overwrite the existing task.

Returns

`True` if successful, otherwise `False`

Return type

bool

CLI Example:

```
salt 'minion-id' task.create_task <task_name> user_name=System force=True␣
↪action_type=Execute cmd='del /Q /S C:\\Temp' trigger_type=Once start_
↪date=2016-12-1 start_time='"01:00"'
```

salt.modules.win_task.**create_task_from_xml**(*name*, *location='\\'*, *xml_text=None*, *xml_path=None*, *user_name='System'*, *password=None*)

Create a task based on XML. Source can be a file or a string of XML.

Parameters

- **name** (*str*) -- The name of the task. This will be displayed in the task scheduler.
- **location** (*str*) -- A string value representing the location in which to create the task. Default is \ which is the root for the task scheduler (`C:\Windows\System32\tasks`).

- **xml_text** (*str*) -- A string of xml representing the task to be created. This will be overridden by `xml_path` if passed.
- **xml_path** (*str*) -- The path to an XML file on the local system containing the xml that defines the task. This will override `xml_text`
- **user_name** (*str*) -- The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.
- **password** (*str*) -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.

Returns

`True` if successful, otherwise `False` str: A string with the error message if there is an error

Return type

bool

Raises

- ***ArgumentValueError*** -- If arguments are invalid
- ***CommandExecutionError*** --

CLI Example:

```
salt '*' task.create_task_from_xml <task_name> xml_path=C:\task.xml
```

`salt.modules.win_task.`**`delete_folder`**(*name*, *location='\\'*)

Delete a folder from the task scheduler.

Parameters

- **name** (*str*) -- The name of the folder to delete.
- **location** (*str*) -- A string value representing the location of the folder. Default is \ which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns

`True` if successful, otherwise `False`

Return type

bool

CLI Example:

```
salt 'minion-id' task.delete_folder <folder_name>
```

`salt.modules.win_task.`**`delete_task`**(*name*, *location='\\'*)

Delete a task from the task scheduler.

Parameters

- **name** (*str*) -- The name of the task to delete.
- **location** (*str*) -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns

`True` if successful, otherwise `False`

Return type

bool

CLI Example:

```
salt 'minion-id' task.delete_task <task_name>
```

`salt.modules.win_task.`**`edit_task`**`(`*name=None*, *location='\\'*, *user_name=None*, *password=None*, *description=None*, *enabled=None*, *hidden=None*, *run_if_idle=None*, *idle_duration=None*, *idle_wait_timeout=None*, *idle_stop_on_end=None*, *idle_restart=None*, *ac_only=None*, *stop_if_on_batteries=None*, *wake_to_run=None*, *run_if_network=None*, *network_id=None*, *network_name=None*, *allow_demand_start=None*, *start_when_available=None*, *restart_every=None*, *restart_count=3*, *execution_time_limit=None*, *force_stop=None*, *delete_after=None*, *multiple_instances=None*, ***kwargs*`)`

Edit the parameters of a task. Triggers and Actions cannot be edited yet.

Parameters

- **name** (*str*) -- The name of the task. This will be displayed in the task scheduler.
- **location** (*str*) -- A string value representing the location in which to create the task. Default is \ which is the root for the task scheduler (`C:\Windows\System32\tasks`).
- **user_name** (*str*) -- The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.
- **password** (*str*) -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.

  Note: The combination of user_name and password determine how the task runs. For example, if a username is passed without at password the task will only run when the user is logged in. If a password is passed as well the task will run whether the user is logged on or not. If you pass 'System' as the username the task will run as the system account (the password parameter is ignored).

- **description** (*str*) -- A string representing the text that will be displayed in the description field in the task scheduler.
- **enabled** (*bool*) -- A boolean value representing whether or not the task is enabled.
- **hidden** (*bool*) -- A boolean value representing whether or not the task is hidden.
- **run_if_idle** (*bool*) -- Boolean value that indicates that the Task Scheduler will run the task only if the computer is in an idle state.
- **idle_duration** (*str*) -- A value that indicates the amount of time that the computer must be in an idle state before the task is run. Valid values are:
  - 1 minute
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour
- **idle_wait_timeout** (*str*) -- A value that indicates the amount of time that the Task Scheduler will wait for an idle condition to occur. Valid values are:
  - Do not wait
  - 1 minute
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour
  - 2 hours
- **idle_stop_on_end** (*bool*) -- Boolean value that indicates that the Task Scheduler will terminate the task if the idle condition ends before the task is completed.

- **idle_restart** (*bool*) -- Boolean value that indicates whether the task is restarted when the computer cycles into an idle condition more than once.
- **ac_only** (*bool*) -- Boolean value that indicates that the Task Scheduler will launch the task only while on AC power.
- **stop_if_on_batteries** (*bool*) -- Boolean value that indicates that the task will be stopped if the computer begins to run on battery power.
- **wake_to_run** (*bool*) -- Boolean value that indicates that the Task Scheduler will wake the computer when it is time to run the task.
- **run_if_network** (*bool*) -- Boolean value that indicates that the Task Scheduler will run the task only when a network is available.
- **network_id** (*guid*) -- GUID value that identifies a network profile.
- **network_name** (*str*) -- Sets the name of a network profile. The name is used for display purposes.
- **allow_demand_start** (*bool*) -- Boolean value that indicates that the task can be started by using either the Run command or the Context menu.
- **start_when_available** (*bool*) -- Boolean value that indicates that the Task Scheduler can start the task at any time after its scheduled time has passed.
- **restart_every** (*str*) -- A value that specifies the interval between task restart attempts. Valid values are:
  - False (to disable)
  - 1 minute
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour
  - 2 hours
- **restart_count** (*int*) -- The number of times the Task Scheduler will attempt to restart the task. Valid values are integers 1 - 999.
- **execution_time_limit** (*bool, str*) -- The amount of time allowed to complete the task. Valid values are:
  - False (to disable)
  - 1 hour
  - 2 hours
  - 4 hours
  - 8 hours
  - 12 hours
  - 1 day
  - 3 days
- **force_stop** (*bool*) -- Boolean value that indicates that the task may be terminated by using TerminateProcess.
- **delete_after** (*bool, str*) -- The amount of time that the Task Scheduler will wait before deleting the task after it expires. Requires a trigger with an expiration date. Valid values are:
  - False (to disable)
  - Immediately
  - 30 days
  - 90 days
  - 180 days
  - 365 days
- **multiple_instances** (*str*) -- Sets the policy that defines how the Task Scheduler deals with multiple instances of the task. Valid values are:
  - Parallel
  - Queue

- No New Instance
- Stop Existing

Returns
`True` if successful, otherwise `False`

Return type
bool

CLI Example:

```
salt '*' task.edit_task <task_name> description='This task is awesome'
```

`salt.modules.win_task.`**`info`**`(`*name*, *location='\\'*`)`

Get the details about a task in the task scheduler.

Parameters

- **name** (*str*) -- The name of the task for which to return the status
- **location** (*str*) -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns
A dictionary containing the task configuration

Return type
dict

CLI Example:

```
salt 'minion-id' task.info <task_name>
```

`salt.modules.win_task.`**`list_actions`**`(`*name*, *location='\\'*`)`

List all actions that pertain to a task in the specified location.

Parameters

- **name** (*str*) -- The name of the task for which list actions.
- **location** (*str*) -- A string value representing the location of the task from which to list actions. Default is \ which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns
Returns a list of actions.

Return type
list

CLI Example:

```
# List all actions for a task in the default location
salt 'minion-id' task.list_actions <task_name>

# List all actions for the XblGameSaveTask in the Microsoft\XblGameSave
# location
salt 'minion-id' task.list_actions XblGameSaveTask Microsoft\XblGameSave
```

`salt.modules.win_task.`**`list_folders`**`(`*location='\\'*`)`

List all folders located in a specific location in the task scheduler.

Parameters
location (*str*) -- A string value representing the folder from which you want to list tasks. Default is \ which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns
Returns a list of folders.

Return type
list

CLI Example:

```
# List all folders in the default location
salt 'minion-id' task.list_folders

# List all folders in the Microsoft directory
salt 'minion-id' task.list_folders Microsoft
```

`salt.modules.win_task.`**`list_tasks`**(*location='\\'*)

List all tasks located in a specific location in the task scheduler.

Parameters

`location` (*`str`*) -- A string value representing the folder from which you want to list tasks. Default is \ which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns

Returns a list of tasks

Return type

list

CLI Example:

```
# List all tasks in the default location
salt 'minion-id' task.list_tasks

# List all tasks in the Microsoft\XblGameSave Directory
salt 'minion-id' task.list_tasks Microsoft\XblGameSave
```

`salt.modules.win_task.`**`list_triggers`**(*name*, *location='\\'*)

List all triggers that pertain to a task in the specified location.

Parameters

- **`name`** (*`str`*) -- The name of the task for which list triggers.
- **`location`** (*`str`*) -- A string value representing the location of the task from which to list triggers. Default is \ which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns

Returns a list of triggers.

Return type

list

CLI Example:

```
# List all triggers for a task in the default location
salt 'minion-id' task.list_triggers <task_name>

# List all triggers for the XblGameSaveTask in the Microsoft\XblGameSave
# location
salt '*' task.list_triggers XblGameSaveTask Microsoft\XblGameSave
```

`salt.modules.win_task.`**`run`**(*name*, *location='\\'*)

Run a scheduled task manually.

Parameters

- **`name`** (*`str`*) -- The name of the task to run.
- **`location`** (*`str`*) -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns

`True` if successful, otherwise `False`

Return type
bool

CLI Example:

```
salt 'minion-id' task.run <task_name>
```

`salt.modules.win_task.`**`run_wait`**(*name*, *location='\\'*)

Run a scheduled task and return when the task finishes

Parameters

- **name** (*str*) -- The name of the task to run.
- **location** (*str*) -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns
`True` if successful, otherwise `False`

Return type
bool

CLI Example:

```
salt 'minion-id' task.run_wait <task_name>
```

`salt.modules.win_task.`**`status`**(*name*, *location='\\'*)

Determine the status of a task. Is it Running, Queued, Ready, etc.

Parameters

- **name** (*str*) -- The name of the task for which to return the status
- **location** (*str*) -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns

The current status of the task. Will be one of the following:

- Unknown
- Disabled
- Queued
- Ready
- Running

Return type
str

CLI Example:

```
salt 'minion-id' task.list_status <task_name>
```

`salt.modules.win_task.`**`stop`**(*name*, *location='\\'*)

Stop a scheduled task.

Parameters

- **name** (*str*) -- The name of the task to stop.
- **location** (*str*) -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns
`True` if successful, otherwise `False`

Return type
bool

CLI Example:

```
salt 'minion-id' task.list_stop <task_name>
```

26.6.254 salt.modules.win_timezone

Module for managing timezone on Windows systems.

class salt.modules.win_timezone.**TzMapper**(*unix_to_win*)

add(*k, v*)

get_unix(*key, default=None*)

get_win(*key, default=None*)

list_unix()

list_win()

remove(*k*)

salt.modules.win_timezone.**get_hwclock**()

Get current hardware clock setting (UTC or localtime)

Note: The hardware clock is always local time on Windows so this will always return "localtime"

CLI Example:

```
salt '*' timezone.get_hwclock
```

salt.modules.win_timezone.**get_offset**()

Get current numeric timezone offset from UTC (i.e. -0700)

Returns
Offset from UTC

Return type
str

CLI Example:

```
salt '*' timezone.get_offset
```

salt.modules.win_timezone.**get_zone**()

Get current timezone (i.e. America/Denver)

Returns
Timezone in unix format

Return type
str

Raises
CommandExecutionError -- If timezone could not be gathered

CLI Example:

```
salt '*' timezone.get_zone
```

salt.modules.win_timezone.**get_zonecode**()

Get current timezone (i.e. PST, MDT, etc)

Returns
An abbreviated timezone code

Return type
str

CLI Example:

```
salt '*' timezone.get_zonecode
```

`salt.modules.win_timezone.`**`list`**`(`*unix_style=True*`)`

Return a list of Timezones that this module supports. These can be in either Unix or Windows format.

New in version 2018.3.3.

Parameters

`unix_style` (*bool*) -- `True` returns Unix-style timezones. `False` returns Windows-style timezones. Default is `True`

Returns

A list of supported timezones

Return type

list

CLI Example:

```
# Unix-style timezones
salt '*' timezone.list

# Windows-style timezones
salt '*' timezone.list unix_style=False
```

`salt.modules.win_timezone.`**`set_hwclock`**`(`*clock*`)`

Sets the hardware clock to be either UTC or localtime

Note: The hardware clock is always local time on Windows so this will always return `False`

CLI Example:

```
salt '*' timezone.set_hwclock UTC
```

`salt.modules.win_timezone.`**`set_zone`**`(`*timezone*`)`

Sets the timezone using the tzutil.

Parameters

`timezone` (*str*) -- A valid timezone

Returns

`True` if successful, otherwise `False`

Return type

bool

Raises

`CommandExecutionError` -- If invalid timezone is passed

CLI Example:

```
salt '*' timezone.set_zone 'America/Denver'
```

`salt.modules.win_timezone.`**`zone_compare`**`(`*timezone*`)`

Compares the given timezone with the machine timezone. Mostly useful for running state checks.

Parameters

`timezone` (*str*) -- The timezone to compare. This can be in Windows or Unix format. Can be any of the values returned by the `timezone.list` function

Returns

`True` if they match, otherwise `False`

Return type
bool

Example:

```
salt '*' timezone.zone_compare 'America/Denver'
```

26.6.255 salt.modules.win_useradd

Module for managing Windows Users.

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to *'user.info' is not available*), see *here*.

---

depends

- pywintypes
- win32api
- win32con
- win32net
- win32netcon
- win32profile
- win32security
- win32ts
- wmi

Note: This currently only works with local user accounts, not domain accounts

---

`salt.modules.win_useradd.`**`add`**(*name, password=None, fullname=None, description=None, groups=None, home=None, homedrive=None, profile=None, logonscript=None*)

Add a user to the minion.

Parameters

- **name** (*str*) -- The username for the new account
- **password** (*str, optional*) -- User's password in plain text.
- **fullname** (*str, optional*) -- The user's full name.
- **description** (*str, optional*) -- A brief description of the user account.
- **groups** (*str, optional*) -- A list of groups to add the user to. (see chgroups)
- **home** (*str, optional*) -- The path to the user's home directory.
- **homedrive** (*str, optional*) -- The drive letter to assign to the home directory. Must be the Drive Letter followed by a colon. ie: U:
- **profile** (*str, optional*) -- An explicit path to a profile. Can be a UNC or a folder on the system. If left blank, windows uses its default profile directory.
- **logonscript** (*str, optional*) -- Path to a login script to run when the user logs on.

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' user.add name password
```

`salt.modules.win_useradd.`**`addgroup`**`(`*name*, *group*`)`

Add user to a group

Parameters

- **`name`** (*`str`*) -- The username to add to the group
- **`group`** (*`str`*) -- The name of the group to which to add the user

Returns

`True` if successful, otherwise `False`.

Return type

bool

CLI Example:

```
salt '*' user.addgroup jsnuffy 'Power Users'
```

`salt.modules.win_useradd.`**`chfullname`**`(`*name*, *fullname*`)`

Change the full name of the user

Parameters

- **`name`** (*`str`*) -- The username for which to change the full name
- **`fullname`** (*`str`*) -- The new value for the full name

Returns

`True` if successful, otherwise `False`.

Return type

bool

CLI Example:

```
salt '*' user.chfullname user 'First Last'
```

`salt.modules.win_useradd.`**`chgroups`**`(`*name*, *groups*, *append=True*`)`

Change the groups this user belongs to, add append=False to make the user a member of only the specified groups

Parameters

- **`name`** (*`str`*) -- The username for which to change groups
- **`groups`** (*`str, list`*) -- A single group or a list of groups to assign to the user. For multiple groups this can be a comma delimited string or a list.
- **`append`** (*`bool, optional`*) -- True adds the passed groups to the user's current groups. False sets the user's groups to the passed groups only. Default is True.

Returns

`True` if successful, otherwise `False`.

Return type

bool

CLI Example:

```
salt '*' user.chgroups jsnuffy Administrators,Users True
```

`salt.modules.win_useradd.`**`chhome`**`(`*name*, *home*, ***kwargs*`)`

Change the home directory of the user, pass True for persist to move files to the new home directory if the old home directory exist.

Parameters

- **`name`** (*`str`*) -- The name of the user whose home directory you wish to change
- **`home`** (*`str`*) -- The new location of the home directory

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' user.chhome foo \\fileserver\home\foo True
```

`salt.modules.win_useradd.`**`chprofile`**`(`*name*, *profile*`)`

Change the profile directory of the user

Parameters

- **`name`** (*`str`*) -- The name of the user whose profile you wish to change
- **`profile`** (*`str`*) -- The new location of the profile

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' user.chprofile foo \\fileserver\profiles\foo
```

`salt.modules.win_useradd.`**`current`**`(`*sam=False*`)`

Get the username that salt-minion is running under. If salt-minion is running as a service it should return the Local System account. If salt is running from a command prompt it should return the username that started the command prompt.

New in version 2015.5.6.

Parameters
`sam` (*`bool, optional`*) -- False returns just the username without any domain notation. True returns the domain with the username in the SAM format. Ie: `domain\username`

Returns
Returns username

Return type
str

CLI Example:

```
salt '*' user.current
```

`salt.modules.win_useradd.`**`delete`**`(`*name*, *purge=False*, *force=False*`)`

Remove a user from the minion

Parameters

- **`name`** (*`str`*) -- The name of the user to delete
- **`purge`** (*`bool, optional`*) -- Boolean value indicating that the user profile should also be removed when the user account is deleted. If set to True the profile will be removed. Default is False.
- **`force`** (*`bool, optional`*) -- Boolean value indicating that the user account should be deleted even if the user is logged in. True will log the user out and delete user.

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' user.delete name
```

`salt.modules.win_useradd.`**`getUserSid`**(*username*)

Deprecated function. Please use get_user_sid instead

CLI Example:

```
salt '*' user.get_user_sid jsnuffy
```

`salt.modules.win_useradd.`**`get_user_sid`**(*username*)

Get the Security ID for the user

Parameters

`username` (*`str`*) -- The username for which to look up the SID

Returns

The user SID

Return type

str

CLI Example:

```
salt '*' user.get_user_sid jsnuffy
```

`salt.modules.win_useradd.`**`getent`**(*refresh=False*)

Return the list of all info for all users

Parameters

`refresh` (*`bool, optional`*) -- Refresh the cached user information. Useful when used from within a state function. Default is False.

Returns

A dictionary containing information about all users on the system

Return type

dict

CLI Example:

```
salt '*' user.getent
```

`salt.modules.win_useradd.`**`info`**(*name*)

Return user information

Parameters

`name` (*`str`*) -- Username for which to display information

Returns

A dictionary containing user information

- fullname
- username
- SID
- passwd (will always return None)
- comment (same as description, left here for backwards compatibility)
- description
- active
- logonscript
- profile
- home
- homedrive
- groups
- password_changed
- successful_logon_attempts

- failed_logon_attempts
- last_logon
- account_disabled
- account_locked
- expiration_date
- password_never_expires
- disallow_change_password
- gid

Return type
dict

CLI Example:

```
salt '*' user.info jsnuffy
```

`salt.modules.win_useradd.`**`list_groups`**`(`*name*`)`

Return a list of groups the named user belongs to

Parameters
name (*str*) -- The username for which to list groups

Returns
A list of groups to which the user belongs

Return type
list

CLI Example:

```
salt '*' user.list_groups foo
```

`salt.modules.win_useradd.`**`list_users`**`()`

Return a list of all users on Windows

Returns
A list of all users on the system

Return type
list

CLI Example:

```
salt '*' user.list_users
```

`salt.modules.win_useradd.`**`removegroup`**`(`*name, group*`)`

Remove user from a group

Parameters
- **name** (*str*) -- The username to remove from the group
- **group** (*str*) -- The name of the group from which to remove the user

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' user.removegroup jsnuffy 'Power Users'
```

`salt.modules.win_useradd.`**`rename`**`(`*name, new_name*`)`

Change the username for a named user

Parameters
- **name** (*str*) -- The username to change
- **new_name** (*str*) -- The new name for the current user

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' user.rename jsnuffy jshmoe
```

`salt.modules.win_useradd.`**`setpassword`**`(`*name*, *password*`)`

Set the user's password

Parameters

- **`name`** (*`str`*) -- The username for which to set the password
- **`password`** (*`str`*) -- The new password

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' user.setpassword jsnuffy sup3rs3cr3t
```

`salt.modules.win_useradd.`**`update`**`(`*name*, *password=None*, *fullname=None*, *description=None*, *home=None*, *homedrive=None*, *logonscript=None*, *profile=None*, *expiration_date=None*, *expired=None*, *account_disabled=None*, *unlock_account=None*, *password_never_expires=None*, *disallow_change_password=None*`)`

Updates settings for the Windows user. Name is the only required parameter. Settings will only be changed if the parameter is passed a value.

New in version 2015.8.0.

Parameters

- **`name`** (*`str`*) -- The username to update.
- **`password`** (*`str, optional`*) -- New user password in plain text.
- **`fullname`** (*`str, optional`*) -- The user's full name.
- **`description`** (*`str, optional`*) -- A brief description of the user account.
- **`home`** (*`str, optional`*) -- The path to the user's home directory.
- **`homedrive`** (*`str, optional`*) -- The drive letter to assign to the home directory. Must be the Drive Letter followed by a colon. ie: U:
- **`logonscript`** (*`str, optional`*) -- The path to the logon script.
- **`profile`** (*`str, optional`*) -- The path to the user's profile directory.
- **`expiration_date`** (*`date, optional`*) -- The date and time when the account expires. Can be a valid date/time string. To set to never expire pass the string 'Never'.
- **`expired`** (*`bool, optional`*) -- Pass *True* to expire the account. The user will be prompted to change their password at the next logon. Pass *False* to mark the account as 'not expired'. You can't use this to negate the expiration if the expiration was caused by the account expiring. You'll have to change the *expiration_date* as well.
- **`account_disabled`** (*`bool, optional`*) -- True disables the account. False enables the account.
- **`unlock_account`** (*`bool, optional`*) -- True unlocks a locked user account. False is ignored.
- **`password_never_expires`** (*`bool, optional`*) -- True sets the password to never expire. False allows the password to expire.
- **`disallow_change_password`** (*`bool, optional`*) -- True blocks the user from changing the password. False allows the user to change the password.

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' user.update bob password=secret profile=C:\Users\Bob
         home=\server\homeshare\bob homedrive=U:
```

26.6.256 salt.modules.win_wua

Module for managing Windows Updates using the Windows Update Agent.

List updates on the system using the following functions:

- *win_wua.available*
- `win_wua.list`

This is an easy way to find additional information about updates available to to the system, such as the GUID, KB number, or description.

Once you have the GUID or a KB number for the update you can get information about the update, download, install, or uninstall it using these functions:

- *win_wua.get*
- *win_wua.download*
- *win_wua.install*
- *win_wua.uninstall*

The get function expects a name in the form of a GUID, KB, or Title and should return information about a single update. The other functions accept either a single item or a list of items for downloading/installing/uninstalling a specific list of items.

The `win_wua.list` and *win_wua.get* functions are utility functions. In addition to returning information about updates they can also download and install updates by setting `download=True` or `install=True`. So, with py:func:*win_wua.list <salt.modules.win_wua.list_>* for example, you could run the function with the filters you want to see what is available. Then just add `install=True` to install everything on that list.

If you want to download, install, or uninstall specific updates, use *win_wua.download*, *win_wua.install*, or *win_wua.uninstall*. To update your system with the latest updates use `win_wua.list` and set `install=True`

You can also adjust the Windows Update settings using the *win_wua.set_wu_settings* function. This function is only supported on the following operating systems:

- Windows Vista / Server 2008
- Windows 7 / Server 2008R2
- Windows 8 / Server 2012
- Windows 8.1 / Server 2012R2

As of Windows 10 and Windows Server 2016, the ability to modify the Windows Update settings has been restricted. The settings can be modified in the Local Group Policy using the `lgpo` module.

New in version 2015.8.0.

depends
salt.utils.win_update

`salt.modules.win_wua.`**`available`**(*software=True*, *drivers=True*, *summary=False*, *skip_installed=True*, *skip_hidden=True*, *skip_mandatory=False*, *skip_reboot=False*, *categories=None*, *severities=None*, *online=True*)

New in version 2017.7.0.

List updates that match the passed criteria. This allows for more filter options than `list()`. Good for finding a specific GUID or KB.

Parameters

- **`software`** (*`bool`*) -- Include software updates in the results. Default is `True`
- **`drivers`** (*`bool`*) -- Include driver updates in the results. Default is `True`
- **`summary`** (*`bool`*) --
  - `True`: Return a summary of updates available for each category.
  - `False` (default): Return a detailed list of available updates.
- **`skip_installed`** (*`bool`*) -- Skip updates that are already installed. Default is `True`
- **`skip_hidden`** (*`bool`*) -- Skip updates that have been hidden. Default is `True`
- **`skip_mandatory`** (*`bool`*) -- Skip mandatory updates. Default is `False`
- **`skip_reboot`** (*`bool`*) -- Skip updates that require a reboot. Default is `False`
- **`categories`** (*`list`*) -- Specify the categories to list. Must be passed as a list. All categories returned by default.

  Categories include the following:
  - Critical Updates
  - Definition Updates
  - Drivers (make sure you set `drivers=True`)
  - Feature Packs
  - Security Updates
  - Update Rollups
  - Updates
  - Update Rollups
  - Windows 7
  - Windows 8.1
  - Windows 8.1 drivers
  - Windows 8.1 and later drivers
  - Windows Defender
- **`severities`** (*`list`*) -- Specify the severities to include. Must be passed as a list. All severities returned by default.

  Severities include the following:
  - Critical
  - Important
- **`online`** (*`bool`*) -- Tells the Windows Update Agent go online to update its local update database. `True` will go online. `False` will use the local update database as is. Default is `True`

  New in version 3001.

Returns

Returns a dict containing either a summary or a list of updates:

```
Dict of Updates:
{'<GUID>': {
    'Title': <title>,
```

(continues on next page)

(continued from previous page)

```
    'KB': <KB>,
    'GUID': <the globally unique identifier for the update>,
    'Description': <description>,
    'Downloaded': <has the update been downloaded>,
    'Installed': <has the update been installed>,
    'Mandatory': <is the update mandatory>,
    'UserInput': <is user input required>,
    'EULAAccepted': <has the EULA been accepted>,
    'Severity': <update severity>,
    'NeedsReboot': <is the update installed and awaiting
↪reboot>,
    'RebootBehavior': <will the update require a reboot>,
    'Categories': [
        '<category 1>',
        '<category 2>',
        ... ]
}}

Summary of Updates:
{'Total': <total number of updates returned>,
 'Available': <updates that are not downloaded or installed>,
 'Downloaded': <updates that are downloaded but not
↪installed>,
 'Installed': <updates installed (usually 0 unless
↪installed=True)>,
 'Categories': {
    <category 1>: <total for that category>,
    <category 2>: <total for category 2>,
    ... }
}
```

Return type
dict

CLI Examples:

```
# Normal Usage (list all software updates)
salt '*' win_wua.available

# List all updates with categories of Critical Updates and Drivers
salt '*' win_wua.available categories=["Critical Updates","Drivers"]

# List all Critical Security Updates
salt '*' win_wua.available categories=["Security Updates"] severities=[
↪"Critical"]

# List all updates with a severity of Critical
salt '*' win_wua.available severities=["Critical"]

# A summary of all available updates
salt '*' win_wua.available summary=True

# A summary of all Feature Packs and Windows 8.1 Updates
salt '*' win_wua.available categories=["Feature Packs","Windows 8.1"]
```

(continues on next page)

(continued from previous page)

```
↪summary=True
```

salt.modules.win_wua.download(*names*)

New in version 2017.7.0.

Downloads updates that match the list of passed identifiers. It's easier to use this function by using list_updates and setting `download=True`.

Parameters

names (*str, list*) -- A single update or a list of updates to download. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

Note: An error will be raised if there are more results than there are items in the names parameter

Returns

A dictionary containing the details about the downloaded updates

Return type

dict

CLI Example:

```
# Normal Usage
salt '*' win_wua.download names=['12345678-abcd-1234-abcd-1234567890ab',
↪'KB2131233']
```

salt.modules.win_wua.get(*name, download=False, install=False, online=True*)

New in version 2017.7.0.

Returns details for the named update

Parameters

- **name** (*str*) -- The name of the update you're searching for. This can be the GUID, a KB number, or any part of the name of the update. GUIDs and KBs are preferred. Run `list` to get the GUID for the update you're looking for.
- **download** (*bool*) -- Download the update returned by this function. Run this function first to see if the update exists, then set `download=True` to download the update.
- **install** (*bool*) -- Install the update returned by this function. Run this function first to see if the update exists, then set `install=True` to install the update.
- **online** (*bool*) -- Tells the Windows Update Agent go online to update its local update database. `True` will go online. `False` will use the local update database as is. Default is `True`

  New in version 3001.

Returns

Returns a dict containing a list of updates that match the name if

download and install are both set to False. Should usually be a single update, but can return multiple if a partial name is given.

If download or install is set to true it will return the results of the operation.

```
Dict of Updates:
{'<GUID>': {
    'Title': <title>,
    'KB': <KB>,
    'GUID': <the globally unique identifier for the update>,
```

(continues on next page)

(continued from previous page)

```
    'Description': <description>,
    'Downloaded': <has the update been downloaded>,
    'Installed': <has the update been installed>,
    'Mandatory': <is the update mandatory>,
    'UserInput': <is user input required>,
    'EULAAccepted': <has the EULA been accepted>,
    'Severity': <update severity>,
    'NeedsReboot': <is the update installed and awaiting
↪reboot>,
    'RebootBehavior': <will the update require a reboot>,
    'Categories': [
        '<category 1>',
        '<category 2>',
        ... ]
}}
```

Return type
dict

CLI Examples:

```
# Recommended Usage using GUID without braces
# Use this to find the status of a specific update
salt '*' win_wua.get 12345678-abcd-1234-abcd-1234567890ab

# Use the following if you don't know the GUID:

# Using a KB number
# Not all updates have an associated KB
salt '*' win_wua.get KB3030298

# Using part or all of the name of the update
# Could possibly return multiple results
# Not all updates have an associated KB
salt '*' win_wua.get 'Microsoft Camera Codec Pack'
```

`salt.modules.win_wua.`**`get_needs_reboot`**`()`

Determines if the system needs to be rebooted.

Returns
`True` if the system requires a reboot, otherwise `False`

Return type
bool

CLI Examples:

```
salt '*' win_wua.get_needs_reboot
```

`salt.modules.win_wua.`**`get_wu_settings`**`()`

Get current Windows Update settings.

Returns

A dictionary of Windows Update settings:

Featured Updates:
Boolean value that indicates whether to display notifications for featured updates.

Group Policy Required (Read-only):
Boolean value that indicates whether Group Policy requires the Automatic Updates

service.

Microsoft Update:
Boolean value that indicates whether to turn on Microsoft Update for other Microsoft Products

Needs Reboot:
Boolean value that indicates whether the machine is in a reboot pending state.

Non Admins Elevated:
Boolean value that indicates whether non-administrators can perform some update-related actions without administrator approval.

Notification Level:
Number 1 to 4 indicating the update level:

1. Never check for updates
2. Check for updates but let me choose whether to download and install them
3. Download updates but let me choose whether to install them
4. Install updates automatically

Read Only (Read-only):
Boolean value that indicates whether the Automatic Update settings are read-only.

Recommended Updates:
Boolean value that indicates whether to include optional or recommended updates when a search for updates and installation of updates is performed.

Scheduled Day:
Days of the week on which Automatic Updates installs or uninstalls updates.

Scheduled Time:
Time at which Automatic Updates installs or uninstalls updates.

Return type
dict

CLI Examples:

```
salt '*' win_wua.get_wu_settings
```

`salt.modules.win_wua.`**`install`**(*names*)

New in version 2017.7.0.

Installs updates that match the list of identifiers. It may be easier to use the list_updates function and set `install=True`.

Parameters
names (*str, list*) -- A single update or a list of updates to install. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

Note: An error will be raised if there are more results than there are items in the names parameter

Returns
A dictionary containing the details about the installed updates

Return type
dict

CLI Examples:

```
# Normal Usage
salt '*' win_wua.install KB12323211
```

`salt.modules.win_wua.`**`installed`**(*summary=False, kbs_only=False*)

New in version 3001.

Get a list of all updates that are currently installed on the system.

Note: This list may not necessarily match the Update History on the machine. This will only show the updates that apply to the current build of Windows. So, for example, the system may have shipped with Windows 10 Build 1607. That machine received updates to the 1607 build. Later the machine was upgraded to a newer feature release, 1803 for example. Then more updates were applied. This will only return the updates applied to the 1803 build and not those applied when the system was at the 1607 build.

Parameters

- **`summary`** (*bool*) -- Return a summary instead of a detailed list of updates. `True` will return a Summary, `False` will return a detailed list of installed updates. Default is `False`
- **`kbs_only`** (*bool*) -- Only return a list of KBs installed on the system. If this parameter is passed, the `summary` parameter will be ignored. Default is `False`

Returns

Returns a dictionary of either a Summary or a detailed list of
updates installed on the system when `kbs_only=False`

list:
Returns a list of KBs installed on the system when `kbs_only=True`

Return type

dict

CLI Examples:

```
# Get a detailed list of all applicable updates installed on the system
salt '*' win_wua.installed

# Get a summary of all applicable updates installed on the system
salt '*' win_wua.installed summary=True

# Get a simple list of KBs installed on the system
salt '*' win_wua.installed kbs_only=True
```

`salt.modules.win_wua.`**`list`**(*software=True, drivers=False, summary=False, skip_installed=True, categories=None, severities=None, download=False, install=False, online=True*)

New in version 2017.7.0.

Returns a detailed list of available updates or a summary. If `download` or `install` is `True` the same list will be downloaded and/or installed.

Parameters

- **`software`** (*bool*) -- Include software updates in the results. Default is `True`
- **`drivers`** (*bool*) -- Include driver updates in the results. Default is `False`
- **`summary`** (*bool*) --
  - `True`: Return a summary of updates available for each category.
  - `False` (default): Return a detailed list of available updates.
- **`skip_installed`** (*bool*) -- Skip installed updates in the results. Default is `True`
- **`download`** (*bool*) -- (Overrides reporting functionality) Download the list of updates returned by this function. Run this function first with `download=False` to see what will be downloaded, then set `download=True` to download the updates. Default is `False`
- **`install`** (*bool*) -- (Overrides reporting functionality) Install the list of updates returned by this function. Run this function first with `install=False` to see what will be installed, then set `install=True` to install the updates. Default is `False`

- **categories** (*list*) -- Specify the categories to list. Must be passed as a list. All categories returned by default.

  Categories include the following:
    - Critical Updates
    - Definition Updates
    - Drivers (make sure you set `drivers=True`)
    - Feature Packs
    - Security Updates
    - Update Rollups
    - Updates
    - Update Rollups
    - Windows 7
    - Windows 8.1
    - Windows 8.1 drivers
    - Windows 8.1 and later drivers
    - Windows Defender
- **severities** (*list*) -- Specify the severities to include. Must be passed as a list. All severities returned by default.

  Severities include the following:
    - Critical
    - Important
- **online** (*bool*) -- Tells the Windows Update Agent go online to update its local update database. `True` will go online. `False` will use the local update database as is. Default is `True`

  New in version 3001.

Returns

Returns a dict containing either a summary or a list of updates:

```
Dict of Updates:
{'<GUID>': {
    'Title': <title>,
    'KB': <KB>,
    'GUID': <the globally unique identifier for the update>,
    'Description': <description>,
    'Downloaded': <has the update been downloaded>,
    'Installed': <has the update been installed>,
    'Mandatory': <is the update mandatory>,
    'UserInput': <is user input required>,
    'EULAAccepted': <has the EULA been accepted>,
    'Severity': <update severity>,
    'NeedsReboot': <is the update installed and awaiting
↪reboot>,
    'RebootBehavior': <will the update require a reboot>,
    'Categories': [
        '<category 1>',
        '<category 2>',
        ... ]
}}

Summary of Updates:
{'Total': <total number of updates returned>,
```

(continues on next page)

(continued from previous page)

```
 'Available': <updates that are not downloaded or installed>,
 'Downloaded': <updates that are downloaded but not
↪installed>,
 'Installed': <updates installed (usually 0 unless
↪installed=True)>,
 'Categories': {
    <category 1>: <total for that category>,
    <category 2>: <total for category 2>,
    ... }
}
```

Return type
dict

CLI Examples:

```
# Normal Usage (list all software updates)
salt '*' win_wua.list

# List all updates with categories of Critical Updates and Drivers
salt '*' win_wua.list categories=['Critical Updates','Drivers']

# List all Critical Security Updates
salt '*' win_wua.list categories=['Security Updates'] severities=[
↪'Critical']

# List all updates with a severity of Critical
salt '*' win_wua.list severities=['Critical']

# A summary of all available updates
salt '*' win_wua.list summary=True

# A summary of all Feature Packs and Windows 8.1 Updates
salt '*' win_wua.list categories=['Feature Packs','Windows 8.1']
↪summary=True
```

`salt.modules.win_wua.`**`set_wu_settings`**(*level=None*, *recommended=None*, *featured=None*, *elevated=None*, *msupdate=None*, *day=None*, *time=None*)

Change Windows Update settings. If no parameters are passed, the current value will be returned.

Supported:

- Windows Vista / Server 2008
- Windows 7 / Server 2008R2
- Windows 8 / Server 2012
- Windows 8.1 / Server 2012R2

Parameters

- **`level`** (*int*) -- Number from 1 to 4 indicating the update level:
  1. Never check for updates
  2. Check for updates but let me choose whether to download and install them
  3. Download updates but let me choose whether to install them
  4. Install updates automatically
- **`recommended`** (*bool*) -- Boolean value that indicates whether to include optional or recommended updates when a search for updates and installation of updates is performed.
- **`featured`** (*bool*) -- Boolean value that indicates whether to display notifications

for featured updates.

- **elevated** (*bool*) -- Boolean value that indicates whether non-administrators can perform some update-related actions without administrator approval.
- **msupdate** (*bool*) -- Boolean value that indicates whether to turn on Microsoft Update for other Microsoft products
- **day** (*str*) -- Days of the week on which Automatic Updates installs or uninstalls updates. Accepted values:
  - Everyday
  - Monday
  - Tuesday
  - Wednesday
  - Thursday
  - Friday
  - Saturday
- **time** (*str*) -- Time at which Automatic Updates installs or uninstalls updates. Must be in the ##:## 24hr format, eg. 3:00 PM would be 15:00. Must be in 1 hour increments.

Returns

Returns a dictionary containing the results.

Return type

dict

CLI Examples:

```
salt '*' win_wua.set_wu_settings level=4 recommended=True featured=False
```

`salt.modules.win_wua.`**`uninstall`**`(`*names*`)`

New in version 2017.7.0.

Uninstall updates.

Parameters

names (*str, list*) -- A single update or a list of updates to uninstall. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

Returns

A dictionary containing the details about the uninstalled updates

Return type

dict

CLI Examples:

```
# Normal Usage
salt '*' win_wua.uninstall KB3121212

# As a list
salt '*' win_wua.uninstall guid=['12345678-abcd-1234-abcd-1234567890ab',
↪'KB1231231']
```

26.6.257 salt.modules.win_wusa

Microsoft Update files management via wusa.exe

maintainer
Thomas Lemarchand

platform
Windows

depends
PowerShell

New in version 2018.3.4.

`salt.modules.win_wusa.`**`install`**(*path*, *restart=False*)

Install a KB from a .msu file.

Parameters

- **`path`** (*`str`*) -- The full path to the msu file to install
- **`restart`** (*`bool`*) -- `True` to force a restart if required by the installation. Adds the `/forcerestart` switch to the `wusa.exe` command. `False` will add the `/norestart` switch instead. Default is `False`

Returns
`True` if successful, otherwise `False`

Return type
bool

Raises
`CommandExecutionError` -- If the package is already installed or an error is encountered

CLI Example:

```
salt '*' wusa.install C:/temp/KB123456.msu
```

`salt.modules.win_wusa.`**`is_installed`**(*name*)

Check if a specific KB is installed.

Parameters
`name` (*`str`*) -- The name of the KB to check

Returns
`True` if installed, otherwise `False`

Return type
bool

CLI Example:

```
salt '*' wusa.is_installed KB123456
```

`salt.modules.win_wusa.`**`list_`**()

Get a list of updates installed on the machine

Returns
A list of installed updates

Return type
list

CLI Example:

```
salt '*' wusa.list
```

`salt.modules.win_wusa.`**`uninstall`**`(`*path*, *restart=False*`)`

Uninstall a specific KB.

Parameters

- **`path`** (*`str`*) -- The full path to the msu file to uninstall. This can also be just the name of the KB to uninstall
- **`restart`** (*`bool`*) -- `True` to force a restart if required by the installation. Adds the `/forcerestart` switch to the `wusa.exe` command. `False` will add the `/norestart` switch instead. Default is `False`

Returns

`True` if successful, otherwise `False`

Return type

bool

Raises

`CommandExecutionError` -- If an error is encountered

CLI Example:

```
salt '*' wusa.uninstall KB123456

# or

salt '*' wusa.uninstall C:/temp/KB123456.msu
```

26.6.258 salt.modules.winrepo

Module to manage Windows software repo on a Standalone Minion

`file_client: local` must be set in the minion config file.

For documentation on Salt's Windows Repo feature, see *here*.

`salt.modules.winrepo.`**`genrepo`**`()`

Generate winrepo_cachefile based on sls files in the winrepo_dir

CLI Example:

```
salt-call winrepo.genrepo
```

`salt.modules.winrepo.`**`show_sls`**`(`*name*, *saltenv='base'*`)`

New in version 2015.8.0.

Display the rendered software definition from a specific sls file in the local winrepo cache. This will parse all Jinja. Run pkg.refresh_db to pull the latest software definitions from the master.

Note: This function does not ask a master for an sls file to render. Instead it directly processes the file specified in *name*

Parameters

- **`str`** (*`saltenv`*) -- The name/path of the package you want to view. This can be the
- **`local`** (*`full path to a file on the minion file system or a file on the`*) --
- **`cache.`** (*`minion`*) --
- **`str`** -- The default environment is `base`

Returns

Returns a dictionary containing the rendered data structure

Return type
dict

Note: To use a file from the minion cache start from the local winrepo root (`C:\salt\var\cache\salt\minion\files\base\win\repo-ng`). If you have `.sls` files organized in subdirectories you'll have to denote them with `.`. For example, if you have a `test` directory in the winrepo root with a `gvim.sls` file inside, would target that file like so: `test.gvim`. Directories can be targeted as well as long as they contain an `init.sls` inside. For example, if you have a `node` directory with an `init.sls` inside, target that like so: `node`.

CLI Example:

```
salt '*' winrepo.show_sls gvim
salt '*' winrepo.show_sls test.npp
salt '*' winrepo.show_sls C:\test\gvim.sls
```

`salt.modules.winrepo.`**`update_git_repos`**`(`*clean=False*`)`

Checkout git repos containing *Windows Software Package Definitions*.

Important: This function requires Git for Windows to be installed in order to work. When installing, make sure to select an installation option which permits the git executable to be run from the Command Prompt.

clean
[False] Clean repo cachedirs which are not configured under *`winrepo_remotes`*.

Note: This option only applies if either pygit2 or GitPython is installed into Salt's bundled Python.

Warning: This argument should not be set to `True` if a mix of git and non-git repo definitions are being used, as it will result in the non-git repo definitions being removed.

New in version 2015.8.0.

CLI Example:

```
salt-call winrepo.update_git_repos
```

26.6.259 salt.modules.x509

Manage X509 certificates

New in version 2015.8.0.

depends
M2Crypto

Deprecated since version 3006.0.

Warning: This module has been deprecated and will be removed in Salt 3009 (Potassium). Please migrate to the replacement modules. For breaking changes between both versions, you can refer to the *x509_v2 execution module docs*.

They have become the default `x509` modules in Salt 3008.0 (Argon). Until they are removed, you can still revert to the deprecated modules by setting `features: {x509_v2: false}` in your minion configuration.

`salt.modules.x509.`**`create_certificate`**(*path=None*, *text=False*, *overwrite=True*, *ca_server=None*, ***kwargs*)

Create an X509 certificate.

path:
Path to write the certificate to.

text:
If `True`, return the PEM text without writing to a file. Default `False`.

overwrite:
If `True` (default), create_certificate will overwrite the entire PEM file. Set False to preserve existing private keys and dh params that may exist in the PEM file.

kwargs:
Any of the properties below can be included as additional keyword arguments.

ca_server:
Request a remotely signed certificate from ca_server. For this to work, a `signing_policy` must be specified, and that same policy must be configured on the ca_server. See `signing_policy` for details. Also, the salt master must permit peers to call the `sign_remote_certificate` function.

Example:

/etc/salt/master.d/peer.conf

```
peer:
  .*:
    - x509.sign_remote_certificate
```

subject properties:
Any of the values below can be included to set subject properties Any other subject properties supported by OpenSSL should also work.

C:
2 letter Country code

CN:
Certificate common name, typically the FQDN.

Email:
Email address

GN:
Given Name

L:
Locality

O:
Organization

OU:
Organization Unit

SN:
SurName

ST:
State or Province

signing_private_key:

A path or string of the private key in PEM format that will be used to sign this certificate. If neither `signing_cert`, `public_key`, or `csr` are included, it will be assumed that this is a self-signed certificate, and the public key matching `signing_private_key` will be used to create the certificate.

signing_private_key_passphrase:
Passphrase used to decrypt the signing_private_key.

signing_cert:
A certificate matching the private key that will be used to sign this certificate. This is used to populate the issuer values in the resulting certificate. Do not include this value for self-signed certificates.

public_key:
The public key to be included in this certificate. This can be sourced from a public key, certificate, CSR or private key. If a private key is used, the matching public key from the private key will be generated before any processing is done. This means you can request a certificate from a remote CA using a private key file as your public_key and only the public key will be sent across the network to the CA. If neither `public_key` or `csr` are specified, it will be assumed that this is a self-signed certificate, and the public key derived from `signing_private_key` will be used. Specify either `public_key` or `csr`, not both. Because you can input a CSR as a public key or as a CSR, it is important to understand the difference. If you import a CSR as a public key, only the public key will be added to the certificate, subject or extension information in the CSR will be lost.

public_key_passphrase:
If the public key is supplied as a private key, this is the passphrase used to decrypt it.

csr:
A file or PEM string containing a certificate signing request. This will be used to supply the subject, extensions and public key of a certificate. Any subject or extensions specified explicitly will overwrite any in the CSR.

basicConstraints:
X509v3 Basic Constraints extension.

extensions:
The following arguments set X509v3 Extension values. If the value starts with `critical`, the extension will be marked as critical.

Some special extensions are `subjectKeyIdentifier` and `authorityKeyIdentifier`.

`subjectKeyIdentifier` can be an explicit value or it can be the special string `hash`. `hash` will set the subjectKeyIdentifier equal to the SHA1 hash of the modulus of the public key in this certificate. Note that this is not the exact same hashing method used by OpenSSL when using the hash value.

`authorityKeyIdentifier` Use values acceptable to the openssl CLI tools. This will automatically populate `authorityKeyIdentifier` with the `subjectKeyIdentifier` of `signing_cert`. If this is a self-signed cert these values will be the same.

basicConstraints:
X509v3 Basic Constraints

keyUsage:
X509v3 Key Usage

extendedKeyUsage:
X509v3 Extended Key Usage

subjectKeyIdentifier:
X509v3 Subject Key Identifier

issuerAltName:
X509v3 Issuer Alternative Name

subjectAltName:
X509v3 Subject Alternative Name

crlDistributionPoints:
X509v3 CRL Distribution Points

issuingDistributionPoint:
X509v3 Issuing Distribution Point

certificatePolicies:
X509v3 Certificate Policies

policyConstraints:
X509v3 Policy Constraints

inhibitAnyPolicy:
X509v3 Inhibit Any Policy

nameConstraints:
X509v3 Name Constraints

noCheck:
X509v3 OCSP No Check

nsComment:
Netscape Comment

nsCertType:
Netscape Certificate Type

days_valid:
The number of days this certificate should be valid. This sets the `notAfter` property of the certificate. Defaults to 365.

version:
The version of the X509 certificate. Defaults to 3. This is automatically converted to the version value, so `version=3` sets the certificate version field to 0x2.

serial_number:
The serial number to assign to this certificate. If omitted a random serial number of size `serial_bits` is generated.

serial_bits:
The number of bits to use when randomly generating a serial number. Defaults to 64.

algorithm:
The hashing algorithm to be used for signing this certificate. Defaults to sha256.

copypath:
An additional path to copy the resulting certificate to. Can be used to maintain a copy of all certificates issued for revocation purposes.

prepend_cn:
If set to True, the CN and a dash will be prepended to the copypath's filename.

Example:
/etc/pki/issued_certs/www.example.com-DE:CA:FB:AD:00:00:00:00.crt

signing_policy:
A signing policy that should be used to create this certificate. Signing policies should be defined in the minion configuration, or in a minion pillar. It should be a YAML formatted list of arguments which will override any arguments passed to this function. If the `minions` key is included in the signing policy, only minions matching that pattern (see match.glob and match.compound) will be permitted to remotely request certificates from that policy. In order to `match.compound` to work salt master must peers permit peers to call it.

Example:

/etc/salt/master.d/peer.conf

```
peer:
  .*:
    - match.compound
```

Example:

```
x509_signing_policies:
  www:
    - minions: 'www*'
```

(continues on next page)

(continued from previous page)

```
    - signing_private_key: /etc/pki/ca.key
    - signing_cert: /etc/pki/ca.crt
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:false"
    - keyUsage: "critical cRLSign, keyCertSign"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 90
    - copypath: /etc/pki/issued_certs/
```

The above signing policy can be invoked with `signing_policy=www`

not_before:
Initial validity date for the certificate. This date must be specified in the format '%Y-%m-%d %H:%M:%S'.

New in version 3001.

not_after:
Final validity date for the certificate. This date must be specified in the format '%Y-%m-%d %H:%M:%S'.

New in version 3001.

CLI Example:

```
salt '*' x509.create_certificate path=/etc/pki/myca.crt signing_private_
↪key='/etc/pki/myca.key' csr='/etc/pki/myca.csr'}
```

`salt.modules.x509.`**`create_crl`**(*path=None, text=False, signing_private_key=None, signing_private_key_passphrase=None, signing_cert=None, revoked=None, include_expired=False, days_valid=100, digest=''*)

Create a CRL

Depends

- PyOpenSSL Python module

path:
Path to write the CRL to.

text:
If `True`, return the PEM text without writing to a file. Default `False`.

signing_private_key:
A path or string of the private key in PEM format that will be used to sign the CRL. This is required.

signing_private_key_passphrase:
Passphrase to decrypt the private key.

signing_cert:
A certificate matching the private key that will be used to sign the CRL. This is required.

revoked:
A list of dicts containing all the certificates to revoke. Each dict represents one certificate. A dict must contain either the key `serial_number` with the value of the serial number to revoke, or `certificate` with either the PEM encoded text of the certificate, or a path to the certificate to revoke.

The dict can optionally contain the `revocation_date` key. If this key is omitted the revocation date will be set to now. If should be a string in the format "%Y-%m-%d %H:%M:%S".

The dict can also optionally contain the `not_after` key. This is redundant if the `certificate` key is included. If the `Certificate` key is not included, this can be used for the logic behind the `include_expired` parameter. If should be a string in the format "%Y-%m-%d %H:%M:%S".

The dict can also optionally contain the `reason` key. This is the reason code for the revocation. Available choices are `unspecified`, `keyCompromise`, `CACompromise`, `affiliationChanged`, `superseded`, `cessationOfOperation` and `certificateHold`.

include_expired:
Include expired certificates in the CRL. Default is `False`.

days_valid:
The number of days that the CRL should be valid. This sets the Next Update field in the CRL.

digest:
The digest to use for signing the CRL. This has no effect on versions of pyOpenSSL less than 0.14

CLI Example:

```
salt '*' x509.create_crl path=/etc/pki/mykey.key \
        signing_private_key=/etc/pki/ca.key \
        signing_cert=/etc/pki/ca.crt \
        revoked="{'compromized-web-key': {'certificate': '/etc/pki/certs/
↪www1.crt', 'revocation_date': '2015-03-01 00:00:00'}}"
```

`salt.modules.x509.`**`create_csr`**(*path=None*, *text=False*, ***kwargs*)

Create a certificate signing request.

path:
Path to write the certificate to.

text:
If `True`, return the PEM text without writing to a file. Default `False`.

algorithm:
The hashing algorithm to be used for signing this request. Defaults to sha256.

kwargs:
The subject, extension and version arguments from `x509.create_certificate` can be used.

CLI Example:

```
salt '*' x509.create_csr path=/etc/pki/myca.csr public_key='/etc/pki/myca.
↪key' CN='My Cert'
```

`salt.modules.x509.`**`create_private_key`**(*path=None*, *text=False*, *bits=2048*, *passphrase=None*, *cipher='aes_128_cbc'*, *verbose=True*)

Creates a private key in PEM format.

path:
The path to write the file to, either `path` or `text` are required.

text:
If `True`, return the PEM text without writing to a file. Default `False`.

bits:
Length of the private key in bits. Default 2048

passphrase:
Passphrase for encrypting the private key

cipher:
Cipher for encrypting the private key. Has no effect if passphrase is None.

verbose:
Provide visual feedback on stdout. Default True

New in version 2016.11.0.

CLI Example:

```
salt '*' x509.create_private_key path=/etc/pki/mykey.key
```

`salt.modules.x509.`**`expired`**(*certificate*)

Returns a dict containing limited details of a certificate and whether the certificate has expired.

New in version 2016.11.0.

certificate:
The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:

```
salt '*' x509.expired "/etc/pki/mycert.crt"
```

`salt.modules.x509.`**`get_pem_entries`**`(`*glob_path*`)`

Returns a dict containing PEM entries in files matching a glob

glob_path:
A path to certificates to be read and returned.

CLI Example:

```
salt '*' x509.get_pem_entries "/etc/pki/*.crt"
```

`salt.modules.x509.`**`get_pem_entry`**`(`*text, pem_type=None*`)`

Returns a properly formatted PEM string from the input text fixing any whitespace or line-break issues

text:
Text containing the X509 PEM entry to be returned or path to a file containing the text.

pem_type:
If specified, this function will only return a pem of a certain type, for example 'CERTIFICATE' or 'CERTIFICATE REQUEST'.

CLI Example:

```
salt '*' x509.get_pem_entry "-----BEGIN CERTIFICATE REQUEST-----MIICyzCC
↪Ar8CAQI...-----END CERTIFICATE REQUEST"
```

`salt.modules.x509.`**`get_private_key_size`**`(`*private_key, passphrase=None*`)`

Returns the bit length of a private key in PEM format.

private_key:
A path or PEM encoded string containing a private key.

CLI Example:

```
salt '*' x509.get_private_key_size /etc/pki/mycert.key
```

`salt.modules.x509.`**`get_public_key`**`(`*key, passphrase=None, asObj=False*`)`

Returns a string containing the public key in PEM format.

key:
A path or PEM encoded string containing a CSR, Certificate or Private Key from which a public key can be retrieved.

CLI Example:

```
salt '*' x509.get_public_key /etc/pki/mycert.cer
```

`salt.modules.x509.`**`get_signing_policy`**`(`*signing_policy_name*`)`

Returns the details of a names signing policy, including the text of the public key that will be used to sign it. Does not return the private key.

CLI Example:

```
salt '*' x509.get_signing_policy www
```

salt.modules.x509.**read_certificate**(*certificate*)

Returns a dict containing details of a certificate. Input can be a PEM string or file path.

certificate:

The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:

```
salt '*' x509.read_certificate /etc/pki/mycert.crt
```

salt.modules.x509.**read_certificates**(*glob_path*)

Returns a dict containing details of all certificates matching a glob

glob_path:

A path to certificates to be read and returned.

CLI Example:

```
salt '*' x509.read_certificates "/etc/pki/*.crt"
```

salt.modules.x509.**read_crl**(*crl*)

Returns a dict containing details of a certificate revocation list. Input can be a PEM string or file path.

Depends

- OpenSSL command line tool

crl:

A path or PEM encoded string containing the CRL to read.

CLI Example:

```
salt '*' x509.read_crl /etc/pki/mycrl.crl
```

salt.modules.x509.**read_csr**(*csr*)

Returns a dict containing details of a certificate request.

Depends

- OpenSSL command line tool

csr:

A path or PEM encoded string containing the CSR to read.

CLI Example:

```
salt '*' x509.read_csr /etc/pki/mycert.csr
```

salt.modules.x509.**sign_remote_certificate**(*argdic*, ***kwargs*)

Request a certificate to be remotely signed according to a signing policy.

argdic:

A dict containing all the arguments to be passed into the create_certificate function. This will become kwargs when passed to create_certificate.

kwargs:

kwargs delivered from publish.publish

CLI Example:

```
salt '*' x509.sign_remote_certificate argdic="{'public_key': '/etc/pki/
↪www.key', 'signing_policy': 'www'}" __pub_id='www1'
```

`salt.modules.x509.`**`verify_crl`**(*crl*, *cert*)

Validate a CRL against a certificate. Parses openssl command line output, this is a workaround for M2Crypto's inability to get them from CSR objects.

crl:
The CRL to verify

cert:
The certificate to verify the CRL against

CLI Example:

```
salt '*' x509.verify_crl crl=/etc/pki/myca.crl cert=/etc/pki/myca.crt
```

`salt.modules.x509.`**`verify_private_key`**(*private_key*, *public_key*, *passphrase=None*)

Verify that 'private_key' matches 'public_key'

private_key:
The private key to verify, can be a string or path to a private key in PEM format.

public_key:
The public key to verify, can be a string or path to a PEM formatted certificate, CSR, or another private key.

passphrase:
Passphrase to decrypt the private key.

CLI Example:

```
salt '*' x509.verify_private_key private_key=/etc/pki/myca.key \
        public_key=/etc/pki/myca.crt
```

`salt.modules.x509.`**`verify_signature`**(*certificate*, *signing_pub_key=None*, *signing_pub_key_passphrase=None*)

Verify that `certificate` has been signed by `signing_pub_key`

certificate:
The certificate to verify. Can be a path or string containing a PEM formatted certificate.

signing_pub_key:
The public key to verify, can be a string or path to a PEM formatted certificate, CSR, or private key.

signing_pub_key_passphrase:
Passphrase to the signing_pub_key if it is an encrypted private key.

CLI Example:

```
salt '*' x509.verify_signature /etc/pki/mycert.pem \
        signing_pub_key=/etc/pki/myca.crt
```

`salt.modules.x509.`**`will_expire`**(*certificate*, *days*)

Returns a dict containing details of a certificate and whether the certificate will expire in the specified number of days. Input can be a PEM string or file path.

New in version 2016.11.0.

certificate:
The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:

```
salt '*' x509.will_expire "/etc/pki/mycert.crt" days=30
```

`salt.modules.x509.`**`write_pem`**(*text*, *path*, *overwrite=True*, *pem_type=None*)

Writes out a PEM string fixing any formatting or whitespace issues before writing.

text:
PEM string input to be written out.

path:
Path of the file to write the PEM out to.

overwrite:
If `True` (default), write_pem will overwrite the entire PEM file. Set False to preserve existing private keys and dh params that may exist in the PEM file.

pem_type:
The PEM type to be saved, for example `CERTIFICATE` or `PUBLIC KEY`. Adding this will allow the function to take input that may contain multiple PEM types.

CLI Example:

```
salt '*' x509.write_pem "-----BEGIN CERTIFICATE-----MIIGMzCCBBugA..." path=/etc/pki/mycert.crt
```

26.6.260 salt.modules.x509_v2

Manage X.509 certificates

depends
cryptography

New in version 3006.0: This module represents a complete rewrite of the original `x509` modules and is named `x509_v2` since it introduces breaking changes.

Changed in version 3008.0: This module is now the default `x509` module and therefore does not need to be enabled explicitly anymore.

Note:

- PKCS12-related operations require at least cryptography release 36.
- PKCS12-related operations with Edwards-curve keys require at least cryptography release 37.
- PKCS7-related operations require at least cryptography release 37.

Configuration

Peer communication

To be able to remotely sign certificates, it is required to configure the Salt master to allow *Peer Communication*:

```
# /etc/salt/master.d/peer.conf

peer:
  .*:
    - x509.sign_remote_certificate
```

In order for the *Compound Matcher* to work with restricting signing policies to a subset of minions, in addition calls to *`match.compound_matches`* by the minion acting as the CA must be permitted:

```
# /etc/salt/master.d/peer.conf

peer:
  .*:
    - x509.sign_remote_certificate

peer_run:
  ca_server:
    - match.compound_matches
```

Note: When compound match expressions are employed, pillar values can only be matched literally. This is a barrier to enumeration attacks by the CA server.

Also note that compound matching requires a minion data cache on the master. Any certificate signing request will be denied if `minion_data_cache` is disabled (it is enabled by default).

Note: Since grain values are controlled by minions, you should avoid using them to restrict certificate issuance.

See *Is Targeting using Grain Data Secure?*.

Changed in version 3007.0: Previously, a compound expression match was validated by the requesting minion itself via peer publishing, which did not protect from compromised minions. The new match validation takes place on the master using peer running.

Signing policies

In addition, the minion representing the CA needs to have at least one signing policy configured, remote calls not referencing one are always rejected.

The parameters specified in this signing policy override any parameters passed from the minion requesting the certificate. It can be configured in the CA minion's pillar, which takes precedence, or any location `config.get` looks up in. Signing policies are defined under `x509_signing_policies`.

You can restrict which minions can request a certificate under a configured signing policy by specifying a matcher in `minions`. This can be a glob or compound matcher (for the latter, see the notes above).

```
x509_signing_policies:
  www:
    - minions: 'www*'
    - signing_private_key: /etc/pki/ca.key
    - signing_cert: /etc/pki/ca.crt
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical, CA:false"
    - keyUsage: "critical, cRLSign, keyCertSign"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 90
    - copypath: /etc/pki/issued_certs/
```

Note: The following semantics are applied regarding the order of preference for specifying the subject name:

- If neither `subject` nor any name attributes (like `CN`) are part of the policy, issued certificates can contain any requested ones.
- If any name attributes are specified in the signing policy, `subject` contained in requests is ignored.
- If `subject` is specified in the signing policy, any name attributes are ignored. If the request contains the same data type for `subject` as the signing policy (for dicts and lists, and only then), merging is performed, otherwise `subject` is taken from the signing policy. Dicts are merged and list items are appended, with the items taken from the signing policy having priority.

Breaking changes versus the previous `x509` modules

- The output format has changed for all `read_*` functions as well as the state return dict.
- The formatting of some extension definitions might have changed, but should be stable for most basic use cases.
- The default ordering of RDNs/Name Attributes in the subject's Distinguished Name has been adapted to industry standards. This might cause a reissuance during the first state run.
- For `x509.private_key_managed`, the file mode defaults to `0400`. This should be considered a bug fix because writing private keys with world-readable permissions by default is a security issue.
- Restricting signing policies using compound match expressions requires peer run permissions instead of peer publishing permissions:

```
# x509, x509_v2 in 3006.*
peer:
  ca_server:
    - match.compound

# x509_v2 from 3007.0 onwards
peer_run:
  ca_server:
    - match.compound_matches
```

Note that when a `ca_server` is involved, both peers must use the updated module version.

Revert to old modules

Until they are removed, you can still revert to the deprecated `x509` modules by setting the following minion configuration value:

```
# /etc/salt/minion.d/x509.conf

features:
  x509_v2: false
```

`salt.modules.x509_v2.`**`create_certificate`**(*ca_server=None, signing_policy=None, encoding='pem', append_certs=None, pkcs12_passphrase=None, pkcs12_encryption_compat=False, pkcs12_friendlyname=None, path=None, overwrite=True, raw=False, **kwargs*)

Create an X.509 certificate and return an encoded version of it.

Note: All parameters that take a public key, private key or certificate can be specified either as a PEM/hex/base64 string or a path to a local file encoded in all supported formats for the type.

CLI Example:

```
salt '*' x509.create_certificate signing_private_key='/etc/pki/myca.key'
↪csr='/etc/pki/my.csr'
```

ca_server
Request a remotely signed certificate from ca_server. For this to work, a `signing_policy` must be specified, and that same policy must be configured on the ca_server. See *Signing policies* for details. Also, the Salt master must permit peers to call the `sign_remote_certificate` function, see *Peer communication*.

signing_policy
The name of a configured signing policy. Parameters specified in there are hardcoded and cannot be overridden. This is required for remote signing, otherwise optional. See *Signing policies* for details.

encoding
Specify the encoding of the resulting certificate. It can be returned as a `pem` (or `pkcs7_pem`) string or several (base64-encoded) binary formats (`der`, `pkcs7_der`, `pkcs12`). Defaults to `pem`.

append_certs
A list of additional certificates to append to the new one, e.g. to create a CA chain.

> **Note:** Mind that when `der` encoding is in use, appending certificatees is prohibited.

copypath
Create a copy of the issued certificate in PEM format in this directory. The file will be named `<serial_number>.crt` if prepend_cn is False.

prepend_cn
When `copypath` is set, prepend the common name of the certificate to the file name like so: `<CN>-<serial_number>.crt`. Defaults to false.

pkcs12_passphrase
When encoding a certificate as `pkcs12`, encrypt it with this passphrase.

> **Note:** PKCS12 encryption is very weak and should not be relied on for security.

pkcs12_encryption_compat
OpenSSL 3 and cryptography v37 switched to a much more secure default encryption for PKCS12, which might be incompatible with some systems. This forces the legacy encryption. Defaults to False.

pkcs12_friendlyname
When encoding a certificate as `pkcs12`, a name for the certificate can be included.

path
Instead of returning the certificate, write it to this file path.

overwrite
If `path` is specified and the file exists, overwrite it. Defaults to true.

raw
Return the encoded raw bytes instead of a string. Defaults to false.

digest
The hashing algorithm to use for the signature. Valid values are: sha1, sha224, sha256, sha384, sha512, sha512_224, sha512_256, sha3_224, sha3_256, sha3_384, sha3_512. Defaults to `sha256`. This will be

ignored for `ed25519` and `ed448` key types.

private_key
The private key corresponding to the public key the certificate should be issued for. This is one way of specifying the public key that will be included in the certificate, the other ones being `public_key` and `csr`.

private_key_passphrase
If `private_key` is specified and encrypted, the passphrase to decrypt it.

public_key
The public key the certificate should be issued for. Other ways of passing the required information are `private_key` and `csr`. If neither are set, the public key of the `signing_private_key` will be included, i.e. a self-signed certificate is generated.

csr
A certificate signing request to use as a base for generating the certificate. The following information will be respected, depending on configuration: * public key * extensions, if not otherwise specified (arguments, signing_policy)

signing_cert
The CA certificate to be used for signing the issued certificate.

signing_private_key
The private key corresponding to the public key in `signing_cert`. Required.

signing_private_key_passphrase
If `signing_private_key` is encrypted, the passphrase to decrypt it.

serial_number
A serial number to be embedded in the certificate. If unspecified, will autogenerate one. This should be an integer, either in decimal or hexadecimal notation.

not_before
Set a specific date the certificate should not be valid before. The format should follow `%Y-%m-%d %H:%M:%S` and will be interpreted as GMT/UTC. Defaults to the time of issuance.

not_after
Set a specific date the certificate should not be valid after. The format should follow `%Y-%m-%d %H:%M:%S` and will be interpreted as GMT/UTC. If unspecified, defaults to the current time plus `days_valid` days.

days_valid
If `not_after` is unspecified, the number of days from the time of issuance the certificate should be valid for. Defaults to `30`.

subject
The subject's distinguished name embedded in the certificate. This is one way of passing this information (see `kwargs` below for the other). This argument will be preferred and allows to control the order of RDNs in the DN as well as to embed RDNs with multiple attributes. This can be specified as an RFC4514-encoded string (`CN=example.com,O=Example Inc,C=US`, mind that the rendered order is reversed from what is embedded), a list of RDNs encoded as in RFC4514 (`["C=US", "O=Example Inc", "CN=example.com"]`) or a dictionary (`{"CN": "example.com", "C": "US", "O": "Example Inc"}`, default ordering). Multiple name attributes per RDN are concatenated with a `+`.

Note: Parsing of RFC4514 strings requires at least cryptography release 37.

---

kwargs
Embedded X.509v3 extensions and the subject's distinguished name can be controlled via supplemental keyword arguments. See the following for an overview.

Subject properties in kwargs
C, ST, L, STREET, O, OU, CN, MAIL, SN, GN, UID, SERIALNUMBER

X.509v3 extensions in kwargs
Most extensions can be configured using the same string format as OpenSSL, while some require ad-

justments. In general, since the strings are parsed to dicts/lists, you can always use the latter formats directly. Marking an extension as critical is done by including it at the beginning of the configuration string, in the list or as a key in the dictionary with the value `true`.

Examples (some showcase dict/list correspondance):

basicConstraints

`critical, CA:TRUE, pathlen:1` or

```yaml
- basicConstraints:
    critical: true
    ca: true
    pathlen: 1
```

keyUsage

`critical, cRLSign, keyCertSign` or

```yaml
- keyUsage:
    - critical
    - cRLSign
    - keyCertSign
```

subjectKeyIdentifier

This can be an explicit value or `hash`, in which case the value will be set to the SHA1 hash of some encoding of the associated public key, depending on the underlying algorithm (RSA/ECDSA/EdDSA).

authorityKeyIdentifier

`keyid:always, issuer`

subjectAltName

There is support for all OpenSSL-defined types except `otherName`.

`email:me@example.com,DNS:example.com` or

```yaml
# mind this being a list, not a dict
- subjectAltName:
    - email:me@example.com
    - DNS:example.com
```

issuerAltName

The syntax is the same as for `subjectAltName`, except that the additional value `issuer:copy` is supported, which will copy the values of `subjectAltName` in the issuer's certificate.

authorityInfoAccess

`OCSP;URI:http://ocsp.example.com/,caIssuers;URI:http://myca.example.com/ca.cer`

crlDistributionPoints

When set to a string value, items are interpreted as fullnames:

`URI:http://example.com/myca.crl, URI:http://example.org/my.crl`

There is also support for more attributes using the full form:

```yaml
- crlDistributionPoints:
    - fullname: URI:http://example.com/myca.crl
      crlissuer: DNS:example.org
      reasons:
        - keyCompromise
    - URI:http://example.org/my.crl
```

certificatePolicies
`critical, 1.2.4.5, 1.1.3.4`

Again, there is support for more attributes using the full form:

```
- certificatePolicies:
    critical: true
    1.2.3.4.5: https://my.ca.com/pratice_statement
    1.2.4.5.6:
      - https://my.ca.com/pratice_statement
      - organization: myorg
        noticeNumbers: [1, 2, 3]
        text: mytext
```

policyConstraints
`requireExplicitPolicy:3,inhibitPolicyMapping:1`

inhibitAnyPolicy
The value is just an integer: `- inhibitAnyPolicy: 1`

nameConstraints
`critical,permitted;IP:192.168.0.0/255.255.0.0,permitted;email:.example.com,excluded;email:.com`

```
- nameConstraints:
    critical: true
    permitted:
      - IP:192.168.0.0/24
      - email:.example.com
    excluded:
      - email:.com
```

noCheck
This extension does not take any values, except `critical`. Just the presence in the keyword args will include it.

tlsfeature
`status_request`

For more information, visit the OpenSSL docs.

`salt.modules.x509_v2.`**`create_crl`**(*signing_private_key, revoked, signing_cert=None, signing_private_key_passphrase=None, include_expired=False, days_valid=None, digest='sha256', encoding='pem', extensions=None, path=None, raw=False, **kwargs*)

Create a certificate revocation list.

CLI Example:

```
salt '*' x509.create_crl signing_cert=/etc/pki/ca.crt
↪signing_private_key=/etc/pki/ca.key                    revoked="[{
↪'certificate': '/etc/pki/certs/www1.crt', 'revocation_date': '2015-03-
↪01 00:00:00'}]"
```

signing_private_key
Your certificate authority's private key. It will be used to sign the CRL. Required.

revoked
A list of dicts containing all the certificates to revoke. Each dict represents one certificate. A dict must contain either the key `serial_number` with the value of the serial number to revoke, or `certificate` with some reference to the certificate to revoke.

The dict can optionally contain the `revocation_date` key. If this key is omitted, the revocation date will be set to now. It should be a string in the format "%Y-%m-%d %H:%M:%S".

The dict can also optionally contain the `not_after` key. This is redundant if the `certificate` key is included, since it will be sourced from the certificate. If the `certificate` key is not included, this can be used for the logic behind the `include_expired` parameter. It should be a string in the format "%Y-%m-%d %H:%M:%S".

The dict can also optionally contain the `extensions` key, which allows to set CRL entry-specific extensions. The following extensions are supported:

certificateIssuer
Identifies the certificate issuer associated with an entry in an indirect CRL. The format is the same as for subjectAltName.

CRLReason
Identifies the reason for certificate revocation. Available choices are `unspecified`, `keyCompromise`, `CACompromise`, `affiliationChanged`, `superseded`, `cessationOfOperation`, `certificateHold`, `privilegeWithdrawn`, `aACompromise` and `removeFromCRL`.

invalidityDate
Provides the date on which the certificate likely became invalid. The value should be a string in the same format as `revocation_date`.

signing_cert
The CA certificate to be used for signing the CRL.

signing_private_key_passphrase
If `signing_private_key` is encrypted, the passphrase to decrypt it.

include_expired
Also include already expired certificates in the CRL. Defaults to false.

days_valid
The number of days the CRL should be valid for. This sets the `Next Update` field. Defaults to `100` (until v3009) or `7` (from v3009 onwards).

digest
The hashing algorithm to use for the signature. Valid values are: sha1, sha224, sha256, sha384, sha512, sha512_224, sha512_256, sha3_224, sha3_256, sha3_384, sha3_512. Defaults to `sha256`. This will be ignored for `ed25519` and `ed448` key types.

encoding
Specify the encoding of the resulting certificate revocation list. It can be returned as a `pem` string or base64-encoded `der`. Defaults to `pem`.

extensions
Add CRL extensions. The following are available:

authorityKeyIdentifier
See *`x509.create_certificate`*.

authorityInfoAccess
See *`x509.create_certificate`*.

cRLNumber
Specifies a sequential number for each CRL issued by a CA. Values must be integers.

deltaCRLIndicator
If the CRL is a delta CRL, this value points to the cRLNumber of the base cRL. Values must be integers.

freshestCRL
Identifies how delta CRL information is obtained. The format is the same as `crlDistributionPoints`.

issuerAltName
See *`x509.create_certificate`*.

issuingDistributionPoint
Identifies the CRL distribution point for a particular CRL and indicates what kinds of revocation

it covers. The format is comparable to `crlDistributionPoints`. Specify as follows:

```
issuingDistributionPoint:
  fullname:  # or relativename with RDN
    - URI:http://example.com/myca.crl
  onlysomereasons:
    - keyCompromise
  onlyuser: true
  onlyCA: true
  onlyAA: true
  indirectCRL: false
```

path
Instead of returning the CRL, write it to this file path.

raw
Return the encoded raw bytes instead of a string. Defaults to false.

`salt.modules.x509_v2.`**`create_csr`**(*private_key, private_key_passphrase=None, digest='sha256', encoding='pem', path=None, raw=False, **kwargs*)

Create a certificate signing request.

CLI Example:

```
salt '*' x509.create_csr private_key='/etc/pki/myca.key' CN='My Cert'
```

private_key
The private key corresponding to the public key the certificate should be issued for. The CSR will be signed by it. Required.

private_key_passphrase
If `private_key` is encrypted, the passphrase to decrypt it.

digest
The hashing algorithm to use for the signature. Valid values are: sha1, sha224, sha256, sha384, sha512, sha512_224, sha512_256, sha3_224, sha3_256, sha3_384, sha3_512. Defaults to `sha256`. This will be ignored for `ed25519` and `ed448` key types.

encoding
Specify the encoding of the resulting certificate signing request. It can be returned as a `pem` string or base64-encoded `der`. Defaults to `pem`.

path
Instead of returning the CSR, write it to this file path.

raw
Return the encoded raw bytes instead of a string. Defaults to false.

kwargs
Embedded X.509v3 extensions and the subject's distinguished name can be controlled via supplemental keyword arguments. See *`x509.create_certificate`* for an overview. Mind that some extensions are not available for CSR (`authorityInfoAccess`, `authorityKeyIdentifier`, `issuerAltName`, `crlDistributionPoints`).

`salt.modules.x509_v2.`**`create_private_key`**(*algo='rsa', keysize=None, passphrase=None, encoding='pem', pkcs12_encryption_compat=False, path=None, raw=False, **kwargs*)

Create a private key.

CLI Example:

```
salt '*' x509.create_private_key algo=ec keysize=384
```

algo
The digital signature scheme the private key should be based on. Available: `rsa`, `ec`, `ed25519`, `ed448`. Defaults to `rsa`.

keysize
For `rsa`, specifies the bitlength of the private key (2048, 3072, 4096). For `ec`, specifies the NIST curve to use (256, 384, 521). Irrelevant for Edwards-curve schemes (`ed25519`, `ed448`). Defaults to 2048 for RSA and 256 for EC.

passphrase
If this is specified, the private key will be encrypted using this passphrase. The encryption algorithm cannot be selected, it will be determined automatically as the best available one.

encoding
Specify the encoding of the resulting private key. It can be returned as a `pem` string, base64-encoded `der` or base64-encoded `pkcs12`. Defaults to `pem`.

pkcs12_encryption_compat
Some operating systems are incompatible with the encryption defaults for PKCS12 used since OpenSSL v3. This switch triggers a fallback to `PBESv1SHA1And3KeyTripleDESCBC`. Please consider the notes on PKCS12 encryption.

path
Instead of returning the private key, write it to this file path. Note that this does not use safe permissions and should be avoided.

raw
Return the encoded raw bytes instead of a string. Defaults to false.

`salt.modules.x509_v2.`**`encode_certificate`**`(`*certificate*, *encoding='pem'*, *append_certs=None*, *private_key=None*, *private_key_passphrase=None*, *pkcs12_passphrase=None*, *pkcs12_encryption_compat=False*, *pkcs12_friendlyname=None*, *raw=False*`)`

Create an encoded representation of a certificate, optionally including other structures. This can be used to create certificate chains, convert a certificate into a different encoding or embed the corresponding private key (for `pkcs12`).

CLI Example:

```
salt '*' x509.encode_certificate /etc/pki/my.crt pem /etc/pki/ca.crt
```

certificate
The certificate to encode.

encoding
Specify the encoding of the resulting certificate. It can be returned as a `pem` (or `pkcs7_pem`) string or several (base64-encoded) binary formats (`der`, `pkcs7_der`, `pkcs12`). Defaults to `pem`.

append_certs
A list of additional certificates to encode with the new one, e.g. to create a CA chain.

Note: Mind that when `der` encoding is in use, appending certificatees is prohibited.

private_key
For `pkcs12`, the private key corresponding to the public key of the `certificate` to be embedded.

private_key_passphrase
For `pkcs12`, if the private key to embed is encrypted, specify the corresponding passphrase.

pkcs12_passphrase
For `pkcs12`, the container can be encrypted. Specify the passphrase to use here. Mind that PKCS12 encryption should not be relied on for security purposes, see note above in *`x509.create_certificate`*.

pkcs12_encryption_compat
OpenSSL 3 and cryptography v37 switched to a much more secure default encryption for PKCS12, which might be incompatible with some systems. This forces the legacy encryption. Defaults to False.

pkcs12_friendlyname
When encoding a certificate as `pkcs12`, a name for the certificate can be included.

raw
Return the encoded raw bytes instead of a string. Defaults to false.

`salt.modules.x509_v2.`**`encode_crl`**`(`*crl*, *encoding='pem'*, *raw=False*`)`

Create an encoded representation of a certificate revocation list.

CLI Example:

```
salt '*' x509.encode_crl /etc/pki/my.crl der
```

crl
The certificate revocation list to encode.

encoding
Specify the encoding of the resulting certificate revocation list. It can be returned as a `pem` string or base64-encoded `der`. Defaults to `pem`.

raw
Return the encoded raw bytes instead of a string. Defaults to false.

`salt.modules.x509_v2.`**`encode_csr`**`(`*csr*, *encoding='pem'*, *raw=False*`)`

Create an encoded representation of a certificate signing request.

CLI Example:

```
salt '*' x509.encode_csr /etc/pki/my.csr der
```

csr
The certificate signing request to encode.

encoding
Specify the encoding of the resulting certificate signing request. It can be returned as a `pem` string or base64-encoded `der`. Defaults to `pem`.

raw
Return the encoded raw bytes instead of a string. Defaults to false.

`salt.modules.x509_v2.`**`encode_private_key`**`(`*private_key*, *encoding='pem'*, *passphrase=None*, *private_key_passphrase=None*, *pkcs12_encryption_compat=False*, *raw=False*`)`

Create an encoded representation of a private key.

CLI Example:

```
salt '*' x509.encode_private_key /etc/pki/my.key der
```

private_key
The private key to encode.

encoding
Specify the encoding of the resulting private key. It can be returned as a `pem` string, base64-encoded `der` and base64-encoded `pkcs12`. Defaults to `pem`.

passphrase
If this is specified, the private key will be encrypted using this passphrase. The encryption algorithm cannot be selected, it will be determined automatically as the best available one.

private_key_passphrase
New in version 3006.2.

If the current `private_key` is encrypted, the passphrase to decrypt it.

pkcs12_encryption_compat

Some operating systems are incompatible with the encryption defaults for PKCS12 used since OpenSSL v3. This switch triggers a fallback to `PBESv1SHA1And3KeyTripleDESCBC`. Please consider the notes on PKCS12 encryption.

raw

Return the encoded raw bytes instead of a string. Defaults to false.

`salt.modules.x509_v2.`**`expired`**(*certificate*)

Returns a dict containing limited details of a certificate and whether the certificate has expired.

CLI Example:

```
salt '*' x509.expired /etc/pki/mycert.crt
```

certificate

The certificate to check.

`salt.modules.x509_v2.`**`expires`**(*certificate*, *days=0*)

Determine whether a certificate will expire or has expired already. Returns a boolean only.

CLI Example:

```
salt '*' x509.expires /etc/pki/my.crt days=7
```

certificate

The certificate to check.

days

If specified, determine expiration x days in the future. Defaults to `0`, which checks for the current time.

`salt.modules.x509_v2.`**`get_pem_entries`**(*glob_path*)

Returns a dict containing PEM entries in files matching a glob.

CLI Example:

```
salt '*' x509.get_pem_entries "/etc/pki/*.crt"
```

glob_path

A path representing certificates to be read and returned.

`salt.modules.x509_v2.`**`get_pem_entry`**(*text*, *pem_type=None*)

Returns a properly formatted PEM string from the input text, fixing any whitespace or line-break issues.

CLI Example:

```
salt '*' x509.get_pem_entry "-----BEGIN CERTIFICATE REQUEST-----MIICyzCC
↪Ar8CAQI...-----END CERTIFICATE REQUEST"
```

text

Text containing the X509 PEM entry to be returned or path to a file containing the text.

pem_type

If specified, this function will only return a pem of a certain type, for example 'CERTIFICATE' or 'CERTIFICATE REQUEST'.

`salt.modules.x509_v2.`**`get_private_key_size`**(*private_key*, *passphrase=None*)

Return information about the keysize of a private key (RSA/EC).

CLI Example:

```
salt '*' x509.get_private_key_size /etc/pki/my.key
```

private_key
The private key to check.

passphrase
If `private_key` is encrypted, the passphrase to decrypt it.

`salt.modules.x509_v2.`**`get_public_key`**`(`*key*, *passphrase=None*, *asObj=None*`)`

Returns a PEM-encoded public key derived from some reference. The reference should be a public key, certificate, private key or CSR.

CLI Example:

```
salt '*' x509.get_public_key /etc/pki/my.key
```

key
A reference to the structure to look the public key up for.

passphrase
If `key` is encrypted, the passphrase to decrypt it.

`salt.modules.x509_v2.`**`get_signing_policy`**`(`*signing_policy*, *ca_server=None*`)`

Returns the specified named signing policy.

CLI Example:

```
salt '*' x509.get_signing_policy www
```

signing_policy
The name of the signing policy to return.

ca_server
If this is set, the CA server will be queried for the signing policy instead of looking it up locally.

`salt.modules.x509_v2.`**`read_certificate`**`(`*certificate*`)`

Returns a dict containing details of a certificate.

CLI Example:

```
salt '*' x509.read_certificate /etc/pki/mycert.crt
```

certificate
The certificate to read.

`salt.modules.x509_v2.`**`read_certificates`**`(`*glob_path*`)`

Returns a dict containing details of all certificates matching a glob.

CLI Example:

```
salt '*' x509.read_certificates "/etc/pki/*.crt"
```

glob_path
A path to certificates to be read and returned.

`salt.modules.x509_v2.`**`read_crl`**`(`*crl*`)`

Returns a dict containing details of a certificate revocation list.

CLI Example:

```
salt '*' x509.read_crl /etc/pki/my.crl
```

crl
The certificate revocation list to read.

`salt.modules.x509_v2.`**`read_csr`**`(`*csr*`)`

Returns a dict containing details of a certificate signing request.

CLI Example:

```
salt '*' x509.read_csr /etc/pki/mycert.csr
```

csr
The certificate signing request to read.

`salt.modules.x509_v2.`**`sign_remote_certificate`**`(`*signing_policy*, *kwargs*, *get_signing_policy_only=False*, ***more_kwargs*`)`

Request a certificate to be remotely signed according to a signing policy. This is mostly for internal use and does not make much sense on the CLI.

CLI Example:

```
salt '*' x509.sign_remote_certificate www kwargs="{'public_key': '/etc/
↪pki/www.key'}"
```

signing_policy
The name of the signing policy to use. Required.

kwargs
A dict containing all the arguments to be passed into the `x509.create_certificate` function.

get_signing_policy_only
Only return the named signing policy. Defaults to false.

`salt.modules.x509_v2.`**`verify_crl`**`(`*crl*, *cert*`)`

Verify that a signature on a certificate revocation list was made by the private key corresponding to the public key associated with the specified certificate.

CLI Example:

```
salt '*' x509.verify_crl /etc/pki/my.crl /etc/pki/my.crt
```

crl
The certificate revocation list to check the signature on.

cert
The certificate (or any reference that can be passed to `get_public_key`) to retrieve the public key from.

`salt.modules.x509_v2.`**`verify_private_key`**`(`*private_key*, *public_key*, *passphrase=None*`)`

Verify that a private key belongs to the specified public key.

CLI Example:

```
salt '*' x509.verify_private_key /etc/pki/my.key /etc/pki/my.crt
```

private_key
The private key to check.

public_key
The certificate (or any reference that can be passed to `get_public_key`) to retrieve the public key from.

passphrase
: If `private_key` is encrypted, the passphrase to decrypt it.

`salt.modules.x509_v2.`**`verify_signature`**(*certificate, signing_pub_key=None, signing_pub_key_passphrase=None*)

Verify that a signature on a certificate was made by the private key corresponding to the public key associated with the specified certificate.

CLI Example:

```
salt '*' x509.verify_signature /etc/pki/my.key /etc/pki/my.crt
```

certificate
: The certificate to check the signature on.

signing_pub_key
: Any reference that can be passed to `get_public_key` to retrieve the public key of the signing entity from. If unspecified, will take the public key of `certificate`, i.e. verify a self-signed certificate.

signing_pub_key_passphrase
: If `signing_pub_key` is encrypted, the passphrase to decrypt it.

`salt.modules.x509_v2.`**`will_expire`**(*certificate, days*)

Returns a dict containing details of a certificate and whether the certificate will expire in the specified number of days.

CLI Example:

```
salt '*' x509.will_expire "/etc/pki/mycert.crt" days=30
```

certificate
: The certificate to check.

days
: The number of days in the future to check the validity for.

`salt.modules.x509_v2.`**`write_pem`**(*text, path, overwrite=True, pem_type=None*)

Writes out a PEM string, fixing any formatting or whitespace issues before writing.

CLI Example:

```
salt '*' x509.write_pem "-----BEGIN CERTIFICATE-----MIIGMzCCBBugA..." path=/etc/pki/mycert.crt
```

text
: PEM string input to be written out.

path
: Path of the file to write the PEM out to.

overwrite
: If `True` (default), write_pem will overwrite the entire PEM file. Set to `False` to preserve existing private keys and DH params that may exist in the PEM file.

pem_type
: The PEM type to be saved, for example `CERTIFICATE` or `PUBLIC KEY`. Adding this will allow the function to take input that may contain multiple PEM types.

26.6.261 salt.modules.xfs

Module for managing XFS file systems.

`salt.modules.xfs.`**`defragment`**`(`*device*`)`

Defragment mounted XFS filesystem. In order to mount a filesystem, device should be properly mounted and writable.

CLI Example:

```
salt '*' xfs.defragment /dev/sda1
```

`salt.modules.xfs.`**`devices`**`()`

Get known XFS formatted devices on the system.

CLI Example:

```
salt '*' xfs.devices
```

`salt.modules.xfs.`**`dump`**`(`*device, destination, level=0, label=None, noerase=None*`)`

Dump filesystem device to the media (file, tape etc).

Required parameters:
- **device**: XFS device, content of which to be dumped.
- **destination**: Specifies a dump destination.

Valid options are:
- **label**: Label of the dump. Otherwise automatically generated label is used.
- **level**: Specifies a dump level of 0 to 9.
- **noerase**: Pre-erase media.

Other options are not used in order to let `xfsdump` use its default values, as they are most optimal. See the `xfsdump(8)` manpage for a more complete description of these options.

CLI Example:

```
salt '*' xfs.dump /dev/sda1 /detination/on/the/client
salt '*' xfs.dump /dev/sda1 /detination/on/the/client label='Company
↪accountancy'
salt '*' xfs.dump /dev/sda1 /detination/on/the/client noerase=True
```

`salt.modules.xfs.`**`estimate`**`(`*path*`)`

Estimate the space that an XFS filesystem will take. For each directory estimate the space that directory would take if it were copied to an XFS filesystem. Estimation does not cross mount points.

CLI Example:

```
salt '*' xfs.estimate /path/to/file
salt '*' xfs.estimate /path/to/dir/*
```

`salt.modules.xfs.`**`info`**`(`*device*`)`

Get filesystem geometry information.

CLI Example:

```
salt '*' xfs.info /dev/sda1
```

`salt.modules.xfs.`**`inventory`**`()`

Display XFS dump inventory without restoration.

CLI Example:

```
salt '*' xfs.inventory
```

`salt.modules.xfs.`**`mkfs`**`(`*device, label=None, ssize=None, noforce=None, bso=None, gmo=None, ino=None, lso=None, rso=None, nmo=None, dso=None*`)`

Create a file system on the specified device. By default wipes out with force.

General options:

- **label**: Specify volume label.
- **ssize**: Specify the fundamental sector size of the filesystem.
- **noforce**: Do not force create filesystem, if disk is already formatted.

Filesystem geometry options:

- **bso**: Block size options.
- **gmo**: Global metadata options.
- **dso**: **Data section options. These options specify the location, size,**
  and other parameters of the data section of the filesystem.
- **ino**: Inode options to specify the inode size of the filesystem, and other inode allocation parameters.
- **lso**: Log section options.
- **nmo**: Naming options.
- **rso**: Realtime section options.

See the `mkfs.xfs(8)` manpage for a more complete description of corresponding options description.

CLI Example:

```
salt '*' xfs.mkfs /dev/sda1
salt '*' xfs.mkfs /dev/sda1 dso='su=32k,sw=6' noforce=True
salt '*' xfs.mkfs /dev/sda1 dso='su=32k,sw=6' lso='logdev=/dev/sda2,
↪size=10000b'
```

`salt.modules.xfs.`**`modify`**`(`*device, label=None, lazy_counting=None, uuid=None*`)`

Modify parameters of an XFS filesystem.

CLI Example:

```
salt '*' xfs.modify /dev/sda1 label='My backup' lazy_counting=False
salt '*' xfs.modify /dev/sda1 uuid=False
salt '*' xfs.modify /dev/sda1 uuid=True
```

`salt.modules.xfs.`**`prune_dump`**`(`*sessionid*`)`

Prunes the dump session identified by the given session id.

CLI Example:

```
salt '*' xfs.prune_dump b74a3586-e52e-4a4a-8775-c3334fa8ea2c
```

26.6.262 salt.modules.xml

XML file manager

New in version 3000.

`salt.modules.xml.`**`get_attribute`**(*file*, *element*)

Return the attributes of the matched xpath element.

CLI Example:

```
salt '*' xml.get_attribute /tmp/test.xml ".//element[@id='3']"
```

`salt.modules.xml.`**`get_value`**(*file*, *element*)

Returns the value of the matched xpath element

CLI Example:

```
salt '*' xml.get_value /tmp/test.xml ".//element"
```

`salt.modules.xml.`**`set_attribute`**(*file*, *element*, *key*, *value*)

Set the requested attribute key and value for matched xpath element.

CLI Example:

```
salt '*' xml.set_attribute /tmp/test.xml ".//element[@id='3']" editedby
↪"gal"
```

`salt.modules.xml.`**`set_value`**(*file*, *element*, *value*)

Sets the value of the matched xpath element

CLI Example:

```
salt '*' xml.set_value /tmp/test.xml ".//element" "new value"
```

26.6.263 salt.modules.yaml

Yaml helper module for troubleshooting yaml

New in version 3005.

depends
yamllint >= 1.20.0

`salt.modules.yaml.`**`lint`**(*source*, *saltenv=None*, *pre_render=None*, ***kwargs*)

lint the output after detecting a sucsessful render.

Parameters

- **`source`** (*`str`*) -- managed source file
- **`saltenv`** (*`str`*) -- the saltenv to use, defaults to minions enviroment or base if not set
- **`pre_render`** (*`str`*) -- The render options passed to slsutil.renderer other wise file is cached and loaded as stream

CLI Example:

```
salt '*' yaml.lint salt://example/bad_yaml.sls
```

26.6.264 salt.modules.yumpkg

Support for YUM/DNF

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see *here*.

Note: DNF is fully supported as of version 2015.5.10 and 2015.8.4 (partial support for DNF was initially added in 2015.8.0), and DNF is used automatically in place of YUM in Fedora 22 and newer.

New in version 3003: Support for `tdnf` on Photon OS.

New in version 3006.10: Support for `dnf5`` on Fedora 41

New in version 3007.0: Support for `dnf5`` on Fedora 39

class `salt.modules.yumpkg.`**`AvailablePackages`**(**args*, ***kwargs*)

`salt.modules.yumpkg.`**`available_version`**(**names*, ***kwargs*)

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

A specific repo can be requested using the `fromrepo` keyword argument, and the `disableexcludes` option is also supported.

New in version 2014.7.0: Support for the `disableexcludes` option

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> fromrepo=epel-testing
salt '*' pkg.latest_version <package name> disableexcludes=main
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.yumpkg.`**`clean_metadata`**(***kwargs*)

New in version 2014.1.0.

Cleans local yum metadata. Functionally identical to *`refresh_db()`*.

CLI Example:

```
salt '*' pkg.clean_metadata
```

`salt.modules.yumpkg.`**`del_repo`**(*repo*, *basedir=None*, ***kwargs*)

Delete a repo from <basedir> (default basedir: all dirs in *reposdir* yum option).

If the .repo file in which the repo exists does not contain any other repo configuration, the file itself will be deleted.

Strict parsing of configuration files is the default, this can be disabled using the `strict_config` keyword argument set to False

CLI Examples:

```
salt '*' pkg.del_repo myrepo
salt '*' pkg.del_repo myrepo basedir=/path/to/dir strict_config=False
salt '*' pkg.del_repo myrepo basedir=/path/to/dir,/path/to/another/dir
```

`salt.modules.yumpkg.`**`diff`**(**paths*, ***kwargs*)

Return a formatted diff between current files and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

Parameters

`path` -- Full path to the installed file

Returns

Difference string or raises and exception if examined file is binary.

CLI Example:

```
salt '*' pkg.diff /etc/apache2/httpd.conf /etc/sudoers
```

`salt.modules.yumpkg.`**`download`**(**packages*, ***kwargs*)

New in version 2015.5.0.

Download packages to the local disk. Requires `yumdownloader` from `yum-utils` or `dnf-utils` package.

Note: `yum-utils` or `dnf-utils` will already be installed on the minion if the package was installed from the EPEL / Fedora repositories.

CLI Example:

```
salt '*' pkg.download httpd
salt '*' pkg.download httpd postfix
```

`salt.modules.yumpkg.`**`file_dict`**(**packages*, ***kwargs*)

New in version 2014.1.0.

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of *every* file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.yumpkg.`**`file_list`**(**packages*, ***kwargs*)

New in version 2014.1.0.

List the files that belong to a package. Not specifying any packages will return a list of *every* file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.yumpkg.`**`get_locked_packages`**`(`*pattern='[\\w+]+(?:[.-][^-]+)*', full=True*`)`

This function is an alias of `list_holds`.

Changed in version 2015.5.10,2015.8.4,2016.3.0: Function renamed from `pkg.get_locked_pkgs` to `pkg.list_holds`.

List information on locked packages

Note: Requires the appropriate `versionlock` plugin package to be installed:

- On RHEL 5: `yum-versionlock`
- On RHEL 6 & 7: `yum-plugin-versionlock`
- On Fedora: `python-dnf-plugins-extras-versionlock`

---

pattern

[w+(?:[.-][^-]+)*] Regular expression used to match the package name

full

[True] Show the full hold definition including version and epoch. Set to `False` to return just the name of the package(s) being held.

CLI Example:

```
salt '*' pkg.list_holds
salt '*' pkg.list_holds full=False
```

`salt.modules.yumpkg.`**`get_repo`**`(`*repo, basedir=None, **kwargs*`)`

Display a repo from <basedir> (default basedir: all dirs in `reposdir` yum option).

CLI Examples:

```
salt '*' pkg.get_repo myrepo
salt '*' pkg.get_repo myrepo basedir=/path/to/dir
salt '*' pkg.get_repo myrepo basedir=/path/to/dir,/path/to/another/dir
```

`salt.modules.yumpkg.`**`group_diff`**`(`*name, **kwargs*`)`

New in version 2014.1.0.

Changed in version 2015.5.10,2015.8.4,2016.3.0: Environment groups are now supported. The key names have been renamed, similar to the changes made in *`pkg.group_info`*.

Changed in version 3006.2: Support for `fromrepo`, `enablerepo`, and `disablerepo` (as used in *`pkg.install`*) has been added.

Lists which of a group's packages are installed and which are not installed

name

The name of the group to check

fromrepo

Restrict `yum groupinfo` to the specified repo(s). (e.g., `yum --disablerepo='*' --enablerepo='somerepo'`)

New in version 3006.2.

enablerepo (ignored if `fromrepo` is specified)

Specify a disabled package repository (or repositories) to enable. (e.g., `yum --enablerepo='somerepo'`)

New in version 3006.2.

disablerepo (ignored if `fromrepo` is specified)

Specify an enabled package repository (or repositories) to disable. (e.g., `yum --disablerepo='somerepo'`)

New in version 3006.2.

CLI Example:

```
salt '*' pkg.group_diff 'Perl Support'
salt '*' pkg.group_diff 'Perl Support' fromrepo=base,updates
salt '*' pkg.group_diff 'Perl Support' enablerepo=somerepo
```

`salt.modules.yumpkg.`**`group_info`**(*name*, *expand=False*, *ignore_groups=None*, ***kwargs*)

New in version 2014.1.0.

Changed in version 2015.5.10,2015.8.4,2016.3.0,3001: The return data has changed. A new key `type` has been added to distinguish environment groups from package groups. Also, keys for the group name and group ID have been added. The `mandatory packages`, `optional packages`, and `default packages` keys have been renamed to `mandatory`, `optional`, and `default` for accuracy, as environment groups include other groups, and not packages. Finally, this function now properly identifies conditional packages.

Changed in version 3006.2: Support for `fromrepo`, `enablerepo`, and `disablerepo` (as used in *`pkg.install`*) has been added.

Lists packages belonging to a certain group

name

Name of the group to query

expand

[False] If the specified group is an environment group, then the group will be expanded and the return data will include package names instead of group names.

New in version 2016.3.0.

ignore_groups

[None] This parameter can be used to pass a list of groups to ignore when expanding subgroups. It is used during recursion in order to prevent expanding the same group multiple times.

New in version 3001.

fromrepo

Restrict `yum groupinfo` to the specified repo(s). (e.g., `yum --disablerepo='*' --enablerepo='somerepo'`)

New in version 3006.2.

enablerepo (ignored if `fromrepo` is specified)

Specify a disabled package repository (or repositories) to enable. (e.g., `yum --enablerepo='somerepo'`)

New in version 3006.2.

disablerepo (ignored if `fromrepo` is specified)

Specify an enabled package repository (or repositories) to disable. (e.g., `yum --disablerepo='somerepo'`)

New in version 3006.2.

CLI Example:

```
salt '*' pkg.group_info 'Perl Support'
salt '*' pkg.group_info 'Perl Support' fromrepo=base,updates
salt '*' pkg.group_info 'Perl Support' enablerepo=somerepo
```

`salt.modules.yumpkg.`**`group_install`**(*name*, *skip=()*, *include=()*, ***kwargs*)

New in version 2014.1.0.

Install the passed package group(s). This is basically a wrapper around *`pkg.install`*, which performs package group resolution for the user. This function is currently considered experimental, and should be expected to undergo changes.

name

Package group to install. To install more than one group, either use a comma-separated list or pass the value as a python list.

CLI Examples:

```
salt '*' pkg.group_install 'Group 1'
salt '*' pkg.group_install 'Group 1,Group 2'
salt '*' pkg.group_install '["Group 1", "Group 2"]'
```

skip

Packages that would normally be installed by the package group ("default" packages), which should not be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```
salt '*' pkg.group_install 'My Group' skip='foo,bar'
salt '*' pkg.group_install 'My Group' skip='["foo", "bar"]'
```

include

Packages which are included in a group, which would not normally be installed by a `yum groupinstall` ("optional" packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```
salt '*' pkg.group_install 'My Group' include='foo,bar'
salt '*' pkg.group_install 'My Group' include='["foo", "bar"]'
```

Note: Because this is essentially a wrapper around pkg.install, any argument which can be passed to pkg.install may also be included here, and it will be passed along wholesale.

`salt.modules.yumpkg.`**`group_list`**`()`

New in version 2014.1.0.

Lists all groups known by yum on this system

CLI Example:

```
salt '*' pkg.group_list
```

`salt.modules.yumpkg.`**`groupinstall`**`(`*name, skip=(), include=(), **kwargs*`)`

This function is an alias of `group_install`.

New in version 2014.1.0.

Install the passed package group(s). This is basically a wrapper around *`pkg.install`*, which performs package group resolution for the user. This function is currently considered experimental, and should be expected to undergo changes.

name

Package group to install. To install more than one group, either use a comma-separated list or pass the value as a python list.

CLI Examples:

```
salt '*' pkg.group_install 'Group 1'
salt '*' pkg.group_install 'Group 1,Group 2'
salt '*' pkg.group_install '["Group 1", "Group 2"]'
```

skip

Packages that would normally be installed by the package group ("default" packages), which should not be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```
salt '*' pkg.group_install 'My Group' skip='foo,bar'
salt '*' pkg.group_install 'My Group' skip='["foo", "bar"]'
```

include

Packages which are included in a group, which would not normally be installed by a `yum groupinstall` ("optional" packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```
salt '*' pkg.group_install 'My Group' include='foo,bar'
salt '*' pkg.group_install 'My Group' include='["foo", "bar"]
↪'
```

Note: Because this is essentially a wrapper around pkg.install, any argument which can be passed to pkg.install may also be included here, and it will be passed along wholesale.

`salt.modules.yumpkg.`**`hold`**(*name=None*, *pkgs=None*, *sources=None*, *normalize=True*, ***kwargs*)

New in version 2014.7.0.

Version-lock packages

Note: Requires the appropriate `versionlock` plugin package to be installed:

- On RHEL 5: `yum-versionlock`
- On RHEL 6 & 7: `yum-plugin-versionlock`
- On Fedora: `python-dnf-plugins-extras-versionlock`

name

The name of the package to be held.

Multiple Package Options:

pkgs

A list of packages to hold. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.hold <package name>
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

`salt.modules.yumpkg.`**`info_installed`**(**names*, ***kwargs*)

New in version 2015.8.1.

Return the information of the named package(s), installed on the system.

Parameters

`all_versions` -- Include information for all versions of the packages installed on the minion.

CLI Example:

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> <package2> <package3> all_
↪versions=True
```

`salt.modules.yumpkg.`**`install`**(*name=None, refresh=False, skip_verify=False, pkgs=None, sources=None, downloadonly=False, reinstall=False, normalize=True, update_holds=False, saltenv='base', ignore_epoch=False, **kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Install the passed package(s), add refresh=True to clean the yum database before package is installed.

name

The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option.

32-bit packages can be installed on 64-bit systems by appending the architecture designation (`.i686`, `.i586`, etc.) to the end of the package name.

CLI Example:

```
salt '*' pkg.install <package name>
```

refresh

Whether or not to update the yum database before executing.

reinstall

Specifying reinstall=True will use `yum reinstall` rather than `yum install` for requested packages that are already installed.

If a version is specified with the requested package, then `yum reinstall` will only be used if the installed version matches the requested version.

Works with `sources` when the package header of the source can be matched to the name and version of an installed package.

New in version 2014.7.0.

skip_verify

Skip the GPG verification check (e.g., `--nogpgcheck`)

downloadonly

Only download the packages, do not install.

version

Install a specific version of the package, e.g. 1.2.3-4.el5. Ignored if "pkgs" or "sources" is passed.

Note: Remember that versions that contain a single . will be interpreted as numbers and must be double-quoted. For example, version `3006.10` will be rendered as `3006.1`. To pass `3006.10` you'll need to use double-quotes. `version="'3006.10'"`

Changed in version 2018.3.0: version can now contain comparison operators (e.g. `>1.2.3`, `<=2.0`, etc.)

update_holds

[False] If `True`, and this function would update the package version, any packages held using the yum/dnf "versionlock" plugin will be unheld so that they can be updated. Otherwise, if this function attempts to update a held package, the held package(s) will be skipped and an error will be raised.

New in version 2016.11.0.

setopt

A comma-separated or Python list of key=value options. This list will be expanded and `--setopt` prepended to each in the yum/dnf command that is run.

CLI Example:

```
salt '*' pkg.install foo setopt='obsoletes=0,plugins=0'
```

New in version 2019.2.0.

Repository Options:

fromrepo

Specify a package repository (or repositories) from which to install. (e.g., `yum --disablerepo='*' --enablerepo='somerepo'`)

enablerepo (ignored if `fromrepo` is specified)

Specify a disabled package repository (or repositories) to enable. (e.g., `yum --enablerepo='somerepo'`)

disablerepo (ignored if `fromrepo` is specified)

Specify an enabled package repository (or repositories) to disable. (e.g., `yum --disablerepo='somerepo'`)

disableexcludes

Disable exclude from main, for a repo or for everything. (e.g., `yum --disableexcludes='main'`)

New in version 2014.7.0.

ignore_epoch

[False] Only used when the version of a package is specified using a comparison operator (e.g. `>4.1`). If set to `True`, then the epoch will be ignored when comparing the currently-installed version to the desired version.

New in version 2018.3.0.

Multiple Package Installation Options:

pkgs

A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version.

CLI Examples:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-4.el5"}]'
```

sources

A list of RPM packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.rpm"}, {"bar":
↪"salt://bar.rpm"}]'
```

normalize

[True] Normalize the package name by removing the architecture. This is useful for poorly created packages which might include the architecture as an actual part of the name such as kernel modules which match a specific kernel version.

```
salt -G role:nsd pkg.install gpfs.gplbin-2.6.32-279.31.1.el6.x86_64␣
↪normalize=False
```

New in version 2014.7.0.

split_arch
[True] If set to False it prevents package name normalization more strict way than `normalize` set to `False` does.

New in version 3006.0.

diff_attr:
If a list of package attributes is specified, returned value will contain them, eg.:

```
{'<package>': {
    'old': {
        'version': '<old-version>',
        'arch': '<old-arch>'},

    'new': {
        'version': '<new-version>',
        'arch': '<new-arch>'}}}
```

Valid attributes are: `epoch`, `version`, `release`, `arch`, `install_date`, `install_date_time_t`.

If `all` is specified, all valid attributes will be returned.

New in version 2018.3.0.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

If an attribute list in diff_attr is specified, the dict will also contain any specified attribute, eg.:

```
{'<package>': {
    'old': {
        'version': '<old-version>',
        'arch': '<old-arch>'},

    'new': {
        'version': '<new-version>',
        'arch': '<new-arch>'}}}
```

`salt.modules.yumpkg.`**`latest_version`**`(`**names*, ***kwargs*`)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

A specific repo can be requested using the `fromrepo` keyword argument, and the `disableexcludes` option is also supported.

New in version 2014.7.0: Support for the `disableexcludes` option

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> fromrepo=epel-testing
salt '*' pkg.latest_version <package name> disableexcludes=main
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.yumpkg.list_downloaded(**kwargs)`

New in version 2017.7.0.

List prefetched packages downloaded by Yum in the local disk.

CLI Example:

```
salt '*' pkg.list_downloaded
```

`salt.modules.yumpkg.list_holds(pattern='[\\w+]+(?:[.-][^-]+)*', full=True)`

Changed in version 2015.5.10,2015.8.4,2016.3.0: Function renamed from `pkg.get_locked_pkgs` to `pkg.list_holds`.

List information on locked packages

Note: Requires the appropriate `versionlock` plugin package to be installed:

- On RHEL 5: `yum-versionlock`
- On RHEL 6 & 7: `yum-plugin-versionlock`
- On Fedora: `python-dnf-plugins-extras-versionlock`

---

pattern
[w+(?:[.-][^-]+)*] Regular expression used to match the package name

full
[True] Show the full hold definition including version and epoch. Set to `False` to return just the name of the package(s) being held.

CLI Example:

```
salt '*' pkg.list_holds
salt '*' pkg.list_holds full=False
```

`salt.modules.yumpkg.list_installed_patches(**kwargs)`

New in version 2017.7.0.

List installed advisory patches on the system.

CLI Examples:

```
salt '*' pkg.list_installed_patches
```

`salt.modules.yumpkg.list_patches(refresh=False, **kwargs)`

New in version 2017.7.0.

List all known advisory patches from available repos.

refresh
force a refresh if set to True. If set to False (default) it depends on yum if a refresh is executed.

CLI Examples:

```
salt '*' pkg.list_patches
```

`salt.modules.yumpkg.`**`list_pkgs`**`(`*versions_as_list=False*, ***kwargs*`)`

List the packages currently installed as a dict. By default, the dict contains versions as a comma separated string:

```
{'<package_name>': '<version>[,<version>...]'}
```

versions_as_list:

If set to true, the versions are provided as a list

{'<package_name>': ['<version>', '<version>']}

attr:

If a list of package attributes is specified, returned value will contain them in addition to version, eg.:

```
{'<package_name>': [{'version' : 'version', 'arch' : 'arch'}]}
```

Valid attributes are: `epoch`, `version`, `release`, `arch`, `install_date`, `install_date_time_t`.

If `all` is specified, all valid attributes will be returned.

New in version 2018.3.0.

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs attr=version,arch
salt '*' pkg.list_pkgs attr='["version", "arch"]'
```

`salt.modules.yumpkg.`**`list_repo_pkgs`**`(`**args*, ***kwargs*`)`

New in version 2014.1.0.

Changed in version 2014.7.0: All available versions of each package are now returned. This required a slight modification to the structure of the return dict. The return data shown below reflects the updated return dict structure. Note that packages which are version-locked using *`pkg.hold`* will only show the currently-installed version, as locking a package will make other versions appear unavailable to yum/dnf.

Changed in version 2017.7.0: By default, the versions for each package are no longer organized by repository. To get results organized by repository, use `byrepo=True`.

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names. This is recommended as it speeds up the function considerably.

Warning: Running this function on RHEL/CentOS 6 and earlier will be more resource-intensive, as the version of yum that ships with older RHEL/CentOS has no yum subcommand for listing packages from a repository. Thus, a `yum list installed` and `yum list available` are run, which generates a lot of output, which must then be analyzed to determine which package information to include in the return data.

This function can be helpful in discovering the version or repo to specify in a *`pkg.installed`* state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If `byrepo` is set to `True`, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```
# With byrepo=False (default)
{
    'bash': ['4.1.2-15.el6_5.2',
```

(continues on next page)

(continued from previous page)

```
              '4.1.2-15.el6_5.1',
              '4.1.2-15.el6_4'],
    'kernel': ['2.6.32-431.29.2.el6',
               '2.6.32-431.23.3.el6',
               '2.6.32-431.20.5.el6',
               '2.6.32-431.20.3.el6',
               '2.6.32-431.17.1.el6',
               '2.6.32-431.11.2.el6',
               '2.6.32-431.5.1.el6',
               '2.6.32-431.3.1.el6',
               '2.6.32-431.1.2.0.1.el6',
               '2.6.32-431.el6']
}
# With byrepo=True
{
    'base': {
        'bash': ['4.1.2-15.el6_4'],
        'kernel': ['2.6.32-431.el6']
    },
    'updates': {
        'bash': ['4.1.2-15.el6_5.2', '4.1.2-15.el6_5.1'],
        'kernel': ['2.6.32-431.29.2.el6',
                   '2.6.32-431.23.3.el6',
                   '2.6.32-431.20.5.el6',
                   '2.6.32-431.20.3.el6',
                   '2.6.32-431.17.1.el6',
                   '2.6.32-431.11.2.el6',
                   '2.6.32-431.5.1.el6',
                   '2.6.32-431.3.1.el6',
                   '2.6.32-431.1.2.0.1.el6']
    }
}
```

fromrepo
[None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

enablerepo (ignored if `fromrepo` is specified)
Specify a disabled package repository (or repositories) to enable. (e.g., `yum --enablerepo='somerepo'`)

New in version 2017.7.0.

disablerepo (ignored if `fromrepo` is specified)
Specify an enabled package repository (or repositories) to disable. (e.g., `yum --disablerepo='somerepo'`)

New in version 2017.7.0.

byrepo
[False] When `True`, the return data for each package will be organized by repository.

New in version 2017.7.0.

cacheonly
[False] When `True`, the repo information will be retrieved from the cached repo metadata. This is equivalent to passing the `-C` option to yum/dnf.

New in version 2017.7.0.

setopt

A comma-separated or Python list of key=value options. This list will be expanded and `--setopt` prepended to each in the yum/dnf command that is run.

New in version 2019.2.0.

CLI Examples:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'samba4*' fromrepo=base,updates
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True
```

`salt.modules.yumpkg.`**`list_repos`**(*basedir=None*, ***kwargs*)

Lists all repos in <basedir> (default: all dirs in *reposdir* yum option).

Strict parsing of configuration files is the default, this can be disabled using the `strict_config` keyword argument set to False

CLI Example:

```
salt '*' pkg.list_repos
salt '*' pkg.list_repos basedir=/path/to/dir
salt '*' pkg.list_repos basedir=/path/to/dir,/path/to/another/dir strict_
↪config=False
```

`salt.modules.yumpkg.`**`list_updates`**(*refresh=True*, ***kwargs*)

This function is an alias of `list_upgrades`.

> Check whether or not an upgrade is available for all packages
>
> The `fromrepo`, `enablerepo`, and `disablerepo` arguments are supported, as used in pkg states, and the `disableexcludes` option is also supported.
>
> New in version 2014.7.0: Support for the `disableexcludes` option
>
> CLI Example:
>
> ```
> salt '*' pkg.list_upgrades
> ```

`salt.modules.yumpkg.`**`list_upgrades`**(*refresh=True*, ***kwargs*)

Check whether or not an upgrade is available for all packages

The `fromrepo`, `enablerepo`, and `disablerepo` arguments are supported, as used in pkg states, and the `disableexcludes` option is also supported.

New in version 2014.7.0: Support for the `disableexcludes` option

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.yumpkg.`**`mod_repo`**(*repo*, *basedir=None*, ***kwargs*)

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the following values are specified:

repo

name by which the yum refers to the repo

name

a human-readable name for the repo

baseurl
the URL for yum to reference

mirrorlist
the URL for yum to reference

metalink
the URL for yum to reference .. versionadded:: 3008.0

Key/Value pairs may also be removed from a repo's configuration by setting a key to a blank value. Bear in mind that a name cannot be deleted, and one of baseurl, mirrorlist, or metalink is required.

Strict parsing of configuration files is the default, this can be disabled using the `strict_config` keyword argument set to False

CLI Examples:

```
salt '*' pkg.mod_repo reponame enabled=1 gpgcheck=1
salt '*' pkg.mod_repo reponame basedir=/path/to/dir enabled=1 strict_
↪config=False
salt '*' pkg.mod_repo reponame basedir= mirrorlist=http://host.com/
salt '*' pkg.mod_repo reponame basedir= metalink=http://host.com
```

`salt.modules.yumpkg.`**`modified`**`(`**packages*, ***flags*`)`

List the modified files that belong to a package. Not specifying any packages will return a list of _all_ modified files on the system's RPM database.

New in version 2015.5.0.

Filtering by flags (True or False):

size
Include only files where size changed.

mode
Include only files which file's mode has been changed.

checksum
Include only files which MD5 checksum has been changed.

device
Include only files which major and minor numbers has been changed.

symlink
Include only files which are symbolic link contents.

owner
Include only files where owner has been changed.

group
Include only files where group has been changed.

time
Include only files where modification time of the file has been changed.

capabilities
Include only files where capabilities differ or not. Note: supported only on newer RPM versions.

CLI Examples:

```
salt '*' pkg.modified
salt '*' pkg.modified httpd
salt '*' pkg.modified httpd postfix
salt '*' pkg.modified httpd owner=True group=False
```

`salt.modules.yumpkg.`**`normalize_name`**`(`*name*`)`

Strips the architecture from the specified package name, if necessary. Circumstances where this would be done include:

- If the arch is 32 bit and the package name ends in a 32-bit arch.

- If the arch matches the OS arch, or is `noarch`.

CLI Example:

```
salt '*' pkg.normalize_name zsh.x86_64
```

`salt.modules.yumpkg.`**`owner`**`(`**paths, **kwargs*`)`

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like *`pkg.version`*, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Examples:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

`salt.modules.yumpkg.`**`parse_arch`**`(`*name*`)`

Parse name and architecture from the specified package name.

CLI Example:

```
salt '*' pkg.parse_arch zsh.x86_64
```

`salt.modules.yumpkg.`**`purge`**`(`*name=None, pkgs=None, **kwargs*`)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any yum/dnf[5] commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Package purges are not supported by yum, this function is identical to *`pkg.remove`*.

name

The name of the package to be purged

Multiple Package Options:

pkgs

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

`salt.modules.yumpkg.`**`refresh_db`**`(`***kwargs*`)`

Check the yum repos for updated packages

Returns:

- `True`: Updates are available
- `False`: An error occurred

- `None`: No updates are available

repo
Refresh just the specified repo

disablerepo
Do not refresh the specified repo

enablerepo
Refresh a disabled repo using this option

branch
Add the specified branch when refreshing

disableexcludes
Disable the excludes defined in your config files. Takes one of three options: - `all` - disable all excludes - `main` - disable excludes defined in [main] in yum.conf - `repoid` - disable excludes defined for that repo

setopt
A comma-separated or Python list of key=value options. This list will be expanded and `--setopt` prepended to each in the yum/dnf command that is run.

New in version 2019.2.0.

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.yumpkg.`**`remove`**`(`*name=None*, *pkgs=None*, ***kwargs*`)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any yum/dnf[5] commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Remove packages

name
The name of the package to be removed

Multiple Package Options:

pkgs
A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

split_arch
[True] If set to False it prevents package name normalization by removing arch.

New in version 3006.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.yumpkg.`**`services_need_restart`**`(`***kwargs*`)`

New in version 3003.

List services that use files which have been changed by the package manager. It might be needed to restart them.

Requires systemd.

CLI Examples:

```
salt '*' pkg.services_need_restart
```

`salt.modules.yumpkg.`**`unhold`**`(`*name=None, pkgs=None, sources=None, **kwargs*`)`

New in version 2014.7.0.

Remove version locks

Note: Requires the appropriate `versionlock` plugin package to be installed:

- On RHEL 5: `yum-versionlock`
- On RHEL 6 & 7: `yum-plugin-versionlock`
- On Fedora: `python-dnf-plugins-extras-versionlock`

---

name
The name of the package to be unheld

Multiple Package Options:

pkgs
A list of packages to unhold. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.unhold <package name>
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

`salt.modules.yumpkg.`**`update`**`(`*name=None, pkgs=None, refresh=True, skip_verify=False, normalize=True, minimal=False, obsoletes=False, **kwargs*`)`

New in version 2019.2.0.

Calls *`pkg.upgrade`* with `obsoletes=False`. Mirrors the CLI behavior of `yum update`. See *`pkg.upgrade`* for further documentation.

CLI Example:

```
salt '*' pkg.update
```

`salt.modules.yumpkg.`**`upgrade`**`(`*name=None, pkgs=None, refresh=True, skip_verify=False, normalize=True, minimal=False, obsoletes=True, diff_attr=None, **kwargs*`)`

Run a full system upgrade (a `yum upgrade` or `dnf upgrade`), or upgrade specified packages. If the packages aren't installed, they will not be installed.

Changed in version 2014.7.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Changed in version 2019.2.0: Added `obsoletes` and `minimal` arguments

Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
salt '*' pkg.upgrade name=openssl
```

Repository Options:

fromrepo
Specify a package repository (or repositories) from which to install. (e.g., `yum --disablerepo='*' --enablerepo='somerepo'`)

enablerepo (ignored if `fromrepo` is specified)
Specify a disabled package repository (or repositories) to enable. (e.g., `yum --enablerepo='somerepo'`)

disablerepo (ignored if `fromrepo` is specified)
Specify an enabled package repository (or repositories) to disable. (e.g., `yum --disablerepo='somerepo'`)

disableexcludes
Disable exclude from main, for a repo or for everything. (e.g., `yum --disableexcludes='main'`)

New in version 2014.7.0.

name
The name of the package to be upgraded. Note that this parameter is ignored if ”pkgs” is passed.

32-bit packages can be upgraded on 64-bit systems by appending the architecture designation (`.i686`, `.i586`, etc.) to the end of the package name.

Warning: if you forget 'name=' and run pkg.upgrade openssl, ALL packages are upgraded. This will be addressed in next releases.

CLI Example:

```
salt '*' pkg.upgrade name=openssl
```

New in version 2016.3.0.

pkgs
A list of packages to upgrade from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. If the package was not already installed on the system, it will not be installed.

CLI Examples:

```
salt '*' pkg.upgrade pkgs='["foo", "bar"]'
salt '*' pkg.upgrade pkgs='["foo", {"bar": "1.2.3-4.el5"}]'
```

New in version 2016.3.0.

normalize
[True] Normalize the package name by removing the architecture. This is useful for poorly created packages which might include the architecture as an actual part of the name such as kernel modules which match a specific kernel version.

```
salt -G role:nsd pkg.upgrade gpfs.gplbin-2.6.32-279.31.1.el6.x86_64␣
↪normalize=False
```

New in version 2016.3.0.

minimal

[False] Use upgrade-minimal instead of upgrade (e.g., `yum upgrade-minimal`) Goes to the 'newest' package match which fixes a problem that affects your system.

```
salt '*' pkg.upgrade minimal=True
```

New in version 2019.2.0.

obsoletes

[True] Controls whether yum/dnf should take obsoletes into account and remove them. If set to `False` yum will use `update` instead of `upgrade` and dnf will be run with `--obsoletes=False`

```
salt '*' pkg.upgrade obsoletes=False
```

New in version 2019.2.0.

setopt

A comma-separated or Python list of key=value options. This list will be expanded and `--setopt` prepended to each in the yum/dnf command that is run.

New in version 2019.2.0.

diff_attr:

If a list of package attributes is specified, returned value will contain them, eg.:

```
{'<package>': {
    'old': {
        'version': '<old-version>',
        'arch': '<old-arch>'},

    'new': {
        'version': '<new-version>',
        'arch': '<new-arch>'}}}
```

Valid attributes are: `epoch`, `version`, `release`, `arch`, `install_date`, `install_date_time_t`.

If `all` is specified, all valid attributes will be returned.

New in version 3006.0.

Note: To add extra arguments to the `yum upgrade` command, pass them as key word arguments. For arguments without assignments, pass `True`

```
salt '*' pkg.upgrade security=True exclude='kernel*'
```

`salt.modules.yumpkg.`**`upgrade_available`**(*name*, ***kwargs*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.yumpkg.`**`verify`**(**names*, ***kwargs*)

New in version 2014.1.0.

Runs an rpm -Va on a system, and returns the results in a dict

Pass options to modify rpm verify behavior using the `verify_options` keyword argument

Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the `ignore_types` keyword argument

CLI Example:

```
salt '*' pkg.verify
salt '*' pkg.verify httpd
salt '*' pkg.verify 'httpd postfix'
salt '*' pkg.verify 'httpd postfix' ignore_types=['config','doc']
salt '*' pkg.verify 'httpd postfix' verify_options=['nodeps','nosize']
```

`salt.modules.yumpkg.`**`version`**(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.yumpkg.`**`version_cmp`**(*pkg1*, *pkg2*, *ignore_epoch=False*, ***kwargs*)

New in version 2015.5.4.

Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

ignore_epoch

[False] Set to `True` to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

26.6.265 salt.modules.zk_concurrency

Concurrency controls in zookeeper

depends

kazoo

configuration

See `salt.modules.zookeeper` for setup instructions.

This module allows you to acquire and release a slot. This is primarily useful for ensureing that no more than N hosts take a specific action at once. This can also be used to coordinate between masters.

`salt.modules.zk_concurrency.`**`lock`**(*path*, *zk_hosts=None*, *identifier=None*, *max_concurrency=1*, *timeout=None*, *ephemeral_lease=False*, *force=False*, *profile=None*, *scheme=None*, *username=None*, *password=None*, *default_acl=None*)

Get lock (with optional timeout)

path

The path in zookeeper where the lock is

zk_hosts

zookeeper connect string

identifier

Name to identify this minion, if unspecified defaults to the hostname

max_concurrency
Maximum number of lock holders

timeout
timeout to wait for the lock. A None timeout will block forever

ephemeral_lease
Whether the locks in zookeper should be ephemeral

force
Forcibly acquire the lock regardless of available slots

Example:

```
salt minion zk_concurrency.lock /lock/path host1:1234,host2:1234
```

`salt.modules.zk_concurrency.`**`lock_holders`**(*path*, *zk_hosts=None*, *identifier=None*, *max_concurrency=1*, *timeout=None*, *ephemeral_lease=False*, *profile=None*, *scheme=None*, *username=None*, *password=None*, *default_acl=None*)

Return an un-ordered list of lock holders

path
The path in zookeeper where the lock is

zk_hosts
zookeeper connect string

identifier
Name to identify this minion, if unspecified defaults to hostname

max_concurrency
Maximum number of lock holders

timeout
timeout to wait for the lock. A None timeout will block forever

ephemeral_lease
Whether the locks in zookeper should be ephemeral

Example:

```
salt minion zk_concurrency.lock_holders /lock/path host1:1234,host2:1234
```

`salt.modules.zk_concurrency.`**`party_members`**(*path*, *zk_hosts=None*, *min_nodes=1*, *blocking=False*, *profile=None*, *scheme=None*, *username=None*, *password=None*, *default_acl=None*)

Get the List of identifiers in a particular party, optionally waiting for the specified minimum number of nodes (min_nodes) to appear

path
The path in zookeeper where the lock is

zk_hosts
zookeeper connect string

min_nodes
The minimum number of nodes expected to be present in the party

blocking
The boolean indicating if we need to block until min_nodes are available

Example:

```
salt minion zk_concurrency.party_members /lock/path host1:1234,host2:1234
salt minion zk_concurrency.party_members /lock/path host1:1234,host2:1234 min_nodes=3 blocking=True
```

`salt.modules.zk_concurrency.`**`unlock`**(*path*, *zk_hosts=None*, *identifier=None*, *max_concurrency=1*, *ephemeral_lease=False*, *scheme=None*, *profile=None*, *username=None*, *password=None*, *default_acl=None*)

Remove lease from semaphore

path
The path in zookeeper where the lock is

zk_hosts
zookeeper connect string

identifier
Name to identify this minion, if unspecified defaults to hostname

max_concurrency
Maximum number of lock holders

timeout
timeout to wait for the lock. A None timeout will block forever

ephemeral_lease
Whether the locks in zookeper should be ephemeral

Example:

```
salt minion zk_concurrency.unlock /lock/path host1:1234,host2:1234
```

26.6.266 salt.modules.zoneadm

Module for Solaris 10's zoneadm

maintainer
Jorge Schrauwen <sjorge@blackdot.be>

maturity
new

platform
OmniOS,OpenIndiana,SmartOS,OpenSolaris,Solaris 10

New in version 2017.7.0.

Warning: Oracle Solaris 11's zoneadm is not supported by this module!

`salt.modules.zoneadm.`**`attach`**`(`*zone*, *force=False*, *brand_opts=None*`)`

Attach the specified zone.

zone
[string] name of the zone

force
[boolean] force the zone into the ”installed” state with no validation

brand_opts
[string] brand specific options to pass

CLI Example:

```
salt '*' zoneadm.attach lawrence
salt '*' zoneadm.attach lawrence True
```

`salt.modules.zoneadm.`**`boot`**`(`*zone*, *single=False*, *altinit=None*, *smf_options=None*`)`

Boot (or activate) the specified zone.

zone
[string] name or uuid of the zone

single
: [boolean] boots only to milestone svc:/milestone/single-user:default.

altinit
: [string] valid path to an alternative executable to be the primordial process.

smf_options
: [string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.

CLI Example:

```
salt '*' zoneadm.boot clementine
salt '*' zoneadm.boot maeve single=True
salt '*' zoneadm.boot teddy single=True smf_options=verbose
```

`salt.modules.zoneadm.`**`clone`**(*zone*, *source*, *snapshot=None*)

Install a zone by copying an existing installed zone.

zone
: [string] name of the zone

source
: [string] zone to clone from

snapshot
: [string] optional name of snapshot to use as source

CLI Example:

```
salt '*' zoneadm.clone clementine dolores
```

`salt.modules.zoneadm.`**`detach`**(*zone*)

Detach the specified zone.

zone
: [string] name or uuid of the zone

CLI Example:

```
salt '*' zoneadm.detach kissy
```

`salt.modules.zoneadm.`**`halt`**(*zone*)

Halt the specified zone.

zone
: [string] name or uuid of the zone

Note: To cleanly shutdown the zone use the shutdown function.

CLI Example:

```
salt '*' zoneadm.halt hector
```

`salt.modules.zoneadm.`**`install`**(*zone*, *nodataset=False*, *brand_opts=None*)

Install the specified zone from the system.

zone
: [string] name of the zone

nodataset
: [boolean] do not create a ZFS file system

brand_opts
: [string] brand specific options to pass

CLI Example:

```
salt '*' zoneadm.install dolores
salt '*' zoneadm.install teddy True
```

salt.modules.zoneadm.**list_zones**(*verbose=True*, *installed=False*, *configured=False*, *hide_global=True*)

List all zones

verbose
[boolean] display additional zone information

installed
[boolean] include installed zones in output

configured
[boolean] include configured zones in output

hide_global
[boolean] do not include global zone

CLI Example:

```
salt '*' zoneadm.list
```

salt.modules.zoneadm.**move**(*zone*, *zonepath*)

Move zone to new zonepath.

zone
[string] name or uuid of the zone

zonepath
[string] new zonepath

CLI Example:

```
salt '*' zoneadm.move meave /sweetwater/meave
```

salt.modules.zoneadm.**ready**(*zone*)

Prepares a zone for running applications.

zone
[string] name or uuid of the zone

CLI Example:

```
salt '*' zoneadm.ready clementine
```

salt.modules.zoneadm.**reboot**(*zone*, *single=False*, *altinit=None*, *smf_options=None*)

Restart the zone. This is equivalent to a halt boot sequence.

zone
[string] name or uuid of the zone

single
[boolean] boots only to milestone svc:/milestone/single-user:default.

altinit
[string] valid path to an alternative executable to be the primordial process.

smf_options
[string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.

CLI Example:

```
salt '*' zoneadm.reboot dolores
salt '*' zoneadm.reboot teddy single=True
```

salt.modules.zoneadm.**shutdown**(*zone*, *reboot=False*, *single=False*, *altinit=None*, *smf_options=None*)

Gracefully shutdown the specified zone.

zone
[string] name or uuid of the zone

reboot
[boolean] reboot zone after shutdown (equivalent of shutdown -i6 -g0 -y)

single
[boolean] boots only to milestone svc:/milestone/single-user:default.

altinit
[string] valid path to an alternative executable to be the primordial process.

smf_options
[string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.

CLI Example:

```
salt '*' zoneadm.shutdown peter
salt '*' zoneadm.shutdown armistice reboot=True
```

`salt.modules.zoneadm.`**`uninstall`**`(`*zone*`)`

Uninstall the specified zone from the system.

zone
[string] name or uuid of the zone

> **Warning:** The -F flag is always used to avoid the prompts when uninstalling.

CLI Example:

```
salt '*' zoneadm.uninstall teddy
```

`salt.modules.zoneadm.`**`verify`**`(`*zone*`)`

Check to make sure the configuration of the specified zone can safely be installed on the machine.

zone
[string] name of the zone

CLI Example:

```
salt '*' zoneadm.verify dolores
```

26.6.267 salt.modules.zonecfg

Module for Solaris 10's zonecfg

maintainer
Jorge Schrauwen <sjorge@blackdot.be>

maturity
new

platform
OmniOS,OpenIndiana,SmartOS,OpenSolaris,Solaris 10

depend
salt.modules.file

New in version 2017.7.0.

Warning: Oracle Solaris 11's zonecfg is not supported by this module!

`salt.modules.zonecfg.`**`add_resource`**`(`*zone, resource_type, **kwargs*`)`

Add a resource

zone
[string] name of zone

resource_type
[string] type of resource

kwargs
[string|int|...] resource properties

CLI Example:

```
salt '*' zonecfg.add_resource tallgeese rctl name=zone.max-locked-memory␣
↪value='(priv=privileged,limit=33554432,action=deny)'
```

`salt.modules.zonecfg.`**`clear_property`**`(`*zone, key*`)`

Clear a property

zone
[string] name of zone

key
[string] name of property

CLI Example:

```
salt '*' zonecfg.clear_property deathscythe cpu-shares
```

`salt.modules.zonecfg.`**`create`**`(`*zone, brand, zonepath, force=False*`)`

Create an in-memory configuration for the specified zone.

zone
[string] name of zone

brand
[string] brand name

zonepath
[string] path of zone

force
[boolean] overwrite configuration

CLI Example:

```
salt '*' zonecfg.create deathscythe ipkg /zones/deathscythe
```

`salt.modules.zonecfg.`**`create_from_template`**`(`*zone, template*`)`

Create an in-memory configuration from a template for the specified zone.

zone
[string] name of zone

template
[string] name of template

Warning: existing config will be overwritten!

CLI Example:

```
salt '*' zonecfg.create_from_template leo tallgeese
```

`salt.modules.zonecfg.`**`delete`**`(`*zone*`)`

Delete the specified configuration from memory and stable storage.

zone
[string] name of zone

CLI Example:

```
salt '*' zonecfg.delete epyon
```

`salt.modules.zonecfg.`**`export`**`(`*zone*, *path=None*`)`

Export the configuration from memory to stable storage.

zone
[string] name of zone

path
[string] path of file to export to

CLI Example:

```
salt '*' zonecfg.export epyon
salt '*' zonecfg.export epyon /zones/epyon.cfg
```

`salt.modules.zonecfg.`**`import_`**`(`*zone*, *path*`)`

Import the configuration to memory from stable storage.

zone
[string] name of zone

path
[string] path of file to export to

CLI Example:

```
salt '*' zonecfg.import epyon /zones/epyon.cfg
```

`salt.modules.zonecfg.`**`info`**`(`*zone*, *show_all=False*`)`

Display the configuration from memory

zone
[string] name of zone

show_all
[boolean] also include calculated values like capped-cpu, cpu-shares, …

CLI Example:

```
salt '*' zonecfg.info tallgeese
```

`salt.modules.zonecfg.`**`remove_resource`**`(`*zone*, *resource_type*, *resource_key*, *resource_value*`)`

Remove a resource

zone
[string] name of zone

resource_type
[string] type of resource

resource_key
[string] key for resource selection

resource_value
[string] value for resource selection

Note: Set resource_selector to None for resource that do not require one.

CLI Example:

```
salt '*' zonecfg.remove_resource tallgeese rctl name zone.max-locked-
↪memory
```

`salt.modules.zonecfg.`**`set_property`**`(`*zone*, *key*, *value*`)`

Set a property

zone
[string] name of zone

key
[string] name of property

value
[string] value of property

CLI Example:

```
salt '*' zonecfg.set_property deathscythe cpu-shares 100
```

`salt.modules.zonecfg.`**`update_resource`**`(`*zone*, *resource_type*, *resource_selector*, ***kwargs*`)`

Add a resource

zone
[string] name of zone

resource_type
[string] type of resource

resource_selector
[string] unique resource identifier

kwargs
[string|int|...] resource properties

Note: Set resource_selector to None for resource that do not require one.

CLI Example:

```
salt '*' zonecfg.update_resource tallgeese rctl name name=zone.max-locked-
↪memory value='(priv=privileged,limit=33554432,action=deny)'
```

26.7 executors modules

direct_call	Direct call executor module
splay	Splay function calls across targeted minions
sudo	Sudo executor module

26.7.1 salt.executors.direct_call

Direct call executor module

`salt.executors.direct_call.`**`execute`**(*opts*, *data*, *func*, *args*, *kwargs*)

Directly calls the given function with arguments

26.7.2 salt.executors.splay

Splay function calls across targeted minions

`salt.executors.splay.`**`execute`**(*opts*, *data*, *func*, *args*, *kwargs*)

Splay a salt function call execution time across minions over a number of seconds (default: 300)

Note: You *probably* want to use --async here and look up the job results later. If you're dead set on getting the output from the CLI command, then make sure to set the timeout (with the -t flag) to something greater than the splaytime (max splaytime + time to execute job). Otherwise, it's very likely that the cli will time out before the job returns.

CLI Example:

```
# With default splaytime
salt --async --module-executors='[splay, direct_call]' '*' pkg.install
↪cowsay version=3.03-8.el6
```

```
# With specified splaytime (5 minutes) and timeout with 10 second buffer
salt -t 310 --module-executors='[splay, direct_call]' --executor-opts='
↪{splaytime: 300}' '*' pkg.version cowsay
```

26.7.3 salt.executors.sudo

Sudo executor module

`salt.executors.sudo.`**`execute`**(*opts*, *data*, *func*, *args*, *kwargs*)

Allow for the calling of execution modules via sudo.

This module is invoked by the minion if the `sudo_user` minion config is present.

Example minion config:

```
sudo_user: saltdev
```

Once this setting is made, any execution module call done by the minion will be run under `sudo -u <sudo_user> salt-call`. For example, with the above minion config,

```
salt sudo_minion cmd.run 'cat /etc/sudoers'
```

is equivalent to

```
sudo -u saltdev salt-call cmd.run 'cat /etc/sudoers'
```

being run on `sudo_minion`.

26.8 fileserver modules

gitfs	Git Fileserver Backend
minionfs	Fileserver backend which serves files pushed to the Master
roots	The default file server backend

26.8.1 salt.fileserver.gitfs

Git Fileserver Backend

With this backend, branches and tags in a remote git repository are exposed to salt as different environments.

To enable, add `gitfs` to the *fileserver_backend* option in the Master config file.

```
fileserver_backend:
  - gitfs
```

Note: `git` also works here. Prior to the 2018.3.0 release, *only* `git` would work.

The Git fileserver backend supports both pygit2 and GitPython, to provide the Python interface to git. If both are present, the order of preference for which one will be chosen is the same as the order in which they were listed: pygit2, then GitPython.

An optional master config parameter (*gitfs_provider*) can be used to specify which provider should be used, in the event that compatible versions of both pygit2 and GitPython are installed.

More detailed information on how to use GitFS can be found in the *GitFS Walkthrough*.

Note: Minimum requirements

To use pygit2 for GitFS requires a minimum pygit2 version of 0.20.3. pygit2 0.20.3 requires libgit2 0.20.0. pygit2 and libgit2 are developed alongside one another, so it is recommended to keep them both at the same major release to avoid unexpected behavior. For example, pygit2 0.21.x requires libgit2 0.21.x, pygit2 0.22.x will require libgit2 0.22.x, etc.

To use GitPython for GitFS requires a minimum GitPython version of 0.3.0, as well as the git CLI utility. Instructions for installing GitPython can be found *here*.

To clear stale refs the git CLI utility must also be installed.

26.8.2 salt.fileserver.minionfs

Fileserver backend which serves files pushed to the Master

The *cp.push* function allows Minions to push files up to the Master. Using this backend, these pushed files are exposed to other Minions via the Salt fileserver.

To enable minionfs, *file_recv* needs to be set to `True` in the master config file (otherwise *cp.push* will not be allowed to push files to the Master), and `minionfs` must be added to the `fileserver_backends` list.

```
fileserver_backend:
  - minionfs
```

Note: `minion` also works here. Prior to the 2018.3.0 release, *only* `minion` would work.

Other minionfs settings include: *minionfs_whitelist*, *minionfs_blacklist*, *minionfs_mountpoint*, and *minionfs_env*.

See also:

MinionFS Backend Walkthrough

26.8.3 salt.fileserver.roots

The default file server backend

This fileserver backend serves files from the Master's local filesystem. If *fileserver_backend* is not defined in the Master config file, then this backend is enabled by default. If it *is* defined then `roots` must be in the *fileserver_backend* list to enable this backend.

```
fileserver_backend:
  - roots
```

Fileserver environments are defined using the *file_roots* configuration option.

26.9 grains modules

core	The static grains, these are the core, or built in grains.
disks	Detect disks
extra	
minion_process	Set grains describing the minion process.
opts	Simple grain to merge the opts into the grains directly if the grain_opts configuration value is set.
package	Grains for detecting what type of package Salt is using
pending_reboot	Grain that indicates the system is pending a reboot See functions in salt.utils.win_system to see what conditions would indicate a reboot is pending
rest_sample	Generate baseline proxy minion grains

26.9.1 salt.grains.core

The static grains, these are the core, or built in grains.

When grains are loaded they are not loaded in the same way that modules are loaded, grain functions are detected and executed, the functions MUST return a dict which will be applied to the main grains dict. This module will always be executed first, so that any grains loaded here in the core module can be overwritten just by returning dict keys with the same value as those returned here

`salt.grains.core.`**`append_domain`**`()`

Return append_domain if set

`salt.grains.core.`**`cwd`**`()`

Current working directory

`salt.grains.core.`**`default_gateway`**`()`

Populates grains which describe whether a server has a default gateway configured or not. Uses *ip -4 route show* and *ip -6 route show* and greps for a *default* at the beginning of any line. Assuming the standard *default via <ip>* format for default gateways, it will also parse out the ip address of the default gateway, and put it in ip4_gw or ip6_gw.

If the *ip* command is unavailable, no grains will be populated.

Currently does not support multiple default gateways. The grains will be set to the first default gateway found.

List of grains:

> ip4_gw: True # ip/True/False if default ipv4 gateway ip6_gw: True # ip/True/False if default ipv6 gateway ip_gw: True # True if either of the above is True, False otherwise

`salt.grains.core.`**`dns`**`()`

Parse the resolver configuration file

> New in version 2016.3.0.

`salt.grains.core.`**`fqdns`**`()`

Return all known FQDNs for the system by enumerating all interfaces and then trying to reverse resolve them (excluding 'lo' interface). To disable the fqdns grain, set enable_fqdns_grains: False in the minion configuration file.

`salt.grains.core.`**`get_machine_id`**`()`

Provide the machine-id for machine/virtualization combination

`salt.grains.core.`**`get_master`**`()`

Provides the minion with the name of its master. This is useful in states to target other services running on the master.

`salt.grains.core.`**`get_server_id`**`()`

Provides an integer based on the FQDN of a machine. Useful as server-id in MySQL replication or anywhere else you'll need an ID like this.

`salt.grains.core.`**`hostname`**`()`

Return fqdn, hostname, domainname

Note: On Windows the `domain` grain may refer to the dns entry for the host instead of the Windows domain to which the host is joined. It may also be empty if not a part of any domain. Refer to the `windowsdomain` grain instead

---

`salt.grains.core.`**`hwaddr_interfaces`**`()`

Provide a dict of the connected interfaces and their hw addresses (Mac Address)

`salt.grains.core.`**`id_`**`()`

Return the id

`salt.grains.core.`**`ip4_interfaces`**`()`

Provide a dict of the connected interfaces and their ip4 addresses The addresses will be passed as a list for each interface

`salt.grains.core.`**`ip6_interfaces`**`()`

Provide a dict of the connected interfaces and their ip6 addresses The addresses will be passed as a list for each interface

`salt.grains.core.`**`ip_fqdn`**`()`

Return ip address and FQDN grains

`salt.grains.core.`**`ip_interfaces`**`()`

Provide a dict of the connected interfaces and their ip addresses The addresses will be passed as a list for each interface

`salt.grains.core.`**`kernelparams`**`()`

Return the kernel boot parameters

`salt.grains.core.`**`locale_info`**`()`

Provides

defaultlanguage defaultencoding

`salt.grains.core.`**`os_data`**`()`

Return grains pertaining to the operating system

`salt.grains.core.`**`path`**`()`

Return the path

`salt.grains.core.`**`pythonexecutable`**`()`

Return the python executable in use

`salt.grains.core.`**`pythonpath`**`()`

Return the Python path

`salt.grains.core.`**`pythonversion`**`()`

Return the Python version

`salt.grains.core.`**`saltpath`**`()`

Return the path of the salt module

`salt.grains.core.`**`saltversion`**`()`

Return the version of salt

`salt.grains.core.`**`saltversioninfo`**`()`

Return the version_info of salt

New in version 0.17.0.

`salt.grains.core.`**`zmqversion`**`()`

Return the zeromq version

26.9.2 salt.grains.disks

Detect disks

`salt.grains.disks.`**`disks`**`()`

Return list of disk devices

26.9.3 salt.grains.extra

`salt.grains.extra.`**`config`**`()`

Return the grains set in the grains file

`salt.grains.extra.`**`get_secure_boot_path`**`()`

Provide paths for secure boot directories and files

`salt.grains.extra.`**`shell`**`()`

Return the default shell to use on this system

`salt.grains.extra.`**`transactional`**`()`

Determine if the system is transactional.

`salt.grains.extra.`**`uefi`**`()`

Populate UEFI grains.

26.9.4 salt.grains.minion_process

Set grains describing the minion process.

`salt.grains.minion_process.`**`grains`**`()`

Return the grains dictionary

26.9.5 salt.grains.opts

Simple grain to merge the opts into the grains directly if the grain_opts configuration value is set.

`salt.grains.opts.`**`opts`**`()`

Return the minion configuration settings

26.9.6 salt.grains.package

Grains for detecting what type of package Salt is using

New in version 3007.0.

`salt.grains.package.`**`package`**`()`

Function to determine if the user is currently using onedir, pip or system level package of Salt.

26.9.7 salt.grains.pending_reboot

Grain that indicates the system is pending a reboot See functions in salt.utils.win_system to see what conditions would indicate a reboot is pending

`salt.grains.pending_reboot.`**`pending_reboot`**`()`

A grain that indicates that a Windows system is pending a reboot.

26.9.8 salt.grains.rest_sample

Generate baseline proxy minion grains

`salt.grains.rest_sample.`**`kernel`**`()`

`salt.grains.rest_sample.`**`location`**`()`

`salt.grains.rest_sample.`**`os`**`()`

`salt.grains.rest_sample.`**`os_data`**`()`

`salt.grains.rest_sample.`**`os_family`**`()`

`salt.grains.rest_sample.`**`proxy_functions`**`(`*proxy*`)`

The loader will execute functions with one argument and pass a reference to the proxymodules LazyLoader object. However, grains sometimes get called before the LazyLoader object is setup so *proxy* might be None.

26.10 netapi modules

rest_cherrypy	A script to start the CherryPy WSGI server
rest_tornado	
rest_wsgi	A minimalist REST API for Salt

26.10.1 rest_cherrypy

- *A REST API for Salt*
  - *Authentication*
  - *Usage*
  - *Content negotiation*
- *Performance Expectations and Recommended Usage*
  - *Long-Running HTTP Connections*
  - *Timeouts*
  - *Best Practices*
  - *Performance Tuning*
  - *Future Plans*

- *Deployment*
  - ***salt-api*** *using the CherryPy server*
  - *Using a WSGI-compliant web server*

A script to start the CherryPy WSGI server

This is run by `salt-api` and started in a multiprocess.

A REST API for Salt

Note: This module is Experimental on Windows platforms and supports limited configurations:

- doesn't support PAM authentication (i.e. external_auth: auto)
- doesn't support SSL (i.e. disable_ssl: True)

depends

- CherryPy Python module.

  Note: there is a known SSL traceback for CherryPy versions 3.2.5 through 3.7.x. Please use version 3.2.3 or the latest 10.x version instead.

optdepends

- ws4py Python module for websockets support.

client_libraries

- Java: https://github.com/SUSE/salt-netapi-client
- Python: https://github.com/saltstack/pepper

setup

All steps below are performed on the machine running the Salt Master daemon. Configuration goes into the Master configuration file.

1. Install `salt-api`. (This step varies between OS and Linux distros. Some package systems have a split package, others include salt-api in the main Salt package. Ensure the `salt-api --version` output matches the `salt --version` output.)
2. Install CherryPy. (Read the version caveat in the section above.)
3. Optional: generate self-signed SSL certificates.

   Using a secure HTTPS connection is strongly recommended since Salt eauth authentication credentials will be sent over the wire.

   1. Install the PyOpenSSL package.
   2. Generate a self-signed certificate using the *`create_self_signed_cert()`* execution function.

      ```
      salt-call --local tls.create_self_signed_cert
      ```

4. Edit the master config to create at least one external auth user or group following the *full external auth instructions*.

5. Edit the master config with the following production-ready example to enable the `rest_cherrypy` module. (Adjust cert paths as needed, or disable SSL (not recommended!).)

```
rest_cherrypy:
  port: 8000
  ssl_crt: /etc/pki/tls/certs/localhost.crt
  ssl_key: /etc/pki/tls/certs/localhost.key
```

6. Restart the `salt-master` daemon.
7. Start the `salt-api` daemon.

configuration

All available configuration options are detailed below. These settings configure the CherryPy HTTP server and do not apply when using an external server such as Apache or Nginx.

port

Required

The port for the webserver to listen on.

host

[`0.0.0.0`] The socket interface for the HTTP server to listen on.

debug

[`False`] Starts the web server in development mode. It will reload itself when the underlying code is changed and will output more debugging info.

log_access_file

Path to a file to write HTTP access logs.

New in version 2016.11.0.

log_error_file

Path to a file to write HTTP error logs.

New in version 2016.11.0.

ssl_crt

The path to a SSL certificate. (See below)

ssl_key

The path to the private key for your SSL certificate. (See below)

ssl_chain

(Optional when using PyOpenSSL) the certificate chain to pass to `Context.load_verify_locations`.

disable_ssl

A flag to disable SSL. Warning: your Salt authentication credentials will be sent in the clear!

webhook_disable_auth

[False] The *`Webhook`* URL requires authentication by default but external services cannot always be configured to send authentication. See the Webhook documentation for suggestions on securing this interface.

webhook_url

[/hook] Configure the URL endpoint for the *`Webhook`* entry point.

thread_pool

[`100`] The number of worker threads to start up in the pool.

socket_queue_size
[`30`] Specify the maximum number of HTTP connections to queue.

expire_responses
[True] Whether to check for and kill HTTP responses that have exceeded the default timeout.

Deprecated since version 2016.11.9,2017.7.3,2018.3.0: The "expire_responses" configuration setting, which corresponds to the `timeout_monitor` setting in CherryPy, is no longer supported in CherryPy versions >= 12.0.0.

max_request_body_size
[`1048576`] Maximum size for the HTTP request body.

collect_stats
[False] Collect and report statistics about the CherryPy server

Reports are available via the *`Stats`* URL.

stats_disable_auth
[False] Do not require authentication to access the `/stats` endpoint.

New in version 2018.3.0.

static
A filesystem path to static HTML/JavaScript/CSS/image assets.

static_path
[`/static`] The URL prefix to use when serving static assets out of the directory specified in the `static` setting.

enable_sessions
[`True`] Enable or disable all endpoints that rely on session cookies. This can be useful to enforce only header-based authentication.

New in version 2017.7.0.

app
[`index.html`] A filesystem path to an HTML file that will be served as a static file. This is useful for bootstrapping a single-page JavaScript app.

Warning! If you set this option to a custom web application, anything that uses cookie-based authentication is vulnerable to XSRF attacks. Send the custom `X-Auth-Token` header instead and consider disabling the `enable_sessions` setting.

Changed in version 2017.7.0: Add a proof-of-concept JavaScript single-page app.

app_path
[`/app`] The URL prefix to use for serving the HTML file specified in the `app` setting. This should be a simple name containing no slashes.

Any path information after the specified path is ignored; this is useful for apps that utilize the HTML5 history API.

root_prefix
[`/`] A URL path to the main entry point for the application. This is useful for serving multiple applications from the same URL.

Authentication

Authentication is performed by passing a session token with each request. Tokens are generated via the *Login* URL.

The token may be sent in one of two ways: as a custom header or as a session cookie. The latter is far more convenient for clients that support cookies.

- Include a custom header named *X-Auth-Token*.

  For example, using curl:

  ```
  curl -sSk https://localhost:8000/login \
      -H 'Accept: application/x-yaml' \
      -d username=saltdev \
      -d password=saltdev \
      -d eauth=pam
  ```

  Copy the `token` value from the output and include it in subsequent requests:

  ```
  curl -sSk https://localhost:8000 \
      -H 'Accept: application/x-yaml' \
      -H 'X-Auth-Token: 697adbdc8fe971d09ae4c2a3add7248859c87079'\
      -d client=local \
      -d tgt='*' \
      -d fun=test.ping
  ```

- Sent via a cookie. This option is a convenience for HTTP clients that automatically handle cookie support (such as browsers).

  For example, using curl:

  ```
  # Write the cookie file:
  curl -sSk https://localhost:8000/login \
        -c ~/cookies.txt \
        -H 'Accept: application/x-yaml' \
        -d username=saltdev \
        -d password=saltdev \
        -d eauth=auto

  # Read the cookie file:
  curl -sSk https://localhost:8000 \
        -b ~/cookies.txt \
        -H 'Accept: application/x-yaml' \
        -d client=local \
        -d tgt='*' \
        -d fun=test.ping
  ```

  Another example using the **requests** library in Python:

  ```
  >>> import requests
  >>> session = requests.Session()
  >>> session.post('http://localhost:8000/login', json={
      'username': 'saltdev',
      'password': 'saltdev',
      'eauth': 'auto',
  ```

(continues on next page)

(continued from previous page)

```
})
<Response [200]>
>>> resp = session.post('http://localhost:8000', json=[{
    'client': 'local',
    'tgt': '*',
    'fun': 'test.arg',
    'arg': ['foo', 'bar'],
    'kwarg': {'baz': 'Baz!'},
}])
>>> resp.json()
{u'return': [{
    ...snip...
}]}
```

See also:

You can bypass the session handling via the *Run* URL.

Usage

This interface directly exposes Salt's *Python API*. Everything possible at the CLI is possible through the Python API. Commands are executed on the Salt Master.

The root URL (/) is RPC-like in that it accepts instructions in the request body for what Salt functions to execute, and the response contains the result of those function calls.

For example:

```
% curl -sSi https://localhost:8000         -H 'Content-type: application/json
↪'         -d '[{
        "client": "local",
        "tgt": "*",
        "fun": "test.ping"
    }]'
HTTP/1.1 200 OK
Content-Type: application/json
[...snip...]

{"return": [{"jerry": true}]}
```

The request body must be an array of commands. Use this workflow to build a command:

1. Choose a client interface.
2. Choose a function.
3. Fill out the remaining parameters needed for the chosen client.

The `client` field is a reference to the main Python classes used in Salt's Python API. Read the full *Client APIs* documentation, but in short:

- "local" uses *LocalClient* which sends commands to Minions. Equivalent to the `salt` CLI command.
- "runner" uses *RunnerClient* which invokes runner modules on the Master. Equivalent to the `salt-run` CLI command.

- "wheel" uses *`WheelClient`* which invokes wheel modules on the Master. Wheel modules do not have a direct CLI equivalent but they typically manage Master-side resources such as state files, pillar files, the Salt config files, and the *`key wheel module`* exposes similar functionality as the `salt-key` CLI command.

Most clients have variants like synchronous or asynchronous execution as well as others like batch execution. See the *full list of client interfaces*.

Each client requires different arguments and sometimes has different syntax. For example, `LocalClient` requires the `tgt` argument because it forwards the command to Minions and the other client interfaces do not. `LocalClient` also takes `arg` (array) and `kwarg` (dictionary) arguments because these values are sent to the Minions and used to execute the requested function there. `RunnerClient` and `WheelClient` are executed directly on the Master and thus do not need or accept those arguments.

Read the method signatures in the client documentation linked above, but hopefully an example will help illustrate the concept. This example causes Salt to execute two functions -- the *`test.arg execution function`* using `LocalClient` and the *`test.arg runner function`* using `RunnerClient`; note the different structure for each command. The results for both are combined and returned as one response.

```
% curl -b ~/cookies.txt -sSi localhost:8000         -H 'Content-type:
↪application/json'         -d '
[
    {
        "client": "local",
        "tgt": "*",
        "fun": "test.arg",
        "arg": ["positional arg one", "positional arg two"],
        "kwarg": {
            "keyword arg one": "Hello from a minion",
            "keyword arg two": "Hello again from a minion"
        }
    },
    {
        "client": "runner",
        "fun": "test.arg",
        "keyword arg one": "Hello from a master",
        "keyword arg two": "Runners do not support positional args"
    }
]
'
HTTP/1.1 200 OK
[...snip...]
{
  "return": [
    {
      "jerry": {
        "args": [
          "positional arg one",
          "positional arg two"
        ],
        "kwargs": {
          "keyword arg one": "Hello from a minion",
          "keyword arg two": "Hello again from a minion",
          [...snip...]
        }
      },
```

(continues on next page)

(continued from previous page)

```
      [...snip; other minion returns here...]
    },
    {
      "args": [],
      "kwargs": {
        "keyword arg two": "Runners do not support positional args",
        "keyword arg one": "Hello from a master"
      }
    }
  ]
}
```

One more example, this time with more commonly used functions:

```
curl -b /tmp/cookies.txt -sSi localhost:8000         -H 'Content-type:
↪application/json'         -d '
[
    {
        "client": "local",
        "tgt": "*",
        "fun": "state.sls",
        "kwarg": {
            "mods": "apache",
            "pillar": {
                "lookup": {
                    "wwwdir": "/srv/httpd/htdocs"
                }
            }
        }
    },
    {
        "client": "runner",
        "fun": "cloud.create",
        "provider": "my-ec2-provider",
        "instances": "my-centos-6",
        "image": "ami-1624987f",
        "delvol_on_destroy", true
    }
]
'
HTTP/1.1 200 OK
[...snip...]
{
  "return": [
    {
      "jerry": {
        "pkg_|-install_apache_|-httpd_|-installed": {
            [...snip full state return here...]
        }
      }
      [...snip other minion returns here...]
    },
```

(continues on next page)

(continued from previous page)

```
    {
        [...snip full salt-cloud output here...]
    }
  ]
}
```

Content negotiation

This REST interface is flexible in what data formats it will accept as well as what formats it will return (e.g., JSON, YAML, urlencoded).

- Specify the format of data in the request body by including the *`Content-Type`* header.
- Specify the desired data format for the response body with the *`Accept`* header.

We recommend the JSON format for most HTTP requests. urlencoded data is simple and cannot express complex data structures -- and that is often required for some Salt commands, such as starting a state run that uses Pillar data. Salt's CLI tool can reformat strings passed in at the CLI into complex data structures, and that behavior also works via salt-api, but that can be brittle and since salt-api can accept JSON it is best just to send JSON.

Here is an example of sending urlencoded data:

```
curl -sSik https://localhost:8000 \
    -b ~/cookies.txt \
    -d client=runner \
    -d fun='jobs.lookup_jid' \
    -d jid='20150129182456704682'
```

---

urlencoded data caveats

- Only a single command may be sent per HTTP request.
- Repeating the `arg` parameter multiple times will cause those parameters to be combined into a single list.

  Note, some popular frameworks and languages (notably jQuery, PHP, and Ruby on Rails) will automatically append empty brackets onto repeated query string parameters. E.g., `?foo[]=fooone&foo[]=footwo`. This is **not** supported; send `?foo=fooone&foo=footwo` instead, or send JSON or YAML.

A note about `curl`

The `-d` flag to curl does *not* automatically urlencode data which can affect passwords and other data that contains characters that must be encoded. Use the `--data-urlencode` flag instead. E.g.:

```
curl -ksi http://localhost:8000/login \
-H "Accept: application/json" \
-d username='myapiuser' \
--data-urlencode password='1234+' \
-d eauth='pam'
```

Performance Expectations and Recommended Usage

This module provides a thin wrapper around *Salt's Python API*. Executing a Salt command via rest_cherrypy is directly analogous to executing a Salt command via Salt's CLI (which also uses the Python API) -- they share the same semantics, performance characteristics, and 98% of the same code. As a rule-of-thumb: if you wouldn't do it at the CLI don't do it via this API.

Long-Running HTTP Connections

The CherryPy server is a production-ready, threading HTTP server written in Python. Because it makes use of a thread pool to process HTTP requests it is not ideally suited to maintaining large numbers of concurrent, synchronous connections. On moderate hardware with default settings it should top-out at around 30 to 50 concurrent connections.

That number of long-running, synchronous Salt processes is also not ideal. Like at the CLI, each Salt command run will start a process that instantiates its own `LocalClient`, which instantiates its own listener to the Salt event bus, and sends out its own periodic `saltutil.find_job` queries to determine if a Minion is still running the command. Not exactly a lightweight operation.

Timeouts

In addition to the above resource overhead for long-running connections, there are the usual HTTP timeout semantics for the CherryPy server, any HTTP client being used, as well as any hardware in between such as proxies, gateways, or load balancers. rest_cherrypy can be configured not to time-out long responses via the `expire_responses` setting, and both *`LocalClient`* and *`RunnerClient`* have their own timeout parameters that may be passed as top-level keywords:

```
curl -b /tmp/cookies.txt -sSi localhost:8000         -H 'Content-type:
↪application/json'         -d '
[
    {
        "client": "local",
        "tgt": "*",
        "fun": "test.sleep",
        "kwarg": {"length": 30},
        "timeout": 60
    },
    {
        "client": "runner",
        "fun": "test.sleep",
        "kwarg": {"s_time": 30},
        "timeout": 60
    }
]
'
```

Best Practices

Given the performance overhead and HTTP timeouts for long-running operations described above, the most effective and most scalable way to use both Salt and salt-api is to run commands asynchronously using the `local_async`, `runner_async`, and `wheel_async` clients.

Running asynchronous jobs results in being able to process 3x more commands per second for `LocalClient` and 17x more commands per second for `RunnerClient`, in addition to much less network traffic and memory requirements. Job returns can be fetched from Salt's job cache via the `/jobs/<jid>` endpoint, or they can be collected into a data store using Salt's *Returner system*.

The `/events` endpoint is specifically designed to handle long-running HTTP connections and it exposes Salt's event bus which includes job returns. Watching this endpoint first, then executing asynchronous Salt commands second, is the most lightweight and scalable way to use `rest_cherrypy` while still receiving job returns in real-time. But this requires clients that can properly handle the inherent asynchronicity of that workflow.

Performance Tuning

The `thread_pool` and `socket_queue_size` settings can be used to increase the capacity of rest_cherrypy to handle incoming requests. Keep an eye on RAM usage as well as available file handles while testing changes to these settings. As salt-api is a thin wrapper around Salt's Python API, also keep an eye on the performance of Salt when testing.

Future Plans

Now that Salt uses the Tornado concurrency library internally, we plan to improve performance in the API by taking advantage of existing processes and event listeners and to use lightweight coroutines to facilitate more simultaneous HTTP connections and better support for synchronous operations. That effort can be tracked in issue 26505, but until that issue is closed rest_cherrypy will remain the officially recommended REST API.

Deployment

The `rest_cherrypy` netapi module is a standard Python WSGI app. It can be deployed one of two ways.

`salt-api` using the CherryPy server

The default configuration is to run this module using **`salt-api`** to start the Python-based CherryPy server. This server is lightweight, multi-threaded, encrypted with SSL, and should be considered production-ready. See the section above for performance expectations.

Using a WSGI-compliant web server

This module may be deployed on any WSGI-compliant server such as Apache with mod_wsgi or Nginx with FastCGI, to name just two (there are many).

Note, external WSGI servers handle URLs, paths, and SSL certs directly. The `rest_cherrypy` configuration options are ignored and the `salt-api` daemon does not need to be running at all. Remember Salt authentication credentials are sent in the clear unless SSL is being enforced!

An example Apache virtual host configuration:

```
<VirtualHost *:80>
    ServerName example.com
    ServerAlias *.example.com

    ServerAdmin webmaster@example.com

    LogLevel warn
    ErrorLog /var/www/example.com/logs/error.log
    CustomLog /var/www/example.com/logs/access.log combined

    DocumentRoot /var/www/example.com/htdocs

    WSGIScriptAlias / /path/to/salt/netapi/rest_cherrypy/wsgi.py
</VirtualHost>
```

26.10.2 REST URI Reference

/

class salt.netapi.rest_cherrypy.app.**LowDataAdapter**

The primary entry point to Salt's REST API

GET()

An explanation of the API with links of where to go next

GET /

Request Headers

- Accept -- the desired response format.

Status Codes

- 200 OK -- success
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available

Example request:

```
curl -i localhost:8000
```

```
GET / HTTP/1.1
Host: localhost:8000
Accept: application/json
```

Example response:

```
HTTP/1.1 200 OK
Content-Type: application/json
```

POST(***kwargs*)

Send one or more Salt commands in the request body

POST /

Request Headers

- *X-Auth-Token* -- a session token from `Login`.
- Accept -- the desired response format.

- Content-Type -- the format of the request body.

Response Headers

- Content-Type -- the format of the response body; depends on the *Accept* request header.

Status Codes

- 200 OK -- success
- 400 Bad Request -- bad or malformed request
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available

lowstate data describing Salt commands must be sent in the request body.

Example request:

```
curl -sSik https://localhost:8000 \
    -b ~/cookies.txt \
    -H "Accept: application/x-yaml" \
    -H "Content-type: application/json" \
    -d '[{"client": "local", "tgt": "*", "fun": "test.ping"}]'
```

```
POST / HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
X-Auth-Token: d40d1e1e
Content-Type: application/json

[{"client": "local", "tgt": "*", "fun": "test.ping"}]
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 200
Allow: GET, HEAD, POST
Content-Type: application/x-yaml

return:
- ms-0: true
  ms-1: true
  ms-2: true
  ms-3: true
  ms-4: true
```

/login

class salt.netapi.rest_cherrypy.app.**Login**(**args*, ***kwargs*)

Log in to receive a session token

Authentication information.

GET()

Present the login interface

GET /login

An explanation of how to log in.

Status Codes

- 200 OK -- success
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available

Example request:

```
curl -i localhost:8000/login
```

```
GET /login HTTP/1.1
Host: localhost:8000
Accept: text/html
```

Example response:

```
HTTP/1.1 200 OK
Content-Type: text/html
```

POST(***kwargs*)

Authenticate against Salt's eauth system

POST /login

Request Headers

- *X-Auth-Token* -- a session token from `Login`.
- Accept -- the desired response format.
- Content-Type -- the format of the request body.

Form Parameters

- **eauth** -- the eauth backend configured for the user
- **username** -- username
- **password** -- password

Status Codes

- 200 OK -- success
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available

Example request:

```
curl -si localhost:8000/login \
    -c ~/cookies.txt \
    -H "Accept: application/json" \
    -H "Content-type: application/json" \
    -d '{
        "username": "saltuser",
        "password": "saltuser",
        "eauth": "auto"
    }'
```

```
POST / HTTP/1.1
Host: localhost:8000
Content-Length: 42
Content-Type: application/json
Accept: application/json

{"username": "saltuser", "password": "saltuser", "eauth": "auto"}
```

Example response:

```
HTTP/1.1 200 OK
Content-Type: application/json
Content-Length: 206
X-Auth-Token: 6d1b722e
Set-Cookie: session_id=6d1b722e; expires=Sat, 17 Nov 2012 03:23:52␣
↪GMT; Path=/

{"return": {
    "token": "6d1b722e",
    "start": 1363805943.776223,
    "expire": 1363849143.776224,
    "user": "saltuser",
    "eauth": "pam",
    "perms": [
        "grains.*",

        "sys.*",
        "test.*"
    ]
}}
```

`/logout`

class `salt.netapi.rest_cherrypy.app.`**`Logout`**

Class to remove or invalidate sessions

`POST`()

Destroy the currently active session and expire the session cookie

`/minions`

class `salt.netapi.rest_cherrypy.app.`**`Minions`**

Convenience URLs for working with minions

`GET`(*mid=None*)

A convenience URL for getting lists of minions or getting minion details

`GET /minions/`(*mid*)

Request Headers

- *X-Auth-Token* -- a session token from `Login`.
- Accept -- the desired response format.

Status Codes

- 200 OK -- success
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available

Example request:

```
curl -i localhost:8000/minions/ms-3
```

```
GET /minions/ms-3 HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 129005
Content-Type: application/x-yaml

return:
- ms-3:
    grains.items:
        ...
```

POST(***kwargs*)

Start an execution command and immediately return the job id

POST /minions

Request Headers
- *X-Auth-Token* -- a session token from `Login`.
- Accept -- the desired response format.
- Content-Type -- the format of the request body.

Response Headers
- Content-Type -- the format of the response body; depends on the `Accept` request header.

Status Codes
- 200 OK -- success
- 400 Bad Request -- bad or malformed request
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available

Lowstate data describing Salt commands must be sent in the request body. The `client` option will be set to `local_async()`.

Example request:

```
curl -sSi localhost:8000/minions \
    -b ~/cookies.txt \
    -H "Accept: application/x-yaml" \
    -d '[{"tgt": "*", "fun": "status.diskusage"}]'
```

```
POST /minions HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Type: application/x-www-form-urlencoded

tgt=*&fun=status.diskusage
```

Example response:

```
HTTP/1.1 202 Accepted
Content-Length: 86
Content-Type: application/x-yaml
```

(continues on next page)

(continued from previous page)

```

return:
- jid: '20130603122505459265'
  minions: [ms-4, ms-3, ms-2, ms-1, ms-0]
_links:
  jobs:
    - href: /jobs/20130603122505459265
```

/jobs

class salt.netapi.rest_cherrypy.app.**Jobs**

GET(*jid=None, timeout=''*)

A convenience URL for getting lists of previously run jobs or getting the return from a single job

GET /jobs/(*jid*)

List jobs or show a single job from the job cache.

Request Headers

- *X-Auth-Token* -- a session token from `Login`.
- Accept -- the desired response format.

Status Codes

- 200 OK -- success
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available

Example request:

```
curl -i localhost:8000/jobs
```

```
GET /jobs HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 165
Content-Type: application/x-yaml

return:
- '20121130104633606931':
    Arguments:
    - '3'
    Function: test.fib
    Start Time: 2012, Nov 30 10:46:33.606931
    Target: jerry
    Target-type: glob
```

Example request:

```
curl -i localhost:8000/jobs/20121130104633606931
```

```
GET /jobs/20121130104633606931 HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

info:
- Arguments:
    - '3'
    Function: test.fib
    Minions:
    - jerry
    Start Time: 2012, Nov 30 10:46:33.606931
    Target: '*'
    Target-type: glob
    User: saltdev
    jid: '20121130104633606931'
return:
- jerry:
    - - 0
    - 1
    - 1
    - 2
    - 6.9141387939453125e-06
```

/run

class `salt.netapi.rest_cherrypy.app.`**`Run`**

Run commands bypassing the *normal session handling*.

salt-api does not enforce authorization, Salt's eauth system does that. Local/Runner/WheelClient all accept `username`/`password`/`eauth` **or** `token` kwargs that are then checked by the eauth system. The session mechanism in `rest_cherrypy` simply pairs a session with a Salt eauth token and then passes the `token` kwarg in automatically.

If you already have a Salt eauth token, perhaps generated by the `mk_token` function in the Auth Runner module, then there is no reason to use sessions.

This endpoint accepts either a `username`, `password`, `eauth` trio, **or** a `token` kwarg and does not make use of sessions at all.

`POST`(***kwargs*)

Run commands bypassing the *normal session handling*. Otherwise, this URL is identical to the `root URL (/)`.

`POST /run`

An array of lowstate data describing Salt commands must be sent in the request body.

Status Codes

- 200 OK -- success
- 400 Bad Request -- bad or malformed request

- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available

Example request:

```
curl -sS localhost:8000/run \
    -H 'Accept: application/x-yaml' \
    -H 'Content-type: application/json' \
    -d '[{
        "client": "local",
        "tgt": "*",
        "fun": "test.ping",
        "username": "saltdev",
        "password": "saltdev",
        "eauth": "auto"
    }]'
```

Or using a Salt Eauth token:

```
curl -sS localhost:8000/run \
    -H 'Accept: application/x-yaml' \
    -H 'Content-type: application/json' \
    -d '[{
        "client": "local",
        "tgt": "*",
        "fun": "test.ping",
        "token": "<salt eauth token here>"
    }]'
```

```
POST /run HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Length: 75
Content-Type: application/json

[{"client": "local", "tgt": "*", "fun": "test.ping", "username":
↪"saltdev", "password": "saltdev", "eauth": "auto"}]
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

return:
- ms-0: true
  ms-1: true
  ms-2: true
  ms-3: true
  ms-4: true
```

The /run endpoint can also be used to issue commands using the salt-ssh subsystem. When using salt-ssh, eauth credentials must also be supplied, and are subject to *eauth access-control lists*.

All SSH client requests are synchronous.

Example SSH client request:

```
curl -sS localhost:8000/run \
    -H 'Accept: application/x-yaml' \
    -d client='ssh' \
    -d tgt='*' \
    -d username='saltdev' \
    -d password='saltdev' \
    -d eauth='auto' \
    -d fun='test.ping'
```

```
POST /run HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Length: 75
Content-Type: application/x-www-form-urlencoded
```

Example SSH response:

```
return:
- silver:
    _stamp: '2020-09-08T23:04:28.912609'
    fun: test.ping
    fun_args: []
    id: silver
    jid: '20200908230427905565'
    retcode: 0
    return: true
```

`/events`

class `salt.netapi.rest_cherrypy.app.`**`Events`**

Expose the Salt event bus

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure.

See also:

Events & Reactor

`GET`(*token=None*, *salt_token=None*)

An HTTP stream of the Salt master event bus

This stream is formatted per the Server Sent Events (SSE) spec. Each event is formatted as JSON.

`GET /events`

Status Codes

- 200 OK -- success
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available

Query Parameters

- **`token`** -- **optional** parameter containing the token ordinarily supplied via the X-Auth-Token header in order to allow cross-domain requests in browsers that do not include CORS support in the EventSource API. E.g., `curl -NsS localhost:8000/events?token=308650d`

- **`salt_token`** -- **optional** parameter containing a raw Salt *eauth token* (not to be confused with the token returned from the /login URL). E.g., `curl -NsS localhost:8000/events?salt_token=30742765`

Example request:

```
curl -NsS localhost:8000/events
```

```
GET /events HTTP/1.1
Host: localhost:8000
```

Example response:

Note, the `tag` field is not part of the spec. SSE compliant clients should ignore unknown fields. This addition allows non-compliant clients to only watch for certain tags without having to deserialze the JSON object each time.

```
HTTP/1.1 200 OK
Connection: keep-alive
Cache-Control: no-cache
Content-Type: text/event-stream;charset=utf-8

retry: 400

tag: salt/job/20130802115730568475/new
data: {'tag': 'salt/job/20130802115730568475/new', 'data': {'minions
↪': ['ms-4', 'ms-3', 'ms-2', 'ms-1', 'ms-0']}}

tag: salt/job/20130802115730568475/ret/jerry
data: {'tag': 'salt/job/20130802115730568475/ret/jerry', 'data': {
↪'jid': '20130802115730568475', 'return': True, 'retcode': 0,
↪'success': True, 'cmd': '_return', 'fun': 'test.ping', 'id': 'ms-1
↪'}}
```

The event stream can be easily consumed via JavaScript:

```
var source = new EventSource('/events');
source.onopen = function() { console.info('Listening ...') };
source.onerror = function(err) { console.error(err) };
source.onmessage = function(message) {
    var saltEvent = JSON.parse(message.data);
    console.log(saltEvent.tag, saltEvent.data);
};
```

Note, the SSE stream is fast and completely asynchronous and Salt is very fast. If a job is created using a regular POST request, it is possible that the job return will be available on the SSE stream before the response for the POST request arrives. It is important to take that asynchronicity into account when designing an application. Below are some general guidelines.

- Subscribe to the SSE stream _before_ creating any events.
- Process SSE events directly as they arrive and don't wait for any other process to ”complete” first (like an ajax request).
- Keep a buffer of events if the event stream must be used for synchronous lookups.

- Be cautious in writing Salt's event stream directly to the DOM. It is very busy and can quickly overwhelm the memory allocated to a browser tab.

A full, working proof-of-concept JavaScript application is available adjacent to this file. It can be viewed by pointing a browser at the `/app` endpoint in a running `rest_cherrypy` instance.

Or using CORS:

```
var source = new EventSource('/events?
↪token=ecd589e4e01912cf3c4035afad73426dbb8dba75', {withCredentials:
↪true});
```

It is also possible to consume the stream via the shell.

Records are separated by blank lines; the `data:` and `tag:` prefixes will need to be removed manually before attempting to unserialize the JSON.

curl's `-N` flag turns off input buffering which is required to process the stream incrementally.

Here is a basic example of printing each event as it comes in:

```
curl -NsS localhost:8000/events |\
        while IFS= read -r line ; do
            echo $line
        done
```

Here is an example of using awk to filter events based on tag:

```
curl -NsS localhost:8000/events |\
        awk '
            BEGIN { RS=""; FS="\\n" }
            $1 ~ /^tag: salt\/job\/[0-9]+\/new$/ { print $0 }
        '
tag: salt/job/20140112010149808995/new
data: {"tag": "salt/job/20140112010149808995/new", "data": {"tgt_type
↪": "glob", "jid": "20140112010149808995", "tgt": "jerry", "_stamp
↪": "2014-01-12_01:01:49.809617", "user": "shouse", "arg": [], "fun
↪": "test.ping", "minions": ["jerry"]}}
tag: 20140112010149808995
data: {"tag": "20140112010149808995", "data": {"fun_args": [], "jid
↪": "20140112010149808995", "return": true, "retcode": 0, "success
↪": true, "cmd": "_return", "_stamp": "2014-01-12_01:01:49.819316",
↪"fun": "test.ping", "id": "jerry"}}
```

/hook

class `salt.netapi.rest_cherrypy.app.`**`Webhook`**

A generic web hook entry point that fires an event on Salt's event bus

External services can POST data to this URL to trigger an event in Salt. For example, Amazon SNS, Jenkins-CI or Travis-CI, or GitHub web hooks.

Note: Be mindful of security

Salt's Reactor can run any code. A Reactor SLS that responds to a hook event is responsible for validating that the event came from a trusted source and contains valid data.

This is a generic interface and securing it is up to you!

This URL requires authentication however not all external services can be configured to authenticate. For this reason authentication can be selectively disabled for this URL. Follow best practices -- always use SSL, pass a secret key, configure the firewall to only allow traffic from a known source, etc.

The event data is taken from the request body. The *`Content-Type`* header is respected for the payload.

The event tag is prefixed with `salt/netapi/hook` and the URL path is appended to the end. For example, a `POST` request sent to `/hook/mycompany/myapp/mydata` will produce a Salt event with the tag `salt/netapi/hook/mycompany/myapp/mydata`.

The following is an example `.travis.yml` file to send notifications to Salt of successful test runs:

```
language: python
script: python -m unittest tests
after_success:
  - |
    curl -sSk https://saltapi-url.example.com:8000/hook/travis/build/
↪success                          -d branch="${TRAVIS_BRANCH}"           ☒
↪      -d commit="${TRAVIS_COMMIT}"
```

See also:

Events & Reactor, *reactor*

POST(**args*, ***kwargs*)

Fire an event in Salt with a custom event tag and data

POST /hook

Status Codes

- 200 OK -- success
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available
- 413 Request Entity Too Large -- request body is too large

Example request:

```
curl -sS localhost:8000/hook \
    -H 'Content-type: application/json' \
    -d '{"foo": "Foo!", "bar": "Bar!"}'
```

```
POST /hook HTTP/1.1
Host: localhost:8000
Content-Length: 16
Content-Type: application/json

{"foo": "Foo!", "bar": "Bar!"}
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 14
Content-Type: application/json

{"success": true}
```

As a practical example, an internal continuous-integration build server could send an HTTP POST request to the URL `https://localhost:8000/hook/mycompany/build/success` which contains the result of a build and the SHA of the version that was built as JSON. That would then produce the following event in Salt that could be used to kick off a deployment via Salt's Reactor:

```
Event fired at Fri Feb 14 17:40:11 2014
*************************
Tag: salt/netapi/hook/mycompany/build/success
Data:
{'_stamp': '2014-02-14_17:40:11.440996',
    'headers': {
        'X-My-Secret-Key': 'F0fAgoQjIT@W',
        'Content-Length': '37',
        'Content-Type': 'application/json',
        'Host': 'localhost:8000',
        'Remote-Addr': '127.0.0.1'},
    'post': {'revision': 'aa22a3c4b2e7', 'result': True}}
```

Salt's Reactor could listen for the event:

```
reactor:
  - 'salt/netapi/hook/mycompany/build/*':
    - /srv/reactor/react_ci_builds.sls
```

And finally deploy the new build:

```
{% set secret_key = data.get('headers', {}).get('X-My-Secret-Key') %}
{% set build = data.get('post', {}) %}

{% if secret_key == 'F0fAgoQjIT@W' and build.result == True %}
deploy_my_app:
  cmd.state.sls:
    - tgt: 'application*'
    - arg:
      - myapp.deploy
    - kwarg:
        pillar:
          revision: {{ revision }}
{% endif %}
```

/keys

class `salt.netapi.rest_cherrypy.app.`**`Keys`**

Convenience URLs for working with minion keys

New in version 2014.7.0.

These URLs wrap the functionality provided by the *`key wheel module`* functions.

GET(*mid=None*)

Show the list of minion keys or detail on a specific key

New in version 2014.7.0.

GET /keys/(*mid*)

List all keys or show a specific key

Request Headers

- *X-Auth-Token* -- a session token from *Login*.
- Accept -- the desired response format.

Status Codes

- 200 OK -- success
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available

Example request:

```
curl -i localhost:8000/keys
```

```
GET /keys HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 165
Content-Type: application/x-yaml

return:
  local:
  - master.pem
  - master.pub
  minions:
  - jerry
  minions_pre: []
  minions_rejected: []
```

Example request:

```
curl -i localhost:8000/keys/jerry
```

```
GET /keys/jerry HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

return:
  minions:
    jerry: 51:93:b3:d0:9f:3a:6d:e5:28:67:c2:4b:27:d6:cd:2b
```

POST(***kwargs*)

Easily generate keys for a minion and auto-accept the new key

Accepts all the same parameters as the *key.gen_accept*.

Note: A note about `curl` Avoid using the `-i` flag or HTTP headers will be written and produce an invalid tar file.

Example partial kickstart script to bootstrap a new minion:

```
%post
mkdir -p /etc/salt/pki/minion
curl -sSk https://localhost:8000/keys \
        -d mid=jerry \
        -d username=kickstart \
        -d password=kickstart \
        -d eauth=pam \
    | tar -C /etc/salt/pki/minion -xf -

mkdir -p /etc/salt/minion.d
printf 'master: 10.0.0.5\nid: jerry' > /etc/salt/minion.d/id.conf
%end
```

`POST /keys`

Generate a public and private key and return both as a tarball

Authentication credentials must be passed in the request.

Status Codes

- 200 OK -- success
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available

Example request:

```
curl -sSk https://localhost:8000/keys \
        -d mid=jerry \
        -d username=kickstart \
        -d password=kickstart \
        -d eauth=pam \
        -o jerry-salt-keys.tar
```

```
POST /keys HTTP/1.1
Host: localhost:8000
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 10240
Content-Disposition: attachment; filename="saltkeys-jerry.tar"
Content-Type: application/x-tar

jerry.pub0000644000000000000000000000000703000000000000010730 0ustar ⊠
↪00000000000000
```

/ws

class salt.netapi.rest_cherrypy.app.**WebsocketEndpoint**

Open a WebSocket connection to Salt's event bus

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure. Uses websocket as the transport mechanism.

See also:

Events & Reactor

GET(*token=None*, ***kwargs*)

Return a websocket connection of Salt's event stream

GET /ws/(*token*)

Query format_events
The event stream will undergo server-side formatting if the `format_events` URL parameter is included in the request. This can be useful to avoid formatting on the client-side:

```
curl -NsS <...snip...> localhost:8000/ws?format_events
```

Reqheader X-Auth-Token
an authentication token from `Login`.

Status 101
switching to the websockets protocol

Status 401
authentication required

Status 406
requested Content-Type not available

Example request:

```
curl -NsSk \
    -H 'X-Auth-Token: ffedf49d' \
    -H 'Host: localhost:8000' \
    -H 'Connection: Upgrade' \
    -H 'Upgrade: websocket' \
    -H 'Origin: https://localhost:8000' \
    -H 'Sec-WebSocket-Version: 13' \
    -H 'Sec-WebSocket-Key: '"$(echo -n $RANDOM | base64)" \
    localhost:8000/ws
```

```
GET /ws HTTP/1.1
Connection: Upgrade
Upgrade: websocket
Host: localhost:8000
Origin: https://localhost:8000
Sec-WebSocket-Version: 13
Sec-WebSocket-Key: s65VsgHigh7v/Jcf4nXHnA==
X-Auth-Token: ffedf49d
```

Example response:

```
HTTP/1.1 101 Switching Protocols
Upgrade: websocket
Connection: Upgrade
Sec-WebSocket-Accept: mWZjBV9FCglzn1rIKJAxrTFlnJE=
Sec-WebSocket-Version: 13
```

An authentication token **may optionally** be passed as part of the URL for browsers that cannot be configured to send the authentication header or cookie:

```
curl -NsS <...snip...> localhost:8000/ws/ffedf49d
```

The event stream can be easily consumed via JavaScript:

```
// Note, you must be authenticated!
var source = new Websocket('ws://localhost:8000/ws/d0ce6c1a');
source.onerror = function(e) { console.debug('error!', e); };
source.onmessage = function(e) { console.debug(e.data); };

source.send('websocket client ready')

source.close();
```

Or via Python, using the Python module websocket-client for example.

```
# Note, you must be authenticated!

from websocket import create_connection

ws = create_connection('ws://localhost:8000/ws/d0ce6c1a')
ws.send('websocket client ready')

# Look at https://pypi.python.org/pypi/websocket-client/ for more
# examples.
while listening_to_events:
    print ws.recv()

ws.close()
```

Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt's event stream by signaling `websocket client ready`.

/stats

class `salt.netapi.rest_cherrypy.app.`**`Stats`**

Expose statistics on the running CherryPy server

GET()

Return a dump of statistics collected from the CherryPy server

GET /stats

Request Headers

- *X-Auth-Token* -- a session token from `Login`.
- Accept -- the desired response format.

Response Headers

- Content-Type -- the format of the response body; depends on the `Accept` request header.

Status Codes

- 200 OK -- success
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available

26.10.3 rest_tornado

A non-blocking REST API for Salt

depends

- tornado Python module

configuration

All authentication is done through Salt's *external auth* system which requires additional configuration not described here.

In order to run rest_tornado with the salt-master add the following to the Salt master config file.

```
rest_tornado:
    # can be any port
    port: 8000
    # address to bind to (defaults to 0.0.0.0)
    address: 0.0.0.0
    # socket backlog
    backlog: 128
    ssl_crt: /etc/pki/api/certs/server.crt
    # no need to specify ssl_key if cert and key
    # are in one single file
    ssl_key: /etc/pki/api/certs/server.key
    debug: False
    disable_ssl: False
    webhook_disable_auth: False
    cors_origin: null
```

Authentication

Authentication is performed by passing a session token with each request. Tokens are generated via the `SaltAuthHandler` URL.

The token may be sent in one of two ways:

- Include a custom header named `X-Auth-Token`.
- Sent via a cookie. This option is a convenience for HTTP clients that automatically handle cookie support (such as browsers).

See also:

You can bypass the session handling via the `RunSaltAPIHandler` URL.

CORS

rest_tornado supports Cross-site HTTP requests out of the box. It is by default deactivated and controlled by the *cors_origin* config key.

You can allow all origins by settings *cors_origin* to *.

You can allow only one origin with this configuration:

```
rest_tornado:
    cors_origin: http://salt.yourcompany.com
```

You can also be more specific and select only a few allowed origins by using a list. For example:

```
rest_tornado:
    cors_origin:
        - http://salt.yourcompany.com
        - http://salt-preprod.yourcampany.com
```

The format for origin are full URL, with both scheme and port if not standard.

In this case, rest_tornado will check if the Origin header is in the allowed list if it's the case allow the origin. Else it will returns nothing, effectively preventing the origin to make request.

For reference, CORS is a mechanism used by browser to allow (or disallow) requests made from browser from a different origin than salt-api. It's complementary to Authentication and mandatory only if you plan to use a salt client developed as a Javascript browser application.

Usage

Commands are sent to a running Salt master via this module by sending HTTP requests to the URLs detailed below.

Content negotiation

This REST interface is flexible in what data formats it will accept as well as what formats it will return (e.g., JSON, YAML, x-www-form-urlencoded).

- Specify the format of data in the request body by including the `Content-Type` header.
- Specify the desired data format for the response body with the `Accept` header.

Data sent in POST and PUT requests must be in the format of a list of lowstate dictionaries. This allows multiple commands to be executed in a single HTTP request.

lowstate

A dictionary containing various keys that instruct Salt which command to run, where that command lives, any parameters for that command, any authentication credentials, what returner to use, etc.

Salt uses the lowstate data format internally in many places to pass command data between functions. Salt also uses lowstate for the *LocalClient()* Python API interface.

The following example (in JSON format) causes Salt to execute two commands:

```
[{
    "client": "local",
    "tgt": "*",
```

(continues on next page)

(continued from previous page)

```
    "fun": "test.fib",
    "arg": ["10"]
},
{
    "client": "runner",
    "fun": "jobs.lookup_jid",
    "jid": "20130603122505459265"
}]
```

Multiple commands in a Salt API request will be executed in serial and makes no guarantees that all commands will run. Meaning that if test.fib (from the example above) had an exception, the API would still execute "jobs.lookup_jid".

Responses to these lowstates are an in-order list of dicts containing the return data, a yaml response could look like:

```
- ms-1: true
  ms-2: true
- ms-1: foo
  ms-2: bar
```

In the event of an exception while executing a command the return for that lowstate will be a string, for example if no minions matched the first lowstate we would get a return like:

```
- No minions matched the target. No command was sent, no jid was assigned.
- ms-1: true
  ms-2: true
```

---

x-www-form-urlencoded

Sending JSON or YAML in the request body is simple and most flexible, however sending data in urlencoded format is also supported with the caveats below. It is the default format for HTML forms, many JavaScript libraries, and the **`curl`** command.

For example, the equivalent to running `salt '*' test.ping` is sending `fun=test.ping&arg&client=local&tgt=*` in the HTTP request body.

Caveats:

- Only a single command may be sent per HTTP request.
- Repeating the `arg` parameter multiple times will cause those parameters to be combined into a single list.

  Note, some popular frameworks and languages (notably jQuery, PHP, and Ruby on Rails) will automatically append empty brackets onto repeated parameters. E.g., `arg=one`, `arg=two` will be sent as `arg[]=one`, `arg[]=two`. This is not supported; send JSON or YAML instead.

A Websockets add-on to saltnado

depends

- tornado Python module

In order to enable saltnado_websockets you must add websockets: True to your saltnado config block.

```
rest_tornado:
    # can be any port
    port: 8000
    ssl_crt: /etc/pki/api/certs/server.crt
    # no need to specify ssl_key if cert and key
    # are in one single file
    ssl_key: /etc/pki/api/certs/server.key
    debug: False
    disable_ssl: False
    websockets: True
```

All Events

Exposes `all` "real-time" events from Salt's event bus on a websocket connection. It should be noted that "Real-time" here means these events are made available to the server as soon as any salt related action (changes to minions, new jobs etc) happens. Clients are however assumed to be able to tolerate any network transport related latencies. Functionality provided by this endpoint is similar to the `/events` end point.

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure. Uses websocket as the transport mechanism.

Exposes GET method to return websocket connections. All requests should include an auth token. A way to obtain obtain authentication tokens is shown below.

```
% curl -si localhost:8000/login \
    -H "Accept: application/json" \
    -d username='salt' \
    -d password='salt' \
    -d eauth='pam'
```

Which results in the response

```
{
    "return": [{
        "perms": [".*", "@runner", "@wheel"],
        "start": 1400556492.277421,
        "token": "d0ce6c1a37e99dcc0374392f272fe19c0090cca7",
        "expire": 1400599692.277422,
        "user": "salt",
        "eauth": "pam"
    }]
}
```

In this example the `token` returned is `d0ce6c1a37e99dcc0374392f272fe19c0090cca7` and can be included in subsequent websocket requests (as part of the URL).

The event stream can be easily consumed via JavaScript:

```
// Note, you must be authenticated!

// Get the Websocket connection to Salt
var source = new Websocket('wss://localhost:8000/all_events/
↪d0ce6c1a37e99dcc0374392f272fe19c0090cca7');

// Get Salt's "real time" event stream.
source.onopen = function() { source.send('websocket client ready'); };

// Other handlers
source.onerror = function(e) { console.debug('error!', e); };

// e.data represents Salt's "real time" event data as serialized JSON.
source.onmessage = function(e) { console.debug(e.data); };

// Terminates websocket connection and Salt's "real time" event stream on the
↪server.
source.close();
```

Or via Python, using the Python module websocket-client for example. Or the tornado client.

```
# Note, you must be authenticated!

from websocket import create_connection

# Get the Websocket connection to Salt
ws = create_connection('wss://localhost:8000/all_events/
↪d0ce6c1a37e99dcc0374392f272fe19c0090cca7')

# Get Salt's "real time" event stream.
ws.send('websocket client ready')

# Simple listener to print results of Salt's "real time" event stream.
# Look at https://pypi.python.org/pypi/websocket-client/ for more examples.
while listening_to_events:
    print ws.recv()       #  Salt's "real time" event data as serialized JSON.

# Terminates websocket connection and Salt's "real time" event stream on the
↪server.
ws.close()

# Please refer to https://github.com/liris/websocket-client/issues/81 when
↪using a self signed cert
```

Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt's event stream by signaling `websocket client ready`.

Formatted Events

Exposes `formatted` "real-time" events from Salt's event bus on a websocket connection. It should be noted that "Real-time" here means these events are made available to the server as soon as any salt related action (changes to minions, new jobs etc) happens. Clients are however assumed to be able to tolerate any network transport related latencies. Functionality provided by this endpoint is similar to the `/events` end point.

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure. Uses websocket as the transport mechanism.

Formatted events parses the raw "real time" event stream and maintains a current view of the following:

- minions
- jobs

A change to the minions (such as addition, removal of keys or connection drops) or jobs is processed and clients are updated. Since we use salt's presence events to track minions, please enable `presence_events` and set a small value for the `loop_interval` in the salt master config file.

Exposes GET method to return websocket connections. All requests should include an auth token. A way to obtain obtain authentication tokens is shown below.

```
% curl -si localhost:8000/login \
    -H "Accept: application/json" \
    -d username='salt' \
    -d password='salt' \
    -d eauth='pam'
```

Which results in the response

```
{
    "return": [{
        "perms": [".*", "@runner", "@wheel"],
        "start": 1400556492.277421,
        "token": "d0ce6c1a37e99dcc0374392f272fe19c0090cca7",
        "expire": 1400599692.277422,
        "user": "salt",
        "eauth": "pam"
    }]
}
```

In this example the `token` returned is `d0ce6c1a37e99dcc0374392f272fe19c0090cca7` and can be included in subsequent websocket requests (as part of the URL).

The event stream can be easily consumed via JavaScript:

```
// Note, you must be authenticated!

// Get the Websocket connection to Salt
var source = new Websocket('wss://localhost:8000/formatted_events/
↪d0ce6c1a37e99dcc0374392f272fe19c0090cca7');

// Get Salt's "real time" event stream.
source.onopen = function() { source.send('websocket client ready'); };
```

(continues on next page)

(continued from previous page)

```
// Other handlers
source.onerror = function(e) { console.debug('error!', e); };

// e.data represents Salt's "real time" event data as serialized JSON.
source.onmessage = function(e) { console.debug(e.data); };

// Terminates websocket connection and Salt's "real time" event stream on the
↪server.
source.close();
```

Or via Python, using the Python module websocket-client for example. Or the tornado client.

```
# Note, you must be authenticated!

from websocket import create_connection

# Get the Websocket connection to Salt
ws = create_connection('wss://localhost:8000/formatted_events/
↪d0ce6c1a37e99dcc0374392f272fe19c0090cca7')

# Get Salt's "real time" event stream.
ws.send('websocket client ready')

# Simple listener to print results of Salt's "real time" event stream.
# Look at https://pypi.python.org/pypi/websocket-client/ for more examples.
while listening_to_events:
    print ws.recv()       #  Salt's "real time" event data as serialized JSON.

# Terminates websocket connection and Salt's "real time" event stream on the
↪server.
ws.close()

# Please refer to https://github.com/liris/websocket-client/issues/81 when
↪using a self signed cert
```

Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt's event stream by signaling `websocket client ready`.

Example responses

`Minion information` is a dictionary keyed by each connected minion's `id` (`mid`), grains information for each minion is also included.

Minion information is sent in response to the following minion events:

- **connection drops**
    - requires running `manage.present` periodically every `loop_interval` seconds
- minion addition
- minion removal

```
# Not all grains are shown
data: {
    "minions": {
        "minion1": {
            "id": "minion1",
            "grains": {
                "kernel": "Darwin",
                "domain": "local",
                "zmqversion": "4.0.3",
                "kernelrelease": "13.2.0"
            }
        }
    }
}
```

`Job information` is also tracked and delivered.

Job information is also a dictionary in which each job's information is keyed by salt's `jid`.

```
data: {
    "jobs": {
        "20140609153646699137": {
            "tgt_type": "glob",
            "jid": "20140609153646699137",
            "tgt": "*",
            "start_time": "2014-06-09T15:36:46.700315",
            "state": "complete",
            "fun": "test.ping",
            "minions": {
                "minion1": {
                    "return": true,
                    "retcode": 0,
                    "success": true
                }
            }
        }
    }
}
```

Setup

26.10.4 REST URI Reference

- */*
- */login*
- */minions*
- */jobs*
- */run*

- */events*
- */hook*

/

class `salt.netapi.rest_tornado.saltnado.`**`SaltAPIHandler`**`(`**args*, ***kwargs*`)`

Main API handler for base "/"

`disbatch``()`

Disbatch all lowstates to the appropriate clients

`get``()`

An endpoint to determine salt-api capabilities

GET /

Request Headers
- Accept -- the desired response format.

Status Codes
- 200 OK -- success
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available

Example request:

```
curl -i localhost:8000
```

```
GET / HTTP/1.1
Host: localhost:8000
Accept: application/json
```

Example response:

```
HTTP/1.1 200 OK
Content-Type: application/json
Content-Legnth: 83

{"clients": ["local", "local_async", "runner", "runner_async"],
↪"return": "Welcome"}
```

`post``()`

Send one or more Salt commands (lowstates) in the request body

POST /

Request Headers
- *X-Auth-Token* -- a session token from `SaltAuthHandler`.
- Accept -- the desired response format.
- Content-Type -- the format of the request body.

Response Headers
- Content-Type -- the format of the response body; depends on the `Accept` request header.

Status Codes
- 200 OK -- success
- 401 Unauthorized -- authentication required

- 406 Not Acceptable -- requested Content-Type not available

lowstate data describing Salt commands must be sent in the request body.

Example request:

```
curl -si https://localhost:8000 \
        -H "Accept: application/x-yaml" \
        -H "X-Auth-Token: d40d1e1e" \
        -d client=local \
        -d tgt='*' \
        -d fun='test.ping' \
        -d arg
```

```
POST / HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
X-Auth-Token: d40d1e1e
Content-Length: 36
Content-Type: application/x-www-form-urlencoded

fun=test.ping&arg&client=local&tgt=*
```

Example response:

Responses are an in-order list of the lowstate's return data. In the event of an exception running a command the return will be a string instead of a mapping.

```
HTTP/1.1 200 OK
Content-Length: 200
Allow: GET, HEAD, POST
Content-Type: application/x-yaml

return:
- ms-0: true
    ms-1: true
    ms-2: true
    ms-3: true
    ms-4: true
```

---

multiple commands

Note that if multiple *lowstate* structures are sent, the Salt API will execute them in serial, and will not stop execution upon failure of a previous job. If you need to have commands executed in order and stop on failure please use compound-command-execution.

`/login`

class salt.netapi.rest_tornado.saltnado.**SaltAuthHandler**(**args*, ***kwargs*)

Handler for login requests

get()

All logins are done over post, this is a parked endpoint

GET /login

Status Codes
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available

Example request:

```
curl -i localhost:8000/login
```

```
GET /login HTTP/1.1
Host: localhost:8000
Accept: application/json
```

Example response:

```
HTTP/1.1 401 Unauthorized
Content-Type: application/json
Content-Length: 58

{"status": "401 Unauthorized", "return": "Please log in"}
```

post()

Authenticate against Salt's eauth system

POST /login

Request Headers
- *X-Auth-Token* -- a session token from `SaltAuthHandler`.
- Accept -- the desired response format.
- Content-Type -- the format of the request body.

Form Parameters
- **eauth** -- the eauth backend configured for the user
- **username** -- username
- **password** -- password

Status Codes
- 200 OK -- success
- 400 Bad Request -- bad request
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available
- 500 Internal Server Error -- internal server error

Example request:

```
curl -si localhost:8000/login \
        -H "Accept: application/json" \
        -d username='saltuser' \
        -d password='saltpass' \
        -d eauth='pam'
```

```
POST / HTTP/1.1
Host: localhost:8000
Content-Length: 42
Content-Type: application/x-www-form-urlencoded
Accept: application/json

username=saltuser&password=saltpass&eauth=pam
```

Example response:

```
HTTP/1.1 200 OK
Content-Type: application/json
Content-Length: 206
X-Auth-Token: 6d1b722e
Set-Cookie: session_id=6d1b722e; expires=Sat, 17 Nov 2012 03:23:52␣
↪GMT; Path=/

{"return": {
    "token": "6d1b722e",
    "start": 1363805943.776223,
    "expire": 1363849143.776224,
    "user": "saltuser",
    "eauth": "pam",
    "perms": [
        "grains.*",
        "status.*",
        "sys.*",
        "test.*"
    ]
}}
```

`/minions`

class `salt.netapi.rest_tornado.saltnado.`**`MinionSaltAPIHandler`**(**args*, ***kwargs*)

A convenience endpoint for minion related functions

`get`(*mid=None*)

A convenience URL for getting lists of minions or getting minion details

`GET /minions/`(*mid*)

Request Headers
- *X-Auth-Token* -- a session token from `SaltAuthHandler`.
- Accept -- the desired response format.

Status Codes
- 200 OK -- success
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available

Example request:

```
curl -i localhost:8000/minions/ms-3
```

```
GET /minions/ms-3 HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 129005
Content-Type: application/x-yaml

return:
- ms-3:
    grains.items:
        ...
```

post()

Start an execution command and immediately return the job id

POST /minions

Request Headers

- *X-Auth-Token* -- a session token from `SaltAuthHandler`.
- Accept -- the desired response format.
- Content-Type -- the format of the request body.

Response Headers

- Content-Type -- the format of the response body; depends on the `Accept` request header.

Status Codes

- 200 OK -- success
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available

lowstate data describing Salt commands must be sent in the request body. The `client` option will be set to `local_async()`.

Example request:

```
curl -sSi localhost:8000/minions \
    -H "Accept: application/x-yaml" \
    -d tgt='*' \
    -d fun='status.diskusage'
```

```
POST /minions HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Length: 26
Content-Type: application/x-www-form-urlencoded

tgt=*&fun=status.diskusage
```

Example response:

```
HTTP/1.1 202 Accepted
Content-Length: 86
Content-Type: application/x-yaml
```

(continues on next page)

(continued from previous page)

```

return:
- jid: '20130603122505459265'
  minions: [ms-4, ms-3, ms-2, ms-1, ms-0]
```

/jobs

class `salt.netapi.rest_tornado.saltnado.`**`JobsSaltAPIHandler`**(**args*, ***kwargs*)

A convenience endpoint for job cache data

`get`(*jid=None*)

A convenience URL for getting lists of previously run jobs or getting the return from a single job

`GET /jobs/`(*jid*)

List jobs or show a single job from the job cache.

Status Codes

- 200 OK -- success
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available

Example request:

```
curl -i localhost:8000/jobs
```

```
GET /jobs HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 165
Content-Type: application/x-yaml

return:
- '20121130104633606931':
    Arguments:
    - '3'
    Function: test.fib
    Start Time: 2012, Nov 30 10:46:33.606931
    Target: jerry
    Target-type: glob
```

Example request:

```
curl -i localhost:8000/jobs/20121130104633606931
```

```
GET /jobs/20121130104633606931 HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

info:
- Arguments:
    - '3'
    Function: test.fib
    Minions:
    - jerry
    Start Time: 2012, Nov 30 10:46:33.606931
    Target: '*'
    Target-type: glob
    User: saltdev
    jid: '20121130104633606931'
return:
- jerry:
    - - 0
    - 1
    - 1
    - 2
    - 6.9141387939453125e-06
```

/run

class salt.netapi.rest_tornado.saltnado.**RunSaltAPIHandler**(**args*, ***kwargs*)

Endpoint to run commands without normal session handling

post()

Run commands bypassing the *normal session handling*

POST /run

This entry point is primarily for "one-off" commands. Each request must pass full Salt authentication credentials. Otherwise this URL is identical to the `root URL (/)`.

lowstate data describing Salt commands must be sent in the request body.

Status Codes

- 200 OK -- success
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available

Example request:

```
curl -sS localhost:8000/run \
    -H 'Accept: application/x-yaml' \
    -d client='local' \
    -d tgt='*' \
    -d fun='test.ping' \
    -d username='saltdev' \
    -d password='saltdev' \
    -d eauth='pam'
```

```
POST /run HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Length: 75
Content-Type: application/x-www-form-urlencoded

client=local&tgt=*&fun=test.ping&username=saltdev&password=saltdev&
↪eauth=pam
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

return:
- ms-0: true
    ms-1: true
    ms-2: true
    ms-3: true
    ms-4: true
```

/events

class `salt.netapi.rest_tornado.saltnado.`**`EventsSaltAPIHandler`**(**args*, ***kwargs*)

Expose the Salt event bus

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure.

See also:

Events & Reactor

get()

An HTTP stream of the Salt master event bus

This stream is formatted per the Server Sent Events (SSE) spec. Each event is formatted as JSON.

GET /events

Status Codes

- 200 OK -- success
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available

Example request:

```
curl -NsS localhost:8000/events
```

```
GET /events HTTP/1.1
Host: localhost:8000
```

Example response:

```
HTTP/1.1 200 OK
Connection: keep-alive
Cache-Control: no-cache
Content-Type: text/event-stream;charset=utf-8

retry: 400
data: {'tag': '', 'data': {'minions': ['ms-4', 'ms-3', 'ms-2', 'ms-1
↪', 'ms-0']}}

data: {'tag': '20130802115730568475', 'data': {'jid':
↪'20130802115730568475', 'return': True, 'retcode': 0, 'success':
↪True, 'cmd': '_return', 'fun': 'test.ping', 'id': 'ms-1'}}
```

The event stream can be easily consumed via JavaScript:

```
<!-- Note, you must be authenticated! -->
var source = new EventSource('/events');
source.onopen = function() { console.debug('opening') };
source.onerror = function(e) { console.debug('error!', e) };
source.onmessage = function(e) { console.debug(e.data) };
```

Or using CORS:

```
var source = new EventSource('/events', {withCredentials: true});
```

Some browser clients lack CORS support for the `EventSource()` API. Such clients may instead pass the *X-Auth-Token* value as an URL parameter:

```
curl -NsS localhost:8000/events/6d1b722e
```

It is also possible to consume the stream via the shell.

Records are separated by blank lines; the `data:` and `tag:` prefixes will need to be removed manually before attempting to unserialize the JSON.

curl's `-N` flag turns off input buffering which is required to process the stream incrementally.

Here is a basic example of printing each event as it comes in:

```
curl -NsS localhost:8000/events |\
        while IFS= read -r line ; do
            echo $line
        done
```

Here is an example of using awk to filter events based on tag:

```
curl -NsS localhost:8000/events |\
        awk '
            BEGIN { RS=""; FS="\\n" }
            $1 ~ /^tag: salt\/job\/[0-9]+\/new$/ { print $0 }
        '
tag: salt/job/20140112010149808995/new
data: {"tag": "salt/job/20140112010149808995/new", "data": {"tgt_type
↪": "glob", "jid": "20140112010149808995", "tgt": "jerry", "_stamp
↪": "2014-01-12_01:01:49.809617", "user": "shouse", "arg": [], "fun
```

(continues on next page)

(continued from previous page)

```
↪": "test.ping", "minions": ["jerry"]}}
tag: 20140112010149808995
data: {"tag": "20140112010149808995", "data": {"fun_args": [], "jid
↪": "20140112010149808995", "return": true, "retcode": 0, "success
↪": true, "cmd": "_return", "_stamp": "2014-01-12_01:01:49.819316",
↪"fun": "test.ping", "id": "jerry"}}
```

/hook

class `salt.netapi.rest_tornado.saltnado.`**`WebhookSaltAPIHandler`**(**args*, ***kwargs*)

A generic web hook entry point that fires an event on Salt's event bus

External services can POST data to this URL to trigger an event in Salt. For example, Amazon SNS, Jenkins-CI or Travis-CI, or GitHub web hooks.

Note: Be mindful of security

Salt's Reactor can run any code. A Reactor SLS that responds to a hook event is responsible for validating that the event came from a trusted source and contains valid data.

This is a generic interface and securing it is up to you!

This URL requires authentication however not all external services can be configured to authenticate. For this reason authentication can be selectively disabled for this URL. Follow best practices -- always use SSL, pass a secret key, configure the firewall to only allow traffic from a known source, etc.

The event data is taken from the request body. The *`Content-Type`* header is respected for the payload.

The event tag is prefixed with `salt/netapi/hook` and the URL path is appended to the end. For example, a `POST` request sent to `/hook/mycompany/myapp/mydata` will produce a Salt event with the tag `salt/netapi/hook/mycompany/myapp/mydata`.

The following is an example `.travis.yml` file to send notifications to Salt of successful test runs:

```
language: python
script: python -m unittest tests
after_success:
    - 'curl -sS http://saltapi-url.example.com:8000/hook/travis/build/
↪success -d branch="${TRAVIS_BRANCH}" -d commit="${TRAVIS_COMMIT}"'
```

See also:

Events, *Reactor*

`post`(*tag_suffix=None*)

Fire an event in Salt with a custom event tag and data

`POST /hook`

Status Codes
- 200 OK -- success
- 401 Unauthorized -- authentication required
- 406 Not Acceptable -- requested Content-Type not available
- 413 Request Entity Too Large -- request body is too large

Example request:

```
curl -sS localhost:8000/hook -d foo='Foo!' -d bar='Bar!'
```

```
POST /hook HTTP/1.1
Host: localhost:8000
Content-Length: 16
Content-Type: application/x-www-form-urlencoded

foo=Foo&bar=Bar!
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 14
Content-Type: application/json

{"success": true}
```

As a practical example, an internal continuous-integration build server could send an HTTP POST request to the URL `http://localhost:8000/hook/mycompany/build/success` which contains the result of a build and the SHA of the version that was built as JSON. That would then produce the following event in Salt that could be used to kick off a deployment via Salt's Reactor:

```
Event fired at Fri Feb 14 17:40:11 2014
*************************
Tag: salt/netapi/hook/mycompany/build/success
Data:
{'_stamp': '2014-02-14_17:40:11.440996',
    'headers': {
        'X-My-Secret-Key': 'F0fAgoQjIT@W',
        'Content-Length': '37',
        'Content-Type': 'application/json',
        'Host': 'localhost:8000',
        'Remote-Addr': '127.0.0.1'},
    'post': {'revision': 'aa22a3c4b2e7', 'result': True}}
```

Salt's Reactor could listen for the event:

```
reactor:
  - 'salt/netapi/hook/mycompany/build/*':
    - /srv/reactor/react_ci_builds.sls
```

And finally deploy the new build:

```
{% set secret_key = data.get('headers', {}).get('X-My-Secret-Key') %}
{% set build = data.get('post', {}) %}

{% if secret_key == 'F0fAgoQjIT@W' and build.result == True %}
deploy_my_app:
  cmd.state.sls:
    - tgt: 'application*'
    - arg:
      - myapp.deploy
    - kwarg:
```

(continues on next page)

(continued from previous page)

```
        pillar:
          revision: {{ revision }}
{% endif %}
```

26.10.5 rest_wsgi

A minimalist REST API for Salt

This `rest_wsgi` module provides a no-frills REST interface for sending commands to the Salt master. There are no dependencies.

Extra care must be taken when deploying this module into production. Please read this documentation in entirety.

All authentication is done through Salt's *external auth* system.

Usage

- All requests must be sent to the root URL (`/`).
- All requests must be sent as a POST request with JSON content in the request body.
- All responses are in JSON.

See also:

`rest_cherrypy`

The *`rest_cherrypy`* module is more full-featured, production-ready, and has builtin security features.

Deployment

The `rest_wsgi` netapi module is a standard Python WSGI app. It can be deployed one of two ways.

Using a WSGI-compliant web server

This module may be run via any WSGI-compliant production server such as Apache with mod_wsgi or Nginx with FastCGI.

It is strongly recommended that this app be used with a server that supports HTTPS encryption since raw Salt authentication credentials must be sent with every request. Any apps that access Salt through this interface will need to manually manage authentication credentials (either username and password or a Salt token). Tread carefully.

`salt-api` using a development-only server

If run directly via the salt-api daemon it uses the wsgiref.simple_server() that ships in the Python standard library. This is a single-threaded server that is intended for testing and development. **This server does not use encryption**; please note that raw Salt authentication credentials must be sent with every HTTP request.

Running this module via salt-api is not recommended!

In order to start this module via the `salt-api` daemon the following must be put into the Salt master config:

```
rest_wsgi:
    port: 8001
```

Usage examples

POST /

Example request for a basic `test.ping`:

```
% curl -sS -i \
        -H 'Content-Type: application/json' \
        -d '[{"eauth":"pam","username":"saltdev","password":"saltdev",
↪"client":"local","tgt":"*","fun":"test.ping"}]' localhost:8001
```

Example response:

```
HTTP/1.0 200 OK
Content-Length: 89
Content-Type: application/json

{"return": [{"ms--4": true, "ms--3": true, "ms--2": true, "ms--1": true,
↪"ms--0": true}]}
```

Example request for an asynchronous `test.ping`:

```
% curl -sS -i \
        -H 'Content-Type: application/json' \
        -d '[{"eauth":"pam","username":"saltdev","password":"saltdev",
↪"client":"local_async","tgt":"*","fun":"test.ping"}]' localhost:8001
```

Example response:

```
HTTP/1.0 200 OK
Content-Length: 103
Content-Type: application/json

{"return": [{"jid": "20130412192112593739", "minions": ["ms--4", "ms--3",
↪"ms--2", "ms--1", "ms--0"]}]}
```

Example request for looking up a job ID:

```
% curl -sS -i \
        -H 'Content-Type: application/json' \
        -d '[{"eauth":"pam","username":"saltdev","password":"saltdev",
↪"client":"runner","fun":"jobs.lookup_jid","jid":"20130412192112593739"}]
↪' localhost:8001
```

Example response:

```
HTTP/1.0 200 OK
Content-Length: 89
Content-Type: application/json
```

(continues on next page)

(continued from previous page)

```
{"return": [{"ms--4": true, "ms--3": true, "ms--2": true, "ms--1": true,
↪"ms--0": true}]}
```

form lowstate
A list of lowstate data appropriate for the *client* interface you are calling.

status 200
success

status 401
authentication required

26.11 output modules

Follow one of the below links for further information and examples

highstate	Outputter for displaying results of state runs
json_out	Display return data in JSON format
key	Display salt-key output
nested	Recursively display nested data
no_return	Display output for minions that did not return
pprint_out	Python pretty-print (pprint)
progress	Display return data as a progress bar
raw	Display raw output data structure
table_out	Display output in a table format
txt	Simple text outputter
yaml_out	Display return data in YAML format

26.11.1 salt.output.highstate

Outputter for displaying results of state runs

The return data from the Highstate command is a standard data structure which is parsed by the highstate outputter to deliver a clean and readable set of information about the HighState run on minions.

Two configurations can be set to modify the highstate outputter. These values can be set in the master config to change the output of the `salt` command or set in the minion config to change the output of the `salt-call` command.

state_verbose:
By default *state_verbose* is set to *True*, setting this to *False* will instruct the highstate outputter to omit displaying anything in green, this means that nothing with a result of True and no changes will not be printed

state_output:
The highstate outputter has six output modes, `full`, `terse`, `mixed`, `changes` and `filter`

- The default is set to `full`, which will display many lines of detailed information for each executed chunk.
- If `terse` is used, then the output is greatly simplified and shown in only one line.
- If `mixed` is used, then terse output will be used unless a state failed, in which case full output will be used.

- If `changes` is used, then terse output will be used if there was no error and no changes, otherwise full output will be used.
- If `filter` is used, then either or both of two different filters can be used: `exclude` or `terse`.
  - for `exclude`, state.highstate expects a list of states to be excluded (or `None`) followed by `True` for terse output or `False` for regular output. Because of parsing nuances, if only one of these is used, it must still contain a comma. For instance: *exclude=True,*.
  - for `terse`, state.highstate expects simply `True` or `False`.
